THE MINERAL INDUSTRY IN 1920.

This issue of the "Canadian Mining Journal" contains reviews of the mining industry in each of the provinces prepared by officers of the mines departments, and a general review of the industry by Mr. John McLeish of the Mines Branch at Ottawa.

There are quite a number of phases of mining during 1930 that mark the year out of the ordinary, and provide reasons for national congratulation.

The outstanding discovery was the oil strike at Fort Norman, a find of major significance and importance. The presence of nickel-copper ore, of Sudbury type, with high percentages of platinum contents near Lac du Bonnet, Man., and the definite prospect of the mining of the Flin Flon ore body, are two additional circumstances of good import. The silver-galena area near Mayo City in the Yukon Territory is one of which most encouraging reports are heard. The gold-bearing rocks of Northern Ontario are, at the end of 1920, determined to be greater in extent and in depth than was previously definitely known. The economic importance of the Gaspé zinc area has been confirmed by explorations during 1920. The coal areas of Alberta have, during 1920, undergone economic discovery, a process not less necessary to their utilization than their physical discovery. By working its coal areas Canada has found 2½ million tons of coal during 1920, which, being interpreted, is better than a $25,000,000 shipment of gold from Canada to New York.

All these are items of solid comfort, of permanence, and provide substantial foundations for reasoned optimism.

The world outlook is not good, but it is better than it was a year ago. Some of the nations of Europe have not returned to sanity, but others have shown signs of greater stability than was generally hoped for in January 1920, and there has been much recuperation. We are not disinterested, because on a continuance of the process of recovery from war sickness in Europe and Asia, depends the course of our trade.

We have some of the things the world needs most. We have civic peace, stable government and no ethnological divisions that need worry us. We have land, and elbow room, and none of the drawbacks of national senescence. We have food, gold and fuel, for ourselves and the outside world. Some of the things we have in abundance that no other nation possesses except in small quantities, as asbestos, nickel and mica. On these things Canada may stand, not unruffled, but unendangered by the winds from Russia or other centres of social collapse.

A mineral production of two hundred millions of dollars in value in 1920, second only to our very best mineral year, is good news at this season, and substantial encouragement to hope for better things in 1921.

NEW GOLD NEEDED FROM CANADIAN MINES

"Chemical Engineering & Mining Review," of Melbourne, Australia, writing on the production of gold, remarks:

"Who can doubt that the British Government would "welcome above everything a fresh source of gold "supply within the Empire? If another Kalgoorlie or "a second Klondike could be found, the whole world "would respond."

This whole hearted advocacy of the necessity to produce coal within the Empire, for its general financial strengthening and the restoration of British exchanges, is confirmation from a mining authority of excellent standing in another British Dominion of the view recently expressed in the "Canadian Mining Journal" that the increase of gold production in Canada had assumed the aspect of a pressing national duty. The measure of that necessity is the premium on New York funds, which would not exist were Canada able to mine sufficient gold to pay its trade balances in specie.

The Canadian viewpoint on gold production is largely coloured by the reflection of the problem of gold production in the United States, a problem quite analogous to our own. The bankers of the United States [illegible] upon increased gold production in this country [illegible] talk of a glut of gold. That is their problem. Its difficulty consists in the scarcity of gold. The [illegible]

that have hindered gold production in the United States, it is true, are the same causes that have hindered gold production in Canada, but the effects of restricted gold output are very different in our case.

Whether we have unworked goldfields in Canada comparable to the Klondike cannot be stated, but that such mines as the Porcupine and Kirkland Lake districts can show are singular and lone examples in the vast expanse of potential gold-bearing rocks that surround them on every side does not seem likely.

If gold-mining in Canada should become more profitable through the decreased cost of materials and lowered costs of living, as seems probable, it should enable not only greater outputs from the favorably situated mines of Northern Ontario, but the opening of closed mines in British Columbia and maybe Nova Scotia, although that province's gold contribution is now almost disappeared.

It would be an interesting speculation to calculate what our exchange rate on New York would be today without the new gold produced from Canadian mines, but it would be a much more interesting and profitable occupation for our national leaders to consider ways and means of largely increasing gold production in Canada.

ONTARIO METAL MINES IN 1921.

Ontario metal mines in the year just closing made fairly good records. During the early part of the year shortage of labor retarded operations considerably and at the close a shortage of water power is acting in a similar way. Falling prices of metals and difficulty in selling some of the metals at even low prices, has resulted in considerable curtailment of production during the last quarter. There is a good deal of uncertainty as to the immediate future. The scarcity of water is bound to interfere seriously with production during the first quarter of 1921. The poor market for nickel and copper is also likely to affect Sudbury mines for some months. The spring rains will bring relief to the gold producers and enable them to greatly increase output and make a good showing before the year is far advanced; but until the rains come the producers will have no opportunity of taking advantage of the favorable turn in conditions. The Sudbury mines will probably show quick return to normal activity when metal manufacturing comes back to life. Some of the silver mining companies will be hampered by lack of power for a few months, but should make up for it before the year is over, others will find it unprofitable to carry on some of their operations unless the price of silver is fairly high.

It is difficult to make predictions as to Ontario's probable metal output during the coming year. The gold miner sees a bright future and expects a busy year and there can be little doubt that gold mining will make good headway now. The shortage of power, however, prevents the operators from being very enthusiastic about the records they expect to make during the balance of the winter. The nickel-copper mine operators are evidently dependent on a general resumption in manufacturing, and if the optimists are right this will come in a few months. The silver mine operators are affected by events in the Far East that it is difficult to get reliable information about. At present prices some of the silver mines will doubtless make fairly large production during the year. At lower prices some of the companies will find operating at a profit a difficult matter.

The outlook for 1921 for metal mining in Ontario is, therefore, not a very clear one and predictions are not worth much. It is a time when little will be done by those who are afraid to venture when business is dull and the clouds still obscuring the view. The metal output during 1921 will to a larger extent than usual depend on the ability of operators to see ahead and form judgments as to when courage will displace fear in the business world. In a falling market it is difficult to judge when the bottom is nearly reached and the upturn at hand. If Canadian industries as a whole make a good record in 1921, the mines will do so. In any event the gold mines should do well.—R. E. H.

COAL PRICES.

Bituminous coal in the United States has a decided downward trend, and in Pennsylvania districts prices have fallen to from $3.25 to $3.75 per ton at the pit mouth, an entirely unremunerative figure at present wage rates. A number of bituminous mines have closed down, and the situation is chiefly affecting the small mines. These mines have benefitted greatly from recent scarcity of coal (or it is more correct to say defective distribution of coal) and high prices, and they will not continue operations when they become unremunerative. The larger companies, however, will have to keep organizations together, and their producing costs will benefit by the closing of competitive small mines and the better attendance of workmen which will result.

The slackness of demand for bituminous coal is largely a result of slowing up of steel making operations, and smaller amount of coal being made. Export business is also falling off because, no matter how badly Europe needs coal, she is unable to pay for it, and the mines of France, Belgium and Germany are beginning to approach to pre-war production of coal. British mines are also, in face of impending unemployment, showing much larger outputs.

A price of $3.50 per ton at the pit mouth would appear to be that below which bituminous coal cannot be produced in the United States profitably so long as existing wage rates and hours persist. Any decided reduction in production during the coming winter will result in shortage and higher prices in the Spring.

The reflex of the situation in the United States is being now felt in Nova Scotia, and a reduced number of working days at the collieries there is now impending and has actually taken place in some instances.

Canada's Mineral Production in 1920

By JOHN McLEISH *

As the year draws to a close the evidence of economic depression, falling prices, restriction, or complete cessation of operation at numerous points grows in strength, tends to monopolize public attention and to develop a general feeling of lack of confidence. Yet the changes effected are exactly those which the public not only expected but demanded, though no doubt it was hoped they might be brought about with less industrial disruption.

As a matter of fact Canada's mining industry during 1920 has in the aggregate had a most successful year and has furnished an output the value of which has been exceeded only once in its history, viz: by the high value of the war production of 1918.

The effect of the year end price decline on the years mineral output has really been of small proportion. It is not the purpose of this article to discuss its probable effect throughout the coming year but the hope may be expressed that it will rapidly be followed by an industrial activity based upon more healthy conditions of price and profit. While Canada has her domestic problems in respect to supplies of iron and petroleum and distribution of coal, the great basic factors of her enormous mineralized areas, her great known resources in coal, nickel, copper, gold, zinc, asbestos, and other metals and products too numerous to specify, and her infinitely greater latent possibilities should never be lost sight of. These will continue to form the basis of industry and of national development ever growing in extent and accelerated with increasing knowledge of better methods of recovery and use.

Under the stimulus of war's demands, Canada's mineral production increased from a total value of $128,863,000 in 1914 to a value of $211,300,000 in 1918.

The reaction in 1919 resulted in a falling off to $176,686,000, practically the same value as was placed upon the 1916 production. For 1920 a broad survey of the probable production indicates a total value of not less than $200,000,000, a production exceeded only by that of the maximum year 1918.

During the past seven years the annual totals have been:—

	Metallic.	Non-Metallic	Total value of Production.
1914	$ 50,386,619	$ 69,476,456	$128,863,075
1915	75,814,841	61,294,330	137,109,171
1916	106,319,365	70,882,169	177,201,534
1917	106,455,147	83,191,674	189,646,821
1918	114,549,152	96,752,745	211,301,897
1919	73,262,793	103,423,507	176,686,390
1920	80,000,000	120,000,000	200,000,000

The year of 1920 has shown a quick recovery in the production of copper, nickel and zinc amongst the metals and in the production of coal and many other non-metallic products. Gold production has continued to increase during each of the past two years, though the increment has been very small, and Canada occupies an almost unique position in being perhaps the only gold producing country which has not shown a serious falling off in the production of this metal. In the production of zinc, asbestos and coal the highest pinnacle of production has been reached during the year just closed. True it is, that some products such as graphite, magnesite and pyrites have not been in strong demand. On the other hand the production of chromite, gypsum, fluorspar, mica and salt have been well maintained while there has been an unusually good demand and considerably increased production of feldspar.

Shortage of fuel throughout the greater part of the year in Central Canada and insufficient transportation facilities have tended to restrict shipments. The production of lime and cement was seriously affected by the fuel shortage while car shortage restricted, or hampered the shipments of coal, asbestos, feldspar, and other products. In many camps labour was none too plentiful and wages for the most part were maintained at the highest levels.

It is probable that in the production of metals the recovery to higher output levels has been too rapid. With the exception of silver, metal prices were well maintain throughout the first nine months of the year, copper holding during this period at slightly above the average of the previous year, lead at about 50 per cent above the average of 1919 and zinc at 30 per cent in excess of the previous year's average.

Toward the end of the year, however, market conditions appeared to indicate the accumulation of excessive stocks, and the crash in metal prices during October, November and December showed the desire of holders to unload. The fall in silver price began in January and was accelerated in October.

The severe price decline has resulted in the recent closing of a number of mining operations with the consequent labour unemployment involved. Some of these must perforce remain closed or work at part capacity until exhaustion of accumulated stocks restores the market demand, or higher prices, or until the operators are able to reduce costs of production to the point of successfully meeting prevailing prices.

Copper and Nickel.

These metals in Ontario are derived chiefly from the great deposits of copper and nickel sulphides found in the Sudbury district, the production of nickel being supplemented by a small recovery from the silver ores of the Cobalt district. There is no nickel production in other provinces. Copper, is, on the other hand, recovered from pyrites, or sulphur ores in Quebec, and from a variety of complex ores mainly sulphides usually carrying some values in gold and silver in Manitoba, British Columbia and the Yukon.

The total production of nickel from all sources in 1920 is estimated at 61,500,000 pounds, an increase of 38 per cent over the 1919 production, and an output that has been exceeded only during the four war years 1915 to 1918 inclusive. The annual production of this metal in Canada for some years to come will be limited only by the demand on the market. Canada has been the principal source of supply for the world's markets. The developed deposits assure an output for many years and smelting capacity has been constructed considerably in excess of the highest production reached during the war which was 53,000,000 pounds in 1918. The company by the name of America Nickel Corporation of the

* Chief of Division of Mineral Resources and Statistics, Mines Branch, Ottawa.

ton and the refinery at Dechênes, Quebec, the former having been placed in operation about January 18 and the latter in April has contributed materially to the increased output during the year. During the last two months of the year the International Nickel Co. of Canada, Ltd., effected a 25 per cent reduction in output both at the Copper Cliff smelter and at the Port Colborne refinery.

The average price of nickel in New York was quoted throughout the year at 45 cents. In London the price per gross ton rose from £215 in January to a maximum of £230 which held from March 15 to November 19. On December 10 price quoted was £215.

The production of copper is estimated at 82,500,000 pounds which compared with a production of 75,000,000 pounds in 1919 shows an increase of 10 per cent. The highest previous production was 118,769,000 pounds in 1918.

The production in 1919 included 2,691,695 pounds from Quebec; 24,346,623 pounds from Ontario; 3,348,000 pounds from Manitoba; 44,502,079 pounds from British Columbia, and 165,184 pounds from the Yukon district. The production from Quebec in 1920 has been less than half that of the previous year, the Eustis mine and mill having been idle throughout the year. In Ontario the production has been increased about 25 per cent. The Manitoba shipments from the Mandy mine were about the same tonnage as the previous year. In British Columbia a slightly increased production seems to have been derived from the Coast mines. The new mill of the Canada Copper Corporation erected to treat the Copper Mountain ores was not placed in operation till October and announcement has recently been made that the low price of copper has compelled its closing down. This mine, therefore, made but a small contribution to the year's production, which, as usual, was obtained chiefly from the Anyox, Britannia and Rossland mines.

The average price of copper during the year was only fractionally less than the average of 18.69 cents in 1919 though from September to the end of the year the price has dropped from 18.5 cents to 13.25 cents.

Gold and Silver.

The value of the gold production is estimated in round numbers at $16,000,000, as compared with $15,850,423 in 1919. While the total value has shown slight increases during the past two years, the production is still less than that obtained in 1916 when the total was over $19,000,000, or in 1900 when a maximum of nearly $28,000,000 was obtained.

In 1919 the production included: $1,875,039 from the Yukon District; $3,457,406 from British Columbia and $10,454,553 from Ontario; with smaller amounts from Manitoba, Quebec and Nova Scotia. The Province of Ontario contributed nearly 66 per cent of the total. In 1920 the Yukon production which has been steadily declining shows a further decrease of about 30 per cent. British Columbia's production is also believed to have declined about 20 per cent, though estimates from this Province at this time are based largely on conjecture.

The alluvial workings are believed to have made about the same output as during the previous year, but the closing down of the Hedley mine in the Osoyoos District eliminated for the time being one of the most important producing mines. The other principal sources of gold in this Province are the gold-copper ores of Rossland, Anyox and of the Surf-Inlet mine in the Skeena District. The development of the Premier mine in the Salmon river area, Portland Canal Division at which a large cyanide mill is under construction will provide a new and important source of this metal. The production in Ontario, on the other hand has been increased at least 10 per cent or sufficient to just a little more than balance the decrease in other provinces.

Ontario has probably contributed about 72 per cent of the total Canadian gold production in 1920 derived from seven mines in the Porcupine District, three at Kirkland Lake and several miscellaneous properties.

Nova Scotia, Quebec and Manitoba are at present the minor contributors to the country's gold production. Nova Scotia for many years boasted an annual production exceeding $500,000 but in 1920 less than $15,000 is reported to have been obtained. Some spectacular gold finds have been made in Manitoba but the copper ores of the Mandy mine have up to the present been the principal source of the gold produced. The development of the Flin-Flon may in a few years provide quite an important source of gold as a by-product.

Falling prices in commodities and a more plentiful supply of labour will furnish a great stimulus to gold mining.

Silver production continues to decline, the estimated output in 1920 being 13,500,000 ounces as against 16,020,000 ounces in 1919. The 1919 production included 12,117,878 ounces from Ontario; 3,713,537 ounces from British Columbia; 140,926 ounces from Quebec; and small quantities from Manitoba and the Yukon. There appears to have been a general decrease from all sources in 1920. The Ontario production estimated at about 10,500,000 ounces the falling off being due in part to power shortage. The rapid decline in the price of silver beginning in January also tended to diminish output particularly toward the end of the year. The average price of silver increased from $1.31 on January 3rd to $1.35 on January 17, then rapidly fell to $1.21 on March 20 and 99 cents on May 22. During the next four months the change was slight but in December the price had fallen to 65 cents.

Silver production in British Columbia has been mainly a by-product recovered from the treatment of lead, copper and gold ores. The opening up of high-grade silver ores such as those found in the Dolly Varden mine at Alice Arm, B.C., gives promise of greater production in the future. The silver-lead ores of the Mayo District, Yukon Territory are also attracting considerable attention, high grade ores having been found over a considerable area in this District.

Lead and Zinc.

While British Columbia is the principal source of lead and zinc production, these metals have also been obtained in important quantities in Ontario and Quebec.

The production of lead in 1919 including lead bullion and lead recovered from ores exported, was 43,827,699 pounds, of which 40,060,113 pounds were obtained in British Columbia; 1,487,586 pounds in Ontario, and 2,280,000 pounds in Quebec.

During 1920 there has been a considerable falling off in the quantities of lead ores exported to the United States from British Columbia. Shipments from Quebec were about one third those of the previous year, while Ontario's contribution has probably been increased by over 50 per cent. The total production during the year is roughly estimated at 35,500,000 pounds.

Lead prices during the greater part of the year aver-

aged considerably higher than in 1919. A price of from 8 to 10 cents was quoted until September, as against an average of 6.966 cents in 1919. In December, however, the price in New York had fallen to 5 cents.

Zinc ores were again shipped from Notre Dame des Anges in Quebec, though the main production has been derived from the Sullivan and other smaller properties in British Columbia. The zinc reduction plant and refinery at Trail has operated steadily with increased production.

The total production from all sources in 1919 of refined zinc and zinc recovered from ores exported was 32,194,707 pounds, of which 30,295,015 were obtained in British Columbia. It is estimated that the 1920 production has been not less than 42,000,000 pounds. With zinc also there has been a distinct falling off in exports of ore to United States smelters.

The price of zinc was well maintained during the first nine months of the year, though with other metals it fell off at the end of the year. Quotations at St. Louis were 9 cents in January; 8 cents in May; 7 cents in November and 6 cents in December.

Iron and Steel.

The shipments of iron ore from Canadian mines in 1919 amounting to 197,170 short tons, were the lowest that had been recorded in 19 years. Production in 1920 has made a new low record, the total shipments according to preliminary estimates not having exceeded 120,000 tons, and were derived mainly from the ore mined by the Algoma Steel Corporation at Magpie Mine and Moose Mountain, Ltd., at Sellwood, Ontario.

The shipments from both mines consist of a beneficiated product, roasted or nodulized siderite from the Magpie and briquettes from concentrated magnitites at Moose Mountain.

The total production of pig-iron from blast furnaces and electric furnaces in 1920 is estimated at 1,080,000 short tons and the total production of steel ingots and steel castings at 1,220,000 short tons, both records showing a substantial increase over the production of the previous year.

In 1919 the production of pig-iron was 917,781 short tons of which 910,080 tons were made in blast furnaces and 7,701 tons were made in electric furnaces from scrap steel.

The total production of steel ingots and direct steel castings in 1919 was 1,030,342 short tons of which 993,039 tons were ingots and 37,303 tons direct steel castings. The total production included open hearth steel 1,007,495 tons; electric steel 15,502 tons; crucible and converter steel 7,345 tons.

During 1920 the blast furnace plants at Sydney and North Sydney N.S. were active throughout the first ten months but were closed down at the end of November. One furnace of the Dominion Iron & Steel Co., at Sydney was blown in on December 10. The furnace plants at Hamilton, Port Colborne and Sault Ste. Marie, Ontario were active throughout the year.

The blast furnace plants at Midland, Parry Sound, Deseronto, and Port Arthur, Ontario, were idle throughout the year.

Asbestos.

The major part of Canada's asbestos production is exported and the export records for the first nine months of the year indicate a productive activity during 1920 between 20 and 30 per cent greater than the previous year, and this result has been achieved notwithstanding car shortage and other adverse factors. The total shipments in 1919 included 136,765 tons of asbestos fibre and 22,471 tons of "Asbestic", having an aggregate value of $10,975,000. All the mines have been very active. Extensive alterations and improvements in equipment have been made at many properties. Much prospecting by diamond drilling has been undertaken on several of the older properties resulting in the development of resources sufficient to assure many years operation. Prospecting for new deposits has also been exceedingly active not only in the Black Lake, Thetford, and other areas of the Eastern Townships, which are the main centres of production, but the asbestos areas of the Porcupine District in Northern Ontario and those in Low Township, Wright county, Quebec have also received attention.

Coal.

Notwithstanding the difficulties encountered in respect to car shortage and the high wage cost of mining coal production during 1920 has exceeded that obtained in any previous year.

Monthly statistics of production have been collected by the Dominion Bureau of Statistics and on the basis of a nine months record it is estimated that the total production for the year has been not less than 16,000,000 short tons and may have reached 150,000 tons in excess of this figure. This production shows an increase of nearly 2,500,000 tons, or about 18 per cent over that of the previous year.

The production in 1919 reached a total of 13,681,218 short tons and by provinces included: Nova Scotia 5,720,373 tons; New Brunswick 179,108 tons; Saskatchewan 380,169 tons; Alberta 4,964,535 tons; British Columbia 2,435,933 tons; and the Yukon District 1,100 tons.

It is estimated that the Nova Scotia production has been increased in 1920 by from 450,000 to 500,000 tons. The production in New Brunswick and in Saskatchewan which is small in the aggregate has been less than in the previous year. Alberta's production has increased to a total not far short of 6,750,000 tons, and that of British Columbia to about 2,800,000 short tons.

Although Alberta has reached its highest production in 1920 that of Nova Scotia and British Columbia is still below the records of former years, Nova Scotia having produced 7,980,073 tons in 1913 and British Columbia 3,330,745 tons in 1910.

CHANGES IN EXECUTIVE CANADIAN COLLIERIES (DUNSMUIR) LTD.

Recent changes in the executive management of the Canadian Collieries (Dunsmuir) Limited have been announced. Henry S. Fleming, of New York City, who for several years has been chairman of the executive committee has resigned as president of the company and allied organizations. It is stated that the board of directors and the bondholders' committee have decided that executive management shall in future be centered wholly in British Columbia, With J. M. Sayward of Victoria, B.C., who is continued in the office of general manager, at the head of the executive with a seat on the board, he also becoming president of the Western Canada Comox branch of the company's organization, with F. Perry, of Montreal, Quebec, vice president of the Canadian Collieries, as vice president. Thomas Graham of Cumberland, Vancouver Island, remains general superintendent for the company.

Ontario's Mineral Industry in 1920

By W. R. ROGERS.*

Statistics of metalliferous production during the first 9 months of the year as collected and published by the Ontario Department of Mines, provide a basis of calculation of output for the full year. These figures, however, cannot be used pro rata, working conditions and prices during the last quarter of the year having changed materially.

The expected period of deflation following the war manifested itself during the closing quarter of the year in so far as general commodities are concerned. In the case of silver the decline in price has been more gradual—a reflection of world market conditions. If the high scale of prices for materials, which had been reached gradually, declines in like manner, no serious business consequences need be feared. Artificial bolstering of prices finally had to give way to world-wide economic conditions.

With the exception of the last quarter of the year there was a shortage of labour at the mines of the province. Gold mines were particularly hard hit for mining costs were at the peak, while the price of the marketable product remained constant. Just as labour was becoming more plentiful in the fall of the year a shortage of hydro electric power set in, precluding the possibility of utilizing this increase in man power in both gold and silver camps. Power shortage, due to scanty precipitation during the late summer and fall, may continue until spring. At Porcupine, Kirkland Lake and Cobalt auxiliary steam plants are being utilized as far as possible. For the silver mines this combination of low prices for silver and a power shortage is particularly serious and a marked reduction in output may be expected until operating conditions improve.

Following is a condensed record of Ontario's mineral output for 1919, with an estimate of production for 1920:

Ontario's Mineral Production in 1920.

Product.	Value of output, 1919.	Estimated Value, 1920.
Gold	10,451,709	11,000,000
Silver	12,904,312	9,800,000
Nickel	11,971,931	13,500,000
Copper	3,709,687	4,000,000
Cobalt	1,009,479	1,600,000
Pig Iron from Domestic Ore	1,200,793	1,800,000
Miscellaneous metallics	342,848	540,000
Total metallic	41,590,759	42,300,000
Non-metallic minerals and structural materials	17,293,157	18,700,000
Grand total	58,883,916	61,000,000

Silver-Cobalt.

The output from the silver-cobalt mines of the Cobalt area continues to be satisfactorily maintained considering the fact that the camp has been producing for 17 years. For the first nine months of the year silver marketed exceeded the figures for 1919 both in quantity and value. Power shortage in the last quarter of the year and a rapid decline in the price of silver will doubtless reduce the figures for the full year below those for 1919. Towards the close of the year labour became more plentiful and consequently more efficient. The system of paying a bonus above a base wage, depending on the market price of silver, has been abandoned. It worked well for the miners when prices advanced, but complaints were frequent when the market declined. Before the war $3.50 per day was the standard wage for miners. At present the rate is $5.75 per day. On December 10 the low price of silver for the year was reached, 59¼ cents per ounce. In 1919 the Nipissing company produced silver for 37 cents per ounce, but the cost to a number of other operators was as high as 65 cents per ounce. It should be pointed out, however, that the producer gets the benefit of the exchange situation as between Canada and the United States, and for the greater part of the year this served to offset the New York price of $1.00 per ounce paid for domestic silver by the U. S. Government under the Pittman Act.

Developments during the year at Gowganda on the Castle property of the Trethewey company were encouraging. Work was in progress on several other claims. Excessive costs, however, hampered operations. Lack of railway facilities is also a factor in preventing this silver camp from reaching its development. In South Lorrain considerable ore was mined and a mill completed by the Keeley Silver Mines, Ltd.

One feature worthy of note was the high price of cobalt until near the close of the year, when commodity prices in general suffered a big slump.

Gold.

In 1920 Ontario's production of gold exceeded that of silver in value, for the first year since 1903, when Cobalt became a silver producer. It speaks well for the gold mining industry, which prior to the discovery of Porcupine in 1909 was small, that this position has been attained despite constantly increasing production costs during the war period. Gold mining in Ontario does not require the stimulus of a McFadden bill, as proposed in the United States, which aims to artificially bolster up a languishing industry by providing a bonus of $10 per ounce for new gold produced. In spite of adverse conditions Canada increased her gold output in 1919 and was the only country in the world to do so, thanks to Ontario's contribution of $10,451,709 or 66 per cent of the total. The estimated output for 1920 added to the previous production gives a total of $64,000,000 for the Porcupine gold area. During 1920 the following Porcupine mines were producers, Hollinger Consolidated, McIntyre, Dome, Northerown, Dome Lake and Davidson Consolidated. The first mentioned is sometimes referred to as the "wonder mine of Canada." Its record justifies the epithet. For the years 1911 to 1919 inclusive, from 3,240,758 tons of ore milled values to the extent of $32,202,921 were recovered. Dividends paid during the same period total $11,146,000. Hollinger ore reserves stand at approximately $40,000,000. Labour shortage in the earlier part of 1920 prevented a larger output, while power shortage had the same effect during the last qauter of the year. As operating conditions improve, the present producers will increase their capacity and other mines are expected to recommence. In the

*Statistician, Ontario Department of Mines.

latter category the Porcupine V.N.T. and Schumacher are included. Similar conditions exist at Kirkland Lake. The Lake Shore, Kirkland Lake and Teck-Hughes mines produced gold to the value of $769.069 during the first nine months of the year. The total output from the Kirkland Lake area up to the end of 1920 will approximate $4.000.000. Wright-Hargreaves is ready to produce as soon as power is available, while Tough-Oakes and possibly Ontario-Kirkland will become producers before the end of 1921.

Ore has been proven to the 925 ft. on the Kirkland Lake property and at the Lake Shore the development program calls for sinking a three compartment shaft to the 800 ft. level. Already a depth of 600 ft. has been reached and lateral development started. Miscellaneous mines with an output during the year include Argonaut Gold, Limited, in the township of Gauthier, Contact Bay Mines, near Dryden, W. E. Stone, of Mine Centre, and W. S. Jackson, of Schreiber.

Northern Ontario is regarded as the most promising gold field in America. If the undiscovered gold areas await the prospector, and we have every reason to believe that such is the case, it is of the utmost importance to the mining industry that well-trained and intelligent prospectors should thoroughly investigate all promising territory. Throughout the winter the Ontario Department of Mines purposes conducting prospectors classes at various mining centres. Dr. W. L. Goodwin, formerly Dean of the Science of Faculty of Queen's University, is in charge of this work. Great interest has been manifested and the hope is entertained that good results will follow the instruction provided. The first class was held in December at Madoc, where some 40 to 50 prospectors and others interested availed themselves of the provileges.

Dividends and Bonuses.

In the final analysis the most important question is, does mining pay? Capital is not interested in creating new wealth unless there is an adequate return on the investment. The following is an official record of dividends paid by silver and gild mining companies in 1919, with comparative unofficial figures for the year 1920.

Silver Mines.

	1919.	1920.
Coniages	$ 400.000	$ 400 000
*Kerr Lake	337.000	75 000
McKinley-Darragh	269.723	269.723
Mining Corporation	622.519	653.119
Nipissing	1,845 000	1,800 000
Trethewey	50.000	. . .
Beaver	. . . .	60.000
Total.	$3.521.212	$3,358.142

*Kerr Lake made a reduction in capital in 1919 of $600 000, and Buffalo $350.000. This disbursements of assets is not included in the dividend figures.

Gold Mines.

Hollinger Consolidated	$1.722.000	$2.214.000
McIntyre Porcupine	364.028	546,042
Dome Mines		400.000
Lake Shore	100.000	80.000
Total	$2,186,028	$3,240,042

Dividends and bonuses paid to the end of 1919 amounted to $78,335,943 for silver mining companies, and $15,545.238 for gold mining companies, a remarkable record.

Nickel-Copper and Metals of the Platinum Group.

Ontario for many years has supplied the major part of the nickel of the world. During the war period production was greatly increased, 1.559,892 tons of ore having been melted in 1918 the maximum year of production. Ore smelted in 1919 was 754.567 tons, placing the industry on practically a pre-war basis. For the first nine months of 1920 at Copper Cliff, Coniston and Nickelton 809.022 tons of ore were smelted. During the last quarter of the year, however the market for nickel and copper has been dull and stocks have accumulated. In consequence the International Nickel Company of Canada curtailed its output by 25 per cent on November 1st, which reduces production to 3 000 tons per month of bessemer (nickel -copper) matte and 400 tons of refined nickel. A further reduction in output has since come into effect.

Early in the year the new smelter of the British America Nickel Corporation at Nickelton was put in blast, and the resulting Bessemer matte, produced without preliminary roasting of ore, was shipped to the new electrolytic refinery of the Corporation at Deschenes, near Ottawa. Both smelter and refinery are reported to be operating satisfactorily. Electrolytic nickel and copper are being turned out, although no slimes have yet been treated for the recovery of silver, gold and metals of the platinum group.

The International Company's refinery at Port Colborne which began operating in July 1918, recovers the platinum metals in impure form. Definite figures have not been available until recently to show what recovery is made by the Mond Nickel Company, which formerly sold its precious metal slimes to Johnson, Matthey and Company, of London, but has now installled a plant at Clydach Wales, for making its own recoveries. A bulletin on Platinum recently issued by the Imperial Institute of London, states that for the years 1916-1918 inclusive from the Mond company mattes there was a recovery of 1.399 ounces of platinum. In 1915 residues disposed of by the Mond company were estimated to contain 3 078 ounces of platinum 5.174 ounces of palladium and 917 ounces of iridium and rhodium. In 1919 from matte produced by the International company there was a recovery at Port Colborne, Ontario and Bayonne N.J., of 1.770 ounces of platinum metals, of which 642 ounces were platinum, 812 palladium, while rhodium, osmium, iridium and ruthenium made up the balance. These figures indicate that Ontario is an important producer of platinum, ranking third among the nations of the world, Russia and Colombia being the first two.

Despite the temporary dullness in the nickel market it should be noted that the use of "Monel" metal, a nickel-copper alloy produced by the International company is rapidly expanding. Its toughness and non-corrosive properties open [illegible] field of uses. Nickel [illegible] France and Italy, while recently Chile [illegible] Paris for [illegible]

Iron Ore, Pig Iron and Coke

Only two companies [illegible] during the year, namely [illegible]

Moose Mountain, Limited. The former worked a siderite deposit in the Michipicoten area known as the Magpie. Operations by Moose Mountain on their magnetite ore body at Sellwood were greatly curtailed towards the close of the year. Both ores require beneficiation, the siderite being sintered and nodulized while the magnetite is briquetted. During the first nine months of the year 135,023 short tons of ore were mined. Development by the Algoma Steel Corporation of an immense body of siderite ore are near Michipicoten Harbour, known as the New Helen, has been indefinitely postponed, owing to excessive construction costs for the necessary plant.

Figures of Canadian production of pig iron for the first 9 months of 1920, as published by the Federal Department of Mines, indicate that, after a decline in 1919, the output is getting back to the figures of war years. The average output for the period was 89,610 tons per month. Ontario's contribution averaged 56,951 tons per month for the nine months. It should be noted, however, that only 9.64 per cent of the ore smelted in Ontario was of domestic origin. Blast furnaces were in operation during the year at Sault Ste. Marie, Hamilton, Port Colborne and Midland.

Both the Algoma Steel Corporation at Sault Ste. Marie and the Steel Company of Canada at Hamilton operate by-product coke ovens to meet their coke requirements. The "by-product" oven possesses two great advantages over the old style "beehive," namely a greater yield of coke and the recovery of by-products. These latter include sulphate of ammonia gas, tar, benzol, toluol and other oils. In the latter part of September the Steel Company of Canada commenced operating their new benzol plant for recovering light oils. In December 100 coke ovens were in operation, using 1,250 tons of coal daily and permitting a production of benzol by-products of approximately 100,000 U. S. gallons per month. Benzol, motor fuel, toluol and solvent naphtha can be produced in various proportions according to market conditions.

Non-Metallic Minerals.

In normal years about 20 per cent of the value of Ontario's mineral output is derived from non-metallic minerals, clay products and materials of construction such as cement, stone, lime, sand and gravel. In 1919 non-metallics made up nearly 30 per cent of the total mineral output. Certain products directly or indirectly used as war minerals such as iron pyrites, fluorspar and graphite will not make as good a showing as in 1919.

Reports supplied by the Supervisor of Petroleum Bounties would indicate a production of crude oil for 1920 of about 170,000 barrels worth nearly $700,000. In the township of West Dover from deep wells in the Trenton formation there was a production of over 10,000 barrels during the first nine months of the year. The total output of crude petroleum from Ontario wells shows a decrease of about 50,000 barrels as compared with 1919, although the valuation was greater. The average price per barrel of 35 Imperial gallons was $2.87½ for 1919. On January 12th, 1920, the price was $3.63 per barrel. On March 10th the price advanced to $4.13 and remained at that figure for the balance of the year. Producers receive in addition a bounty of 52½ cents per barrel from the Dominion Government.

West Dover wells, some of which are 3,700 feet deep, produce both oil and gas. Such deep drilling is very expensive. The output from the Tilbury natural gas field is rapidly declining as indicated by the rock pressures and open-flow measurements. The field, a marvellous producer for 15 years, has arrived at the stage where only a limited supply should be drawn upon, otherwise water flooding will take place and the field be ruined in a few weeks time. The total output of natural gas from Ontario in 1920 is estimated at 11,500,000,000 cubic feet, approximately the same as for 1919. If the question of gas rates is settled in the near future, exploratory drilling will be stimulated and the restricted use of the output will tend to prolong the lives of the fields.

Structural Materials.

The building industry is reviving which means a larger output of structural materials. Had labour and fuel costs been more moderate the output of clay products would have been much greater than in 1919. Towards the close of the year soft coal became more plentiful and cheaper. The same remark applies to labour, which means increased efficiency. The outlook for 1921 in the building industry would indicate a considerable increase in the output of structural materials.

MINING STATISTICS 1920-1919-1918.

(Supplied by Division of Mineral Resources and Statistics Mines Branch, Ottawa.)

	1920.	1919.	1918.
Total Mineral Production of Canada (Value in Dollars)	$200,000,000	176,685,390	211,301,897
Pig Iron Production, (Short tons)	1,080,000	917,781	1,195,551
Steel Ingots and Castings, (Short tons)	1,220,000	1,030,342	1,873,708
Copper production, (Pounds	82,500,000	75,053,581	118,769,434
Zinc Production, (Pounds)	42,000,000	32,194,707	35,083,175
Gold Production, (Value in Dollars)	$16,000,000	15,850,423	14,463,689
Silver Production, (Ounces)	13,500,000	16,020,657	21,383,979
Nickel Production, (Pounds)	61,500,000	44,544,883	92,507,293
Lead Production, (Pounds)	35,500,000	43,827,699	51,398,002
Coal Production, Short tons)	16,000,000	13,681,218	14,997,926

MINERAL PRODUCTION OF NOVA SCOTIA, 1920.

By the courtesy of Mr. Hiram Donkin, Deputy Commissioner of Mines in Nova Scotia, we are enabled to give figures of mineral production and of iron and steel operations in the Province during the Mines Year, which closes 30th September.

GOLD MINING.—The production is nearly 200 ounces below that of 1919, and marks another new low point. The causes of decline are those that have affected gold mining elsewhere.

SALT MINING.—As will be seen from a note on the Malagash Mine, elsewhere in this issue, salt production has become an important item in provincial mining. The production during the mines year was 3,100 tons, which was disposed of to the fishing industry, ice-cream manufacturers, and for use on railways and tramways. The possibility of still greater concentrations of potash being found at depth is generally accepted.

COAL MINING.—This was fully dealt with in our last issue. The figures for the mines year showed an output of 5,682,000 long tons in 1920 compared with 5,005,000 tons in 1919.

STRUCTURAL MATERIALS.—In common with the rest of the Dominion, the year showed an improvement in output of clay products and structural materials, particularly gypsum, a staple of Nova Scotia. Firebrick is reported separately from common brick for the first time.

No production of tungsten or molybdenum took place during 1920. Manganese ore to the extent of 100 tons, and barytes to the extent of 550 tons were produced, and 500 tons of arsenical concentrates.

Comparison with previous years is as under :

Mineral Production of Nova Scotia.

(For years ended 30th September)

	1918	1919	1920
Coal, long ton . . .	5,265,404	5,004,757	5,682,000
Pig Iron, short ton.	415,808	334,500	280,600
Steel Ing., short ton	512,377	374,888	361,700
Coke, short ton . .	584,891	518,713	382,600

Mr. H. Sweaton who has been recently on the staff of the Temiskaming Testing Laboratories at Cobalt, has joined the staff of Thos. Heys & Son, Analytical Chemists, Toronto.

MALAGASH SALT MINE, NOVA SCOTIA

Messrs. Chambers and Mackay are prosecuting the mining of salt and low-grade potash at their mine at Malagash, Nova Scotia, and are investigating further the large possibilities for use of the potash material for a fertilizer salt.

The analysis of the material used as a fertilizer shows insoluble matter 12.2 p.c., sodium chloride 81.3 p.c. and potash 1.1 p.c. The results so far have been extremely satisfactory. Agriculturists are not yet decided what the actual benefit is from the use of chlorides, but the use of mixed chlorides, and even sodium chloride alone, is recommended for certain crops. There are good reasons to believe that the potash content of the Malagash deposits will increase in depth, as so far only that portion of deposit has been mined that has been subjected to surface leaching.

The discovery of salt and fertilizer in Nova Scotia is quite important as next to mining, fishing and farming are the staple industries of the Province. Hitherto salt has been imported to preserve the fish, and the average Nova Scotia farm is in dire need of fertilizer.

From the analogy of the Malagash deposit to other salt deposits associated with potash it is quite probable that the occurrence may assume much greater importance than has yet been attached to it.

TO DRILL SILVER ISLET VEINS THROUGH THE ICE.

A carload of diamond drilling outfit arrived at Port Arthur on the 22nd, and was taken to Silver Islet on the 23rd, by the Great Lakes Transportation Company's steamer "Strathmore." This outfit is under contract to the Silver Islet Syndicate, which proposes to undertake a very large footage of drilling.

Operations will be carried on during the winter, drilling through the ice to reach the veins covered by the waters of Lake Superior. These veins were never touched under the old operations at the mine, and are, prospectively, good ground.

The Silver Islet Syndicate, of which Messrs. Jamieson & Peacock, of Duluth, Minn., are the principals, plan to thoroughly explore the dyke, and later to crosscut the hitherto untouched veins. They have outlined an active mining campaign to begin in the Spring of 1921. Their commendable enterprise in undertaking to resuscitate Silver Islet is being watched with great interest and the best wishes of the mining community for their entire success.

MEDALS AWARDED BY INSTITUTION OF MINING & METALLURGY

We are informed by the Secretary of the Institution that the following Awards have been made by the Council :—

The Gold Medal of the Institution of Mining and Metallurgy, the highest distinction in the power of the Council to bestow, has been awarded to Sir Thomas Kirke Rose "in recognition of his eminent services to the advancement of Metallurgical Science [illegible] reference to the Metallurgy of Gold."

"The Consolidated Gold Fields of South Africa Ltd." Gold Medal and Premium of Forty Guineas has been awarded to Mr. H. Livingstone Solomon for his Paper "A Contribution to the Study of [illegible] (Transactions Vol. XXIX 1919-1920).

Gold and Silver Mining in Northern Ontario

Gold Production Exceeds any Previous Year but when By-products are Added to Silver Production, its Lead was maintained during 1920.—In 1921, Gold Output Promises to Exceed Silver in Value.

Review by J. A. McRAE, Cobalt.

The Gold Mines.

Gold mining in Northern Ontario has come to be regarded as a leading industry. Output for the year 1920 will amount to over $11,000,000, and will easily exceed any previous record in the history of gold mining in this province. The achievement is remarkable in the light of the fact that in nearly every other country the production has been declining.

High grade ore has enabled the leading companies to operate in the face of extremely adverse economic conditions. In spite of the obstacles to overcome, in no case has it been necessary to resort to selective mining and prematurely jeopardize the physical condition of the mines. In each case, the estimates of ore reserves at the end of 1920 promise to at least equal the average gold content as estimated when the year began. Not only is this a tribute to the managerial staffs but it conveys to the stockholders that the future may reasonably contain even a fuller measure of prosperity than that already experienced.

Basing calculations on the ability of the gold mines to establish a new record under the drawbacks of one of the tensest periods of economic pressure ever experienced in this country, what may be the achievements of the industry during times when reasonably normal conditions prevail? During the first, second and third quarters of 1920 the gold mines of Porcupine and Kirkland Lake were able to procure not more than two-thirds of the required number of workmen, and production was proportionately reduced. During the last quarter of the year, the supply of labor commenced to increase, a condition which the mines were not able to take full advantage of owing to extremely low water in the rivers having caused a pronounced shortage of hydro-electric power. This, of course, is a purely temporary reverse, and may be eliminated when reviewing the future outlook.

The crash of commodity prices is as music to the ears of the miners of gold. For every cent decline in the cost of material an extra cent is added to the margin of net profit realized. For every dollar saved on the material used in the industry, another dollar is made available for dividends. The reason for this is that no matter how low the cost of material may decline, the product of the gold mines will continue to command a full $20.67 an ounce. Gold is the yardstick of commerce, its value never fluctuates. Hence, with adverse economic conditions the industry suffered greatly during the recent period of inflated costs. Therefore, when output actually increased in the face of such adversities, the achievements of the future in the light of a rapid downward swing in costs, may reasonably exceed all former calculations.

Big Asset Paid For.

A factor which bears heavily in relation to a comparison of past and present production in gold from the Mines of Northern Ontario has to do with the fact that in the early stages of the recent war the leading mining companies were caught in the midst of extensive constructive programs. For the greater part, this construction work was completed and its cost was paid for out of current operations. However, labor shortage prevented the companies from utilizing these added mining and milling facilities and left the work as an enormous asset for the future. This asset as yet lies dormant, but during 1921, as all signs point toward a most favorable era for gold mining, it promises to be brought into full play.

The Progress Made.

Gold was first discovered in the Porcupine field in the year 1909. Other discoveries soon followed in Kirkland Lake, Boston Creek, Munro Township, Sesekinika, Beaverhouse Lake, etc., and since that time the following summary presents an idea of the success achieved, it being kept in mind that adverse conditions fell heaviest in 1918, 1919 and 1920, but with 1912 offering promise of greatly improved conditions:—

Year.	Ounces.	Value.
1910	3,089	$ 63,849
1911	2,062	42,625
1912	86,523	1,788,596
1913	219,801	4,543,690
1914	268,264	5,545,509
1915	406,577	8,404,693
1916	497,836	10,339,259
1917	420,894	8,698,881
1918	411,878	8,500,480
1919	505,963	10,451,688
1920 (est.)	560,000	11,381,008
Total	.....	$59,760,270

To understand the position of the gold mining industry from the point of view of the great likelihood of early increases in production, it is only necessary to keep in mind a few facts. First, that the ore blocked out and ready to mine amounts to around $70,000,000, or the greatest amount so far in the district's history. Second, that the supply of labor promises to fully meet the demand within the early part of 1921. Third, is the large amount of milling equipment ready to be pressed into service, which may be estimated by an analysis of the following summary:—

Facilities for Milling Gold Ore.

The Porcupine Gold Mines—

Mine	Daily Capacity in Tons	Present Rate in Tons
Hollinger Consolidated	3,500	2,000
Dome Mine	1,400	1,000
McIntyre-Porcupine	600	550
Schumacher Mine	200	Closed
Northerown Mines	140	80
Porcupine V. N. T.	120	Closed

Dome Lake	100	Closed.
Davidson Consolidated	36	Closed.
Newray Mine	25	Closed.
Totals	6,120	3,630
The Kirkland Lake Field—		
Wright-Hargraves	180	Just completed.
Kirkland Lake Mine	150	100
Tough-Oakes	140	Closed.
Teck-Hughes	120	100
Lake Shore	60	60
Totals	650	260
Munro Township Area—		
Croesus Mine	50	Closed.
Hill Gold Mines	40	Closed.
Totals	90	Nil.
Larder Lake Area—		
Argonant	30	20
Associated Goldfields	30	Closed.
Totals	60	20
Summary—		
Porcupine	6,120	3,630
Kirkland Lake	650	260
Munro Township	90	Nil.
Larder Lake	60	20
Grand totals	6,920	3,910

Note:—Bush fire destroyed two mills at Boston Creek, one at the Miller Independence, and one at the Patrick property.

The Promise Offered.

The average gold content in the ore of the Porcupine district is about $9 per ton. In the Kirkland Lake field the average is higher. These two districts make up the greater part of the producing area. Taking $9 ore as an average, and operating the mills already installed at the rate of 95 per cent possible capacity, the possible output would amount to $22,987,700 annually, or about double that of the present time.

Another point which may be full of important significance is the fact that the production as recorded in this summary has been mined almost entirely from the townships, namely, Tisdale in the Porcupine field and Teck Township in the Kirkland Lake area. With such a record in the highly developed sections of the gold-bearing area, and with gold known to be present in more than fifty townships, as yet only prospected to a limited extent, it is reasonable to expect other important gold producing mines will be developed as exploration work proceeds.

The message, therefore to the outside world is that here in Northern Ontario lies one of the most promising new gold mining areas in the world. The vast stretch of territory constitutes an enormous treasure house of fortune. Each year some one out of every few pioneers seems certain to strike it rich and the field is wide open to all those who care to make a bid for a share of the wealth.

The Silver Mines.

Silver mine operators in Northern Ontario have had a successful year in 1920, although sensational fluctuations have occurred in quotations for the metal. In January of this year, it rose to the record high point of $1.37 an ounce, and at the middle of December had declined to around 60 cents an ounce. For the year, the price has averaged a fraction under $1 an ounce.

For the calendar year 1920, the silver mines of this district produced approximately 9,931,143 fine ounces of silver, according to preliminary estimates, and which had a value of approximately $9,905,088. The decline of about $3,000,000 is due in part to the price of silver having been about 12 cents an ounces lower than during 1919, and also due to labor shortage during the first nine months, followed by a shortage of electric power in the last quarter.

Offsetting the decline in silver output to some extent was the increase in production of Cobalt metallics and Cobalt oxide. These two by-products added about $1,800,000 to the output of the silver mines as compared with some $900,000 during the preceding year, the increase amounting to about $900,000.

Including the by-product with the silver produced, the silver mines of Northern Ontario produced a value of approximately $11,705,088.

Following is a summary of the output from the precious metal mines in the district of Temiskaming during 1920:

The Silver Mines.

Silver	$9,905,088
By-products	1,800,000
	$11,705,088

The Gold Mines.

Gold produced	$11,381,008
By-products	80,000
	$11466 008
Grand total from silver and gold mines	$23,166,088

Silver Mines Still Lead.

It may be seen the gold output now exceeds the production of silver, but that the by-product recovered during the course of mining silver is such as to retain for the silver mines a leading position during the year. As to this, the year 1921 promises to see the gold mines assume the leading place.

About 25 mines contributed to the silver production for 1920. The Nipissing was the heaviest producer, with the Mining Corporation occupying second place.

Dividends paid by the silver mining companies amounted to $3,458,112 during 1920, as compared with $4,232,311 in 1919. The decline was due to adverse economic conditions which caused lower production.

As the year drew to a close, commodity prices showed a tendency to decline. This included the cost of blasting powder. Wages, however, continued high in spite of the reported large surplus of labor.

New Developments.

A noteworthy development during the year was the extensive development of the Keeley Silver Mines in South Lorrain. During the year a large [illegible] containing several hundred thousand ounces of silver ore developed. The property was also equipped with a 20-stamp mill. About the time this mill was completed a power shortage developed, and at the end of the year the plant had not yet been utilized to the extent planned.

At surface on the Keeley [illegible] high-grade veins were discovered and [illegible]

underground will take place in the coming year. The Chambers-Ferland also encountered a new zone of mineralization on that part of its property lying between the Nipissing and La Rose properties. The further development of this will be included in the interesting work of the coming months.

On the Crown Reserve mine one of the most interesting pieces of exploration work is being done, diamond drilling to a depth of about 2,000 feet. This work is for the purpose of determining whether or not another diabase still lies somewhere beneath the one close to which the Cobalt silver deposits occur.

As regards the future for the silver mines of this field, the price of silver and the question of obtaining cheaper supplies as well as wages at the mines, may be expected to determine to a large extent the scope of operations.

Following is a summary of production from the silver mines since 1903:

Northern Ontario Silver Output from 1903 to 1921.

Year	Average Price, cents per ounce.	Fine ounces	Value $
1904	57.2	206,875	111,887
1905	60.4	2,451,356	1,360,503
1906	66.8	5,401,766	3,667,551
1907	67.5	10,023,311	6,155,391
1908	52.9	19,437,875	9,133,378
1909	51.5	25,897,825	12,461,576
1910	53.5	30,645,181	15,478,049
1911	53.3	31,507,791	15,953,847
1912	60.8	30,243,859	17,408,935
1913	57.0	29,681,975	16,553,981
1914	54.8	25,162,841	12,765,461
1915	49.69	24,746,534	12,135,816
1916	65.66	19,915,090	12,643,175
1917	81.41	19,401,893	16,121,013
1918	96.77	17,738,153	17,415,882
1919	111.12	11,383,905	12,913,316
1920 est.	99.89	9,931,143	9,905,088
Totals		313,777,373	191,704,275

Gowganda and Elk Lake.

In a general way, mining operations continued active in the Gowganda district. The Miller Lake-O'Brien continued to produce at the rate of about three quarters of a million ounces annually. Also, on the Castle property of the Trethewey Company, considerable high grade ore was encountered, and the operation about paid its own way. The proposed light narrow-gauge railway was not built as planned during the Summer, and the question of transportation is still a serious handicap.

In the Elk Lake district, a limited amount of exploration and development work was done on such properties as the Triangle, Cane Silver, Regent and White Reserve.

Summarisation of Gold and Silver Production, Capitalization and Dividends Disbursed.

The production of silver and gold from the district of Temiskaming since the discovery of silver in Cobalt in 1903, and the finding of gold in the Porcupine field in 1909 has reached a grand total of over a quarter of a billion dollars.

Production Total.

It may be summarized as follows:

Silver	$191,704,275
Gold	59,760,270
Grand total	$251,464,545

Added to this are several million dollars in by-products, making a total of perhaps close to $260,000,000.

1920 Dividends.

Dividends paid during 1920 were made up and compare as follows with 1919:

	1920	1919
Silver	$3,458,142	$4,232,341
Gold	3,240,042	2,368,039
Total	$6,698,184	$6,600,380

Dividends paid by the silver and gold mines of Northern Ontario since 1904 up to the end of 1920 are as follows:

Silver	$81,975,040
Gold	18,785,280
Grand Total	$100,760,320

In addition to this large amount of net profit distributed among the shareholders of the mining companies, about $4,000,000 may reasonable be estimated to have been earned by close corporations, thereby bringing the total up to approximately $104,750,000.

In addition, the various companies carry an additional amount in treasury surpluses which may aggregate $15,000,000. From this it may be seen that the net profit realized may reach not far under fifty per cent. of the total value produced, and thus constitute a record perhaps unequaled in any other mining field in the world.

Following is a detailed summary of the capitalization and the dividend record of the paying mines:

Cobalt Field.

Company	Stock Iss.	1920 Div.	Total Div.
Aladdin-Cobalt	$ 500,000		75,000
Beaver Cons.	2,000,000	60,000	710,000
Buffalo Mines	150,000		2,787,000
Casey-Cobalt	100,000		203,249
Cobalt Central	5,000,000		192,845
Cobalt Comet	1,000,000		230,000
Cobalt Silver Queen	1,500,000		315,000
Coniagas	4,000,000	500,000	10,140,000
Crown Reserve	2,000,000		6,190,849
Foster-Cobalt	1,000,000		45,000
Hudson Bay	3,200,050		778,909
Kerr Lake	2,400,000	75,000	8,860,000
La Rose	1,500,000		6,300,546
McKinley-Darragh	2,500,000	269,723	5,955,391
Mining Corporation	8,300,250	653,419	5,530,768
*City of Cobalt	1,500,000		145,000
*Cobalt Lake	3,000,000		465,000
*Cobalt Townsite	45,011		1,042,259
Nipissing	6,000,000	1,800,000	23,083,297
Penn Canadian	1,349,705		256,443
Peterson Lake	3,000,000		462,350
Right of Way Mining Co.	500,000		324,643
Right of Way Mines	2,000,000		252,825
Seneca-Superior	478,884		1,579,817
Temiskaming	2,500,000	100,000	2,159,156
T. & H. B.	7,761		1,940,250
Trethewey-Cobalt	1,000,000		1,211,998
Wettlaufer	1,416,590		637,465
Totals		$3,458,142	$81,975,040

The Porcupine Field.

Dome Mines	$ 476,000	$ 400,000	$ 1,900,000
Hollinger Cons.	24,600,000	2,214,000	13,360,000
McIntyre-Porcupine	3,640,283	546,042	1,994,655
Porcupine Crown	2,000,000	.....	840,000
Rea Consolidated	200,000	.....	12,000
Totals		$3,160,042	$18,106,655

Lake Shore	2,000,000	80,000	280,000
Tough-Oakes	2,657,500	.....	398,625
Totals		$80,000	$678,625

Grand Summary of Dividends.

Cobalt	$81,975,041
Porcupine	18,106,655
Kirkland Lake	678,625
	$100,760,321

Metal Mining in British Columbia During 1920

Decline in the Metal Market.—Particularly in Copper Prices.—Hindered Production.—Silver and Gold Production both Show Reduction. —While Outlook is Uncertain it is one Phase of General World Condition, and Does Not Affect Soundness of Mining in British Columbia.

Review by Robert Dunn, Victoria, B.C.

Copper.

There can be no doubt that the weakness of the copper market is having its effect on the industry in British Columbia. How serious this is to be depends entirely on the length of time it takes for world conditions to adjust themselves. At present it must be admitted, and it serves no good purpose to attempt to blind ourselves to the facts, the outlook does not look particularly promising. With the Granby Company's forces at Anyox materially reduced; with the Britannia Mining & Smelting Co., according to authentic report, devoting itself to development of its properties to the exclusion of production and shipment, which policy has meant a cutting down of the working force; with the Canadian Consolidated Mining & Smelting Co. at Trail making declaration that for the time only necessary construction will be proceeded with; and with the Canada Copper Co., newly established at Allenby and with its Copper Mountain Mines just in shape for production, announcing that operations must cease until the market improves, it is quite clear that the larger mining corporations of this Province have concluded that it is impossible with copper at its present low figure to produce the metal at a profit.

That many of those close in touch with the situation declare that it cannot last for long, and that as soon as copper climbs back to its normal place the Granby, Canadian Consolidated, Canada Copper, and other British Columbia Companies will resume with renewed vigor both production and development, constitute the silver lining to the cloud. And in passing it is interesting to direct attention to the paramount importance of copper in consideration of the mining of this Province. When that metal slumps its effect is serious wherever there is a mining industry but in this Province the result is more or less of the character of a "knock out" as, being without an iron and steel plant of consequence and there being no production in iron, it hits at the very backbone of our industry.

Taking the year 1920 all through, up to the middle of December, British Columbia has not done at all badly in point of the production of its metalliferous mining. To give the exact figures is impossible at the time of writing but, from the general information available, it would appear that the output of Copper for the twelve months will be about equal to that of 1919, viz., 42,459,339 lbs. For the first nine months of the year, it must be borne in mind, the larger companies, for the most part, maintained their production at a high level. The Britannia Mining Company, for instance, milled as many tons of ore as it did in 1919 before the copper market fell into the doldrums. The price having fallen to 14 cents a lb. in New York production was cut down, otherwise the tonnage treated by flotation in the concentrating mill at Britannia this year might have established a new record for the plant.

These latter observations tell the story of the operations of the Granby Consolidated Mining & Smelting Co. at Anyox. Not until the latter part of the year was the output reduced so that it is expected that the figures for the twelvemonth will not be unfavourable in comparison with those of the previous year.

As to the Consolidated Mining & Smelting Co., at Trail, it is not at present a large producer of copper. Its returns in this respect are likely to be unfavourably affected because of the fact that Rossland Mines have not been shipping largely. With a large variety of independent shippers, although none contributing in quantity and regularly, and with some shipments of importance from the Mandy Mine of Manitoba, the Trail Smelter returns, however, may contain a surprise.

This Company, in a greater degree than heretofore, is turning its attention to copper. The construction of concentrating plants at the "Old Sport" Group of Claims, Quatsino Sound, Vancouver Island; and at the "Smelock" Jordan River, V.I., had been planned for 1920 but costs of labour, supplies and machinery were so high as compared with the average price of the metal and the projects were permitted to stand. A start on these plants may be looked for during the new year. The intervening time has not been lost, development having continued, working openings having been driven on both properties and diamond drilling so pursued that much greater tonnages of ore have been proved.

The Tidewater Copper Company, operating the "Indian Chief Group" of Crown Granted Mineral Claims, Sidney Inlet, west coast of Vancouver Island, is an enterprise to which special attention should be directed. Through the adoption of a well thought out policy and faithful adherence to the same this Company has placed itself in a position to mine and ship considerable

tities of concentrates over a long period with every prospect of developing further resources as the work continues. During the past two years a sufficient body of ore has been blocked out to furnish 300 tons for treatment daily for two years by a mill which has been reconstructed, enlarged and much improved. In connection with the latter a battery of "Peterson" flotation cells and an electrical plant for driving all machinery, including the air compressor, have been installed. Two creeks have been used for the generation of power, the necessary plant having been provided.

The Kamloops District will show a drop in copper production this year because of the closing down of the "Iron Mask" Mine. This took place last April and since that time a start has been made in the installation of a new water system and in other improvements to the Mine and Plant. The shaft has been straightened, new concrete foundations to the head gear provided, a new conveyor built from the shaft to the mill, and increased storage constructed for the treatment liquids.

Gold.

With reference to the 1920 production of Gold it may be said with reasonable certainty that there will be a decline in comparison with the previous year. In placer mining there has been considerable activity manifested in the Cariboo, and further North and Northeast. Whether this will have any effect on the sum total of production, however, is doubtful because there is no doubt that, for the most part, this season's work has been along the lines of development, so that results are not likely to become apparent at least for another year. In 1919 the placers of British Columbia produced 14,325 ounces of gold. That the lode-gold mining will not show as satisfactory results as in 1919 is assumed from the fact that the Rossland Mines, Consolidated Mining, Smelting & Power Co., have been very quiet and that the Nickel Plate Mine, Hedley Gold Mining Co., had been slowing down for some time prior to the final close of the mine for an indefinite period. This occurred some two or three months ago and was the result of high costs and the diminished purchasing power of the yellow metal. The management figured that, until more normal conditions returned, it would be good business to leave the riches of their property in place. It is not advisable, however, to make anything but a qualified prediction in respect of gold, because while it is true that the Rossland Mines have not been producing, it must be remembered that they did not do much in 1919; and, although it is a fact that the Nickel Plate cannot be depended upon for a large production, it should be borne in mind that there will be a considerably greater return in gold from the output of the Premier Mine, Salmon River. The lode-gold production for 1919 was 152,426 ounces.

Silver.

Notwithstanding that the Silver production of the northeast of British Columbia, wherein is situated the Dolly Varden Mine, will be substantially greater than in 1919 it looks as though the general 1920 output of the white metal in this Province will be less than it was in the previous year. The whole of the provincial coast and the Boundary District will show about the same production for this year, or perhaps a little better than in 1919. If the figures are higher the credit will have to go to the Premier and the Dolly Varden Mines, especially the latter, which has been operated on a large scale throughout the year and from which a large quantity of high-grade silver-bearing ore has been shipped. But the Slocan District will be found to be short in production and, in order that the significance of this may be properly understood, let it be said that in 1919 the Northern Coast produced in silver, 920,413 ounces; the Boundary-Yale District, 231,599 ounces; East Kootenay, 274,134 ounces; and West Kootenay, 1,799,229 ounces. The total for the Province was 3,403,119 ounces. It is only necessary to add that the richest silver mines of West Kootenay are in the Slocan.

What have been the conditions in the Slocan responsible for the slump? Two circumstances have served to well-nigh throttle the industry. One was the lack of labor in the early part of the year and the other the discontent which developed later among the miners, finally resulting in a strike called by the One Big Union. If the workers aimed to tie up the mining industry they were successful beyond a doubt. The operators refused their demands with one exception, viz., the management of the Silversmith Mines, Ltd. operating the old Slocan Star, and for months only that property was active. The situation now has changed. The lumber business has fallen off, logging is at a standstill, and there are plenty of men for the mines. Latest advices are that work has been resumed on most of the well-known properties of the District but the damage, as far as the year's production is concerned, has been done and the effect may be expected to be shown in the official statistics.

Lead and Zinc.

The production of lead and zinc depends largely on the output of the Sullivan Mine, of Kimberley, B.C., which is treated at the Trail Smelter of the Consolidated Mining & Smelting Co. This mine has been extensively developed and it has been yielding greater quantities of ore so that it is possible the lead production of the Province, which in 1919 was 29,475,968 lbs. will be about the same for 1920. There is no doubt that there will be a falling off in the product of the Slocan so that much depends on the showing made by the Company's Mines. In regard to zinc the same remarks apply, except that it would appear likely that 1920 will show an increased output of that metal. Again the Sullivan Mine is responsible, it being known that zinc ores were largely mined at Kimberley during the past twelvemonth. In 1919 East Kootenay produced 46,460,705 lbs. of the total 56,737,651 lbs.

Basic Conditions not Injured by Trade Depression.

Taking it as a whole the foregoing is not as bright a review as it has been possible to give for several years but it is not unsatisfactory. British Columbia mining men cannot avoid being affected by the world's metal markets. For some time exceptionally high prices in copper, silver, and other products of the minerals of this Province were enjoyed and the fullest advantage was taken of the opportunities thus afforded for development. Consequently the industry has advanced far beyond the point it had reached five years ago in respect of productive possibilities. The present slump in the market, the existing unsettled conditions, and the results apparent in this Province, should not be viewed with alarm. They would be met with fortitude and optimism, confident in the knowledge that, when conditions are such that it will be economically practical to mine copper in this Province, the industry will be resumed on a scale never before attempted; confident also in the assurance that the richness of British Columbia's resources guarantees to the producers of gold, silver and other metals as full a measure of success as can be looked for anywhere else on the continent

A RETROSPECT OF THE YEAR IN MANITOBA.

R. C. WALLACE.*

In looking back over the year that is gone, one feels it advisable to direct attention rather to major considerations in the mining situation than to details of mining progress. This is all the more in order as fairly complete details of the work of the past summer have already appeared in an article published by the "Journal" in the issue of October 22nd, 1920. To this the curious reader may be referred.

Since 1910 it has been uphill work in Manitoba. A province which is so pre-eminently agricultural turns out readily to follow new lights. There was sometimes more than a suspicion that the new light was a will-o'-the-wisp. There was a well-defined attitude that we had done well enough by the soil and could do still better, and should confine our strivings to that channel—all of which was very natural, if the horizon was limited. The great extent of territory ceded to Manitoba in 1912 extended the horizon and seized the imagination of many citizens with visions of the day when agriculture in the south and industry based on mineral, forest, and water power wealth in the north, would blend to maintain a population to whom scope would be given for the utilization of diverse aptitudes and abilities. Fortunately, discoveries substantiated the visions, and business-like development work seconded the discoveries. As a result, the year that has passed opened with Manitoba not yet numbered among the important mining provinces, but to be counted to pass some day into that category.

The year closes without any important production to record. True, the final shipments from the Mandy Mine went through to the Trail Smelter, completing a production that totals more than $2,000,000 in copper, gold and silver. There was a small production of gold from the Rex Mine, but blocking out of ore rather than milling was the aim. Trial mill-runs from the Northern Manitoba and Bingo properties completed the actual production for the Province in metallics. The progress for the year lies in other directions not so amenable to statistical treatment, but none the less significant.

The visit of members of the Provincial Legislature to the Flin Flon property has already shown important results. For the first time many members of the House, whose concerns were mainly with agriture, met north-country prospectors and mining men, appreciated north country conditions and received a north-country welcome. They cherish warm recollections of the North and will deal with proposals to aid development with that background of knowledge and sympathy which is necessary in the task of developing the North. They were deeply impressed with the property they were invited to see, and with the opportunities in a country in which such a property has been found, and they have lost no opportunities to impress their constituents with their own convictions.

The Winnipeg meeting of the C.I.M.M. achieved in a notable way the purpose for which it was planned. It is the part of the Institute to point the way to the new fields and to expose the pit falls that may lie in the path, just as truly as it is its duty to smooth the difficulties that confront the industry in fields already developed. We in Manitoba have had reason to appreciate very fully the extent of the assistance which the Winnipeg meeting has given to the Province in many and unexpected ways, and fellow-members in Alberta have expressed themselves as more than pleased at the interest taken by the citizens of Winnipeg in the discussion on the utilization of western coal. It was specially important that this central city of Canada should appreciate the fact and the importance of the fuel resources of the west. The practice of this winter would seem to indicate that the citizens of Winnipeg have decided to encourage the industry in a very practical way. Western annual meetings have come to stay. They will ensure the active co-operation of the western members in the affairs of the Institute as a whole, a result which was much to be desired.

The main features of the year are the renewed interest in the Rice Lake area, the discovery and investigation of nickel-copper-bearing norites of the Sudbury type south of the Rice Lake field, and the developments on the Flin Flon property. The year closes with the assurance that this property will be bought in March, 1921. The next few months will be very critical for Manitoba, but we look forward to the outcome with a confidence based on the facts of our discovered mineral wealth.

*Commissioner of Northern Manitoba

CRAIN'S DIRECTORY AND MARKET DATA BOOK.

Crain's Market Data Book and Directory of Class, Trade and Technical Papers, now on the press, promises to be of unusual interest to advertisers generally and users of trade and technical papers in particular. It not only lists all of the business publications of the United States and Canada, giving circulations, rates, type page sizes, closing dates, etc., but supplies a market analysis of each trade, profession and industry. Thus the reader is given the basic facts of each line in which he may be interested, including its buying power, buying methods, character of requirements, etc. The volume, which is bound in cloth and contains nearly 500 pages, is published by G. D. Crain, Jr., 417 S. Dearborn street, Chicago. The price is $5. Orders in advance of publication are being accepted at the rate of $3.75.

Results of recent examinations held by the British Columbia Department of Mines for certificates of competency as coal mine officials have been announced as follows:

Third Class: George A. Brown, Michel; Thomas Smith, Merritt; Ralph H. Chambers, Nanaimo; James Sim, Merritt; John Walls, Coal Creek; Fred Menzies, Nanaimo; Steve Klegko, Coleman, Alta.; Ernest Waites, Nanaimo; John Hynd, Nanaimo; Preston Boyle, Cumberland.

Second class: William Hynds, Fernie; Hugh Osborne, Corbin.

Mine Surveyors: James T. Hepburn, Nanaimo; Edward Hughes, Michel; E. S. Bowerman, Nanaimo; Austin Wright, Nanaimo.

The examinations were held at Fernie, Michel, Nanaimo and Cumberland. There were [illegible] for first class certificates, four for second class, fifteen for third class and six for mine surveyors.

A Montreal Letter

By ALEX. GRAY.

Oil Fields Regulations.

Ottawa authorities have been exacting about the new Northwestern Oil Fields. They understand what are the physical and fiscal pre-requisites for those who wish to participate in the adventure. Mounted Police are seeing to it that the vanguard possesses physique, and will be able to undergo privations. But in stipulating that individual holdings shall be restricted to 640 acres and that the Government shall become a fifty-fifty partner in respective areas, besides having the option to take a variable percentage, unlooked for discouragement was recorded. Said one person interested: "There is no use in the 'tender-foot' going into that country with 'two bits.' Having located 640 acres, the Government takes half and the half the Government gets must be as valuable as the half the locator retains. Now, how can that be determined? It will take money to prove it, and those who provide the money must have the wisdom of Solomon and assume all the risk. Then, there are several optional features in the regulations. The Government may take so much, and so much more. The effect will be, that large concerns alone can stand the strain. I have sent a party into the Mackenzie country. We have to have seven or eight relays of dog teams and drivers, for each team of dogs must have its own driver, whom the dogs must know, or they won't work for him. Beforehand we had to provide food for the dogs at each station. One small party cost me $7,000. It is all right enough to impose restrictions, and to have it understood that stamina is required, but it has been made more difficult to obtain capital, and very few, even of the important oil corporations, have money to play with, just now."

Washington Waives Assessment Work.

President Wilson has acquiesced in petitions for the waiving of assessment work upon mining claims. A six months extensions has been granted by him. While this concern is warranted in that it relieves all holders of ground from the necessity of what in ordinary times may be considered a relatively trifling outlay, it will also have a slight effect in the conservation of labor. Mining fields in general are feeling the pinch—only gold producers being encouraged—and the aim is avoid needless operations. This, of course, militates against "prospects" and non-producers, and yet working capital for new ventures is so scarce it might as well be recognized that priority should be given to those in a position to continue outputting. Undoubtedly a more plentiful supply of labor will permit considerable activity next summer, but the unproved things can await easier money conditions. So Washington was wise in deferring assessment work.

The Forward View.

Colonel Leonard and his co-directors of Coniagas Mines, bestowed the customary seasonal greetings upon shareholders. Assets of $6,734,972 after distributing $10,140,000, carry no regrets. The mines, mill and metallurgical works continue to be sources of pride

Sauerman drag-line excavator at Coniagas Mine reclaiming sands carrying 3 to 3½ ozs. of silver per ton. The sand is re-ground in tube mills to 100-mesh and treated by the flotation process.

(Photo loaned by Ont. Dept. Mines.)

to those who have followed the fortune of the company throughout its money-making years. Messrs. Leonard, Longwell, and others who pioneered the enterprise and have never permitted it to become a mining share-market feature, deserve the millions they have derived. Constructive and clean-handed, their 40-acre "patch" has enabled them to reinvest a not inconsiderable part of their capital in reproductive undertakings designed to benefit the country and mining industrialism in particular. In all respects, Coniagas has been distinctly Canadian, and this is written without prejudice to those American capitalists and capable mining chiefs whose technical control greatly strengthened the status of Ontario's silver industry. The directors see in "the changed conditions as affecting the supply of labor and cost of materials, which present tendencies indicate," a surer foothold on "greater economies in production," and that is inspiriting.

"Railways Through Gold Fields."

Under that heading The Globe editorially implies that it favors the construction of about eighty miles of railway from Westree on the Canadian National to Swastika on the Temiskaming and Northern Ontario Railway. The Globe does not explicitly advocate it, but it cites the results obtained from other railways built in Northern Ontario and gives space to this scenario on what the projected line may bring in the way of "an enormous output" of "precious metals":

"It is claimed that in addition to gold, silver and iron there are in these rich regions many other valuable minerals, including barite, fluorite, asbestos, potash-feldspar, molybdenite, sheelite and platinum. The presence of periodite in dykes and larger masses makes it probable that platinum, chrome iron and possibly diamonds will be found in economic quantities."

The list of "probabilities" and "possibilities" need not have ended there. Anything is "probable" and "possible" in Ontario's Wonderland. It has not been shown, perhaps, conclusively shown, there are so "many potentially large mines of gold and silver in West Shining Tree, Gowganda, Matachewan, and other fields," and yet "you never can tell": The "triangle lying northwest from the junction of the Temiskaming and Northern Ontario Railway and Canadian National Railway at North Bay" has been the happy and unhappy hunting ground of prospectors, was pretty thoroughly "papered," has a good deal of what is claimed in its behalf, but not all peridotite contains diamonds or platinum, and not every gold and silver prospect will contribute to the support of a railway. It will be noted that the printer erroneously injected "periodite" instead of peridotite, but really the periodic petitions for railways before there is profitable tonnage, indicated or proved, are somewhat premature. Larder Lake proferred "potentially large" propositions as needing rail transportation, but nothing so semtillant as the attractions of the "triangle" arrayed in the tentative prospectus. Rare metals, royal gems, a series of Geological Ages, and "potentially large" mines will, when substantiated, justify such a railway. As yet the tonnage offering has been mostly script.

Metals A'Begging.

Copper at 12½ cents for January and February delivery; zinc at 5.70-5.75 cents—and a dearth of cash buyers at that—did not provide "good cheer" at the year-end. There cannot be a great deal of the former on hand. With rare exceptions it cannot be produced for the price; consequently Canada is out of it for the moment. The American "porphyries" cannot meet the market and make any money. One or two of the older companies—notably Calumet & Hecla—are availing of Flotation with their stored tailings, and are putting something on the right side of their ledgers. Otherwise, the copper situation is dolefnl, the one consolation being that "it is darkest before the dawn." For zinc there is slightly more inquiry, but the margin is too close for comfort, notwithstanding Canada is able to produce it as cheap as the cheapest. Besides, there is a lot of spelter awaiting buyers.

British Columbia Letter

The Metal Mines.

The necessity of encouraging the production of gold in British Columbia is becoming increasingly apparent and the latest public body to take action is the Mining Bureau of the Vancouver Board of Trade which recently passed a resolution offering a number of suggestions to the Dominion and Provincial Governments. One is the removal of all taxation on gold mines until "such time as conditions return to normal;" another "the return to Canada of all gold produced from exported ores and the purchase thereof by the Mint at Ottawa and the Dominion Assay Office at Vancouver;" and a third "that all gold sold by the before-mentioned institutions for industrial purposes should be so priced as to cover the normal cost of production, any surplus revenue to be distributed among the gold mining companies in proportion to production."

The interests of the Bullion Gold Mining Company in the Cariboo District, B.C., are reported to have been optioned to a syndicate of New York and Kansas City financiers. R. T. Ward, manager for the Company, states that $20,000 already has been paid down on the deal. Mr. Ward and his associates acquired the Bullion property in 1913. It first was owned by Sir William Van Horne, Lord Shaughnessy and other C. P. R. officials. Later it was taken over by the Guggenheims, who sold to the present owners. About $1,000,000 have been spent in development. Previous to the litigation between Ward and Hopp, which resulted in the former's success, the digging of a canal to carry the waters of Spanish Lake to the scene of mining operations was started. To complete this will cost $250,000, Mr. Ward asserts, nothing having been done for the past six years. The canal will be fourteen miles in length. At the present time the waters of Morehead Lake are carried twelve miles and Bowron Lake also a considerable distance. Thus there is an assured supply of water for two years work on. Mr. Ward explains that he is looking to the future so that the property does not pass out of his hands. The Company is prepared to carry on development and operations itself.

Receipts of ore received at the Trail Smelter of the Consolidated Mining & Smelting Co. Ltd. totalled

9,967 tons for the week ending December 21, making the aggregate for the year 369,871 tons. The following shipments appear in the weekly statement:

	Tons
Canada Copper, Allenby	161
Horn Silver, Chopaka	53
Josie, Rossland	257
North Star, Kimberley	190
Paradise, Lake Windermere	138
Company Mines	9,168

Unconfirmed reports are in circulation in mining circles to the effect that negotiations are in hand having in view the transfer of the holdings of the Granby Consolidated Mining & Smelting Co. Ltd, at Anyox, including the Hidden Creek Mine, and at Cassidys, Vancouver Island, where is situated a modern coal mining plant now in active operation, to the Canadian Consolidated Mining & Smelting Co. These stories must be taken with much reserve because it seems to those best informed highly improbable that the Granby Company is desirous of abandoning its mining operations in British Columbia. However as they have been given publicity there can be no harm in making passing reference to them. It is stated, briefly, that engineers representing the Canadian Consolidated, a subsidiary corporation to the C. P. R., have been over the plant of the Granby Co. at Anyox; that the C. P. R. would find it convenient to have the output of the Cassidy Collieries available now that coal is replacing oil as fuel for its coast steamships and its British Columbia railways; and that the Canadian Consolidated has long been feeling its way towards the establishment of a smelter on the coast. On the latter point reference is made to the Company's expenditure of approximately half a million dollars in the development of the Old Sport Mineral Claims, Quatsino Sound, Vancouver Island; to its interest in the Sunloch Mining Co's properties, Jordan River, V.I.; and to the option it has secured on the Big Interior Group, Great Central Lake, V.I. All these are copper prospects and, if development proves them capable of producing the tonnage of copper bearing ore now indicated, especially in respect of the Old Sport and the Sunloch, a smelter on the coast for the treatment of the ore will be necessary. Hence it is claimed to be not unlikely that the Canadian Consolidated Company would consider the acquirement of the Granby Company's holdings if the latter were open to business.

The Yukon Gold Company is reported to have opened up a rich vein of galena on the Rice Claim, Keno Hill, Mayo District, one sample of ore being said to have given a return of 14,000 ounces of silver to the ton, the average being over 200 ounces to the ton. The Company has installed a power plant and now is using electrically driven compressors and drills. Because of the growing travel to the district, and the now clearly established mining future of the section, the Gold Commissioner has recommended that the Ottawa Government appropriate $100,000 for the construction of an automobile road into the scene of operations.

The Coal Mines.

It is difficult to conceive of a more important announcement in point of its effect on the coal mining industry of Vancouver Island, B.C., than that made a few days ago by J. M. Savage, general manager of the Canadian Collieries (D) Ltd., that a contract has been entered into by his Company to supply the Canadian Pacific Railway Co. with 25,000 tons of coal per month for use on the Company's Trans-Pacific and coast steamships.

The coal is required almost immediately as many of the vessels already have been converted from oil burners to coal burners and the bunkering will be carried out either at Ladysmith or Union Bay, at both of which places are facilities for the shipment of the fuel.

This is the first noteworthy illustration to develop in this Province of the result of the growing scarcity of fuel oil. Coal-mine operators accept it as an indication that the industry is coming into its own again, that the prophecies so often made in recent years are about to be realized, and that the thousands of acres of coal reserves of Vancouver Island shortly will be opened up and made productive in order that the demand, now sure to become evident, may be satisfied.

If the predictions of those in touch with the situation may be relied upon a condition has arisen that assures a market for much more Island coal than is involved in the contract referred to. The statement is made that at least 70,000 tons per month will be wanted in addition to what the collieries have been supplying in the past few years. In support of this it is pointed out that the Canadian National Steamship and the Canadian National Railways both will require fuel and that the steaming coal of the British Columbia coast fields has been found to be most suitable to their needs. Some conception of what this means may be gained when it is known that the Canadian National Steamships shortly will have five or six vessels plying the Pacific Ocean and that it is likely that the Canadian National Railways will use the product of the Island on their locomotives. The latter assertion is founded on the knowledge that the coal of the Herewood Mine, Canadian Western Fuel Co., Nanaimo, has been tested on the railroad from Prince Rupert to the British Columbia boundary with splendid results. Having these facts in mind it would appear safe to say that much more Island coal will be sold in 1921 and that the fields have before them a period of unprecedented development.

After all, however, this improvement in market conditions has been gradually coming for some time. It is manifest in the returns as to output from the various collieries of Vancouver Island covering the last four or five months. When the officials statistics are available it will be found that production from the fields in question has been better in 1920 than in any previous year since 1912. And yet there is at present the anomaly of one of the Island collieries, the Pacific Coast Coal Mines Ltd., practically closing down. This Company, however, has been depending on the domestic market and the mild weather experienced on the Coast thus far this winter perhaps explains why the demand from this source has not been better maintained. The Company, too, is handicapped because of lack of tidewater facilities for the bunkering of large vessels. No doubt its difficulties will be overcome because it possesses fine coal-bearing lands, a producing mine, and, with coal about to assume again undisputed sway as King, may be depended upon to soon be on a producing basis.

TELFORD GOLD MEDAL MERITED BY Mr. G. H. DUGGAN.

In announcing the awards for papers published without discussion in the Transactions of 1917-18, the Council of the Institution of Civil Engineers (Great Britain) state that a paper by Mr. G. H. Duggan, President of the Dominion Bridge Company, had merited the award of a Telford Gold Medal, but the author being a member of the Council of the Institution is for that reason ineligible to receive a medal.

The miners of Nanaimo, B.C., are elated over the success of the Barton First Aid Team in winning the Montizambert Trophy representing the Canadian Championship as well as other honors in connection with the country-wide competition conducted by the St. John's Ambulance Society. Arrangements are being made for a public presentation of the cups. Hon. Wm. Sloan, Minister of Mines, has sent personal congratulations to the Captain of the winning team. It is thought likely that this success will give a fillip to interest both in Mine-rescue and First-aid work in connection with the collieries of the Province.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt Field.

Owing to the price of silver having appeared to settle down around from 60 to 65 cents an ounce over the year end, silver mine operators in Northern Ontario are confronted with the definite problem of finding some method whereby operating costs may be reduced. Silver production under present costs, and with the metal commanding current prices is profitable only in the case of the larger mines. For this reason some scheme must be decided upon to overcome the difficulty.

Regarding the power situation, no offical announcement has been made as to how long or to what extent the hydro-electric energy may be counted upon. The mining companies as well as the public at large are left to form unofficial estimates. In the reservoir above the power plant, water was recently understood to be about 40 inches above the dead-line. Since that time it is understood one log was removed, which leaves perhaps 30 inches as a fair estimate. This would carry operations well through the Winter. However, it is not clear what will be the result of two or three feet of ice forming during the Winter.

During January, the silver and gold mines of Northern Ontario will distribute over a million and a quarter dollars in dividends. The Nipissing and Kerr Lake represents the Cobalt district, these two companies having declared $675,000, of which the Nipissing accounts for $600,000.

Geological information resulting from deep diamond-drilling on the Crown Reserve mine has attracted considerable interest, and the Geological Survey, Ottawa, is making inquiry into the matter. This diamond-drilling hole has reached a depth of about 3,000 feet and is for the purpose of determining whether or not another diabase still lies at great depth. No official statement has so far been issued relative to the formations encountered but it is understood the drill will be continued to a still lower depth.

During the fiscal year ended Oct. 31st., according to the annual statement just issued, the Coniagas mine produced a greater quantity of silver than during either of the two preceding years. The output for the period amounted to 994,234 ozs., compared with 940,267 ozs. during the fiscal year ended Oct. 31st, 1919, and with 974,264 ozs. during the preceding year. Total production to date amounts to 28,188,762 ozs. The silver was mined and concentrated at a cost of 48.98 cents an ounce, added to which was a cost of 7.35 cents for smelting, refining, shipping and marketing. This made a total cost of 56.33 cents an ounce. During the year the company paid $500,000 in dividends, making a grand total to date of $10,040,000. During the year, the amount of broken ore in the mine was increased by about 13,521 tons. After spending $17,862 in connection with exploration work on the Agaunico property in Bucke township, and failing to get encouraging results, the company disposed of this property for $10,000 and thus redeemed part of the loss incurred. Concerning the Trethewey property which was purchased early in the year by the Coniagas, F. D. Reid, manager, has this to say: —"Ore milled from the property amounted to 7,482 tons, which yielded approximately 70,000 ounces of silver. There is still in the workings 5,000 tons of broken ore. The price paid for the property is assured, and it is anticipated that a fair profit will be made on the investment."

Drifting is under way with a small force of men on the Ruby Operative Cobalt Mines, formerly known as the Ruby Silver Mines. This work is being conducted at a point a little below the 100-ft. level, and encouraging quantities of silver is officially reported. The geological theory is being borne out and has given rise to optimistic views on the part of the officials of the company. The directorate of the new concern is composed of local business men.

With the payment of a dividend of 12½ cents a share on Jan. 15th, the Kerr Lake will have returned a total of $8,860,000 to its shareholders, the highest point of prosperity having been reached in 1910 when $1,200,000 was paid for the period.

Elk Lake and Gowganda.

Interest in the Gowganda field again centres around the question of possible rail transportation. Not only has the Northern Light Railways appeared to come to life again, but there is talk of the construction of a branch line of the T. & N. O. Ry., running south-west by north-east and passing through Westree on the West, to Gowganda, Forth Matachewan and connecting up with the main line at Swastika; thence, in an easterly direction through Kirkland Lake, to the Larder Lake district, and perhaps continuing on along the belt of promising geological formations in the province of Quebec. Under present conditions, the business through the area would not make the venture a profitable one, the possibility of it leading to the development of as yet unknown recourses being left to determine the wisdom of the scheme. For that reason it is believed no action will be taken by the Government. It is believed, however, the Kirkland Lake branch may receive favorable consideration, this requiring only about six miles of line, as compared with about 80 miles over the territory lying between Westree and Swastika.

Ore and Bullion Shipments.

During the week ended Dec. 31st. the O'Brien mine was the only company to ship ore, sending out one car containing approximately 64,000 pounds.

During the corresponding period the Mining Corporation was a heavy bullion shipper, sending out 99 cars containing 101,100 ozs.

Monthly Ore Statement.

Following is a statement of ore shipments over the T. & N. O. Ry., for the month ending November 30th, as submitted by Arthur A. Cole:—

Silver Ore.

(In tons of 2,000 lbs.)

Cobalt Proper.	Tons.
1. Beaver	30.00
2. Bailey	75.00
3. Coniagas	84.49
4. Dominion Reduction	41.50
5. LaRose	98.63
6. McKinley-Darragh	42.85
7. Nipissing	152.40
8. O'Brien	64.44
	589.31

The above shipments were made to the following Companies:—

Canada..

Deloro Smelting & Refining Co., Marmora	356.97
Coniagas Reduction Co., Thorold	145.93

United States.

American Smelting & Refining Co., Pueblo	43.56
American Smelting & Refining Co., Perth Amboy	42.85
	589.31

Price of Silver.

Nov. 11th Highest	82.875
Nov. 30th Lowest	68.125
Average	77.731

THE GOLD MINES.

The Porcupine District.

The position of the mines of the Porcupine district may now be estimated with reasonable accuracy. Uncertainty about the power supply has been largely removed, and it is now stated about 4,000 h.p. will be available throughout the winter. This is to be divided between the producers, the Hollinger getting over half the total, with the Dome getting about 1,000 h.p., the Porcupine Crown 250 h.p., and the McIntyre getting an allottment in proportion to consumption hereafter.

The Hollinger finds itself in quite favorable condition, due to having been able to develop an extra 1,000 to 1,500 h.p. from auxiliary steam equipment. This power added to the available hydro electric supply is expected to make it possible to treat an average of more than 2,000 tons of ore daily. This calculation is based upon an estimate of from 3,500 to 3,800 h.p., and it must be borne in mind that it was recently possible to treat about 2,300 tons of ore daily by employing about 1,000 h.p. With the arrival of Spring the Hollinger may be expected to increase all branches of operations up to full capacity and treat an average of from 3,000 to 3,500 tons of ore

daily. This would tend to indicate an output at the rate of upwards of $10,000,000 a year, as compared with the former highest record of around $7,000,000.

The allotment of power to the McIntyre has enabled that company to operate at about two-thirds capacity, and it is expected about 350 tons of ore may be treated daily, with the assurance that by about the middle of April it will again be possible to increase to normal rate of from 550 to 600 tons daily. The McIntyre is numbered among the dividend payers for the opening month of the new year. This company pays 5 p.c., amounting to some $180,000.

On Jan. 20th the Dome will also disburse a dividend of 2½ p.c., amounting to about $120,000. This company, in common with the other producers expects to be able to add greatly to its earning power with the arrival of Spring.

Officials of the Porcupine V. N. T. and the Northcrown Mines have been in conference with regard to the proposed consolidations of these two properties. At a meeting held last week in Montreal promising progress was made, and it is generally believed the merger will be consummated in due course. The territory involved comprises about 320 acres in a block adjoining the Hollinger on the south. Two mills, one of which is on the Northcrown and one on the Porcupine V. N. T. have combined capacity for treating close to 300 tons when operating at full blast. Recent developments on the Northcrown have been favorable. In a crossent from the 500-ft. level, two new veins have been found at a point about 1,400 feet from the shaft. The crossent is to be driven another 600 feet south to a vein formerly opened up through a drift from the adjoining Porcupine V. N. T. This intervening 600 feet is considered to have very promising prospective merit.

The Kirkland Lake District.

Good progress is reported in connection with the negotiations between the Teck-Hughes and the Orr Gold Mines, with the object in view of consolidating these two properties. It is planned to incorporate a new $5,000,000 company, with 5,000,000 shares of the par value of $1 each. Of this total, 2,500,000 shares would be allotted to the shareholders as well as bondholders of the Teck-Hughes while 1,500,000 shares would be distributed among the shareholders of the Orr. The balance of 1,000,000 shares would remain in the treasury. As regards the plan of operation, provided the merger goes through, it is understood the main shaft would be continued as quickly as possible to a depth of about 1,000 feet, and with drifts connecting up the workings of both properties at the desired levels. This would add greatly to the amount of ore immediately available, and would likely lead to the capacity of the mill being increased. Provision for this increase was made at the time the Teck-Hughes mill was designed, and the addition could be made with a minimum of difficulty.

During the coming week the crossent at the 250-ft. level of the Porcupine-Keora is expected to reach the veins indicated some time ago in diamond drill cores.

A mining plant for the King-Kirkland property in Lebel township has been placed on order and will be transported to the mines as quickly as possible. Surface work on the King-Kirkland opened up encouraging quantities of gold-bearing ore, and an aggressive campaign of exploration and underground development has been decided upon.

EDITORIAL

CRITICISM OF BRITISH AMERICA NICKEL CORPORATION.

A Select Committee on National Expenditure in London severely criticises the arrangement which the Board of Trade concluded with the British America Nickel Company, and suggest that an immediate effort be made to secure recovery of as much of the capital invested by His Majesty's Government as practicable, and that no further liability be incurred.

Criticism of arrangements made during war times are easily made in times of peace, and the fact that today "the world supply of nickel is in excess of the demand" is one that might have been pointed out by any schoolboy, who could also give the obvious reason. It is doubtless true, and we hope it may continue to be true, that the demand for nickel for armaments has declined since 1917, when the British Government concluded the arrangement that has culminated in a producing smelter and nickel refinery at Nickelton and Deschênes. "On purely commercial grounds", says the Select Committee, "the arrangement cannot be defended." Probably not, but then the British Empire was not being run on purely commercial grounds in 1917. General Currie has told us that the Allies were desperately put to it during 1917, and for any committee to criticise the policies of 1917 now that the war is won, and the cost is being counted, is the most futile kind of amusement. In all probability the reasons why the British-America Nickel Company did not make earlier delivery of nickel are capable of most satisfactory explanation, and it is quite certain that the existence of the Corporation's smelter and electrolytic refinery are matters for much satisfaction to Ontario and to Canada as a whole.

Nickel is a Canadian mineral asset of unique value. Its usefulness in peaceful arts has been obscured by its employment in armaments. There is no very striking tendency towards disarmament in the World today, and we have unfortunately no reason, reviewing human history, to assume that wars have ceased. At the same time, the nations have learned once again that war is a fool's game, and for a time it is probable we shall have peace and progress in the arts. We may expect to see the uses of nickel multiplied as the public learns that the metal is available in quantity, and as manufacturers develop its many advantages, not only as an alloy, but for its intrinsic merits of non-corrosibility, susceptibility to polish, and its unique combination of the artistic beauty of silver with the strength of iron.

From a Canadian point of view, any suggestion that the British Government's capital, when invested in a nickel deposit, having its own smeltery and a most modern type of refinery in Canada, is wrongly employed, is an uncalled-for imputation upon the country, and shows a persistence of that inability of overseas critics to understand the real reasons for just such a controlled source of nickel supply within the Empire; reasons which led to some unfortunate deficiencies in our metal control before and during the war, and in regard to which other British Dominions, such as Australia, have taken a definite and determined attitude.

"Purely commercial grounds" almost led to the defeat of the British peoples, which would have meant the dividing of their heritage among the robber nations of earth. Nothing is cheap, nothing is profitable, that puts commercial grounds before national defence. This country ought to know that, and does know it, by token of many graves overseas, and many taxes over here, neither of which are desirable, even on "purely commercial grounds."

THE NEW DIRECTOR OF THE U. S. BUREAU OF MINES.

The New Director of the United States Bureau of Mines, succeeding that distinguished physicist Dr Cottrell, will have the good wishes of many confrères in Canada, and many friends overseas. Since 1900, Mr Bain has been a corresponding member of the Canadian Institute of Mining and Metallurgy, his address at that time being Shanghai, China. He was one of Herbert Hoover's assistants in Belgian Relief Work during the war, that expression of national sentiment which antedated the actual entrance of the United States into the campaign against the Hohenzollern concept of human progress, and [illegible] inevitable lifting of a siege that was an contemptuous

thrown down as any in history. The manner in which the Canadian Institute co-operated with the American Institution of Mining Engineers in this work under Mr. Hoover's direction is a pleasant memory of fraternal oneness in a good work.

Mr. Bain was formerly Editor of the "Mining and Scientific Press" of San Francisco, and later Editor of the "Mining Magazine" of London, and he is a globe-trotter of cosmopolitan experience.

The United States Bureau of Mines is an institution of value not only to the country it primarily serves, but it has always extended courteous aid to the mining industry in Canada.

The Bureau, and its new Director, have, we venture to state on its behalf, the good wishes of the mining profession on this side the line that has no guns, and is delimited by good faith and mutual respect.

THE NOMINATED PRESIDENT OF THE INSTITUTE.

The "Bulletin" announces in the January issue that Mr. C. V. Corless, of Coniston, is nominated as President of the Canadian Institute of Mining and Metallurgy for the 1921-1922 term. No better choice could have been made. Mr. Corless's advocacy of the study of the human element as an aid to corporate efficiency was singular and lonesome in the ranks of the industrial managers of Canada, when his voice was first raised, but he has since had many followers and his writings have attracted more attention in recent years than any other contributions to the Transactions of the Institute. Recently, in these columns, it was stated that the name of our Sage of Coniston, in recent industrial annals of Canada "led all the rest". At that date there was no inkling that Mr. Corless would be the elected head of the Institute, and we take it that his selection for the highest honor the Institute has in its bestowal indicates not any foreknowledge on our part, but an unanimous feeling that Mr. Corless has added lustre to the Institute and is the proper person at this time to give it leading also.

NON-EFFICIENCY OF COLLIERY MANAGEMENTS REFUTED.

At the time of the Sankey Coal Commission in Britain the miners' leaders explained the decreased individual production of the mineworkers by attributing it to poor, old-fashioned mine equipment, state of disrepair of colliery machinery, lack of mine cars and inefficiency of the technical management of the coal mines. These men also accused the mine managements of the neglect of safety of life. There is no doubt that the Commission, and the public also were impressed by this persistent campaign, to which the managers could offer little defence before a non-technical tribunal, in connection with conditions that are to no small extent matter of opinion and partial debate.

The singular part of this campaign of calumny—for that was what is amounted to—was that it was not confined to Britain, but was heard in Canada, in Germany, the United States, Australia and in France, word for word.

The sequel is interesting. In every one of the countries mentioned the individual production of coal has greatly increased, with no changes in equipment or management, but with a decided change in the mentality of the workers.

It is unfortunate, however, that the lies of propaganda never catch up with the truth, and the public is still under the impression that colliery managements are inefficient, and that accident rates are unnecessarily high. The precise reverse is the truth, and the whole incident is an interesting example of how helpless an industry can be made when those engaged in it conspire to disseminate a lie.

A NEW COMPENSATION ACT FOR QUEBEC.

It is satisfactory to know that the shortcomings of the present Workmen's Compensation Act in Quebec are generally realised, and that the Canadian Manufacturers' Association is interesting itself in the drafting of a new act that will be less out of line with the workmen's compensation legislation of the other provinces and that of most of the States in the United States. The great objection to the present Quebec Act, as we have maintained on a number of occasions in these columns is the disproportionate amount of litigation it entails, with correspondingly unnecessary disbursement of legal fees, entailing lessening of the amount that eventually goes to the injured claimant or his dependents, and generally embittering all relations between industrial corporations and their workmen.

The general principle of the equity of workmen's compensation is too well-established to attack, and it is in every way desirable, from the viewpoint of employer and workman, that compensation payments should suffer no diminution in transmittal and that every possible source of dispute should be avoided. These are precisely the points that the existing Quebec Act does not ensure, and a new act is a long time overdue.

RAW MATERIALS OF THE STEEL INDUSTRY IN 1920.

The statistics available at the year end show the following production of domestic mines during 1920, as compared with 1919 and 1918 :

	Short Tons.		
	1920	1919	1918
Iron Ore	120,000	197,170	211,608
Coal	16,000,000	13,681,218	14,997,926
Pig-Iron	1,080,000	917,781	1,195,551
Steel ingots and castings	1,220,000	1,030,342	1,873,708

With the exception of the production of iron ore, which is to be credited almost entirely to Ontario, the figures are encouraging. A very small proportion of the welcome increase in coal production can be credited to consumption in steel-making processes. In Nova Scotia, the coke tonnage showed a decrease from that of 1919. A certain amount of coal has been used in the steel and iron trades in the West, but this, of course, is as yet inconsiderable in quantity.

The continued decline in the production of native iron ore, which now stands at the lowest point in twenty years, is disturbing, but, despite much research and many proposals for state assistance of domestic iron-ore production, the problem has received no solution on economic grounds. From a patriotic viewpoint, the situation is distinctly dangerous, but, so far, the attempts which have been made by Canadian steel companies to utilise domestic ores have received the scantest recognition from federal or provincial governments. On strictly economic grounds, this attitude is probably an irreproachable one, but economic considerations are only one phase of national life, and if Canada were to frame its policies entirely on economic grounds it would logically lead to placing our seat of government in that country where we get our raw materials. However, it has not yet been demonstrated that cheapness is the main reason for our national existence. It is quite possible also that nothing is cheap that is bought abroad when it can be produced at home. Coal and iron are two things that are cheap at any price in times of national necessity, and it may well follow that they are dearly purchased at any price abroad if thereby our own resources are unutilized and their existence practically negatived.

A year ago we ventured a hope that the revelation of Canada's deplorably subservient position in regard to supplies of coal and iron, and our exchange rate, which had resulted from the strikes of steel, coal and railway workers in the United States, would, if the independence of the Canadian spirit were interpreted as it is usually accepted and believed in—"do more to stimulate our native production of coal, iron and gold, than millions of government subsidies."

An increase of 2½ million tons in our coal production indicates that the interpretation was not a false one, but, in regard to iron-ore mining, the patriotism of Canadian steel companies has exceeded reasonable limits, and has gone largely unrewarded and unrecognized. From "Iron & Steel of Canada"

WALTER H. PREST, HALIFAX.

Walter H. Prest, for many years associated with the mining industry in Nova Scotia as surveyor and civil engineer, died on Christmas Day. He was formerly a member of the Mining Society of Nova Scotia, and was the author of a handbook for metal miners

SAVING MINE TIMBERS FROM DECAY.

(Note by Forest Products Laboratory, U.S. Forest Service.)

Enormous quantities of valuable timbers are being placed in the coal and metal mines of this country without any preservative treatment against decay. That the life of these timbers might be greatly lengthened by the injection of certain chemicals has been proved by the U. S. Forest Products Laboratory in numerous service tests. In 1910 the laboratory installed in an Alabama mine untreated timbers and timbers which had been treated with coal-tar creosote. Ten years later all the untreated timbers had been removed because of decay, while 80 per cent of the creosoted timbers were still sound and none had decayed to a point where removal was necessary. This is only one of the many records obtained by the laboratory which should induce every mining company to install some sort of wood treating plant.

At least three preservativves have been found suitable for mine work. These are coal-tar creosote, zinc chloride, and sodium fluoride. Creosote is the most effective in preventing decay. Timbers thoroughly impregnated with it are likely to resist decay until they are crushed or worn out. Occasional objection is made to the possible fire hazard of creosoted wood, but long experience indicates that the additional fire risk is very small. Zinc chloride and sodium fluoride are odorless, and if anything they tend to reduce the inflammability of wood. They are cheaper than creosote and although they do not give such permanent protection they greatly increase the life of timbers. Coal-tar creosote may be applied by the brush, dipping, open-tank, or pressure methods. Zinc chloride and sodium fluoride may be injected by the steeping, open-tank, or pressure methods. The cost and effectiveness of the methods of treatment increase in the order given. The saving possible with any of them is so great that it will pay every mine to adopt the use of some preservative on permanently located timbers.

ORDER-IN-COUNCIL DESIGNED TO AID DEVELOPMENT OF FLIN FLON PROPERTY, MAN.

(Published in the "Canada Gazette" of 25th Dec., 1920.)

Certified Copy of a Report of the Committee of the Privy Council, approved by His Excellency the Governor General on the 16th December, 1920.

The Committee of the Privy Council have had before them a report, dated 10th December, 1920, from the Minister of the Interior, stating that by Section 103 of the regulations for the disposal of quartz mining claims on Dominion lands in Manitoba, Saskatchewan, Alberta, the Northwest Territories and the Yukon Territory, approved by Order in Council dated the 25th May, 1917, it is provided that all grants and leases issued under the provisions of these regulations shall be subject to the provision that all ores or minerals mined from locations described in such grants or leases shall be treated and refined within the Dominion of Canada so as to yield refined metal or other product, suitable for direct use in the arts without further treatment; in default whereof the grant or lease issued for such lands shall be and become null and void and the said lands shall forthwith revert to and become revested in the Crown freed and discharged of any interest or claim of any other person or persons whomsoever; and shall be open to disposal in such manner as the Minister may decide.

The Minister further states that representations have been made to the Department of the Interior that a syndicate, of which Mr. Charles Ayer, of New York, is manager, has acquired under option agreement a number of mineral claims at Flin Flon Lake, in the province of Manitoba, comprising an area of about 1,500 acres; that by means of the diamond drill a large body of low-grade ore, containing copper with a small percentage of gold and silver, has been developed at an expenditure of about six thousand dollars; that should the option be exercised, a railway for a distance of approximately one hundred miles will become necessary; that it will also be necessary to erect a mill and smelting plant, at a cost of abont three million dollars, and to develop a water-power involving thirty-five miles of transmission line, at a cost of not less than two million dollars. The mine, if brought to the producing stage at the tonnage estimated would employ not less than one thousand persons, and to construct a railway and fully equip the mine would occupy a period of probably five years.

It has also been represented that in treating these ores a crude product, known as blister copper, containing about ninety-eight per cent of copper, gold and silver values, will thus be obtained; but that further refining by the electrolytic process can only at present be accomplished in one place in Canada, namely, the Trail Smelter, in British Columbia.

In order to complete the refining process in Canada, it would become necessary to ship the product west to Trail for refining, and return the refined product to the eastern markets, involving an additional haul of about 2,500 miles, and, therefore, greatly added expenses.

In view of the greatly increased cost of final treatment at the only smelter in Canada at present equipped for the work, and the fact that the mill and smelter which the syndicate referred to proposes to erect in Northern Manitoba will be of great public benefit in the reduction of ores of that and the adjoining province to a crude product known as "blister copper," containing about ninety-eight per cent refined metal, the Minister recommends that permission be granted to export for final treatment such blister copper, the product of the mill and smelter to be erected in connection with the mining property above referred to, for a period of ten years, unless in the meantime, in the opinion of the Minister, facilities have been established in Canada for the electrolytic refining of such product as cheaply and efficiently as elsewhere.

The Minister submits that by an Order in Council dated the 13th December, 1910 (P.C. 2102), provision was made that no royalty shall be charged on the products of coppermining locations acquired under the provisions of the regulations for the disposal of quartz mining claims on Dominion lands in Manitoba, Saskatchewan, Alberta, the Northwest Territories and the Yukon Territory, for a period of ten years,—that is, up to the first day of January, 1921—but that provision be made that on and after that date locations acquired under the provisions of the said regulations shall be subject to whatever regulations may be made in respect of royalty.

The Minister, therefore, further recommends that the product in copper of the aforesaid mineral mines at Flin Flon Lake in the said Province of Manitoba, in which the gross recoverable values average less than ten dollars per ton, and which are reduced to blister copper at the mill and smelter hereinbefore mentioned, be exempted from royalty for a period of ten years from the first of January, 1921, but that at the expiration of such period the product of such claims shall be subject to said regulations as may then, or thereafter, be enforced with regard to royalty.

The Committe concur in the foregoing recommendations and submit the same for approval.

RODOLPHE BOUDREAU,
Clerk of the Privy Council.

23rd ANNUAL MEETING, C. I. M. & METALLURGY.

Ottawa, March 2nd to 4th, 1921.

The "Bulletin" announces that arrangements for the Ottawa Meeting are well under way, and gives further particulars as follows:

"During the opening session, following the registration of members and guests, addresses will be delivered by prominent Government officials and the President of the Institute. The usual preliminary estimates of the mineral production for 1920 will then be presented, after which matters of general business will be submitted for consideration. These will include the report of the Publication Committee on the future publication of the "Bulletin" and the proposed amendment to the by-laws respecting the appointment of an executive Committee. In the afternoon the question of Canada's iron and steel industry will be discussed and papers on this subject will be presented. The customary "Smoker" will probably be held on the evening of the first day.

The sessions of the second day will be devoted largely to the non-metallic minerals, coal, and general mining and metallurgical practice. For the evening it may be possible to arrange a theatre party if the Entertainment Committee considers the matter favourably.

The arrangements for the final day will include the presentation of papers on economic geology in the morning, and excursions in the afternoon, including an inspection of the Ottawa Branch of the Royal Mint, if arrangements can be made, or a visit to the refinery of the British America Nickel Corporation at Deschênes, Quebec. The Annual Dinner will be held in the Chateau Laurier during the evening.

INCOME TAX AND THE INDIVIDUAL.

The Royal Trust Company of Montreal will send to anyone making application a copy of "The Income Tax and the Individual" which our readers are recommended to peruse. The 1920 Act contains some unprecedented features in Income Tax requirements. The taxpayer must not wait until he is called upon, or officially notified, but must personally obtain the necessary forms, fill them out, and accompanied by at least a quarter of the tax, self-calculated, must remit the money and the forms before 30th April. The penalties for non-compliance are of the most drastic character. Certain allowances are made which it is necessary to fully understand when making out returns. Some of our readers — but not many — will be interested to know that if they have an annual income of one million dollars the Government will collect $696,349 of it as a tax. The Royal Trust Company's little manual is very clear, and information such as it contains is quite necessary to every person whose income exceeds one thousand dollars per year.

A 300-ton Electric Shovel in Open-cut Quarrying

Employment in Michigan Limestone Quarries.

The "General Electric Review" for December 1920 contains a description by C. R. Fisher, Electrical Engineer of the Michigan Limestone & Chemical Company, and H. G. Head of the General Electric Company of Detroit describing the design and application of electric shovels of unusually large capacity to open-cut quarrying.

Mr. Carl D. Bradley, the President & General Manager of the Michigan Limestone & Chemical Company contributes the following statement to the "Review" regarding the evolution of the idea of using large-scale electrical shovels.

"About ten years ago the Michigan Limestone & Chemical Company purchased a tract of several thousand acres extending for several miles along the shore of Lake Huron and containing limestone which the company intended to develop commercially for blast furnaces, chemical plants, etc. The limestone lay close to the water front and delivery to steamers was comparatively easy and economical with proper facilities.

In order to establish a market for its product the company made sales contracts at very low prices which required very careful consideration of all details relating to construction and operation of the plant in order that costs might be kept within the limits prescribed by the selling prices obtainable. Large scale operations were involved and many engineering problems had to be solved. The general problem was to drill, blast, quarry and transport the stone to the mill and there crush, size, wash and convey it to storage, and thence load it into steamers.

Changes were necessarily made in the plant from year to year, and the difficulty of handling the great tonnage was finally overcome by the installation of large crushers, large screens and similar equipment. The loading facilities have developed to a point where steamers of 13,000 gross tons are loaded in six hours, and the management is convinced that theoretically the problem of quarrying the limestone is no different from that of handling and loading it. However, no adequate means of geting large output from open cut quarry operations at low cost had been developed, and therefore attention has lately been forced upon production at the quarry.

Quarrying operations are being conducted against the natural bluff of limestone which is now in excess of one and one half miles long and more than one hundred feet high, requiring two benches. This bank is too high for the economic and safe operation of the 100 ton steam shovel, and because of this fact and the high costs of labor and material the management has become deeply interested in the application of large digging and transportation units which will permit the quarrying operation to keep pace with the mill and loading system. If a digging machine can be had which will take care of 5000 tons of material in ten hours and operate satisfactorily under this punishment day in and day out, the problem is approaching solution, with a resultant economy in all operations.

For the future the quarry will approximate two miles in length in one face with five large electric shovel units working against it, served by locomotives and cars of comparable capacity. One man will operate the shovel and another the train, and the tonnage per man hour will be multiplied by five over that of present day equipment. With the introduction of the 300-ton electric shovels, quarrying on a large property such as that under consideration is reduced to a scientific basis.

The modern trend in industrial development has been toward increasing the efficiency of the individual, or in other words, the rate of commodity handling per man hour; only by such a test have we the right to measure accomplishment. While the management has been able to satisfactorily increase the rate in crushing limestone, in screening, conveying and loading it, until recently efficiency at the digging end has not kept pace with that of other operations, and it was specifically for the purpose of improving this performance that the 300-ton electric shovel was installed. The results that have been accomplished by the new equipment have been most gratifying, and it is firmly believed that through the proper application of these large electric shovels the quarry operations will be made entirely satisfactory."

The shovel described is a model 300 E. Marion electric shovel, fitted with 80 ft. boom, to give a digging radius of approximately 54 ft. at the rail, and 99 ft. at 40 ft. above the rail. The dipper now being used has a capacity of six cubic yards, but ultimately a capacity of eight cubic yards is proposed for the dipper. A detailed description of the electric drive and control, and figures of performance and cost is given, and the article is well worth consulting by those who have large-scale digging operations in charge.

COLONEL E. G. PRIOR, P.C.

The late Colonel E. G. Prior, the Lieutenant-Governor of British Columbia, whose death occurred during December, had many connections with the mining industry in that province.

Colonel Prior was born in Yorkshire in 1853, was educated at Leeds Grammar School, and was articled as a pupil in mining engineering to a Wakefield mining engineer, Mr. J. Tolson White. He came to Nanaimo in 1873 and took a position as engineer and surveyor with the Vancouver Coal Mining Company, living in Nanaimo until 1878, when he became Government Inspector of Mines. Afterwards he went into a general mercantile business, and was very successful. His interest in military affairs was great. He commanded the Canadian Rifle Team at Bisley in 1890, and was twice President of the Dominion Artillery Association. In 1897 he was one of the Canadian Contingent at the Queen's Jubilee. He was a life member of the North of England Institute of Mining and Civil Engineers. He was buried with full state and military honors.

STATISTICS OF ORE RECEIPTS AT TRAIL SMELTER.

The Trail Smelter of the Consolidated Mining and Smelting Company of Canada received during the year up to 21st December 366,799 tons of ore, of which 318,981 tons was from the Company's own mines. The receipts, apart from Company mines, included treatment material from 97 mines of which 5,957 tons was in the form of concentrates. There was in addition 2,703 tons of zinc concentrates. The Mundy Mine sent from The Pas 7,536 tons, and one shipment of 3 tons came from Mayo.

DR. JOHN A. ALLAN, EDMONTON, ALBERTA.

(From Bulletin of C. I. M. & M.)

Dr. Allan was born at Aubrey, Quebec, which lies on the southwestern side of the Chateauguay valley in the St. Lawrence post-glacial marine basin. Brought up on a farm situated near the Champlain fault, his attention, while a boy, was directed by this peculiar structural feature towards the study of geology. Later, when attending Huntingdon Academy, the collecting of fossils from the Ordovician limestone in that neighbourhood engaged his attention. After a course at McGill University he graduated in 1907, and a year later obtained the degree of M. Sc. In the autumn of 1908 he secured a fellowship at the Massachusetts Institute of Technology, and in 1912 obtained the degree of Ph.D. His thesis for this degree forms part of Memoir 55 of the Geological Survey of Canada that includes the results of his investigations on the Ice River Valley near Field, B.C.

In 1912 Dr. Allan received an appointment as lecturer in geology and mineralogy at the University of Alberta, organizing the work of this department and beginning the collection of material for the present excellent museum at the University. In the following year he was made Professor of Geology, which position he has since held. Since 1906 he has been connected at various times with the Geological Survey in the field, and has also carried on consulting work for several years. Research has also taken up a great deal of his time and his published contributions to scientific literature include several on general and economic geology, physiography and mineralogy. Recently he has undertaken the systematic investigation of the mineral resources of the province for the provincial government and his "First Annual Report of the Mineral Resources of Alberta" was published last spring.

Dr. Allan joined the Institute in 1913 and was elected to the Council in 1919. He has always taken the keenest interest in the Institute's activities and was instrumental for the formation of the Northern Alberta Branch in April 1918. He was the first chairman of the Branch and occupied that position until January 1920. Dr. Allan is also a Fellow of the Geological Society of America.

APPLIED SANITY.

At this season of goodwill it is timely to quote from a letter just received from a Californian mining engineer residing in London and practising his profession there. We asked him to what extent the sentiments evoked by the War have restricted the scope for American mining engineers among British operators abroad. He replies that he has "met with only the best of treatment, most courteous in every respect." He had been elected a director of a company and later he had been appointed consulting engineer, the latter being the more profitable, and more important, appointment, of course. There is no "anti-American feeling" in mining circles in London; indeed, he adds, an Englishman has asked him to enter into partnership with him, and that, he suggests, the other man would not have done if there had been any prejudice against Americans. We mention this to correct an impression to the contrary that seems to obtain among some of our friends in the profession. Whatever little fusses may arise between the newspapers — not the governments — on opposite sides of the Atlantic, and however much pro-German and Sinn Fein propaganda may unite in striving to make trouble between the English-speaking peoples, we are glad to believe, and to know, that the English-speaking mining engineers are comrades all, pleased to work with one another, and willing always to extend the hand of good-fellowship, whether it be done under one or the other of the two flags that have led the way in exploring and developing the mining regions of the world from Cape Nome to Cape Leeuwin, from the Gila to the Vaal, from Chuquicamata to Cusihuiriachic, from Pike's Peak to Mount Morgan.—"Mining & Scientific Press."

NOVA SCOTIA COAL MINING NOTES.

The production of the Dominion Coal Company's Cape Breton collieries in December was 285,996 tons, comparing with 274,969 in December 1919, and being smaller than November 1920 figures by 10,000 tons. The reduced scale of operations at the Dominion Steel Company's plant lessened the coal requirements, and some difficulty is being experienced in finding a market for the surplus coal at this time of the year. While a considerable tonnage of coal will be stored in the banks, yet this will not take all the coal produced, and the business outlook is not sufficiently clear to justify an unusually heavy banking programme, particularly in view of the action of the Railway Commission in imposing an embargo on export shipments last Summer.

The following table shows the production of the individual collieries of the Dominion Coal Company in Cape Breton Island during the year just ended, and for comparison the figures for 1919 and 1913 are also given:

	1920	1919	1913
Phalen Seam Mines			
1	338,561	331,619	533,599
2	550,035	613,994	810,627
3	.....	.....	118,206
4	330,049	330,553	393,650
5	105,901	84,326	220,719
6	258,101	227,025	260,990
Hub Seam			
7	.....	.....	221,816
Harbor Seam			
8	.....	.....	80,033
9	277,462	270,094	393,591
Emery Seam			
10	125,211	103,681	198,115
11	174,813	157,431	44,425
24	48,108	449	.....
Victoria Seam			
12	178,939	188,394	352,590
14	204,839	182,855	415,927
17	22,037	1,341	25
Lingan Seam			
15	123,442	143,690	221,250
16	157,003	157,997	259,173
Birch Grove Seam			
21	172,075	146,433	153,054
22	194,387	147,726	61,359
Total,	3,260,963	3,087,638	4,739,149

Commenting on the foregoing figures, it may be noted that in regard to the mines on the three upper seams, namely and inorder of depth, the Hub, Harbor and Phalen seams, three collieries, Nos. 7, 8 and 3 have been closed down, and one other, No. 5 is approaching exhaustion. The land area in these seams is all taken up by the existing mines, and no new collieries are required. Large future expenditures are likely, however, for the winning of the submarine continuation of these seams, and new openings at the shore will be required. One of these openings between No. 1 and 2 Collieries, is now in process of completion. No. 7 Colliery, on the topmost seam was closed, but not through exhaustion of the coal. As the coal is of good quality and as there is a large untouched submarine area the mine will some day be re-opened.

The percentage of coal mined from the Emery Seam is steadily increasing, and as there is a large unworked field of this seam under the land area, and a virgin submarine extension, additional openings will be made in the future. The seam underlies the Phalen at a depth of about 160 feet. No. 10 colliery is situated on the site of the Phalen Mine 5 (Reserve Mines), and No. 11 on the site of Phalen 3, in each case utilising existing plant and houses for the workmen. Similar utilisation of plant and houses may be expected at Phalen and Harbor seam mines that have not yet been extended downwards to the Emery Seam.

The Birch Grove mines are in the Morien Basin, and there is room for still other slope mines on the seam being worked, which is not definitely correlated with the seams of the Glace Bay Basin. In this district the Dominion Coal Company is preparing to work the submarine tract of coal, which contains a number of seams, and is re-fitting and unwatering the Morien shaft, formerly operated by the North Atlantic Collieries, and now owned by the Dominion Coal Company. Should really extensive submarine operations be projected in this district—as they will be some day—larger and deeper shafts will be required.

The mines on the Victoria Seam are in the Waterford district, and are now all submarine operations. The Victoria is definitely correlated with the Harbor Seam on the Glace Bay side, but not as yet with the seams on the North Sydney shore of the Harbor. There is room for additional collieries on this seam. These remarks apply also to the Lingan collieries, this seam being equivalent with the Phalen at Glace Bay.

The equivalent of the Emery Seam, and seams below it, are present in the Waterford area, and a number of mines will some day be opened on these underlying seams in the rear of the existing mines. In the same way the equivalent of the Hub Seam in the Glace Bay district overlies the Victoria (Harbor) in the Waterford district and is being tapped by an ascending cross-measure drift out of the Victoria seam.

Just how far inland the seams below the Emery extend, or what course their outcrops take is not definitely determined, as the amount of coal available has been sufficient to prevent much interest being taken in the outlying districts of the lower seams. It is probable, however, that future generations will regard the unworked seams of the Sydney coalfield, under the land areas and at greater depths than those now worked, as constituting a much more dependable and more accessible reserve than the unknown submarine extension of the seams as a whole, and this statement is not intended to depreciate the great value of the submarine coal.

This inland extension is delimited in fairly accurate manner by the outcrop of the Millstone Grit series, but the exact course of the crops within this area is not precisely mapped.

A modern transmission line will be run from the Dominion Steel Company's new powerhouse at Sydney to serve a number of the Dominion Coal Company's collieries in the vicinity of Glace Bay. The poles are to be spaced 300 ft. upon concrete pedestals. Up to recently it has not been possible to put the lines of the Steel and Coal companies in electrical connection because of a difference in frequency in the two systems, but in later additions to the Steel Company's generating capacity the extension of spare current to the collieries has been borne in mind.

BRITISH SELECT COMMITTEE CRITICISE BOARD OF TRADE ARRANGEMENT WITH BRITISH AMERICA NICKEL CO.

The Montreal "Gazette" under date of December 31st has the following London cable.

The report of the select committee on national expenditure severely criticizes the Board of Trade in connection with the nickel deal it made early in the war. The deal was concluded with the Kristiansand Nickel Raffienerings-weerk and with at least one other Norwegian company, and the total expenditure was £1,030,000.

On purely commercial grounds, says the select committee, the arrangements and payments made cannot be defended. They have let the Government in for big liabilities.

"To facilitate negociations with the Kristiansand Company," says the report, "His Majesty's Government concluded with the British American Nickel Corporation a trading contract under which they agreed to take nickel ore from the corporation for ten years from 1917, 6,000 tons a year, at the market price, with a Government option to call for 1,000 tons at a fixed price of £125 a ton. The Government also subscribed in 1917 for $3,000,000 six per cent. first mortgage gold bonds in the corporation at a cost of £620,000, the entire sum payable in five annual instalments from January 1, 1920. There has been no delivery of nickel under the contract and, as a fact, the world supply of nickel is in excess of the demand. No interest on the loan of £620,000 has been paid nor any instalment of the redemption. As the corporation have failed to carry out their agreement, the committee recommend an immediate effort to recover as much of the capital as practicable, and that no further liability be incurred in the matter."

BOOK REVIEW.

THE HUMAN FACTOR IN INDUSTRY: By Dr. Leo. K. Frankel and Dr. Alexander Fleisher, respectively Third Vice-President and Assistant Secretary of the Metropolitan Life Insurance Company, with the co-operation of Laura S. Seymour. Cloth Boards. 5½ by 8 inches 366 pp. with list of references and Index. Price $3.00. Published by the Macmillan Company of Canada, Toronto.

This work is designated to be used as a text-book in service and personnel management technique. The arrangement of contents is by subject and not by industry, in itself a commentary on the growth of literature of this class. Interpolated throughout the chapters are numbered references to the literature on the subject under discussion, which, as the chapter deal with such subjects as "Hiring & Holding", "Education", "Refreshment & Recreation", make the collected references appended to the volume a reasonably good selected bibliography.

Under the significant heading of "New Names for Old", is is pointed out that the responsibility of the employer for his workmen, or to use now archaic terms, the solicitude of the master for his man, was fully realised under the guild organizations of medieval industry. Later submerged by the dominance of the machine, we are today re-discovering forgotten duties and giving them a modern paraphrase. The authors query why the value of human labor has been more appreciated in the past decade than in former years of machine industry, and while they state that no one reason can be given, they give a number, the resultant of which appears to be that neglect of the individual has been found not to pay.

The work throughout does not stress the religious or altruistic side of human dealings, but explains that in the last analysis the value of this factor in industry will be measured by the employer in terms of increased production, and, by the employee, by the opportunities which are accorded to him for personal development, both financial and spiritual. In short the yardstick will be: "Does it pay? Is it worth while?" This is putting the matter in terms of lowest denomination, but also in terms of final and permanent expression. It is this dispassionate treatment, backed by definite instances of successful application, that gives this book its value.

As a handbook to officers of industrial corporations, engaged in personal work, it strikes us as a most valuable compilation, and it contains definite information on such subjects as housing, technical and part-time education, food catering for employees, insurance, sickness, death, and other benefits, charts on the organization of employment departments and medical services, and, as previously stated, a satisfyingly complete bibliography.

One penetrating phrase we may quote from the book, dealing with development of the employee, once he has been hired and inducted into his work, is that "a careful policy of promotion makes of the employee's personal ambition 'a centripetal instead of centrifugal force' in the industry". The secret of the success of many well-known executives of industry lies in their appreciation of this principle.

A Montreal Letter

By ALEXANDER GRAY.

Future of Silver.

Quite a few years have elapsed since that picturesque character—H. A. Tabor—depicting his financial status said to me:—

> "I have a couple of silver mines—but that makes me worse off than broke—so I'm working a bit of a gold prospect up here at Blackhawk."

The ex-Governor and ex-Senator—one of the "Bonanza Kings" of Colorado—and made such by silver—hardly exaggerated the position of those who were left with white-metal mines on their hands.

Not many "Silver Kings" were created after Bankers decreed there must be monometallism—until the Cobalt crop of them rapidly matured. Silver was somewhat anathema. The "Silver Barons" were as roundly denounced as the "Coal Barons" and modern "Profiteers"—so the metal was demonetized—and there is not much difference in its price to-day and when Cobalt was discovered. High finance banned it. Mexico and the Orient adhered to it, but it is so susceptible to fluctuations in trade and commerce that it is begrudgingly conceded to be suitable only as "loose change": for genuine silverware is a rarity. Even the Flowery Kingdom is contemplating the gold standard. India is not taking so much for ornamentation of its people. Latterly

the Imperial Government debased their subsidiary coinage. Switzerland plaintively declares it has an over-supply of silver belonging to affiliated countries whose depreciated exchange makes it difficult to trade with them. France is substituting a bronze-aluminum alloy for some of its franc pieces. Germany is not particular, since its marks are in the discard. So it goes. Asiatic countries finding themselves over-extended and without commensurate European outlets for their products, had to liquidate their holdings of silver. This, and earlier pressure caused by speculation in the metal itself, sent silver to 59¾ cents, the lowest price since the outbreak of war. That it has recovered and is higher than the average for 1916, may or may not mean that the flurry is over. If it takes as long to restore the equilibrium of international exchange as it has to arrange Reparations, silver may lack buoyancy. It is completely subject to trade conditions; so much so that it would seem as if something should be done to encourage production of the metal, instead of having the mines of Canada, the United States and Mexico in periodic ferment. While the current market price, plus the premium on New York funds, is acceptable to those who have high grade enabling them to purchase at a more or less nominal cost, not many mines are in that fortunate situation. The generality of silver and copper mines cannot make their metals for prevailing markets, copper being enmeshed in widespread business depression, however temporary.

Gambling in silver on trade fluctuations is a habit with Asiatic merchants, gyrations of the rupee being a source of profitable amusement. If the coinage of silver is going to be restricted, partly because crippled, convalescing countries cannot buy it and prefer "any old thing" for day-to-day bartering, the only recourse suggested by unsolicitous capitalists is that "silver can go into 'the movies,'" where it is availed of in the making of films. That, however, might be another false sense of security, of which silver producers have had more than their share. In reality, owing to the strained conditions resulting from waste and worse, not a few contend "an international currency that will be legal tender the world over," is the only permanent solution. General Smuts has suggested this, irrespective of wars or rumors of war; yet the fiscal millenium hardly is in sight. Creditor nations are indisposed to confide so much of their prestige to those with whom they were, or are at war. For that matter "Commerce is War." Canadian silver sold in the States at the market, brings the premium on New York funds, but Canadian silver coins circulating among neighbors along the border are at "the usual discount." Smuts foresees a fiscal fellowship no conflict could destroy. The disruption of it would mean immediate bankruptcy. With such an ideal in effect, silver right be stabilized and producers freed from recurring reverses. A monetary zollverein similar to what Prussia exacted, would be a solution of the intricate problems of to-day and to-morrow.

Thus far the Smuts ideal is in abeyance. The Chancelleries are impenitent when it comes to conceding "the benefit of the doubt" to each other. Credit facilities are more eagerly sought but they have not been sufficiently broad based to create the requisite optimism. Possibly the conferences initiated by Sir Robert Horne will strengthen sterling exchange, in which event all metals would participate. Gold alone is unassailable, now the cost of producing it is headed toward normal and its purchasing power is advancing. Silver cannot be extricated from necessitous international conditions until "business as usual" has more significance and Washington defines its policy in the matter of the purchase of silver under the Pittman Act. A year ago decreased production and Oriental demand put silver to $1.37 an ounce. Then the seignorage ceased to be adequate, and melting of silver coinage became more profitable, the metal in the dollar being intrinsically worth more than a dollar as bullion. Collectors hoarded silver coin. Considerable European silver coinage was melted and sold. Pressure of this upon the market, and the debacle in the Orient due to over-speculation, started the break which has been almost continuous since last March.

On May 13 silver was at $1 an ounce and the Pittman Act became operative. This Act was passed in 1918 to meet the situation arising from the insistance by India upon payment for war materials in silver, a large amount of which was lying idle in the United States Treasury vaults. By the terms of the Act, 207,000,000 ounces of this silver were to be availed of to settle trade balances in the Orient, the Washington Government receiving an equivalent of $1 an ounce. A further provision was that, as trade became normal, the Government should buy back the same amount of silver, at $1 an ounce, this purchase, however, to be made of silver of American origin. While that action formed a basis upon which producers could work, it also checked any advance about the dollar mark. Producers were stopped from reaping the full benefit of what happened. In February silver went to about 90 pence an ounce in London, and the Shanghai tael exchanged for $1.67. The precipitate fall has militated against Canadian and Mexican mines, but the Pittman Act broke the fall for American silver mines, hence the suggestion that inequities in international exchange might be removed by some sort of agreement bearing upon silver coinage. Bankers have criticized the Pittman Act, but it enabled silver mine owners to operate to a greater extent and "kept a flood of American silver off a demoralized world market," as one authority put it. The Washington Government lost nothing. If the Pittman Act is repealed by the incoming Administration, the Government can replenish its stock of silver at the expense of the producers, whose profits were arbitrarily though temporarily curbed by the upset price of $1 an ounce, as fixed by the Pittman Act. Manifestly it would be unfair to repeal the Pittman Act, and yet "the King can do no wrong." Meanwhile, Canadian producers are prejudiced. They get 60-70 cents plus exchange on New York while the American producers, whose their government take silver, get $1.

During the current year there may be radical departures from standards of credit, designed to bolster up decrepit countries. At any rate the case for silver ought not to be prejudiced. Meanwhile production cannot be pushed. Whatever can be done for the metal without departing from soundest financial principles, should be done, instead of ineffective concerted efforts which put silver mines out of the running.

Copper Producers "Sitting Tight".

According to copper statistics, the past year closed with the available supplies in the States about 30,000,000 lbs. less than they were at the end of 1919. It is assumed that considerable of the Canadian copper production was not marketed. Canada accounted for about 2,000,000 lbs., more than half of it from British Columbia, 30 per cent of it from Ontario, and the remainder scattering. The slump in the market for the metal, especially in the final months prohibited anything like capacity production. Now, those in a position to carry their copper until markets improve, are holding off. While the stocks of raw and refined copper on hand amount to about 900,000,000 lbs., an active demand soon would clean up that. Approximately 200,000,000 lbs. less was produced in the States last year, and yet the visible supplies seemed to be about 30,000,000 less; so the market must have absorbed some of the surplus. At the same time, the situation does not suggest new copper ventures.

Hollinger Consolidated.

Preliminary to the annual meeting, not yet called, anticipating discussion of the Hollinger ore reserves never is welcomed by those in control. Enforced conservatism, high costs and low efficiency on the part of the inadequete working force, have precluded the presentation of much that would have been of greater public interest. The gross revenue last year was nearly $7,000,000, unless there was a slowing down in the concluding weeks. Actual gold production may be placed at about $6,250,000. Having increased the surplus, and being more confident as to the supply of labor, it remains to ascertain whether the ore reserves have been augmented, and, if taxation will be modified. Just what are the ore reserves, in relation to capital liabilities will make this Company the object of favorable comment, when the management is in a more generous mood.

Zinc Institute Seeking More Protection.

Rather than meet the market zinc producers are pursuing a policy of masterly inactivity. They have taken a leaf out of the strike manual and are emulating farmers, copper producers, silver producers, and all others who find it unprofitable to conform to buyers' markets. That the statistical position of zinc is strong, the liquidation of Government stocks and curtailed output made possible. Settlement of the Broken Hill labor dispute is expected to bring Australian zinc into the market. That Canada has become more than ever a factor, has been taken to heart by Americans engaged in this department, and they are conferring at Washington about further tariff protection. President Warren, of the Consolidated Mining & Smelting Company, having petitioned the Canadian Tariff Commission for the protection of zinc and lead, the vote appears to be unanimous. Between the Broken Hill product and the Washington protection proposals, it devolves upon Ottawa to maintain the integrity of the Canadian situation, rather than have it prejudiced unnecessarily. To a certainty, Canada can produce zinc in competition with the other countries, but if trade barriers are interposed then domestic producers will be entitled to assistance. The American Zinc Institute has been assiduous in popularizing the metal, and does not propose to overlook the opportunity to impress Washington. Mexican lead shipped roundabout through England is a grievance. More is at stake with regard to zinc.

MINING IN THE YUKON.

New Mineral Discoveries & Excellent Prospects.

Our issue of the 3rd December 1920 contained a description of the Mayo Silver Area, adjacent to Mayo City, in the Upper Stewart River Country, 150 miles west of Dawson, by Mr. George E. Johnson, who stated that in his opinion the Mayo area "would astonish the world by its richness."

A special edition of the "Dawson Daily News" is to hand, under date of 29th November 1920, gives further particulars of the Mayo area, and in particular of Keno Hill, which it describes as a "massive plateau of silver-bearing rock extending eight miles in length and five miles in width. This hill lies 6,400 ft. above sea-level, is situated 40 miles west of Mayo City, and on it these have been located, it is stated, no fewer than 200 veins, most of them bearing ore or rich silver and lead content.

The most extensive development work to date on Keno Hill is that of the Yukon Gold Company. Ore, averaging, it is said, $200 and more to the ton, is being hauled by horses and sleighs and a motor-truck to Mayo Landing, 40 miles away, and latest advices, (Nov. 15th) state that ten tons of ore are being mined and sent away daily. The ore is silver-galena, and it costs from $100 to $150 per ton to mine the ore and convey it to the smelter at the coast. Some of the ore specimens are of a spectacular kind.

The following review of the mining situation in the Yukon, by George P. Mackenzie, the Gold Commissioner of the Yukon, is taken from the issue of the "Dawson City News" referred to.

"Up to the present Yukon owes her position in the mining world almost wholly to deposits of placer gold, the mining of which has increased the gold supply of the world over two hundred millions of dollars since the first discovery of importance in 1896. With the price of gold fixed, and the mining costs enormously increased by the conditions brought about by the war, it speaks well for the vitality of the industry that it has not entirely succumbed.

Only very rich gravels, however, could be profitably worked during the last five years, and as the richest of the known areas have now been worked, the problem that has been engaging the attention of our mining engineers is, how, under these abnormal conditions working costs may be further reduced so that the very large area of defined low grade gold-bearing gravels can be operated at a profit.

The evolution of the placer mining industry in this country is an interesting study. It is a far cry from the early primitive methods of thawing the frozen gravels by means of wood fires and hoisting with a hand windless to the immense steam thawing plants of today, and the modern gold dredge.

The fact that the auriferous gravels are in the main frozen, necessitating artificial thawing, presents a problem the solving of which has taxed the ingenuity of some of the ablest mining engineers in the world, and it has long been realized that further material reduction in operating costs must be in this item, if at all. During the summer of 1919 both the Yukon Gold Com-

pany and the North West Corporation, Limited, two of the largest operating companies in the territory, experimented extensively with what is known as cold water thawing and demonstrated the practicability of the method, and during the season of 1920 have established beyond question that thawing costs may be reduced at least ten or twelve cents per cubic yard compared with thawing by steam, the cheapest known process up to this time. This is rightly regarded as the most important development in the industry since thawing by steam supplanted thawing by wood fires, and when condition with regard to labor and supplies again become normal, cannot fail in having a stimulating effect on the industry.

The discovery of rich deposits of silver-lead ore on Keno Hill, about forty miles from Mayo, in the Stewart River district, during the summer of 1919, is perhaps the most important made in the territory since the discovery of gold on Bonanza Creek in 1896. Over 800 quartz claims have been located and recorded in the district, and considerable development work done on a number of the claims, the most extensive by the Yukon Gold Company on a group which includes the central or discovery group, which the company has taken over and formed into a subsidiary company known as the Keno Hill, Limited. This company has a considerable force of men employed in mining and hauling to Mayo high grade ore for shipment on the opening of navigation.

Arrangements have been made to mine and haul to Mayo during the present winter at least three thousand tons for shipment to the smelter from that point on the opening of navigation next spring. Other operators will have smaller shipments.

The development work done has shown that this high grade ore is distributed over a large area, but except in a very few cases sufficient work has not yet been performed to speak with assurance of the extent of the deposits. I had occasion to visit the district last summer, and while the time at my disposal only permitted of a visit to a very few of the properties being developed, what I saw and learned from experienced mining engineers and miners on the ground, convinced me that the discovery is one of first importance. The pressing immediate needs of the district are roads and a government assay office and telephone or telegraph communication. Here is certainly a field that should be an attractive one for experienced prospectors who have sufficient funds to keep them in the field at least a year.

The prospects for renewed activity in copper mining in southern Yukon is bright. The Granby Consolidated Mining, Smelting & Power Company, Limited, has had experts in the Whitehorse district during the last summer, and on the strength of their reports, have taken options and are making arrangements to do extensive drilling and other prospecting within the next few months. Lack of capital has always handicapped operations in this field.

In general, a conservative review of the situation warrants the statement that at no time in Yukon's history has the future of the mining industry looked brighter."

Dr. Cockfield, of the Geological Survey has been engaged during the past two years in examination of the new district, and his Report, which it is expected will be issued by the Survey in the Spring, will be looked forward to. In a preliminary note, written at Dawson at the end of September last, and published in the "Dawson News", Dr. Cockfield summarises the geology of the district, and states that while a great deal of prospecting is required before any real estimate of the value of the Mayo area can be made, many of the deposits can even today be worked at a profit. The prospect for a permanent mining camp at Mayo he considers to be fairly bright.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

As was expected, an increase in the demand for commercial bar-silver developed during the opening days of the New Year. As a consequence of this, the quotations for silver increased to a higher point that any time during the last three weeks of December. At the time of writing, with quotations not far under 70 cents an ounce, the outlook for the silver-producing mines of the Cobalt field has improved.

Operators, however, are compelled to take a very serious view of the general situation, and no effort is being made to minimize the difficulties which confront the majority of the mines with costs of operation running perilously near to the total value which the metal commands. Already the closed down mines include the McKinley-Darragh, Temiskaming, Beaver Consolidated and Hudson Bay. In addition to this, the Kerr Lake has closed its production end and is doing only development work, while the Dominion Reduction plant for treating customs ore is closed. These are bare facts which clearly show the difficulties.

On the other hand, such mines as the Nipissing, Mining Corporation, Coniagas and O'Brien, which have occupied the positions of being the four leading producers for some time, are all continuing operation.

The hydro-electric power supply has improved somewhat, partly due to the demand for energy. This appears to leave the question of high operating costs as the only obstacle in the way of maximum production from each of the mines. The cost of supplies has receded only very slowly, and no reduction in wages has been announced. It is obvious, of course, that under present prices for silver, a wage reduction at an early date may be considered inevitable.

The Kerr Lake Mining Company is considering opening negotiations with the Hargraves Consolidated with a view to securing a working option on the two Hargraves claims which adjoin the Kerr Lake. It is learned that by the date of expiry of the option, provided the results achieved warrant the purchase, the Kerr Lake will take over the property at a price which will probably be sufficient to pay off the debts of the Hargraves Consolidated. In event of this, the Hargraves would continue in existence on the strength of other property held. It is learned that these negotiations have been opened as a result of the Kerr Lake having decided to carry on further exploration and development work on its old No. 3 vein, along the lower contact between the diabase and Keewatin formation. This vein runs south onto the Hargraves.

Curtailment of mining and milling operations at the McKinley Darragh mine was due to the present high cost of material and the high wages prevailing making it quite difficult to realize profit, conditions which would have made it necessary to select the richer ore

ore. Such a policy would have placed the physical condition of the mine in jeopardy, and the decision to remain closed for the Winter is based upon the belief that a substantial decline will occur in cost of material and wages.

Suspension of work at the Beaver Consolidated was due in a general way to similar conditions as which caused the McKinley-Darragh to close. It is believed both mines may be able to resume their place among the producers in the early spring. In the meantime, however, more than 300 men have recently been thrown out of employment in this field.

Ore of a fairly high grade is enabling the La Rose Consolidated to continue operations profitably on the University and Princess properties. This company is understood to have closed a favorable period of operation with the end of 1920, the earnings for the twelve months being higher than during either of the two years preceding. It will be some two months before the annual statement is issued.

Next week the Kerr Lake will disburse a dividend of 12½ cents a share, amounting to $75,000, and payable January, 15th. During the following week, the Nipissing will disburse a dividend of 5 p.c. amounting to $300,000, plus a bonus of 5 p.c., making a total of $600,000 from this company, and payable January, 20th.

Elk Lake and Gowganda.

In spite of power shortage the Miller Lake-O'Brien mine will continue operations throughout the entire winter. Power shortage has been felt for some time, although no announcement has been made with regard to the extent of curtailment. It is generally believed this will be confined to the mill, and that underground work will continue normal rate.

A good deal of uncertainty exists in relation to the proposed scheme to build a light railway from Elk Lake to the centre of activity at Gowganda. There has been no definite evidence forthcoming which would assure the district of such an improvement in its transportation problems..

Ore is being hauled to the railway from the Regent Mines at Elk Lake, and part of a car will be shipped to Cobalt for treatment. This trial shipment will have an important bearing on future operations. The shaft is down thirty-five feet, and medium grade ore occurs over a width of about two feet. A meeting of the company is being held in Sarnia this week to determine the question of whether to do its work on straight company account, or to let the underground work by contract. Opinion is divided on the question.

THE GOLD MINES

The Porcupine District.

Announcement comes that the Hollinger will disburse a 1 p.c. dividend on January 28th. This is interpreted in mining circles as an indication that the Hollinger intends to continue on a dividend paying basis of 13 p.c. annually. Since August 11th, last, this company has paid 1 p.c. dividends regularly at intervals of every four weeks. At this rate, the profit distributed amounts to $3,126,000 annually.

At the Dome Mine, an average of from 500 to 600 tons of ore is being treated daily, and it is not expected the company will alter its present rate of dividend disbursements of 2½ p.c. quarterly. Within the next three months the company will be completing plans for bringing the entire plant into play, and increasing daily tonnage to upwards of 1,400 tons daily.

A general appeal is being made in certain parts of the press, with a view to encouraging the companies operating producing mines to issue regular monthly statements as to progress made and the amount produced. It is believed the publication of such statements would encourage greater interest in the mining industry of Northern Ontario and might prove to be of general benefit to the country as a whole. Such a plan, it is believed, would encourage additional prospectors to enter this northern field, and such would undoubtedly be beneficial to all established mining companies. As matters stand, the Lake Shore Gold Mines, at Kirkland Lake, is the only gold mining company to issue regular monthly statements, and this policy has won great popularity for the company, as well as creating a satisfied list of stockholders. In the Cobalt silver area, the Nipissing, and the Kerr Lake are the only two companies to issue regular monthly statements, and these two companies have been general favorites for many years. The public has been presented with much valuable information, and the statements have proved to be excellent propaganda calculated to aid the mining industry and to serve at the same time the best interests of shareholders. It is remarkable to note that the Nipissing has over 13,000 shareholders.

At a depth of 250 feet, the cross-cut on the Porcupine-Keora is stated to have entered a mineralized zone, formerly indicated by diamond drilling. No official statement has been issued, but it is reported in South Porcupine that a number of highly mineralized stringers are in evidence, visible gold showing, but no average assays having so far been made. Considerable further development will be necessary before determining whether or not the development is of commercial importance.

Although some little time has passed since the meeting between officials of the Northerown Mines and the Porcupine V.N.T., no statement has been forthcoming with respect to the progress made in connection with the proposed consolidation of these two properties.

According to official advice to the Journal, good progress is being made in the development of the Ontario-Kirkland Gold Mines. New ore is being developed at the 450-ft level at a point west of the fault reported some months ago. The vein was close to 15 feet in width where cut along the fault, and values range from $4 to $16 to the ton. A conservative average is stated to be from $10 to $12 to the ton as near as has been determined to date. A drift is now being driven along part of the vein, and at intervals of 50 feet short crossents will be driven through the full width of the ore body. It is also officially stated the new 100-ton mill is expected to be completely installed sometime in September and the mine should join the producing list during the last quarter of the current year. The main shaft is down 470 feet, with working levels at 100, 300 and 450 feet. Operations have been under way for over two years, and already more than 3,000 feet of underground work has been done. Ore bodies opened up in some parts of the mine contain gold values ranging from $8 to $28 to the ton, in addi-

tion to the new ore now being opened up west of the fault.

Work has been temporarily suspended on the Fidelity property in the northern part of the township of Teck.

It is learned arrangements are under way with a view to re-opening the Kennedy-Boston property, in the Boston Creek district.

In an official preliminary statement to the president and directors of the Miller Independence Mines, prepared by W. E. Simpson, general manager, obtained by this paper, the following favorable results are shown to have occured during the year 1920:—

"The year just ended has been the busiest in the history of the enterprise, the total amount of development work far exceeding that of all previous years combined.

"The progress of constructive work has been mostly one of bringing to completion operations previously started, chief among which may be mentioned the replacement of steam by electricity with its consequent reduction in working cost and simultaneous rise in working efficiency. The capital outlay for this has amounted to not far short of $50,000 which includes over two miles of transmission-line, motors, sub-station and transformer equipment complete with a capacity of nearly 1,000 horse power. The cost of power consumption has been reduced to about one-third of that previously incurred through the use of imported coal, and the mine has been rendered independent of any foreign fuel supply, the winter heating now being derived from firewood, which is still available locally in comparative abundance. Enquiries are also being received from neighboring properties for the purchase in retail of electrical energy so it must be conceded that the improvement while being essentially a boon to the mine, can also be made the means of greatly benefitting the district. The report further states, in regard to development work:—

"The chief piece of development work on the property was the continued sinking of the "A" or main shaft to a total depth of 515 feet and the opening up of a station and main working area at the 500-ft level. From here a main cross-cut north has been advanced to a point immediately underneath the "D" shaft which, in a straight line is 487 feet north of the starting point. The last hundred feet of this work follows a vein similar in appearance to the hanging wall in the "D" shaft and is being continued to the northern boundary. Cross-cuts both east and west are in progress at this level so as to thoroughly explore the whole of this, (the principal zone of mineralization) in all directions. From here also it will be possible to test all the formations at still greater depth by means of diamond drills.

"At the 500-ft level, a large number of veins have already been intersected each one, without exception showing gold values by assay, but probably the most important discovery was the locating in the main north-crosscut, at slightly less than 200 feet from the shaft, a formation or fracture which examination in detail confirms as being identical in both dip and direction with that encountered right in the heart of the telluride deposit in the "D" shaft. Development work is proceeding energetically on this discovery with most encouraging results."

TORONTO COAL PRICES.

Very little coal is moving and dealers report business as extremely dull, partly because of unusually mild weather. Stove and nut anthracite are quoted at $10.50 to $11.50 gross at mines. Smokeless coal is quoted $9.50 to $10.00 at Toronto. Slack $7.50 to $8.25, lump bituminous $8.25 to $8.75.

COAL PRICES.—WINNIPEG.

Winnipeg coal prices are quoted for carload lots f.o.b. at steam plants, delivered at business blocks, dealers at yard, and retail prices, with additional charges for sacking.

Following are prices effective from 28th December, 1921, subject to freight increase or increase in miners' wages.

American Bituminous.	Steam Plants.	Blocks.	Dealers.	Retail.
Lump	15.95	18.10	16.60	.....

COAL PRICES.

Bituminous coal is dropping in price, and it is likely that consumers will get soft coal next Spring at lower prices than in recent years. This reduction will not be due to decrease of pitmouth prices as much as lessening of intermediate profits. Bituminous coal production has been high and well sustained during the past six months in the United States, and the Winter has been unusually mild so far. Slackness in steel manufacture, and lessening of overseas exports, have lowered the demand, and it is well known that a few tons makes all the difference between a shortage and an apparent over-production. The fact of over-production of bituminous coal in the United States — from legitimate mining concerns — has never been demonstrated. The high profits of recent years have largely gone to ephemeral producers, "farmer's pits and snowbirds", and not to the large companies whose first, last and only business is coal production over the life of their properties. The drop in selling prices will eliminate the temporary producers, and prices will have then to adjust themselves to the cost of production of the regular companies, and this is very close to recent pitmouth sales around $2.75 to $3.25 per ton.

Lower prices to common carriers of bituminous coal will tend to lowering of freight rates, and this also offers some hope to the distant consumer. Fundamental costs of coal production cannot, however, go back to pre war figures, and it may be taken for granted that the last person to receive a wage reduction will be the United States' coal miner. Those districts, however, in Canada and elsewhere that compete with United States coal will have to accept sufficient wage reductions to offset the differential in favor of the United States which originates in the more favorable physical conditions under which coal is mined there.

There is by no means the same tendency to dropping prices in anthracite, and in this case, the question of over-production cannot be mooted, it being hardly possible to conceive such a condition in view of declining anthracite reserves and increasing population desiring to use anthracite because of its undoubted advantages as a fuel. So far as anthracite consumers in Canada are concerned, they may look for lowered prices arising from improvement of the Canadian exchange on New York, and lowering of freight rates when commodities get down a little lower in price and wages follow, but there is virtually no likelihood that the pitmouth prices of anthracite will recede materially from present quotations. Indeed they may increase.

The embargo on the freight offered to the Canadian National Railway by the Dominion and Scotia Steel Companies imposed by the railway brotherhoods employed on the Canadian National Railways has been stated by a leading official of the railway unions to have been ineffective and mistaken and to have played into the Company's hands. There is little advantage, apart from other considerations, [illegible] embargoing the products of plants that are not producing and Mr. Stone's sizing up of the situation is quite accurate.

G. Gray, formerly on the staff of the Dome Mines Company takes charges of operations on the Amalgamated Goldfields property at Larder Lake, succeeding [illegible] month.

British Columbia Letter

Semi-official estimates of the mineral production of British Columbia for the year 1920, based on reliable figures furnish a surprise to most comutators. The unexpected results of the year's work are to be found in connection with the output of silver and copper. Silver, it appears likely, will show a slight increase over 1919, the improvement amounting to about eighteen hundred ounces. The explanation, of course, lies in the activities of the northern mines, chiefly the Dolly Varden at Alice Arm although it was not thought possible that the blight with which the Slocan Silver Mining Camps were afflicted through labor troubles would be overcome. There were approximately three hundred thousands pounds more copper produced in the province than in the previous year. Lead will show a decline of nearly eight million pounds but zinc is put down for an advance of over twenty million pounds. All things considered, therefore, the past year has very creditable to the mining industry of British Columbia.

However the condition of the mining industry in British Columbia at the close of 1920 may have appeared to those pessimistically inclined there is no doubt, because it is indisputably proven by figures, that the Canadian Consolidated Mining Smelting & Power Co., whose smelter headquarters are at Trail, has had a banner year.

The mines and the smelter of this company has produced mineral aggregating a value only less in comparison with previous years to what was accomplished in the war years of 1917 and 1919. The estimated value of its 1920 output is $8,161,200 as against $7,942,191 for 1919. If the comparison were based on the quantity of the metal turned out the achievement of the twelvemonth just passed would appear in an even more favorable light.

A decline is shown in the production of the precious metals and copper. This is accounted for by the closing down of the Rossland Mines and to some extent by the failure of the Canada Copper Company to continue shipment of copper concentrates to the Trail Smelter. Perhaps a better explanation can be found in the reduction of the output of the Slocan Mines by reason of the fact that there was a dearth of labor for so many months.

These decreases, however, have been more than compensated for by the production of the Sullivan Mine in lead and zinc, chiefly in respect of the latter which contributed more than one-third of the total value of the smelter's output.

The total ore receipts at the Trail Smelter for 1920 approximated 381,275 tons, a gain of 60,797 tons over 1919. The production of the mines of the Kootenay-Boundary Districts, however, did not equal the 1919 figure as in that year over 556,000 tons of Granby Ore were handled by the Granby Company's Smelter at Grand Forks, since closed down.

Receipts at the Trail Smelter up to May 21 showed that the Sullivan Mine at Kimberley up to that date produced 59,582 tons of zinc ore and 2,955 tons of lead ore. After that date the Company lumped the receipts from all its properties and the origin of the company ore, as to districts, is not distinguishable. There is no reason to believe, however, that the East Kootenay Mine failed to maintain the pace set at the beginning of the year.

Improved processes of treatment are credited with responsibility for the showing made by the Canadian Consolidated Mining Co. in 1920. One of the developments of 1919 was the erection of a large experimental mill at Trail to treat the Sullivan ore and this plant designed for 600 tons was one year ago handling 400 tons daily. Now, owing to various improvements, it is handling from 800 to 900 tons. At the beginning of 1920 magnetic separation was giving excellent results. In March an improvement in the flotation process deleted the magnetic machines from the flow sheet. An important modification in June gave even better results. Twice during October further improvements were introduced. These various improvements either increased recoveries or brought about economies which contribute to the reduction of the cost per pound of producing the metal.

Three years ago the Consolidated Company, as the result of years of experimenting, was able to produce refined zinc for the high market then existing. The market since 1918 has steadily declined, till now i is slighly below pre-war level, but constant improvement to the process of treatment, aided somewhat by more economical mining, have enabled the company to still produce zinc profitably. Two years ago this accomplishment would have been beyond belief.

Further development of the Company's zinc industry as to time will probably depend on the money market. A site has been acquired at Kimberley for the projected large mill and one of the possibilities is that one unit of this mill, a unit of 2,500 tons capacity, could be proceeded with without entailing too heavy a draft of the money market. At present the Sullivan is stoping at the rate of about 800 tons of lead-zinc ore a day and the mill could be operated up to 1,000 tons capacity without necessitating further power development at the West Kootenay Power & Light Co's. plant at Bonnington Falls. Incidentally the factor that has reduced mining costs at the Sullivan is that selective mining has ceased and the ore being treated is run-of-mine.

It is said that the power company, now a subsidiary of the Consolidated, in order to furnish current to operate a unit of 2,500 tons at Kimberley would have to double its existing plant at Upper Bonnington, and that when the mill is extended to 5,000 tons recourse will have to be made to further development of the lower falls.

The operation of a 2,500 ton mill at Kimberley would require double parts of the present zinc plant at Trail.

A production of 5,000 tons a day at the Sullivan is said to be well within the mark of economic mining and this would equal 40 per cent of the world's zinc output.

With reference to the proposed construction of a concentrator for the treatment of the ores of the ores of the Rossland Camp it is said that it is now assured that the site of the plant will be at or near Trail and that the million-dollar installation when complete will have a capacity of from 1,500 to 2,000 tons.

Among the Company's 1920 developments are the enlargement of its copper refinery from a 30-ton to two 50-ton capacity and the commencement of the erection of a mill for the manufacture of copper rods. This structure and plant is nearly ready and

will roll 50 tons of rods in a eight hour shift. The re-building of the silver refinery, one of the best on the continent, has been completed and a concrete pumping plant, drawing water from the Columbia river, has been constructed in such fashion as to be unaffected by the rise and fall of the water.

Squamash, B. C.

Preparations are being made by the Tatlayoco Lake Gold Mines, Ltd., to install a concentrating plant of 100 tons capacity. The property consists of six crown-granted mineral claims situated off the line of the Pacific Great Eastern Railway on which $50,000 worth of development work has been done. Four tunnels have been driven and ore has been disclosed containing good values in gold, antimony, and arsenic. There are a saw mill and an assay office on the ground.

Vancouver, B. C.

The manager of the Hedley Gold Mines, Ltd., stated recently in addressing the mining bureau of the Vancouver Board of Trade that if economic conditions permit the Nickel Plate Mine will be re-opened within three months. It is asserted that, providing a satisfactory declaration of policy as to taxation can be secured from the government, there was reason to believe that conditions soon might be expected to be so improved as to permit the mine to be operated.

The Northwest Mining Convention, which is to be held at Spokane, Wn., next month, will be largely attended by representatives of the mining industry in British Columbia. Hon. Wm. Sloan, Minister of Mines, is likely to be present. Mr. Nichol Thompson has been appointed to attend on behalf of the mining bureau of the Vancouver Board of Trade.

There is to be a convention of the British Columbia Branch of the Canadian Institute of Metallurgy and Mining between the eighth and the eleventh of next month at Vancouver when the programme of the institute's year's activities will be drafted and business of importance to the industry discussed.

In discussing the geology of the Salmon River District, Portland Canal, B.C., before the Canadian Institute of Metallurgy and Mining, Dr. Schofield, of the University of B. C. and formerly of the Canadian Geological Survey, stated recently that the most important rocks were the quartz porphyries and the tuffs and observed that most ore bodies occurred at the contact. The only instances of secondary enrichment in the district were the discovery of native silver along fault line in ore bodies but these deposits did not go to any depth. The ordinary silver ore bodies, however, were likely to be found to continue at depth, so that some of the properties under development might be expected to prove valuable mines.

During the year 1920 there were 1348 deposits at the Dominion Assay Office, Vancouver, the aggregate value of which was $2,499,230. In 1919 the deposits totalled 1391 and the value was $3,547,525. In 1918 there were 1,358 deposits and the value was $4,099,596. The bulk of the gold production of British Columbia and the Yukon passes through the Vancouver Office so that these statistics tell the story of the effect of the fixed value of gold and the rising costs of production. The fact that gold is bought in American Funds only partially off-sets the high cost of operation.

Stewart, B. C.

It is reported to be a possibility that an 11-mile aerial tramway will be constructed from the Premier Mine, Salmon River, to tidewater to take care of the transportation problem facing the management of the Premier Gold Mining Co. To keep the road open is said to be proving too costly and constant a task. The drop between No. 2 tunnel where shipments originate and Stewart is about 1,400 feet, of which 900 feet occurs in the first three miles. H. A. Gness, managing director of mining operations, is understood to have commissioned competent engineers to investigate and report on the project. There now are several hundred tons of high grade ore at the mine awaiting shipment.

Prince Rupert, B. C.

G. A. Clothier, provincial government mining engineer, has asked the co-operation of the administration of Alaska in the building of a wagon road up the Unuk river into the mineral zone lying to the north of the British Columbia Portland Canal Mining District, which includes both American and Canadian territory. Mr. Clothier has explained to Governor Thomas Riggs that the road suggested would run up the Unuk River for a distance somewhat greater than 25 miles and into a section of which little is known except that its geological formation is such as to lead to the conviction that it has mineral possibilities. Governor Riggs is expected to submit the matter to the Territorial Road Bureau.

Alice Arm, B. C.

The Dolly Varden Mine has closed down temporarily. With the close of the railroad, because of a heavy snowfall some weeks ago, shipments from the property ceased.

EDITORIAL

THE FAITH OF A GEOLOGIST.

Dr. John C. Merriam took for the subject of his presidential address before the Geological Society of America the background of history as seen by the student of those sciences that deal with the physical history of Earth, the background "out of which history "emerges and against which its movement must always "be projected". Dr. Merriam dealt with a viewpoint of the geologist of wider range, permitting of more extended vision, that that of the student of recorded human history, and one which has before now brought him into conflict with the theologian. "Of all favored men", says Dr. Merriam, "the geologist and paleonto- "logist see the panorama of the past unrolled in clearest "reality. To them the life record is not written in "doubtful hieroglyphs and symbols. It represents the "imprints of living feet that have never ceased to "advance in unbroken procession over a trail that "winds upwards through the ages".

At a time like the present, when many are suffering from spiritual disillusion, and whole nations have apparently slipped backwards and have lost hope in the future, it is helpful to have the testimony of a geologist "as the ages go by, in each successive step, almost "without exception, we find a higher level of life, rep- "resenting greater intelligence, greater efficiency, and "greater progress".

Dr. Merriam sees no reason to apprehend cessation of being or of a continuity in the forces that have hitherto made world history, and he foresees a time when man shall reach "to heights of mental ability, of comprehension, of intellect, of understanding, greater than those yet known".

The record of earth sciences Dr. Merriam summarises as "tangible proofs of progress from eon to eon which "might well help a forlorn world to take heart once "more. We may not understand the method by which "betterment has come, but we see the stages of its "movement and realize that, whatever struggles the "future may have in store, we shall always be credited "with a margin of safety when we risk ourselves in "the cause which makes for uplift in the truest sense."

Brave words these and refreshing. Man has never gone wrong through excess of knowledge, but through insufficiency, and those timid souls who in earlier and well-nigh forgotten days feared for the eternal verities because the paleontological record apparently contradicted their preconceptions, stand rebuked by the strengthening of faith and the buttressing of hope that always follows earnest and honest research and the acceptance by man of the logical conclusions of his own intellect based on the accumulated record of the sciences.

The half-learned man may pose as a cynic and become self-sufficient, but the wider vision of the past that accompanies great learning brings with it completer understanding of what is yet to be, and tends to tolerance, faith in humanity's future, and the humility of wisdom.

SIR J. H. DUNN, Bt.

A sufficiently significant commentary on the criticisms of a parliamentary Select Committee upon the British Government's interest in the British-America Nickel Corporation is the baronetcy conferred upon James Hamet Dunn in the New Year Honours "for public services rendered to the Government during the war." It is understood that these services consisted in making the precise arrangement that the Select Committee disapproves of "on purely commercial grounds."

THE MAYO SILVER DISTRICT.

By the courtesy of the Director of the Geological Survey we are enabled in this issue to include a description of the Mayo Silver Area, and of the development work to date, by Dr. W. E. Cockfield, who has for two years been engaged in examination of the district. The establishment of a silver lode mining camp in the Yukon, and was made the subject of a special edition of the "Dawson Daily News" that was not only a credit to journalistic enterprise and the belief of the Yukoners in their country, but contained information regarding the agricultural achievements and the communal conditions of Dawson and its vicinity that are quite at variance with usually accepted ideas of this northern outpost of Canada.

The Dawson "Daily News" states that the Yukon has already given two hundred million dollars of gold from its placer camps, and it looks forward to a further contribution of similar amount from the Mayo area alone. We hope this prediction will be realised.

By no means the least interesting item in the special edition of the "News" referred to is the menu of a Dawson cafe, in which every item of the bill-of-fare is stated to be the product of some Yukon farm, forest or stream. The menu is of proportions that indicate good appetities in Dawson, and the prices are much more moderate than the average Canadian hotel in the East.

ELECTRIC LOCOMOTIVE IN COAL MINING.

Some months ago, "Coal Age" stated that if the electrically-operated locomotive had to be done without in United States collieries it would become necessary to abandon many of these mines. There is no doubt that the refusal of British authorities to permit the use of this type of haulage motor underground in coal mines has prevented much economy in mining costs. It may also have prevented much loss of life and wastage of property that would have outweighed the initial saving in production cost. The same statements are applicable to coal mines in Canada, more particularly to collieries in Nova Scotia and British Columbia.

While we would hesitate, even at any prospect of cost saving, to recommend the adoption of such risky equipment as is common in many coal mines in the United States, the possibility of employing a type of electric haulage motor that is reasonably safe is worthy of consideration in some Canadian collieries that have up to now barred the electric locomotive because of its dangers. The question of haulage costs is one of ever-increasing importance, and in some mines it is greater than the cost of mining the coal.

The greatest economy resulting from the use of electric locomotives in collieries in the United States has been in their substitution for men and horses as "gathering motors" in the face-roads feeding the auxiliary and main haulages. This practice, of course, involves the employment of electricity at or near the face of the coal, the position of greatest danger from explosive conditions of the mine air.

The storage-battery locomotive is preferable from a point of safety to a trolley-operated motor, and a number of motors of this type have already been used in coal mines in Canada, and are also used in metal mines where explosive conditions are absent.

The handicap of cost imposed upon some Canadian coal mines by physical conditions and extreme length of haulages underground is now so severe that unless cheaper operating costs can be obtained by the use of mechanical equipment in substitution for hand labor and by speeding-up the movement of the coal from the face to the pitmouth, the production of these mines will be limited to the supplying of immediate local needs, as the costs of mining will be too high to permit of additional costs of transportation to a market.

In considering ways and means to cheapen coal production it is suggested that the use of electric motors underground should be given serious consideration. There are varying degrees of danger in the underground conditions of coal mines, even in the same district, and that fact that the use of electric motors is properly considered inadvisable in some collieries, should not deter impartial enquiry into the possibility of using them in mines having less dangerous atmospheric conditions.

At the same time it is necessary to protest against the widely disseminated idea that the coal mine equipment of Canadian and British collieries is out-of-date. A usually fair and discriminating editorial writer in "Toronto Saturday Night" blamed the low individual output of the British miner on the use of obsolete equipment. The precise truth is that nowhere is the theory and practice of coal mining more advanced than it is in Britain, but nowhere do the statutory regulations imposed to secure safety of human life act so stringently in restriction of output and enhancement of the cost of coal production. The larger individual output of the United States miner is in large measure due to thicker and more accessible coal seams, and to the use of mechanical appliances that the Coal Mines Regulation Act of Great Britain and the similar act of the British Dominions specifically prohibit because of their risk to life.

ENGINEERING STATUS LEGISLATION DISCUSSED BY TORONTO BRANCH C. I. M. & M.

The Toronto branch of the Canadian Institute, at a meeting at the Engineers' Club in Toronto on Jan 15th discussed the proposed legislation in respect to the engineering profession to come before the Ontario Legislature at its coming session. The draft act is already in shape, having been finally formulated by the Advisory Conference Committee on Engineering Legislation. This committee was organized to consider the question of engineering legislation for the Province of Ontario and at the time of its formation it was understood that the function of the committee was advisory only, and that it should report back to the constituent bodies. The feeling of the mining engineers at the meeting was favorable to legislation which would elevate and increase the status of the engineer and protect the public and it was thought by some that the legislation should follow the general lines of the Solicitor's Act, making proper examination mandatory and not restricted to any country in its scope. A general discussion of the matter was participated in by Mr. D. O. Lewis, of Victoria, who is connected with the Canadian National Railways and Mr Dunn of Winnipeg, who briefly outlined the status of the engineering profession in their respective provinces. The main features of the bill are as follows:

1. It follows closely along the lines of legislation already enacted in the Provinces of British Columbia,

Alberta, Manitoba, Quebec, New Brunswick and Nova Scotia. For this reason reciprocal privileges between these provinces and our own should be much easier than if our legislation were on radically different lines.

2. It places the control of engineering in the hands of the profession itself, thereby avoiding control by Government officials who may lack full understanding of our diversified needs.

3. The Government will have a share in choosing the personnel of the Council, thus providing a guarantee that the Council cannot be controlled by any particular group.

4. The different branches of engineering are given equal representation, so that no one branch can gain control.

5. The branches are made partially autonomous, so that their regulations may vary from one another in matters requiring such variation. At the same time the Council has power to prevent these variations becoming too extreme.

6. The legislation is intended to cover engineering only. Technical trades and similar occupation cannot be brought within its scope. It is only by remaining distinct from these that engineering can attain full professional status.

7. Provisions for registration of present practicing engineers are made reasonably broad so that nobody with fair pretentions will be debarred from his present livelihood.

The Committee feels that these features should prove acceptable to every professional engineer in Ontario. Other styles of legislation may have points in their favor, but the above considerations were considered to be of more importance.

The Committee hopes that every engineer will consider the draft bill from the standpoint of broad, general principles, and lend his hearty support to it, if found satisfactory in this regard. It will never be possible to get every minor detail adjusted to the full satisfaction of all concerned. To give consideration and effect to all the petty amendments and alterations which might be proposed, would effectively prevent the matter ever being brought to an issue.

TARIFFS AND "CART-TAIL ORATORY."

"We are apt to speak casually of the tariff of the United States, without stopping to think that a tariff policy is the one thing we never have had. Since the first discussion in 1789, we have been deluged with argument on both sides of the question, for whenever a political party is utterly at a loss for a platform, it immediately takes up the question of changing the tariff, in one direction or the other. Congressional and cart-tail oratory have never been lacking, while the books, pamphlets, reports and briefs on tariff questions have been one of the main causes for the vast growth in the American paper industry."

Edwin C. Eckel, "Coal, Iron & War."

Between the Railway Commissioners and the Railway Brotherhoods, the word embargo is coming to have an unpleasant significance in Cape Breton Island. The embargo on coal in the Summer injured the coal trade, and the railwaymen are now doing their best to injure the steel trade, which everybody knows has sufficient troubles of its own without the opposition of those who live upon it.

CORRESPONDENCE.

A GRIEVANCE.

Editor Canadian Mining Journal.

Sir:

Permit me to draw to your attention a matter of grave moment.

The conjoint committee of engineering societies has recently drafted a bill for the consolidation and protection of the engineering profession. My branch of the profession has been totally and, I fear, deliberately, overlooked.

I am a theologist. My claims for the inclusion of my profession in one of the engineering categories are at least as valid as are those of the geologist.

To be both brief and specific, let me enumerate a few points that are incontrovertibly axiomatic.

1. The geologist studies genesis. The theologist specialises in exodus.

2. Both professions are levitical.

3. An understanding of the phenomena of metamorphism (in the one case that of mere rocks, in the other that of souls) is fundamental to both geologist and theologist.

4. In the matter of results ours is infinitely the more practical vocation.

Whilst the engineering phase of the geologist's activity is confined to the political arena, our engineering practice covers the social, moral, business, commercial, and political fields, not to mention our functions in relation to the hereafter.

Sir, exclusion of the theologist from the fold is as invidious as it is cruel. I do not wish to impute motives, but I am to confess my belief that our professional brethren, the geologists, will not be held guiltless if we continue to be denied admission.

Were it seemly I would cite scriptural warrant for this warning. Let it be taken to heart.

Yours in thermal fervor,

REV. H. E. AVENS.

THE WESTREE-SWATSTIKA RAILWAY PROJECT

Editor,

Canadian Mining Journal.

Sir:—

Your correspondent from Montreal, in your Journal for the 7th, appears to lack information when dealing with the proposed Railway from Westree to Swatstika.

Gowganda alone, have produced in round numbers, 6,000,000 ounces of silver. That more of that sort of Script is not available, the lack of railway transportation facilities are chiefly responsible.

The building of this Railway is not asked as a matter of charity but as a matter of justice to invested capital.

During the year ending Oct. 31, 1920, the T. and N. O. made a profit of $3,000,000 chiefly from the mining industry. Additional revenue collected from mining during the year, by the Government, amounted to over $1,000,000. The Editor of the "Northern Miner" voices the general feeling of the North when he says "Put it back".

I do not think that the people of Northern Ontario would ever wish to guide public expenditure asked for by the people of Quebec and fail to see why our Montreal correspondent is using the little hammer.

L. O. HEDLUND.

The Silver Lead Ores of Mayo District, Yukon

(W. E. COCKFIELD).
(Published by permission of the Director, Geological Survey, Ottawa).

Mayo district has been attracting more and more attention from a mining standpoint within the past few years, as it is the only district in central Yukon that promises to develop into a lode-mining centre in the immediate future. In the year 1914, with the opening of the extremely rich deposit at Galena creek, an impetus was given to the seach for argentiferous galena, which resulted in the discovery of a number of promising properties. These include Keno hill, Lookout mountain, Rambler hill, Stand-to mountain, Mt. Cameron, and a number of others.

Keno Hill.

Keno ridge is a long wedge-shaped ridge lying between the heads of Lightning creek, Christal creek and Ladue river about about 42 miles from Mayo by road. It has the characteristic flat top of the Yukon plateau country, and is surmounted by a number of hillocks known locally as Keno hill, Minto hill, Monument hill, Caribou hill and Beauvette hill. Upwards of 600 claims have been staked on the ridge, and on most of these sufficient work has been done to keep them in good standing. Real development work, however, has been performed only on a small number of groups.

The geology of Keno hill is similar to that of the greater part of Mayo area. The rocks exposed consist of a series of crystalline schists and gneisses, intruded by sills of greenstone and dykes and sills of rhyolite, quartz porphyry and granite porphyry. The schist series is made up of gneissoid quartzite, quartz-mica schists, mica, and chlorite schists. The greenstone sills vary in colour, composition and texture, ranging from a diorite to a diabase. The acid sills and dykes are believed to be apophyses from a granite mass to the eastward. The strata in general have an east-west trend and dip to the south at low angles. Near the hillocks known as Keno hill, Minto hill and Monument hill, however, they undergo a sharp flexure bending nearly at right angles, and in the vicinity of this flexure there is much local faulting.

The ore bodies are found in fissure veins and are consequently intimately related to the systems of faulting. Two such systems have been recognized, one of which is in a general way parallel to the trend of the strata and will be referred to as longitudinal faulting; the other making an angle of 70 to 80 degrees with these and crosscutting the strata, will be referred to as transverse faulting. In the longitudinal system one main fault traverses the ridge for several miles and in the vicinity of the flexure referred to above diverges into three main branches, which are also quite persistent. Traces of other faults parallel to these have been found, but owing to the rather heavy drift cover, they could not be followed any considerable distance. These faults are mineralized with quartz and arsenopyrite, and occasionally with galena, manganite and siderite. The transverse faults occur in great numbers, particularly in the vicinity of the flexure referred to above. As a rule they are much shorter than the longitudinal faults and of relatively slight displacement. They are mineralized with galena, manganite and siderite, and occasionallly with calcite and zinc blende. In both systems the galena is enriched in places with freibergite.

Ore Shoots.

The principal ore shoots already discovered lie in the transverse faults. From what has already been learned it may be established as a general rule that where one of these fissures taps a longitudinal fault and passes upward out of a hard stratum such as quartzite or greenstone into schist, on ore shoot will be found in the vein below the schist capping. In the longitudinal faults ore deposition has taken place at points where the older filling of quartz-arsenopyrite has been opened by a distinct fracture, but at some localities a disseminated ore does occur, which may have been introduced at the time of formation of these veins.

The ore shoots vary in width from a few inches up to 4 or 5 feet. The galena in them is fairly free from mixture with gangue minerals and samples are usually taken of the galena only. A content of about 200 ounces of silver per ton and 60 per cent lead probably represents closely the value of the ore shoots. None of these shoots has been fully blocked out as yet, and none of the deposits has been tested in depth. The galena occurs fresh and unaltered right at the surface, but on some properties carbonates are encountered at a depth of a few feet. In other cases no alteration was noted.

It is expected that about 3,000 tons of ore will be hauled to Sewart river during the winter from these deposits.

Lookout Mountain.

The Lookout property is situated on a spur of Lookout mountain about 29 miles from Mayo by road. It is being prospected by a number of local men and the development includes about 1,000 feet of underground work. There are three adits, the uppermost of which is 50 feet long and is terminated by a winze 25 feet deep. A second adit 39 feet below the upper and 90 feet to the north is 59 feet long to the point where it taps the vein, which is followed by a drift to a point directly below the winze. The third adit is 125 feet below and 320 north of, the second, and is 135 feet long. It is terminated by a drift on the vein 305 feet long. From this drift an incline and winze have been sunk.

The vein follows a well-defined fracture 7 to 12 feet wide, in quartzite and quartz-mica schist. The filling consists of quartz, manganite and pyrolusite, limonite, cerussite and anglesite and galena. The ore is of a disseminated character, the galena occurring in small streaks and masses, which are in some cases sufficiently concentrated into zones to be termed ore shoots. Three such zones have been cut by the workings but none of them have been fully blocked out. The ore is of a lower grade than the Keno deposits and will require milling before shipment. Several small shipments of hand-sorted ore have been made from this property. (1)

Rambler Hill Property.

Rambler hill is situated near the foot of McQuesten lake about 50 miles from Mayo. A winter road passes near the property.

(1) For more complete descriptions, see Geol. Surv., Can., Sum. Rept., 1918, 1919, pt. B.

At the time of the writer's visit very little could be seen of the deposits owing to the shaft being partly filled with ice. The width of the vein is 12 feet but this included several horses of country rock. The filling consists of limonite, galena, pyrite, quartz, cerussite, anglesite, malachite and chalcopyrite. The limonite makes up the bulk of the deposit, but in it are nodules of galena, apparently residuals, coated with oxidation products. The deposit at Rambler hill, showed an iron capping of considerable extent through which the workings had not penetrated in 1918. Since the writer's visit, it is claimed that much better showings were encountered lower on the hillside and these are being drifted on.

Mount Cameron.

Mt. Cameron is situated about 65 miles from Mayo by road and is more interesting as serving to show the extent of these deposits than from an economic standpoint. It is not considered that the deposits here can be worked until better facilities for transportation can be afforded. It is hoped with the opening of the Keno hill deposits that means of communication in the district will be improved.

Only the outcrop of this deposit could be seen. This is apparently a shear zone with a width of about 50 feet, mineralized with galena, sphalerite, limonite, siderite, malachite, azurite, chalcopyrite, pyrite and calcite. The vein has a banded appearance with alternating streaks of galena, sphalerite and other gangue minerals.

Other Occurrences.

The deposits on Stand-to mountain, and several newly-discovered deposits lying between Rambler hill and Mt. Cameron have not yet been visited by the writer. The stand-to property is situated across Ladue valley from Keno hill, and evidently marks the extension of the Keno deposits.

Conclusions.

It is only a few years since the first shipment of ore was made from Galena creek, and in that time all the deposits mentioned in this article have been discovered. These are widely scattered and embrace an area of at least 1,000 square miles. As the country is a difficult one to prospect it is extremely likely that prospecting will bring to light other similar deposits, but it remains to open one or more mines in order that transportation facilities may be improved. With such improvement lower grade properties may be worked, and as the Keno hill properties are in a fair way towards establishment as producing mines, the prospects of Mayo district becoming a lode mining camp are regarded as favourable.

NOVA SCOTIA COAL MINING.

Practical cessation of all pig iron and ingot steel manufacture at the steel plants in Cape Breton Island, and curtailment of export orders, is causing slackness at the collieries. The Dominion Coal Company announces that it has received cancellation of export orders from the Dutch Government, fulfillment of which was prevented by the export embargo imposed by the Railway Commissioners in the Summer. In the closed season of navigation, this reduces the outlet for coal production to the requirements of the Maritime Provinces and coal stored in the banks. The Company states that it is the intention "to bank a large quantity "of coal with the hope that it may be able to enter the "Montreal market next Summer, but as the United "States competition is very keen there is no assurance "that with the present high cost of production Nova "Scotia will be able to compete."

Reduction of the working time of the collieries by half, and curtailment of the number of workmen employed in the machine shops, railway and construction departments will take place. Not since the winter of 1914-1915 has there been any interruption to production from lack of outlet. It is becoming apparent that the rate of wages called for by the Montreal agreement is beyond the capacity of the Nova Scotian coal mines to pay if they desire to compete in other than purely local markets, and it is also higher than will enable the coal produced to be used in the manufacture of steel and steel products that have to compete with importations from the United States.

Fairly well-informed opinion looks forward to a revival of coal demand, and possibly also of steel demand by the Summer, but this anticipated revival will be based on a belief that selling prices are fair and more or less permanent after-war prices, and contracts will once more be awarded on a competitive basis, and will not be the result of insistent demand.

As the United States is the chief competitor of Nova Scotia coal in the Montreal market, it is significant to note that "Saward's Journal," a good authority on coal trade matters, states that the middle of January prices of lower-grade coal in the United States are now down to the cost of production, and prices of the better coals are in many cases approaching that point. It is fairly evident that with United States coal entrenched in the Montreal market after over five years unopposed dominance, any sales of Nova Scotian coal effected will, with the best of good will on the part of Canadian purchasers, be required to meet severe competition.

An underground fire in No. 1 Mine of the Inverness Coal & Railway Co., is reported to be under control.

The output of the Bras d'Or Coal Co., near Sydney Mines, during 1920, was 120,000 tons. This compares with 41,000 tons in 1919, and is a great advance on any previous annual production of this Company.

The output of the Milford Mining Company, Thorburn Pictou Co., during 1920, was 21,000 tons, about the same as last year. The property of this Company, which is controlled by Mr. Alex. Sutherland, has been acquired by the Acadia Coal Company. The property was held under a sub lease from the Nova Scotia Steel & Coal Co., which has holdings in Pictou County that it has not operated for a number of years.

The Greenwood Coal Co., at Thorburn, Pictou Co., had a production of 51,831 tons in 1920, comparing with 11,523 tons in 1919.

The "embargo" upon the freight of the steel companies in Nova Scotia, sought to be imposed by the employees of the Canadian National Railways, has been lifted. The action of the railwaymen in this instance is in complete contradiction to their traditional policy in Eastern Canada, and, generally speaking, the incident has been a puzzling one. It must have been obvious to the railwaymen's leaders that there was no advantage to be gained in striking for higher wages at a time when the impossibility of providing employment at any wages faced the steel companies.

Mining in Quebec in 1920

THEO. C. DENIS.*

Whether or not the total figures of mineral production of the province of Quebec for 1920 equal or surpass the 1919 production, will depend on the value of the building materials, and it is very difficult to foretell before hand what what this value will be. Quarrying, brick-making and cement manufacture have been active, but it is only from the returns of operators that figures can be arrived at.

Asbestos has held its own, and it is not expected that the production will show a great variation from last year's. During the first six months this industry was very active, and although somewhat hampered by the difficulties in obtaining cars for shipments, the tonnage and the value showed an advance as compared with the corresponding period of 1919. The demand was keen, the United States market absorbing almost all of it. The second half of the year was marked by the closing down of two of the important mines for a period of nearly five weeks, owing to a strike brought on by the exigencies of labour, to which the operators could not or would not acquiesce. The strike ended by the miners returning to work unconditionally, at the old terms and rates. During the three last months of the year the American market has appeared to be somewhat satiated, the demand and orders becoming perceptibly slower. This, however, had practically no effect on the prices, which kept firm, owing to the European demand, the English and French markets having had to be somewhat neglected during the previous months. The asbestos operators have taken advantage of this era of prosperity to push on development work, to block out reserves, and to improve methods of working. As an example, it may be mentioned that one of the companies has been putting down many thousand feet of diamond drill holes, has given a contract for the removal of 600,000 cubic yards of overburden to give access to the new ground and that they count on having a reserve blocked out for thirty year's mining, at the present rate of production. The figures for the first six months of 1920 show a production of asbestos and asbestic of 82,500 tons valued at 5,763,000 dollars, whereas for the previous twelve months, they were 160,000 tons valued at $10,995,000.

In the chromite industry two operators have shown their faith in its permanency by erecting some very substantial concentrating mills. One was built by the Mutual Chemical Company of Canada, mainly to treat their ore from their mine on lot 19 N. W. range X of Coleraine. This was started early in the year, and has given very good satisfaction. The second concentrator, which is built within a few hundred feet of the first, on the adjoining lot, is that of the J. V. Belanger Mining Co. and it has a capacity of 180 tons of ore a day, giving about 30 tons of chromite concentrates at 50 per cent. This was started in July, and the efficiency of the mill may be gathered from the facts that the shipments for the first month of operation of the mill totalled 600 tons of concentrates. Practically the whole production of this company went to the American Alloys Company. The Black Lake Asbestos & Chrome Co., worked their Caribou Lake mine during the early part of the year only. The production was limited to "crude", that is lump ore assaying from 35 to 40 per cent of sesquioxide.

The magnesite industry of Argenteuil county is now well established and two of the operators have erected very complete sintering plants near the quarries, for the production of dead-burned magnesite. The capacity of these two plants is 75 tons of finished product a day, requiring approximately 150 tons of crude magnesite. Heretofore the clinkering was done in cement plants, in Hull and in Montreal, which entailed railway transportation of the raw magnesite.

The mica industry has been active. Production will be higher than in the previous year. Quebec's output of this substance is approximately 80 per cent of the total Canadian output.

There has been a keen demand for felspar, both for ceramic purposes, and for enamelling. Several new deposits were opened during the year and shipped feldspar, mainly to pottery centres in the United States.

Pyrites mining has been very inactive, only the Weedon mine having been in operation. The Eustis mine has not reopened, having closed down in April 1919, after forty years of practically continuous exploitation. The market for iron pyrites for the manufacture of sulphiric acid has been very dull. The sulphur deposits of Louisiana and Texas have been increasing their production to a very great extent and this has had a marked effect on the demand for pyrites.

On the whole, metalliferous mining has keenly felt the drop in prices of all the metals. According to New York quotations, copper is now 28 per cent lower than in the early part of the year; zinc has dropped 34 per cent and lead 45 per cent as compared with prices in February and March, and the operations of our mines of these metals have decreased in proportion. Nevertheless the Zinc Company worked their Montauban mine, with comparatively few interruptions, and the Federal Zinc Company, who are developing a very promising deposit of zinc and lead ore in Gaspé county, worked actively on the construction of the road, 42 miles long, which will connect the mine with the railway and enable them to haul the concentrates by tractor.

Very little prospecting was carried on during the year, and practically no development work was done on the gold occurrences of Lake de Montigny, in the Abitibi region.

NOTE.—The foregoing note was prepared by Mr. Denis for inclusion in the Annual Review issue of January 7th, but was by oversight omitted, which we regret.—Ed.

*Superintendent of Mines for Province of Quebec.

PERSONAL.

Mr. Edgar Stansfield, who has for many years been the Chief Chemist of the Mines Branch at Ottawa, and is well-known through his work in connection with lignite briquetting, has entered the service of the Government of Alberta to take charge of the chemical part of the extensive investigation on Alberta coals which the Provincial Government proposes to undertake in conjunction with the staff of the University of Alberta at Edmonton.

British Columbia Mineral Production in 1920

Abstract of the Preliminary Review and Estimate Issued by the Minister of Mines.

With a production valued at $35,580,625 for 1920, which is $2,284,312 greater than the 1919 figure, British Columbia once more takes a foremost place among the mining provinces of Canada; in fact it is doubtful whether any other mineral producing area of the Continent will be in a position to report more than a 7 per cent increase over the output of the previous year.

The foregoing statement is based on statistics furnished by the Preliminary Review and Estimate for 1920 just issued by Hon. Wm. Sloan, Minister of Mines. Besides the chief point that the industry as a whole shows a 7 per cent monetary improvement over the result of 1919 it is set out that there has been an increase in the amount of silver produced of 1,807 oz. —3,404,926 as against 3,403,119 oz. — although in value, owing to the falling world quotations, there has been a decline of $327,349; that there have been 314,-321 lbs. more Copper produced than in 1919—42,773,-660 as against 42,459,339—although in value, again owing to the decline in prices, there is a reduction of $454,506; and that in Lead there has been a decline in quantity of 7,930,921 lbs—21,545,047 as against 29,-475,968—but an increase in valuation, because of improved prices, of $13,616.

But, in connection with metalliferous mining, the most noteworthy fact is the development of the Zinc industry. There was an increase of output in 1920 over 1919 or 20,027,617 lbs, the figures for the two last years being, 1919—56,737,651 lbs; 1920—76,765,268 lbs. In volue the improvement is estimated at $1,-602,843.

The explanation of this is found, beyond a doubt, in the enlargement of operations in connection with the Sullivan Mine, East Kootenay, and the activity of the Trail Smelter. Mr. Sloan in his report says with reference to this matter that the growth of this branch of the mining industry is due to the greater production of the Sullivan and that "during the last half of the year in other places there has been little or no market for zinc ore, and a very small volume of sales of the metal; several of the larger zinc mines and refineries in the United States closed down early in the fall."

In Gold production, both placer and lode, the comparison is not as favorable. There is a decline in placer output of 1075 oz.—13,250 as against 14,325 oz. —and in lode gold it amounts to 34,250 oz., 118,176 as against 152,426 oz. In monetary terms the difference amounts to $21,500 in respect of the placer and to $707,947 in respect of the lode product.

"This might have been expected" the Minister of Mines report explains "as the mining of Gold, with its fixed value, has in these times of high cost of labour and supplies for some years past offered little encouragement and even less at the beginning of this year, on the eve of what promised to be a period of unstable prices. With what is now an assured promise of lower costs of supplies and living it would seem that gold mining would again become profitable and we may confidently look for an increased gold production in the near future."

With further reference to this matter Mr. Sloan maintained that recent amendments to the Placer Mining Act might be expected to bring considerable areas of the placers of the Province, for years inactive, under development. There were many indications that hydraulic and dredging operations would be undertaken in the large placer-fields of the northeastern interior on such a scale that the effect on the annual production would be notable. There was no doubt, too, the adverse economic conditions, with respect to gold mining, conditions responsible for the closing down of such a well-known and large producing mine as the Nickel Plate of Hedley, were improving. He looked for a return to a normal rate of production as regards the lode gold mines and for such further development, in both placer and lode gold mining during the year, as would materially advance the production of 1921.

Dealing with the Silver production Mr. Sloan said that it was particularly gratifying to find that in quantity the output was slightly greater than in the previous year for the reason that the result was unexpected by many because of the closing down of a number of the mines of the Slocan District. A disagreement between the employers and the employees had led to the practical closing down of a number of the mines of this section for a great part of the year. Inasmuch as it was this mineral area that is responsible for a large proportion of the silver production of the Province it was thought, naturally, that it would be impossible to overcome the setback thus received. But, as pointed out, those so figuring were not making sufficient allowance for the productivity of the mineral areas of the northern coast sections the properties of which have taken a place as producers comparatively recently. One of the chief of these was the Dolly Varden, of Alice Arm, the output of which, from the 1st of September 1919 to the 30th of September 1920 amounted to 1,170,000 ounces. Added to this was the product of the Premier Mine, Portland Canal Mining Division.

In considering the whole question of the results of the year's effort in metalliferous mining Mr. Sloan said:

"It is extremely gratifying that British Columbia's Mining Industry has been so well maintained, notwithstanding the fluctuating metal market, and despite generally unsettled conditions, that it is possible to report an increase in 1920 over the value of the production of 1919. It is to be remembered, too, that other mineral producing sections of America have, of late, been announcing deductions in mineral output, a fact which emphasizes the very satisfactory showing of this Province."

There had been in recent months a considerable drop in metal prices as compared with those of war days. As mining costs had not yet declined in the same proportion, the producing mines had suffered some embarrassment and recently the output, especially of copper, had been cut down. As had been predicted, however, in respect of gold, it might also be said in regard to the production of the base metals that conditions gradually were on the mend. Mr. Sloan stated that he was not one of those who viewed the future pessimistically. Such a sentiment was in no way justified

Present conditions were but a passing phase of war aftermath which history taught was to be expected and which shortly would be forgotten with the return of industrial stability. Meanwhile it was re-assuring that in the face of untoward conditions the metalliferous mines of the Province as a whole had been able to make an increase over the previous year of $105,157, their estimated production amounting to $20,142,155.

Mr. Sloan was enthusiastic in reference to the splendid showing made by the collieries of the Province. In coal there had been an increase of 444,487 tons in 1920 over 1919—2,712,228 as against 2,267,541 tons. Reduced to monetary terms this meant an improvement of $2,223,435. The output of coke was down somewhat, the production being 68,190 tons as compared to 91,138 tons in 1919, a decrease in value of $160,636.

To Mr. Sloan this manifestation of increased productivity on the part of the collieries of British Columbia is one of the most satisfactory features of the 1920 report. He expresses the opinion that coal once more is coming into its own, that it is going to take the place of fuel oil to a greater and greater extent from this time forward, and that the development of the industry during the past year is but the beginning of a period of sustained productivity and prosperity to the coal fields of the Province. That the collieries at present in a position to turn out this fuel should be prepared to take advantage of the enlargement of both the domestic and foreign markets is his opinion. They should make preparations to develop their coal areas, to the utmost. It was apparent that the immense coal resources of British Columbia were not going to lie practically dormant for much longer.

It is interesting to note, in this connection, that the returns for the month of December, as far as available, indicate that the rate of production is being well maintained. For the month of November the output totalled 261,608 tons while, with the production of the Crow's Nest Pass Collieries for December estimated, that for the past month will reach at least 240,000 tons. The figures for the Vancouver Island collieries for December follow:

	Tons.
Canadian Western Fuel Co., Nanaimo	52,796
Canadian Collieries (D) Ltd., Comox	42,761
Canadian Collieries Ltd., South Wellington	7,512
Canadian Collieries Ltd, Extension	17,054
Pacific Coast Coal Mines	3,205
Nanoose Wellington Coal Mines	3,287
Granby Consolidated Mining and Smelting & P. Co., Cassidy	18,279
Total	144,894

Following is the official table showing the estimated mineral production for 1920 as compared with that of the previous year:

Mineral Production for Two Years, 1919-20.

	Production, 1919.		Estimated Production, 1920.			
	Quantity.	Value.	Quantity.	Value.	Increase.	Decrease.
Gold, placer ..oz.	14,325	$ 286,500	13,250	$ 265,000	.....	$ 21,500
Gold, lode ..oz.	152,426	3,150,645	118,176	2,442,698	.....	707,947
Total gold	.....	$ 3,437,145	.....	$ 2,707,698	.....	$ 729,447
Silver ..oz.	3,403,119	3,592,673	3,404,920	3,265,324	.....	327,349

VANCOUVER NOTES.

Mr. J. M. Lay, Manager of the Imperial Bank at Vancouver, was elected President of the British Columbia Chamber of Mines at the Annual Meeting. The Secretary reported 321 members, which is a substantial increase over the membership of last year. In place of the technical lectures which were held last Winter, it was decided to arrange for a smaller number of popular lectures on the mining industry with moving pictures. The Chamber has for its object dissemination of accurate information regarding the mining industry of the Province, and welcomes visitors from all parts of the world to its rooms. New quarters have been acquired on Seymour St., Vancouver, and the Secretary solicits enquiries.

In order that the meetings shall not clash the Associated Boards of Trade of British Columbia has postponed a conference which was scheduled for the first week in February to give precedence to the meeting of the Canadian Institute of Mining and Metallurgy, which takes place on the 3rd, to 5th of February. In doing this, the Board of Trade has courteously recognised the importance of the Institute's meeting.

The Committee in charge of the coming meeting has decided to encourage full discussion of topical subjects which will be introduced by persons specially qualified, and the public is invited to all the sessions, except the opening business session.

The Rise of the Hollinger Mines

By J. A. McRAE, Cobalt.

The history of the Timmins-McMartin-Dunlap interests is unusual. These men all made money in mining silver at Cobalt. Unlike many who make small fortunes in mining ventures, they did not retire from the field, but, instead showed their confidence in the mineral resources of Northern Ontario by venturing into the Porcupine field, where gold discoveries of promise were made in 1910. They bought the Hollinger group of claims for $330,000, a mining prospect then of more or less uncertain merit.

The writer has secured from Mr. A. A. Cole, Mining Engineer of the T. & N. O. Ry. a photograph of the Hollinger prospect taken ten years ago, reproduced herewith because of its historic value. The quartz outcrop is one in which promising gold values were found, and on which one of the first tests pits were sunk. Mr. P. A. Robin, who up to the Spring of 1918 managed the operation of the mine, is seated on the outcrop.

In contrast with the condition shown by the photograph, the Hollinger Mine is now equipped with a mill

The Hollinger Mine Ten Years Ago.

capable of treating from 3,000 to 3,500 tons daily, and can employ close upon 2,000 men when operating at full capacity. The ore carries an average of about $9 per ton in gold.

In the past two years, the production from this property has averaged upwards of $580,000 per month. Total output to date has amounted to close to $39,000,000 and the ore blocked out in reserve exceeds the total so far mined. A total of 77 veins have been discovered, of which 38 are being developed, and with 39 so far undeveloped below the 100-ft level.

Estimating an average of 3,250 tons every twenty-four hours, and a recovery of $8.50 in gold per ton treated, the Hollinger Consolidated is now equipped to treat approximately 1,190,000 tons and to produce about $10,000,000 yearly in gold.

The discovery of the Hollinger mine by the late "Benny" Hollinger in 1909 is one of the chapters which offers inducement to prospectors in Northern Ontario. Benny was a comparative "tenderfoot" in the prospecting game at the time he made the find, and his success is a star toward which many another prospector has directed attention and pinned his highest hope.

The subsequent development of the property constitutes a similar example for those who have money, confidence in the great mineral resources of Northern Ontario, and the courage of their convictions.

In a period of ten years, an important gold mining industry has sprung into being in the Porcupine and surrounding districts. Rock formations over an enormous area are such as to encourage the belief that other Hollingers may be found, if indeed, not already in the making among one or another of the large number of other mines entering the producing stage, or in a state of exploration and development such as that shown in the accompanying photograph.

Every mining enterprise has a more or less humble beginning. Every producing mine was once but a mining prospect, of quite uncertain merit and requiring courage on the part of its owners to spend the necessary money to carry on the required exploration and development work. The Hollinger Consolidated was no exception, although nearly $80,000,000 has been either produced or blocked-out, with the mine still young.

The Hollinger Mines Today.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

One of the most important developments in recent weeks has occurred on the first level of the University property of the La Rose Consolidated. A new ore-shoot has been encountered, from which high-grade ore is being bagged. The vein is from two to four inches in width, and is exceptionally rich. It occurs in the Huronian slate formation and is believed to be the westerly continuation of a vein formerly worked at that level. This new find, together with the favorable developments during the closing months of the past year offers promise of the University being a quite heavy producer during the current year.

There are indications that the Hudson Bay mine may come to life again. Work at depth on this property, in the Conglomerate area some little distance from the contact, has resulted in opening up a comparatively large tonnage of mill rock, the average silver content of which is said to be richer than the usual run of low-grade. The Company recently negotiated a loan for the purpose of carrying on development work during the Winter. It is planned to resume ore shipments in the Spring.

It is understood the current supply of hydro-electric energy can be maintained throughout the Winter in the Cobalt district. The weather continues exceptionally mild, and at the middle of January the thermometer actually rose above the freezing point, but much colder weather followed.

One of the chief developments in connection with the economic operation of the mines in the Cobalt district is the announcement that wages would be reduced 75 cents daily, beginning Feb. 15th. In a statement to the Central Council of Employees, the Temiskaming Mine Managers' Association makes the following explanation:—

> "This Committee of the Mine Managers' Association has been asked to meet the Central Council and advise them of a decision regarding wages that the operators have been forced to make.
>
> "As you know, the price of silver is half of what it was a year ago and, as a consequence, about eighteen properties have been compelled to close entirely or suspend most of their operations, while those companies still maintaining their output have all reduced their working forces. Less than one thousand men are now employed in the camp, compared with about two thousand a year ago. The probabilities are that if costs are not reduced, more properties will be compelled to close and unemployment be further increased.
>
> "This situation has for some time past received very serious consideration by the operators, and as an essential step in the reduction of costs it is

their unanimous opinion that a cut of seventy-five cents per day on all classes of labor should be made, this decrease to become effective February 15th, 1921.

"It may be said that there has not been a sufficient reduction in the cost of living to justify this action, but unfortunately, the condition facing the camp of Cobalt is not one where the cost of living is a factor; it is rather a case of whether the mines at present operating shall be able to continue or be forced to shut down.

"The bonus was paid on the highest silver prices obtained, but was not reduced when silver declined, and the operators feel that they have more than lived up to their agreement.

"While they are reluctant to adopt the present course, it is forced upon them by conditions over which they have no control."

During the month of December, the Nipissing mine reports an output of $524,098, this being the highest record in the history of the mine, and setting the highest record ever established by any silver mine in the Dominion. Of this total, however, $224,204 is made up of cobalt metal, of which $199,424 had been produced in 1920 and not previously reported.

Apart from the cobalt metal reported, the silver production amounted to $299,894 during December, as compared with $190,219 in November and $184,578 in October, the increase being well over fifty per cent.

The Manager's regular monthly report to the President and Directors, states:—

"During the month of December the company mined ore of an estimated net value of $524,098 and shipped bullion from Nipissing and custom ores of an estimated net value of $378,222. The value of the silver production was estimated at 65¾ cents per ounce. Included in the value of the cobalt production is an item of $199,434, representing value of residue produced in 1920 and not heretofore reported."

During the week ended Jan. 14th, the Coniagas was the only mine to ship ore, this company sending out two cars containing a total of approximately 125,827 pounds. One car went to Thorold and the other to Perth Amboy.

During the corresponding period, no bullion shipments were reported, although it is noted that the Mining Corporation sent out 99 bars containing 101,100 ozs. on December 31st, this shipment not having been reported in this paper for the week in which it occurred.

The Gowganda District.

A shipment of high grade ore is in course of transportation from the Castle property of the Trethewey Company. About 378 bags are contained in the shipment, the weight being about 17 tons. This is the largest shipment so far made from the Castle. It is understood the property is in a very encouraging physical condition.

The Miller Lake O'Brien is also making a shipment of ore this month, and will send out a carload, part high-grade and part concentrates. This shipment is now being hauled over the sleigh road to the railroad at Elk Lake.

South Lorrain Area.

Arrangements are to be made to resume operations on the Keeley Silver Mines in the early Spring. This was discontinued last fall owing to the shortage of power. Although the electric energy now available would permit operations to resume, yet the difficulties of re-opening at this season would be great, and no effort will be made to do so until Spring. The newly-installed mill may then be set in operation.

A small force of men are at work on the Haileybury Frontier property. Effort is being directed toward the exploration and development of large veins in which cobalt metal occurs. The plan is to mine the cobalt and possibly recover a certain amount of silver as a by-product.

THE GOLD MINES.

January tonnage going through the mills at the mines of the Porcupine district has been reduced considerably as compared with December. The Hollinger treated upwards of 2,000 tons daily during the closing month of 1920, but owing to power shortage has curtailed to under 1,500 tons daily this month. The distribution of the available 4,000 h.p. of electric energy, among all the mines, together with the auxiliary power being generated has caused an average reduction in tonnage of about thirty per cent.

The Dome Mines has reduced to about 500 tons or under, as compared with from 700 to 1,000 tons during the past several months. The condition of the treasury, however, is believed to assure dividends without interruption, and with the probability of production at full blast about May.

In connections with the proposal to consolidate the Northerown Mines and the Porcupine V. N. T., the entire outline of the proposal was discussed at a recent meeting, and Major P. McIntosh Bell, of the Porcupine V. N. T., has gone to London to present the matter to the English interests who are in control of that company. It is generally believed the merger will be carried through, and the big enterprise may actually be under way by next Spring.

Considerable work is to be done on the property of the Union Mining Corporation, situated in the township of Whitesides, some 30 miles south west from Porcupine. This concern is stated to have arranged for an extensive diamond drilling campaign, in addition to sinking operations. It is planned to carry the main shaft to a depth of 500 feet, with working levels at each 100 feet. The work of erecting camp-buildings has been almost completed, and mining machinery is to be installed this Winter. The contract for freighting in the large amount of supplies and equipment has been let to Alex. Corrigan, of Porcupine, while the contract to do the sinking has been secured by H. McQuarrie. A meeting of the directors was recently held in Toronto at which the present plan of operation was endorsed.

The annual meeting of the Tough Oakes Gold Mines will be held near the end of this month. Important changes are reported to be pending on the directorate. It is understood this change will be the first step preliminary to outlining a policy of operations commencing next Spring. Capt. Jorgensen, representing the English interests in control of the Tough Oakes, is understood to have sailed from Liverpool on Jan. 15th and will be present at the meeting. It is believed less secrecy will surround the plans of the new Kirkland Lake Proprietary, 1919 following the contemplated change on the directorate and the assumption of control by the new Company. It is understood also that more or less complete details may be forthcoming in relation to the progress made in the [illegible]

includes the Tough-Oakes, Burnside, Sudbury Syndicate, Aladdin-Cobalt, and possibly the Sylvanite.

Among the properties on which work may be resumed within the next few weeks in the Boston Creek district are the Boston-Kennedy, Boston-McCrea and the Allied Gold Mines. These thre promising prospects lie adjacent to the Miller Independence on the East, West and North.

HUDSON BAY MINE NOT CLOSED DOWN.

Our Cobalt correspondent included the Hudson Bay Mine with others, in his communication of last week, as being closed down, but the "Journal" is informed by the Secretary that this is not the case, the mine being working steadily with no intention of closing down. The Mill is closed, but underground work is being continued as usual, and a satisfactory tonnage of ore is being broken against the starting of the Mill in the Spring. We are glad to make this correction.

DAVIDSON CONSOLIDATED GOLD MINES TO BE ACQUIRED BY ENGLISH SYNDICATE.

Shareholders of the Davidson Consolidated Gold Mines met in Toronto on Jan. 17 and reached the decision to sell the property to an English syndicate which has purchased one million shares of one dollar par value of Treasury stock at 75c a share, and will buy in the outstanding stock in the hands of the shareholders at $1.18 a share. It is stated that the intention of the mine is to reopen the mine on March 1 with ample funds to carry on the work and erect a 500-ton mill. The money necessary to the deal is to be paid by the end of March, the proposal having been changed to cash from the previous option plan. At the meeting, S. R. Kean, of Toronto, was elected as a director, the others on the board being G. C. Crean, H. H. Sutherland, Toronto; C. W. Moodie, Hamilton; E. A. Snowman, Springfield; J. J. Davis, London, and Col. Robert Stark, of Montreal. The financial statement read at the meeting showed assets of $4,057,265 made up of plant and equipment $74,401; developing expenses $237,660; gold receipts since last meeting $17,069 and property $3,556,810. The liabilities total $57,260, and the largest item is $31,121, money advanced by F. C. Sutherland & Co. The report of the mining engineer who examined the property for the English syndicate described the mine as one of immense possibilities.

Toronto Coal Prices.

Toronto, Jan. 20. There are indications of a coming stiffening of the market due to colder weather conditions, and the closing down of a number of mine which were unable to produce coal at present prices. Anthracite coal is quoted at $9.50 to $11.00; smokeless $9.00 to $10.00; slack, $7.50 to $8.00, lump, $8.00 to $8.50.

A Montreal Letter

By ALEXANDER GRAY.

"Under-Consumption" the Most Pressing.

Two such outstanding figures as Col. Thompson and Judge Gary have clearly indicated that pessimism can be carried to extremes. One speaks for mining industrialism—the other for the steel and coal trades. Were their opinions inconclusive, it is necessary only to quote that other personality, Mr. A. C. Bedford, Chairman of the board of directors of the Standard Oil Company of New Jersey, who has first call upon every material fact in the States, and has just returned from a study of the European situation. Mr. Bedford is sponsor for the greatest mineral industry—an industry that found it convenient to do some unprecedented financing owing to the acute credit position. He is constructively optimistic and holds that the ills of the world are due chiefly not to over-production, but to under-consumption, because Europe lacks the capital to buy necessities. He compares the Continent of Europe with a manufacturing plant with all machinery and facilities, but without raw materials, which are unobtainable except through the extension of long-time credits. In other words, once business interests have rehabilitated the world, (to do which "real peace must be established") — the "economic equilibrium will be restored".

Messrs. Thompson, Gary and Bedford—representing copper, steel, coal, and the allied trades, and oil and its by-products,—are not at all lachrymose. To the contrary. Resumption of great buying power, of huge consumption, may not come along on the "double quick"—and yet it is assured, if, as Mr. Bedford asserts, "sweeping reductions are made in Government expenditures, and if Governments forego costly experiments in conducting business, and leave the business of the world to be done by business men, governed by the basic laws of trade, the laws of free and fair competition".

These are the sentiments of thoughtful leaders like Otto Kahn. Of course those gentlemen have decided advantages in "free and fair competition". Nevertheless they dispel gloom. Every mineral industry in Canada will be required to accept their formula-produce at the lowest cost, and supply the impecunious nations with raw materials at least. Already the jam is about broken. Arrangements are being made in the States for foreign loans amounting to $300,000,000 —a dole—but a start.

Too Much Gold — Too Little Credit.

Whether or not the United States want all of it, they are getting gold from the four quarters of the globe, India being the latest contributor. Already in possession of more than half the gold in circulation and silver being offered so freely by the Orient that the price slumped, business interests and financiers across the border would as lieve forego their privilege of getting gold in liquidation of already outstanding obligations or in payment for new supplies. American exchange is so high, buyers abroad cannot avail of it as a luxury—even though the States be the one free market in gold. Yet weekly receipts of the yellow metal are announced, while Washington has more gold than it wishes for. The emergency having arisen, the Orient at least is having something by delivering what it asked for when exchange was high in the East, owing to Allied purchases. If the same could be said of the silver that has come out of the East of late, Asia in general might not have fared so badly on balance.

Anyhow the Washington Government and the Federal Reserve banking system have piled up gold until it is manifest there is a certain amount of embarrassment in being "all dolled up" and having "no place to go", as it were. Exports have fallen off and financing bills of exchange met with an embargo upon credits of this sort. Either exchange on London — sterling exchange — has to go up — or that on New York will have to be neutralized so as to balance international industrialism and permit of freer trading on credit.

Banks have found their glut of gold lacks action. Undoubtedly the volume of overseas credit—extended private trading interests since the Government put the lid upon official credits, had grown to such proportions that the banks became over-extended; for outstanding loans to their domestic institutions were excessive. It was this latter and the demand that precipitated the liquidation movement—and it was the foreign bills carried by the banks which have recently been attracting gold to this side. Last year United States exports totaled over eight billion dollars. The favorable balance of trade as reported amounted to over three billions. But the nearly four billions of private credits, in addition to official loans made previously, loans in general, as well as the huge quantities of undistributed war securities, together with European impoverishment, brought things to an impasse.

Appreciation of sterling exchange, and of American exchange forced trading issues. The Continental manufacturer or trader declined to purchase. The United Kingdom could not finance the Continental and American positions. Canada has purchased and borrowed so heavily in the States, while production has been slowing down, exchange has been prohibitive. That is why Sir Henry Drayton strenuously is urging economies and buying of domestic commodities and materials. Sir Edmund Walker, in his Annual Report as President of the Canadian Bank of Commerce, also points out the unwisdom of underproduction at home and excessive imports of what can be made here. Furthermore, Sir Edmund, whose annual utterances are unfailing in their consideration for the mineral industries, took firm ground in the matter of greater production and more extensive research. Among other things, he said:

"We have iron ores in plenty, but we do not spend enough on research to ascertain their status in relation to other ores in the United States on which we steadily depend. We have about 5 per cent. of the coal areas of the world, so far as such areas are accurately known. It may be that science cannot remove impurities and reassemble the coal so as to make transportation charges possible, and thus relieve Ontario of its great drawback, and the nation of its vast expenditure for the importation of this article, but research should be persistent until we are assured that such is the case. We have lately developed manufacturing processes in which chemistry is the main feature and others dependent on cheap water power, and through these the triple benefit comes to us of giving employment, of enlarging the market for those who sell food and the other necessaries of life, and of offsetting or lessening by the selling value of the home created product, the cost of those imports which are the main cause of our present difficulties. We are very glad indeed that our Dominion and Provincial Governments all spend large sums of

money in educational and other ways, to aid agriculture. The Dominion Government and some of the provinces also do something in the way of research for other industries, but we have come to a juncture where, along with the ordinary desire for progress, comes the heavy pressure of national debt which can only be relieved by increased production. For this we need research in countless directions and in addition to what is now being done, I hope liberal aid will be given to all of our universities and that the scope of our Government research work may be enlarged.

More hardly could be conveyed to the Dominion and Provincial Governments and all concerned with industrial activities, sustained by scientific effort. To reach the goal of our ambitions, domestic policies will have to be more aggressive with regard to natural resources and the finished products thereof. In a nutshell Sir Edmund evolved a programme that will have to be lived up to. First and foremost he places coal and iron. Water powers are self-evident. To give impetus, however, more prominence should be given to special and precious metals. Increased gold production is a prerequisite—and that is coming. Wages are rather high for economical operations in metal mines. At the moment, and temporarily, more miners are seeking employment than can be put to work, owing to the power shortage. Beginning about two months hence, it is expected that the Hollinger, Dome, McIntyre, of Porcupine, and Lake Shore, and the others, of Kirkland Lake, will be able to give a demonstration. Nor will Cobalt and the Montreal River properties be laggard. Precious metals are vital while international exchange markets are adverse to Canada. And the base metals will participate in the broader activities confidently anticipated in the coming Spring and Summer. Influential copper interests are bestirring themselves.

What the Premiums on Bullion Brought.

Vice President Pease of the Royal Bank of Canada touched upon the matter of Canada's exchange relations with the United States during the past year. He considered they "have been fairly stable compared with those of other countries with the United States. The premium on American funds ranged from eight to nineteen per cent. during the year, and is now 15 per cent. Contrast this with the discount on other currencies in New York on December 31st: Sterling 27 per cent., French Exchange 69 per cent., and Italian Exchange 82 per cent". Had Mr. Pease stated the average for the year, the exact premium on gold and silver shipped to the States could be approximately given. Assuming the average at 10-11 per cent., the extraordinary revenue from this source accruing to the gold and silver mines was from $2,000,000 to $2,250,000. Of that, the gold mines got about $1,200,000, and the silver mines correspondingly. Hollinger, in this way, probably netted from $625,000 to $650,000.

PHYSICAL PROPERTIES OF NICKEL.

"Chemical & Metallurgical Engineering" of New York for January 12th contains a paper on the physical properties of pure nickel by Paul D. Merica, Superintendent of Research, International Nickel Company, which is published by permission of the Director of the United States Bureau of Standards. The article is a compilation of literature references, and original and unpublished work on the various physical, mechanical, thermal, electrical and optical properties of pure nickel.

BOOK REVIEW.

Pumping by Compressed Air.—By Edmund Ivens. Second revised edition 1920. Cloth Boards, 9 by 6 in. 266 pp. with Index. John Wiley & Sons, New York.

This work does not deal with the common use of compressed-air as a substitute for steam in operating direct-acting pumps situated underground, but with such uses of compressed air as the displacement pump, and the air-lift. As the author states, there is very little literature on this phase of the use of compressed air, and there is very little to be found in mining text-books. The history, types and the mathematical theory of the air-lift are very fully dealt with. The book will be of value to those directing operations at mines where, owing to local conditions, the displacement pump or air-lift principle is employed in pumping, of water, or semi-liquids containing gritty or corrosive substances. We do not remember having seen such collected and extended treatment of compressed-air pumping in other text-books.

COAL IN GREAT BRITAIN: The Composition, Structure and Resources of the Coal Fields, Visible and Concealed, of Great Britain. By Walcot Gibson. Demy octavo. 50 figures and 8 plates. Edward Arnold, London, 1920. Price 21/-net.

While Dr. Gibson's work deals in particular with British coalfields, which from his connection with the Geological Survey of Great Britain he is uniquely qualified to discuss, it is also an important contribution to the geology of coal generally. Part of the work is reproduced, with many additions, from the author's earlier work on the "Geology of Coal and Coal-Mining, which formed the first volume of Arnold's Geological Series, and is now out of print. The book is stated by Dr. Gibson to be a condensation of personal observations in the field extending over a period of thirty years. The treatment of coal geology, which covers its chemical and physical properties, formation and origin, distribution, and the use of fossils as zonal indices may at first sight appear to be slight in extent, but perusal will show that Dr. Gibson has condensed his facts in a manner that only a master of his subject dare attempt. Such condensation entails far greater experience and labor than much more discursive treatment, and more can be learnt from the first eight chapters of this work than from many more voluminous treatise on coal geology.

As bearing on the anthracitization of the Cretaceous coals of the West when approaching the folded zones near the Rocky Mountains, several similar instances are mentioned.

Actual thermal effect from contact with igneous intrusions seems to be limited in range, and mention is made of coal seams in South Wales which remain unaltered to within a few feet of a huge lacollitic mass of igneous rocks. While the author does not deal definitely with the suggestion that the original vegetable material was different in the case of true anthracite and humic coals, he states that recent researches, especially those of M. Renault, "indicate that very "different degrees of alteration may be effected by "biological action prior to entombment, while the subsequent mechanical and physical changes may be relatively trifling, and many paleobotanists doubt if "peat, lignite, coal and anthracite indicate a succeeding series in the process of coalification." It is pointed out that some compound coal seams, such as the Barnsley Coal of Yorkshire, consist partly of a high-

ly bituminous coal and partly of anthracities coal. A good many examples could be given of this nature.

A feature of the work are the half-tone plates of fossil plants reproduced in natural size. Dealing with the use of fossil plants in defining stratigraphical horizons, Dr. Gibson points out that while they can be regarded as indications of a higher or lower order in the general sequence of the Coal Measures, they are only of local significance in the determination of the position of one stratum. Plants are therefore, concludes the author, of service only as an index to horizon in a broad and general sense. With mollusca it is different because of the existence of two distinct types, marine and estuairine of fresh-water types. In an area of practically continuous deposition, such as Britain was in the Coal Measure period, the "mussel-beds" are a very useful horizon index. "The determination "of horizons in the Coal Measures by means of fossils", "states Dr. Gibson, whether plant or animal, perhaps "must be regarded as on trial, since the amount of "material to be dealt with is so great and active re-"search in many districts is not common..... it as "unwise at phesent to place complete confidence in "fossils as zonal indices in the Carboniferous sequence "as it is to cast entire discredit on the whole method." If a member of the Geological Survey of Great Britain is forced to state that in British coal mining explorations "the material has not even been examined for fossils" and for this reason to express such limited confidence in fossils as zonal indices, we can scarcely congratulate ourselves in Canada where virtually no recent literature exists in regard to the fossils associated with coal seams in the Dominion.

The importance of preserving the cores of drillings, and having the records of boreholes made by competent men is mentioned, not without good reason.

The chapter on the concealed coalfields of Britain is interesting as bearing on similarly concealed coalfields which will probably be discovered in such places as, for example, Nova Scotia, when the exhaustion of the seams now being worked stimulates the undertaking of such geological research and deduction as led to the discovery of coalfields in Britain, and indicates the presence of still undetermined coal seams there.

The book is desirable for any person interested in coal-mining who desires to fortify knowledge of his own district by the nature observations of one of the best informed geologists in Great Britain, where coal mining was first prosecuted, and where, consequently, the opportunities for observation and recording of facts have permitted their greatest accumulation. As a record of the position of the several British coalfields, the work would also interest that not inconsiderable body of men engaged in coal mining in Canada who came here from Great Britain, and may not have realised that in a comparatively short period Britain has enlarged the known area of coalfields, and that whole counties which a generation ago were purely agricultural are now prosperous coal-mining districts.

"The British Empire is still the most important trade factor in the world. . . Regarded either as a competitor or as an ally, Great Britain is by all odds the most important single factor in American life, and her political development is perhaps the thing which will best repay our (The United States) attention."

Edwin C. Eckel "Coal, Iron & War."

PORT ARTHUR NOTES.

By J. J. O'CONNOR.

Most encouraging results are being obtained from the preliminary development work being carried on at the Vimy Ridge gold property, situated two miles east of Schreiber, close to the railway right-of-way. This property received its famous name because of the fact that it happened to be recorded, on the day the Canadians fought and won the historic battle of Vimy Ridge.

The property is owned by Harry Harkness, of West Fort William, who has had a force of men engaged in development work that is being continued during the Winter, the ore taken out being carried to the nearest railway siding at Blue Bird, about one mile east of the mine, in pack sacks.

Several tons of the ore have been shipped to Queen's University, at Kingston, Ontario, that have shown remarkable value. One ton shipped on November 20th, 1920, realized $118. This particular lot was the result of one blast, and was by no means hand-picked. Several assays of hand-picked samples have ranged up to $4,000 per ton.

Mr. Harkness states that he expects to begin shipping on a fairly large scale in the spring, when a wagon road will be constructed from the property to the railway siding, and the ore transported by teams. The nature of the ground is such, that a good wagon road, over which heavy loads may be carried, can be easily constructed.

Mr. J. W. Morgan, Mining Recorder, has been advised by Dr. W. L. Goodwin, that Prospectors Classes will open Tuesday, January 25th, at Port Arthur, and continue for two weeks. Quite a large number have signified their intention of taking instruction at these classes, by signing the register. Those signing come from various parts of the Port Arthur Mining Division, as well as from the local centres. This course, and the lectures accompany it are expected to be of signal benefit to the mineral interests of the district, by stimulating and encouraging an intelligent class of men to enter the mining field, equipped with the necessary knowledge.

BRITISH IRON FOUNDERS LOOKING FOR IRON ORE SUPPLIES ABROAD.

The "Mining Journal," of London, states that there are at the close of the year 100 idle blast furnaces in Great Britain, and attributes this slackness, not to lack of business, because it is stated that Britain is "starving for want of pig-iron," but to inadequate production of coal and coke.

The following reference to Canadian steel companies, and to the Wabana ore deposit, indicates that British steel makers are anxious about their ore supply. "There is little doubt but that the Wabana deposit is the largest available source of iron ore supply within convenient shipping distance of England, and, if consideration is confined to sources of supply within the British Empire, outside of Britain itself, it is virtually the only source of supply.

The comment referred to is as follows:

"But although the chief, the coal shortage has not been the sole restrictive influence at work in the iron and steel industry. Almost equally serious have been the dwindling supplies of native ironstone and limestone. This question of the maintenance of adequate

supplies of raw material has, in fact, become the main concern of the manufacturer, and the whole trend of events in recent years has been in the direction of the acquisition by the big steel producing firms of control over the sources of supply. Of this the most notable example in the past year has been the projected alliance between big British steel firms and the Dominion Steel Corporation of Canada, which would give home manufacturers access to and partial control over some of the richest mineral deposits in the world. High freights have as yet prevented a resumption upon a large scale of the shipment to England of the rich Wabana ores which are highly suitable for basic iron production, but one or two experimental shipments have been made to the Tees, and unless the alliance is abandoned, as is now reported to be likely, these ores, will again be shipped here as they were in pre-war days on a large scale, as soon as the now rapidly dwindling freights make it commercially profitable. Messrs. Dorman, Long & Co. Ltd, some time ago also acquired interests in the Itabira mines of South America, and other firms are questing further and further afield, Sweden, France, Spain, North Africa, Syria, the Caucasus, and far-off India, all being laid under regular tribute to keep up the flow of iron ore to the furnaces of Britain. At home, too, the quest continues, and deposits once thought too lean to be profitably worked are now engaging attention as the richer deposits approach exhaustion.

MAGNESITE MINING IN THE UNITED STATES DURING 1920.

(Bulletin of U.S. Geological Survey.)

The magnesite industry in the United States as a whole enjoyed a good year in 1920. The quantity of magnesite mined exceeded that mined in any previous year except 1917. Notwithstanding the contention made by the domestic producers in 1919 that without a tariff the market in the eastern part of the United States would be supplied with European magnesite and that companies which had made large investments in magnesite deposits and plants in California and Washington would be forced out of business, no tariff legislation was enacted, and the industry seemingly has not suffered disaster.

Preliminary figures reported by the United States Geological Survey, Department of the Interior, indicate that the production of crude magnesite in Washington was about 235,000 short tons, as compared with 106,200 tons in 1919. Practically all this was dead-burned and was sold as refractory material to steel companies and manufacturers of refractory products east of Chicago. The figures for California are not yet available but the output of crude magnesite in the State was about 60,000 tons. California and Washington are the only producing States, and the total output for the United States was therefore probably between 275,000 and 300,000 tons.

The imports entered for consumption from January 1 to September 30, 1920, amounted to 20,730 tons of crude and 10,439 tons of calcined magnesite, as compared with 6,381 tons crude and 9,471 tons calcined entered in 1919. Estimated as crude magnesite the imports for the first nine months of 1920 were about 41,600 tons, as compared with 25,300 tons in 1919. The imports in 1920 probably amounted to about 50,000 tons of crude magnesite, or double those of 1919.

On January 13, 1920, the Senate Finance Committee held a hearing at which users and importers of foreign magnesite presented their objections to a tariff on magnesite.

An investigation of the relations of time, temperature, and size of particles in the decomposition of magnesite was made during the year by the Bureau of Mines in co-operation with the Northwest Magnesite Co. at the mining experiment station at Berkeley, Calif. An electrically heated rotary furnace was used for these experiments in calcination, and the samples of crude magnesite used were obtained from mines in California and Washington.

Experiments with magnesite from Washington that has been used exclusively as refractory material are said to show that it is suitable also for use as plastic material, and preparations are being made to calcine it at the mines near Valley, Wash., for use in cement.

THE LATE DR. JAMES DOUGLAS.

Doctor, Chemist, Teacher, Preacher.

(From Chemical & Metallurgical Engineering).

In the Transactions of the Institution of Mining and Metallurgy of Great Britain for the years 1917-18 there is a necrological note of interest. It refers to one of their members born in Canada in 1837, the son of a Canadian surgeon. As a young man the late member planned to follow his father's footsteps, studied medicine in Canada and Germany, but on returning to Quebec he became professor of chemistry at Morrin College, Quebec, instead of practising his avowed profession. In the end neither medicine nor chemistry could hold his attention against what seemed a greater call, for he returned to Europe, this time to Scotland, where he matriculated and took the course in theology at the University of Edinburgh. In 1875, when he was thirty-eight years of age, he received his license to preach in the Presbyterian Church. He was not ordained in any pastorate, however, because just at that time his father's affairs, owing to unfortunate investments, called for his immediate presence in Canada again. He therefore returned and addressed himself to the problem of saving his father's property, but in order to provide for his own sustenance he became superintendent of an insane asylum, thus reverting in part to the practice of medicine again. Now, among the old doctor's investments that had gone wrong was the Harvey Hill copper mine in Quebec, which could never be developed into a great success—but it gave the junior doctor-clergyman both interest in and experience on the subject of copper mining and the treatment of copper ores. His work along this line led to his engagement, as a man of forty, to become superintendent of a chemical copper extraction plant in Pennsylvania where Western matte was treated. In 1880, being then forty-three years of age, he went West to pay a visit to a recently opened mine in Arizona, where he recognized a great future for the industry. Then he returned East and interested some of the partners of a leading metal firm in the enterprise, but endured four or five years of great uncertainty and anxiety before the tide turned. After this there followed nearly forty years of immense personal and professional success in the development of the American copper mining and smelting industry, in which he was recognized as a great leader. The metal firm to which we refer was Phelps, Dodge & Co., and the man whose history we have been sketching was none other than the late Dr. James Douglas.

PRESIDENT STILLMAN OF IMPERIAL OIL CO. ON PETROLEUM SUPPLY OF CANADA.

Mr. Stillman, President of the Imperial Oil Company, has given an interview to the New York newspapers in which he suggests the necessity that Canada should become self-sustaining in oil supply, and, what is more interesting, outlines a possibility that this may be so.

Mr. Stillman says: "The Canadian industry has a serious problem of its own. That problem is exchange. As one of the greatest factors in building up the markets of the United States, Canada should send to your country a much larger volume of goods and should be encouraged in this. At present, however, her purchases from the United States are over double her sales, and this and other circumstances have produced the depreciation of the Canadian dollar in New York.

"Canada produces only a portion of her annual consumption of petroleum. Canadian oil companies, in securing raw material, a major part of which comes from the United States and Mexico, must compete against all other importers from the United States for American funds in which to make their remittances.

"Imperial Oil, Ltd., and, I believe, some other Canadian companies as well, have been impelled by this circumstance and others to prosecute with increasing vigor the search for oil in Canada. In our case these activities have extended over a number of years and have covered a wide area, but without result except in one instance—the well at Fort Norman in Northwest territories.

"But for the existing world situation this well would have not much more than an academic interest, but necessity of making Canada self-sustaining in petroleum supplies has become so vital that no such indication of a field as presented by our expedition to Fort Norman can be neglected. To practical oil men it is hardly necessary to emphasize the obstacles confronting the making a commercial proposition of a well within 150 miles of the Arctic Circle and 1900 miles beyond the most northerly city in Canada. To complete the task will undoubtedly require years, but a beginning will be attempted this year.

"Manufacturers of petroleum products, like manufacturers of everything else, have a responsibility resting upon them to keep business on an even keel, and especially to demonstrate their consideration for labor. There is nothing as wasteful as giving a man a perfectly useless thing to do in order that he may be supported, but in times like these it seems to me the duty of those who command industry to exercise their utmost abilities in finding productive channels to direct surplus labor. On the other hand, the squeeze through which we are passing should eliminate the last traces of the malingering which in boom days put actual wages so far above their apparent level.

"I believe the reason the petroleum industry has suffered so slightly in comparison with others is its inherently sound position, and while we cannot expect to escape effects of business readjustments, I do not look into the future of the oil industry with any apprehension."

AN ENGLISH OIL SHALE COMPANY.

The annual meeting of English Oilfields, Ltd., discloses the beginnings of what may prove to be an important aid to British mining, and a source of petroleum production rivalling that of the Scotch oilfields. A report on the raw material by five well-known technicians estimated a possible profit of three pounds per ton of shale treated, and the Chairman anticipated that by June some 200 tons daily would be available. The shale deposits lie under shallow cover, and the original idea was to mine through shafts, but this has now been abandoned in favor of open-cast mining with mechanical shovels, by which method it is expected to lessen the estimated mining costs to a fifth. By the use of the Black retort a yield of from 29 to 30 gallons of oil per ton of shale is being regularly obtained. The presence of sulphur in the shale is not expected to oppose any insuperable difficulty, a statement that is distinctly at variance with one made by Dr. Alderson, of the Colorado School of Mines, on his return from a recent inspection of oil-shales in Britain. The shale deposits are very extensive, and the Company is purchasing freehold land outright, which carries with it the mining rights, and is necessary if the open-cast method is to be used.

In view of Britain's chronic petroleum deficiency, the development of these Norfolk oil-shales, is not of less interest than the discovery of a new coalfield in Britain.

LONDON CRITICISM OF NEWFOUNDLAND OIL PROJECT.

The following criticism of a Newfoundland oil flotation is taken from the "Petroleum Times" of London, and seems not wholly uncalled for. The only Hawke's Harbor shown on the map of Newfoundland that we can find is situated on the West Coast far up on the northern peninsula of Newfoundland facing Labrador and nearing the Straits of Belle Isle. The U. S. Geological Survey's Index to the Stratigraphy of North America shows the rocks to be a fringe of Cambrian or Ordovician strata along a boss of Laurentian rocks. This would not appear a favorable location for oil discovery.

Following is the London comment:

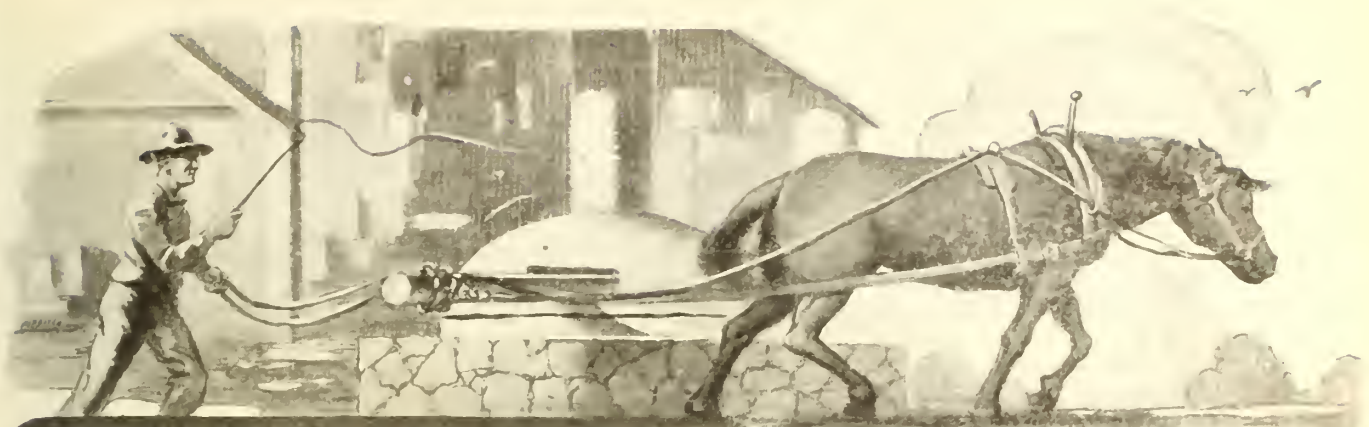
"Newfoundland Oil-Producing Company.—This "newly formed undertaking is pushing its own £1 "shares at par through the medium of circulars.

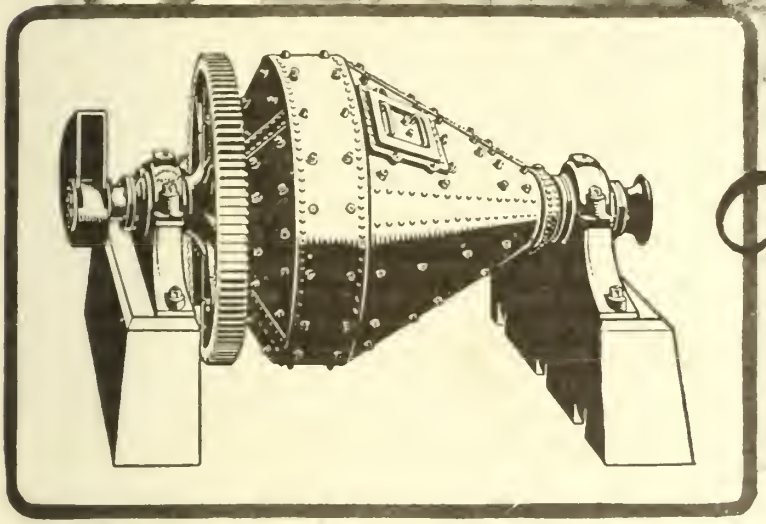
"The authorised capital is £50,000 in £1 shares, "25,000 being offered to the public and the balance "being credited as fully paid as purchase consider-"ation 'for the purpose of acquiring certain oil "lands comprising 9,600 acres situated at Hawke "Harbour in the Parsons Pond district of the "island of Newfoundland, also to acquire for the "colony a patent system of superheating steam, "etc.'

"According to the headline of the prospectus "there is 'a 75 per cent. dividend in sight'! The "people behind the venture prefer, however, to "give others the task of finding the capital.

"Of course, it is impossible on any grounds to "recommend a purchase of the shares: but this "does not mean that many people will not be "found who will send their money, inconceivable "as this might seem.

"Whilst giving space to this unsatisfactory "proposition, it will be of interest to mention that





When Labor was Cheap and Plentiful

The era of the $1.65 a day laborer lives only as a matter of memory. Labor is scarce and expensive. The labor payroll is approximately three times as great as in pre-war times. To reduce this enormous overhead is a problem for the Hardinge system of reduction.

Hardinge Conical Mills are automatic and continuous in operation. Many large mills throughout the country have batteries of as many as from twenty-five to sixty-four Hardinge Mills working continually requiring the attention of but one or two men per shift.

Compare this modern labor saving and power saving grinding system with the old horse-drawn abrasive method as pictured above. Actual statistics show that one Hardinge Mill requiring fifty H.P. reached a greater production than twelve of the horse drawn abrasive grinders which required two hundred and forty horse power and five men per shift. With the Hardinge Grinding System, the finished product is always uniform. There is practically no weak parts which require constant repairing.

The principle used in Hardinge Grinding is the first recognized grinding principle; crushing a smaller, softer material with one that was harder and heavier. The process of reduction is by stages, coarse material upon entering comes in contact with the largest balls which strike with the hardest impact. Automatically the material being ground flows to the narrower end and there meets the smaller balls. The required degree of fineness and the discharge end are reached simultaneously.

We will be glad to furnish you with any special grinding information.

HARDINGE COMPANY

120 BROADWAY, NEW YORK

DENVER, COLO. FIRST NATIONAL BANK BUILDING

LONDON, ENGLAND SALISBURY HOUSE

Hardinge Conical Mills

"the prospectus of the concern appears very "familiar, and on examining certain particulars "given therein more closely there would appear "no doubt that this new venture is not unconnect-"ed with that other Newfoundland enterprise, the "Colonial Oil Development Syndicate, which was "commented upon in these columns on October "25th last, although the respective boards of dir-"ectors are not the same.

"Apart from anything else, there can be no real "market for such shares as these. Buyers should "take this point into consideration before parting "with their money."

"OF NO PAR VALUE."

A London Opinion On Shares So Designated.

A few weeks ago the International Petroleum Company of Toronto, which acts as the marketing concern of the Lobitos Oilfields, reorganised its capital and issued to its shareholders in exchange for their old scrip Preference shares of $5 each and Common shares "without nominal or par value." Still more recently news has arrived here of another Canadian undertaking, called the Three Rivers Pulp and Paper Company, whose Ordinary capital also consists of shares "of no par value." Both British and Dominion capitalists are understood to be interested in this enterprise, and the Common shares are offered as a bonus to subscribers to the Eight per Cent. Cumulative Participation Preferred $100 shares.

The Common share "without nominal or par value" is well known in Canada and the United States, and it seems we may now have the opportunity of getting acquainted with it here by importation from the latter country. Our own joint stock law precludes any such form of capital in a limited company, as the memorandum of association must state the nominal amount of share capital and the fixed amount of each share. There is, we believe, a tradition at Somerset House that some daring promoter once submitted the registration of a company part of whose capital consisted of shares of no denomination or value, and that the scandalised Registrar summarily rejected it.

Of what advantage is the share "of no par value," and why is it rather popular on the other side of the Atlantic? The only tangible advantage that appears to attach to it in the States is that in the case of an amalgamation involving an exchange of shares if scrip "of no par value" were received it would show no profit on the transaction which could be taxed, even though actually the recipient obtained something of much greater market worth than that which he surrendered. But this, after all, is a problematical benefit of restricted scope, and we cannot seriously believe that a company would be formed solely for the purpose of securing it. A more reasonable argument is that the share "of no par value" is a convenient type to allot as consideration for patent rights, secret processes, goodwill or other intangible assets, since any monetary valuation of such assets is thereby avoided. To the extent, therefore, that it discounts the overloading of a balance-sheet with dead items it is a class of share not without abstract merits.

We fancy, however, that much of the popularity of the share "of no par value" in America is due to the fact that it necessarily largely appeals to the speculative instinct in mankind. It is true a prospective purchaser must inquire pretty closely into the status of an undertaking issuing such shares, as the only criterion of their value is what they have earned in the past and what are their particular rights in a distribution of profits or assets. But assuming that roughly a reasonable value could be diagnosed, the investor, if of the plunging kind, would probably buy mainly for the reason that there was always a delightful element of uncertainty as to what return he would get and on what terms he might at any time sell. Such factors of gambling interest exist, of course, in every speculative share of fixed denomination, but naturally they must be more emphasised in the case of a type of scrip which its proprietors have ostentatiously forborne to place any value on, even in the act of creation.

The one good feature about the share "of no par value" is that you certainly could not persuade even a greenhorn to take it as representing assets of much worth, but when given as a bonus to Preferred or other shares of fixed nominal value we are not sure that it could not be used as a very good stalking-horse to work off a considerable amount of worthless scrip, which does not necessarily take unto itself any superior virtue by being merely given preferential rights. The moral of the whole subject is that no matter what may be the company or the character or denomination of its shares, the investor can never afford to omit an inquiry into the nature and record of the undertaking itself and into the character and personnel of its management. This is the only sound and reliable practice, and all substitutes are bound to yield inferior results. —"Financier" London.

A CHANGE FOR THE BETTER IN COPPER SITUATION.

Boston—W. F. Bartholomew, of Tucker, Bartholomew & Co., says of the copper situation:

There has been a change for the better in the copper situation which has been reflected in copper share prices. I have just received copper figures for 1920 which are as near official as can be obtained. They show:

	Pounds.
Total refined copper production	1,537,000,000
Total domestic and foreign sales	1,406,000,000
Total mine production	1,235,000,000

These figures show production of 64 per cent of 1917, while total refined copper output shows 61 per cent of 1917. Total refinery output exceeded sales by 131,000,000 pounds although total sales exceeded production by 71,000,000 pounds and these figures take no account of over 100,000,000 pounds of scrap copper that was remelted and sold in competition with new copper.

Copper has sold as low as 13c. by the big producers, but I do not believe much copper can be purchased at this price; in fact, I believe that copper will be selling at 17c. per pound within a few months, based on absolute scarcity of copper available for consumption in this country after European demands have been taken care of and inability to restore production in this country.

Copper stocks are selling below normal prices on a 14c. metal market, and with a prospective reduction in costs, through labor, supplies and taxes, I see a great improvement in store in net profits for the copper producers during the next few months.—"Boston News Bureau."

EDITORIAL

Our Knowledge of Coal Substance

This issue of the "Journal" contains a first instalment of a treatise prepared by Dr. Reinhardt Thiessen, Research Chemist of the United States Bureau of Mines at the Pittsburgh Experimental Station, for a meeting of the Coal Mining Institute of America, held at Pittsburgh on the 9th December 1920.

A perusal of this paper and the admirable summary of the progress towards fuller knowledge of coal substance by which it is prefaced, discloses the considerable contribution made by Canadian scientists, particularly the work of Sir J. W. Dawson of Pictou, Nova Scotia. Canada has an ancient and honorable record in coal-mining on the American continent. That father of modern geology, Sir Charles Lyall, in his record of his first and second visits to North Ameriea, acknowledges the assistance of the then young Dawson of Picton, and of the painstaking researches of an observant English mining engineer, Richard Brown, of Sydney Mines, to whose work, in conjunction with Mr. Binney, is due the identification of stigmaria as the roots of sigillaria. Probably the first coal commercially mined and sold in North America came from the coal seams of Cape Breton, and certainly some of the most permanent contributions to our understanding of the origin and substance of coal were made by Dawson and his confrères from observations of the coal deposits of Nova Scotia.

Dr. Thiessen points out that our knowledge of coal substance has been of slow and interrupted growth, in which he reflects the feeling of the searchers of earlier days.

In the preface to a work on "Coal" from the pen of Professor Thorpe, of Yorkshire College, Leeds, in 1878, is to be found the following expressive paragraph:

> "A generation has passed away since Joule
> "first determined the Mechanical Equivalent of
> "Heat, but the doctrine of the Correlation of
> "of Heat and Work has hardly yet come down
> "to the popular intelligence; nay, three genera-
> "tions have elapsed since Erasmus Darwin main-
> "tained that Coal was formed out of ancient
> "morasses and forests, but what proportion of
> "those who use Coal in these latter days know
> "anything of the mystery of its origin? If the
> "knowledge of these things is in future to spread
> "at no greater rate than this, it is to be feared
> "that our coal will be at an end before our peo-
> "ple have learned to know what it actually is,
> "how it has been formed, and what it can do."

In 1878 the production of coal in the United States was about sixty million tons. It is today ten times that quantity. That of Canada was about 700,000 tons—all from Nova Scotia. It is now twenty times greater

Can it be seriously advanced that modern knowledge of coal substance, of its combustion, of its intrinsic value, has advanced correspondingly to the extent of the increase in its production and use? Can it be said that Canada is making today the contributions towards coal technology that she did in days gone by? So far as can be learned, the Canadian contribution to the microscopic study of coal, to its fossil botany, and to the questions of coal deposition and the inter-related earth movements, have in recent years been quite small, and, since the work of Porter and Durley, on the analyses and combustion of Canadian Coals, there has not proceeded, from Canadian sources, anything comparable with the work of investigators in other countries.

It is understood that the Government of Alberta, through the faculty of the University of Alberta, proposes a series of investigations into Alberta coal deposits that shall avail themselves of the new instruments for coal research that are now obtainable. Alberta has coal reserves that are notable even in North America. A reservation of one mill per ton of coal produced in Alberta would produce an endowment fund, which, if applied to coal research in that Province, would some day return millions of dollars. We do not know of any mineral deposit in Canada that can compare for potential wealth, and in its bearing on Canada's future, with

the coal seams of Alberta. If a start were made today, while the coal industry is but a puling infant, astonishing things might be done when the industry becomes the commercial giant of Canada, as it inevitably must become; and Canada might look to regain some of the scientific eminence in coal technology that it once had, but has not retained.

GOLD DEPOSITS EAST OF LAKE WINNIPEG.

There has just been issued by the Government of Manitoba a bulletin on Mineral Prospects in Southeastern Manitoba. In this attractive well illustrated bulletin, J. P. De Lury gives much interesting information concerning the Rice Lake, Maskwa River and Boundary districts where many mineral deposits have been discovered during the past few years.

Of particular interest to those engaged in gold mining is the description of properties in the Rice Lake district. Gold has been found on a large number of claims and in a few cases underground development has been carried on. Some very rich ore has been taken from some of the properties and mining equipment, suitable for development work, has been installed on a number of the claims. As is frequently the case in other areas, the result from development work have not been satisfactory and no considerable amount of gold has yet been produced in this area. It is not improbable, however, that there are some workable deposits among the numerous ones discovered and further prospecting of the area may lead to the discovery of large deposits of ore of good grade. Much work must be done on many of the deposits already discovered before it will be known whether they can be worked profitably or not.

Professor De Lury's report shows that the prospectors have found many gold deposits. To determine which of these deposits are of economic value will necessitate the expenditure of considerable sums of money. To those who are willing to venture, the Manitoba Government has, in this little bulletin, presented facts which show that the Rice Lake area is worthy of attention.

A significant feature of the description of gold deposits in this area is that the area is just beyond the Western boundary of Ontario and the geological descriptions show that this is but a small part of the Pre-Cambrian area which covers so much of Northern Ontario. It is reasonable to expect that prospecting will result in the discovery of gold in many places. If the Rice Lake deposits are developed and some of them prove profitable, there will probably result more vigorous exploration of North Western Ontario.

The number of properties on which gold has been found in the Rice Lake area is large. In many cases the owners have not been able to do a great deal of development work, and the value of their discoveries is difficult to determine. Some of the deposits warrant the expenditure of large sums of money in work of a purely exploratory nature. If such work brings satisfactory results, improved transportation will be needed. Rice Lake is only 100 miles from the city of Winnipeg, however, and if the establishment of important producing gold mines so near that city depends only on transportation improvements, we may reasonably expect that this matter will be taken care of satisfactorily.

R. E. H.

WOODEN SHINGLES vs. ASBESTOS SLATES.

The Ontario Fire Prevention League suggests legislation prohibiting the use of wooden shingles, or other combustible material as a roof covering. The Secretary of the League does not see why the roof of a building should not be constructed of material as lasting and as permanent as any other part of the structure, and he points out that asbestos slates never need replacement, and that, even allowing for first high cost, the longer life of the asbestos covering makes it, in the long run, cheaper than the perishable and dangerous wooden shingle. The days when the wooden shingle will be preferable from the point of cost are rapidly passing away, and, should the use of asbestos be enlarged by a more general adoption of it for roof coverings, there is a great deal of short fibre and inferior asbestos available in Quebec Province. Asbestos is mined today primarily for the long-fibre material, and the roofing material is largely a development of a desire to use the by-product of separation of the better material.

Many Canadian towns, and this is particularly true in the Maritime Provinces, are always in danger of a clean-sweep by fire, and fires are of almost daily occurrence. The reason for this lies entirely in the combustible material of which the buildings are made, and the only hope of fair freedom from disastrous fire in many of these towns is that the "clean-sweep" which always comes sooner or later shall be followed by restricted areas from which all combustible buildings are barred.

Canada is rich in building materials. Clays for brick are numerous and good, cement rock is widespread in occurrence, building stones — especially in the East — are of the finest and most permanent character. Gypsum we have in endless tonnages. Our occurrences of commercially usable asbestos have by no means been fully employed, and there is asbestos of good quality in Newfoundland also.

The use of the wooden erection is not today either necessary or desirable in any urban community in the settled portions of Canada, and mining companies at least should carefully consider the substituting the approved structural materials that we have in such

abundance for the temporary and ever-dangerous wooden building. Some remarkable examples of saving in insurance premiums on mine plant could be quoted that have resulted from substitution of fireproof erections for wooden ones. Some not less remarkable examples of disastrous loss and consequential damages resulting from covering expensive mine machinery with a wooden erection could be given.

It should be remembered that the most adequate insurance can never fully replace a legitimate fire-loss, and, in the case of mining companies at least, the consequential damages are usually heavy, and uninsurable. The best fire insurance premium is a fireproof structure.

OUR EMPIRE, "CONSIDERED AS A UNIT."

A review of Major Edwin C. Eckel's recent book on "Coal, Iron & War" appears elsewhere in this issue.

As a fair-minded appraisal of the position of nations as influenced by their possession of minerals, and especially of those dominant materials coal and iron, the book has much interest, particularly as representing the viewpoint of an informed citizen of the States in regard to the British Empire.

Mr. Eckel points out that the industrial revolution which followed the development of steam power was first witnessed in Great Britain, and that from 1760 to 1810 that country rose to an industrial supremacy that was unquestioned and unapproached by the rest of the World. The industrial revolution did not reach the United States until forty years later, namely from 1823 to 1857. In Germany, the industrial growth commenced after the war of 1870, and was largely based on the coal and iron obtained by robbery under arms. At the beginning of the Nineteenth Century Britain led in production of coal and iron. In the meantime Germany passed Great Britain in production of iron, and the United States has since assumed a position of permanent supremacy in the output of both coal and iron.

Under these conditions, and in view of the lessened man-power of Great Britain which is a result of the war, it is worthy of note that a competent observer should still believe that Great Britain "either as a competitor or as an ally, is by all odds the most important single factor in American life," and further that the British Empire "is still the most important trade factor in the World."

"There seems to be reason," writes Major Eckel, "however, to expect considerable change in the relative "importance of its separate parts," and he further remarks, "Considered as a unit, the trading and "manufacturing position of the British Empire has "gained somewhat, rather than lost, through the occurrences of the past five years."

That the Empire is justified in considering itself as a unit the occurrences of the past five years have put beyond doubt. The family reunion, which not less than the breaking up of families, was one of the phenomena of the war to the British peoples; the inter-marriage, the travel, the widened vision, the freemasonry of experience and like endurance that links together these of both sexes who wore the British uniforms for a common purpose in the furthest flung battlefield that the world has yet seen; all these things have occasioned a revolution of thought among our peoples from which future historians may well date the beginnings of a new nationalism that shall have consequences fully as momentous as those of the Industrial Revolution, if we are able properly to appreciate the nature of the considerable changes in the relative importance of the separate parts of the Empire that are impending.

If, as Mr. Eckel states, the balance of world-power has been repeatedly changed through the concentration of industrialism around the centres of coal and iron deposition, a little consideration of the extent and location of these materials in Canada will convince us that a brilliant page of History is about to be unrolled in this Dominion, which is the eldest and most opulent daughter of the Empire, and stands where the United States stood in the early years of the Nineteenth Century.

H. FOSTER BAIN.

Newly Appointed Director of the United States Bureau of Mines.

Recent Developments in the Microscopic Study of Coal

By REINHARDT THIESSEN.*

(Paper given before the Coal Mining Institute of America, Pittsburgh, December 9th, 1920.)

Résumé of the Knowledge of the Nature of Coal until the Present Century.

Almost from the beginning of written history coal appears to have been known and described, and in some instances, records indicate its use by the ancients. Aristotle and Nicander wrote about it and Theophrastus (372-287 B.C.) described it at some length and said that blacksmiths made use of it. It was then believed to be an inorganic substance and that its origin was similar to that of rocks and stone in general. Its weight, hardness, and other characteristics similar to those of stones were mainly responsible for this belief.

Later Claudius Galen (A.D. 130-200) advanced the hypothesis that coal was composed of earthy matters such as clay, shale, and other clayey rocks impregnated with pitch or bitumen. Lakes of pitch and springs of asphalt and petroleum had been known a long time. They occurred in the vicinity of the Dead Sea and must have been known to Galen. Galen, it should be noted, advanced the dual theory as well as the impregnation theory of coal, both of which were to influence the idea of the nature of coal even to the present day.

In England coal was discovered and used as far back as the ninth century, and is said to have been brought into common use during the reign of Charles I. (1625-1649). The English adhered to the idea of the inorganic origin for some time. This theory was supported by Georgius Agricolo 1544, and Francesco Stelluti, 1637, and later by R. Kirvan, 1799, all noted scientists of their day.

In most coals there is so much evidence of plant structure, even when observed with the naked eye, that plants soon become associated with the origin of coal. Valerius Cordus, 1544, and Balthasar Klein, 1592, appear to be the first to have associated wood with the origin of coal. Later the opinion of the chemists became prevalent that coal was chiefly composed of carbon or charcoal and bitumen. The bitumen was generally held to be of inorganic origin while the carbon or charcoal on account of its evident resemblance to wood was held to be derived from plants. Others held that woody substances somehow buried in the earth or deposited at the bottom of the sea had become impregnated with mineral bitumen.

There was at that time no knowledge of the Earth's history, no knowledge of the time relationships of the

A BLOCK OF ILLINOIS COAL.

The dark bands (an) represent the bright coal or larger anthraxylon components; the grey striated layers (d) between the anthraxylon bands represent the dull coal. The white lines vertically to the banding represent thin plates of quartz filling narrow vertical crevices in the coal. Some of these plates are seen exposed on their broad side. Natural size.

different strata of rocks, and until this was known the position of the coal strata far below other rocks was hard to account for. Such ideas as advanced by Buffon (1744) offered a plausible solution and are therefore not surprising. He believed that during solidification of the earth's crust caverns and bubbles remained, that the surface was left uneven and full of hollows. Vegetation then appeared in great luxuriance, which after death and decay covered the earth with a slimy mass, and was then carried into the coverns and hollows, where we now find it as coal.

Scheuchzer, a Swiss, in a book on natural history, written in 1718, advanced the first plausible explanation that coal was formed from deposits of woody matter. This woody deposit was thought to have been left by the Noachian Flood. For many years after, the Noachian Flood was held as the cause of the accumulation of plant matter, giving rise to coal beds, in spite of other explanations to the contrary, based upon careful observations and correct interpretations. It was probably dangerous, however, to argue against anything involving the Flood at that time. About this time, coal was being discovered and first mined in the eastern United States; in the Richmond Basin (1760), at Pittsburgh (1763), Wyoming and Lackawana (1768), and Pottsville (1790).*

Peat-to-Coal Theory Advanced by Beroldigen.

Beroldigen, (1778 and 1792) was the first one to advance a definite and plausible explanation of the origin of coal, namely, it was analgous to that of recent peats. Beroldigen, then, is the one who advanced the "peat-to-coal" theory. His ideas at once found firm adherents and a lively controversy was set up by those who believed in the drift theory advanced by Scheuchzer. The controversy of the peat theory versus the drift theory has continued even up to the present time, although the evidence supporting the peat theory was and still is incontrovertible. The works of Beroldingen and his followers, however, were soon to be forgotten, mainly through the writings of Johann Voigt, a very prominent and influential writer. His history of coal published in 1802, in which Beroldingen is attacked in a slanderous way, and in which Voigt defends the drift theory, received recognition from the Academy of Science, of Goettingen.

Voigt found no plant imprints in coal. The cause of this he believed to be that the plant mass, after having accumulated through drift, had undergone a fermentation process in which the plant mass had lost its form and structure and had been transformed into a gelatinous mass, which later hardened under the great weight of the superincumbent rocks. Through the fermentation process an oily substance had been formed which impregnated the remaining plant residue, thus forming bituminous coal.

Voigt, although doing much to retard the correct ideas of the origin and formation of coal, advanced ideas of bituminisation, that lead in the right direction. In this he found an eager follower in Charles Hatchet. Through a fortunate opportunity in having at hand a series of coals of all grades, Hatchet was able to examine and compare coal in all it possible gradations of structure, texture, and trans

*Note:—Coal was first noted in Nova Scotia in 1672, and was mined in 1720.—Ed.

formation, and to establish a positive proof of the plant origin of coal and also to show the relationship of the resinous and perhaps the oily and gummy substances of plants to the bituminous substances in coal.

Coal Recognized as Stratified Fossil Deposit.

In 1831, more than forty years after Beroldinger, McCulloch revived the peat theory and also gave the true relationships of coal beds to the earth's strata. He showed that the different coal beds were of different ages and many of them must be of much greater age than was supposed. This, it should be noted, marks a great step in advance.

With McCulloch, during the third decade of the 19th century, the controversy concerning the origin of coal lost much of its interest and may be considered to have closed. The occurrence of plant remains in all kinds of coal was considered by many such convincing evidence of its origin in plants that all further proof was deemed superfluous. Yet it must not be thought for a moment that arguments in favor of the inorganic origin of coal were concluded.

A Wooded Peat Bog of Wisconsin.

Quite a number of men, and some of them quite prominent, within recent years have appeared in favor of the inorganic theory. Towards the middle of the 19th century the trend of investigation and thought in coal was taking three directions. As has been already noted, there were two opposing theories of the origin of coal since the earliest time, namely, the peat theory, that is the plants grew on the spot where the coal bed had been formed, and the drift theory, that the plants had been drifted or floated to the spot where the coal beds had been formed. This controversy was continued mainly by the geologist.

The Coming of the Paleobotanist.

The discussion of the origin of coal gradually merged into that of the composition of coal. The investigation in this field in turn assumed two directions, the one which chiefly engaged the interest of the fossil botanists had to do with the problem of what kind of plants entered into the formation of coal, the other had to do with the problem of what kind and nature of plant products survived to form the coals, or in other words of what is coal now composed. These two phases were carried on by diversified classes of men—geologists, chemists, paleobotanists, and even preachers were engaged in the problem with but small results.

Incomplete Chemical Knowledge Deterred Research.

The problem of the nature of coal is of the most vital importance and engages our thought at this time. With the theory of the origin of coal there was also associated the problem as to how the plant material was transformed into coal, and what the agents were that brought about this transformation. This problem mainly engaged the chemists and received a new impetus about this time by the works of De Sassure and Liebig but towards the end of the 19th century lost most of its interest for lack of proper knowledge in chemistry. This phase of the coal problem involves colloidal chemistry, which of course, until within the last few years was an unknown science and so no progress could be expected. It formed an unsurmountable barrier to further investigation in this direction at that time.

The Microscope Open News Field for Research.

Very little had, up to this time, been contributed to the knowledge of the real nature of coal. That which was known was contributed incidentally in the discussion of the origin of coal. Little could have been done in this direction for want of proper means of observation. Only with the advent of the compound microscope, which at that time was very crude and inefficient was attention turned to this method of research. The first real object in using the microscope, by the way, lay not in the study of the composition of coal, but was to prove its plant origin. This, however immediately led into the study of its composition and structure, because in order to study the origin a better knowledge of its structure was required.

British Microscopists Were Pioneers.

The first one to use the microscope in the examination of coal was Witham (1831). Witham had been accustomed to make sections of fossil wood, and to examine it with the microscope. He thus became familiar with the structure of wood, particularly that of coniferous wood. It should be remembered that but little knowledge of the structure of plants had been obtained at this time. It occurred to Witham to examine coals in a similar way. In the Bovey coal, a brown coal or lignite, he observed unmistakably the structure of coniferous wood. In the cannel coals he observed peculiar cellular structures. It was these peculiar structures that induced Hutton (1837) to continue the study. Hutton was not able to tell what these cells were but found them in all the ordinary coals investigated. He also found that the ordinary bituminous coals consisted of two classes of coals, the one a more homogenous or more crystalline portion, and the other a duller portion. The peculiar cells filled with wine colored matter occurred only in the duller portions. These bodies were observed by a number of later workers, but was left to Balfour (1854) to identify them as spores, of certain lycopodeaceous plants. Hooker, only a few years before this (1848) had examined and described a fossil cone in which the same kind of objects were found and identified as spores. The larger ones, now known to be megaspores, he called seeds and spore-cases. Some of these were later identified as megaspores by Dawson.

Huxley (1870) showed the universal presence of the spore matter and that it always forms an important constituent in coal; although it should be noted that Huxley much over estimated the proportion the spores lent to the coal mass. Other investigators who observed spores in coal were Williamson, Wethered, Bennie and Kidston and all agree with Hutton that the spores do not occur in all the layers of the coal bed but mostly in the duller portions. Wethered points out that the dull and bright laminae occur alternately and that the dull laminae contain most of the spore-matter while the bright coal contains little or none. Bennie and Kidston confirmed the relationship of these spores beyond any doubt.

Theories of Bertrand, Renault and Potonie.

Just at the time when the presence of spores and their origin was considered as settled, Bertrand and Renault (1900) came forward with new theories that, by virtue of their prominence in science, upset the whole conception of spores in coal and also the idea of the origin and formation of coals. They conceived that most of these bodies that had hitherto been called spores, were algae, and with these developed the gelosic-algal theory of the origin of coals. It became all the more serious when the theory was in part accepted by Potonie, the foremost investigator on coal at the time, with a long list of followers.

Thiessen and Jeffry Uphold Spore Theory.

Jeffry (1912) and Thiessen (1913) independently corrected this false notion of the algal and geolosic theories in proving that all the bodies called algae were the spore exines of Paleozoic plants. But the gelosic-algal theory was very fascinating and at once appealed to the geologists, as it also explained a number of phenomena that seemed as yet inexplicable and so it became very popular and spread fast. It also got into the text books where much of it is yet.

Hutton (1837) saw, besides the "peculiar cells", "unmistakably more or less of the vegetable texture in the coal he examined." Link (1836), who examined similar coals soon after, did not believe that what Hutton saw was the structure of wood. Link probably was right, and what Hutton saw were merely the cross sections of thin sheets of woody matter in coal, usually mistaken for fibres. Link according to his description saw the structure of wood in coal as well as other plant tissues. It should be remembered that the plant structures observed in coal all through the years, were not so much from thin sections of coal as from the macroscopic* appearance of the horizontal cleavages. Goeppert (1846-1852) added most to the knowledge of coal and apparently obtained all or most of his knowledge of coal through the microscopic as well as macroscopic appearance of the horizontal cleavages, and the ash method as he never speaks of thin sections. We are indebted to Goeppert for the first extensive knowledge of the kind of plants that formed the original substance of coal, but he is somewhat [illegible] error as to what tissues of the plants remained to form it. He inferred that the charcoal or "mother-of-coal" was derived mainly from the Araucaria (coniferous trees); the bulk of the true coal to be formed from Stigmaria, Sigillaria, Lepidodendra and Calamites, but that the structure of these had been so much changed, that nothing or very little of it was left; and that the discernible plant structure in the coal was derived from the bark of these trees. Fossil

*"Macroscopic", perceptible to unaided vision. Used in contradistinction to microscopic

played but a small part in coal formation. Balfour (1854) claimed that Sigillaria and Stigmaria were the most important coal-forming plants and backed his statements up with good illustrations. Queckett (1853) on the other hand believed that the Lepidodendra, Sigillaria and Stigmaria rarely, if ever, formed coal and that it was formed almost entirely of coniferous trees, that is, trees related to our pines.

Dawson's Contribution.

Dawson also spent much time in determining what kind of plant gave rise to coal and adds Poacites and Ulodendra to the list already given. The conifers he concluded are represented only by their bark. He found but very little woody or plant structure in the compact coal, the plant cells having mostly been obliterated and compressed into a homogenous mass. Mineral charcoal, he inferred, consists of fragments of bark. Huxley concluded that none of the wood was left in coal and that the bark and the spores of plants contributed to the bulk of a coal bed.

Lesquereux, probably made the most complete survey of fossil plants in relation to the kind of plants entering into the coal, that has ever been made in America, as he believed it to be impossible to get a correct idea of the nature of coal if the nature of plants contributing to coal was not known.

With Dawson, Lesquereux and Guembel, a new era in the idea of the nature of coal was inaugurated. They showed that all parts and products of all the plants, as far as known, contributed to coal; all possible plant structures and tissues such as woody tissues and fibers, bark, cellular tissue, cuticles, spores, pollen-grains, resinous bodies and other minor objects could be recognized; and that in the coals all is bound together by a substance which Guembel called the "carbohumin," into a more or less homogenous-appearing mass. Relatively little plant structure had been preserved.

The problem as to what kind of plants gave rise to the coal beds has been supplemented by a number of investigators, the foremost of whom in this country is White. This subject has been worked up more from the rocks accompanying coal beds than from the coal itself and has assumed vast proportions. It is of relatively little importance in the present consideration.

Alternation of Dull and Bright Layers in Coal.

When Hutton was looking for spores in coal, he also discovered that coal was composed of different kinds of layers and that these could be classified into two kinds, the one a homogeneous "crystalline" containing no spores, or only a few; and the other a duller, less homogeneous layer which contained most of the spores in coal. Upon this basis, he proposed to classify coals into slate-coals, coking-coals and cannel-coals. The different layers and varieties of coals were ascribed to the original differences in the plants from which they were derived.

Dawson, 35 years later, came to similar conclusions, but he distinguished two main classes, mineral charcoal and compact coal. The compact coal consisted of bright conchoidal pitch-coal and duller slate-coal with a horizontal fracture containing much earthy matter arranged in thin interrupted laminae. The bright coal, he concluded, was mainly derived from bark, and the dull coarse coal to consist of numerous sublaminae of disintegrated vegetable matter mixed with mud. The mineral charcoal was supposed to be derived from the woody matter impregnated with bitumen.

Huxley also distinguished two classes: mineral charcoal and coal proper. The charcoal was thought to be composed of stems and leaves reduced mostly to carbon. The compact coal, he believed to be mainly composed of spore matter and some bark. The woody parts of tree, he concluded, has largely decomposed and disappeared.

Wethered (1885) calls the "bright coal" a "hydro-carbon," and describes it as a structureless, dark-brown mass, forming a very important constituent of coal, but he does not attempt to account for its origin. The dull coal contained a large number of micro-spores and megaspores.

Muck (1888) discusses the layering of coals at some length and introduces a new term, pseudo-cannel-coals, applied to the dull coal associated with the fatty coals and differing from the dull coals which are associated with gas coals, in respect to its origin. The difference between cannel coals and pseudo-cannel coals is that the latter contain no algae-like bodies. To determine the difference in origin in these coals, he regarded as a very difficult matter.

Potonie divides coals into three classes: humus coals, derived for the most part from land plants; cannel coals, derived for the most part from aquatic plants; and spore coals derived largely from the more resistant plant substances like spores, pollens and resins. The humus coals have assumed a homogenous, pitch-like consistency and are of a lustrous appearance and so are called "bright" coals. The dull coals have assumed a granular consistency and a dull appearance and so are called "dull" or "mat" coals. Most all the ordinary bituminous coals are mixtures of humus and cannel coals, arranged in more or less alternate layers and are called "banded" coals. Since the typical humus coals were supposed to be formed under ordinary conditions, such as we may observe in the growth of the land plants and the cannel coals under very wet conditions; in order to account for the alternations of the two kinds of coal in the same bed, Potonie assumed that during the formation of the ordinary striped coals, there was a sort of struggle going on between very wet and dry conditions, a sort of oscillation from one to the other in relatively short periods of time.

These in brief are the peaks over the road that leads up to our knowledge of the nature of coal as it stood at the beginning of the 20th century. Volumes have been written during this time of almost two centuries. Yet considering the number of investigators engaged on the problems involved but little progress has been made. If any one should attempt to get an adequate understanding of the nature of coal through a study of the literature compiled on it during this time he would be ill advised, because of the numerous contradictions, conclusions drawn from wrong premises, wrong interpretations and hasty assumptions. Progress was slow on account of the difficulty of the subject, and wrong methods of attack; further in many phases, there was a lack of the knowledge of the underlying principles. As is often the case today, investigators occasionally blindly followed a leader into realms that led nowhere. Writers of text books copied the conclusions of prominent men irrespective of right

or wrong, and when a statement has once gotten into a textbook of authority it is hard to eradicate it. It is so even today and was more difficult in the years gone by. Scientists in other fields were content with what the text books had to say.

Investigation on coal was primarily the work of the man in quest of knowledge for the sake of knowledge itself to satisfy his hunger to know why and how, a quest for that which exceeds gold in value.

The industrial world did not bother itself much with the nature of coal. Fuel was plenteous, and nobody worried about its nature as long as they could shovel it into the furnaces, even if it did smoke too much to suit kings, queens and squires. At one time the burning of coal was stopped in London, when Parliament was in session, under penalty of death, and, as the Chronicles relate one man was hanged for burning coal. But that was long ago. We would all be hanged in Pittsburgh today under a reign of an Edward I.

(To be Continued.)

MINING IN NORTHERN MANITOBA.

By R. H. HAGUE, Winnipeg.

There is comparatively little activity in connection with mining in Manitoba at present. In The Pas district development work on the Flin Flon has been suspended, and the miners discharged. A staff of 25 will be kept on, however, to keep the shafts pumped and for work of a general character. It is generally understood that the New York interests who have the property under option will close the deal in April next, and pay over the purchase money to the owners.

The development work was done by Messrs. Longyear Co., of Minneapolis. The miners were first employed last February, and some handsinking was done while waiting for machinery, which was set in motion late in the Spring. Two shafts were sunk, one at the north end and the other at the south end of the outcrop. A depth of 200 feet was reached on No. 1 shaft, at which level some cross cutting was done, 24 feet east and 294 feet west, and a drift to the south for 270 feet, where a second cross-cut was made for a total of 245 feet. No. 2 shaft was sunk to a depth of 300 feet, and encountered solid sulphides at 40 feet. At the 100 foot level a small amount of stoping was done, and a total of 160 feet of cross-cutting east and west. At 300 feet a cross-cut of 111 feet to the east and 3 feet to the west was done.

In addition to the tonnage of between 16 and 20 million tons of ore ascertained in September, new bodies have been encountered that were not disclosed by diamond drilling, but no estimate of the additional tonnage has been given by the Syndicate.

A preliminary survey of the proposed railway route from The Pas to Flin Flon is being conducted by the Manitoba Provincial Government. General satisfaction is expressed at the suggested route, which will lie largely in a greenstone area where many promising prospects exist, and will be handy to Copper Lake, where some good gold propositions have been staked.

At Herb Lake shaft sinking continues on the Rex and Bingo properties, and it is reported that very satisfactory results are being obtained.

A certain amount of work is being done on various properties in the Rice Lake district, and the question of putting a mill on the Pendennis group is being discussed. Several new discoveries, which promise to prove of importance, have been made in the Lac du Bonnet region.

The Copper Lode Exploration Company have opened offices in Winnipeg and anticipate diamond drilling some of their properties in The Pas mineral belt shortly. The directors of this company are principally well-known Saskatoon men. The managing director, S. S. Reynolds, was the original discoverer of the Mandy Mine, in Northern Manitoba, from which over $2,000,000 worth of high-grade ore has been taken. He is at present in Winnipeg. The objects of this Company are to take over properties from prospectors on the interest basis and develop and diamond drill them to an extent where an engineer from a purchasing company can inspect and report. The principal difficulties which engineers have experienced in this district in the past have been on account of the lack of development work done on properties which they have been sent to inspect, which rendered it almost impossible to pass a definite opinion. Such companies as the Copper Lode Exploration Company should do a great deal to improve this situation. This company already holds 650 acres of promising mining country in The Pas district and has options on other propositions, including the Rosen property, situated four miles east of the Mandy Mine, and comprising five claims, which has been described as one of the most important discoveries made in Northern Manitoba. The outcrop contains considerable cobalt bloom, which has not been noticed elsewhere in Canada since the silver mines of Cobalt, Ontario, were discovered. It is reasonable to expect the presence of silver in this ore body, occurring as it does in pre-Cambrian rocks with characteristics similar to those of Northern Ontario. This is a very recent discovery and has not yet been systematically sampled. Some smaltite can be seen in surface specimens. From another vein said to have been traced 1,500 feet with an average width of 150 feet, copper samples assayed four per cent, and a third vein, which has been traced for 800 feet, with an average width of 20 feet, is a promising gold prospect, and apart from the gold values in the quartz is valuable as a flux in the treatment of the copper contained in the other veins. It is the intention of the Company to devote considerable attention and expenditure to this property.

A GOOD SUGGESTION.

The Halifax Herald suggests the revival of the old University of Halifax, to prescribe courses, give examinations to, and confer degrees upon, such persons as may be able to qualify themselves, by private study, for University recognition. It cites the University of London as the model to be followed in this connection. The suggestion is a sound one. Such a university would be certain to broaden the influence of higher education in the Maritime Provinces. As it is, there is too much traditionalism and exclusiveness in our colleges. University extension courses should be developed on a systematic scale by all the degree-conferring institutions in this province, working in co-operation with one another. If such courses were inaugurated, and a University examining board established along the lines followed by the University of London, a great renaissance of educational effort would result. If some such plan should be worked out by the Universities, campaigns for endowment funds would have more meaning for the general public, and would elicit more cordial and generous support.—"Sydney Post."

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

Assurance from Senator Key Pittman, of the United States, that there is no danger of the Pittman Act nor the purchase clause of the Act being repealed is among the most satisfactory news reaching the operators of silver-producing mines. The statement issued by Senator Pittman is presented elsewhere in this issue of the Journal, and indicates that the author of the Act is entirely confident of its full operation. This means that the United States Government will continue to purchase the annual output of the silver mines of that country for a period of at least several years, and is interpreted in other countries as likely to so influence the market that world prices for silver will rule comparatively high during the period of its operation.

The development of ore on the Bailey Silver Mines continues to be favorable. An official of the company informs your Correspondent that good milling values occur over a width of three or four feet, and the deposition of the metal is uniform. This in itself is of considerable importance. In addition, however, high-grade patches of ore are encountered at intervals of about each second round of shots, and this is adding considerably to the importance of the deposit. About 600 feet of almost virgin territory lies ahead and the geological structure is favorable.

On the University property of the La Rose, the high grade vein opened up in the closing days of 1920, some very rich ore is being found. This vein occurs in close proximity to the boundary of the Bailey. Indeed, it is learned that the location and strike of the new vein on the Bailey as well as that on the University holds out promise of both of these properties being in line for general favorable results along one and the same zone of mineralization.

The distribution of profits realized up to 1917 in addition to the dividends and bonuses paid up to that time on the Coniagas Mines, came as a quite general surprise in mining circles. The disbursement, which amounts to $600,000, is equal to 15 p.c. on the company's issued shares. The nature of the disbursement is unique in the history of the mining companies operating in this field. It is understood to be due to the fact that the profits realized up to that time were not subject to income tax, which permits this large distribution to be made without being taxed.

In recent years the Coniagas has made regular distribution of dividends at the rate of 2½ per cent quarterly, and during 1920 paid a bonus of 2½ per cent, making a total of 10 per cent or $500,000 for the year, added to which is the special disbursement of accrued profits of $600,000.

The Coniagas paid its first dividend of 2 per cent. on May 1st, 1907. Since that time a total of $10,740,000 has been paid, inclusive of the present distribution of accrued profits up to 1917.

Following is a summary:—

	P.C.	Amount
Dividends	197½	$ 7,900,000
Bonuses	56	2,240,000
Accrued to 1917	15	600,000
Totals	268½	$10,740,000

The Coniagas is the second largest dividend paying silver mine in Canada, being led only by the Nipissing, which has over $23,000,000 in dividends to its credit. The record is exceeded by only one dividend-paying gold mine in Canada, that being the Hollinger Consolidated with a little over $13,500,000 to its credit.

Diamond drilling on the Crown Reserve mine has been discontinued. The drill reached a depth of about 1,500 feet without revealing the presence of another sill of diabase formation.

The Kerr Lake has taken an option on the two Hargraves claims for which negotiations have been pending for the past few weeks. It is planned to extend drifts onto the Hargraves from the main workings of the Kerr Lake. These drifts will follow the No. 3 vein, one being driven from the 375-ft. level and one from the 425-ft. level. Part of the plan consists of exploring both above and below the contact. During the course of this work, developments in other parts of the Kerr Lake mine will be narrowed down somewhat. It is understood the option on the Hargraves is for about three months, and the price is adequate to pay off the debts which the Hargraves owes, provided the Kerr Lake meets with the encouragement necessary to warrant exercising the option. On January 20th, Harry Kee, manager of the Kerr Lake, left for New York, and will visit the Kerr Lake's silver property in Utah during the course of about a month or six week's absence from Cobalt.

South Lorrain.

Mining interests in the South Lorrain district are preparing to lend their support to a general movement in the district of Temiskaming to induce the Ontario Government to build a trunk road from North Bay to Cochrane. This proposed road would pass through South Lorrain and would provide transportation for the various promising mining properties in that area. Truck haulage would greatly minimize the difficulties which confront operators at present in that field.

The coming summer promises to see the Keeley Silver Mines producing at a moderate rate, while the Haileybury Frontier is expected to be making regular shipments of cobalt-bearing ore.

Work in Lorrain during the coming months will depend a great deal upon the quotations for silver, as well as the demand for cobalt metallics, a high percentage of which occurs in various promising veins, throughout the district.

Ore and Bullion Shipments.

During the week ended January 21st, three Cobalt companies shipped an aggregate of three cars containing 207,990 pounds of ore, this being an increase of one car above the former week.

Following is a summary:—

Shipper	Cars	Pounds
La Rose	1	87,990
Beaver Con.	1	60,000
Dominion Reduction	1	60,000
Totals	3	207,990

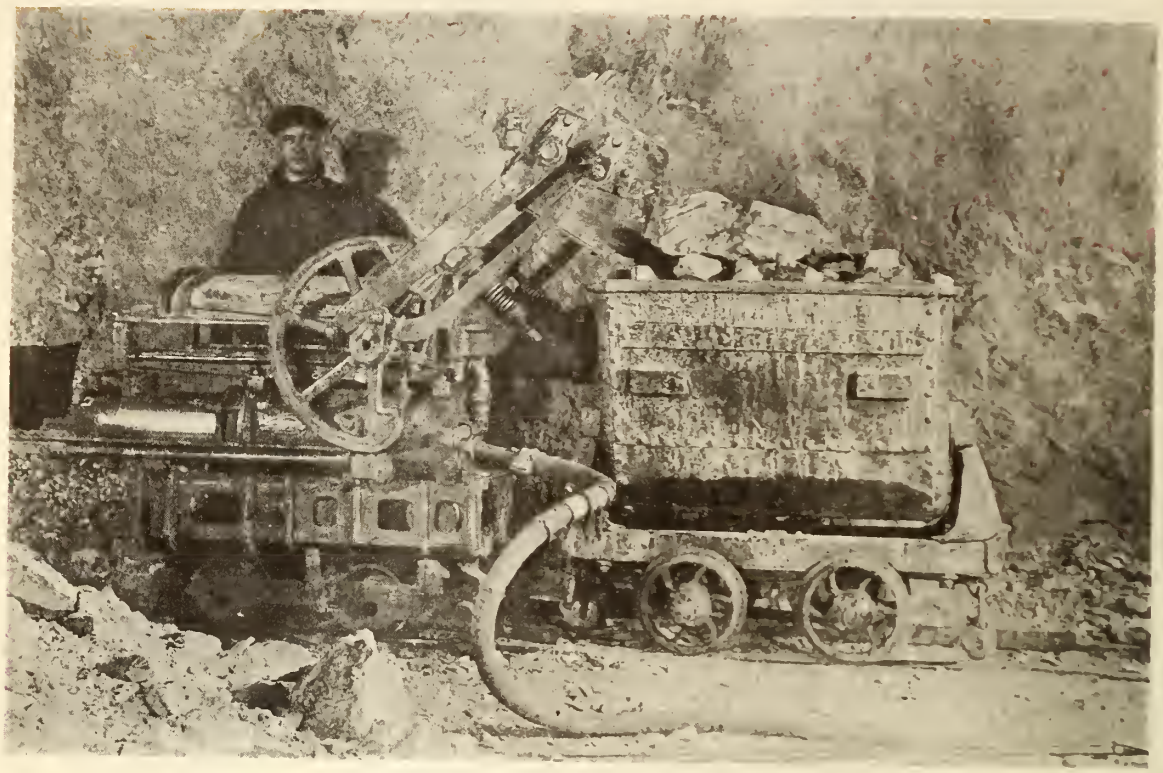
During the corresponding period, no bullion shipments were reported.

THE GOLD MINES

The Porcupine District

Mild weather has prevailed into the third week of January, and the power situation is less severe than would otherwise be the case. However, work is seriously restricted, and the operating companies are meeting the situation as best they can pending the arrival of Spring and a normal power supply.

Developments of importance are stated to have been



A Mechanical Shoveller—An Endeavor to Cut Shovelling Costs.

Loading Ore into Cars From a Hope Ore chute, Hollinger Mine.

made at a depth of 1,050 feet on the Dome Mines. Sections of the new orebody are said to contain approximately $20 per ton in gold. The importance of this find may be estimated to some extent by keeping in mind the fact that the average gold content of the ore developed in the upper levels does not exceed six dollars a ton. Officials of the Dome are reticent with regard to the new developments, although the advice comes from good authority. Power shortage has reduced the tonnage going to the mill but mining men familiar with the situation are looking to the future in estimating the earning power of the Dome. It is believed the Dome may be able to show a net profit of about three dollars on each ton of ore treated. Provided this proves to be correct, the monthly net profit would be upwards of $120,000 when operating at full capacity. At this rate, the annual profit would reach $1,500,000, and would exceed 31 per cent a year on the companies 476,000 issued shares of a total par value of $4,760,000.

Unofficial reports are current which would indicate the likelihood of arrangements being made to re-open the Schumacher mine in the early spring. Work formerly carried to a depth of 700 feet may be extended to the 1000-ft. level as part of the program following the re-opening. The property is equipped with a mill which is adequate to treat over 200 tons of ore daily.

Kirkland Lake District.

Capt. Jorgensen, of the Aladdin-Cobalt company, is understood to have sailed from Liverpool on January 15th for the purpose of visiting the company's Cobalt property, as well as to attend the annual meeting of the Tough-Oakes Gold Mines which is due to be held at an early date.

No material change is anticipated in regard to the output of gold from the Kirkland Lake district during the balance of the winter. Power supply is now said to be adequate to meet demands, although not sufficient to permit the Wright-Hargraves to utilize its mill. This big new plant, however, is now completed and can be turned up at any time required. For the time being, a limited amount of underground work is being done, and this branch of work will be speeded up in the coming months so as to be prepared to meet the full demands of the mill.

A petition is bring circulated in the Swastika district with a view to encouraging the construction of a railway from the C. N. R. Railway, through West Shining Tree, Gowganda and Fort Matachewan to Swastika on the mainline of the T. & N. O. Ry. The petition is being signed by a great many in the districts mentioned. Branches of the T. & N. O. Ry. already built to Elk Lake and to Timmins make either of these points attractive as a starting point for such a project, and would reduce the distance very considerably as compared with the Swastika line. However, in view of the Ontario Government having recently refused to consider the proposal to build such a line from Timmins to the C. N. R. because it would injure business on the T. & N. O. Ry. it is not believed the present petition will succeed.

Fort Matachewan.

Scarcely a blow is being struck in the Fort Matachewan gold area. This is due chiefly to adverse economic conditions, but is due in part to unsatisfactory transportation. The Matachewan Gold Mines, which is the one outstanding property to receive a reasonable amount of exploration and development work, is conceded to be developed to a point where it may be regarded as likely to prove to be a commercial proposition of limited size. This is looked upon as an excellent beginning, and holds out hope of the size of the enterprise increasing with additional work. It may be seen, therefore that a railway which would tap this district would have its advantages, although the present time may be a little premature.

SENATOR PITTMAN'S DEFENSE OF SILVER PURCHASE ACT.

The following statement, made by Senator Key Pittman, explaining the reasons that led the United States to enact the Silver Purchase Act, and the unlikelihood of its early repeal, is of general interest to Canadian producers of silver, who are fully cognisant of the stabilizing nature of the Pittman Act.

"Neither the bill nor the puchasing clause will be repealed, because, in the first place, it would be morally wrong, and, in the second place, there are sufficient western Senators to defeat any such attempt. In fact, any such attempt would be such a violation of the moral obligations of the Government to the silver producing section of the country that the Senators from such sections would be justified in conducting an open filibuster. No amendment and no bill can pass the United States Senate in the face of such a serious and intense filibuster.

"But, as to the moral grounds: In April, 1917, Great Britain had to have a large quantity of silver to use in the redemption of her silver notes in India. It was frankly admitted by the British representatives that unless this silver was supplied for redemption there would probably be a revolution in India. A revolution, in India at that time might have changed the whole result of the war in Europe, and undoubtedly would have at least long delayed our victory.

"There was only one place to obtain the silver and that was from the coined silver dollars in the Treasury of the United States, which were held there as security for the security of silver certificates issued against them. The silver could not be used except by authority of Congress. The Administration realized that the dumping of three or four hundred millions of dollars worth of silver on the market of the world would have a tendency to long depress the market price of silver. They were aware that western Senators and western Representatives would oppose, and justly oppose, the dumping of this silver on the market unless at the same time there was a provision made to protect the American producer against loss resulting therefrom.

"The Government, therefore, entered into a frank discussion of the matter with the Senators and Representatives from the silver producing states. It was evident that no bill could be passed without their approval. These Senators and Representatives were patriotic, and were impressed by the necessities of the case. They only insisted upon the silver being sold to Great Britain at a fair price, and that with the money obtained from Great Britain an equal amount of silver be purchased from American producers with which the silver dollars would be replaced.

"It was finally agreed that our Government should sell not to exceed three hundred and fifty millions of the silver dollars at a dollar an ounce net to the Government, and that it should purchase American produced silver when tendered to it at a dollar an ounce until an amount of silver had so been produced equal to that which was sold.

"The Government neither made nor lost anything in the transaction. The government is not paying any bonus to silver producers. If any bonus is being paid, it is being paid by Great Britain, because our Government is purchasing the American silver at a dollar an ounce with British money.

"The whole matter was the result of the solemn agreement between the executives of the Government and the Congress of the United States, and the Act received the unanimous vote of the Committee on Banking and Currency of the Senate and the Committee of Banking and Currency of the House of Representatives, and was passed by both bodies with hardly a dissenting voice.

"It matters not if the Pittman Act does guarantee that the price of silver does not fall below a dollar an ounce for many years. This protection was well earned and the country does not suffer by reason of it. Any further talk of the repeal of the Pittman Act or the purchase clause in it must be either the result of ignorance or a premeditated intention to depress the price of silver properties and securities.

"England's effort to supply base silver coin is in every respect of similar effect to the circulation of fiat paper money. By reason of the small amount of it, it may continue to circulate in Great Britain at par. Its value in foreign countries will be depreciated to the extent of its lack of purchasing power in the United States."

TORONTO COAL PRICES.

Toronto, Jan. 27—Railway movement of coal is good, a record having been established during the past two weeks by coal coming through from Pennsylvania in from five to seven days. Enquiries are coming in a little better and there has been some slight improvement in trade although business is still rather dull. Smokeless coal is quoted at from $8.25 to $9.00; slack, $6.25 to $7.50; lump, from $8.00 to $8.50; anthracite $9.50 to $11.00.

TORONTO NOTES

A group of Canadian and American men interested in mining is seeking incorporation at the Ontario Parliament Buildings under the name of Feconis, Limited. They are to engage in the building up of a mining, smelting and refining industry in the Sudbury district. Wide powers are asked for including the right to ex-

propriate property or easements for the construction of a tramway line to connect its property with the C. P. R. and the C. N. R. The directors are all residents of Erie, Penn., except R. J. Copeland of Toronto and J. A. McEvoy, barrister, of Toronto.

Decisions of importance affecting the future of Goldfields, Limited, were reached at a meeting of shareholders held in Toronto on Jan. 22. The plan of the sale of the assets of the company to the recently formed Canadian Associated Goldfields, Limited, put forward by the directors, was approved. Mr. A. C. McMaster, on behalf of the company, gave the shareholders his undertaking that the transfer would not be put into effect until Mr. J. Y. Murdoch had assured himself that the auditor's statement, as presented, was correct, and also that the transfer of the assets of Goldfields, Limited, under the agreement would be put through simultaneously with the transfer of the assets of the Associated Goldfields Mining Co., Ltd., the exchange of shares having been already effected individually by shareholders. The annual meeting will not be held until Feb. 23rd.

British Columbia Letter

The Metal Mines.

Atlin, B. C.: — The placers of the Atlin District, northern British Columbia, have not been bringing the returns nor furnishing the employment that they did in past years and residents of the mining town and of adjacent country are looking forward to the development of lode-mining properties to assure a return of the camp's prosperity. The property upon which they chiefly depend is the Engineer. When its title is established by the Courts it is asserted that the Guggenheims will be prepared to take over this mine for a substantial consideration and operate it. Atlin people, therefore, want to see the litigation brought to an issue without delay. The purchase of the Engineer by a concern having adequate financial resources would mean, not only the exploitation of that property, but the acquirement and development of a considerable adjacent area. There are besides quite a number of promising propositions in the Atlin District to which attention would be directed should the Engineer become active.

Prince Rupert, B. C.: — H. S. Munroe, general manager of the Granby Consolidated Mining, Smelting & Power Co., has denied that there is any truth in the report that the Consolidated Mining, Smelting & Power Co. has entered into negotiations for the purchase of the Anyox Mines and Smelter Plant. Before leaving for New York recently he said that, while the copper market was unsatisfactory, the Anyox plant was being maintained and would continue to operate at present capacity, producing about 2,750,000 pounds of copper a month and employing 1,100 men. The recently adopted method of transporting blister copper to the New Jersey refinery by water through the Panama Canal was effecting a saving of half a cent a pound and the period taken for delivery was about the same as by rail between 40 and 45 days from the City of Vancouver.

The Drum Lummon Mine will be re-opened on April 1st next according to Glenville A. Collins, the new Manager. Plans are being made for the separate treatment of the gold values and a new plant is to be installed for the handling of the high-grade copper. There is a water-fall situated close to the property which it is proposed to harness, thus equipping the mine plant with electrical energy.

Alice Arm.—Mining men interested in prospects on the Illiance River expect some of their holdings to develop into high-class producing mines. It is said that the Bellevue Group is showing up well, there having been uncovered a well-defined vein, samples from which have assayed 23.05 ounces of silver to the ton, .07 ounces gold; and from 3.4 to 5.4 lead. Work is proceeding this Winter and the syndicate in control proposes installing a concentrator next season. The operating company is known as the Alice Arm Consolidated Holdings Ltd.

Nelson, B. C.—At a recent meeting of the Nelson (B.C.) Board of Trade a resolution was adopted urging the Dominion Government to purchase silver at 80 cents and to institute the coining of silver dollars. This will be placed before the annual meeting of the Associated Boards of Trade of Eastern British Columbia for endorsement. The resolution is as follows:

"Whereas the present unemployment situation amounts in effect to an industrial crisis and it is desirable and behooves every good and loyal citizen to avert such crisis, and as owing to the high cost of production, many mines have been forced to suspend operations, since it is unprofitable to mine for silver at the present variable prices of the metal, there is of necessity much unemployment and suffering throughout the country. The establishment of the silver industry would ameliorate this state of affairs.

"Resolved therefore that this Board of Trade urges upon the Dominion Government to take such legislative action as may be necessary to secure:

(a) The control and purchase of all silver produced in the Dominion at a fixed price of eighty cents per ounce fine silver for a period of two years or so much shorter or longer a time as may be necessary to secure the desired objects;

(b) The withdrawal of an agreed amount of one dollar bills from circulation and the substitution of minted silver dollars:

"Be it further resolved to draw the attention of the Dominion Government to the fact that the United States continues to purchase silver under the Pittman Act at 99 1/2c per oz. and to issue silver currency in lieu of paper money, and that still further coinage is advocated, thereby removing the metal from the world's market and making for the maintenance of silver values at a price higher than the eighty cents per ounce mentioned at the opening of this resolution. And be it finally, "Resolved to urge upon the Dominion Government the vital necessity for expeditious action in order that the mining of silver and associated metals may proceed upon a profitable basis, thus assuring to mine operators an appropriate equality with producers in other countries; and to miners and the many occupations dependent upon mining operations relief from unemployment; and to the country at large greater prosperity than now is enjoyed."

The Nelson Board of Trade also sponsors a resolution calling for the establishment of an ore-testing plant in Eastern British Columbia. This is a matter which has been brought to the attention of the federal authorities on many occasions and is one which, some time ago, it was thought had been disposed of when

the House of Commons passed an appropriation providing for the finances necessary for the purchase of the necessary site and plant.

The Nelson branch of the B. C. Prospectors' Assn. held its annual meeting recently with J. W. Mulholland in the chair. It was reported that the Government's exhibit of the rarer minerals was in preparation and soon would be ready for display. Hon William Sloan was re-elected Honorary-President and other officers were appointed as follows: President, J. W. Mulholland; vice-president, C. E. Crossley; secretary, Fred. A. Starkey; treasurer, Robert Elliott. M. H. Baskin and J. P. Sherran were elected to the Executive.

A number of resolutions are being drafted for presentation to the Provincial Minister of Mines. One protests against alleged favoritism in the construction of mining trails; another asks for further protection against the loss to prospectors and miners by reason of the breaking into cabins, caches and closed mines; a third requests the establishment of a government winter school for prospectors; and finally the government is to be asked to obtain for prospectors blasting powder at cost.

"Righteousness and Righteous Laws for the Slocan" is the subject of a letter written to a British Columbia paper by C. F. Caldwell, General Overseer of the Christian Catholic Apostolic Church in Zion, and prior to his acceptance of that office better known as an energetic mine owner and operator in this Province and the Northwest. His effort is not alone interesting because of the knowledge of its author of mining matters in the Canadian West but by reason of the unique manner in which religion and the business of mining are associated.

"We are of one mind," says Mr. Caldwell, "in that our ore should be milled or smelted in Canada. It should be done in the interests of mines, miners, mine owners, and business-men, and not alone for the smelting trust, who, with the C. P. R. are destroying the value of all mines not owned or controlled by them. We can't prove this statement to the Government, although we know it to be true, unless we unite as one man and ask the government for a Royal Commission, namely, one chosen by the Independent Mine Owners' Association, one by the Smelter and one by the Government..... Any other solution or kind of Commission not allowing the mine owners one man chosen by themselves will keep us in our present deplorable condition —abandoned and idle mines, slow starvation and death to the Slocan."

He continues: "Now is the time of all times for the agitation for the remonetizing of silver in the interest of Canadian silver mines, as and for the only means of saving the world from bankruptcy. And now as I am giving my mind and life in upholding His teaching, I realize by His spirit, that to be right is to be victorious that the centralized money power acting as a unit under one head, and in one mind, succeeded in demonetizing silver in 1873, one of the most successful but demoniacal acts, destroying one half of the basic money of the world, doubling all the debts of the world and enslaving all the debtor nations and all money borrowers in the interests of the money lending Jews and Shylocks. It was the greatest crime that ever was committed against commercial civilization."

Two events of interest to the mining fraternity are to take place shortly in the Pacific Northwest.

The first of these is the Annual Convention of the western division of the Canadian Institute of Mining and Metallurgy to be held at Vancouver from the 9th to the 11th of February.

At Spokane Wn. from February 28th to March 5th will take place the annual Northwest Mining Convention. While the technical features of the programme have not yet been announced there is no doubt that they will be worth while. Socially there is no question but that the delegates will be well taken care of. An exceptionally fine exhibit of the minerals of the northwest is being assembled for the occasion.

THE COLLIERIES.

The improvement shown by the figures of 1920 over those of 1919 in respect of coal production, which amounts roughly to 500,000 tons, is one of the outstanding features of the Annual Preliminary Report of the Minister of Mines.

There is no doubt, on this showing as well as on the basis of general indications, that the coal mining industry of the Canadian West is recovering from the comparative slackness which resulted when fuel oil became firmly established as a formidable competitor both in the industrial and the domestic fields.

The year 1920, it is believed, marked the turn of the tide in British Columbia. Besides during that twelve month there were not the serious labor disturbances that marked the previous year, and this applies particularly to the Crow's Nest Pass Field. With all the old collieries working pretty well to capacity, with attention being turned to an ever greater extent to coal because of the evidences that America's stock of oil is not inexhaustible, and with new foreign markets developing, it is confidently predicted that the output of 1921 will show a further advance.

Following are statistics showing the British Columbia coal production by districts in 1920:

PRODUCTION OF COAL BY DISTRICTS IN 1920

Vancouver Island.

MINERAL PROSPECTS IN SOUTH-EASTERN MANITOBA.

We have received a copy of a new Bulletin published by the Government of Manitoba, issued from the office of the Commissioner of Northern Manitoba, and prepared by J. S. DeLury of the Department of Geology of the University of Manitoba.

During the Summer of 1920, Prof. DeLury, assisted by Messrs. L. G. Thompson and R. W. Hiebert, of the Department of Geology, University of Manitoba, examined the Rice Lake and Maskwa River Districts, and a description of these districts forms the larger part of the subject matter of the Bulletin.

In addition, Prof. DeLury states that he has been for several years in touch with developments in an area he names the "Boundary District", embracing the country adjacent to West Hawk, Star and Falcon Lakes, near the Ontario boundary. A sketch map of this district, with a descriptive chapter forms the concluding portion of the Bulletin. A bibliography is appended.

Southern Manitoba is the original province, as it was prior to 1912, and one-eighth of it is covered by the waters of Lakes Winnipeg, Manitoba and Winnipegosis, all draining into Lake Winnipeg and finding an outlet to the sea by way of the Nelson River to Hudson's Bay.

Gold was found in the Rice Lake district in 1911, and fresh discoveries of gold- bearing quartz have been made every year in that district since the first discovery. In recent years some of the rarer metalliferous minerals have been found in the drainage area of the Lake of the Woods, and nickel and copper have been located in the Bear (Maskwa River) area,—(see Dr. Colony's paper, reproduced from the Bulletin of the C. I. M. & M. in our issue of 26th. Nov. 1920).

The country has been very recently glaciated, and some interesting photographs of the effects of glaciation are included in the Bulletin. For this reason, the Bulletin states, the original altered rocks show at or near the surface, and the sinking of deep shafts to ascertain the nature of the primary ores is not necessary. Prospecting and sampling of an ore body are thus rendered comparatively simple.

The gold occurrences of the Rice Lake district, the local geology and the status of properties in various stages of development are dealt with in full detail. As a corrective to some of the promotion literature a perusal of this part of the Bulletin is recommended.

Prof. DeLury summarises the position of the Rice Lake District as follows:

"In the history of mining development in Manitoba, " the Rice Lake district wears the aspect of an old " camp. It has received attention for a period of only " nine or ten years, four of which were the years of the " war. This is a comparatively brief time for the de- " velopment stage of a mining district...To some, the " district appears as one which has gone through all " its stages and has not been proven. This attitude " is decidedly unfair, as the district is still, relatively " speaking, in an early prospecting stage. To one " passing through, and impartially examining the " whole district, it is apparent that there is a huge " area of attractive prospecting ground, containing " some possibilities in the deposits already located in " its smaller areas, and greater possibilities in its " larger, unprospected, areas."

No property in this district has as yet attained the rank of a producing mine, and the district has suffered from lack of transportation facilities. In conclusion, the Bulletin states "it will be surprising if in " future years the Rice Lake district is found to have " no workable gold deposits. The duration of these " years will be lessened if a spirit of co-operation is " fostered, and active steps are taken to check ex- " aggerated stories and illegitimate promotions, both " of which have done the district an infinite amount " of harm in the past."

The "Boundary District" contains showings of mineral deposits of varied type, including gold, bismuth, galena, sphalerite, chalcopyrite, pyrite, pyrrhotite, arsenopyrite, molybdenite, bismuthinite and scheelite. There are few areas anywhere, it is stated, that can show so many occurrences of deposits with such a variety of ore-minerals. These are said to merit further investigation.

A Montreal Letter

By ALEX. GRAY.

Penalizing Silver.

It is refreshing to have "The African World", of London, take up the cudgel in behalf of silver and in doing so to denounce the latest edict by which the Imperial Government reduced the silver contents of their subsidiary coins. This "half-and-half" debased money is a species of false pretenses, and the Financial Editor of "The African World" goes at the matter in this vigorous fashion:

"It is a pity that steps cannot be taken to withdraw the new half-and-half coinage which is now being put into circulation. I am well aware that it will be said that even when the silver coinage was .925 fine it was only a silver token coin, and that it therefore does not matter if the metallic contents should be further diluted. I cannot agree with the reasoning. A good deal of our present internal troubles have been caused by the general impression that a Government can issue an unlimited quantity of currency. Over and over again I have heard it argued that as the authorities could issue as many Bradburys as was wanted for the war, the same can be done for social purposes, and I am afraid the issue of the new silver coinage will be pointed out to our workers that the purchasing power of our currency pound in gold-using countries has fallen to nearly 14s. It is not obvious to them, and what is not obvious does not exist. At the present price of silver there is no excuse for the reduction of the silver contents of our coins, and instead of withdrawing the old silver coinage steps should be taken to retire the new issue."

Of course the Imperial authorities will not recede unless there be more than casual protest against this penalizing of silver. Canadian mineowners may not have much weight at Westminster; yet they ought to place on record their objections to the degradation of the metal—and the impression it will leave with the laity. Certainly it is poor economy to make a sixpence pass for a shilling.

Miners' Altered Wage Scale.

While a great many miners are idle, those in employment could not expect to escape from the general trend of wages. Butte companies made a start a few days ago by putting into effect a new scale under which all miners receiving $5.75 or more a day were reduced 75 cents. Bonus payments to employes on a salary basis also were reduced. At the same time several of the iron ore companies made a cut of 15

per cent. in wages. So the inevitable is happening. If Canadian miners gracefully accept the situation, mineral production may be accelerated sooner than it will be otherwise.

British Columbia Prospects.

Outputting data for 1920 coming from Minister Sloan make it apparent that British Columbia mines and metallurgical works have earning capacity meriting more support. Gold production is downright disappointing, although Mr. Sloan hopes normal conditions will remedy this. The total gold produced was $2,707,698. Not half the Hollinger output. Trail operations, and those of the Dolly Varden and Premier Mines, enabled the Province to establish a record for Zinc and to maintain silver production. In zinc and coal 1920 was the banner year for the Pacific province. However, the grand total of $35,380,625, including building material, is altogether too inadequate for a great section that has been sorely handicapped by world-wide conditions, plus long hauls and high freights.

Death of Benjamin B. Lawrence.

The death of Benjamin Bowden Lawrence at New York, on January 21st, will be regretted generally throughout the Ontario North Country. In the earlier years of Cobalt, he was active and prominent as a Mining Engineer, representing more particularly the Lewisohn-Steindler interests. He was born in New York State sixty-three years ago, graduated from the Columbia School of Mines, engaged in engineering work throughout the American West, Mexico and Cuba, and was highly esteemed in Canada. He was the first alumni trustee of Columbia University, and at the expiration of his term was elected a life member of the board of that institution whose graduates have contributed so much toward the development of Ontario's gold and silver fields.

How Will Mines Fare?

It appears to be understood that the Ottawa Government will substitute a Turnover Tax for the Profits Tax. This, it is presumed, will apply upon all sales. Instead of "taking it out of the rich", as Mr. Otto Kahn puts it, all would have to contribute in proportion. But how the levy upon the turnover is to be applied to mining is going to cause hesitation until details are officially forthcoming. Such a tax might raise large revenue from general sources, and yet it might retard mining expansion. Has anyone who comprehends the economies of mining enterprises been consulted in this vital matter?

Stealing Our Thunder.

An Oklahoma correspondent of the "New York Evening Post", who bewails the curtailment of operations throughout the southwestern oil fields, has this by way of encouragement to those seeking new pastures:

Reports of Alaskan Gusher.

> "Meanwhile, oil men in the mid-continent field are hearing reports from oil prospectors who are rushing toward Alaska, where the discovery of gushers adjacent to the Mackenzie River has precipitated a stampede. According to one report sent to a Tulsa oil man from Edmonton, Canada, a gusher at 783 feet has been discovered upon a lease of the Imperial Oil Company, Ltd., a Standard Oil subsidiary."

There has been an impression that this "gusher" is in Canadian territory, even though it be 900 miles as the crow flies from Edmonton and 1,500 miles by "the water routes now in use."

Perfection of Engineering.

The career of Herbert Hoover since he left his Hawkeye State home has been so stellar he might be said to have an empyrean all his own. Throughout both hemispheres — in Asia, Australasia, Africa, Canada, the United States and London — his name for twenty years has stood for fiscal and scientific rectitude. If some of his mining enterprises have not worked out to schedule and reorganizations or consolidations rather emphasized oversights while remedying overdrafts, at no turn in the road to his engineering and financial pre-eminence has he been other than a distinctive personality of probity-professionally and in his public work. His present purpose is to hasten the millenium when there will be no strikes, no waste, no animosities as between employes and employers—when the efficiencies will be a matter of mutual, voluntary effort. Through the American Engineering Council of the Federated American Engineering Societies, of which he is President, plans for perfect harmonies throughout are to be devised in co-operation with labor and commercial organizations. It is in that connection Mr. Hoover has scheduled the following as the part to be played by the Engineer:

> "It is the function and province of the engineer to make the correct analysis, to predict effect through known causes. It is purely the mission of the engineer of wide experience or great foresight and of unselfish motive to see to it: first, that every action is based upon the principles of honesty, justice, and fairness to the employe, the employer, and the public; second, to formulate the plan of action as to eliminate all unfair provisions of employer and employé and to make it possible for each to fulfill its responsibility to the community, and, third, to so organize the plant or industry as to make it exceedingly difficult for an incompetent to hold a position of authority or to have autocratic control."

Nothing could be finer than this as an ideal. The capable, conscientious engineer whose dictum would bring about the relationships outlined, also would require psychic force and accident insurance against board room direction. Before the industrial world is Hooverized in this manner—however commendable the objective-human nature will have to be deflated. To have efficiency and fellowship with unselfishness and incompetence eliminated, is a "tall order". Yet, whatever is accomplished, should be extended by at least evolutionary process. The spirit of unity preached for centuries still requires considerable intensive cultivation. In many ways Mr Hoover has proven to be evangelic.

British-American Oil.

Offering by Carl H. Pforsheimer & Co., of New York, "of a limited amount of stock of the British American Oil Company" stock, serves to direct attention to the probability of Canada having a real oil movement. This firm has a semi-official relationship with paramount oil interests, has more or less to do with the higher class oil stocks dealt in on the New York Curb, and when it offers an issue due notice is taken of it. The British American Company recently acquired the assets and the business of the Winnipeg Oil Company which operated in the Canadian Northwest and was the marketing agency for central Canada, having a refinery at Toronto. As the British-American Company controls about 25,000 acres in the Canadian Northwest, in sections where drilling is progressing,

it looks as though important people are bestirring themselves.

"Controls" De Beers.

New York newspapers announce the arrival there of Sir Ernest Oppenheimer, and hail him as "one of the richest men in South Africa, who controls the Kimberley diamond mines and is Chairman of the Anglo-American Company—which owns diamond and gold mines." In this there is some truth, and fiction. Undoubtedly Sir Earnest is identified with the Anglo-American Company—which includes Morgan, Guaranty Trust, W. S. Thompson, and other interests, that took over the German Southwest African diamond mines, and also is associated with the Mines Selection Corporation at the Rand—but to credit him with "control" of the Kimberley mines—De Beers—is rather stretching it. The Barnato interests are predominant in De Beers, as well as in the Premier and Jagersfontain mines. Sir Ernest and his colleagues are important factors in the arrangement by which the market for diamonds is regulated. It was he who offered handsome honorariums for the first South Africans to win Victoria Crosses in the late World War. Otherwise he was prominent in patriotic and philanthropic work, but "Solly" and "Jack" Joel have more De Beers in their strong boxes.

BOOK REVIEW.

COAL IRON AND WAR.—A Study in Industrialism Past and Future. By Edwin C. Eckel. 8 by 5½ inches. Cloth Boards. 375 pp. with Index. Henry Holt & Co., New York.

Major Eckel is a well-known authority on the iron ores of the American continent and Newfoundland, and while his most recent work is addressed to the people of the United States, it is noteworthy for a consistent fairness towards the peoples and the achievements of the British Empire, and in its numerous references to Canada and Newfoundland.

While the title of the work intimates strong stressing of the importance of coal and iron in international relations, and an all too rare appreciation of their bearing upon the balance of national power and the migration of industry, the author reviews also the world influences of petroleum, natural gas, and water power; the precious metals, commercial metals; and chemical and industrial materials. In regard to gold, Mr. Eckel shows by graphs of index numbers, population, and gold production, that there is much to be said against the traditional views of economists regarding the tendency of increased gold output to raise commodity prices. An interesting statement is that at the date of the discovery of America the entire gold possession of all Europe was only one hundred million dollars worth of gold in any form, or less than one-quarter the annual gold production of the world at this time. The tremendous increase of gold production commencing about 1885 coincided with the lowest prices of the century.

Mr. Eckel emphasises the great lead that Britain had in the industrial revolution that followed the application of steam power, and proves that this revolution reached different countries at different periods, that it is not necessarily a slow process—to emphasise which he instances Japan,—and that it is not dependent on the genius of any particular people, but is rather conditioned by possession of the essential materials. He views the effect of tariffs as negatory in the long run, and calls the embargo on foreign imports,

"that most futile of political expedients." Mr. Eckel's views on tariff questions are refreshing, and what one might expect from a writer who sees that invention and discovery and possession of the essential materials will always outrank legislative attempts at controlling the evolution of industrialism. To discussions on the tariff and resulting literature he credits the vast growth of the paper industry in the United States—something in regard to which Canada is not entirely guiltless. To the existence, and unequal distribution of coal and iron ore over the earth, and to the concentration of industrial development in favored regions which has resulted, the author credits the repeated changing of the balance of power in the world, effects which he states are not yet finished.

Petroleum does not, Mr. Eckel believes, provide any permanent substitute for coal. "Our children will in all probability see the end of the petroleum industry." His remarks on Canada in this connection were made before the discovery of oil in the Arctic Circle.

The calculations on iron ore reserves are of much interest to Canadian readers, inasmuch as Mr. Eckel allows a life of 45 years, at annual shipments of 55 million tons, to the ores of the Lake Superior region. He states that every year sees a fall of about one-half of one per cent in the metallic content of the iron ore used in the Northern United States, wherein there is conveyed a palpable hint regarding the leaner ores of the Lake Superior region that lie in Canadian territory.

The duration of the iron ore deposit of Wabana, Newfoundland, at present shipment rates of one million tons annually is placed at 4,000 years, only approached by Cuba, which, at an annual shipment rate of two million tons, is given a life of 1,500 years. The iron-ore beds of Newfoundland are stated to be true sedimentary beds, and Mr. Eckel criticises as "one of the most persistent of scientific stupidities" that theory of their origin by replacement from the surface, wrongly applied to the ores of Lorraine, and also to those of Wabana and Alabama. In each case, states Mr. Eckel, this opinion has cost a lot of money, "and in the case of Lorraine it has cost a war."

The concluding chapter of "The Future of World Competition" appraises very fairly the charged position of Britain arising from her dwindling fuel supply, but states that "in the Dominions and the colonies overseas there lie the means for renewing the ascendancy of the Empire as a whole. It is overlooked by those who think only in terms of acreage and population, that in Canada and in Australia there are very large coal supplies, very accessible for water shipment, while in South Africa and India there are large but important deposits. Eastern Canada will come day become one of the great steel exporters of the world."

As the possessor of the greatest coal resources in the Empire, the coming industrial importance of Canada is very plain to those who read history in terms of coal and iron.

With regard to the East, Mr. Eckel does not fear Japan as an industrial competitor, because of that country's lack of coal and iron, but with regard to China, his view is summed up in the statement that the Hangyang steel works, could even now, if they had any surplus for export, lay down finished steel products in San Francisco more cheaply than could any American steel works." Mr. Eckel sees no

reason why the growth of Chinese industrialism should not be concentrated into ten years, and he intimates his belief that "the chief industrial features of the "next two or three decades may easily be the growth "of Chinese industrialism."

In his last chapter the author discusses the possibility of future wars which he considers will arise from unequal national distribution of important natural resources.

We consider Mr. Eckel's book to be a most important one, and worth the perusal of persons interested in mining in Canada. The character of the work merits a review of unusual length. F. W. G.

BOOKS ON PETROLEUM.

The sustained interest in petroleum technology is shown by the continued appearance of books on specialised phases of this growing industry, which has now an importance in Canada that it did not have before the Fort Norman strike. The McGraw-Hill Book Company announce the publication of three new works concerned with the petroleum industry since the beginning of the year. Particulars are as follows:

THE EXAMINATION OF PETROLEUM.—6 by 9 inches. 591 pp. with appendices and Index. By W. A. Hamor and F. Warde Padgett. First Edition. Price $6.00, postpaid, New York.

This new and very detailed manual on analytical bitumenology is one of the volumes of the Technochemical Series of the Mellon Institute of the University of Pittsburg, of which Mr. Hamor is the Assistant Director. His associate in the authorship is Prof. Padgett of the University of Oklahoma. The work is one of especial value to petroleum chemists, dealing as it does with the analytical examination of crude petroleum, petroleum naptha products, illuminating oils, lubricating oils and greases, and the sampling of petroleum oils. Other chapters deal with the characteristics of bituminous road materials, with the evaluation of oil-shale, and the laboratory side of the operation and control of benzol-recovery plants. The work should be useful to those concerned with the chemical side of coke-oven by-product plants, particularly where utilisation of the tar-products for road material and the manufacture of benzol is in operation. Canadian references to asphaltic limestones and sands, of the Athabasca River type, refer only to reports of the Mine Branch at Ottawa, but the work is purely confined to technical evaluation, and does not deal with deposits. The significance of benzol and benzol-gasoline mixtures as motor fuels is referred to, and some laboratory methods of the Koppers Company are published.

GEOLOGY OF PETROLEUM.—Dr. W. Harvey Emmons, University of Minnesota. First Edition, 1921. 6 by 9 inch. 600 pp. with Index. 254 maps and illustrations. Price $6.00 postpaid. New York.

Dr. Emmons, whose status is too well-known to require emphasis, states in the preface that his work is based on a series of lectures given by him in courses on economic geology. Out of twenty-eight chapters, fourteen deal with the general subject of petroleum geology and occurrence, and the other chapters describe particular oilfields. The references to Canada are full and well illustrated, and citations of the authorities are given. Recent as the work is, it does not contain specific reference to the Fort Norman discovery, but it is interesting to note that in the sketch map of Canada and Newfoundland (after Clapp) the presence of petroleum is noted at approximately the position of Fort Norman on the Mackenzie River.

A perusal of the work indicates that oil geology is now a very definite science, with a large literature and a much wider knowledge of world occurrences that would have been thought possible twenty-five years ago. A significant phrase is "that the most thoroughly explored countries have been the most productive." The author gives small credence to the inorganic theory of petroleum origin. With regard to the Canadian protagonist he states: "Coste has defended the inorganic theory, but most of his assumptions are unsubstantiated."

The book is an authoritative and timely monograph on the economic geology of petroleum and gas in all the explored portions of the world.

FIELD METHODS IN PETROLEUM GEOLOGY.—By G. H. Cox, C. L. Dake, and G. A. Muilenburg. First Edition, 1921. 5 by 7¼ inches. Limp leatherette backs. Price $4.00, New York.

A handbook of field minutiae, written for those with moderate familiarity with the principles of geology, surveying and mathematics, including at least trigonometry. The introduction summarises the theory of oil occurrences. The instruments commonly used by the oil geologist are described; the various geological criteria used in correlating beds and identifying structures are discussed, and full detail is given regarding personnel of field parties, actual field procedure in reconnaissance and detailing, and the preparation of the final map and reports. Surveying tables are appended.

The adaptation of ordinary surveying practice to the specialised requirements of oil geology, necessitating observations of altitude and rapid estimation of levels at great distances, is described, with the special instruments recommended.

THE ARCTIC OIL FIELD.

A Yukon Viewpoint.

Yukon will do well to look into the possibilities of the oil strike in the Mackenzie River valley in the vicinity of Fort Norman. It may that a great traffic in oil and similar products from that region will develop in the near future. If so, the business likely will pass through Yukon Territory. In that event Yukon would be very much on the map and as a consequence of extensive activity this territory would receive a tremendous impetus.

By examination of the map it will be seen that Fort Norman is close to the sixty-fifth degree of latitude, or about one degree north of Dawson. The official application for a pipe line route for taking the oil out of the country says that the route will be down the Mackenzie, thence across the divide and down the Porcupine, and it is further announced in press dispatches that the plan of the promoters is to pipe the oil to Bering sea and from some point on that coast ship it by tankers to world markets.

It is well known that Bering sea is frozen solid more than half of the year. If the oil could be piped to a more southerly point it would reach Pacific tidewater south of the Bering sea and at a port where ships can come and go the year round. For instance, if a route could be found for a pipe line to Skagway, it would have to pass through the heart of Yukon, and the trend would be a little southerly. Examination of the map shows that there are several passes in the Rocky mountain range to the westward of Dawson which

might be suitable for the crossing of the oil lines. Even if it not be practicable to pipe the oil in winter, the route through Yukon to Skagway or vicinity would have a tremendous advantage in being shorter and in reaching the coast a thousand mile or more farther south. The ocean steaming in the aggregate for the fleets of the future which thus would be saved would be tremendous.

Construction of a pipe line through Yukon would mean great outlay of money alone, and would create a big initial expense as well as subsequent distribution for maintenance. The opening of such enterprise might with it the incentive for a railway. Couple the demand for such service for the oil business with that for the new silver camps and other Yukon enterprises and there is a multiplied inducement.

The whole thing is of such promise that representative Yukon organizations and others interested may feel assured their time will not be spent without hope of big advantages if they will look into the possibilities of getting the oil of Fort Norman sent out this way. A stampede is in sight or already under way to the new fields. Yukon should not be slow in rising to the opportunity.—"Dawson News."

EDITORIAL

APPROPRIATE LEASING UNITS FOR OIL LANDS.

The action of the Minister of the Interior in suspending the privileges of staking oil lands in the Northwest Territories until the regulations can be revised is what might be expected of careful guardians of the natural resources of the State. Some months ago, this journal called attention to the new mineral-leasing laws of the United States, which make it incumbent upon the Geological Survey, Department of the Interior, to determine the geological structure of producing oil or gas fields, and to advise the Government on the division of the public domain into "appropriate leasing units."

In the "Atlantic Monthly" for February 1921, Arthur D. Little, of New York, writing on the "Fuel Problem," states in regard to oil and natural gas in the United States:

"These wastes of natural gas, which is an ideal fuel, " and the losses and maladjustments which attend the " orgy of petroleum production, again afford glaring " examples of the need of a constructive national po- " licy for the development of our resources.....So " long as ownership of portions of a common reservoir " of oil is determined by vertical boundaries, each " owner can hope to secure his own only by getting it " before his neighbor. The result is necessarily hur- " ried, unregulated and wasteful production."

There are other considerations that need the thoughtful attention of Ottawa, connected with civil government, transportation and the protection of the public from "wild cat" promotions.

If, under these conditions, the Government should take time to reconsider the whole situation, it would appear to indicate a sense of due responsibility that calls for commendation, rather than criticism, at least until the nature of the revised regulations is made known.

No legitimate interests are likely to suffer at the hands of the Canadian Government, who will doubtless have in mind the large expenditures and the energy that has been necessary to disclose the presence of oil near Fort Norman, and will realise that the greater problem of geeting the oil to a market has yet to be solved. This is a problem that will call for larger expenditures than have yet been made, and some entirely novel departures from hitherto general practice will be required, because the Fort Norman oil-well and any others that may be tapped in the future in the Mackenzie River Country, have a climatic environment and a remoteness from settlements that are unique in the oil business.

Moreover, while the presence of oil has been indubitably proved, and the geological conditions suggest the existence of a large reservoir of oil, this last-named condition is as yet only a presumption, and not an ascertained fact.

It would be difficult to exaggerate the significance, and the importance of the Fort Norman oil-strike, to Canada, and the country generally will commend any attitude of Government that indicates a desire to act only if fortified by full possession of all the relevant facts.

PORCUPINE GOLD-REDUCTION MILLS DECLARED NON-TAXABLE.

The Appellate Division of the Supreme Court of Ontario has decided that the mills of six gold-mining companies in Tisdale Township, namely those of the Schumacher, Dome Lake, McIntyre-Porcupine, Dome Mines, Porcupine Crown Mines and the Davidson Gold Mines, are exempt from taxation under subsection (4) of Section 10 of the Ontario "Assessment Act". A long-continued dispute, which turns upon the interpretation of the word "concentrator" in the aforementioned sub section, is this decided in favor of the gold mining companies against the Township of Tisdale.

In the first instance the companies appealed against assessment of their reduction mills for taxation, and the Court of Revision for Tisdale Township decided in favor of the miners. The District Court on appeal reversed the finding of the Revision Court. On further appeal, the Ontario Railway and Municipal Board re-

versed the judgment of the District Judge of the District of Temiskaming, and the finding of the Board has now been upheld by the Supreme Court. The text of the judgment of the Board was published in the "Journal" of March 5th 1920, see page 177. The gist of the Board's decision is expressed in its conclusion that "the term 'concentrator' is a term loosely applied by technical men to various kinds of mills in various localities, and is not a rigid term of fact having a strictly defined signification, and that a mill of the kind in question on these appeals is not disentitled to be termed a 'concentrator' by reason of its combining chemical processes — the amalgamating or cyaniding, or both — with mechanical apparatus in separating values from mineral-bearing ore."

The effect of the decision appears to be, from the point of interpretation of the loosely-applied term "concentrator" that any part of the process of extraction of gold bullion from the native ore, or gold-bearing rock, is covered by the term "concentration."

THE RAILWAYS AS PIONEERS.

Canada has railways of which she might well be proud. To the men who built these railroads belongs no small share of the credit of Canada's prosperity. It is nevertheless seldom that anyone admits in Canada that our railway builders are respectable citizens. It is quite true that when we are away from home we tell with pride of the great accomplishments of these men and we take special pleasure in talking about the great Canadian Pacific Company and the younger Mackenzie-Mann enterprises. But here in Canada criticism of the railways and their builders is a popular sport. We don't like to give the railway companies credit for anything. As we were in the position of buyers we were satisfied with modest appraisals of the value of the railroads. The Public Ownership propaganda has been carried so far that our great railway builders must have long since lost their halos. They have to be content for the present with the knowledge that they did good work which will be recognized as of National importance some day.

Railways and development of natural resources go hand in hand. The great increase in Western Canada's grain production came with the railway extensions that made settlement reasonably easy. Our mineral output has been largely determined by the facilities for transport by rail. The bringing of forest products to market is largely a railroad problem. The railways made possible the development of our basic resources and the development of those resources on the other hand has given the railway companies their chief source of income.

The part that railways play in developing new industries is well illustrated in Northern Ontario. The great Sudbury nickel industry is the result of the discovery of nickel-copper ore at the Murray Mine during construction of the railway. The millions that have been made by mining silver at Cobalt are the direct result of discoveries made by workmen engaged on construction of the Ontario Government Railway. The possibilities of the great gold deposits at Porcupine remained unknown until the near approach of the railway made access to the district fairly easy. The development of water powers and building of great pulp and paper mills in the heart of the Northern forests is also a direct result of railway construction. The agricultural settlement of this district is being slowly accomplished and would not have warranted the building of the railway, but will be a permanent result of the establishment of the other industries which the railway make possible.

There is being agitated now in Northern Ontario the construction of an eighty mile railway to traverse the country between the Ontario Government Railway and the Canada National Railway. This area is known to have resources that should be developed and the construction of a railway here may reasonably be expected to have such results as did the building of the Ontario Government railway from North Bay to Cochrane. As in that case no guarantee can be given that the road will be a financial success. Those who build it must take a chance. Now that we have made private enterprise in railway building so unattractive we must look to Governments for this pioneer work.

Whether Governments wish to take the pioneering risks or not remains to be seen. It is common opinion that Governments should take an active part in the development of natural resources and it may be that the history of the Ontario Government railway enterprise will be considered as a fairly good indication of what may result from the construction of the proposed railway from Swastika to Westree. Along this line mineral deposits are already being developed at Matachewan, Gowganda and Shiningtree. There is an abundance of timber and pulpwood along the route and some good agricultural land. If the Ontario Government would take some interest in the project and have a topographical, geological and forest survey made of the route, it would probably be found that there is good cause for asking that the road be built. Whether the present Ontario Government is ready to do pioneering work or not is as yet unknown.

R. E. H.

"SCIENTIFIC AGRICULTURE."

The latest professional periodical to commence publication in Canada is "Scientific Agriculture", the official journal of the Canadian Society of Technical Agriculturists.

A perusal of the contents of the first number discloses numerous points of contact between the mining industry and agriculture as it is practised today. The man who first fashioned the metal point that turned the primitive wooden stick into the predecessor of the modern many-bladed plough that follows the mechan-

ical tractor, was presumably both miner and metallurgist, and the dependence of agriculture on the products of the mine has been steadily growing ever since.

In the new magazine there are articles dealing with insecticides and fungicides, with grasshopper control in the West, and with the control of various plant and animal diseases obtained by use of mineral poisons. The manufacture of fertilizer from phosphoric iron-ores, of ammonium sulphate and motor-fuel from the destructive distillation of coal, the use of various chlorides as fertilizers, and the effect of the fumes from metallurgical processes on farm lands, are some of the points where the farmer and the miner come into contact with each other, and there are many others. The first historic conflict between the farmer and the miner-metallurgist took place between Abel and Cain, and it is not recorded that either participant benefitted from the fight. The analogy holds true today, and in the Canadian West the traditional evolution of mining alongside agriculture is taking place. One is the complement of the other, and any dispute as to precedence or pre-eminence is bootless, and may even, as in the Rabbinical tradition, have undesirable ending.

GOLD PRODUCTION A PUBLIC SERVICE TO CANADA.

The suggestion comes from Cobalt that the Minister of Finance would be a welcome speaker at the Ottawa Meeting of the Canadian Institute of Mining and Metallurgy, and that he might clarify the ideas of members on the gold standard. Sir Henry Drayton's comprehension of the economic situation of Canada was disclosed by the searching and pertinent questions that he put to those who appeared to give evidence before the Cabinet Committee on the Tariff, and a word from him on the country's gold reserve, the relation of increased gold production in Canada to the rate of international exchange, and the gold standard, would clear the minds of mining men of a number of erroneous conceptions that are apparently abroad.

For example, a tax on gold used in the arts is again proposed, as it was proposed by the American Mining Congress in Denver recently, and at the Vancouver Meeting of the C. I. M. & M. in November 1919. This proposal suggests two standards for gold, and is wholly unsound, as gold is **the standard.** It is no more possible to have two gold standards than to have a foot-measure of varying lineal distance. A new standard of gold value might be adopted, and has indeed been suggested, but a standard that varies is no longer standard.

A clear exposition of Canada's credit position, given by some competent authority, would indeed be a welcome feature of the proceedings of the Annual Meeting of the Institute. It might tend to reconcile miners to taxation, and it certainly would stimulate their desire to produce those materials from the mine which are so essential to restore our credit.

There are an awful lot of things connected with currency and exchanges that obfuscate the thinking of all who are not specialists in the matter—and these are mighty few—but it is most clear that the more new gold Canada can produce at this time, the better. If some outstanding political or financial leader in Canada could be induced to tell the members of the Institute precisely why this is the case, and hammer home his words with figures, it might hearten some to know that in addition to some varying amount of personal pecuniary advantage, the gold producer in Canada is performing a real public service.

ROMANCE BRINGS UP THE DAILY PLANE.

The Winnipeg "Free Press" is running an advertisement of an air-service from McMurray to Fort Norman, beginning first of May, eight hours from point to point.

The aged and sated Hebrew who, not far from the "slime-pits" of the Vale of Siddim, concluded that there was no new thing under the Sun and that all was vanity, could not foresee that the Valley of the Euphrates would witness the incoming of men from countries unknown eagerly searching for oil, and that one day men would fly from the ashphalt beds of McMurray to a far northern point with the same quest. Kipling said that Romance brought up the 9-15, and Mr. Wells has no sooner completed his Outline of History, when a new page is inscribed that transcends in bald fact the poetical imaginings of the masters of Romance.

For once, at least, there is seen a new thing under the Sun, and, not for the first and may be not for the last time, the antidote to boredom and satiety has come from Canada. If Canada does not produce great literature it will not be for lack of the stuff of which dreams are made, and, quite incidentally, pockets are lined

The Pittsburgh Coal Co. is stated in a "Boston News Bureau" item to have maintained reasonable prices for its product during the recent days of high coal selling prices, having quoted $3.75 for running and $4.00 per ton for screened coal throughout the period. Similar prices are now being quoted by the large Company.

In a smaller way, the Dominion Coal Company followed a similar policy in Nova Scotia, and generally speaking, it will be found that unification of mining operations under single control tends to stabilization of selling prices, avoiding undue [illegible] in times of demand, and preventing disastrous [illegible] in times of little demand.

So far as the smaller operators are concerned, the existence of large companies is helpful, providing a reservoir of labour from which they can draw in busy times, and supplying in bad times that stiffening of selling prices that prevents widespread collapse of mining undertakings that are not buttressed by substantial financial reserves.

Recent Developments in the Microscopic Study of Coal

By REINHARDT THIESSEN.*

(Paper given before the Coal Mining Institute of America, Pittsburgh, December 9th, 1920).

(Continued from Page 64, issue 28th Jan. 1921.)

In recent years investigations of coal were mainly taken up by botanists from a botanical standpoint. Much credit for the resumption of the work on this line of attack must be given to David White, of the United States Geological Survey. White saw that in order to get a proper understanding of the nature of coal it must be attacked from the botanical side first and from the chemical side later; also that its study must begin with the peats and continue successively on through the lignites and the sub-bituminous coals into the bituminous coals.

Before actual microscopic examination of coal could begin, difficulties in preparing it for examination had to be overcome. This in itself proved to be no small problem. Then before the investigation of the nature of coal could be attacked, the knowledge relative to the subject available in other branches of the sciences, such as geology, botany, chemistry, colloid-chemistry, physiography and fossil botany, had to be collected and brought into harmony.

Technique.

The great hindrance to the investigation of coal has been the difficulties encountered in preparing it for examination. From the time of Witham and Hutton to the present day, the one great difficulty has been to make thin sections for microscopic observation. Many attempts have been made to overcome this and to devise and discover means in other directions towards better results. For a number of years a method was pursued that might be termed the "ash method." Small bits of coal were carefully burned, either partially or totally, and the remaining skeleton of ashes examined under the microscope. Among such investigators were Reade, Phillip, Goeppert, Bailey, Tesehemacher and Ehrenberg. Goeppert seems to have become quite efficient in this method, as a large amount of his knowledge of the coal was obtained in this way. The method, however, proved unsuccessful in general and led to no important results. Other methods were tried but without success.

Frank Schulze devised a maceration method. Schulze had been accustomed to purify cellulose by means of nitric acid and potassium chlorate. It occurred to him to test coals for residual cellulose by the same method, and so he discovered that coal could be macerated by first treating it with a mixture of nitric acid and potassium chlorate and then digesting it with ammonia. By watching the latter reaction under the microscope much of the structure in coal may be observed. Guembel applied this same method with great success. It is mainly through this process that he gained his great insight into the nature of coal and was able to make the first adequate contribution to knowledge of the structure of coal. This method is now generally used to supplement the microscopic examination of thin sections. Quite recently Jeffrey, of Harvard, has tried to overcome the difficulties of cutting thin coal-sections by first treating the coals alternatively with a mixture of hydrofluoric and nitric acid and with alkalies and finally heating them in a hot ether and absolute alcohol solution. These treatments were supposed to soften the sample and then permit cutting it with a sharp knife into thin serial sections. Nothing was gained in execution by this method, and besides, the original condition of the coal was entirely changed. It was no longer coal.

Ground Thin Sections Found Most Reliable.

Thiessen finally adapted the old and ordinary methods, used from the first, to his needs. It is the same method successfully used for many years by petrologists and fossil botanists. The method, as adapted, is, in brief, as follows:

A small rectangular piece of coal to be examined is polished on one surface. By means of a mixture of about 1 to 2 parts of marine glue and 3 to 4 parts of Canada balsam, heated to a proper consistency, the polished surface is cemented permanently to a glass object-slide. The piece is then ground down roughly to within a safe thickness on an ordinary lapidary's wheel, and is finally ground down by hand on a very fine hone until thin enough to be transparent.* Oil-shales are prepared in the same way. From 8 to 12 sections can be made in a day. The coal in such sections is entirely in its original condition. Sections can thus be cut from any desired part of the coal, either cross-wise to the bedding planes or horizontally with them, and studied at any magnification possible and photographed.

The Banding of Coal.

Every ordinary bituminous coal has a more or less pronounced alternate banding of bright and dull layers. (Photograph 1, for which see last issue.) This phenomenon had long been noticed but was first observed in connection with microscopic work by Witham and Hutton, and later more definitely defined by Dawson and Wethered, who called the layers "bright coal" and "dull coal" respectively. Potonie, who called them "glanz" and "mat" coal made them the object of considerable discussions and theoretical work in order to explain them.

It has now been definitely determined that the bright bands represent constituents that at one time were pieces or fragments of wood of varying sizes and that the "dull coal" represents layers compiled of constituents that at one time were smaller fragments of wood interlayered by macerated plant-matter or "debris" derived from many kinds of plant products, called the "attritus." Photographs 1, 2.

Bright Coal or Anthraxylon.

Many sections have been made of the bright bands and examined under the microscope and in every case it has been shown that they were derived from pieces or fragments of wood such as parts of stems, limbs, branches, twigs and roots. Woody structure has been preserved in all of them. (Photograph3). In some cases such constituents represent quite large pieces, but most of them represent but minute fragments. Between these two extremes all sizes are present. These constituents are always flat, the semi-decayed wood having been at one time soft and pliable, has been compressed and flattened. Being constituents derived from

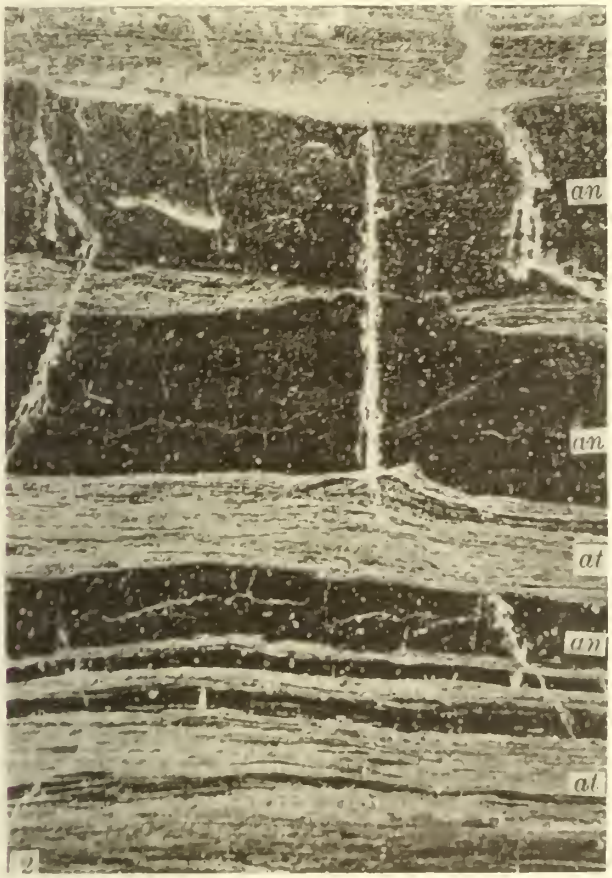
*A fuller description of the method is to be found in Bull. 117, "Structure in Paleozoic Bituminous Coals," U. S. Bureau of Mines, 1920.

wood now turned into coal they have been called anthraxylon, meaning wood coal.

Study of Formation of Peat a Good Guide.

The nature of the anthraxylon may best be elucidated through a study of peat. It is now generally admitted that coal was formed in a manner similar to the formation of peat today. The whole process can therefore be studied at first hand through the observation of peat. Peat may be taken as the first step and lignite as the second step in the process of coal formation.

Peat is a deposit of semi-decayed and semi-macerated plant products formed in a wet or poorly-drained area.



2—A part of a vertical cleavage face of coal magnified ten diameters, photographed by reflected light. The black bands (an) represent anthraxylon, the light striated bands (d) represent the dull coal. It will be noticed that the latter is compiled of black and light striae, the former represent anthraxylon and the latter attritus.

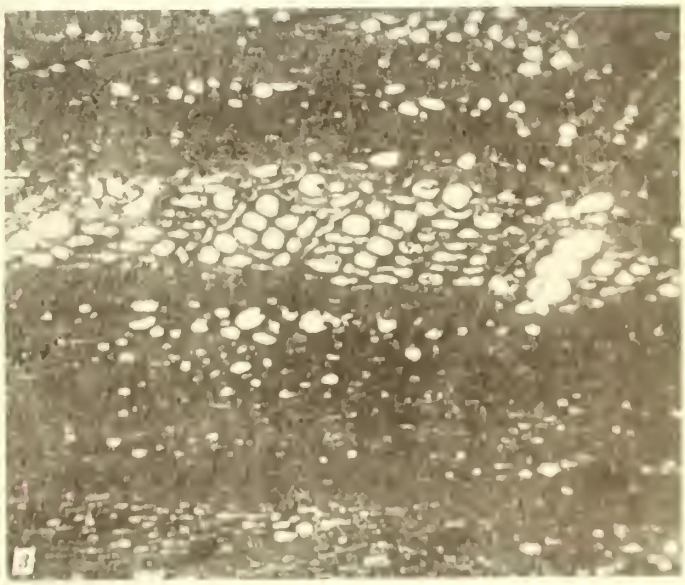
In it are found all the plant products that vegetation growing in it may yield. The woody plants are by far the most important and the most abundant in the peat-forming processes, and woody matter forms by far the largest part of the deposit. The best examples are the deposits formed of and now covered with dense growths of trees adapted to a very wet condition. (Photo. 1—a., see last issue). As already intimated, the plant products are semi-decayed and in various stages of maceration. The harder or more woody parts have resisted maceration more than the softer parts, such as bark, young parts, leaves, etc. But much of the wood has also been disintegrated and has been transformed together with the other products of decay, into a general "debris."

The Characteristics of Peat Substance.

We have then a mass that consists of semi-decayed tree trunks, limbs and roots and fragments thereof embedded in a mass of "debris." When this general "debris" is more closely examined it is found to consist largely of smaller fragments of woody matter in the shape of chips or fragments of stems and twigs. These are again embedded in a mass that consists of very finely macerated plant-matter. It has very much the appearance of mud. When examined under the microscope, it is shown to consist of bits of all kinds of tissues and plant cells and fibres of all kinds, besides pollen grains, spores, cuticles, resinous matter and some dirt. The mass of this plant matter, most of which consist of woody matter, is in a very peculiar physical condition. It has been turned into a sort of a jelly that has retained the plant structure and contains more water than plant matter. It is the nature of substances in this condition to form a hard, rather brittle mass when dried. Mature peat has exactly that property—one of the first conditions necessary in the progress towards coalification — and when dried is very coal like. Unmatured peat may be brought into this condition by artificial means, and when dried resembles bituminous coal in many respects.

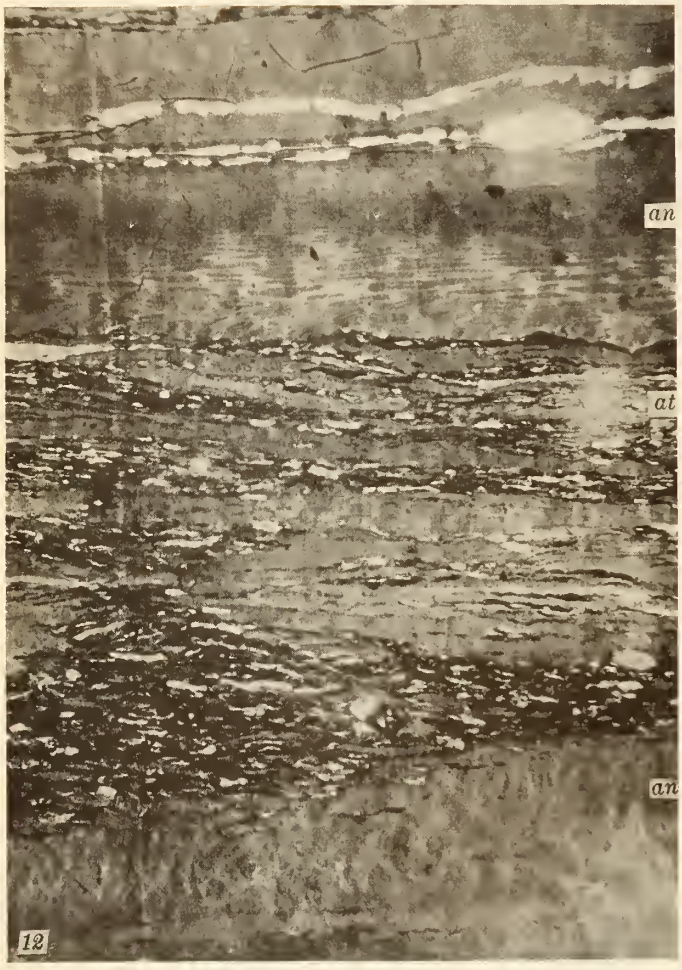
Lignite and Sub-Bituminous Structure.

The lignites are very similar in compositions to the peats. But in the lignites all the plant matter has been compressed, flattened, and hardened, and deprived of much of the original water. Coalification has taken place to a considerable extent, but has not nearly been completed. Indications show that it once was in the same peculiar physical condition described as characteristic of peat.



3—A thin cross section of anthraxylon or bright coal showing well preserved cell structure including resinous matter. Magnification 60.

The sub bituminous coals, the geologists tell us, were formed during the same time as the lignites. Some are part of the same bed, some in fact are younger than the lignites. But in the sub bituminous coals the coalification has proceeded farther than the lignites, through the effects of earth movement, or, as the geologists call it, dynamic action. Microscopic examination shows that on the whole sub bituminous coals are composed of the same kind of plants and the same kind of plant fragments as the lignites. It is hardly necessary to say that plant structure has been retained to a large extent in the lignites and in the sub bituminous coals,



12.—Thin vertical section of coal from the lower Freeport seam, showing thin bands of anthraxylon (an) and attritus (at).

but it is important to emphasize, as we go from peat to lignite and from lignite to sub-bituminous coal, that the plant structure has been more and more effaced, or obscured, because the mass has been more and more compressed and hardened, and has become more opaque. When we come to the bituminous coals the coalification, in general, has proceeded still further, and hence we should expect the plant structure to be still more effaced, or rather made less evident. The fact is that it has not been effaced,, but the structures have been still more hidden or obscured. Every anthraxylon in every coal examined has revealed abundant woody structure. (Photograph 3).

Dull Coal.

The duller portions of the coal are shown on close examination to be composed of numerous thinner strips of bright jetty black coal interlayered by a granular-appearing mass, the attritus. (Photograph 2). The black jetty strips represent, like the larger portions of bright coal, or anthraxylon, constituents derived from woody matter. Woody structure is preserved in all of them. (Photograph 12). Some of them represent small chips of larger stems, branches or roots, others represent fragments of smaller branches, twigs or roots and still others represent twigs, rootlets and petioles themselves. There is in reality no boundary line between the larger and the smaller to the smallest layers of bright coal. There is a gradual transition in size from the largest to the smallest. It is safe to say that in all of them, plant structure is abundantly preserved and that there is no cubic centimeter of coal in which there is no plant structure left. It may not always be easily discernible in cross-section but in horizontal sections it is always revealed.

The Attritus.

The pieces of bright coal are embedded in a mass that has been derived from all kinds of plant products, such as finely-macerated woody matter, bark, pith, cortex, leaves, leaf stalks, plant fibres, plant cells and parts of the same, all derived from the cellulosic parts of plants; among these are distributed constituents that stand out clearly, such as resinous matters, spores, and pollens. This part is called the attritus. (Photographs 2, 5, 6, 9, 12). Intermingled with this are to be found cuticles, megaspores, sporangium walls, carbonized parts of tissues and cells, sand particles and other mineral matter.

All the plant matter has been subjected to putrefaction and decay, and at one time was soft and pliable. It was later compressed and flattened to the bedding planes. The attritus has been generally referred to as the ground mass, fundamental matter and binding matter. The different constituents named are present in greatly varying proportions. Sometimes it may consist largely of spores instead of woody matter, and then again of resinous or cuticular matter, or of earthy matter.

All Bituminous Coals Derived from Woody Growths.

In the foregoing analysis it is seen that all the ordinary bituminous coals were derived largely from woody growths. The peat bogs that gave rise to them consisted of wooded swamps similar to those found in Minnesota, Wisconsin (photo 1—a) and Michigan and

5.—Thin cross section of coal from the Brookville seam showing the general appearance of dull coal; (an) represent thin anthraxylon constituents, and (at) the attritus, the latter composed of spore-exines, cellulosic degradation matter, resinous matter and some inorganic matter. Magnification 200.

Dismal Swamp of Virginia and North Carolina. The lignites of North Dakota and Montana are completely analogous to these and form intermediary steps between peat and coal.

By far the largest part of the mass of the ordinary coals then is made up of woody matter. By woody matter is meant all that which is generally understood under the term wood, such as comprise the tree trunks, branches, limbs, twigs and roots. This wood, of course, is present in various degrees of fragmentation as already noted. The larger fragments are represented by the bright or glanz coal; the small fragments by the thin sheets of bright coal in the dull coal. In the attritus there is further represented woody degradation matter in a finely divided state where it is mixed with other

9.—Thin vertical section of coal from the Upper Freeport seam, composed chiefly of attritus with a few thin strips of anthraxylon. Magnification 200.

plant matter such as resins, spores, pollens, cuticles, bark, etc.

It should be noted that besides that part of the plants generally designated as wood, such as the stems, branches and roots, the more delicate part of the plant also contains woody matter. The cell walls of succulent plants, the leaves and their petioles, the bark, growing parts and pith all contain the same substances that compose wood, namely cellulose and ligno-cellulose. The macerated matter of all of these contributed to the attritus. It is clear, then, by far the greater part of coal is derived from woody matter, and a very large share is derived from wood that is that part of the plant usually termed wood.

Lomax and Glover see but little evidence that coals

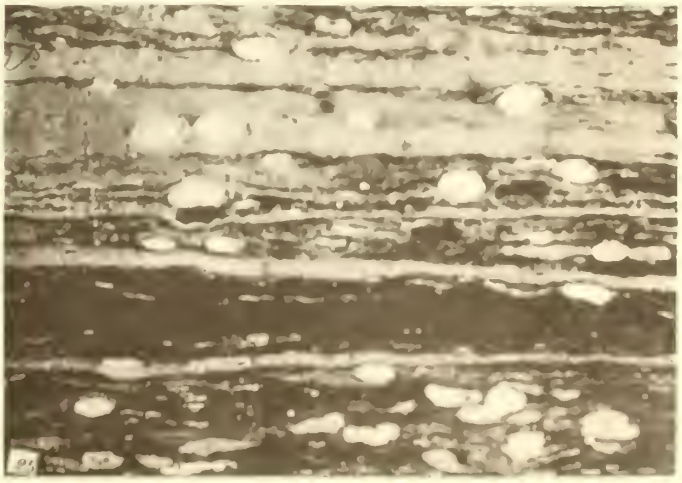
6.—Thin cross section of Pittsburgh coal, consisting mostly of attritus including some thin anthraxylon strips and resinous particles. The attritus is rich in spore matter. Magnification 200.

contain any great amount of matter derived from woody parts of plants such as stems and branches, and what there is occurs in the form of mineral charcoal. They conclude that the ordinary bituminous coals have been derived mainly from the droppings of trees and plants in the form of spores, fruits, leaves, twigs and sometimes fragments of stems. If this is true our whole conception of coal formation has to be changed. We have here no deposits analogous to those of their conception.

Resin.

Resins are found in both the anthraxylon and the attritus of coal. Photos. 3 & 25. Much has lately been said about resins in coal. The term is, however, used rather losely and indefinitely. We read of resins, resinous substances, resinic substances, resinic extracts and resinic residues in coal without a definite knowledge as to what they really are.

In the living plants there are so many kinds of resins that it is very hard to define them and bring them all under one head. But in speaking of resins in plants it is usually quite well understood as to what is meant. They have peculiar characteristics of their own that differentiate them sharply from



Thin cross section of [illegible] and showing resinous [illegible]. Magnification [illegible].

other substances. Rosin, Canada Balsam, dammar-resin, and tamarack gum are well known examples.

The chemist who is working with resins has arranged them very precisely and systematically into many groups and kindred orders. To him the large and intricate array of resins is as easily as the outlay of a coal mine is to the coal mining engineer.

Under resins are comprised a very large number of specific substances, most of which belong to the ring compounds. These may be divided into resin acids, resin phenols, resin alcohols, resin tannins and resenes, each group having a large number of members. Several or many of these, as esters (compound ther) or as esters and mixtures, form definite kinds of resins; as rosin and Canada balsam, similarly as

18.—Thin vertical section of coal from the Yagger bed of Alabama. (an) anthraxylon; (at) attritus.

fatty acids and alcohol form fats or oils, as lard, butter and olive oil.

In the peats the resins are readily recognized. They are still in the tissues where they belong when the plant was living without much change in character; or they form a part of the attritus, having been set free through decay, where they are easily determined by means of micro-chemical tests.

In the lignites, resins are found both in the anthraxylon, or woody part, and in the attritus, where they are in most cases easily recognized. The woody parts of the coal, the anthraxylon, has in most cases been well enough preserved so that the generic and in some cases the specific determinations can be made and are found to be closely related to species living today. The resins are in the very tissues where they would be expected, were the tree living. In the attritus of the lignites, it is not quite so easy to determine the origin of all resinous constituents. Most of them, however, can clearly be traced to their sources without a doubt; others are not so clearly defined and their origin is doubtful.

An interesting condition is shown in the anthraxylon of the lignites with respect to the concentration of resinous inclusions. The largest amount of resin in the stems of certain living pines is in the neighborhood of 2 per cent of the dry weight. In the lignites, sample after sample of anthraxylon, shown to be part of a tree trunk, is found where the resin content is far above 12 per cent—in many pieces it is close to 50 per cent. This concentration is to be accounted for in that the wood decayed and disappeared to a large extent while its resin was not decayed and thus was concentrated.

The sub-bituminous coals are similar to the lignites in every respect in regard to the resinous content.

In the bituminous coals also resinous bodies are found both in the anthraxylon and the attritus. An examination of the anthraxylon shows that they are held in the tissues and in the cells where they would be expected to occur were the tissues living. (Photograph 3.) It is fair to assume therefore that they were the natural resins of the plant that contributed to the coal. In some cases such resinous bodies form a considerable part of the coal.

Paleozoic Plants Contained Resinous Matter.

White, through a number of years of experience and study of fossil plants, concludes that the plants of the Carboniferous Period contained as much resinous

4.—Thin cross section of dull coal, Pittsburgh seam, photographed by transmitted light at a low magnification. The narrow lighter bands represent thin strips of anthraxylon or bright coal; the darker, mottled bands between them represent the attritus, showing that the dull coal is compiled of alternate layers of anthraxylon and attritus. In reality the anthraxylon consists of definite constituents embedded in the attritus. Magnification 10.

matter as the plants of the later ages, and that the amount of the wood found in the Paleozoic coals containing resin justifies the conclusion that the quantity of resin contributed by the coal forming plants, and preserved either in place in the wood or as accumulations in various layers of the coal, may have been as great in the Paleozoic as in later periods.

There are also invariably scattered through the attritus of all bituminous coals resinous-appearing bodies, usually of a rounded to oval shape, (Photograph 25), but also of cylindrical and irregular shapes. A good many of these can directly be traced to be of the same origin as those in the anthraxylon, others are

inferred by analogy and through their similarity to those in lignite to be derived from the natural resins; in others again it is not safe to venture any conclusion. On the whole it is quite safe to say that they are derived from plant substances similar to the plant resins of today. The fossil resins, whether found in lignite and coal or in the ground, like amber, fishtelite and succinite, are among the most stable substances known. It took the best chemists years of work to find the composition of fishtelite, for example, on account of its resistant nature. It is therefore, little wonder that the chemistry of coal is so difficult. In view of this fact, if certain constituents of coal, like the resins could be isolated and dissolved, they should yield durable commodities like lacs and varnishes.

(To be continued.)

A Montreal Letter

By ALEXANDER GRAY.

Dumping Zinc and Copper.

While the longer view brings no misgivings as to the future of metal markets, it is frankly acknowledged that current developments are discouraging. A few days ago, Germany dumped 10,000 tons of zinc on this side of the Atlantic, at 4½ cents — which is less than the metal can be produced for in the States. Last year England unloaded a lot of Mexican and European zinc, in Canada. Besides all of this, it is no secret that one of the very largest producers of zinc is "working in the red ink", as a Director expressed it — meaning there is a debit in the present production. As this latter corporation has an investment in its plant of $75,000,000, it is not difficult to understand why there is pressure at Washington for an increased measure of protection and why the Canadian Consolidated Mining and Smelting Company "deferred" dividends. If the exceptional American zinc producer and the largest Canadian Company capable of supplying the market have adverse experiences with cost and metal markets, manifestly there is need of first aid.

Nor is zinc alone in adversity. Copper producers are a long way from being ebullient. They cannot discern buying power, excepting upon credit, and that credit, for the time being, is not forthcoming. Most of the copper companies are prepared to quicken their pace, but disconcerting receipts of old brass, which can be reworked, of old copper and clippings, and of composition metals with a copper content, have not ameliorated the situation. The extent of these brass and copper shipments from European countries is thus summarized in lbs:—

	Old Brass	Old Copper	Composition Metal
1920 (10 months)	34,864,700	9,742,907	2,422,601
1919	15,875,171	1,217,310	355,982
1913	8,726,112	7,253,039	2,211,406

The inference is that European battlefields and munition plant odds and ends are being salvaged. Yet it was understood there is a dearth of copper over there.

Outlook for Silver.

Specialists in the market for silver are not clear in their own minds about the immediate demand. They are rather bearishly inclined, because of Asiatic depression and universal necessity for economy. One authority holds silver to be a luxury and that the peak price of 89½ pence reached a year ago was too abnormal. Under the conditions prevailing, the inquiry for silver is going to be governed by the revival of trade in China and the ability of India to right itself while Europe is so short of funds. The Continent of Europe is a seller of coin, not a buyer for coinage — and the use of silver for plate and jewelry is apt to be curtailed. It is quite obvious from the following review by the bullion house of Samuel Montagne & Co. they are none too optimistic, although these admit Asia may rapidly recuperate:

"The world as a whole would have good reason to welcome the return of the price of silver to a pre-war level. The persistent advance in the price of this metal has much to do with the increase in the prices of commodities, the reason being that the Allies had to depend so largely upon the products of the East, chiefly from India, with whom the world balance of trade has always been — unless the monsoon proved a failure — heavily in her favor. Wheat, rice and beans, jute, cotton, hides and skins figure largely in the useful goods which come from India and China. It was the rise in the cost of such items as these which stimulated that of other commodities in the markets of the world.

The total output for 1920 is not expected to show much change, but the apportionment among the contributing countries will be different. The United States will record considerably less, and Canada will show a further shrinkage. These reduced contributions will be offset by an increase from Mexico and from Burma. The last named mines, worked under British auspices used to be exploited by Chinese. In a similar fashion, Professor Sayce deduces from recent discoveries that Babylonian firms worked the silver mines in Asia Minor centuries before the days of Abraham.

A good deal of misconception outside India as to the rupee problem arises from overlooking the fact that the natives of India regard the question as one of bullion rather than of currency, and choose to set their own ratio between currency composed of gold and of silver. In other words, the two precious metals are looked upon as commodities, the imprints of the die being but an official certificate as to the contents. The Indian government during the year clearly endorsed the native point of view by removing the prohibition against using gold and silver coin otherwise than as currency — thus conferring a privilege not enjoyed in the United Kingdom. Gold and silver coins do not change hands in India to anything like the extent that they do in western countries. They are obviously more treasured than current."

A VERY SWEEPING STATEMENT

"Prior to 1890, Great Britain made more pig iron than the United States. Now we have four times the British capacity. Why? The chief reason is not our Lake Superior ore. We have Alabama ore, Lake Champlain Ores, Cuban ores and Chilean ores. It is not our engineers, nor our blast furnace practice, nor our steel mill practice. The British have or could have all that. The chief reason why our industry is four times the size of the British industry, where a third of a century ago we were a poor second, is that we have the open shop and the British have the closed shop. We have paid much higher wages, but our men have worked and produced much more." "The American Metal Market."

Alkali Deposits of Western Canada

L. H. COLE, B. Sc.

(No. 1 of a "Memorandum Series" issued by the Mines Branch, Ottawa.)

Occurrence.

Natural occurrences of soluble mineral salts are known in the Provinces of Manitoba, Saskatchewan, Alberta, and British Columbia, either in the form of bedded deposits, or as brines. Some are of considerable extent, and are probably of sufficient size to warrant commercial development.

The occurrences of these salts may be broadly classed under two types:—

(1) Solid salts and brines in undrained or partially drained basins;

(2) Brines of the following streams or springs.

Type 1.

Those of the first class are very numerous in the prairie provinces.

It is probable that the accumulation of salts is due to leaching out of the soluble salts in the prairie soils by surface waters, and their concentration and deposition in the undrained basins which are found in the glacial morainic covering of the western prairies.

These deposits are generally of a similar character, although the percentage of the different salts will vary in different localities. In many cases the name 'alkali lake' has been appropriately applied to deposits of this nature, since in the early spring and often into late summer the deposits are covered with water. The water accumulating through the melting snow and rain is often a foot or two in depth, and carries a considerable quantity of the alkali salts in solution. Beneath this water one generally finds a solid bed of crystallized salts. In late summer, especially when the season is a dry one, these so-called lakes become deposits of snow white alkali, which when seen from a distance resemble snow covered basins.

The deposits will vary in size from a few acres to many acres in extent, and in thickness, from a few inches to possibly fifteen feet. The salts are generally found interbedded or mixed with mud or peaty material, and in very few instances are the deposits in a pure enough form to be commercially marketable in their raw state. The mud beds also contain numerous crystals of the alkali salts.

Type 2.

Brine streams or springs occur in many places, and may carry sufficient salts in solution to warrant their commercial exploitation for medicinal and other purposes. In some of the occurrences of this nature the principal salt present is sodium chloride, the other salts being present only in small quantities. The brine springs of northern Manitoba are good examples of this class of deposit.

Composition.

The composition of the salts occurring in these basins consists chiefly of mixtures of sodium and magnesium sulphates in varying proportions, with, generally, small quantities of sodium chloride and possibly other salts such as sodium carbonate, etc.

Sodium Sulphate.

Sodium sulphate in the hydrous form (known as Mirabilite or Glauber's salt) has the following composition:—

$Na_2SO_4.10H_2O$ — SO_3 24.8% (sulphur trioxide) Na_2O 19.3% (soda) H_2O 55.9% (water)

In its pure state it is white, transparent to opaque; and has a hardness, 1-5-2, with a specific gravity, 1.48. It is readily soluble in water, and at first is cool to the taste, and afterwards saline and bitter.

Sodium sulphate in the anhydrous form (known as Thenardite) has the following composition:

Na_2SO_4 — SO_3 43.7% (sulphur trioxide) Na_2O 56.3% (soda)

Its colour, when pure, is white, translucent to transparent, and the mineral has a hardness of 2-3, with a specific gravity of 2.68.

Magnesium Sulphate.

Hydrous magnesium sulphate (known as Epsomite or Epsom salts) has the following composition:—

$MgSO_4.7H_2O$ — H_2O 51.2% (water) MgO 16.3% (magnesia) SO_3 32.5% (sulphur trioxide)

This is a soft, white or colourless mineral, readily soluble in water, and with a bitter saline taste. Its hardness is from 2 to 2.5, and its specific gravity, 1.75

Sodium Chloride.

Sodium Chloride (known as Halite or Common salt) has the following composition:—

NaCl — Na 60.6% (sodium) Cl 39.4% (chlorine)

The natural salt is nearly always impure. It has a hardness of 2.5 and a specific gravity 2.1-2.6. It is colourless or white when pure, but often yellowish, or red or purplish, from the presence of metallic oxides or organic matter. It is readily soluble in cold water, and has a saline taste.

With these salts may be associated other soluble salts such as sodium carbonate, and in small quantities, the salts of the calcium, potassium and alum groups.

On account of the nature of the natural alkali deposits and brines of Western Canada, it will be necessary in nearly all cases to purify the raw product from such deposits, in order to produce marketable commodities. A pure Glauber's salt can be obtained by evaporating the brines or by dissolving the soluble salts already deposited and separating the sulphate of soda by differential crystallization. To produce salt cake from the hydrous salt, it will be necessary to develop processes for eliminating the water of crystallization. Theoretically, this appears easy, but there are a number of practical difficulties in the way of development which have not yet been overcome.

Uses.

Sodium sulphate in the anhydrous form is more commonly by its trade name "Salt Cake". As salt cake, it finds its chief use in the manufacture of sulphate pulp; in metallurgical work, in the refining of nickel; in the manufacture of window, plate and bottle glass; and in making water glass. In the hydrous form, it is marketed as Glauber's salts, and as such, is used in dyeing; in tanning; in the textile industry as a mordant; and in medicine.

Magnesium Sulphate or Epsom salts is largely used in the cotton trade for warp-sizing; it is also employed for medicinal and agricultural purposes, and in dyeing with aniline colours, since goods thus dyed are found to stand the action of soap better.

Sodium Chloride is the ordinary common salt of commerce, and as such, does not need further mention.

Market Situation.

Sodium Sulphate.

So far there has been no steady production of sodium sulphate from the alkali lakes of western Canada. The Salts and Potash Company, Ltd., of Kitchener, Ont., operating Muskiki lake, (Tp. 39, R. 16, W.2nd), Sask., have erected refining plants at their lake and also at Kitchener, Ont., in which they have carried out considerable experimental work and hope shortly to be in a position to place the refined products regularly on the market. The salt cake so far used in the country has been obtained as a by-product from the manufacture of hydrochloric acid. The amount produced by this process in future will necessarily be governed by the market for hydrochloric acid. Glauber's salts are made from the anhydrous form by dissolving the salt cake and recrystallizing below 32.4° C.

Salt cake is manufactured in Canada by the following firms:—

Grasselli Chemical Co., Hamilton, Ont.

Nichols Chemical Co., Montreal, P. Q.

Plants: Sulphide, Ont.; Capelton, P. Q.

Victoria Chemical Co., Victoria, B. C.

The Canadian production of salt cake and Glauber's salts are furnished by the Dominion Bureau of Statistics for 1918 and 1919 as follows:—

	1918		1919	
	Tons	Value	Tons	Value
Salt Cake	6,001	$133,544	3,197	$57,045
Glauber's Salts	2,358	60,281	1,423	45,731

Canadian Imports of salt cake and Glauber's salts are as follows:—

Calendar Year	Amount Salt Cake	Value	Amount Glauber's Salts	Value
	lbs.	$	lbs.	$
1910	17,728,543	95,054	1,080,309	5,217
1911	13,782,241	88,761	1,531,555	7,826
1912	19,243,823	97,768	1,951,619	9,129
1913	25,902,190	133,030	811,053	3,815
1914	38,175,601	170 333	810,062	3,407
1915	30,970,231	147,047	840,994	8,058
1916	42,194,077	178,370	522,703	8 133
1917	71,583,645	560,711	722,913	16,218
1918	68,773,341	676,571	686,712	9,748
1919	17,905,001	343,007	738,123	9,763

Magnesium Sulphate.

During the year ending March 31st, 1920, there was imported into Canada $67,074 worth of Epsom salts, and in the same period 1523 cwt. valued at $893 was exported. This export was from the natural deposits of Epsom salts in British Columbia.

Market Prices.

The market prices of these commodities are constantly varying. The following figures as reported in the Oil, Paint and Drug Reporter New York give the New York market prices for the years 1914 to date:—

	Aug.1 1914	Jan.1 1915	Jan.1 1917	Jan.1 1918	* 1919	* 1920
	$	$	$	$	$	$
Salt cake ground - bbls. per ton.	11.00 to 13.00	11.00 to 13.00	....	30.00 35.00	12.00 to 30.00	17.60 to 60.00
Glauber's Salts, cwt.	0.65 to 0.75	0.60 to 0.75	0.60 to 0.65	0.90 to 1.00	1.00 to 2.25	1.15 to 3.00
Epsom Salt U.S.P. cwt.	not quoted prior to 1918			3.62½ to 3.90	2.75 to 3.62½	2.50 to 6.00
Epsom Salt tech cwt.	1.00 to 1.10	1.75 to 2.00	1.75 to 1.85	3.37½ to 3.50	1.80 to 3.37½	1.75 to 3.75

* High and low figures for year.

MEETING OF SUDBURY BRANCH OF THE C. I. M. & M.

The Sudbury branch of the Canadian Institute of Mining and Metallurgy, held a most interesting session for its members in the Sudbury club on January 26th. The evening was given over entirely to a discussion of technical questions, and papers were read by different mining men, dealing for the most part with past troubles experienced in the different mines and the methods adopted to solve them. There were about thirty-three members of the branch in attendance.

E. Austin, Coniston, opened with a paper on the elimination of blast furnace delays. H. L. Roscoe, of the British American Nickel, touched on "a self-aligning bearing for mine skips".

William Kent, Copper Cliff, dealt with "converter chutes" and F. J. Eager, Levack, outlined a device for filling grease guns. He outlined a device that not only saves grease but also makes for more efficient mining and is applicable to lubrication of mine-drills. It keeps the dirt out and in the amount of grease saved, it pays for itself in a month. It also avoids loss of time in having the machine men running around for grease.

J. G. Gill, of the B. A. N. C., dealt with improvements in the separator of matte and slag in the "settler". Geo. A. Morrison, Creighton, outlined the Creighton Mine orepasses, whereby they are always able to maintain a steady run of ore down to the crushers, despite any interruptions. This is achieved by storage space on every level, leading to the main tramming levels. B. C. Tomlinson, B.A.N.C., gave a paper on the Krone scale for weighing "converter flux" and W. J. Rolfe, Creighton, a paper on the Creighton ore chutes, describing in detail the type worked out there. F. H. Conover, B.A.N.C., detailed a reversing brake device for conveyors, and Frank Taylor, of Copper Cliff touched on converter matte loading. This used to be done by hand, until of late a mechanical device was worked out to do it. R. M. Coleman, Copper Cliff, told of a scheme to prevent delays due to the blast furnace spout wearing out and forcing a shut-down of the furnace.

The next meeting will be in February and will take the form of a smoker with one or more speakers.

COAL PRODUCTION IN ALBERTA IN 1920.

We have received from Mr. J. W. Richards, the Inspector of Mines, Edmonton, Alberta, some preliminary figures of coal production in Alberta during 1920, which compare with previous years as follows:

	(Short Tons.)		
	1920.	1919.	1918.
Domestic Coal	3,358,992	2,611,009	3,035,061
Bituminous Coal	3,418,921	2,325,787	2,982,334
Anthracite.	130,594	85,616	131,225
	6,908,507	5,022,412	6,148,620
Briquettes	101,922	70,033	100,470

No coke was made during either 1920 or 1919. In 1912 coke was made to the extent of 105,684 tons, and in the period 1913 to 1918 about 30,000 tons annually was made, all from beehive ovense. The beehive type of coke-oven may be therefore said to have passed away in Canada.

The coal output for 1920 exceeds by three-quarters of a million tons the record production of 1918. In November 1920 a production for the month of 803,745 tons was recorded, or at the rate of closely approaching 10,000,000 short tons annually. In the Annual Report of the Mines Branch of Alberta for 1919, the Chief Inspector of Mines, Mr. Stirling, estimated the output capacity of the Alberta coal-mines at 9,000,000 short tons, and, as will now be seen, did not err in overstatement, although at the time the largeness of the figure mentioned caused general surprise.

The Drumheller field produced 1,210,687 tons in 1920, comparing with 804,930 tons in 1919.

The most interesting part of the progress of the Alberta coal trade in 1920 is not the capacity of the coal mines to produce the largest tonnage in their history, but the capacity for absorption shown by the surrounding territory. The limit to production in Alberta has always been of that of commercial outlet, but apparently the coal requirements of the area of distribution are increasing, and, what, is not less significant, the radius of distribution is itself being rapidly widened.

Alberta now has a permanent lead in coal production in Canada, which it will enlarge year by year. The coal trade in Alberta is admittedly in a formative stage. As was pointed out very plainly by Mr. Stirling in the 1919 Annual Report, the production is spread over too many openings and incorporations, and much capital has been wasted on openings that have been abandoned. Out of 324 abandoned mines, the Chief Inspector stated that three only had been closed through exhaustion of the coal area tributary to the mine opening.

Jevons, in "British Coal Trade" has a paragraph that seems applicable to the stage of coal-mining through which Alberta is now passing. He writes:

"The technique of manufactures and of mining "which has developed in Europe and the United States "is applicable to any part of the world where there is "a sufficient demand for the products, and the necess-"ary labor can be obtained.

"As soon as there is a fully settled agricultural "population, there arises a demand for manufactured "goods and for coal. For twenty or thirty years they "may be brought long distances; but as soon as large "enough markets are established, capital begins to "arrive so as to produce coal or goods on the spot. "**The stage of mining in a small way will usually be** "**short.** After twenty or thirty years will come the "period of mining large companies owning many "square miles of minerals. To each of them the volume "of output, to the limit the market can stand, is a sure "road to big dividends. The growth of total demand "will then regulate the number of large mining con-"cerns which come into existence."

What is the limit of coal supply the Canadian market can stand? It certainly has never been tested, so far as the production of domestic mines is concerned, but Alberta and British Columbia are about to test not only the Canadian market, but far wider fields.

GRANBY CONSOLIDATED CO.

Its Coal Expenditure.

Boston — In the acquisition and development of its coal property on Vancouver Island, the Granby Consolidated Mining, Smelting, & Power Co. has spent close to $5,000,000.

These expenditures were made since October, 1915, and were comprised of the following items:

870 acres coal land	$320,000
Handling equipment and town . .	1,400,000
Timber claims, saw mill	490,000
Coke ovens	2,470,000
Total	4,680,000

Granby's policy regarding depletion and depreciation has been to make periodical adjustments on its books. The company writes off its depletion on a basis of net reduction in ore reserves compared with total ore reserves, at values commensurate with copper content. It has no definite method of computing depreciation. The general rule followed contemplates amortization less salvage values, of plant and equipment within the life of the mineral properties which they serve. — "Boston News Bureau."

BRITISH GOLD OUTPUT.

While it will be a considerable time before complete returns are available, returns from most of the leading producers of gold within the Empire are now available, and show a general decline on the figures of 1919, as follows:—

	1920. Ozs.	1919. Ozs.	+ or —
Transvaal . .	8,153,625 fine	8,330,091 fine	—176,466
Western Australia . . .	618,577 fine	734,066 fine	— 115,489
Rhodesia . .	522,808 crude	593,222 crude	— 40,414
India	475,893 crude	504,002 crude	— 28,109
Queensland. .	118,476 fine	121,030 fine	— 2,554
New South Wales . . .	48,907 fine	65,839 fine	— 16,932
Canada . . .	773,000 fine	767,167 fine	+ 6,000 about

The foregoing figures are excerpted from the London "Mining Journal", and the approximate production of Canada, as estimated by the Mineral Resources Division of the Mines Branch, is added. It will be noticed that Canada alone, among the British Dominions, increased gold production in 1920 over the previous year, and this increase is all to be credited to the gold mines of Northern Ontario.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

Already there are signs that the mining industry in the Cobalt district is finding its stride under the changed conditions caused by a lower price of silver. Instead of further curtailment, the tendency is now towards a resumption of work at some idle mines and development of new properties.

Apart from the McKinley-Darragh, Beaver Consolidated and the Temiskaming, no important operations have been curtailed. Such mines as the Nipissing, Mining Corporation, Coniagas and O'Brien are running full speed, and operations at not far below full blast are under way at the La Rose, Chambers-Ferland, Hudson Bay and Kerr Lake. Among the new operations coming into prominence is the Bailey Silver Mines where work is being conducted aggressively and exceedingly favorable results are being obtained.

The results so far achieved on the Bailey, added to the comparatively large tonnage of ore in sight at the time work commenced a few months ago, promise the inclusion of this mine among the regular shippers. Not only will a large tonnage of mill-rock be sent to the Bailey mill, but a considerable quantity of high-grade ore is being bagged, and this will be allowed to accumulate until such time as a high-grade shipment may be made. An extensive area of ground of good prospective merit lies directly ahead of the present point of operation, and the development of this property is one of the most interesting pieces of work now under way in this field.

Among the newly incorporated mining companies is the Prima Cobalt Silver Mining Company, Ltd. This company has an authorized capitalization of 1,000,000 shares of the par value of $1 each. Of this amount, 500,000 shares have been allotted to S. Barber, the original owner, and the remaining 500,000 shares will be used for treasury purposes. The property lies in the western part of Coleman township about a mile and a half west of the Montreal River. A number of strong veins have been opened up, in which low silver-values occur together with a comparative high percentage of cobalt. One shaft has been sunk 50 feet and a second pit is now down 20 feet. It is now proposed to instal a mining plant, and part of the equipment has already been purchased. Two 60 h. p. boilers are being hauled to the property, as well as a 4-drill compressor and other corresponding equipment. The plan of operation is to sink to 120 feet before commencing lateral work. Following this, the shaft will be deepened.

Reduced operating costs on account of lower wages and a gradual decline in the price of supplies offers every likelihood of a prosperous period ahead for the silver producers of the Cobalt and surrounding district. The assurance that the Pittman Act will continue in operation in the United States seems to have gone a long way toward stabilizing things. With silver having recently remained steady around 61 to 67 cents an ounce, plus the premium of around 10 to 12 p.c. on New York funds, the margin of net profit indicated at the majority of the mines is very satisfactory, although latest quotations for silver have fallen to below 60 cents.

Capt. Conrad Jorgensen, and H. G. Latilla, both of whom are interested in the Kirkland Lake Proprietary, 1919, arrived in Cobalt January 28th. After a visit to the Chambers-Ferland mine of the Aladdin-Cobalt Company they proceeded to Kirkland Lake to look over the other properties of the new company. By way of explanation, it may be said that the Kirkland Lake Proprietary, 1919, is the new concern which is to operate the merged properties of the Aladdin-Cobalt, Tough-Oakes Gold Mines, Burnside Gold Mines, Sudbury Syndicate and possibly the Sylvanite. The development policy has not been outlined, but may be announced after the annual meeting of the Tough-Oakes Gold Mines.

Much interest is being centred on the operations at the old Ruby Silver Mines. The drift at the 110-ft. level has reached a length of about 100 feet, and an official of the company informs your correspondent that the present face of the drift carries close to 30 ozs. of silver to the ton over a width of close to six feet. The vein itself has widened out to about eighteen inches, and carries patches of native silver, while silver values extend two or more feet back into the walls of the vein.

Reports are denied that the Mining Corporation of Canada has opened negotiations with a view to purchasing the McKinley-Darragh mine. Local officials have received no advice of any such negotiations.

Elk Lake and Gowganda.

A meeting of those interested in the Walsh property in the Gowganda district will be held on February 8th in Montreal to decide upon some course of action. It is understood the prospects for raising funds for development are good. The plan to remove the mining plant to an island in Miller Lake has been abandoned, and effort will likely be directed towards further developing the veins in which native silver has already been found.

Work is at a stand-still on the Collins property in the Leroy Lake section, but arrangements are to be made to haul in supplies this Winter so as to carry on work throughout the Summer. The shaft was sunk to a depth of 300 feet, where considerable water was encountered.

Transportation problems remain difficult in the Gowganda area. Last year's application by private interests for a charter to construct a narrow-gauge railway, which caused the Ontario Government to abandon the plan to build a macadam road, has left the transportation problem as far as ever from a solution.

Ore Shipments.

During the week ended January 28th, two Cobalt companies shipped ore, the following being a summary:

Shipper	Cars	Pounds
McKinley-Darragh	1	80,654
La Rose	1	88,073
Totals	2	168,727

During the corresponding period, no bullion shipments were reported.

THE GOLD MINES.

The outlook of the gold mines in the Porcupine District is uniquely favourable. Ore reserves, in the aggregate, were never previously so large. Labor supply is abundant, and the mine equipment could produce twice or three times the current gold output. These conditions justify a very general enthusiasm in regard to the events of the next ninety days.

Through shortage of hydro electric power more than half of the milling capacity is unused, and the quantity

of crude ore awaiting treatment is such as to promise an unpreecdented yield, for this field, when power is again available. Before the end of the year a production of three tons of gold every month, worth approximately $1,500,000, is looked for. Everything points to record production of gold during the last half of 1921.

Information from the Dome is highly favorable. Developments in the lower workings justify most optimistic views. A large quantity of ore ranging from $7.65 to $20 a ton has been encountered, and mill heads at this mine promise to increase very considerably as a result of further development at this low horizon. According to the opinion of those who should be well informed, the average grade of the ore on the Dome may within the next couple of years approach the high average so far established on the Hollinger Consolidated. That zone lying between the 500-ft and the 1,150-ft. level will probably add substantially to the resources of this property. Those interested in the mine are accordingly looking forward with interest to the returns when the mill will be operating to capacity, shortly anticipated.

Although power shortage has been acute during the past three months, yet it promises to be even more pronounced during February and part of March, and early spring rains are hoped for.

Mining men are making the suggestion that Sir Henry Drayton, Minister of Finance, should be invited to attend the Annual Meeting of the Canadian Institute of Mining and Metallurgy to be held in Ottawa in March. The idea has been mooted that the Government should purchase all the gold produced in Canada, at $20.67 an ounce. Sufficient of this should be retained to keep the country on a gold basis, while the balance should be sold as a commodity at a rate say fifty per cent higher than the standard price. This extra revenue could then be distributed among the mines in proportion to the amount sold to the Government. The scheme, however, appears to be one which it might be difficult to operate unless a similar plan should be followed in the United States. The McFadden Bill in the United States is pointed to as reason for somewhat similar agitation in Canada. At any rate, however, an address from Sir Henry Drayton in regard to the relation of gold production to the amount of paper issued, an explanation of who authorizes the dilution of the country's currency, as well as the relation of gold production to the rate of exchange would be instructive to mining men in general, and gold miners in particular.

Additional stringers have been encountered at the 250-ft. level of the Porcupine-Keora property, situated in the northern part of Whitney township, some six miles from the producing part of the Porcupine gold area. No statement has been made as to the average gold content of the mineralized body.

A TYPICAL STOPE HOLLINGER MINE.
(Photo and others on facing page lent by M. A. A. Cole.)

Reports are current of a possible merging of the La Palm property with the Three Nations. These two properties lie adjacent, and were explored in a fairly aggressive manner in the early days of Porcupine. No information is available in regard to the financial arrangements necessary before operations could be resumed.

An official statement has been given to your correspondent in regarding the results of diamond-drilling in the township of Mountjoy, lying immediately west of the Hollinger Mine area of Porcupine. A total of 6,000 feet of drilling was done. One hole was 1,800 feet in length. The core disclosed prophyry and greenstone schists which is considered a favorable indication. Large quartz veins were also encountered, although no commercial ore was detected in the areas tapped. The drilling was carried on for the purpose of testing

the formation being beneath the sand plains which lie immediately in the strike of the mineralized zone of Porcupine. As a consequence of the encouragement met with, the operators are understood to be preparing to exercise the options held on at least two of the properties. A number of other options may be abandoned. The exploration work was financed by British interests, and it understood further work will be proceeded with in the coming Summer.

Kirkland Lake.

A mining plant is being installed on the Wood-Kirkland property in the Lebel section of the Kirkland Lake district. Just as soon as the equipment is in place, it is planned to continue underground work from the point where left off at the 100-ft. level. At this depth the vein is comparatively wide, and an encouraging amount of ore is in sight. Assays are said to run about $8 a ton across four feet of the vein.

The mining plant on the Bidgood property is being doubled in capacity, and an extensive plan of operation is being planned. Among other things, the shaft will be continued beyond the present depth of 300 feet. D. H. Angus, of the Right of Way Mines at Cobalt will take charge beginning February 1st.

3042 Pouring the Gold—Hollinger Mine

The shaft on the Fidelity property in the northern part of Teck township is being kept pumped out and work is to resume here within a reasonably short time.

Shaft sinking has resumed on the Hunton-Kirkland after a temporary delay. The present depth is about 75 feet. It is proposed to carry the work to a depth of at least 200 feet, possibly 300 feet, before commencing lateral driving.

The power supply in the Kirkland Lake district is now adequate to fully supply the operating mines, but is not large enough to permit any large new operations to start. Consequently, the Wright-Hargreaves may not start its new mill before spring.

The Kirkland Lake Gold Mines of the Beaver Consolidated, is now fully supplied with power, and the output promises to increase considerably from this property.

In all sections of the gold mining areas of Northern Ontario the outlook is entirely favorable for much expansion.

A Prospectors' Class will commence in Haileybury on March 22nd. It will be conducted in the Haileybury Mining School, and will be under direct charge of Dr. W. L. Goodwin of Kingston University. Dr. Goodwin will come to Haileybury direct from Port Arthur where he has held similar classes.

Boston Creek Area.

The crosscut, north from the 500-ft. level of the main shaft has reached a length of 530 feet. Among the numerous veins encountered, the one at present showing in the face is believed to be important. It is associated with the customary dyke, and strikes north-east by south-west, a principal characteristic of the more important orebodies in the gold-mining areas of this country. The dip is about seventy degrees to the south-east or similar to that of the "D" or telluride vein directly above.

Before starting to develop this vein, it is proposed to continue the cross-cut right to the northern boundary, about 150 feet beyond the present point, as this is believed to be the chief area of mineralization in the district. From the appearance of the vein at this level, it would seem that it does not show, or has not been discovered at surface.

The drift north-east at the 500-ft. level is following what appears to be the "D" or telluride vein. At a point 70 feet from the cross-cut, the presence of a "mud seam" is considered a favourable indication.

3041

Two Gold Bars, valued at $112,000—a weekly shipment of bullion from the Hollinger Mine.

The laboratory sampling and testing outfit has reached the mine, and preparations are being made to instal it at once.

NEW YORK FUNDS PREMIUM AS A HIGH PROTECTIVE TARIFF.

"The existing exchange situation gives foreign nations the advantage of a highly protective tariff, ranging from 20 to 80 per cent, directed against the United States only, and this without creating any unpleasantness. It serves automatically to limit imports of American goods, and to stimulate the sale in America of foreign goods." Edwin C. Eckel, "Coal Iron & War."

PERSONAL.

C. H. Macnutt has resigned the resident management of the Black Lake Asbestos & Chrome Co., Ltd., to take charge of the Vimy Ridge property of the Bennett Martin Asbestos and Chrome Mines, Ltd., Coleraine Que., Canada.

MONTREAL METAL QUOTATIONS.

Following are fair average prices for ingot metals (in less than car-load lots) at Montreal. Quotations at Toronto and Vancouver are reported unchanged from the figures in the last issue.

	Cents per pound. 26th Jan.	3rd Feb.
Copper, electro	18	17½
Copper, castings	17¾	17¼
Tin	38	36½
Lead	6¾	6½
Zinc	7½	7
Aluminum	34	34
Antimony	7¾	7½

METALS AND PRICES.

("Financial News," London.)

Gold and Base Metals.

Investors in mining shares have experienced anything but good fortune for a considerable time past, and many of them have become distinctly uneasy as to the future. Whether we look at precious or base metal ventures, the position is the same. There are factors in mining that should always be present to the minds of the public, one of the cardinal being, of course, the fluctuating prices of the metals. Until 1919 gold was sold at a recognised level; in fact, it was stable, and, consequently, companies winning it were in rather more favour than the producers of silver, tin, lead, copper, etc. Base metals are subject to the law of supply and demand, while gold aways finds a home, and, though excessive output of the last-named may have affected prices of commodities, there has been no holding up of the metal for favourable opportunities of realising. Now, gold—at least that part of it produced outside the United States—is sold in the open market, and, consequently, investors are receiving the benefit of the excess over the standard, or what, for want of a better term, is called the premium. Had it not been for this premium, gold producing companies would be in as parlous a state as base metal undertakings. At present, the former receive a certain amount of compensation for the higher level of working expenditure, and it may perhaps be assumed will continue to receive it, though much naturally depends upon the American exchange. If this country simply had to rely upon its own trade position, the premium would decline; but so long as other nations with greatly depreciated currencies make London their clearing-house with New York, a full restoration of the £ sterling can scarcely be expected. The outlook for many gold mining companies may therefore be regarded as hopeful.

A Gloomy View of Silver Outlook.

With silver things are vastly different, and the dollar level which American miners had fondly believed to be permanent and something approximating the real value, has sunk very considerably. In fact, so serious is the actual position that a move is on foot to bring about a reduction in output. Perhaps the case cannot be better stated than in the letter written by Mr. Charles Butters to Mr. E. P. Earle, president of the Nipissing Mining Company, of Ontario, which appears in the *Engineering and Mining Journal*, of New York. Mr. Butters discusses the problem from the standpoint of the persons employed and the mercantile community on the one hand and from the point of view of the owners on the other, and arrives at the conclusion that it is far better to keep the ore in the mine than it is to go on and knock the price of silver by producing on such a market as exists at present. "I cannot see the object of increasing the supply of metal," he says, "even if the supply is withheld in the face of such an extremely light demand. . . . Instead of benefiting in the world we are hurting hundreds of millions of people by trying to force silver on the market already surfeited and unable to absorb the smallest amount without lowering the price. I urge every silver and copper mining company to close down definitely for either six months or a year." This is pretty drastic. Whether the Nipissing Board will agree remains to be seen, but there is much force in the arguments used by Mr. Butters. In connection with the low price to which

metals other than gold have fallen it is worth while drawing attention to the fact that the great Anaconda and the Utah Copper to say nothing of smaller producers, have thought fit to pass their dividends.

Tin.

Similar conditions exist where tin is concerned. Apart from some of the Malayan companies, which are, in a sense, protected by being guaranteed a minimum price, the number of mines being operated at a profit is reduced nearly to vanishing point. To begin with the home industry, the misfortunes of Cornwall are only too well known to our readers, and scarcely less so are those of Nigerian undertakings. For months an attempt has been made to stabilize the price of tin, and a minimum of £250 per ton was suggested. The Malayan, Cornish, and Nigerian Chambers of Mines discussed the subject almost *ad nauseam*, and we believe it was the action of the last mentioned that caused the failure of the negotiations. To be quite frank, and the criticism can scarcely be objected to, the Nigerian Boards seem to us to be all at sixes and sevens. There is not that cohesion which would go far to make the success of the industry. Take the labour question, for example. Instead of profiting by the experience of the Rand, and forming a recruiting association, a disposition is manifesting itself for the competitive enlisting of natives. Initial benefits will in the long run disappear, and the whole field will be unfavourably affected; for the wages problem will be an ever-present thorn. It is suggested in more than one quarter that the mines should not win more tin than they can actually dispose of on the market, thus taking a line of action parallel to that suggested by Mr. Butters in regard to silver, and identical with the policy of the United States copper companies. By restricting output hardships would undoubtedly be created; they might, nevertheless, prove small in contrast with the advantages to be gained. Governments have ceased buying metals; some of them still have stocks to work off, and industrial consumption is at a low ebb. There is no reason, however, for despondency. Nations cannot live without work, and work without metals is unthinkable in these days. We have no means at present of gauging the world's stocks; but with reconstruction work in progress, consumption is certain largely to increase. The turn of holders of base metal shares will come in due course, and it would be folly to sacrifice interests at current levels.

PRODUCTION OF GOLD AND SILVER IN THE UNITED STATES IN 1920.

The Bureau of the Mint, with the cooperation of the United States Geological Survey, has issued the following statement of the preliminary compilation of the production of gold and silver in the United States during the calendar year 1920.

State or Territory.	Gold		Silver.	
	Fine Ounces	Value.	Fine Ounces.	Value.*
Alaska	380,034	$ 7,856,000	792,751	$ 804,745
Alabama	10	200	5	5
Arizona	239,118	4,943,000	6,098,251	6,190,518
California	692,119	14,305,300	1,513,495	1,536,394
Colorado	368,298	7,613,400	5,572,407	5,656,718
Georgia	53	1,100	140	142
Idaho	22,509	465,300	7,531,253	7,645,201
Illinois	0	0	8,500	8,629
Michigan	0	0	510,601	518,326
Missouri	19	400	123,219	125,083
Montana	88,971	1,839,200	13,583,164	13,788,677
Nevada	171,968	3,554,900	7,392,689	7,504,540
New Mexico	22,417	463,400	764,586	776,154
North Carolina	53	1,100	11	11
Oregon	46,687	965,100	182,588	185,320
South Carolina	14	300	0	0
South Dakota	203,243	4,201,400	84,351	85,627
Tennessee	280	5,800	112,595	114,299
Texas	5	100	534,212	532,143
Utah	100,446	2,076,400	11,564,155	11,739,121
Washington	7,198	148,800	183,437	186,213
Wyoming	10	200	72	73
Philippines	51,568	1,066,000	21,947	22,219
Porto Rico	97	2,000	135	137
	2,395,017	49,509,100	56,564,504	57,420,325

Compared with 1919 production these figures indicate reduction in gold output of $10,821,000 and in silver output of 117,941 ounces.

* Silver valued at $1.01513 per fine ounce being the average price based on the New York Market Jan. 1 to 17, and $1.00 per fine ounce thereafter. By the terms of the Pittman Act and Mint regulations the domestic silver produced and reduced in the United States subsequent to Jan. 17th is salable to the Director of the Mint at $1.00 per fine ounce.

CANADIAN RAYBESTOS COMPANY.

Realizing the importance of the Canadian Brake Lining market, the Raybestos Company of Bridgeport, Conn., organized, last spring, the Canadian Raybestos Company, Limited, capital stock of which is $250,000.

This step was taken after consideration of the highway program of Canada, which contemplates the expenditure of $50,000,000 within the next five years, and of the status of the automobile industry in Canada at the present time. There are over 350,000 passenger automobiles and motor trucks in Canada at present, which means one car to every twenty-two persons. The rate in the United States is one car to about every fifteen persons but since the cost of automobiles and trucks is from fifty to sixty percent higher in Canada than in the United States, the Canadian investment per capita in automobiles and trucks is considerably higher than that of the United States.

The Canadian Raybestos Company purchased the factory of the Lundy Tool and Shovel Company at Peterborough, Ont., remodelled it, installing a sprinkler system, modern heating plant, concrete floor, new plumbing and a new roof. Machinery for the manufacture of brake lining, molded facings and other products of similar nature was shipped from the States. The nearness of the Canadian Asbestos Mines may lead the Company to set up a spinning department in addition to the manufacturing plant.

The officials of the Canadian Raybestos Company, Limited, are President, Sumner Simpson; Vice Pres., Howard C. Simpson; Secy. & Treas., Robert Abbott; Directors, the above, L. V. Simpson and Morton F. Judd, Mr. Abbott is manager of the Canadian factory. All the officers are connected with the Bridgeport organization. Canadian sales headquarters are at the factory and Henry Ervin is in charge.

HEATON'S ANNUAL.

The 17th edition of Heaton's Annual issued by Heaton's Agency, Toronto, maintains the high standard of former editions. As an indispensable office handbook for commercial and financial firms it needs no introduction, and no public or private library in Canada is complete without it.

In addition to Dominion and Provincial directories, banking and insurance directories, postal, cable, financial and commercial information, which we would expect to find in such a book, the Annual is known as the standard authority on the Canadian Customs Tariff and Regulations, there is a very complete summary of the Income Tax and Sales Tax, and it has two features that are unique: a complete encyclopedia of the Natural Resources of each Province including: Agriculture, fisheries, forest products, fur trade, minerals, water powers, etc., all revised to date, and the official Boards of Trade Register which gives up-to-date descriptions of towns in each province including railways, banks, schools, hotels in order of merit, industries, assessment, population and local opportunities, with clear maps of each province. Smaller places are covered in a Shippers' Guide giving banks, railways and population.

General information includes temperature and rainfall tables, statistics of commerce, population, immigration, transportation, etc., and a complete detailed directory of Universities and Schools in Canada. There are valuable exchange and miscellaneous tables at the end. The illustrated advertisements of the Provincial Governments and progressive towns add interest to the book.

A special section on Manufactures covers, Development of Treaty Making Powers, Statistics of Manufactures, Growth of Home and Foreign Markets, British and American Branch Factories, Industrial Opportunities in each province, Notes on various manufactured products, and statistics of Trade Unions in Provinces and Cities.

NIPISSING MINES COMPANY.

Averages Slightly Better than $1 an Ounce for its 1920 Silver.

Boston — Nipissing Mines Co. averaged slightly better than $1 an ounce for its 1910 silver yield, notwithstanding the probabilities that American companies will show better than $1.15 as their sales average. The disparity was due to the $1 price placed on silver from domestic mines by the United States government and the drop in the open market for foreign products to below 70 cents an ounce.

With the inclusion of $224,000 of cobalt into its last month's operations, Nipissing in December scored the biggest month in its history with production of $507,320 from which there were estimated profits of $412,000.

It has been the idea of the Nipissing management during the past few years to operate the property as nearly like a manufacturing concern as possible with production yielding just a trifle more than dividend requirements.

This was impossible in 1919, owing to the sensational advance in silver prices, but the activities of 1920 were conducted strictly on these lines, with the result that net for the past twelve months will show but little more than $1,800,000 paid out in dividends. — "Boston News Bureau."

MR. GEO. S. MACKENZIE.
The Secretary of the Canadian Institute of Mining and Metallurgy

EDITORIAL

THE MINING PROFITS-TAX IN ONTARIO.

The proposal to increase the exactions of the Mining Profit-Tax in Ontario seems singularly ill-timed. The Excess Profits Tax in Britain has been abandoned, although it is very generally admitted the government in Britain needs the money that this tax brought in. The reason for abolition of a profits tax in Britain is that it has proved to be a deterrent to enlargement of business ventures, and a hindrance to new investment. A judicial decision in Ontario has clarified the meaning of the word "concentrator", but what is perhaps more urgently needed is a clarification of the meaning of the word "profits". Only the very vaguest idea of what constitutes a profit in a mining enterprise is held by many people, even by people who depend for livelihood and income upon mining ventures.

The tendency for legislators to tax mining enterprises is often traceable to the erroneous book-keeping methods pursued by mining companies, and to book entries called "profits" and "surpluses" of fictitious calculation. No calculation of profits is possible that does not take under review the entire life of a mine, and that does not plainly distinguish "profits" from the reserves required for return of capital invested, for ordinary bank interest on such capital, and for the dying days of a mining property. No "profit" accrues to any investor in a mining venture until his capital is returned. Further, any balance-sheet that shows property assets at any figure greater than breaking up value, is fictitious, and yet how many mining companies show such a balance sheet?

If the Ontario Mining Association desires to properly represent the position of those who compose its membership, and to prevent the government and the public from forming erroneous ideas on so-called "profits" it would be well advised to consult eminent actuarial authority and see that the financial statements of the mining companies are in deed and in truth representative of the financial position of these companies.

The formulation of a standard form of profit and loss statement, and of a balance-sheet of assets and liabilities, is something to be desired in Canada, and it is one in which the Ontario Mining Association, the Canadian Institute of Mining & Metallurgy and the various taxation authorities of Canada might well co-operate to secure the necessary expert actuarial and mining advice that is needed.

THE FUEL PROBLEM.

The "Atlantic Monthly" for February has an article by Arthur D. Little of New York on the fuel problem of the United States. There is really no fuel problem in that country, at least so far as available sources of supply are concerned, but there are some very urgent problems connected with distribution, problems that are not less our problems than those of our neighbours so long as the most densely-populated portions of Canada form part of the normal distribution radius of United States coal.

Mr. Little mentions that the anthracite reserve is only 190 tons per capita, a quite sufficient explanation of the increasing cost of this admirable fuel and of coming restrictions in its uses. Bituminous coal is present in the United States in reserves of inconceivable vastness, but it is far exceeded by the reserves of lignitic coals. The lignites are regarded by Mr. Little as a most valuable fuel reserve, and we have proved in Canada that by briquetting and powdering it can be made to serve all the purposes of bituminous coal in industry, and of anthracite in domestic heating.

A most striking feature in Canadian municipal development is the little use that has been made of coal gas, and Mr. Little confirms that contention often put forward in this journal that the more closely complete gasification of coal fuel is carried prior to its use as a heating medium, the more ideal is the practice. There are large areas of bituminous and lignitic coal consumption in Canada without municipal or corporate gas plants, which amounts to depriving large portions of our population of the most convenient and economical method of securing light, heat and power from coal.

Similarly, this United States authority comments on the incomplete manner in which we have applied the

selves of central electric-generating stations. "We mine, transport, and distribute nearly 700,000,000 tons of coal, when what we really want at the delivery points are heat, light and power. We ask for energy and are given a stone."

The opportunity for the "super-gas-works, and super-power-plants, high-pressure distribution of gas and common-carrier transmission lines for electric energy" is greater in Canada than it is in the United States, because our coal reserves are most unevenly distributed, and in the most acute sense the problem of providing light, heat and power in Canada is a study in transportation, or what is equivalent, a problem of power transmission.

The development of our water-powers for generation of electricity is not a rival of fuel-fed power stations. The two methods of power-generation are complementary, and both added together, plus all our peat resources, cannot overtake the fuel deficiency of Eastern Canada. Intensive, but co-ordinated development of every possible source of motive energy is desirable in Canada. The Intercolonial Railway, from Sydney to some undetermined point beyond Moncton, is an anachronism of the steam age perpetuated into what Mr. Little calls "the adolesence of electricity", inasmuch as it carries fuel for steam locomotives past four suitable locations for electric-generating stations at the coal-pit mouths. With only three-quarters of one percent of Canadian coal beds situated east of Saskatchewan it cannot be maintained that there is not urgent need for availing ourselves of every possible economy in generation of power, and it most certainly cannot be stated that there has been even an elementary attempt to modernise our practice.

CORRELATION OF COAL SEAMS BY MEANS OF SPORE EXINES.

Dr. Reinhardt Thiessen's suggestion that exact correlation of coal seams by observation of the predominance of one or more types of spore exines, opens up a very fascinating avenue of study. The distinctive character of the sculpturing and general outline of typical spore-exines that have been photographed by Dr. Thiessen to illustrate his paper, and are reproduced in this issue, are astonishing examples of the ornamentation and artistry that the Supreme Architect has expended upon the most obscure and infinitesimal things that the microscope reveals to the searcher, and one more example that Nature never exactly repeats herself. This apparently was not less true in paleozoic times than in our day.

The study of the characteristic microscopic plant remains in any given coal seam, combined with observation of the leaf impressions of the roof and floor, and with the presence of animal remains, such as small crustaceans and shellfish, should enable some very exact conclusions to be reached in regard to the stratigraphical position of the seam in question, and its correlation with other seams. Dr. Thiessen's studies form a most interesting chapter of contemporary coal literature, and indicate that extensive as the present-day knowledge of coal substance is, compared with quite recent times, only the fringe of the subject has been skirted. There remains much work, in many localities, for patient investigation and recording, but even today, it is noticeable that scientific investigation of coal substance has enabled several definite applications of the knowledge gained to economic geology and applied chemistry.

Apropos of the subject of coal-seam correlation, the "Colliery Guardian" of London urges supervision of boreholes by geological surveys. Mining engineers in Britain, and not in Britain alone, have in some instances been decidedly antagonistic towards divulging information bearing on the rocks disclosed by boreholes, but the "Colliery Guardian" believes that the trend of modern opinion is changing in this respect, and "that it is now more generally recognised that mining engineers have as much to gain from the assistance of the Geological Survey, as the last-named has from the information that a borehole may afford."

The point is well taken. Secrecy in the arts is an exploded anachronism, and one of the signs of the times that is hopeful is that a paper such as Dr. Thiessen has prepared should be available for general public use, and that it should also be available for the public of many countries, although primarily it is the result of the expenditure of public monies by one country only.

CAPITALIZING A NUISANCE.

A Boston news item stated that the Tennessee Copper Company has become less and less a copper factor since the demand for sulphuric acid expanded so rapidly, and today the copper output "may be considered as a by-product." There would appear to be distinct encouragement in this experience for the recovery of sulphuric acid from copper-nickel ores which are smelted in Ontario, especially as it is understood the sulphur content in the smelter gases is much less in the case of the Tennessee Company than is the case with the Ontario companies. Not for the first time has it happened that an addition to a plant for recovery of by-products has proved a veritable anchor in times when the demand for the main product was small and selling prices unprofitably low. The Tennessee Copper Company was, in the first instance, driven to purification of its smelter fumes by legal injunction, one of the few instances probably in history where litigation has benefitted all the parties concerned.

The low value which the Canadian Government places upon its technical officers is unfortunately merely a reflex of the uninstructed state of the public

mind as to the economic value of scientific studies. Under the existing idea of civil service remuneration by rigid classification according to seniority and position held it is quite evident that there is no possibility of any scientists of outstanding achievement remaining in the public service except during a limited period in the earlier stages of their careers. Probably a chief objection to a democratic form of government by electoral control is that it encourages mediocrity among the civil servants, and by a process of natural selection ejects those whose attainments merit special distinction. It is fortunate that there are scholastic institutions left where the aristocracy of intelligence persists and where some of the more vicious tendencies of democracy are held in check.

DR. J. A. BANCROFT APPOINTED ASSISTANT MANAGER OF THE GRANBY COMPANY At ANYOX, B.C.

It is announced that Dr. Bancroft has been granted one year's leave of absence dating from the close of the present session at McGill University, during which period he will hold the position of Assistant Manager of the Granby Company's mine at Anyox. Dr. Bancroft has been a member of the McGill Faculty for fifteen years, and holds the Dawson Chair of Geology. He has a very extended acquaintance with the economic geology of metal occurrences in British Columbia. While his Montreal friends would welcome any material advancement that might come to Dr. Bancroft in executive capacities, there would be general regret should ability in a new direction deprive the country of his services as a teacher of geology.

DR. M. Y. WILLIAMS LEAVES GEOLOGICAL SURVEY.

Dr. M. Y. Williams has been appointed Professor of Paleontology at the University of British Columbia, and his leaving Ottawa is very generally regretted, where he has not only been recognised as a distinguished member of the Survey, but has taken a lively interest in the community life. Dr. Williams is an authority on Silurian geology in Canada, and in recent years he has specialised in the economic geology of oil. He is a member of the Geological Society of America, a graduate of Queen's University and a Ph. D. of Yale. He was also President of the Professional Institute of the Civil service, to which organization he has given much time and energy.

The Ottawa "Citizen" regards Dr. William's departure from the Survey at Ottawa as another instance of the bad results of "a hastily prepared, ill-considered classification, based on inadequate remuneration". It is understood that Dr. Williams has refused offers from foreign oil corporations.

THE CEMENTATION PROCESS APPLIED TO MINING.

The Journal of the Chemical, Metallurgical & Mining Society of South Africa for November contained a paper by Dr. G. A. Voskule, describing the application of the cementation process in the construction of a dam for the Mazoe Irrigation Scheme in Southern Rhodesia. In this instance the process was used to solidify and render impervious the substrata of the foundations to support the retaining wall of the dam, and it was successful in achieving this purpose, and in avoiding an enormous amount of excavation and subsequent refilling with concrete. After some preliminary treatment to form the foundation of the dam, the construction of the dam and the cementation of the substrata were carried on simultaneously.

Twenty-five thousand cubic yards of rock were treated by cementation at a cost of eight shillings per c. yd. The cost of one cubic yard of concrete laid down was sixty shillings and a saving by use of the cementation process of £65,000 is estimated.

In the discussion that followed the reading of Dr. Voskule's paper, it was mentioned that the damage to the coal shafts in the Lens district had been repaired by cementation of the strata which had enabled the water from the upper, water-bearing strata to be quickly cut off.

Shaft sinking by the cementation process has been perfected in recent years in Europe, and has been used in the eastward extension of the Midlands Coalfield in England, which has required shaft-sinking below sea level. The François system is the one generally adopted.

TENNESSEE COPPER COMPANY PRODUCE SULPHURIC ACID AS MAIN, AND COPPER AS THE BY-PRODUCT.

A new high record was established last year by the Tennessee Copper & Chemical Co. with a sulphuric acid production of 333,629 tons, an increase of more than 50,000 tons over the best previous year.

From now on the company will make larger profits as new three-year contracts began on January 1, with more than half its yearly output being sold to the International Agricultural Corporation, American Agricultural Chemical Co. and Virginia Caroline Chemical Co.

"Capitalizing a nuisance" has been the company's experience during the past decade or more as the company was forced to commercialize its smelter fumes or be closed down by court order. Production of sulphuric acid on a large scale was the result.

The company has become less and less a copper factor since the demand for sulphuric expanded so rapidly and today the copper output may be considered as a by-product.—"Boston News Bureau."

REPORT FOR 1919, WESTERN AUSTRALIAN DEPARTMENT OF MINES.

The Report of the Department of Mines for West Australia, with its accompanying statistics is a most carefully prepared and exhaustive document. The value of the mineral output for 1919 was £3,561,201, being £701,373 less than the previous year. The greatest decrease was in gold, the chart accompanying the Report showing a continuous decrease since the record year of 1903. Gold production was valued at £3,118,113 being 87.56 per cent of the total mineral value. To the end of 1919 the total mineral production of the State is valued at £157,732,633, of which amount £140 729,627, or 95½ per cent represents gold production. Other minerals produced, in order of total value, were coal, silver, lead, tin and copper.

The Fuel Problem of the United States

By ARTHUR D. LITTLE

(Condensed from February "Atlantic Monthly.")

I

Our civilization is built on coal. It has much of coal's murkiness and grime. It has, nevertheless, developed a complex industrialism based on power, which, utilized through the agency of machines, multiplies many times the productive capacity of the individual. Whether a coal civilization is upon the whole better than the man-power civilization, which Thomas Jefferson so ardently prayed might persist in America, is perhaps more open to question than we realize; it is certainly more debatable than we admit but, for better, for worse, here it is, and it is here to stay. We have long passed the time when, as Dr. Johnson said, 'Four good wants ought to last a man a year.' The industries that we created to meet our relatively simple wants feed and develop on the new wants which they themselves create. They have thus grown, until they dominate our civilization; but, as pointed out by Gilbert, it is a curious and pathetic anomaly that the two most basic industries in the United States, food-production and the coal industry, are the most inefficiently organized of them all.

In the United States the enormous increase within our memory in the production of basic products gives spectacular testimony of the rate of our industrial growth. In 1870, we produced 1,600,000 tons of iron; in 1919, 30,000,000 tons. Our coal output, which was then 33,000,000 tons, is now approaching 700,000,000. We mined, in 1870, 28,000,000 pounds of copper; in 1919,1,289,000,000; while our per-capita consumption of petroleum, which was .016 barrels in 1860 and only .83 in 1900, has, during twenty years, jumped to three-and-a-half barrels.

These figures are significant only as one is able to visualize the ramifications of industry into which these basic products enter. The textile and paper mills, the steel works, the electrical manufactures and the diversified distribution and influence of their products, the gas-works, the automobile industry, the countless factories which pour their product into the market—to each and every one of these the fuel problem is a problem of the first magnitude; for without fuel, or its equivalent in energy, they cannot turn a wheel.

With more than half of the world's coal reserves within the area of the United States, we have permitted a situation to develop which has involved shortage at the mines, with the miners on strike or 'on vacation', famine at consuming points, embargoes, priority rulings, and the complexities and inhibitions of fuel administration by the state.

The situation is due, of course, to the converging influence of many factors, not all of which find their origin in the war. There is a noticeable shortage of men at the bituminous mines, and there is a serious shortage of coal-cars. The men work little more than half the time. They show a broad catholicity in the observance of church holy days, whether it is their own church that celebrates, or some other. With winter upon us the anthracite miners take a vacation, and this curtails output by 3,500,000 tons. Water-shipments to New England have been hampered, or interrupted, during most of the summer by labor troubles at the piers, which may have had no nearer cause than a hunger strike in Brixton prison or the failure of an archbishop to land in Ireland.

Concurrently with the gradual and general breakdown of rail-transportation services has come the building up of an enormous increase in the demand for power, which, nevertheless, is so inefficiently distributed and utilized that, in the densest industrial section of the country, the average load-factor is only 15 per cent, where it might well be 60. We may expect no cessation in the development of this demand for power, because only by rendering available to the individual worker larger and larger units of power, may we hope measurably to satisfy the insistent demands of labor.

The increased cost of coal has probably imposed an annual tax upon the American householder of not less than $600,000,000 in direct charges, and has been the cause of much acute suffering in the households of the poor. An indeterminate, but probably far greater, additional burden has resulted from higher manufacturing costs, and delayed production due to failures in coal-deliveries. The industries consume more than 30 per cent of all the coal we mine, and in many cases of bulk-production the amount of coal consumed is greater than the weight of product. A ton of paper, for example, requires for its manufacture two tons of coal. Moreover, the fuel problem bears a very direct relation to the housing problem, since great quantities of coal are required for burning lime, cement, and brick, and for smelting and working the iron and steel that enter so largely into construction. In other important industries, like the manufacture of gas and coke, calcium carbide for acetylene, and for the nitrogenous fertilizer cyanamide, as also in many metallurgical operations, coal functions as an essential raw material, which enters directly, or as coke, into the reactions of the process.

About a quarter of our total coal-production, or 153,000,000 tons, is used, and used wastefully, by our railroads. The steam locomotive, with its varying load and frequent periods of idleness, is not an efficient unit of power-generation. Moreover, about a third of the freight tonnage of the railroads consists of coal Obviously, therefore, a very pressing phase of the fuel problem is that which concerns the railroads. It can be met only by lifting the general load-factor of our industrial communities, while at the same time, wherever possible, transmitting electrical energy or distributing high-pressure gas, instead of transporting coal

Sir William Crookes, toward the close of a phenomenally long life, summed up his experience by saying, 'Whatever happens makes for progress.' If we can accept his conclusion, we may even reconcile ourselves to the present high level of coal prices, since they seem altogether likely to lead to the adoption of methods long in common practice abroad for the utilization of low-grade fuels: the far wider use of producer gas from coke, peat, lignite, and high-ash mine refuse; the expansion of the coal-gas industry with recovery of chemical values; and, finally, to the production and general use for city fuel of artificial anthracite, which permits the same recovery We commonly think first of coal in terms of its heating values, and some of us stop there. Most of us recognize that its energy values as applied to power-

development are of at least equal importance, but comparatively few realize the significance of the chemical values in coal.

Obviously, there should be a way for the home to get its fuel more cheaply, when a ton of coal, costing in 1915 about one dollar at the mine, contains about fifteen dollars' worth (at 1915 prices) of commodities useful to society. These are,—

1,400	pounds of smokeless fuel	$4.67
10,000	cubic feet of gas, at 90c.	9.00
25	pounds ammonia sulphate, at 2.8c.	.70
1½	gallons benzol, at 26c.	.39
9	gallons tar, at 2.6c.	.23
		$14.99

The way to get these values generally out of coal lies, according to Gilbert, in the development of artificial anthracite. Another way would seem to be through the establishment of great super-gas plants, and the distribution, over a considerable radius, of high-pressure gas for industrial purposes. Such distribution does not seem to lend itself to domestic heating, by reason of the enormous fluctuation in the demand, with temperature variations.

The smallness of the anthracite field, which, by the way, now contains only about 190 tons per capita, has favored a closeness of control under which effective mining methods have been developed in spite of laws opposing the means to that end. Bituminous coal, of which we have vast reserves estimated at 15,000 tons for each inhabitant of our country, fails, nevertheless, to meet its obligations, because of the competitive manner in which it is mined, the unnecessary extent to which it is transported, and the improper way in which it is used. It is a necessity, which cannot be produced advantageously under competitive operation. Integrated mining will reduce waste, stabilize production, and hold the centres of production longer than otherwise to their present spots, to the advantage of distribution; but to reduce the price to the consumer, we must change our methods of use and recover other values than mere heat value. As it is, we have a public policy hostile to combination, and no methods of storage; so that we can mine only when cars are available. The companies are scattered and unorganized, while many are small and financially weak. The price at the mine has in the past been so low that only thick seams could be worked. The industry is hampered by the restrictions of the miners, and subject to the derangements resulting from a fluctuating demand and seasonal variation.

These conclusions, which have been strikingly emphasized by Gilbert and Pogue, and many other facts and tendencies, point to a very real danger of the ultimate nationalization of coal, petroleum, and perhaps other basic resources. Such a prospect can be regarded with equanimity only when we have been able to secure a far higher level of efficiency in the conduct of public affairs. Not only must we demand vision in our public men, but we must demand a public policy based on vision and directed toward the coordinated development of the resources of our estate.

The present spectacular boom in oil; the feverish search throughout the world for new producing fields, the immediate shortage in our own supply and the impending exhaustion of our oil reserves; the new oil-burning navies and merchant fleets; the extending use of fuel oil by railroads and the industries; the enforced economy in the employment of gas-oil for carburetting water-gas; the flood of gasoline required to drive automobiles, trucks, tractors, power-boats, and aeroplanes, and its soaring price — all bear witness that the fuel problem is not confined to coal. The internal-combustion engine, by reason of its efficiency, convenience, and compactness, has brought us to the verge of another industrial revolution, which may yet prove to be as far-reaching in its effects as the one which derived so much of its impetus from coal. Already it has resulted in the development of a new and most pervasive system of transportation, dependent upon petroleum and insistent in its demand for better roads. It supports scores of new industries, drains the labor market, profoundly affects real-estate values, upsets the economy of households, and conducts its operations on such a scale of magnitude that two per cent of the American people are said to be dependent upon the activities of a single manufacturer of motor-cars.

Our aspirations for an over-seas commerce under the American flag involve the assurance of a supply of fuel oil, since four ships burning oil will do the work of five propelled by coal. Fuel oil, according to Lord Fisher, increases the strength of the British Navy 33 per cent; and, partly because of its remarkable adaptability to service, partly because of its greater efficiency, it is generally recognized as far superior to coal as fuel. It generates in practice nearly double the British thermal unit per pound consumed. None the less, its general use as fuel can be regarded only as an economic crime, in view of its other and greater potential values and the limitation of supply. Its price is bound to rise to a point prohibitive for ordinary fuel uses. In the Diesel engine its capacity for doing work is multiplied by three, and one ton of oil is equivalent in effective power to four tons of coal.

Meanwhile, the demand for fuel oil is increasing at an unprecedented rate, under the stimulus of an aggressive campaign by the oil companies, whose stocks had begun to accumulate in disconcerting volume with the termination of the war. The programme of the Shipping Board will soon require an annual supply of 60,000,000 barrels, for much of which we must depend on Mexico. Already the price has reached a point that has led the navy, in several instances, to seize supplies held at figures that it refused to pay.

More than 90 per cent of all the automobiles in the world are in the United States. It is estimated that their number in 1921 will reach 10,000,000, without including motor-trucks or tractors. We consume to-day about 120,000,000 barrels of gasoline and 7,200,000 barrels of motor-oil a year, and are called upon to concentrate a requirement of 250,000,000 barrels of gasoline, by the automobile industry alone, within fifteen years. There is small justification for the hope that we can get it. There is no general substitute in sight that promises to be available in adequate amount, although both alcohol and benzol function admirably as motor-fuel. The Geological Survey estimates that the oil resources of the country are more than 40 per cent exhausted. In 1870 we mined 5,000,000 barrels. In 1919 our production was 378,000,000. The 60 per cent reserves represent what is left in spite of our utmost endeavors to get it out. It totals something like six and a half billion barrels on which we may hope to draw at our present rate of consumption for about sixteen years. That is a short time in which to develop a substitute for 250,000,000 barrels of gasoline, even if the possibility and

means of such development were in sight. Requa foresees a demand for 900,000,000 barrels of petroleum in 1930; and it is not surprising that he regards it as a quantity which the oil territory of the United States is probably incapable of supplying.

With our domestic yield representing two thirds of the entire petroleum output, and with a consumption within the United States of one half of all petroleum values produced, it is not surprising that nations, corporations, and individuals are engaged in a desperate search for petroleum, which extends to the remotest corners of the earth. It is indeed the Day of Petroleum, but no one knows the time o' day.

Vast quantities of gasoline have in the past been allowed to escape with natural gas, the waste of which has been as high as a billion feet a day. In 1900, in West Virginia, in only two counties, over half a billion feet were lost every twenty-four hours. Several ingenious processes are now employed to recover gasoline at the casing head of gas-wells. The quantity obtained from this source was about 12,000,000 barrels in 1919. It is an important contribution, but without real bearing on the general situation; and our reserves of gas are failing.

These wastes of natural gas, which is an ideal fuel, and the losses and maladjustments which attend the orgy of petroleum production, again afford glaring examples of the need of a constructive national policy for the development of our resources. So long as ownership of portions of a common reservoir of oil is determined by vertical boundaries, each owner can hope to secure his own only by getting it before his neighbor. The result is necessarily hurried, unregulated, and wasteful production.

The hope has been held out that, as our oil reserves fail to meet the increasing demands upon them, the burden can be shifted to the vast deposits of oil-shale in the Middle West, notably in Utah, Colorado, Wyoming, and southwestern Indiana. These deposits in Colorado alone are estimated to contain not less than twenty billion tons of shale, much of which yields upon distillation a barrel of oil per ton. Much leaner shales have been profitably treated for many years in Scotland, though the industry is now said to be jeopardized by the competition of Persian and Egyptian oil. Unfortunately, the Scotch methods of operation do not seem to lend themselves to the treatment of our American shales, from which the large-scale production of oil presents industrial problems of the first magnitude. These problems are in fact so great, and so remote from solution, that no relief from shale in the near future can reasonably be expected. We shall undoubtedly some day have an oil-shale industry of vast proportions; but it is well to realize that, before it can carry the burden of responsibility now borne by oil, we must develop mining operations upon a scale at least equal to our present effort in mining coal, and must superimpose upon these operations a great transportation system, and a refinery capacity of the order of that now serving petroleum. It may well employ a million men, and its operations will build up mountain of waste beside which the anthracite culm piles will look like hillocks.

In peat and lignite we have other great reserves of fuel, as yet untouched. The peat deposits of the country are estimated at fourteen billion tons, most of which is in the eastern states along the Atlantic seaboard. New England, which is now dependent upon the delays and hazards of rail and water transportation for its fuel, is especially rich in peat, which it does not know how to use. In Boston we shivered through the rigors of last winter, and endured the hardships of a protracted coal-famine, while great beds of peat remained untouched around us. The basic problem of peat-production remains that of harvesting, which is often complicated by a mass of interweaving roots in the overburden; and there is still the difficulty, due to its colloidal character, of drying peat, which commonly contains from 80 to 90 per cent of water. Much admirable work has been done, nevertheless, in the direction of peat-utilization. On the dry basis it has rather more than half the heating power of the best coal (8500 B.t.u.), and in some instances has equaled coal in economy when burned under boilers. As amply demonstrated in Germany and Canada, it yields its best return in gas-producers, with recovery of ammonia as sulphate. With beds averaging 2 per cent in nitrogen, power-gas has been produced from peat at nominal or negligible cost.

Our supply of lignitic coals exceeds our total bituminous reserves by 33 per cent, and amounts to some 20,000 tons per capita. It is far more available at once than peat. The Bureau of Mines has shown that one ton of dry lignite yields from 8000 to 10,000 feet of gas, 17 pounds of ammonium sulphate, one gallon of oil, 50 gallons of tar, and one half to two thirds of a ton of carbon residue, convertible into briquettes approaching the value of anthracite. Lignite, when mined, has the disadvantage of powdering in the process of drying and weathering; but used as powdered coal, it undergoes very complete combustion and gives high efficiencies. For domestic and general purposes it needs only to be briquetted after carbonizing, with recovery of by-products, and is thus potentially one of our most valuable fuel reserves and one upon which we are likely soon to draw. There are, for example, great lignite deposits in Texas, which, like the whole of the Southwest, is now entirely dependent on a failing oil-supply for fuel.

A shocking proportion of the values in our fuel is now lost through preventable wastes. We have wasted more natural gas than we have used. A recent British critic estimated that indiscriminate drilling and inefficient work has resulted in the loss of over 50 per cent of our potential petroleum production. The wastes, not all of them preventable, in our mining of coal approach the same order of proportionate magnitude. The absurdly low average load-factor carried in our industries, the great excess of air commonly supplied in burning coal, and the inefficiency of the locomotive as a 24-hour power-plant, all add heavily to the burden of waste we carry.

For metallurgical purposes we coke about 80,000,000 tons of coal a year; but only half of this is coked in by-product ovens, in spite of the stimulus to their development afforded by the war. The other 40,000,000 tons are still coked in crude beehive ovens, with complete loss of gas and chemical values. Thus we still waste prodigally the ammonia required by our agriculture; tar and oils available for waterproofing, road-making, and wood-preservation benzol, toluol, aniline, anthracene, and naphtaline, the basic raw materials for dye-stuffs and explosives industries, and for countless synthetic products of widely diversified usefulness.

Anyone who has seen a great battery of boilers fired by natural gas must have been impressed by the ease and flexibility of control, the steady maintenance of steam-pressure, the absence of smoke, the cleanliness

of the equipment and surroundings, and the minimum of manual effort required for these results. This remarkable adaptability to the requirements of service makes gas an ideal fuel for most industrial and domestic purposes. Our annual consumption of natural gas is around six hundred billion cubic feet, which is probably twice the volume produced by all the gas-works and coke-ovens in the country. This includes coal-gas from the destructive distillation of coal, water-gas made by the reaction of steam on incandescent coke, and producer-gas, which is the result of the complete gasification of coal under the action of a mixture of air and steam. In our development of the gas industry we may still learn from the British, with whom coal-gas originated and who are now demonstrating the economic advantages of lower heating values. Our smaller municipal gas-plants are too often antiquated organizations, without vision, and far from realizing, either in their present practice or in their preparation for the future, the possibilities of the industry. They are, therefore, not likely to initiate, and are poorly equipped to meet the revolutionary developments which seem to be impending. They are confronted with higher manufacturing costs, due to dearer coal, labor, and money. They are being rapidly shut off from the supplies of gas-oil required for the enrichment of the relatively cheap water-gas. A forced return to coal-gas seems inevitable, if present standards of quality are to be maintained, though the immediate tendency is toward combination processes involving the complete gasification of the coal. Meanwhile, a general advance in rates is in effect.

Looking to the future, there is obvious need of a more flexible method of manufacture and a wider range of products. The utilization of the gas itself is still relatively undeveloped, but the gas-engine, the new methods of surface-combustion, the range and convenience of high-pressure gas, and many other factors, point to a great expansion in the industrial use of gas. Similarly, the progress made in the low-temperature distillation of coal and the remarkable results already attained point to the ultimate city gas-plant as one designed to receive the raw coal required by the community, and to produce therefrom gas, artificial anthracite, oils, motor-fuels, and alcohol from ethylene, concurrently with the recovery of the benzol, tar, and ammonia now lost when the community burns raw coal. In fact, coal is the only resource in sight available in sufficient quantity to serve as raw material on which to base a method for the production of fuel-oils and motor-fuel in quantities adequate to meet the ultimate demand. It devolves upon chemistry to develop such a method, and, when developed, the place for the method is in the gas-works. Very significantly, the yields of oils obtainable from coal by carbonization have almost doubled since 1918.

But the gas-works are not alone involved in the impending revolution in our use of fuel. Powdered coal combines many of the advantages of gas with many of those of oil. It is highly efficient, easily controlled, and, perhaps best of all, permits the effective use of low-grade coals, culm, and lignite. A more recent development is colloidal fuel, composed of an emulsion of powdered coal and fuel-oil. The usual proportions are 40 per cent coal, 59 per cent oil, and one per cent of a "fixateur" to ensure the stability of the emulsion. Colloidal fuel remains in the liquid state, can be stored and pumped like oil, and burned in the usual oil-burners. Its chief present importance lies in the fact that it conserves and extends the supply of fuel-oil.

III

We sometimes call the period in which we are living the Age of Electricity, whereas it is really the adolescence of electricity. We mine, transport, and distribute nearly 700,000,000 tons of coal, when what we really want at the delivery points are heat and light and power. We ask for energy and are given a stone. The transportation of energy and its delivery to our homes and factories and along our railroad lines have just begun. In its extension on a scale vastly greater than anything we have known lies the hope of solving our fuel problem. We have come to the day of super-gas-works and super-power-plants, high-pressure distribution of gas, and common-carrier transmission lines for electric energy.

Electricity has already become the most effective servant in the house. At the turning of a button, it floods our rooms with light; it is not above doing a little cooking; it runs the vacuum cleaner, the sewing-machine, the dumb waiter, and the pianola. It heats the curling tongs and the flatiron, and may even be persuaded to replace the iceman at the refrigerator door. It is a prompt and willing messenger. The farmer who, in response to the revolt of mother, installs an electric pump, soon finds that mother's labor at the old pump-handle was worth only one half-cent an hour. Some indication of what these integrated services cost in power may be found in a recent order for one million electric washing-machines, each of one kilowatt capacity. A million kilowatts is interesting to any central-station manager.

The well-recognized relation of water power to fuel is expressed in the popular phrase, 'white coal'. The present production of hydro-electric power in the United States is roughly equivalent to 40,000,000 tons of coal; whereas nearly ten times that amount is used in the generation of steam power and carbo-electric power. In densely populated districts as much as one quarter of the coal-fired power is often devoted to the generation of electricity. Generally speaking, however, our public electrical utilities even now probably consume not more than 7 per cent of our total output of coal. The large unit applications of electricity to the industries are, nevertheless, rapidly extending. These applications involve not only the turning of wheels. More and more generally are great installations being devoted to the processes of electro-chemistry and electro-metallurgy, to the production of bleaches and alkali, carbide and acetylene, fertilizer, abrasives, aluminum, magnesium, special steels, and other basic products of the decomposing cell and the electric furnace. We have hardly begun to make electric steel, but the world already devotes some nine hundred million kilowatt hours of energy to its production.

The results obtained through the complete or partial electrification of a few of our railroads have amply demonstrated that the electric locomotive, in every variety of railroad service, does its work always as well as, and in most cases better than, the steam locomotive, while the latter as a prime generator of power is of course hopelessly behind the great turbo-electric generator.

These converging factors, which are quite general in their bearing, have already developed in England a strong trend toward the concentration of fuel consumption in super power plants as a step toward the ultimate electrification of British industry. In our own coun-

try the reaction to the obvious necessities of the situation has taken on an even more definite and concrete form in the stupendous plan for the creation of a super-power zone, extending provisionally from Washington to Boston, and inland from 100 to 150 miles. As a necessary preliminary to the realization of the plan, Congress in July authorized and provided for the conduct of the Super-power Survey, which is now being made by a special engineering staff under the inspiring leadership of W. S. Murray, and the general direction of the United States Geological Survey. Although the super-power zone includes only 2 per cent of the land area of the country, there is concentrated within it 47 per cent of our industrial activities. It contains an estimated machine capacity of 17,000,000 horsepower, of which 10,000,000 is employed for industrial purposes and the remainder utilized by the railroads. In a word, the super-power plan provides a means of lifting the average load-factor, which now within the zone does not exceed 15 per cent, to a load-factor of more than 50 per cent, and possibly as much at 60 per cent. It proposes to make one ton of coal do the work now done by two, and to relieve the railroads of transporting one half the amount of coal required for power and lighting purposes. It expects to increase the value of the machine capacity within the zone from threefold to fourfold, and to save not less than 30,000 000 tons of coal a year, worth, even at $5 a ton, $150,000,000. The reduced cost of maintenance of machinery and the reduction of train-miles through consolidation of trains will, it is believed, save another $150,000,000, making the total annual saving $300,000,000, or 24 per cent of the estimated cost of installation. The plan offers immediate relief from the present intolerable congestion of the railroads within the zone, by automatically increasing rail capacity without extending track mileage.

The present economy of power-production within the Boston-Washington zone will average at least 40 pounds of steam per kilowatt hour. In the contemplated super-power-plants of 300,000 to 500,000 kilowatts capacity, located near the mines and along the coast, not more than 15 pounds, and it may well be as little as 10 pounds of steam, with a total consumption of one and a half pounds of good coal per kilowatt-hour output, should be required.

These super-power-stations, together with all efficient generating units within the zone, and all available water-power, will be linked together and pour their output of high-tension current into the common-carrier transmission line from which both the railroads and the industries will draw their primary power.

This super-power plan may well be regarded as the first step in that co-ordination of our resources, and their development under a comprehensive general plan, which I have long advocated, and from its successful operation still greater things may reasonably be anticipated. Thrift has been defined by Roosevelt as 'common sense in spending'. We need sadly to develop a national common sense, and to apply it to the spending of our natural resources, which are the basis of our national wealth. More than ever before is the whole world under a heavy responsibility to use its resources wisely; and the major portion of that burden falls upon us who are the most richly endowed of all. We are beginning vaguely to recognize the urge of the hoarding instinct, which, according to Gilbert, marks the dawning of economic consciousness in the progress of civilization. We must learn to hoard until we can learn to use. We must substitute coordinated development by planning for opportunist development designed primarily for the enrichment of the individual. We have only to contemplate the situation into which opportunist development has brought us, as regards our coal, our oil, our gas, our water-power, our transportation systems, and our forests, to realize that most of the wastes, delays, and difficulties which characterize the situation are due simply to lack of planning years in advance, and to our failure to embody in a coordinated general plan those lines of action which are well recognized by experts as vitally essential to our proper development as an industrial nation.

NOVA SCOTIA COAL MINING NOTES.

The collieries of the Nova Scotia Steel & Coal Company produced in January 53,500 tons, comparing with 52,256 tons in January 1920 and with 62,372 tons in December. The lower output in January was caused by idleness at the collieries enforced by lack of outlet. The new colliery, No. 7, produced 439 tons.

The collieries of the Dominion Coal Company in the Glace Bay district produced during January 256,473 tons, comparing with 285,021 tons in December and 275,129 tons in January 1920. Enforced idleness at the collieries due to lack of outlet accounts for the smaller production.

All the Nova Scotian collieries have signed the wage agreement with the United Mine Workers. This was based upon negotiations at Montreal between the U. M. W. and leading operators, and has been acquiesced in by the smaller mines, in some cases under pressure of circumstances.

A. D. Matheson, who has been Manager of Dominion No. 4 Colliery has been appointed an Inspector of Mines for the Coal Company, and his place as Manager has been taken by J. R. Dinn, for a good many years Underground Manager of this mine. Alex. K. Hay, formerly City Engineer of Sydney, has been appointed Assistant Mining Engineer of the Dominion Coal Company.

The export trade to Europe is virtually dead, and the outlet for the production of the collieries in Nova Scotia is now limited to local uses, and a very small consumption at the steel plants, where operations are on a very reduced scale. As much coal as is considered advisable is being banked out, and an early opening of navigation is hoped for that will permit of coal being sent to St. Lawrence ports in quantity larger than since 1915.

ASBESTOS NOTES.

Asbestos Mines, Ltd., owners of the one time Boston Mine at East Broughton, Quebec, has increased the capacity of the mill from 4000 to 800 tons a day. It is stated to be the largest asbestos mill in Canada.

It is reported that the Quebec Asbestos Corporation of East Broughton, has purchased the adjoining property of the Asbestos Fibre Mining Company.

Asbestos Mines Limited has awarded a contract for an aerial ropeway to the American Steel & Wire Company. The aerial will have a capacity of delivering 1,000 tons of rock a day from the pit to the mill. The refuse from the mill will also be handled by the aerial.

The Asbestos & Mineral Corporation of New York announce the occupation of new quarters on the Gotham Bank Building, 1819, Broadway.

Recent Developments in the Microscopic Study of Coal

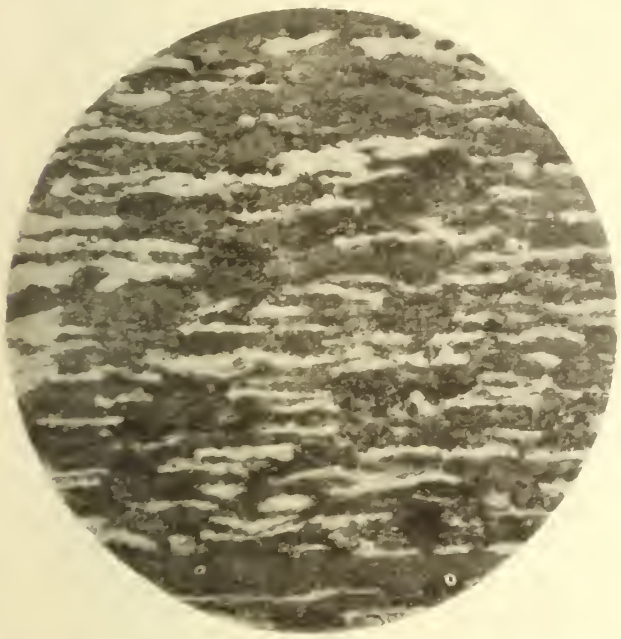
By REINHARDT THIESSEN. *

(Paper given before the Coal Mining Institute of America, Pittsburgh, December 9th, 1920.)

(Continued from Page 91 issue of Feb. 4th, 1921.)

SPORES IN COAL.

On account of their beautiful colors and brilliant appearance under the microscope, the spores were the first objects discovered in coal. Since their discovery, they have often formed the objects of the main discussion on investigations of coal, while the main subject to be discussed was only slightly mentioned or left out altogether. More prominence and



7.—Thin section of Pittsburgh coal more highly magnified to show the character of the spore-exines and other constituents in detail. Magnification 1000.

more importance has therefore been put on them than they deserve. It must, however, not be construed that they do not form important constituents in the coals.

The spores and pollen grains are only found in the attritus of coals, usually mixed with the other constituents (Photographs 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 18, 19.) Here and there they are found in mats. Frequently they are in lumps still held together the way they grew in the plant. Before it was known what they really were various names were given to such lumps. Occasionally whole cones of the coal forming plants remained in the coal with all the spores intact.

The spore content of coal may vary greatly in the same bed from place to place, from top to bottom and also from seam to seam. When spores form a considerable part or a large proportion of a coal bed or a part of a layer of coal bed, it lends distinctive characters to it.

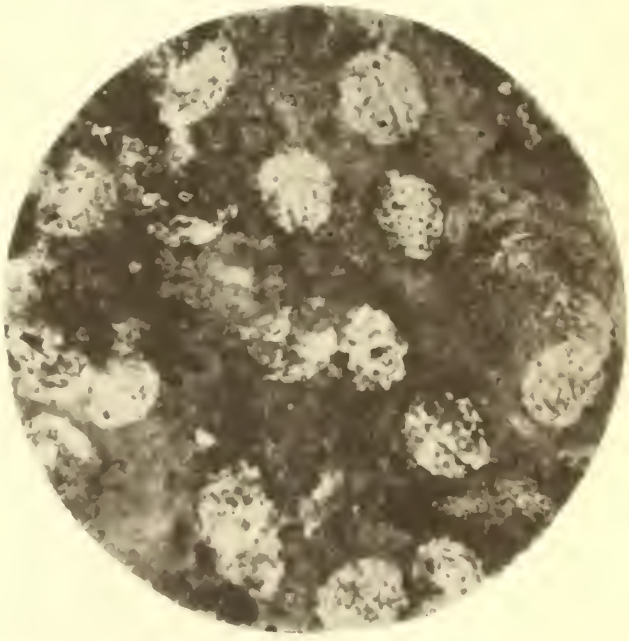
The important part of the spores in coal formation are their outer walls or exines. The inner or living parts were soon destroyed in the peat stage. But the outer walls or exines are very resistent to bacterial activities and chemical reagents and have thus escaped decay and disintegration to a large extent. In this respect the spore exines of all the spore bearing plants are alike, as are also the exines of pollen grains of the seed plants. In the living plants they are composed chiefly of oils, waxes, fatty acids, alcohols, some resinous matters and cellulose. Langer found in the spores of a club moss, for example, 49.3 per cent oil. Besides this they contained philosterine, benzol derivatives, an acid called pollin, and cutin.

Horn Coal and Cannel Coal.

When the attritus forms a considerably thick layer in a seam, say half an inch or an inch or more in thickness, and is composed largely of spores it is called horn coal (Photograph 30). When such a layer is still thicker so that it forms a considerable part of the bank or forms a bed by itself, it is called cannel coal. In other words, cannel coal is an attritus in which spore matter forms the predominant part. Some cannel coals contain little else than spore matter. They are then called boghead coals. Others have varying amounts of other plant degradation-matter present. The ash content is usually high in them. There is no real distinction between cannel coal, boghead coal, torbanite and torbane mineral. By far the largest part of the organic matter in all of them consist of spores.

Bone Coal.

When a layer of attritus occurs in a seam that is rich in mineral matter or ash together with spores and other organic matter and is of such thickness as to be fairly well noticeable, it is called bone coal:



8.—Horizontal section of Pittsburgh coal at a high magnification to show the broad side characters of spore exines and other constituents in detail. Magnification 1000.

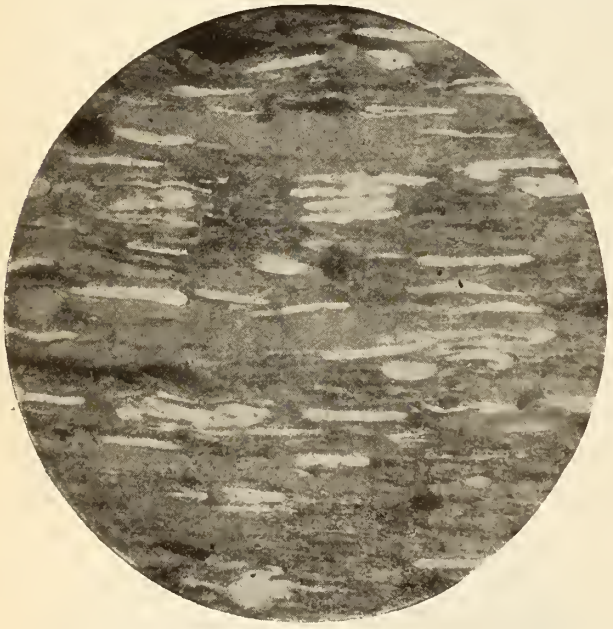
when it is composed very largely of mineral matter, it becomes shale.

Oil Shale or Carbonaceous Shale.

When a layer of attritus in a coal is rich in clay or where clay is a predominant constituent together with organic matter, it is called carbonaceous shale (Photographs 7, 28, 29). Such shales often form beds by themselves and are occasionally of considerable

thickness and extent. They are found all over the world and are generally called black or carbonaceous shales. When such deposits or rocks are rich enough in organic matter, so that when subjected to distillation, they yield oils, they are called oil-shales. Microscopic examination shows that the oil does not exist in the shale as such, but is generated from the organic residue or attritus in the shale when heated. Because the organic remains yield oil on distillation, they are now generally called "kerogens", from the Greek "keros" meaning wax, and "genesis", to be born. The kerogens, however, are nothing more or less than the remaining parts of plants, residues of plant matter, or plant degradation-matters. Spore remains form the most predominant part of the organic matter of many. In the oil shales of the Devonian from Illinois, Indiana, Kentucky, Ohio and Tennessee, the organic matter consists almost entirely of the remains of spores, very intimately mixed with a fine clay (Photographs 27, 28, 29). More or less pyritic matter and a few sand grains are also distributed through the mass (Photographs 27, 28 and 29). The spores are of the ordinary fern type prevalent in the coals of the Carboniferous Age, and present the same general appearance.

The deposits were evidently formed over a very large area, which must have been a plane with very poor drainage and for the most time covered with a shallow sheet of water. The basin was the habitat of aquatic and semi-aquatic plants related to the coal-forming plants of the Carboniferous. As is the case of such habitats at present, the main plant-parts decayed and disappeared very largely, while the most resistant parts, the spore-walls, remained, and together



10.—Part of a thin section of the same at a higher magnification, showing the constituents in detail. Notice the smooth outline of the spore-exines. Magnification 1000.

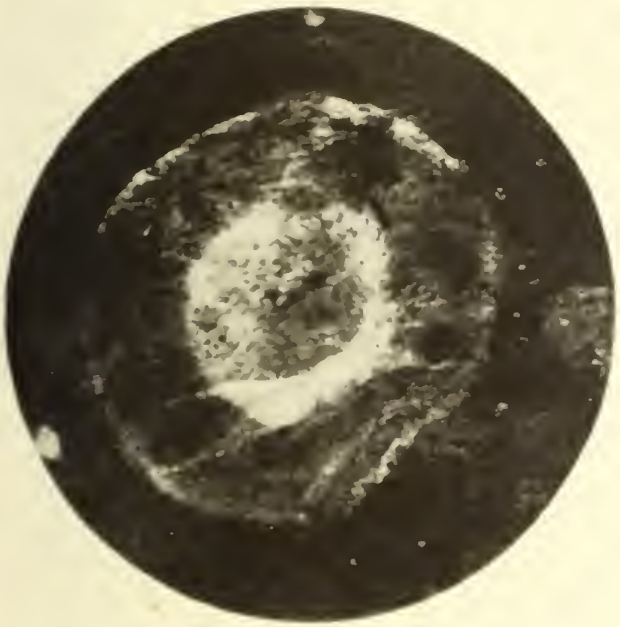
with the mineral matter of the plants, and that carried in by wind and perhaps water, formed the deposit. It is probable that spores form the larger part of the organic matter of all oil shales and that the spores are the source of the oils distilled from them.

CORRELATION OF COAL SEAMS BY MEANS OF THEIR SPORE EXINES.

The spore-exines have very definite and clearly defined characteristics, such as form, size and surface sculpturing (Photographs 7, 8, 10, 11, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24.) Different genera and perhaps different species are different in sculpturing, size, thickness of wall and form. By means of these differences, they can be readily distinguished from one another. These spore characters have been so well preserved in almost all coals that the spores of one kind of plants can be clearly distinguished from those of another kind. In examining the spore-exines of some seams, it is found that by far the largest bulk of the spore-exines of that seam are of the same kind. In other seams, two kinds, while in others, three kinds of exines may form the main bulk. In comparing the predominating exines of one seam with that of another, it is not difficult to see that those of one bed are different in some way from those of any other.

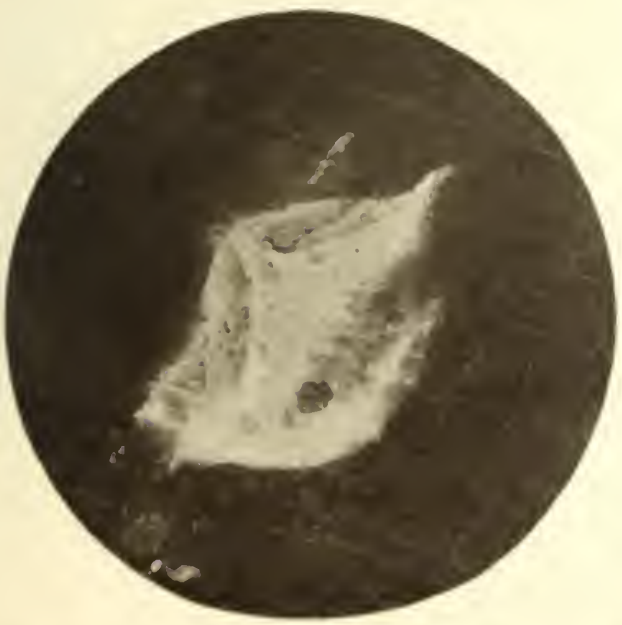
Occasionally a spore-exine will be found in a given coal seam that differs materially from those found in other seams but does not predominate. This spore-exine may be a distinguishing characteristic of the coal seam in question, but is not the predominant one.

Although not nearly all coal seams have been exam-

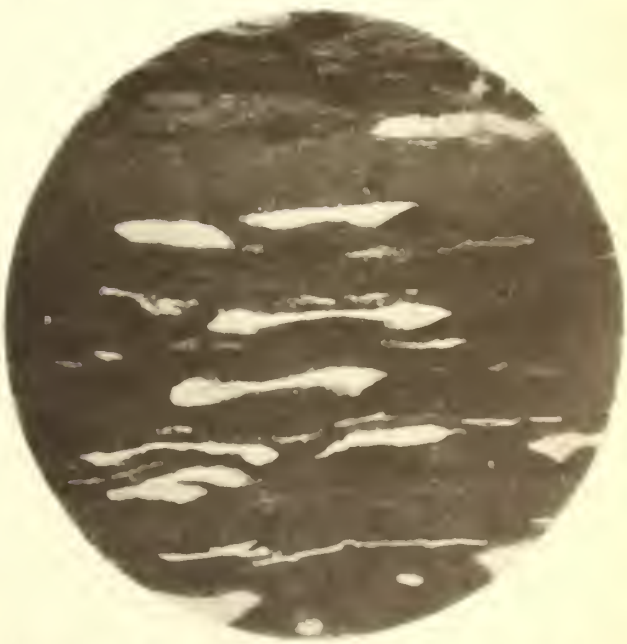


15.—Part of horizontal section of Brookville coal including ring type of spore-exine. Magnification 1000.

17.—Part of horizontal section of Brookville coal including spore-exine with spines. Magnification 1000.



18.—Part of horizontal section of Brookville coal including spore-exine with peculiar processes. Magnification 1000.



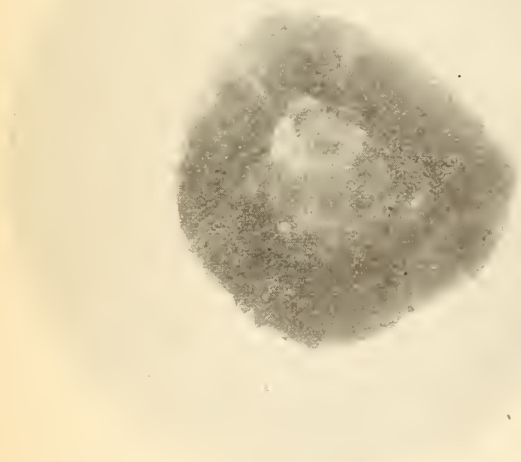
19.—Part of [illegible] vertical section of Yoakum coal showing characteristic spore-exines and other constituents of coal. Magnification 1000.

ined in this respect, there are sufficient grounds for the broad statement, that as far as they have been examined, each coal seam contains one or more kinds of spore-exines that are predominant and characteristic, or if not predominant, characteristic of that seam. By this means many seams may be distinguished from any other. A few examples as illustrations will be given:

The Pittsburgh (Photograph 6, 7, 8) seam contains a type of spore-exine that is at once predominant and characteristic, that is, a large majority of the spores are of the same kind and found in no other seam. It is a small spore, only 15 microns across the disk (photograph 7) and relatively thin. The outer surface, when highly magnified, has very much the appearance of the outer form of a brain (photograph 8). In cross section, it has a corrugated appearance due to this sculpturing. By means of this sculpturing the spore may be distinguished very easily from all other spores. Since no other coal contains this spore, the Pittsburgh seam may be readily identified by means of it.

The Upper Freeport contains a smooth and somewhat larger spore that predominates. (Photographs 9, 10, 11.) It also contains in small numbers a much larger, thick-walled spore sculptured with coarse ridges. This same spore is the predominant spore in the Lower Freeport. (Photograph 12, 13, 14.) The predominant smooth-walled spore of the Upper Freeport appears to become one of the minor spores of the Lower Freeport. These two coals need considerably more study in order to make positive statements concerning them. There is as yet no telling whether the one or the other may not become the predominant spore of the same seam, until more type samples have been examined.

The Brookville seam has three kinds of spore-exines.



20.—One of thespores of the Yagger coal seen on the broad side. Magnification 1000.

21— Broad side view of a spore exine from a coal from Buxton, Iowa. Magnification 1000.

22.—Part of thin cross section of Buxton coal, showing the same spore-exine in cross section. Magnification 1000.

23.—Broad-side view of megaspore-exines of the Buxton coal. These spore-exines in the coal have each three long delicate wings or air sacks, but these were broken in recovering them from the coal. Magnification 30

all predominant (photographs 5, 15, 16, 17); that is, the three kinds form the largest bulk of the spore matter; and each one is so decidedly different from the other and from those of any other seam that either one offers a ready means of identification. The different spores may be distinguished quite well at a magnification of 200 diameters. Their specific characters are, however, much better brought out at a magnification of 1,000 diameters. The most peculiar

24—Cross section of the same kind of spore-exine shown in Photograph 23, showing one of its three wings in cross section. Magnification 100.

one is a rather large exine with very peculiar processes giving it a very odd shape in cross sections. In horizontal sections (photograph 16), this spore-exine presents different appearances, all according to how it lies and how it was cut, yet no matter how located and how cut they all present a somewhat similar appearance.

A second type is studded with rather large echinate spines (photograph 17). It is between 45 and 60 microns, or in the neighborhood of 1-500 of an inch in diameter. A third kind of spore-exine in horizontal section reminds one of Saturn and its rings (photograph 15). It is a large thin-walled exine with a thicker central part, the spore proper, surrounded by a much thinner outer zone forming a wing to the whole. The total diameter of the disks is between 80 and 90 microns, or close to 1-250 of an inch.

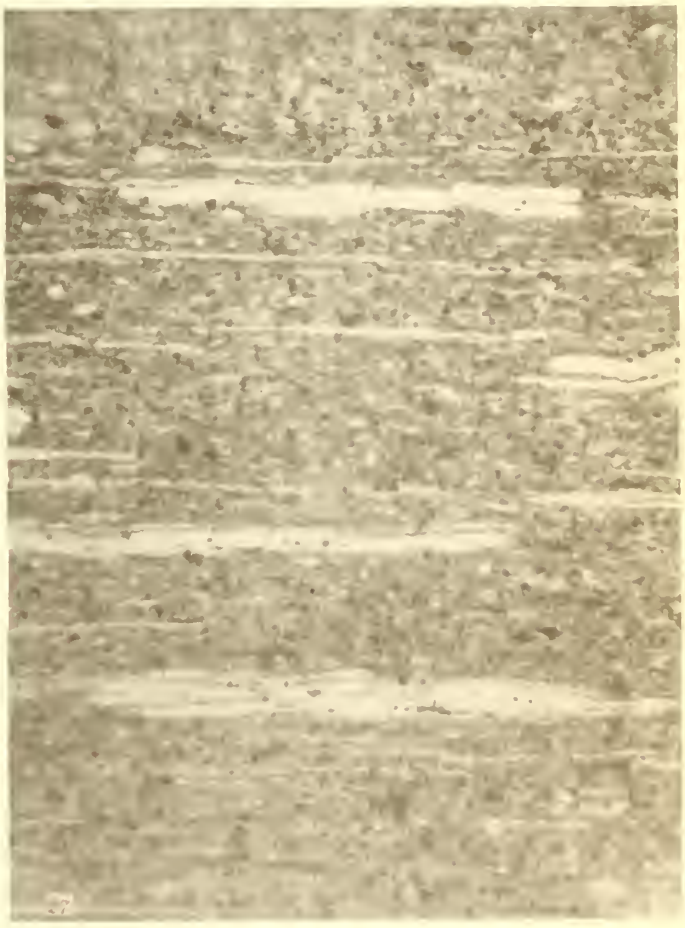
A fourth spore exine is found quite abundantly in this coal. It is rather small and in many ways is similar to the one predominating exine in the Upper Freeport.

A number of other coal seams in Pennsylvania and in Kentucky, Alabama, Illinois and Iowa, have been examined. Each one has been shown to contain spore-exines as characteristic as those shown. By this means any of the coals could be identified, some at first sight, others after more careful study. A spore, for example, in the coal from the Black Creek Bed in Alabama has such decided characteristics, both as seen in cross section and in horizontal section, that it can easily be recognized without mistake wherever found. (Photographs 18, 19, 20.) This identical spore-exine is found in "C" or Kellioko bed of Kentucky. This at once raises the question whether the Kellioko bed of Kentucky and the Bank Creek bed of Alabama represent the same coal seam or not.

The predominating spore-exine of the Yagger bed in Alabama is also of such a shape and appearance that it can be distinguished readily from any other. As seen in cross section, it is a broad, thin-walled exine with a smooth surface. In no other coal seam have spore exines been found resembling this one.

A bed at Buxton, Iowa, contains two spore-exines either of which is decidedly different from any other spore-exine yet found. At first sight, the one appears very similar to that one of the Black Creek bed in Alabama, but at close inspection and when seen on the flat side, a very marked difference is shown. (Photographs 21, 22.) The other is the exine of a megaspore with three large air sacks or wings. (Photographs 23, 24.)

A number of other spore-exines could be shown every one of which having characters as specific and as different from any other as those shown, but enough



examples have been given to show how full of possibilities this line of study on the correlation of coal seams is. In cases where one or a few exines would fail to warrant a safe correlation, more could be studied. In the percentages of each very many different fossil plants are often required to determine a correct stratigraphic position. The same method could be followed for a proper correlation of coal seams.

(To be continued.)

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

A proposal to increase the Mining Profit-Tax in the province of Ontario has aroused quite general and united opposition in the mining districts . The Ontario Minister of Mines proposes to increase the tax from a former rate of 3 p.c. on the first million earned, and 5 p.c. on all amounts exceeding that figure, and make a 4 p.c. rate apply on the first million with 7 p.c. on everything above a million. The representative of the "Canadian Mining Journal" has been delegated authority to speak through the "Journal" for the mining industry of the entire Province. One of the chief point to be emphasized is this:

The Serious Truth.

At the great silver-producing area of Cobalt, only a few mines are now able to work at a profit. More than a dozen properties have closed on account of being unable to continue work under the present burdens, Where 2,200 to 2,300 men found employment a year ago, the total does not exceed 900 at present. Additional burdens in the form of an increased tax might precipitate a serious crisis in the silver-mining industry.

Canada and Mexico are now rivals in the bid for capital, with which to speedily develop enormous mineral wealth. A special decree was passed a few days ago in Mexico, removing duty entirely from silver when quoted below 60 cents an ounce. The duty is to apply only on a sliding scale above that figure. To increase the tax in Ontario would place this province under an added handicap.

The United States is encouraging silver mining by paying American producers 99½ cents an ounce for their silver. Resolutions drafted in mining districts of British Columbia are urging the Dominion Government to fix the price of silver at a minimum of 80 cents an ounce. In the face of all this evidence, which goes to show how difficult is the position of the silver miners, the Ontario Government is endeavoring to add yet another burden and thus increase the discouragement which has already slowed down the industry to an alarming degree in this province.

The workers in the mines see in the proposed tax increase, the possibility of the mining companies having to seek some way to offset the added cost, which may affect employment and wages.

Drifting operations at the 410-ft. level of the Chambers-Ferland mine have reached a point where the vein being followed is expected to join a larger vein which comes onto the property across the boundary of the Nipissing. This vein carried high grade ore across about two inches at the point where worked on the Nipissing.

Among the new favorable developments taking place in the Cobalt field, the veins on the Bailey as well as the University continue to attract attention. The mill. rock accompanying the veins carries silver in sufficient quantity to make it profitable to mine even with silver quoted at a low figure. The high-grade shoots of ore encountered from time to time along these veins make them doubly important.

The January statement sent out with the dividend and bonus paid by the Nipissing shows the treasury of the company to be in a strong condition. Cash in bank, including Canadian War Bonds and investments amounted to $3,422,201 as of January 3rd. The value of ore bullion in transit, on hand and in process at the mine and mill and buillion ready for shipment was estimated at $1,488,809, thus making a total of $4,921,-010. The dividend and bonus paid amounted to $600,-000 and was distributed among approximately 13,000 shareholders. The company has 1,200,000 shares issued, and it follows that the average held by each individual amounts to only about 92 shares. The frank policy of the company in keeping its shareholders advised each month as to progress made, has made a favorite of the Nipissing.

Annual statements soon due from the mining companies of the Cobalt district will show a considerable decline in ore reserves. This is due in part to the labor shortage during the first nine months of the year 1920, and a power shortage during the last quarter. It is also due to a considerable extent to the slump in the price of silver. This decline has relegated a large amount of mineralized rock to the waste heap, in that it could be handled profitably only with silver selling at a reasonably high figure. Large blocks of ground may now have to be eliminated from the estimates. The McKinley-Darragh is expected to show a very large decline of upwards of 25 per cent.

The O'Brien mine of the M. J. O'Brien, Ltd., is maintaining its position satisfactorily and is one of the largest individual employers of labor in the Cobalt district. The present pay-roll includes about 170 men. The Nipissing which is the largest employer has a total of approximately 270.

Elk Lake and Gowganda.

The sleigh-road from the railhead at Elk Lake to Gowganda is in excellent condition and quite large quantities of supplies are being transported over the road for use during the coming summer. Considerable new activity is being planned in spite of the low price of silver, and the tendency is to proceed with work on the strength of the belief that conditions within the reasonably near future will settle down to something like what prevailed at the time of the outbreak of the recent war.

Exploration work is proceeding quietly on the property of the White Reserve Mining Company, at Maple Mountain.

A sheriff's sale of the goods and chattels of the Mapes Johnson Mining Company, Ltd., as well as the Brant Mines, Ltd., will be held in Haileybury on Feb. 10th.

The annual statement issued by the Crown Reserve Mining Company, for the year 1920 shows that the company lost $72,054 during the period. The surplus was reduced to $512,481. This is equal, however, to about 25 2-3 cents a share. No dividends were received during the year from the Porcupine Crown Mines which is controlled by the Crown Reserve.

During the week ended Feb. 4th, the Dominion Reduction was the only company shipping ore from the Cobalt district. This company sent out two cars containing an aggregate of approximately 171,000 pounds.

THE GOLD MINES.

The Porcupine Field.

In all sections of the Porcupine gold area, there are continued signs of increased activity on various mining prospects of promising merit. The success being met

with on the proven mines, and the general belief that the gold-mining industry is on the verge of a very prosperous era combines to offer added inducement to the owners of such properties.

Announcement has just been made to the "Journal" that the old Standard property, known in the early days as the Standard mine, and later as the Premier, is to be operated aggressively by the Premier Paymaster, a new company incorporated for that purpose. The company has an authorized capital of 2,500,000 shares of the par value of $1 each, and financial arrangements have been completed so as to commence work within the next few weeks. It is the company's intentions to sink a shaft to a depth of 500 feet, with lateral operations at each 100-ft. level. Former work on the property opened up an encouraging amount of ore. The No. 1 shaft was driven to a depth of 216 feet, while the No. 2 shaft was sunk to 100 feet and connected up at that depth with No. 1. About 800 feet of underground work was done, one mineralized zone about 50 feet in width being cut. The property is equipped with a mining plant, consisting of two 80 h.p. boilers, a compressor and hoist. A good set of camp-buildings are already on the property. A S. Fuller, of Porcupine, is vice-president and manager. The property lies about half a mile southwest from the Dome Mines.

A new company, known as the Porcupine Associated Goldfields has been incorporated for the purpose of taking over the Three Nations, La Palm, Dominion Porcupine and Jermey Veteran claim, all situated in a group in the north-eastern part of the township of Whitney. The total area comprises about 720 acres. The new company has an authorized capital of 5,000,000 shares of the par value of $1 each. It is understood a substantial block of the stock is being underwritten by English interests who propose to sell the stock at par in the Old Country. In regard to the organization, the Three Nations stockholders (the original) will not participate owing to that company having previously gone into liquidation. The La Palm shareholders, it is understood, will be allotted one of the new shares for each two held in the La Palm. Previous work on the properties, particularly the Three Nations, was quite encouraging. A shaft was sunk 260 feet and a limited amount of lateral work done. On the La Palm, the amount of work was quite limited, but showings at surface were quite promising. The strike of the veins on the Porcupine-Keora property which lies a short way to the West is in the general direction of the northern part of the merged properties.

Highly favorable results continue on the Dome Mines. A large amount of high-grade ore has been encountered at the 1,050 level and the size of the deposits lends color to the belief that the average grade of the ore to be treated at this mine will gradually increase and may ultimately approach in richness that heretofore treated on the Hollinger Consolidated. Beginning with April, the scope of work on the Dome, as well as milling operations will undergo a steady increase and the entire operation will be brought up to full capacity at as early a date as possible.

In regard to the proposal of the Ontario Minister of Mines to increase the Mining Profit Tax as applied to the silver, and gold mines, the operators of gold properties have openly expressed the opinion that such a step would be exceedingly unwise at this time. They point to the fact that a large amount of capital is required with which to develop the many promising properties, and that every effort should be made to encourage development. Later on, when the industry becomes more firmly established, taxation could be borne with greater ease. The opinion is that added taxation at present might dwarf the industry in its infancy and result in less revenue to the province than were taxation modified at present with a view toward heavier taxes at some later date. The views of the mining interests are to be presented to the Ontario Government, and every effort will be made to induce the Government to hold any such measure in abeyance for another year at least.

Among the properties which are likely to resume work during the coming spring is the Gold Reef. Former work on this property resulted in the recovery of encouraging quantities of high-grade gold ore. This was taken out by miners who worked the property under lease. Plans are being made to sink a shaft to a depth of 300 feet at which point diamond drilling formerly indicated the presence of a strong vein.

Kirkland Lake Area.

During the month of December, according to a report just issued by R. C. Coffey, manager, the Lake Shore Mine treated 1,865 tons of ore and recovered $34,670.49. The average grade of the ore for the month was $18.48 per ton, and an average of a little over 60 tons of ore were treated daily. It is the intention of the company to instal additional crushing equipment so as to increase the capacity to about 100 or 120 tons daily. The cyanide equipment is already adequate to handle such an increased tonnage. The main shaft in the Lake Shore has been deepened to the 600-ft. level, and crosscutting is under way toward the rich No. 2 vein which lies under the lake.

Henry Cecil, well-known mining man, particularly in the Kirkland Lake district, is stated to be taking legal action against Conrad Latilla, and H. Sedgewick, both of London, England, as well as against the Kirkland Lake Proprietary, (1919) for the purpose of enforcing the terms of a partnership agreement alleged to exist between Cecil, Jorgensen and Sedgewick, under date of Feb. 26th, 1913. Mr. Cecil is endeavoring to restrain trading in the Kirkland Lake Proprietary until settlement of his alleged claim of one-third of the profits arising as a result of the partnership agreement referred to.

The annual meeting of the Tough-Oakes Gold Mines has been called for Feb. 10th, at which time it is understood the directorate elected will be representative of the Kirkland Lake Proprietary (1919) which controls the merged properties of the Tough-Oakes Gold Mines, Burnside Gold Mines, Aladin Cobalt, and Sudbury Syndicate.

The annual meeting of the Sylvanite Gold Mines will be held on the same date as the meeting of the Tough-Oakes. An effort is being made to include the Sylvanite in the general consolidation. It is believed the Buffalo interests who hold a minority of the Sylvanite stock may join in the scheme.

At a depth of about 85 feet on the Hunton Kirkland property, an encouraging amount of visible gold has been encountered. Average assays have not yet been made, but from the appearance of the ore it will run high.

Larder Lake District.

A petition is being circulated among heavy shareholders of the Goldfields, Ltd., of Larder Lake, for signatures to a request to Premier Drury to order an investigation into the affairs of the Company and the actions of its officers. Already upwards of a score of names have been placed on the petition, representing between 150,000 and 200,000 shares.

Reports about the Associated Goldfields, which is negotiating for control of Goldfields Ltd., have been very contradietory, and the Mines Department is understood to be prepared to institute an examination proved the request comes directly from the shareholders of the Company.

TORONTO COAL PRICES.

Toronto, Feb. 9.—According to local coal dealers at least fifty per cent of the coal being sold in this market is being disposed of at below the cost of production. Business is extremely dull. Slack coal is selling in Toronto all the way from $6.25 to $8.00 a ton according to quality. Lump coal is any where from $7.50 to $8.50 and smokeless is selling from $8.00 to $9.00 with little or no market.

THE LATE HARRY D. SYMMES

Mr. Harry D. Symmes, who was widely known in oil, gas and mining circles in Ontario, died at his home in Niagara Falls, Ont., on Dec. 31st at the age of 51 years.

After his graduation from Trinity College School, Port Hope, he entered the University of Toronto, where he was graduated from the School of Practical Science in 1891. He was a member of the Zeta Psi Fraternity of the University, and a member of the Canadian Institute of Mining Engineers.

Mr. Symmes was the Manager of the first electric railroad in Canada. Early in the practice of his profession he was a contractor of the Hydro Power Development of the Ontario Power Company at Niagara Falls and later constructed several water power plants in Northern Ontario. In mining he was connected for many years with the Cobalt and Porcupine Camps having been a director of the McIntyre Porcupine mines and the Temiskaming Mining Company for several years. At the time of his death he was a director of a number of oil and gas and mining companies. He was the principal promoter of and personally financed the Volcanic Oil & Gas Company and Glenwood Natural Gas Company, two of the largest and most successful gas companies in Ontario. He was also prominent in political circles, and a member of the Anglican church.

Mr. H. C. Crow of the Canada Metal Company, Toronto, and head of the Cartwright Goldfields, Limited, is about to leave on a month's trip to the Pacific Coast on a visit to the Canada Metal Company's branches. He will spend a little time at Winnipeg and Vancouver.

British Columbia Letter

THE METAL MINES.

Stewart, B.C.—The Premier Gold Mining Company is shipping ore over the winter trail from its property on Salmon River to the town of Stewart, at tide water, at the rate of about 500 tons a fortnight. The snow has packed on the road and two caterpillar tractors are proving serviceable. On each trip they draw four sleighs loaded on the up-trip with machinery for the new Mill and on the down with ore. The survey of the proposed aerial tramway from the Mine to the Coast and reported to have been completed and the work will proceed as soon as the directors approve the expenditure. An exceedingly rich pocket is said to have been found in the mine workings, the contents giving returns of gold running from $5 to $10 a pound.

Action brought by Maurice W. Bacon against R. K. Neill, one of these interested in the Premier Mine, for the recovery of a one quarter interest in the property has been dismissed by Federal Judge E. H. Rudkins, in the courts at Spokane, Wash. The latter in his judgment states that the plaintiff in two cases has influenced witnesses and had lacked good faith in not bringing the suit in 1917 when he first knew of Neill's operations instead of waiting until the mine had proved of worth.

Patrick Daly, of Nelson, B.C., is suing R. K. Neill, R. W. Trite, A. B. Trite and W. R. Wilson, all of whom are interested in the Premier Mine, for a one-fifth interest in the same. He alleges that Neill entered into an agreement with him to finance the development of the property and to give him the share he is asking for. This undertaking, he asserts, was approved by the other defendants when they became partners.

Ashcroft, B.C.—A large quantity of hydraulic placer-mining machinery is being moved from Bullion and Horsefly Properties, Cariboo, B.C., by R. T. Ward, who recently sold these claims after successfully asserting his title, and that of his associates, in a legal battle with John Hopp, which was carried to the Privy Council, England. The claims are said to have changed hands at a considerable figure and the nature of future operations is such that the long disused equipment is not required. It, therefore, has been disposed of separately in Vancouver.

Trail, B.C.—Ore receipts at the Trail Smelter of the Consolidated Mining & Smelting Co. from the 7th to the 14th insts., inclusive, totalled 6,890 tons, making the aggregate for the year to that date 13,148 tons. Among the independent shippers were the Paradise, Windermere; the Horn Silver, Similkameen; the North Star, Kimberly; and the Velvet, Rossland.

Nelson, B.C.—The Columbia section of the American Institute of Mining Engineers, whose membership is taken from the northwestern states, will hold sessions next Summer at Nelson and Trail, the date to be arranged to coincide with those of the International Mining Convention to be held at Nelson. It is likely that these joint gatherings will take place sometime in June. S. G. Blaylock, General Manager of the Canadian Consolidated Mining & Smelting Co., has promised his cordial co-operation in the endeavor to give the visitors the opportunity to see all of interest to them and to make them feel the warmth of genuine western Canadian hospitality.

Vancouver, B.C.—S. Silverman, President of the Alaska B. C. Mineral Corporation, recently visited the Sidney Inlet Copper Company's property on the west coast of Vancouver Island. Owing to the low price offering for copper, and by reason of the fact that the Tacoma Smelter is not inclined at present to accept copper shipments, no doubt because, if reports are correct, it has some 26,000,000 pounds on hand, the Sidney Inlet Mine has been shut down. There is a small crew engaged in diamond drilling but outside of this development work operations have ceased. It is expected, however, that the Mill will be re-opened in the Spring.

THE COLLIERIES.

An inquiry into the reasons for the high cost of coal to the consumer in British Columbia, where there is produced annually between two and one-half and two and three-quarters of a million tons, is demanded by the citizens of the City of Vancouver. The agitation does not appear to be of the usual ephemeral character. At a mass meeting called to discuss the situation, a large crowd was addressed by Mrs. Ralph Smith, member of the Legislative Assembly, who is reported to be likely to receive a call to the executive of the Provincial Government, and other prominent person. The upshot was the unanimous passage of a resolution calling upon the Government to take such action as is necessary to disclose the reason why coal, mined sixty or seventy miles from Vancouver, should cost the people of that City about $15.00 a ton delivered to their homes. The Mining Bureau of the Vancouver Board of Trade is understood to have undertaken to make an investigation and there is a well grounded belief that the Government will take official cognizance of the discontent of the consumers.

A section of the Press has been diligent in the collection and publication of information as to mining and delivery costs. How much reliance can be placed on figures so assembled and circulated, of course, is a question and it does not seem that reliable knowledge is yet available regarding the financial situation of the mine operators and the coal dealers. The statement that Vancouver Island coal may be bought cheaper in the City of Seattle than in Vancouver, for instance, scarcely appears to be borne out by the facts because the quotations ordinarily given are prices in the dealers' bunkers and there are to be added delivery charges, which vary in proportion to the distance of the particular residence from the centre of the city. Other assertions have been made with which those concerned in the production and the distribution of the fuel disagree so that it is improbable that the air will be cleared until the Government, or some public body, probes the companies' affairs as well as those of the dealers and publishes the results. Certainly that would appear to be the only avenue open either to force down an unjust exaction for one of the necessities of life, or to wipe out the public's impression that the consumer is being villainously robbed by soulless profiteers.

The Premier of the Province and the Minister of Mines are to meet a committee of Vancouver citizens in a few days to discuss the matter and it is possible that the outcome will be the instituting of a public inquiry.

Not alone are the residents of the Coast Cities of British Columbia concerned over the price of fuel. There is deep feeling in the Kootenays on the same question as is manifested by a resolution recently passed by the Nelson Board of Trade for submission to the approaching convention of the Associated Boards of Trade. The latter body will be asked by the Nelson organization to endorse a request addressed to the Dominion Government for the undertaking, through that government's fuel controller in this Province and in Alberta, of a thorough investigation of the cost of coal and coke. It also is to be urged that the aforementioned controller be empowered to investigate the cost of living in coal towns and that a public representative be appointed to participate in the inquiry.

Several reports are in circulation regarding the development of new coal areas on Vancouver Island, B.C. One is that 50,000 acres of coal land situated on the Island has been acquired by American interests for $1,750,000. It would appear, however, that the deal has not been finally closed, its issue depending upon the results of exploration, prospecting, and some drilling now in progress under the supervision of engineers. W. S. Henderson, president of the Gem Coal Mine Co. and Jewel Collieries of the Drumheller area, Province of Alberta, has been on the Pacific Coast recently and it is stated that he is making investigation with a view to taking over British Columbia coal lands. John Arbuthnot, of Victoria, with whom he spent some time, holds promising coal-rights near Nanaimo. It is believed that development will disclose coal in commercial quantity on Reid, Thetis, Kuper and Wallace Islands, situated in the vicinity of Portier Pass, Gulf of Georgia.

The value of coal bunkers to a sea port is a subject prominently before the three chief Canadian Pacific-Coast cities at present. Prince Rupert, the most northerly railway terminal has taken the lead. Bunkers are to be constructed at that port and the enterprizing citizens are being backed both by the Dominion Government and the Canadian National Railways. Victoria has extensive docking facilities recently completed that, thus far, have been used scarcely at all. The Board of Trade of that City believes that coal bunkers at the ocean docks would bring mercantile business and Victoria, therefore, is stepping in behind Prince Rupert. Public opinion in both communities is strongly behind the enterprise. To Prince Rupert, situated hundreds of miles from the coal mines of Vancouver Island and of Alberta, extensive and modern fuel storage accommodation will be invaluable. For Victoria, placed almost within stone's throw both of the Island mines and of the channel of North Pacific oriental shipping, bunkers would be a business-getter, bringing needed fuel within convenient reach of coal-burning vessels. Vancouver, always a trade rival of the provincial capital, and likewise a port and in point of volume of business the most important Canadian centre of the Coast, also is in line for bunkers, so that it may be said that western Canadians are awakening to the vital importance of coal, not only in a strictly limited industrial sense, but as the propelling force in trade.

The Fraser Lake Collieries Ltd. has been incorporated in British Columbia with a capitalization of $600,000, its headquarters being in Prince Rupert. This Company has been formed to develop and operate coal property situated near Fraser Lake in northern British Columbia. The coal, which is said to be of good quality, giving satisfaction both as a domestic fuel and for steaming purposes, is so close to the surface that a steam shovel may be used in its recovery. This method was adopted last year on a small scale and is to be continued this year.

The British Columbia Coal & Land Co. is another new British Columbia coal-mining concern. It has purchased the holdings of the Cassiar Coal Co., situated on the Telkwa River, consisting of 20,480 acres. This, too, is a first-class fuel, although the reports available indicate that it is not a coking coal.

The Morden Mine of the Pacific Coast Coal Mines Ltd., Vancouver Island, still is non-productive. It is understood that some form of company re-organization is in progress and that there is a prospect that not only will the mine mentioned be re-opened, but extensive development of the Company's Island holdings will be commenced in the near future. Meanwhile there are quite a number of miners in the Nanaimo section out of employment.

A Montreal Letter

ALEX. GRAY.

Gold Producers Only are Serene.

With the purchasing power of gold increasing—and all other metal markets "without money and without price," as the saying goes, those producing the yellow metal have a serenity that is all their own. They have been "patient in long-suffering". When other metals were at their peak, gold mining was out of it because of reasons too well known to require recapitulation. Now, and notwithstanding the gold standard is more or less weakened by the necessities of debtor nations, the metal is not subjected to the vagaries of international trade which is approaching a goods basis rather than being maintained on a strictly gold basis. Labor and supplies are in process of readjustment; gold mining is not so vicarious, whereas silver seems to be without a friend among those who represent the market for it. London and New York have banged the white metal until the price is almost prohibitive to mining advocates of economy; governments which disregard intrinsic worth and will have it that subsidiary coins are mere "tokens"; metal dealers who probably are "short," make it appear as though silver was more than ever a non-essential—at least until the Orient recovers its economic equilibrium.

As for copper, zinc and lead: I quote one whose business it is to know the metals position. "It might as well be admitted that there is not enough money to make copper under present conditions—and there is not enough money in Europe to pay for what copper can be produced on short notice. The idea of pooling 400,000,000 lbs. of copper and carrying it by issuing debentures, while minimizing operations, I suppose is the only remedy. Europe cannot pay cash for enough copper to invite great activity. At 13c. the company able to make copper is the exception. Therefore, the only thing to do is to stop production until working conditions are upon bed rock. Half way measures cannot accomplish the desired objective. What is true of copper is more so with regard to zinc. We have a new British zinc and lead combination to contend with. If the Burma and Broken Hill Corporations, acting with

others through this latest Associated Lead Manufacturers combine, accomplish their purpose, Canadian producers of zinc and lead will have to bestir themselves. The Anaconda Company will cease producing zinc. They have been buying zinc from other producers. These latter also will suspend operations. I know another very large zinc company is not content to operate at a loss. New Jersey zinc earnings in the quarter ended December 31, were cut in half. So, I maintain, there is nothing to it but to practically shut down."

Chinese selling, and lack of support are given as the reasons for the break in silver. The Indian bazaars had given the cue to the market for the metal the price dropped to the point where producers in general will feel the pinch.

PORT ARTHUR NOTES.

By J. J. O'CONNOR.

Present indications point to active gold mining development in North Western Ontario at an early date.

The Dryden district is forging to the front with excellent prospects of entering the producing class during the current year. With intelligent methods of development, and the efficient means for the recovery of the metal values in the ores, now being adopted, it is confidently predicted that it cannot fail to make good, as a prosperous gold camp

Mr. C. P. Charlebois has arrived in the city with a $2,300 gold brick, from the St. Anthony Mine, at Sturgeon Lake. This brick was the result of a five-day mill run of the waste dumps and tailings of former mill operations.

The mill went into commission on August 20th, 1920, operating solely on tailings, and material formerly wasted. Since that date, Mr. Charlebois has Mint certificates to show that $16,483.40 has been produced and marketed from this class of material. The ore is high-grade, running about $19 to the ton. Up to the present, no ore has been raised from underground. The mill has been put in first class condition, and has a capacity of 200 tons daily. Since it was started in August last it has been treating about 70 tons daily.

Underground mining has now been commenced, and the mill started early in February, on this ore, which has an average value in the present workings of $22.00 per ton.

The mine has been completely unwatered to the fourth level, has been carefully sampled and checked throughout the entire workings, and shows an average value of $10.50 per ton of ore in sight.

The ore blocked out has been carefully measured, and assayed, separately in each level, showing a total of $800,000. Added to this there are concentrates, and ore on the dump that will bring the total value of ore in sight up to $1,250,000.

Dr. W. L. Goodwin concluded a most successful two weeks term of Prospectors' Classes on the 4th instant. There was an average attendance of 25 prospectors, while the public were well represented at the lectures delivered on geology and mineralogy, in the City Hall, by Dr Goodwin. The Board of Trade tendered a complimentary luncheon to Prof Goodwin, in the Prince Arthur Hotel, in recognition of his services to the pioneers of mining in this district

THE MALAGASH SALT DEPOSIT, CUMBERLAND CO., N. S.

Memoir 21 of the Canadian Geological Survey, recently issued, is a report on the Malagash Salt Deposit in Cumberland County, Nova Scotia, by Dr. A. O. Hayes, together with a review of the literature describing salt springs in Nova Scotia and New Brunswick, the location of which is shown upon an index map included in the Report. The deposit has been previously described by L. Heber Cole and Dr. Hayes in reports of the Survey, and in this journal.*

The following is the summary of Dr. Hayes's conclusions, excerpted from the Report. The analogy drawn between the Malagash occurrence and the Strassfurt deposits in Saxony is most suggestive.

Summary of Conclusions.

The Malagash salt is a deposit formed by the evaporation of sea water during a recession of the Mississippian sea in Windsor time.

Mining development has demonstrated the presence of a sufficient quantity of salt for the establishment of an important industry, and the market is now supplied by run of mine salt from a bed 4 feet thick, an average sample from which contained 98 per cent sodium chloride. A bed of clean crystalline salt 21 feet 6 inches thick has been encountered in a boring by a diamond drill at the face of the underground workings. Sixty feet thickness of salt strata measured at right angles to the dip has been cut by a shaft and level, all of which can be utilized for the manufacture of refined salts or other sodium compounds. As only about one-tenth of the ground underlain by brine has been crossed in the Malagash mine workings, the outlook for a much thicker body of salt is good.

Potassium chloride occurs in a lenticular deposit in the form of crystalline masses of pink and yellowish green sylvite in a matrix of halite. A potash zone has been penetrated at two points 30 feet apart, varying in thickness from a few inches to 5 feet. The potash content is variable, dependent on the concentration of sylvite which is probably of secondary origin.

In the shaft near the top of the salt bed a 4-foot seam, with an analysis of 1.16 potash was encountered, and, in the face of the drift, about 30 feet lower stratigraphically, a much richer potash zone was exposed. In one place, a full shot from the face ran 8.73 per cent potash.

The salt strata are probably offset by faults at certain localities, but the regularity of the structure along the coast to the north, for a distance of about three-quarters of a mile, suggests that the salt may extend without serious interruption for an equal distance along the strike, and the sedimentary character of the salt points to a continuation in depth, parallel to the dip of the enclosing rocks.

The occurrence at many localities in Nova Scotia and New Brunswick of salt springs issuing from rocks of the same geological age, suggests that other deposits of a similar nature occur in the vicinity of these springs. The salt strata are similar in origin to the extensive Strassfurt deposits in southern Saxony, in which large accumulations of potash-bearing sediments occur. The presence of small quantities of potash at Malagash and in the brines from springs elsewhere indicates that, possibly, potash in commercial quantities may also occur in the Maritime Provinces.

The establishment of a salt and allied chemical industry should receive careful consideration as the favourable location of Malagash with respect to the supply of raw materials and fuel and its exceptional advantages for transportation either by rail or water offer an opportunity for successful competition in both domestic and foreign markets.

The Report states that as the result of a reconnaissance of the district from Hillsborough to Hampton, N.B., lying between the Kennebecasis and Hammond rivers, made by Dr. Hayes and W. J. Wright of the Survey in September 1919, the conclusion was reached that the Windsor series is more extensive than previously reported. It is suggested by the facts observed that the rocks between Elgin and St. John, N.B., formerly correlated with the Albert series, belong to the Windsor, which lies unconformably above the Albert.

*See issue of 8th January 1918, pp. 8, 9. Malagash Salt Deposit, by L. H. Cole.

NEW MINE RESCUE PHONE IN ENGLAND.

A new mine rescue telephone has been brought out in England to fulfill requirements of the British mining acts, which prescribe that rescue telephones must be part of the equipment of a rescue outfit and that they must be metal cased.

The new telephone outfit is constructed of cast aluminum, and is of the magneto type, made easily portable and compact, and is fitted with induction coil, two dry cells, powerful magneto generator and buzzer. It has a combination transmitter and receiver of a short pattern, which clips into a cast aluminum hinged cover on top of the case, which fastens with a strong spring. The cover also protects the generator handle. The hand combination is connected by a metallic fexible cable, which coils in the cover when not in use, and the case is provided with a strong leather carrying strap. The line cable is connected by means of a twin connecting plug. Cable of especially strong construction is unreeled from a cable reel on a special stand at the top of the mine, and is so connected that conversation with the person down in the mine with the phone can be carried on even when the person below is moving and unreeling more cable.

CLAYS & SHALES OF VIRGINIA, U.S.A.

Bulletin No. xx, Virginia Geological Survey, is a report on the clays and shales of Virginia, West of the Blue Ridge, by Professors Ries and Somers. In addition to full descriptions of the clay and shale deposits and working clay-plants, the report contains useful general information on clays and the tests to be applied to prove economic value for specified uses. Prof. Ries is a well-known authority on the economic geology and general technology of clays and shales. The clays found in this part of Virginia, which is in Appalachian Mountains territory are stated to be suitable for common and pressed brick, drain-tile, hollow blocks, fire brick, electric porcelain, earthenware, paper, paint, etc. Office of issue is the University of Virgina, Charlotteville

EDITORIAL

GOLD AT DEPTH IN NORTHERN ONTARIO.

Elsewhere in this issue will be found a summarisation of the information given to the shareholders of the Hollinger Consolidated Gold Mines, Ltd. While the Hollinger Mines is the darling of the North, and may seem to the uninitiated to be a too oft-quoted exemplar of what is and what may be typical of Northern Ontario, the 1920 Report provides ample justification for the sentiment in the gold camps of the North.

A feature of the gold occurrences of Northern Ontario that is becoming increasingly impressive is the persistence and even improvement of gold-bearing ore at great depths. This is true of the Hollinger, Dome and McIntyre Porcupine mines in the Porcupine District, and is also being disclosed at the Kirkland Lake District mines and at Boston Creek.

Emerging from the wealth of geological data that has been collected, and the actual proving of the gold-bearing rocks by mine development, there is also, we venture to suggest, a glimmering of the connected origin of gold occurrences that have been found, in the first instances by a series of intelligent accidents and guesses, and in later instances by following a line of search suggested by geological deductions. The schematic arrangement of the gold-bearing rocks—if this phrase is permissible in connection with repeated igneous flows—is beginning to be apprehended, and the cumulative value of a multitude of detached and apparently unrelated observations is about to be applied in Northern Ontario, with possibly most valuable economic results. It may be suggested that [illegible] persistence of gold bearing rocks to great depths is indicated by actual tests at moderate depths in the instances referred to.

While surface gold occurrences are often very rich and approaching the spectacular in character they do not offer the hope of permanence that deep-seated deposits hold out. At the same time deep-seated deposits call for large expenditures of capital and require intelligent and far-sighted planning. There are a number of mines in Northern Ontario, notably the Hollinger, McIntyre and Dome trilogy, where these essential conditions have been fulfilled, and the confidence in the future of the camps that is observable in the newspapers and in correspondence from Northern Ontario seems fairly warranted.

THE VALUE OF THE RETURNED-SOLDIER GRADUATE.

The "Canadian Mining Journal" is especially pleased to put before its readers the letter in this issue from Mr. J. D. Mackenzie of Vancouver which pleads eloquently the claim for preferential consideration in the matter of employment of returned-soldier graduates of our technical universities.

If discipline of mind and body, hard knocks in war and a large measure of disillusion in peace, experience in human nature, and the real achievement of resuming and completing interrupted studies after their war experiences, are to be regarded as meriting recognition — as they are traditionally so regarded — the returned-soldier graduate should be eminently fitted for responsible positions in industry by personal qualifications. These men would be the last to request consideration on any other grounds than their own capabilities, and Mr MacKenzie rightly regards the coming release of returned soldiers from their studies as affording a real opportunity to employers to obtain men of unusual merit. In this connection may be mentioned the excellent work that has been done by the Canadian Institute of Mining and Metallurgy, through the Employment Bureau of the "Bulletin" in putting returned engineers in touch with mining companies having vacancies in their staffs. This work is still being carried on.

MONTREAL, INSTEAD OF OTTAWA, FOR C. I. M. & M. MEETING.

After due consideration, the President and Council of the Canadian Institute of Mining and Metallurgy have decided to hold the Annual Meeting, March 2nd to 4th inclusive, at the Windsor Hotel, Montreal, instead of at Ottawa. The change is rendered neces-

ary by the smallpox quarantine against persons leaving Ottawa for eastern points. While it is believed the epidemic at Ottawa has been given undue prominence, there is a likelihood that the holding of the meeting in Ottawa may tend to reduce the number in attendance.

The necessity for a change of meeting place is regrettable, as the Ottawa Branch has been very active in preparation for the meeting there. Naturally, they are disappointed, but they have been willing to do what was deemed best for the Institute as a whole, and the Council has been required to act at short notice to the best of its judgment.

The co-operation of the eastern members to make the Montreal meeting successful is therefore most desirable, as it means that much of the work which was already accomplished by the Ottawa Branch will require to be duplicated in readiness for the unexpected meeting in Montreal.

As some consolation for the Ottawa members it may be stated that Montreal is not without its compensations, and that enconiums have been passed upon the cheerful character of Montreal gatherings by the highest authority.

OIL PROPAGANDA.

The virulence of the oil propaganda increases, and as this "Journal" pointed out about a year ago, there is growing danger that the paid propagandists of large oil interests may drift into "propagandists of hate" between friendly and allied nations. The mere suggestion that the world's peace might be again endangered, which recently emanated from London and was magnified into an international incident without the slightest warrant, nevertheless sent an icy chill to the hearts of a world sick of the lunacy of war and not unforgetful of that awful hetacomb of men who died that wars might cease. Such talk is not only preposterous, as Secretary Colby said, but it is the lunacy of Hell.

There is a further consideration that the conflict of rival oil interests is based on misconception of the future of oil. Neither the permanence of oil supply, nor the permanence of the use of oil is assured to the world. The hottest controversy is being carried on in Britain — and quite openly through the columns of the "Times" — as to the relative importance of the capital ship, the submarine and the air-fighting machine. Sir Percy Scott has prepounded a conundrum; "What is the use of a battleship?" a question that is about as answerable as queries on the value of a dollar or the name of the gentleman who gets the exchange differential. It is presumed by authorities, who should know, that the fighting machine driven by oil is supreme in sea, and sky, and under the sea. This question we may leave to these learned gentlemen. It is likely to be their funeral in any case.

It is further presumed that the only source of motor fuel is petroleum. This belief is, however, nothing more than an assumption. There is the best reason to believe that coal is the substance that will provide the motor-spirit of the future. The presence or absence of coal in a country is a demonstrable fact. The presence or absence of petroleum is a more or less intelligent guess — a good deal more intelligent than it used to be admittedly — but nevertheless largely a guess.

The whole nasty business of oil propaganda is based first on selfishness, and secondly on assumptions. The public understands neither the source of the propaganda, or the misconceptions of fact and ingenious inaccuracies with which it is sedulously fed, a very fruitful source of mischief, as the world ought to know by this time.

Some provocative statements are being circulated as to the financial control by corporations of extra-national oilfields. What possible significance has that? Is not the sovereign power of any nation over its own national resources admitted, and cannot it do what it likes with its own? If not, then the world is little else than a congerie of bandits, and the fight of the Allies for the delivery of Belgium was based on error.

It is desirable that business interests of any or all nationalities should not attempt to prostitute patriotic feeling to the furtherance of commercial profit. This is the molecule of truth in the belief of certain political groups that Capital caused the war of 1914, and it is inevitable that any nation which permits such procedure by private corporations will reap as grim a whirlwind as those who lately followed this same perilous path are reaping at this time.

THE STONE TRADES IN CANADA.

The meeting of men concerned with the crushed-stone, and stone-cutting trades in Toronto last week calls attention to a branch of the mineral industry in Canada which has a bright future. Road-building, of a permanent character, and the substitution of non-inflammable structural materials in the construction of buildings, are two very good signs of a progressive civilization, and they offer the widest scope for growth.

Although the Geological Survey has published excellent monographs on the building stones, the road-building materials, and the clay and cement possibilities of Canada, there has not been that growth — particularly in the East — in the use of these structural materials that our stores of such materials would have permitted had not the tradition of using timber in dwelling and other construction persisted too long. In this regard, the cities of Ontario and the West are much in advance of eastern cities. Toronto, in particular has an admirable building tradition, and the manner in which the western provinces have provided themselves with permanent and artistic public buildings is most striking to visitors from the East. The

kaloids and others. While some of these are present in the plants in only small proportions, like the glucosides, phytosterines and others, a number are present in considerable amounts like the resins, fats and waxes.

Many of those plant products that occur in small amounts belong to the aromatic or ring-compounds and their derivatives, and for that reason are of great significance. Hydrocarbon compounds that contain either a single or compound benzol ring are very stable. Oxidizing reagents, for example, will not attack the benzol ring, but any hydrocarbon of the paraffin group attached to the benzol ring as an end group or side chain is readily changed or removed. Compounds with a group of closed rings, that is, compounds with the naphtalene, anthracene or phenanthrene nucleus and their derivatives, show the same behavior. These compounds are waste products of plant assimilation, that is, they are not food stuffs and are therefore thrown off. Because they are not food stuffs, they are not usually attacked by organisms like bacteria and fungi. Fr this reason many of the plant products that occur in but small quantities in the plants, like benzols, the phenols, chinones, aromatic alcohols, ketones, and alcehydes and their derivatives, terpenes, camphors, and phytosterines, alkaloids and others that may have remained in the coal-rorming debris, may have accumulated or concentrated, as is known to be so in the case of resins, and thus are found in considerable amounts in coal as revealed in coal distillation.

In peat, the presence of many of the ring compounds found in plants may be shown by means of microchemical tests. In the lignites, some of them can still be detected. In the bituminous coals, however, none can be detected by such means, but when they are subject to distillation, many of these compounds and their derivatives appear in the distillates. During the whole process of the transformation of plant substances into coal, there is a gradual loss of oxygen. More correctly there was a loss of carbon, hydrogen and oxygen, but there was a relatively greater loss of oxygen than of carbon and hydrogen. This is what the geologists call deoxygenation. What other changes have taken place in the organic compounds besides the loss of oxygen is not exactly known. It may be polymerization, dehydrogenation, or both. That dehydrogenation takes place in some cases is certain. An example of this is found in Retene, a fossil resin found in peat, lignite and in fossil conifers. It is a hydrocarbon having three rings with only one hydrogen atom attached to each free carbon atom. It may be derived from the two constituents of rosin, abietinic acid and pimaric acid, by distillation, as has been shown by Vesterberg and Tshireh, and it is therefore related to these. But abietinic and pimaric acids have two hydrogen atoms attached to each free carbon atom instead of one. There has been not only a removal of the oxygen but also a removal of one of each of the two hydrogen atoms attached to the carbon atoms in the change from the resin acids to retene. Chemists call the dehydrogenation. Fichtelite* is another fossil resin, also found in peat lignite and fossil wood and sometimes associated with retene, and is also supposed to be derived from either abietinic acid and pimaric acid. But in this case, each side group containing oxygen has been replaced by two hydrogen atoms, and in every place where retene has one hydrogen atom attached to a carbon atom, fichtelite has two. Fichtelite is among the most stable organic compounds known. Amber and succinite are also fossil-resins with a similar history. These examples are given to convey an idea as to what probably has happened to the many well-known compounds which are contained in plants.

What was said concerning the aromatic or ring compounds and their derivatives is true also to some extent of the aliphatic or chain compounds and their derivatives, although these are not as stable as the ring compounds. It should be emphasized that the aliphatic compounds constitute by far the largest part of the plant substance. The cellulose, gums oils, fats, starch, alcohols, proteins, sugars, and acids belong here. Their radical or nucleus is a paraffin chain to which are attached various end groups, containing oxygen, that make them what they are. Some of the plant substances, like starch, sugar and protein, may decompose readily, but not without leaving some of the decomposition products behind. Others, like fats, waxes and cellulose, are relatively stable. Their end groups, that is that group that makes a fatty acid or an alcohol, or whatever it is, out of a paraffin, are more easily removed and a paraffin remains. Supposing the root stocks of one of the coal forming plants had contained in a part of its tissue, 20 per cent of fat consisting of palm and Japan oils, as in one of the living plants of to-day. These oils would split into their respective fatty acids and glycerin. During the coal forming period, the fatty acids, as well as the glycerin, would, to some extent at least, be deprived of the end groups containing the oxygen and result in two corresponding paraffins. It is a well-known fact, as already stated, that the coal-forming process is accompanied by the loss of oxygen.

All plants contain more or less fats and oils ranging from a fraction of one per cent to as much as 75 per cent in certain parts of the plant. There is hardly a living plant cell that has no fat or oil in it, but it is more concentrated in certain tissues as seeds, fruits and roots. In the peats, some of the fats and oils may still be detected. In the lignites, also, they may yet be detected, although with difficulty, on account of their changed nature. In the coals, fats and oils are not recognized as such by the microscope, except in the spores and cuticles which are oil-yielding. But we cannot imagine for a minute that they should have been lost completely to coals and, aside from spores they should be present either as oils or as "kerogens", that is oil-yielding substances.

The leaves, young stems, petioles, fruits and often older stems are covered with a layer of protective covering called cuticle. This covering is composed of oils and waxes. The outer covering of spores and pollen grains also consists of oils and waxes.

Outer covering or exines of pollens and spores are characteristic constituents of both peat and lignites. In the coals they form an important part of the attritus particularly the spores as already noted. Cannel coals are composed very largely of spores, and the organic matter of oil shales are very largely composed of them also. In Europe, there are certain deposits known as

* Fichtelite—A mineral resin found in white shining scales embedded in coniferous trees in peat bogs in the Fichtelgebirge, Bavaria.

pyropissit, that are very valuable for the distillation of oils and waxes. These deposits consist very largely of spore-matter, and these are the source of the large amount of oil and wax in them. We have not developed such industries in this country, although deposits consisting largely of spore matter are known. One at Lester, Arkansas, has been utilized for the distillation of oil in a crude way with a relative large yield. The cannel coals were quite extensively used for the same purpose before petroleum was discovered in the rock. Today when the oil wells are waning, attention is again turned to the oil-shales that promise an almost inexhaustible supply of oil owing to the spore matter of which the organic matter is very largely composed.

Acknowledgement.

The writer is deeply indebted to Mr. A. C. Fieldner, Supervising Chemist of the Pittsburg Experiment Station of the Bureau of Mines for valuable suggestions and assistance in the work.

INTERNATIONAL NICKEL CO.

International Nickel Co. for 9 months ended Dec. 31, 1920, reports net profits, after charges and federal tax, of $2,620,873, equivalent after preferred dividend to $1.33 a share (par $25) earned on the 41,834,600 common stock, compared with net profits of 1,799,957 or 83 cents a share on the corresponding period of 1919.

Consolidated income account for the nine months compares as follows:

	1920	1919
Earnings	$4,415,774	$4,326,897
Other inc.	920,165	79,563
Tot. inc.	5,335,939	4,406,460
Exp., etc.	495,218	400,751

kaloids and others. While some of these are present in the plants in only small proportions, like the glucosides, phytosterines and others, a number are present in considerable amounts like the resins, fats and waxes.

Many of those plant products that occur in small amounts belong to the aromatic or ring-compounds and their derivatives, and for that reason are of great significance. Hydrocarbon compounds that contain either a single or compound benzol ring are very stable. Oxidizing reagents, for example, will not attack the benzol ring, but any hydrocarbon of the paraffin group attached to the benzol ring as an end group or side chain is readily changed or removed. Compounds with a group of closed rings, that is, compounds with the naphtalene, anthracene or phenanthrene nucleus and their derivatives, show the same behavior. These compounds are waste products of plant assimilation, that is, they are not food stuffs and are therefore thrown off. Because they are not food stuffs, they are not usually attacked by organisms like bacteria and fungi. Fr this reason many of the plant products that occur in but small quantities in the plants, like benzols, the phenols, chinones, aromatic alcohols, ketones, and alcehydes and their derivatives, terpenes, camphors, and phytosterines, alkaloids and others that may have remained in the coal-forming debris, may have accumulated or concentrated, as is known to be so in the case of resins, and thus are found in considerable amounts in coal as revealed in coal distillation.

In peat, the presence of many of the ring compounds found in plants may be shown by means of microchemical tests. In the lignites, some of them can still be detected. In the bituminous coals, however, none can be detected by such means, but when they are subject to distillation, many of these compounds and their derivatives appear in the distillates. During the whole process of the transformation of plant substances into coal, there is a gradual loss of oxygen. More correctly there was a loss of carbon, hydrogen and oxygen, but there was a relatively greater loss of oxygen than of carbon and hydrogen. This is what the geologists call deoxygenation. What other changes have taken place in the organic compounds besides the loss of oxygen is not exactly known. It may be polymerization, dehydrogenation, or both. That dehydrogenation takes place in some cases is certain. An example of this is found in Retene, a fossil resin found in peat, lignite and in fossil conifers. It is a hydrocarbon having three rings with only one hydrogen atom attached to each free carbon atom. It may be derived from the two constituents of rosin, abietinic acid and pimaric acid, by distillation, as has been shown by Vesterberg and Tshirch, and it is therefore related to these. But abietinic and pimaric acids have two hydrogen atoms attached to each free carbon atom instead of one. There has been not only a removal of the oxygen but also a removal of one of each of the two hydrogen atoms attached to the carbon atoms in the change from the resin acids to retene. Chemists call the dehydrogenation. Fichtelite* is another fossil resin, also found in peat lignite and fossil wood and sometimes associated with retene, and is also supposed to be derived from either abietinic acid and pimaric acid. But in this case, each side group containing oxygen has been replaced by two hydrogen atoms, and in every place where retene has one hydrogen atom attached to a carbon atom, fichtelite has two. Fichtelite is among the most stable organic compounds known. Amber and succinite are also fossil-resins with a similar history. These examples are given to convey an idea as to what probably has happened to the many well-known compounds which are contained in plants.

What was said concerning the aromatic or ring compounds and their derivatives is true also to some extent of the aliphatic or chain compounds and their derivatives, although these are not as stable as the ring compounds. It should be emphasized that the aliphatic compounds constitute by far the largest part of the plant substance. The cellulose, gums oils, fats, starch, alcohols, proteins, sugars, and acids belong here. Their radical or nucleus is a paraffin chain to which are attached various end groups, containing oxygen, that make them what they are. Some of the plant substances, like starch, sugar and protein, may decompose readily, but not without leaving some of the decomposition products behind. Others, like fats, waxes and cellulose, are relatively stable. Their end groups, that is that group that makes a fatty acid or an alcohol, or whatever it is, out of a paraffin, are more easily removed and a paraffin remains. Supposing the root stocks of one of the coal forming plants had contained in a part of its tissue, 20 per cent of fat consisting of palm and Japan oils, as in one of the living plants of to-day. These oils would split into their respective fatty acids and glycerin. During the coal forming period, the fatty acids, as well as the glycerin, would, to some extent at least, be deprived of the end groups containing the oxygen and result in two corresponding paraffins. It is a well-known fact, as already stated, that the coal-forming process is accompanied by the loss of oxygen.

All plants contain more or less fats and oils ranging from a fraction of one per cent to as much as 75 per cent in certain parts of the plant. There is hardly a living plant cell that has no fat or oil in it, but it is more concentrated in certain tissues, as seeds, fruits and roots. In the peats, some of the fats and oils may still be detected. In the lignites, also, they may yet be detected, although with diffienlty, on account of their changed nature. In the coals, fats and oils are not recognized as such by the microscope, except in the spores and cuticles which are oil-yielding. But we cannot imagine for a minute that they should have been lost completely to coals and, aside from spores, they should be present either as oils or as "kerogens", that is oil-yielding substances.

The leaves, young stems, petioles, fruits and often older stems are covered with a layer of protective covering called cuticle. This covering is composed of oils and waxes. The outer covering of spores and pollen grains also consists of oils and waxes.

Outer covering or exines of pollens and spores are characteristic constituents of both peat and lignites. In the coals they form an important part of the attritus, particularly the spores as already noted. Cannel coals are composed very largely of spores, and the organic matter of oil shales are very largely composed of them also. In Europe, there are certain deposits known as

* Fichtelite—A mineral resin found in white shining scales embedded in coniferous trees in peat bogs in the Fichtelgebirge, Bavaria.

pyropissit, that are very valuable for the distillation of oils and waxes. These deposits consist very largely of spore-matter, and these are the source of the large amount of oil and wax in them. We have not developed such industries in this country, although deposits consisting largely of spore matter are known. One at Lester, Arkansas, has been utilized for the distillation of oil in a crude way with a relative large yield. The cannel coals were quite extensively used for the same purpose before petroleum was discovered in the rock. Today when the oil wells are waning, attention is again turned to the oil-shales that promise an almost inexhaustible supply of oil owing to the spore matter of which the organic matter is very largely composed.

Acknowledgement.

The writer is deeply indebted to Mr. A. C. Fieldner, Supervising Chemist of the Pittsburg Experiment Station of the Bureau of Mines for valuable suggestions and assistance in the work.

THE METAL MINES.

Stewart, B.C.

The Nabob Group, Portland Canal District, is reported to be showing up well on development. Considerable tunnelling has been done and latest reports state that twelve feet of solid ore, carrying promising value, have been disclosed, both the hanging and footwalls being well defined, the former being a black slate and the latter a well-mineralized porphyry. The property is on the north fork of Glacier Creek.

Hazelton, B.C.

J. D. Galloway, British Columbia resident mining engineer for the Northeast Mineral Survey District, has opened a course of lectures for the benefit of the prospectors of that section of the Province. The other five government engineers are to give addresses in their several districts during the Winter. A. G. Langley, of East Kootenay, and Major B. T. O'Grady, his assistant, will start a tour of the chief centres of East Kootenay within the next few weeks. They are to speak to the prospectors and the mining man on geology, mineralogy, and kindred subjects, dealing particularly with the problems of those engaged in mining in the eastern parts of British Columbia. P. B. Freeland, whose headquarters are at Grand Forks, will cover the Boundary section and Wm. M. Brewer, whose residence is Nanaimo, will give a series of similarly instructive addresses in the various centres of Vancouver Island and the lower Midland. This is a recent innovation of the Department of Mines. It is a broadening of the influence of the mining engineers on the Department's staff and, apart from the educational value of the lectures, they are expected to serve to bring closer together those directly concerned in the mining industry and those charged with the responsibility of framing and administering the laws dealing with the business.

Anyox, B.C.

E. E. Campbell, assistant general manager of the Granby Consolidated Mining, Smelting & Power Co., has resigned and has left to take a position with a large copper corporation operating in the southern United States. Mr. Campbell has been identified with the Granby Co. for a number of years.

Princeton, B.C.

Steps are being taken towards the development of a deposit of strontium, a new mineral to British Columbia, the discovery of which was reported some two years ago. The property is situated about three miles from Princeton. It is stated that there are no difficulties facing the owners in respect of opening up the claim and the fact that transportation is within easy access further simplifies matters. There are prospects that a plant for the refining of the material will be installed shortly, it being stated that a good market is assured to the product.

Nelson, B.C.

An amendment to the provincial Income Tax law insofar as it affects the miner who sells a mining property; the establishment of a co-operative system of "proving up" and marketing prospect; and powder at cost to prospectors, are the three chief "planks" in the present platform of the B. C. Prospectors' Association. At any rate these are the achievements to which the members of the Nelson branch of that organization have set their hands. The first and the last—less taxation and free powder—involve representations to the Provincial Government, which no doubt will take place sometime during the session of the Legislature now in progress.

An interesting publication, lately become available by application to the Canadian Geological Survey, is Leopold Reinecke's report on the "Mineral Deposits between Lillooet and Prince George, British Columbia." The field work was planned to include the investigation of all mineral deposits, except placers, which are adjacent to and likely to afford traffic to the Pacific Great Eastern Ry. This road traverses in a northwestly direction the country lying between Squamash, Howe Sound, and Prince George. It has not yet reached the latter point but, in the vernacular, "is on its way" with the ultimate intention of tapping the rich Peace River country. Two introductory chapters of the publication in question are devoted to transportation, topography, agriculture and geology, and six chapters cover description and discussion of mineral occurrences. The substances treated are: hydromagnesite, calcareous tufa, epsomite, sodium carbonate, clay, diatomaceous earth, lignite, peridot, mica, chromite, manganese, nickel, gold, silver, copper and lead.

Commenting on the press reports that the Copper Export Association has sold between 300,000,000 and 400,000,000 pounds of copper for export, Mr. Lorne Campbell, manager of the West Kootenay Light & Power Co., which supplies power to the Consolidated at Trail, and the Canada Copper Co., at Allenby, states that, if true, the effects will be felt immediately in British Columbia. The lack of a market has resulted in comparative stagnation in this Province and Mr. Campbell observes that, such a movement of the metal, would so relieve the pressure that activity would be restored.

Victoria, B.C.

Although nothing much has been said of late regarding the possibility of the Mines Department, Victoria, B.C., being transferred from its at present unsatisfactory quarters to the spacious and architecturally impressive left wing of the Parliament Bldgs, Victoria, the matter is not dead. There is a prospect that it will be actively and determinedly revived at the present Session of the Provincial Legislature. Hon. Wm Sloan, Minister of Mines, is understood to be enthusiastically in favor of the move and the hesitation thus far apparent, no doubt is due to the expense attached to taking the plant and equipment of the printing establishment from its present domicile and placing it in the old Drill Hall which, while very adjacent, no doubt would have to be altered and to some extent reconstructed. There also is to be considered the outlay necessary in the refitting of the aforesaid left wing for the reception of the Minister of Mines and his staff.

There is a growing sentiment, however, that "the end justifies the means", not that there is any manifestation of the development of the reckless spirit that occasions the exclamation "expense be hanged" but because it is sincerely believed that Mines Department is not properly housed and that the switch would be a public benefaction, both in respect of efficiency and of accessibility. As it is, an important branch is housed in an antiquated timber structure—one of the reliefs of

the government buildings as they were before the days of the present magnificent stone edifice — which is placed to the rear of Parliament Square. This is the Bureau of Mines, presided over by Wm. Fleet Robertson, Provincial Mineralogist. Here is to be found, and it may be said parenthetically that it never is found without inquiry and minute direction, British Columbia's mineral exhibit, the finest display of the commercial minerals of this Province, as well as of the rarer minerals discovered from time to time, that is to be seen anywhere. To visiting geologists, mineralogists, mining men, prospectors, everyone whether scientifically, technically or with but the vague interest of the products of mother earth, the Exhibit is worth while. As an advertisement of the mining possibilities of the Province it is a silent testimonial that deserves a better fate than the constant and lamentable oblivion to which it has been consigned.

Such is the strong argument made in support of the proposal. Incidentally there is the advantage the contemplated new quarters would have of bringing together all branches of the Department — a department the importance of which is growing, as is indicated by the steady upward sweep of the monetary value of the mineral production of British Columbia. This would mean greater efficiency. The added space available would make it possible to increase the size and the value of the mineral exhibits, it being suggested in this connection that the government might secure the mineral collection of the late W. J. Sutton, in his time one of the foremost independent geological investigators of the Province. He left a splendid assortment of specimens of the rarer minerals and formations not only of British Columbia but of the world which would be an acquisition to any mineral museum. The fear is expressed that this will go out of Canada unless action is taken with little loss of time.

Dawson, Y. T.

It would appear that the Mayo District, upper Stewart River Country, has reached that point in its development where its right to admission to a place of acknowledged permanence and importance as a mineral producer is established. This, at all events, is judged by the constant reports received of the richness of its silver deposits and by the supporting reports coming from geologists and mining engineers who have visited the section. The latter state that a zone having every formation favorable to extensive silver-lead deposits runs athwart the Mayor area for at least twenty-five miles in length and ten miles in width. Within this strip there are eight hills upon which locations have been made and development done with the result that ore has been discovered in quantity and of exceptional richness. Nearly a thousand claims have been staked in these localities which are known as: Keno Hill, Lookout Mountain, Stand-To Mountain, Rambler Hill, Galena Hill, Galena Creek, Mount Hinton and Mount Cameron. Veins from several inches to five feet in width are said to have been discovered and the assays reported range from $200 to $5,000 a ton in silver and lead. The latter, of course, is exceptional but it is stated that returns from $200 to $1,000 are common. The Yukon Gold Company, which is proceeding with extensive development operations, is figuring on having 3,000 tons of sacked ore hauled out this winter for shipment by the water route, via St. Michael, when navigation opens.

THE COLLIERIES.

Two interesting judgments have been delivered by the British Columbia Appeal Court with respect to title to important coal lands situated on Vancouver Island. The areas, the possession of the coal seams underlying which has been at issue, are 227 acres situated in the Cranberry District near Nanaimo and 117 acres in the same section. These were acquired by the Granby Consolidated Mining, Smelting & Power Co., the first from the estate of the late Joseph Ganner and the latter from Elizabeth Dunlop, title coming from the Province, and being based on the Settlers Rights Act.

After the Granby Company had spent some two and one half million dollars in the opening up of a part of these coal deposits and in the establihment of collieries, with all that that signifies in equipment and housing accommodation, and after it had laid out approximately one million and a half in the installation of by-product coking ovens at Anyox, its copper mining and smelting centre, for the treatment of the output of the Island collieries, the Esquimalt and Nanaimo Ry. Co. attacked in the courts the right of the mining company to the coal within these lands. The chief point raised in support of the claim was the allegation that the Provincial title was unsound and of no value because the Settlers' Right Act was ultra vires of the Province and had so been declared by the Dominion Government when that government disallowed the measure. There were other arguments, among which may be instanced the assertion that those representing the estate of Joseph Ganner and the interests of Mrs. Dunlop had not satisfactorily proven their just right to the benefit of the concession granted by the Settlers Rights Act, which concession consisted of the privilege of proving to the Provincial Government that the length of the tenure of their antecedents was sufficient to justify, under the early laws, their title both to the surface of the land occupied and to the minerals, including coal, contained therein.

The judgment of the Court of Appeal, insofar as the Settlers' Right Act is concerned, is that its provisions had full force and legal effect, between the time of the passage of the Act by the Provincial Legislature and its disallowance by the Federal Government. Almost a year elapsed between the first and the last mentioned event and it was during that period that the claims of Ganner and Dunlop were heard by the Provincial Government, that they were allowed, and that title was passed to the coal within the lands, which coal subsequently was taken over by the Granby Company.

On the point of the validity of the Ganner and Dunlop Claims with respect to the bona fides of the latter as "settlers" within the meaning of the Act, the Court places the two on entirely different footings. It is held that the Ganner claim for such classification has not been sustained and that "therefore the Grant is rightfully annulled." This, of course, is against the Granby Company and in regard to damages it is held that "there should be an assessment of damages on the footing of innocent trespass without negligence." What this will mean it is difficult to say but unofficially it is stated that it will not amount to more than $150 an acre which would mean something slightly over $30,000. The Dunlop Claim, however, is pronounced to be valid so that the title of the Granby Company is upheld in this 117 acres.

Dawson, Y. T.

It would appear that the Mayo Distriet, upper Stewart River Country, has reached that point in its development where its right to admission to a place of acknowledged permanence and importance as a mineral producer is established. This, at all events, is judged by the constant reports received of the richness of its silver deposits and by the supporting reports coming from geologists and mining engineers who have visited the section. The latter state that a zone having every formation favorable to extensive silver-lead deposits runs athwart the Mayor area for at least twenty-five miles in length and ten miles in width. Within this strip there are eight hills upon which locations have been made and development done with the result that ore has been discovered in quantity and of exceptional richness. Nearly a thousand claims have been staked in these localities which are known as: Keno Hill, Lookout Mountain, Stand-To Mountain, Rambler Hill, Galena Hill, Galena Creek, Mount Hinton and Mount Cameron. Veins from several inches to five feet in width are said to have been discovered and the assays reported range from $200 to $5,000 a ton in silver and lead. The latter, of eourse, is exceptional but it is stated that returns from $200 to $1,000 are common. The Yukon Gold Company, which is proceeding with extensive development operations, is figuring on having 3,000 tons of sacked ore hauled out this winter for shipment by the water route, via St. Michael, when navigation opens.

THE COLLIERIES.

Two interesting judgments have been delivered by the British Columbia Appeal Court with respect to title to important coal lands situated on Vancouver Island. The areas, the possession of the coal seams underlying which has been at issue, are 227 acres situated in the Cranberry Distriet near Nanaimo and 117 acres in the same section. These were acquired by the Granby Consolidated Mining, Smelting & Power Co., the first from the estate of the late Joseph Ganner and the latter from Elizabeth Dunlop, title coming from the Province, and being based on the Settlers Rights Act.

After the Granby Company had spent some two and one half million dollars in the opening up of a part of these coal deposits and in the establihment of collieries, with all that that signifies in equipment and housing accommodation, and after it had laid out approximately one million and a half in the installation of by-product coking ovens at Anyox, its copper mining and smelting centre, for the treatment of the output of the Island collieries, the Esquimalt and Nanaimo Ry. Co. attacked in the courts the right of the mining company to the coal within these lands. The chief point raised in support of the claim was the allegation that the Provincial title was unsound and of no value because the Settlers' Right Act was ultra vires of the Province and had so been declared by the Dominion Government when that government disallowed the measure. There were other arguments, among which may be instanced the assertion that those representing the estate of Joseph Ganner and the interests of Mrs. Dunlop had not satisfactorily proven their just right to the benefit of the concession granted by the Settlers Rights Act, which concession consisted of the privilege of proving to the Provincial Government that the length of the tenure of their antecedents was sufficient to justify, under the early laws, their title both to the surface of the land occupied and to the minerals, including coal, contained therein.

The judgment of the Court of Appeal, insofar as the Settlers' Right Act is concerned, is that its provisions had full force and legal effect, between the time of the passage of the Act by the Provincial Legislature and its disallowance by the Federal Government. Almost a year elapsed between the first and the last mentioned event and it was during that period that the claims of Ganner and Dunlop were heard by the Provincial Government, that they were allowed, and that title was passed to the coal within the lands, which coal subsequently was taken over by the Granby Company.

On the point of the validity of the Ganner and Dunlop Claims with respect to the bona fides of the latter as "settlers" within the meaning of the Act, the Court places the two on entirely different footings. It is held that the Ganner claim for such classification has not been sustained and that "therefore the Grant is rightfully annulled." This, of course, is against the Granby Company and in regard to damages it is held that "there should be an assessment of damages on the footing of innocent trespass without negligence." What this will mean it is diffieult to say but unofficially it is stated that it will not amount to more than $150 an acre which would mean something slightly over $30,000. The Dunlop Claim, however, is pronounced to be valid so that the title of the Granby Company is upheld in this 117 acres.

NOVA SCOTIA COAL MINING NOTES.

The breaking of a wire-rope attached to a "riding-rake" on the Main Deep of No. 2 Colliery of the Dominion Coal Company, on the 8th February, resulted in injuries to fifteen men, but fortunately no fatalities. The use of riding-cars to convey men to and from their work at the coal-face has in recent years become quite general at the Dominion Coal Company's mines because of the increasing distance of the faces from the shafts in the collieries having a submarine extension. This accident is the first that has yet occurred to a "riding-rake" in this district.

The Inverness Collieries and Railway Co. at Inverness, Nova Scotia, has got into financial difficulty, and the property has been taken over by the Eastern Trust Co. representing the creditors. A delegation of the citizens of Inverness conferred in Halifax with representatives of the Provincial Government and the Trust Company, as a result of which arrears of wages were distributed to the employees. The Company has, it is understood, no orders on its books, and was unable to finance the banking-out of coal which is always necessary at Inverness, and generally at the Cape-Breton collieries at this time of the year, when water transportation is stopped by ice conditions in the St. Lawrence and along the coast. This journal, in protesting against the imposition of an embargo on export coal from Nova Scota, and in especial from the Inverness Collieries, stated in the issue of 20th August last: "During the coming Winter, and particularly during the Spring season, when the drift-ice will prevent water shipments of coal, the collieries will either have to bank out coal or remain partially idle. If the collieries as was suggested by the Fuel Controller, can be given long-term advance contracts for railway coal by the Government, with a guarantee that the coal will be taken away in the shipping season, then it would be possible for the mines to work all winter without interruption, thereby largely increasing the annual output of coal."

This comment had a general application, but these conditions are especially severely felt by a community such as Inverness, where the coal-mining company was not possessed of the necessary financial reserves to carry out winter stocking. Some of the policies of the Inverness management were strikingly contrasted with the extremely conservative management that previously controlled these collieries, and the action of the Federal Government in connection with the export embargo had extenuating circumstances, but it is fair to say that any action taken by a government which prevents profitable operations in the Summer requires the acceptance of concomitant responsibility for keeping the mines working in the Winter, if the object of that action was to increase the production of domestic mines to supply a domestic need.

RELATION OF THE PUBLIC TO THE MINING ENGINEER AND GEOLOGIST.

At the afternoon session of the 10th February during the Annual Meeting of the British Columbia Division of the Canadian Institute of Mining and Metallurgy, Mr W. G. Norrie-Lowenthal spoke with regard to the relationships that should exist between the public and the mining engineer and geologist. The speaker stated that while the general public would instinctively consult a doctor in case of sickness a lawyer in case of legal difficulty, an architect when they wanted a home built, or in fact any specialist on most matters which required a specialist's attention, the mining engineer's and the geologist's professions were sadly neglected by the public, and the majority of people did not even consider the existence and certainly did not realize the importance of these highly-qualified men whenever any mining investment was considered. The speaker said the public generally were rather prone to consult so-called old-time prospectors, or miners, or mining-camp cooks, or in fact anybody with a glib tongue who represented himself as possessing a superior knowledge of a mine or a mining district. This would be analogous to consulting a hospital orderly in case of sickness, or the janitor in a courthouse in case of legal troubles. The speaker showed conclusively that it was neglect on the part of the public to consult properly qualified authorities that had resulted in the large loss suffered by the public in wildcat mining gambles. There was no more speculation, if as much, in mining as in lumbering, fishing, or even farming, if people would only exercise the same care in their dealing with mines as they exercised in other industries. Only by the consultation of experts could the mining industry be removed from the field of the wildcat kind of gamble to that of legitimate speculation. Mr. Norrie-Lowenthal blamed the mining engineers and the geologists as much as the public themselves for this attitude of apathy and suspicion. Engineers did not sufficiently appreciate the viewpoint of the public, and were not sufficiently interested in the political and other problems of the day. He also pointed out that as a rule engineers' reports were couched too much in the language of technology, and technical matters in connection with mining were emphasised to the neglect of the more important, economic side of mining.

THE INORDINATE COST OF COAL DISTRIBUTION

The Corn Exchange Bank of Philadelphia makes some interesting statements in a recent issue of its house organ with regard to the wastefulness of anthracite distribution and the stabilizing influence of large-scale mining operations, which are of quite general application to the whole question of coal distribution and selling prices in North America. These observations confirm views put forward by the "Canadian Mining Journal" on this subject from time to time. An excerpt from the article in point states:

"The cost of distributing coal in Philadelphia is very high. Before the war, when a dealer had a "spread" of $1.25 a ton he could turn around. Now he needs $3.25.

It is difficult to conceive a less economical thing than the present method of distributing coal in this city. There are about 230 different local dealers. Those in a position to know say that 30 would be enough. One dealer handles about 1,000,000 tons, or just about one-sixth of all the anthracite burned in Philadelphia. But that dealer has a plant equipped to handle 2,000,000 tons.

There are about 7,000 coal delivery autos or wagons in use here, and nobody can estimate how many times these vehicles duplicate each other's routes, covering the same ground half a dozen times. When the food administrator during the war looked into a similar condition of the local milk dealers, the first thing he did was to recommend a consolidation of interests

which would prevent half a dozen rival milk wagons traversing one little street.

Once $9 a week hired a coal-wagon driver. Now the wages for that sort of work run as high as $35. One-quarter of the delivery vehicles are auto trucks, which dealers say are economical for long hauls, but are beaten by horses on the short hauls.

It is more or less popular to blame most of the public's coal troubles upon the big operators. Local distributors of coal who know the facts generally admit that the public owes a debt to the big operator which he will never collect.

The big operators stabilize the market, and they alone prevented a real skyrocketing of hard coal during the past couple of years. Even at that there are known instances where small independents during the worst coal stress charged as much as $5 a ton above the regular price schedule laid down by the dominating operators.

The recent advance of 40 per cent in freight rates is one new element which helps keep up the price of coal to the city buyer. So when coal dealers are asked what will bring down the price of coal, they will say that cheaper labor at the mines or a much greater output per man is the first requisite."

TORONTO NOTES.

At the annual meeting of the Tough Oakes Gold Mines held in Toronto last week an intimation was given that the mine might reopen within the next month. The announcement was made by H. G. Latilla of London, England, who represented the Kirkland Lake Proprietary (1919), Limited, which is the largest single shareholder of the Tough-Oakes Company. He stated that if the proposals of the directors to sell the assets of the company to the Kirkland Lake Proprietary were consummated, a proposition would be made to immediately reopen the mine. The matter will be further considered at a special meeting of the shareholders to be held at a later date.

Only formal business was transacted at the annual meeting of the Sylvanite Gold Mines, Limited, which was held in Toronto last week. Directors elected for the Tough-Oakes were: Dr. R. J. Robbins, Charles Richardson, E. S. Gordon, Haileybury; Albert Burt, London, Eng. and J. Y. Murdock, Toronto. The new directors are Messrs. Richardson and Gordon. Albert Burt was elected president, Charles Richardson, Vice-President and M. E. Green, Secretary-Treasurer. Three new directors were elected for the Sylvanite Mine. They are Albert Burt, E. S. Gordon and Charles Richardson. Those re-elected were G. A. Young and J. Y. Murdock. It is understood that negotiations are pending for the amalgamation of the Tough-Oakes.

Sylvanite and Burnside Gold Mines, Ltd., which would make the largest single holding of property in the Kirkland Lake district, comprising some 500 acres. The new company is known as the Kirkland Lake Proprietary (1919), Ltd. which already owns and operates the Chambers-Ferland Mine at Cobalt.

At the annual meeting of the shareholders of The Herrick Gold Mines, Limited, held at Toronto, last week, the managing director, Mr. F. C. Sutherland gave a report which surveyed the operations and development work carried on at the mines during the year. After describing successful operations by diamond drilling, Mr. Sutherland said that the drill cores from one of the veins gave an average assey of $12.88 to the ton over a width of ten feet. In addition to the various veins mentioned in the report, the diamond drills pitched up a further vein which is located about 400 feet to the west of the present workings. Over a width of nine feet on this vein, the drill cores gave an average assay of $39.10 to the ton. It is planned to undertake actual work on this vein at a later date. It is the intention of the Company to push the development on the two veins in the main workings. Present plans call for the sinking of the shaft to a depth of four hundred feet and the opening up of the ore-body at the intermediate levels. Additional plant and equipment is now being secured, and will be taken into the property this Winter, while the roads are in good condition and transportation less costly. According to the financial statement presented the Company is free from debt, with the exception of a few small current accounts.

THE ANNUAL STATEMENT OF THE HOLLINGER CONSOLIDATED MINES FOR 1920.

The Annual Statement and Report of the President and Directors of the Hollinger Consolidated Gold Mines, Ltd., for 1920, is a thoroughly satisfactory one, and fully justifies the recent appreciation in the market value of the shares.

The Profit & Loss Statement for three years compares as follows:

	1920	1919	1918
	$	$	$
Production	6,939,628	6,722,266	5,752,370
Oth. revenue	222,982	340,832	155,956
Total income	7,162,611	7,063,099	5,908,327
Op. charges	3,144,328	3,222,617	2,857,510
Oper. profit	4,018,282	3,840,482	3,050,817
Deduct:			
Taxes	225,940	286,372	82,404
Deprec., etc.	1,117,066	1,232,819	379,850
Net profit	2,675,274	2,321,290	2,588,563
Dividends	2,214,000	1,722,000	1,230,000
To surplus	461,274	599,290	1,358,563

Quick assets, consisting of bonds, cash and bullion, compare with current liabilities for wages, taxes and accounts payable, in the two years shown, as follows:

	1920	1919
Quick Assets	$5,206,257	$3,602,554
Bills Payable	335,125	261,158
Working Capital	$4,871,132	$3,341,396

These figures disclose a very liquid and comfortable cash position. The surplus stands at $3,131,852 at the end of 1920 as compared with $2,670,577 at the end of 1919.

The operating profit increase over the preceding years is remarkable in view of the fact that in 1920 the tons of ore milled totalled 650,205 tons against 711,882 tons in 1919. The General Manager states that "marked decreases in the labor supply and consequent low tonnage output necessitated the milling of better-grade ore than a normal programme would have determined. We have not, however, depleted our high-grade reserves. The net yield is $9.56, as compared with $9.40 in 1919".

Two interesting examples of the conservative methods followed by the Hollinger management are the generous writing-down of the plant equipment, which has been reduced from a first total cost of $3,700,466 to a present valuation of $1,500,000, representing 40.5 per cent of the total cost of the equipment. Even this low estimate, when compared with first cost is greater than the amount that would be realised at breaking-up prices, and it is to be presumed that the policy of annual depreciation will be continued until the capital investment represented by plant and equipment is completely amortized. All development costs, totalling $1,417,469, have been written off, an eminently proper policy.

A comparison of some of the more striking operating figures is as follows:

	1920	1919	1918
Tons of ore milled	650,205	711,822	578,755
Average value per ton	$9.93	$9.73	$10.24
Net value of gold recovered	$6,219,665	$6,722,000	$5,752,000
Ore Reserves (tons)	4,087,083	4,392,000	4,439,000
Computed Value	$41,719,670	$39,928,430	$41,080,000
Average number men employed	1,025	1,207	1,061

With regard to ore reserves, Mr. Brigham comments:

"A complete recalculation of the tonnages and values "of all veins, based upon new and more accurate data, "discloses material improvement in the gold contents. "Labor shortage has resulted in confining our efforts "to the development of better grades of ore.

"Increasing in wages and the continued high prices "of mining supplies have determined the policy of de-"leting all ore of six dollars or less per ton. The ton-"nage formerly reported in the statement of surface "outcrops is similarly treated. This does not mean "that we consider them valueless, but, keeping in mind "the present disabilities under which gold-mining is "being carried on, we feel that these items should not "be included in a conservative statement."

For the purposes of the Balance Sheet, therefore the figures of ore reserves shown in the foregoing table are corrected, and compare with 1919 figures as follows:

		1920	1919
Gross Ore Reserves	(tons)	4,087,083	4,392,000
Deduct Probable Ore.			
Veins under $6.00	(tons)	585,078	—
Surface Outcrops	"	208,000	—
Net Ore Reserves	"	3,294,005	—
Net Value		$36,596,059	$37,693,450

The great handicap the Hollinger has been under in recent months through a shortage of power is revealed by the General Manager's statement that the connected apparatus of the mine totals 7,500 kilowatts, but that the Company had been unable to obtain from the power company more than 1,700 kilowatts. An intimation is made that the extra cost of steam-generated power during the first four months of 1921 will be chargeable to the power company, presumably in default of delivery obligations. Evidently the most pressing problem of the Hollinger Mines is an adequate power supply. The capacity of the mine and mill was stated in the last annual report to be 3,200 tons daily, and it is now stated by the President that operations are curtailed by power shortage to 1,700 tons daily.

An interesting and unusual remark in the President's report may be quoted. Mr. Timmins comments as follows:

"The return of 9 per cent to shareholders during "the current year includes 4½ per cent return of "capital because the gold taken from the ore is "not replaced by anything and the total value of "the property is thereby reduced by that amount. "Comparing mining with other forms of industry "the shareholder should always bear in mind that "the amount of raw material is limited and the "capital value of his property is yearly being "diminished. Therefore, it is essential that a part "of his dividend should be applied to the amortiz-"ation of the capital represented by his shares."

The Hollinger Report is pleasing, not only in the results it shows, but in the satisfying fullness of the information given to the shareholders. No competent mine manager is content with anything less than the completest kind of statistical information, and it is not difficult to deduce from the condensed information contained in the Annual Report that the Hollinger management requires and is in possession of precisely that kind of statistical information that is a hallmark of all-round competency in mine supervision. The appreciation of the work of the General Manager and his staff which concludes the statement of the President, is, judging by the Report, unusually well-deserved.

THE PROPOSED GOWGANDA-WEST SHINING TREE RAILWAY CONNECTION.

At a largely-attended meeting of mining men, held in the office of F. C. Sutherland & Co., on Feb. 12th, on motion of Frank C. Loring, seconded by Charles G. Knott, the following resolution was passed unanimously:

"Whereas, the construction of the Timiskaming & Northern Ontario Railroad has resulted in the discovery of subsequent development of the important silver-mining district of Cobalt, which has produced nearly 11 per cent. of the world's silver since discovery; of the great Porcupine camp, which contains some of the world's greatest gold mines, and which has produced already many millions of dollars in gold; of the great Kirkland Lake camp, and also many other important and promising districts, from which the total production of the precious metals has amounted to many times the total cost of the said railroad, and which are maintaining a large and industrious population, which is a source of much revenue to the Ontario government, and, directly and indirectly, to the entire population of Ontario.

"And whereas, in the mining camps of West Shining Tree, Gowganda and Matachewan, and elsewhere in that region, similar geological conditions exist as exist

in the mining districts heretofore mentioned, and the potentialites of these districts are equal to those of the mining areas already developed.

"And whereas, the development of these districts and their permanent advent as gold and silver producers, with the consequent permanent population, and the certain revenue which will result when these districts are properly developed, depends on the establishing of proper railroad connections with the already existing railroad systems of Ontario

"Therefore, be it resolved that this meeting urges the government of the province of Ontario to seriously consider the construction of such a railroad for the best interests of the mining districts mentioned, and the people of the province of Ontario in general."

The meeting also, on motion of J. P. Bickell, seconded by Charles Millar, passed a resolution declaring that the government had the sole and exclusive right to fix and determine the route and termini of the proposed railway, in accordance with the public interest

A committee composed of Weldon C. Young, S. R. Clarke and S. J. Dixon was appointed to confer with the Associated Boards of Trade of Northern Ontario, which meet at Cobalt during the present week

EDITORIAL

ENGINEERING STATUS LEGISLATION.

Apropos of the statutory creation of Councils of Professional Engineers in various provinces of Canada, and the widespread movement to make engineering a closed profession in Canada, it may be interesting to note that the recent Report of Council of the Institution of Mining Engineers in Britain contains an announcement that a Bill for the registration of Civil Engineers, prepared by the Institution of Civil Engineers, has after careful consideration of the Council of the first-named body been considered to be detrimental to the interests of mining engineers. A Committee, consisting of the President of the Institution of Mining Engineers and the Secretaries was appointed to interview the President of the Civil Engineers to state the objections to the Bill and the Committee was empowered to take any steps that might be necessary to co-operate with any other bodies in opposing the legislation proposed. Action of this nature was taken, but has not been carried to any definite conclusion, as it has been found that the time at the disposal of Parliament would not permit of consideration of the Bill.

The Institution of Civil Engineers in Britain has not attempted to include within its membership the numerous specialised branches of engineering that do not come strictly within the ordinary conception of the province of the civil engineer, and the Institution of Mining Engineers, the Institution of Mining & Metallurgy, the Iron & Steel Institute, the Institution of Engineers & Shipbuilders, and other similar bodies that could be named, have very jealously guarded their special privileges. The Institution of Mining Engineers, for example, was granted a Royal Charter in 1915, which carries with it some very definite liberties in Britain. The range of acquirement necessary to the making of a really accomplished mining engineer is so wide and so varied that it gives him an unusual number of affiliations, and tends to decentralise his sympathies and diffuse his energies in a way that sometimes creates bewilderment in his own mind. It is therefore not perhaps to be wondered at that other branches of engineering are apt to misinterpret the mining engineer's position. Georgius Agricola, writing in the Sixteenth Century regarding the necessary qualifications of the mining engineer, listed philosophy, medicine, astronomy, surveying, accounting, architecture and the law, as some of the sciences in which he should be expert in addition to his specific knowledge of the mining art proper. The matter is therefore not one of yesterday.

The profession of the mining engineer is sufficiently ancient, honourable and important to suggest that of all those interested in his privileges, emoluments and etiquette, the mining engineer himself is most interested, and is also best fitted to guide his own policies.

The statutory law long ago recognised the special character of the work of the mining engineer by specifying his technical qualifications and prescribing a standard of competency, and all engineering-status legislation of today has to confess and avoid this preempted status of the mining engineer. Why should not the mining engineer stand therefore upon his ancient rights and ask that his actions should be free and untrammelled by supervisory affiliations, and demand that the voice of mining engineers in select council, and that voice only, should be regarded as the representative of the profession of the mining engineer?

THE NATURAL ALOOFNESS OF THE ENGINEER IN POLITICS.

The heading to a newspaper paragraph recently noted referring to President Wilson's plans after his retirement from office, read: "Wilson's plans when ousted 4th March." This little phrase is one of those lightning flashes that, probably without conscious intent on the part of the writer, illuminate some points of view, and reveal hidden things. Without emphasising the bad taste of the phrase which is quite sufficiently obvious, it is suggested there is something rotten in the tendency that impells to reference to the retiring chief executive of a great nation as being "ousted" from a position that was delegated to him by electoral vote, and from which he retires by expiry of his trust after two terms of responsibility and

has not been the lot of any previous President of the United States. It ill becomes anyone to belittle the dignity of electoral trust, and if there is any higher honour that can be conferred upon a citizen of an electorally governed nation than that of Chief Executive, (whether he be called Prime Minster, or President) it has not been announced. The little phrase quoted, innocently betrays that poisonous perversion of thinking arising from party politics which sickens decent citizens and deters too many of them from entering the public service by way of what is known as "politics". The engineer, of all men, is because of his precise habit of thought and his daily dealings with natural laws that do not lie and are immutable, averse to mixing in the game of politics, where unprecision, inaccuracy and unreasoning change predominate. Nevertheless, such abstention is something to be deplored, particularly as it is likely to be persisted in. The engineer, peace to his soul, is first cousin to the Pharisee, and not bad company at that.

THE EXPLOSIVES TESTING STATION.

Our issue of 30th April 1920 contained the first annual report of the Explosives Division of the Department of Mines, Ottawa, an organization that took ten years to assume shape. In this first report the Chief Inspector, Lt.-Col. G. Ogilvie stated that the provision of a testing station for tests of "permitted" mine explosives was a matter of vital importance, but the Chief Inspector did not seem to anticipate any early establishment of this most necessary national equipment. It is to be hoped that the same protracted and unnecessary delay in providing a testing station will not be experienced as was the case with the establishment of the Explosives Branch itself, the Act authorising it having been passed in 1910. It is very desirable that Canada should be able to issue its own list of permitted explosives. We noted last April that every notable coal-mine explosion that had taken place in Canada had as its proximate cause the flame or shock of some form of blasting powder or explosive, and it is the widespread opinion of coal-mining men in Canada that this country should long ago have possessed its own explosives-testing station. The passing of the appropriation and the provision of the Station should at once be proceeded with. Further procrastination would be unfair to the coal-mining industry.

A COAL MINER'S COMMENDABLE CANDOUR.

The address given by Mr. Thomas Graham, the General Superintendent of the Canadian Collieries (Dunsmuir) Limited, of Vancouver Island, before a joint luncheon of the Associated Boards of Trade of British Columbia and the Canadian Institute of Mining & Metallurgy, is a model of refreshing candour, and there would be less hostility shown by the general public towards mining enterprises if executives would speak right out in meeting as Mr. Graham has done. Every word that Mr. Graham spoke with regard to the treatment handed out to the coal industry in the West can be applied with equal truth to the conditions in the East. The coal-miner is the soldier of industry, regarded as a nuisance in times of peace, thought of by the public and its reflex, the government, as representing merely a burdensome appropriation, but "its a special train for Mr. 'Coal Man', when the troopship's on the tide". Mr. Graham is to be heartily congratulated on his straight talk. The coal miners and operators of Canada, taken as a whole, during the war period, did less profiteering, gave more men to the firing line, submitted to more governmental interference and received less consideration than any body of industrial workers in the country. The high prices of coal in recent years were paid on coal imported from the United States, and were the inevitable result of that neglect of the industry always meted out to Canadian coal producers in so-called normal times. If one were asked to devise a method by which Canadian unity could be corroded to the point of dissolution, by which national independence could be destroyed and Canada reduced to the position of an obsequious satrapy, it would puzzle even an accomplished disciple of Lenin to devise a more effective method than is exemplified by the traditional treatment of the coal producers of Canada in the past. Perhaps it is merely lack of method, but be that as it may, the effect is the same.

MINING PROFITS TAXATION

The taxation proposals of the Ontario Government in regard to mining profits are open to all the objections that have been urged against excess profits taxes in other countries, objections so grave that they have been admitted by the various governments concerned and have led to abrogation of imposts that have proved most injurious to business in general. The objection which is best sustained against the taxation proposals of the Ontario Government is one that it has not been possible to urge against other governments, namely that in Ontario the government has singled out mining for invidious and discriminatory treatment. On what grounds the government defends taxation upon mining enterprises that it is not prepared to impose upon all other business interests in similar manner does not appear, and it is a proper question to ask. The mining industry will not complain of taxation that is imposed upon all the public alike, and because of common public necessity; but it has good reason to complain of taxation directed against the mining industry in a partial and very marked manner. This is really the case of the mining industry, and the aspect of the taxation proposals of the government of Ontario that has caused the population of the mining districts to make common cause against unfairly injurious imposts which the government has not attempted to defend on the ground of

principle, notwithstanding that it may have explained its action on the ground of necessity. Some explanation of the government's action, and at least an attempt at a defense of its equity is due to the industry.

Not only are the taxation proposals of the Ontario government discriminatory against mining in general, but in the restricted circle of the industry itself invidious distinctions are made, the nickel-copper mines being marked out for a higher burden than the other mines. The question of principle is again indicated, as the narrow range of applicability of this higher rate of taxation is well understood.

TAXATION FORFEITURE PROCESS AMENDED IN ONTARIO.

A bill that is being introduced by the Minister of Mines at the current session of the Ontario Legislature provides that lease and mining rights forfeited by reason of non-payment of taxes shall not be open for re-staking until the lapse of one year, or until declared open for re-staking by Order-in-Council. Provision for redemption of forfeited claims by previous lessee is possible by payment of arrears of taxation, costs and a penalty of ten dollars. This is commendable legislation.

In forfeiting leases last Autumn the Ontario Department of Mines did not exercise due care to notify the defaulting taxpayers of the threatened forfeiture, and in immediately throwing open claims for re-staking the Government did not gain that possessory advantage from the re-invested title that it should have done. The whole incident was a disturbing one, and in altering the statutory provisions to prevent its recurrence, the Government is acting wisely. Due notice is just as much a part of the cancellation of a contract as the monetary lease consideration is of its continuance.

INVESTMENT vs. SPECULATION.

Our Port Arthur correspondent complains of reflections made upon the Dryden gold area by "Saturday Night" of Toronto. It is of course not open to any critic of mining enterprises to condemn as a failure any district except after careful personal examination, and from long-continued weekly reading of the "Gold and Dross" column of our lively contemporary, we believe that any criticisms that have been passed are intended to refer to the presumptions and errors of management rather than to the intrinsic physical values of any mining field. He would be a rash man that would attempt the last named appraisal without some very definite technical qualifications and exact knowledge of a selected field.

"Saturday Night" gives financial advice to people who very palpably need it, judging from the nature of the published enquiries, but does not, and properly so, counsel the placing of investment funds in mining stocks or industrial common stocks. Most of the persons who write for advice to financial editors are unable to distinguish between investment and speculation. In order to enable intelligent distinction between these two forms of hypothecation of cash assets, it is first of all essential that the person who exchanges cash for scrip should be possessed of all necessary information regarding the venture he has chosen. A deplorably large number of those who purchase mining scrip know less than nothing about the financial soundness of enterprise they have put money into, and it is for this reason, presumably, that those who have to advise persons of small means, widows and women investors, and persons quite ignorant of corporate financing and procedure, refuse to class mining stocks as "investments." The person who hopes to get rich by putting money into mining ventures—unless he possesses the ability to size up the financial stability of a mining enterprise—may of course make lots of money, but he is just as likely to lose all he ventures. It is about the same form of excitement as betting on a horse race, except that the ability to pick a winner is not so widely distributed in the populace.

In a recent issue of "Saturday Night" the best mining stock in the North Country was described as distinctly not an "investment", but as a promising speculation. The same may be said of hundreds of seasoned common stocks, preferred stocks, debentures and even bonds, purchasable today at prices to yield from eight to twenty percent. Many of these stocks, if bought today, are most likely to yield profitable returns, to those who know what to buy. At the same time, they are not investments comparable with government war-loan certificates, municipal and provincial bonds, and such issues as are permitted to trustee investors. The duty of those whose business it is to advise the small investor was never so plain as it is today, because never before in this generation were government-secured loans obtainable so easily and at prices to yield high interest returns and selected maturities.

Advice such as given by "Saturday Night"—and it is good for the most of those who ask it—is not, however, to be considered as bearing in any way upon the general question of mining as related to investment. Mining is a business, and a very profitable one. It is moreover not a less necessary business than other usual industrial activities, but it requires not less specialised knowledge. This journal does not favor the financing of mining enterprises by a multitude of subscriptions from small investors, and, if this viewpoint is strenuously objected to (as may well be the case) as shutting out a number of persons from the profits of the industry, it is suggested that the dangers that small investors avoid outweigh this supposed advantage, and that the good name of mining is more likely to be upheld by participation in mining enterprises limited to those who know what they are about and are therefore likely to choose competent technical advisors.

AS TO "SELLING" OURSELVES.

It might help to clear the viewpoint of those persons in the United States who advocate the "sale", by some unmentioned and vague authority in the British Empire, of certain territories within the Empire, if they would kindly explain how such a similar proceeding could be carried out by the United States. Suppose, for example, the United States undertook to sell California, how would the sale be initiated and carried to a conclusion? A few studies along these lines might assist some extremely ill-informed citizens of the United States in getting our viewpoint in Canada. Where is the authority that can break the entail of the British Empire? And what would the rest of the family say about it? A West Indian newspaper, irritated and fed-up with such inanities, asks: "Why should a great Empire wish to sell any part of itself?" This is a natural outburst, under the circumstances but a more comforting question would be: "How could any part of the Empire sell itself?" Search for the answer would be found vain, but not altogether unprofitable maybe.

23rd ANNUAL GENERAL MEETING, CANADIAN INSTITUTE OF MINING & METALLURGY. MONTREAL, MARCH 2nd to 4th. 1921

The Annual General Meeting of the Intitute will be held at the Windsor Hotel (in the Ladies' Ordinary).

In addition to the business and ordinary proceedings of the Meeting, a Smoker and Concert will be held on Thursday evening, the 3rd March. The Annual Dinner will be held on Friday the 4th. at the Montreal Club. Excursions have been arranged, through the courtesy of the Thos. Davidson Manufacturing Company, and the Dominion Engineering Works, Ltd., for inspection of the plants of these companies on the afternoon of Friday, the 4th. The works are situated not far apart, and can be seen in the same afternoon. They both posses features of unusual interest, the Davidson Company specializing in electric-steel castings, and the Dominion Engineering Works in paper-making machinery and in hydraulic machinery.

PROGRAMME OF THE MEETING.

WEDNESDAY, MARCH THE 2nd.

(9.30 a.m. to 5 p.m.—Registration at Windsor Hotel)

Morning Session — 10.00 *a.m. to* 1 *p.m.*

Chairman, The President,
Addresses of Welcome,
Presidential Address, by O. E. S. Whiteside.
Mineral Statistics for 1920.
The Dominion.—John McLeish.
Province of Ontario.—T. W. Gibson.
Province of Quebec.—T. C. Denis.
Province of British Columbia.—W. Fleet Robertson (or by proxy).
Province of Nova Scotia.—Hiram Donkin (or by proxy).

Intermission.—1 p.m. to 2.30 p.m.

Afternoon Session. — 2.30 *p.m. to* 6 *p.m.*

Chairman, Dr. F. D. Adams.

General Business:—

Discussion on the proposed amendments to the By-Laws to provide for the appointment of an Executive.

Report of the Publication Committee on the future printing of the Monthly Bulletin.

Engineering Legislation, etc.

Evening Session. — 8 *p.m.*

Chairman, Mr. Balmer Neilly.

Principles of Copper Leaching and Precipitation. By F. E. Lathe.

Characteristics of Ontario Gold Deposits. Illustrated by lantern slides. By P. E. Hopkins.

Suggestions for the Better Development of the Mineral Resources of Northern Ontario. By W. E. Simpson.

The Operations of the Mond Nickel Company. — Moving pictures directed by a member of the staff of the Mond Nickel Company.

THURSDAY, MARCH 3rd.

Morning Session. — 9.30 *a.m. to* 1 *p.m.*

Chairman, Capt. J. G. Ross.

"Institute Service."—Some Suggestions. By G. C. Mackenzie.

"Blue-Sky Laws as they Affect the Mineral Industry." By J. P. MacGregor.

"The Silver-Lead Deposits of the Mayo District, Yukon." By W. E. Cockfield.

Intermission—1 p.m. to 2.30 p.m.

Afternoon Session. — 2.30 *p.m. to* 6 *p.m.*

Chairman, T. W. Gibson.

"Canada's Coal Problem." By F. W. Gray.

"The Discovery of Oil at Fort Norman." Official memorandum from the Imperial Oil Company.

"Salient Features of the Geography and Geology of the Mackenzie River Oil Region." By E. M. Kindle.

"The Story of Petroleum." — Moving pictures directed by W. A. P. Schorman, British American Oil Company.

Evening Session. — 8.00 *p.m.*

Chairman, Colonel J. J. Penhale.

Smmoker and Concert in the Ladie's Ordinary

FRIDAY, MARCH 4th.

Morning Session. — 9.30 *a.m. to* 1 *p.m*

Chairman, Mr. R. L. Peck.

"Welfare Work," A. W. Macdonald.

Discussion on Increased use of Canadian Iron Ores. Messrs. Stansfield, Gray, Cowie, Dannecy, Mackenzie and Evans.

"Steel Castings for Mining Purposes" R. L. Lindstrom.

"Manganese Steel Castings in the Mining Industry." By W. S. McKee and J. H. Blake.

Intermission.—1 p.m. to 2.30 p.m.

Afternoon Session. — 2.30 *p.m. to* 6 *p.m.*

Chairman, Theo. Denis.

The Asbestos Industry.—Capt. J. G. Ross.
Super-Cements.—G. M. Thomson.
Graphite.—V. L. Eardley Wilmot.
Mica.— H. L. Forbes.
Fluorspar.—M. E. Wilson.
Feldspar.—N. B. Davis.
Brick and Clay.—J. Keele.

Evening.

Annual Dinner at 7.30 p.m. at the Montreal Club

The Coal Industry of Vancouver Island

An Address by Mr. Thomas Graham,* Before the Canadian Institute of Mining & Metallurgy, at Vancouver, February, 1921.

Having been associated with the coal industry of Vancouver Island for the past sixteen years, I shall endeavor to talk to you for a short time today in a general way on the Island coal fields.

My remarks may be somewhat rambling, as there is quite a large subject to cover. They will, however, in no way be technical, nor do I propose to weary you in quoting figures extensively. I propose chiefly to refer to certain fallacies that exist in the public mind relative to the coal field and coal industry on Vancouver Island.

Most of us gathered here today have unlimited faith in the future of British Columbia. We believe that within its boundaries lies immense mineral wealth; this wealth awaits the advent of the prospector to bring it to light, capital to produce it, and the development of our coal resources to manufacture and shape it to the wants of a world eager and willing to pay for it.

Our Province in no sense can be termed agricultural; its greatness must lie in its timber, fishing and mineral resources, and our ability to manufacture; and no country can be great in manufacturing when dependent upon some other state or country for their fuel supply.

Experience gained during the war has demonstrated to the world that industrial supremacy lies with a nation in proportion to its ability to produce or control the fuel to drive its machinery.

Despite the part that fuel oil has played in retarding the development of the coal industry in British Columbia, it, generally speaking, plays a small part in the world's production of steam, and is every day destined to play a smaller part. The industries of the world are today run by coal and will be so run for hundreds of years to come. Floyd Parsons, late editor-in-chief of "Coal Age," a journal devoted to coal, makes the statement that we have on the North American continent enough coal to last us 1,500 to 2,000 years, and enough oil to last us 10 or 12 years.

The production of coal in the Province of British Columbia was 500,000 tons less in 1920 than in 1910 —some room for thought in this statement. That is to say that during the decade in which British Columbia made the greatest industrial strides in its history its basic industry, coal, retrograded

To those of you who have made and watched with pride the industrial progress of this city in the past ten years, it should be quite plain that such progress should be upbuilding prosperous communities adjacent to you, paying tribute to you as their chief distributing point. Such would have been the case on Vancouver Island had its coal industry kept even pace with the growth of your industries.

Fuel oil has displaced approximately 600,000 tons of Vancouver Island coal per year, and, at present prices paid for oil, means that we are sending out of this Province $6,000,000 per year that should be spent in supporting our own industries and building up our own Province. Six million dollars per year to help swell the balance of trade against us and depreciate the value of our own dollar.

The transportation companies, rail and coastal waters, who had most to gain by the upbuilding of our own Province, contribute largely to this amount. But they are not alone in this; your manufacturers and the owners of the large business blocks in this city and Victoria all contribute, and are largely responsible for a condition that a few years hence will block and retard the industries of this Province.

And, may I ask, what have the Boards of Trade done to develop the coal industries of this Province? If my memory serves me right, in 1915 the coal mines of Vancouver Island were working one and two days per week, and an attempt was made to have a slight increase placed on the tariff on California fuel oils, to permit the mine employees to obtain sufficient employment to live. The Vancouver Board of Trade opposed the movement, preferring to build up the industries of our neighbor to the South rather than those of our own Province.

I note since arriving in your city to attend this meeting that the Associated Boards of Trade of British Columbia have launched a great movement for the purchase of made-in-British Columbia goods, and much display and advertising is being done to impress the importance of the movement upon the people of this community. I am heartily in sympathy with your movement, but I have been wondering, if the promoters were really honest with themselves in the movement. Are you honest enough to tell the public that your made-in-British Columbia goods are manufactured with imported oil, or that they are being sold to them in buildings heated with imported fuel?

But I started out to speak of some of the erroneous ideas existing in the public mind re the coal areas and the coal industry of Vancouver Island.

The resources of this Province are sufficiently large and attractive to satisfy most people, without resort to gross exaggeration and misrepresentation

I fear that in many instances, for promoting as well as political purposes, much exaggeration and misrepresentation has been indulged in, and to such an extent that many people who are right on the ground, and who should know better, have in their optimism been carried away by such statements and readily make use of them

It is quite commonly believed that the greater portion of Vancouver Island is underlaid with several seams of high grade coals In fact, many people believe that you can back a barge up against any portion of the East coast of the Island, scratch a little of the soil away, and proceed to load coal on the barge

Some millions of years ago—how many I do not care to venture to guess—in that age known to geologists as the Carboniferous, a period when Nature so far as coal making material was concerned was in a most generous mood, the great coal deposits of the eastern portion of this continent were laid down. If the geologist is correct this portion of the continent on which we live did not then exist. And in proof of their theory we have no trace on the western portion of the con-

*General Superintendent Canadian Collieries (D) Limited, Vancouver Is

tinent belonging to that period. I presume some millions of years later this portion of the continent appeared, and we have the rocks belonging to the Cretaceous period lying close upon the trap or igneous rocks. It is to this period that the Vancouver Island coals belong, and apparently Nature was not in such a kindly mood at this period, as the seams are interlarded with many intrusions of shale, some of these bands varying from inches to a smuch as four to six feet in thickness.

The area of the deposit was undoubtedly large, but long following the formation of the seams the great uplift that formed the mountain range now comprising the backbone of Vancouver Island, and the corresponding drop which formed the area now known to us as the Gulf of Georgia, destroyed the greater portion of the field. Following this came the Glacial Period, which completed the work and eroded much that the uplift had spared, until today we find that instead of the greater portion of the Island being underlaid with coal, there are only a few isolated basins left, and these are very much faulted and disturbed.

It is generally believed that the E. & N. land grant on Vancouver Island, comprising approximately two million acres, is all underlaid with three seams of coal. The public are not to blame for this belief, as it has been fed to them by promoter and politician for the past forty years. At the risk of being termed a knocker and a pessimist I desire to say that at least one and one-half million acres of the two million acres in the grant cannot possibly contain coal, being denuded of coal bearing strata. Of the half million acres left which may contain coal, but the greater portion of which is unproven, we know that large areas do not contain coal in seams sufficiently thick and advantageously placed to have commercial value.

There have been some very good, although small, detached basins of coal on Vancouver Island, as at Old Wellington, Extension, Nanaimo Harbor, and adjoining Comox Lake, and it is probable that there are some more similar basins on the Island, but they have to be found and proven.

There are, however, no large extended areas of unbroken coal measures on Vancouver Island, containing continuous and regular seams of coal similar to those of the Eastern portions of the continent, or in the plains and foothills of the Rocky Mountains. We have only very small basins much faulted and contorted with many barren spots, containing seams very dirty in character, and presenting problems to the mining engineer unequalled in any mining country in the world.

The present areas now operating are principally those originally opened, and the mines are now very old and cover immense areas, and the coal being produced is chiefly that which, in the early days of the mine, was either lost or left because it was too dirty or too thin to work at a profit.

You will naturally ask why we do not open new mines. The reason is simple, we have no proven territory in which to make the openings and it requires money to prove and open new mines on Vancouver Island. To illustrate this, the Canadian Collieries (D) Limited, by whom I am employed, have for the past two years been prospecting a likely basin. During that period we have made twenty-one miles of roads for transporting diamond drills and supplies to run these, we have drilled twenty-five holes an aggregate of 15,000 feet, the area so far prospected does not contain more than 1,000 to 1,200 acres, the work has cost, $100,000, and the information obtained to date is not sufficient to fully convince us that the field has commercial possibilities, and would justify the cost of development and building of ten miles of railroad to connect the field with tide water.

Again it is generally believed that we pay the coal miner around seventy cents per ton for mining and the difference between that and $9.75 received for lump coal at the docks is clear profit. Now, the tonnage rate of the miner at present is slightly over $1 per ton, plus a yardage rate, plus so much for setting timber, plus a cost of living bonus of $2.09 per day, but the actual coal miners form only approximately 25 per cent of the men employed in and around a mine; they merely break down the coal at the working face. The great army of men are employed in transportation, maintenance of roadways, ventilation, timbering, pumping, tracklaying and general preparation of the coal, and are paid by day labor. Some idea of the amount of this work will be obtained when I state that No. 4 Mine of the Canadian Collieries, Comox, covers an area of over 1,300 acres, and that the nearest coal-producing place in this mine is almost three miles from the entrance of the mine.

An eight-hour day in a coal mine is eight hours from the time the workman leaves daylight until he returns to daylight; when he travels these distances to and fro and lunches during the period, the net result is about six hours actual work.

The actual miner is paid for the weight of coal contained in the mine car at the tipple. This is known as tipple weight, and is the production of the mines given from month to month in the press by the Mines Department. The coal is here screened and separated into the commercial lump coal sold as such on the market, and screenings; these two products are then transported by rail to tidewater, at Comox, a distance of twenty one miles, and at Extension, a distance of eleven miles.

The lump coal and screenings are, relatively speaking, fifty-fifty in proportion. The screenings are then submitted to a washing process. This product contains a large quantity of fine shales from the rock bands contained in the seam and cannot be extracted except by a mechanical process which is called washing and consists of agitating the material on a series of jigs, in water, the difference in the specify gravity of the coal and rock being used to separate these two substances. The product saved is again separated into nut coal, pea coal and fine coals.

Fifty per cent of the tipple weight goes to the washer, and in the process of washing forty to fifty per cent is lost, being too high in ash for commercial purposes. In a colliery having a tipple tonnage of 2,000 tons per day, 1,000 tons would be a lump coal and 500 to 600 tons of washed products, making a daily commercial recovery of 1,500 to 1,600 tons from the 2,000 tons the miner was paid for at the tipple.

The production of the Canadian Collieries in 1920 was 100,000 tons less than in 1919; thirty-seven days were lost in the Comox colliery, due to lack of demand and here let me say that our mines are not like a factory, we cannot lock the door and leave them on an idle day, like you lock your store or factory. The roadways and ventilation must be maintained and water pumped. The gases and water do not stop when we stop producing coal. It costs us $2,000 per day to be idle.

We have three mines in the Comox Collieries in which the ventilating fans run twenty-four hours per day 365 days in the year. Each is capable of producing 200,000 cubic feet of air per minute, and each fan requires a 350 h. p. motor to drive it.

As an illustration of our water problem, we have one mine producing 750 to 800 tons of coal per day; we are hoisting from this mine 1,200 gallons of water per minute; at ten pounds per gallon this is 12,000 pounds, six tons per minute, 360 tons per hour, 8,640 tons in twenty-four hours, or eleven times the weight of the coal produced.

In addition to the large quantity of water handled, it is acid in character, and all the pumps used must be made of bronze.

The Vancouver Island field will never be a large producer of coal as compared to other coal-producing centres. The cost at the docks is in no way out of keeping with the natural difficulties of the field, neither has the cost of the product at any time during the war and reconstruction period been out of keeping with the general advance in cost of labor and supplies.

The coal industry has been the only industry in British Columbia that has practically been controlled by the Government during the war. The labor Department regulated the advance in our labor rates, in accordance with the cost of living, and the Fuel Controller regulated the advances in selling prices.

Our entire business, production and selling, payrolls, cost sheet and receipt, from the first appointment of the Fuel Controller to the present time, are monthly sent to the Government at Ottawa, who are as familiar with our business as the auditors of our own company.

Vancouver City has for the past six years been fortunate in its coal supply; throughout the entire war, and the two years since, not a day has been lost by Vancouver Island mines through labor troubles; your supply of coal has been regular, when the rest of the world was rent with labor troubles, and lacked fuel to operate their industries and heat their homes.

You obtained this supply, not at an outrageous price for labor, but at a price that was only in keeping with the increased cost of living. I desire to here pay tribute to the fairness of the miners on Vancouver Island. At a time when their product was an absolute essential to the country, they faithfully abided by their agreements and rendered splendid service to their country.

Both the miner and the operator of Vancouver Island are to be congratulated on the achievement of the past six years. It is unequalled in any basic industry in any country in the world.

The price to you today is 100 per cent above pre war times. Now, as business men, I appeal to you, how many of you have been handling goods during the past few years that have not increased that amount in price?

The increase in our labor cost was approximately 95 per cent, and the remaining five per cent is easily accounted for in rise and cost of material.

A coal business, as you will note from what I have said, is seasonal. There are two seasons in Vancouver, the season in which you don't give a damn if every mine on Vancouver Island closed down and every miner and his family starved; and, the season when a cold spell strikes you and you expect that the people who kept us alive during your indifferent spell should be told to go to blazes and get their coal in order that your temporary wants may be relieved. I had almost forgotten a third season, which is also peculiar to Vancouver. I refer to that season immediately preceding the municipal elections, when the good steaming qualities of Vancouver Island coals are much in demand to raise the necessary pre-election pressures to the blowing-off point.

Then there is the ever ready belief that over capitalization of the coal companies is the thing that makes Vancouver Island coals cost so much by paying dividends on watered stock.

Many of you remember that the Canadian Collieries bought the Dunsmuir coal interests in 1910 for eleven million dollars. Much preferred and common stock was placed on the market, and a debenture issue of $5,000,000 gold-bearing bonds was floated in order to raise money to develop the property. These bonds carried six per cent interest. The interest was paid on this issue in 1911, and one per cent of interest has been paid on one dollar of the issue since that year. In 1914 the bondholders took over the property to protect their interests so that the preferred and common stockholder ceased to have an interest in the property. The bondholder decided to forego interest on his bonds until after the war. Since that time the company has been reorganized and the bondholder accepted in the reorganization $500 of stock for every $1,000 of bonds he owned, so that this company has not paid a cent of interest on its bonded indebtedness in the past nine years, let alone any interest on stock, either real or watered.

A second company on the Island recently closed down, being unable to meet its payroll.

The day is not far distant when this city must return to the use of coal for power and heating purposes. When that day comes the coal industry of Vancouver Island is in no shape to take care of your wants. It has been neglected and starved, and will be unable to respond on notice to the increased production required to maintain the progress you have made in this city during the past ten years, a progress built on imported fuel. You will then pay for the past neglect, not only in price but in curtailed output of your factories, through insufficient supply of that material on which your whole industrial fabric must rest—namely, coal.

In conclusion, Sir, let me say that the producing end of the coal business in no way fears investigation into their operations. We do, however, strongly object to the verdict being rendered before the investigation has functioned.

We, however, believe that although you live only a few miles from us, you have been too busy attending to your own affairs to get acquainted with our business, and therefore, on behalf of the Canadian Collieries (D.), Limited, Sir, and a committee of your mining division, an invitation to pay us a visit. We shall be pleased to show you our conditions, and we feel confident that we can convince you that there are many industries in British Columbia that are more pleasant, more remunerative and less hazardous, financially, than coal mining.

We would be pleased if Mayor Gale of your city, could accompany the committee. We do not expect that the smile for which your Mayor is so justly famous, will dispel the gloom that eternally pervades the interior of a coal mine, but we hope he may garner sufficient information on our business to enable him to remove many of the erroneous ideas held by his fellow citizens about the coal industry of Vancouver Island.

Notes from the Pas, Manitoba

By REECE H. HAGUE.

Lignite in Northern Saskatchewan.

Considerable interest has been excited in The Pas district over the discovery on the Carrot River, some 100 miles South-west from The Pas, and across the Saskatchewan boundary, of a deposit of lignite.

The Pasquia mountains, in which the discovery was made, have long been known to contain oil shales, and much speculation has been rife as to the possibilities of a future petroleum industry in those parts. However, the recent discovery of lignite is the first time for many years that any rumour of coal occurring in the locality has become prevalent.

For the most part prospectors in The Pas district have been too busy searching for gold, silver, copper, and other metals, to think much about The Pasquia hills deposits of oil shales, and consequently the locality has been practically overlooked.

Some time ago, however, an outcropping of coal was discovered by Indians in the Pasquia Hills Forest Reserve. The discovery was examined in December by a prospecting party sent out from The Pas by Col. W. H. Coy and Thos. C. Strain of Vancouver. A sample of the outcropping proved so attractive upon examination that Messrs. Coy and Strain, backed by a syndicate of Saskatoon business men, sent out a second party to continue the work of exploration. The party returned to The Pas a few days ago, with further samples and data, and were most enthusiastic over the discovery. Col. Coy has left for Saskatoon to have samples analysed by the Department of Chemistry of the Saskatchewan University. Further exploration work by means of diamond drilling will be commenced as soon as the syndicate can get the necessary machinery upon the ground.

A large acreage has been staked and registered by Col. Coy's syndicate, and the result of further development is looked forward to with great interest among local mining men.

Samples are on exhibit at The Pas, and in addition to lignite show a bituminous matter in a grey clay. Other samples show the half-way stage in the process of coalification of vegetable matter.

The location of the discovery is six miles from the proposed railway line from Melfort to The Pas, to connect up with the Hudson Bay Railway.

Should the new find prove economically important it will have far-reaching effects. Once the smelter at the Flin Flon mine gets under way large quantities of fuel will be required, and if a local supply is available it will save large sums of money in transportation charges.

In addition to the oil-shales occurring in the Pasquia Hills, there are large deposits of clay, which may prove suited for pottery work. Settlers have in the past been in the habit of using this clay for chinking their cabins.

The hills also contain considerable quantities of ochre, used locally for paint, and the salt for the tables of the settlers is also found in the same district.

It is anticipated that the coming Spring will find a number of prospectors visiting The Pasquia hills, and a more intensified prospecting may reveal further mineral occurrences.

NOTE.—No mention of lignites in the locality mentioned by our correspondent can be found in the reports of the Geological Survey, but Mr. Dowling's memoir on the coal resources of Canada notes a few occurrences of coal in the Dakota sandstone. This formation he states is exposed along the base of the Cretaceous plateau through Manitoba and into Saskatchewan, south of the Churchill River. At one place, east of Lac la Ronge a lignite seam. 2 ft. 6 ins. thick in the lower part of the Cretaceous escarpment, was traced for 3¼ miles. A proximate analysis of an outcrop sample of this seam gave moisture 11.23 per cent., volatile 30.97 per cent., fixed carbon 34.8 per cent., ash 33 per cent. (There is apparently an error in these figures as given in the report). The Carrot River occurrence lies over a hundred miles to the south-east of Lac la Ronge.—Ed.

Flin Flon Railway to be considered by Manitoba Legislature.

Of vital importance to the mining interests of northern Manitoba is the question of the railway from The Pas to the Flin Flon property, which will come up for discussion before the Manitoba Legislature sometime within the next few weeks.

A survey of the proposed railway is now being made by engineers of the Canadian National Railways, authority for which, at an approximate cost of $15,000, was given by the provincial cabinet last November. This with the latest report on the whole district by Professor R. C. Wallace, Commissioner for Northern Manitoba, will be laid before the Legislature during the present session.

The Flin Flon ore-body, which was discovered in the summer of 1915, is recognized to be one of the largest mineral-bearing bodies in Canada. The work done to date has been more or less in the nature of preliminary development work, which has been rendered costly by lack of adequate transportation facilities.

A New York syndicate, which secured an option on the property for one year from last March, has expended some $300,000 in shaft sinking cross-cutting, drifting, etc. Prior to this syndicate taking up the property, about $500,000 had been done on diamond drilling and other work, and an ore body of approximately 16,000,000 to 20,000,000 tons had been blocked out. At a depth of 900 feet, when the diamond drilling ceased, good ore was found. Recent work has disclosed another ore body, the extent of which cannot be guaged, and was not encountered in diamond drilling. The ore carries an average value in copper, gold and silver contents of about $10 a ton.

The all-important question in regard to this property is transportation. By airline the Flin Flon is 68 miles from the Pas, and a railroad by the most feasible route would be some 85 miles long.

A "try line" is now being run from mile 7 on the Hudson Bay Railway, the route running for some 35 miles along a gravel ridge and then going around Lake Athapapuskow and Schist Lake, passing through a greenstone belt in which many good properties have been discovered.

It is estimated that the cost of construction would be approximately $30,000 per mile, bringing the total cost to about $2,500,000.

Considerable interest has been displayed by the Manitoba provincial government in the furtherance of the Flin Flon mine's development. Last September some of the members of the Cabinet, as well as a number of members of the legislature were the guests of The Pas Board of Trade on a visit to the property, and evinced considerable interest in what they saw.

Not only is a railroad necessary to development to the Flin Flon property, but it would add impetus to mining in the whole district. The proposed line would run very close to the Mandy Mine, from which over $2,000,000 worth of high-grade copper ore have already been shipped to the smelter at Trail, B.C., after almost insurmountable transportation difficulties. This deposit is known to contain at least an additional $15,000,000 worth of low-grade ore which could be worked at a profit with a smelter at Flin Flon.

Another property which lies near the proposed railway line is the Baker-Patton discovery on the north arm of Lake Athapapuskow. Professor Wallace visited this property some little time ago, and in the course of his report said: "The claims are staked on an iron-sulphide body of total width on surface-showing of at least 130 feet and of probably still greater width in a muskeg adjacent to the rock exposure. There are many iron-sulphide bodies in the mineral belt, the mineralization being in practically every case pyrite with a relatively small amount of pyrrhotite. The iron-sulphide body under discussion is particularly important, in that, for a width of 18 feet, chalcopyrite mineralization occurs to such an extent that a channel assay will run probably from 3 per cent to 5 per cent copper over this width. Copper mineralization also shows to a much smaller extent immediately east of the ore-body mostly in quartz veins.

> "So far as exploration work has yet gone, the ore body is strictly limited to the North, but its southward extension and its total width have not yet been fully explored. I have felt for some time that there is a great opportunity for exploration work in the larger of the iron-sulphide bodies in this territory, particularly in the vicinity of the districts through which the proposed Railway to Flin Flon property will provide easy transportation. The property under discussion is one which offers sufficient surface showings to justify very considerable underground exploration by diamond drilling. I also feel that the whole district in the vicinity of these properties is one which promises well for further prospecting and is one which will, in all probability, be closely served by the railway when it passes through to the Flin Flon property."

Another district which could be served by a short branch line from the Flin Flon railway would be the Copper and Elbow Lake locality, where some really good prospects occur, both in the way of sulphide bodies, and quartz outcroppings carrying good values in gold. The railway route passes through the Cranberry Lakes district, which also affords good prospecting ground.

The Pas mineral belt has never been really prospected up to the present, although good indications have been discovered, but with the advent of a railway into the district, intensified prospecting could be carried out, when, there is every reason to believe many other valuable properties would be uncovered.

A recent invention in Germany is an illuminated gauge-glass, adaptable to stationary or locomotive steam-boilers, which enables the height of the water in the gauge-glass to be observed independently of the illumination of the boilerhouse or other surroundings. The waterlevel itself shows as a brightly-lighted white line, and can be observed from a considerable distance either by day or night.

THE DRYDEN, ONT., GOLD AREA.

By J. J. O'CONNOR, Port Arthur.

The mining companies operating in the Dryden district feel that great injustice has been done to that part of the Province, by an item that appeared in "Saturday Night," of January 1st, under the heading of "Gold & Dross," in answer to L. B., of Chicago, Ill. They strongly resent, and rightly so, the publication of erroneous statements of a sweeping character, condemning an entire mining area as "having gone down as a failure," qualified by the statement that "some day there is the chance that some enterprise may prove to be the exception to the rule."

Mining, at best, is a hazardous and venturesome enterprise deserving of the greatest encouragement, when being carried on in a legitimate manner, as it is being carried on in the Dryden district, by the two companies now operating there.

These companies, The Contact Bay Mining Company, Ltd., and the Wachman Mining & Milling Company, Ltd., have expended well over a quarter million dollars during the past four years, in a legitimate endeavour to prove whether this gold-bearing area has payable-bodies, or not. Neither of these companies has been dependent on stock-jobbing methods to raise its money. They have played their own game, with their own money, and have left the public severely alone, which is more than can be said for many mining ventures, legitimate, and otherwise. The management of these two companies, with all the knowledge that four years' experience has given them, make no claim, as yet, to being "thoroughly familiar" with either the formation or ore bodies of the district, but feel that they are fairly entitled to pass judgment on the possibilities, so far as development has proceeded.

This district has always been noted for the large number of parallel quartz-veins, with an east and west strike, covering some miles from North to South. It is the belief of the best informed men in the territory, that, given intelligent and conservative methods of development, and the adoption of the most efficient means for the recovery of the metal values contained in the ores, that many profitable mines will be located within the area, and that there are reasonable possibilities that it may develop into another Porcupine. In any event, it is much too early to classify this area among the "failures," as reasonable time should be given to prosecute the full development of the ore bodies now being operated.

The Contact Bay Mining Company, under the superintendence of Mr. H. S. Badger, have opened up two properties, one known as the Rognon, the other as Bonanza. The Rognon working-shaft is down 100 feet, with over three hundred feet of drifting on the two levels. They have opened up an ore body averaging four feet in width, with an average value of $8.00 per ton. The character of this ore is such, that occasionally rich pockets are encountered, none of which is included in the above average value. The ore occurs in well defined shoots. Outside these profitable mining can not be carried on. Having determined the existence of these ore shoots, and that they carried to depth along certain well defined lines of pitch within the vein, they decided to close down work on this property, pending the erection of a mill.

They have put down a working shaft of the Bonanza that is now 86 feet deep. Two drifts from this point, running East and West, have a combined length of 286 feet. The shaft has been put down in the ore body

which has been found to widen with depth, and to increase in valne, and is now in an ore body that has increased from 12 inches to 5 feet. Under an arrangement with the Reddemer Mine, they have just made a mill-run of 120 tons, through the last named Company's mill, which averaged from $12.00 to $22.00 per ton, by amalgamation alone, with tailings running to $5.00 per ton. The future work as outlined, and to be immediately prosecuted, is to fully develop this ore body by further sinking and drifting. Contracts have been let to continue the shaft another 100 feet, and to drift on this lower level.

Heretofore, all operations for the recovery of values have been confined to amalgamation. In the future, modern methods for the maximum of recovery, will be adopted by this Company.

D. J. Browning, of Chicago, Ill., is Consulting Engineer for the Contact Bay Mining Co., Ltd.

SITUATION AT INVERNESS COLLIERIES, NOVA SCOTIA.

During the week ending the 17th February, meetings have been held at Halifax between the representatives of the provincial government, the trustees for the bondholders, and the workmen and trades people at Inverness, Cape Breton Island, seeking for means by which the Inverness Collieries might resume production, and thereby give employment to a number of men now idle.

The difficulty at the Inverness Mine really originates in the exhausted condition of the No. 1 Mine. There is a very large area of pillar coal to the rise of the working faces, which are now so far out to sea that the conveyance of the coal from the deep to the pit-mouth against a heavy pitch makes the haulage costs extremely onerous. Similarly high cost, arising from the same cause accompanies the pumping of the mine-water, which is also extremely acid in character and is destructive to pumps and pipelines.

While the absolute necessity to reduce operating costs is seen by all concerned, the miners are opposed to any reduction in wages because of the reflex such a procedure would have on the newly-made agreement on wages applying to the whole of the coal-mines in the Province.

As a result of the meetings held in Halifax proposals have been agreed to between the workmen and the trustees for the bondholders for a reorganization of the working forces with a view to obtaining greater efficiency, and for the extraction of coal from pillar areas.

There is an overlying seam on the Inverness properties, which it is expected will be developed energetically in view of the spent condition of the No. 1 Mine. An opening has already been made upon this seam.

The ability of the trustees for the bondholders to operate the mine, at this time, depends on the securing of a market, a very difficult problem during the season of closed navigation. No statement has yet been made as to the probable date of resumption of production.

The situation at the Inverness No. 1 Mine is similar to that which will have to be met in all the submarine mines off Cape Breton Island, and the problem which now faces the Inverness Company is more than usually acute because this operator has been depending entirely upon a submarine territory with which difficult engineering problems are associated. The continued advancement of submarine working-faces, unaccompanied by methodical extraction of pillars left in the first working, cannot, of course, proceed indefinitely, and the Inverness Mine is one of the first in Nova Scotia to reach the *impasse* that comes when the cost of production from remote submarine faces exceeds the selling price of the product. Mr. Walter Herd, in a paper read before the Mining Society of Nova Scotia in May last (see our issue of 21st May 1920, pp. 410 and 413) dealt with the application of hydraulic stowing to this condition, and intimated that the "pillar and room" method of coal extraction was unsuited to the winning of submarine areas and should be abandoned in favor of a panel system of extraction, combined with hydraulic stowing of the waste. In the thicker seams Mr. Herd advocated following up the first working by immediate extraction of the pillars in each panel, the waste being filled by flushed material. In the case of thinner seams he advocated a panel-system of retreating longwall combined with hydraulic flushing of the waste. The practice of leaving vast areas of ungotten pillars in the rear of working faces advancing indefinitely seawards, on seams with a continuous seaward inclination, is one that must be revised, and Inverness Colliery presents precisely the problem that will result in every case where this practice is persisted in.

There is another consideration, which was strongly pointed out by Mr. Herd, accompanying the mining of superimposed seams simultaneously. Hydraulic flushing would, states Mr. Herd, "allow of this simultaneous extraction, an operation that without it should be highly condemned, being the ruin of many mines."

In the submarine areas of the Sydney Coalfield there are at least seven, and possibly more superimposed seams extending under the sea, all of them workable seams containing good-quality coal. Hydraulic stowing, as Mr. Herd was careful to point out, is not an easy or a simple matter, but "it well deserves the careful consideration and co-operation of those interested in the ultimate recovery of all the coal."

A further obervation is suggested by the plight of the Inverness Collieries, namely that the local conditions of coal mines in Nova Scotia must be taken into consideration by all interested in wages, selling prices and government restrictions. For many years the principle of a differential in wages which would allow for local differences in the cost of mining and transportation of coal was recognised by the miners' union in Nova Scotia, but the most recent agreement regarding wages has established the principle that all mines —irrespective of local conditions must pay the same rate of wages. The Inverness incident proves the wisdom of the old arrangement, and indicates the impossibility of applying the new principle, except by allowing the necessary effect of closing down all the coal-mines but those where cheap operating is feasible.

Also, in imposing government restrictions — such as the export embargo of last Summer—the necessitous and peculiar condition of some mines must be taken into consideration. This consideration applies also to the selling price of coal.

Our issue of 11th February contained some notes on the asbestos mines in Quebec, for which credit should have been given to "Asebestos" of Philadelphia. The mill of the Asbestos Mines, Ltd., at East Broughton, Que., was incorrectly stated to be the largest asbestos mill in Canada. This should have read "the largest mill in East Broughton".

Annual Meeting of the British Columbia Division of the Canadian Institute of Mining and Metallurgy, Vancouver, Feb. 9-12th 1921

(Reported by ROBERT DUNN, Victoria, B.C.)

There were two special features of the annual meeting of the British Columbia Division of the Canadian Institute of Mining & Metallurgy, held at Vancouver from the 9th to the 12th of February. One was the discussion of the problem of economically treating the complex ores of the Kootenays, combinations of zinc, silver, lead and iron, and the other the question of coal mining on Vancouver Island, its difficulties, and the resulting high price of the commodity in provincial centres quite adjacent to the mines.

An address of welcome by Mayor R. H. Gale occupied the Session of the morning of Wednesday, the 9th inst. This was followed by a complimentary luncheon to the visting members of the Institute after which, with Wm. Fleet Robertson, Provincial Mineralogist in the chair, the business was opened with a general resume of the mining activity of 1920 and the prospects for the new year.

Mr. Fleet Robertson's Resumé.

Mr. Robertson pointed to the satisfactory showing made in respect of output, 1920 being an improvement over 1919 of approximately 7 per cent, notwithstanding adverse conditions. Latterly there had been a marked falling off in copper production, as well as in connection with other phases of the industry, for the reason that the market was weak and uncertain. In the years 1913 to 1916 the cost of mining copper was 9 cents per pound; in 1917 the cost averaged 12 cents; in 1918, 18 cents, and it was estimated that the figure would be 20 cents for 1920. The only remedy was for the price of copper to rise or the cost of production to fall. Personally he thought there would be a compromise between the two. The readjustment was underway and it would not be long, in his opinion, before equilibrium was re-established. Then renewed activity might be looked for.

The Unprospected Northeast.

Large sections of the northeast territory of British Columbia had never been traversed by the prospector asserted John D. Galloway, government engineer for that district. This applied particularly to the portion north of the Grand Trunk Pacific Ry. Most of the mineral deposits under development in this region fell within the classification of medium-grade ores but high grade ores also were to be found. Placer gold production in the North would be about the same for 1920 as 1919, but in copper mining there practically was nothing doing. Considerable attention now was being given to the dredging of placer ground and many sections were being tested by the Keystone drill with the intention of initiating this form of activity if the possibilities were found to warrant it. The Provincial Government had undertaken this form of development at Harper's Camp but no conclusive results could be reported. The Cariboo Platinum Extracting Co. was engaged on a large scale at Quesnel. There was no doubt that some new dredging would be started next season.

The Boundary District.

Notwithstanding that the Hedley Gold Mining Co. has closed down temporarily and that the Copper Mountain Mines are idle, P. B. Freeland government engineer for the Boundary District, in which these properties are situated, was able to sound an optimistic note regarding the outlook for mining in the southern part of the province. He said that there was a good reason to believe that the Nickel Plate Mine soon would resume work. The Canada Copper Co. would begin production just as soon as the copper market righted itself. There were many promising properties in his section as yet in the development stage and he referred to the diamond drilling of the Provincial Government in the Franklin Camp as being likely to be productive of much good.

The Kootenays.

The Kootenays were dealt with by W. A. Langley, government engineer, referred to the remarkable showing of the Sullivan Mine, Canadian Consolidated Mining & Smelting Co., the further development of which had proven immense ore-reserves. While mining generally had been affected last year by strikes there was a shipping list in the district of between seventy and eighty mines. Increased attention was being paid to placer mining.

Portland Canal and Alice Arm.

George Clothier, engineer for the northwest, was unavoidably absent and delegates heard from S. J. Schofield, of the Geological Survey, and P. W. Racey, well known operator, regarding the Portland Canal and Alice Arm zones. The former explained that the former area, where is situated the famous Premier Mine, has by no means been fully prospected and that it is probable more highly productive properties will be located and developed. Mr. Racey touched on the work of the Dolly Varden Mine, stating that 29,600 tons of ore had been shipped from this property in 1920, which averaged twenty-seven ounces of silver. Outside of the Esperando, the Dolly Varden was the only mine that was shipping from Alice Arm during the season. There were, however, many good looking prospects in the district and the future of mining in the section was bright.

South Western District and Vancouver Island.

Wm. M. Brewer, of the south western district, spoke of the prosperity of coal mining on Vancouver Island, the product of the collieries being considerable in excess of the 1919 record. He dwelt also on the development of the Britannia Mining Company's property, Howe Sound, and predicted a likely future for the Lucky Four Group in the Cheam Range.

Distribution of Prizes for Student Papers.

Hon. Wm. Sloan, Minister of Mines, was present during the day and presented prizes won by students of the British Columbia University for essays on mining and metallurgy. L. B. Shaw won first for a paper on Metallurgy, and S. O. Swanson was awarded first for a composition on mining. Mr. Sloan, in complimenting the young men, promised that he would consider the possibility of having their literary efforts published in the Annual Report of the Minister of Mines for 1920.

In the evening a lecture was delivered by T. B. Adams, of the Commission of Conservation, on "Mining Camp and Village Planning and Improving."

Discussion on Metallurgical Practice in B. C.

Under the chairmanship of S. S. Fowler, the Session of Thursday morning opened with a discussion on "Metallurgy in British Columbia." One of the most

interesting addresses on this subject was that of Horace Freeman, who pointed to the persistency of the problem of dealing economically with the fractious ores of the Kootenays. There were found here large bodies of ore containing lead, silver, zinc, copper and iron in varying proportions. The difficulty with which operators and smeltermen had been grappling for years was the extraction of these metals at a profit. The chief trouble was with the zinc and Mr. Freeman pointed out that, while metallurgy had made tremendous strides, it was backward in its knowledge of simple economic methods of handling this element when found complicated by its association with others. The fact that the proportion of zinc increased with depth in eastern British Columbia further aggravated the difficulty. There were some high-grade native-silver deposits contaminated by zinc sulphides. In lead smelting and in silver cyaniding the zinc interfered, in the first making infusible slags, and in the second keeping the silver from dissolving in the cyanide solution.

General reference was made to the smelting practices of the past and the present, none of which was satisfactory insofar as the peculiar ores of the Kootenay are concerned. What the British Columbia silver-lead-zinc miners wanted was a simple concentration of the silver-lead-zinc into one, the shipment of this and its treatment by a process that would yield the three metals in few steps. It was for research on the treatment of this ore that the Advisory Council for Scientific and Industrial Research had made its first grant in this Province and work along this line now was progressing.

Mr. Freeman emphasized the importance to the industry of finding a satisfactory solution of the problem. The financial assistance granted those engaged was insufficient. He was hopeful of success but lack of funds was a serious handicap. In view of the incalculable wealth tied up in these ores the amount expended in making them economically available should not be considered. It was his opinion that, if the Provincial Government were to expend a portion of the moneys it was laying out for the fostering of industries in helping to solve the puzzle of the fractious ores of the Kootenays, it would stand a much better chance of receiving returns on its investment.

The Smelterman and the Mine Operator.

Prof. H. N. Thomson, of the University of British Columbia, dealt with the relationship between the smeltermen and the mine operator in a manner that indicated his familiarity both with the difficulties of the former and the prejudices of the latter. To the mining man who ships ore for treatment, figuring that his return should be little short of the actual mineral values known to be contained in the ore, he advised greatly consideration for the difficulties very often encountered in the process of smelting. If it were possible, for instance, to run through a combination of zinc and copper ore and take away brass it would be a very happy condition. But the process of separating the various metals from the ore was not so simple as to permit this and he proceeded to describe some of the things that might occur to worry a smelterman in handling material containing combinations of zinc, silver, lead, etc. Under the circumstances it was to be expected that penalties should be exacted against some ores and that others should be so welcome as almost to warrant the payment of a premium therefore. A better appreciation of the problems met with in the handling of a smelter, he felt sure, would remove much of the misunderstanding prevalent among mining men. He looked forward to the day when the lion and the lamb would lie down together in amity but was careful to explain that he did not presume to refer to either one as the "lion" or "lamb." (Laughter).

A. G. Langley, referring to Mr. Freeman's experimentation, confirmed the statement that there were large quantities of ore waiting the solution of the problem of treating zinc-silver-lead combinations. The importance of the question could not be exaggerated. Thousands of tons of this material was to be found lying on dumps throughout the Kootenays. The smelter at Trail could not accept it. With the high freight costs it could not be forwarded to smelters south of the line or any great distance. Therefore the progress of Mr. Freeman's work was of first interest and concern to the miners of the eastern section of the Province and he hoped that the Government would be able to see its way clear to extent further financial aid.

Referring to the observations of Mr. Freeman it was stated by E. E. Campbell, who has left the Granby Consolidated Mining & Smelting Company's employ to take a position in Arizona, that his experience in smelting practice at Anyox was that scientific principles could not always be strictly adhered to with success. In practical work a "cut and fit" policy had to be adopted. Of course the basic principles always were there, but it was a fact that things were done in actual economic metallurgy to which the scientist would not give his approval but which got results. There was a problem in treating the ore of the Hidden Creek Mine which was being made the subject of research with every prospect of success. A small mill had been installed to carry out this work and there seemed to be little doubt that the difficulties in question would be overcome.

Coal Industry of Vancouver Island.

"The Coal Industry of Vancouver Island" was the subject of an address by Thomas Graham, general superintendent of the Canadian Collieries (D) Ltd., before a joint luncheon of the Mining Institute and the Associated Boards of Trade of British Columbia. In view of the special interest attaching to his remarks in the West, because of the agitation for an official inquiry into the cost of coal, Mr. Graham's speech is elsewhere in this issue, reproduced in full.

Fuel Supply, Distribution and Substitutes.

In the afternoon there was a general discussion on "Fuel Supply, Distribution and Substitutes." This was introduced by a paper by George Wilkinson, general manager of the Pacific Coast Coal Mines Ltd. who covered much the same ground as did Mr. Graham. Mr. Wilkinson, however, dealt in more detail with underground working costs, production per man, and the number of handlings to which the product was subjected before reaching the consumer. He showed that costs on the Pacific Coast were higher than in most other fields and the production per man per shift very low comparatively speaking. Some surprise was expressed that the consumer insisted on obtaining the very finest lump-coal, at the highest prices, in order simply to give himself the pleasure of going into the cellar and, in breaking up the lumps, converting the material into "run-of-the-mine" product.

Alexander Sharp gave a paper in which he referred to the possibility of increasing the production in this Province by the greater use of mine machinery. He stated that there was less of this in use in this Province than anywhere else on the Continent and that, if the operators kept up to date in this respect, the production per man might be expected to grow.

To this it was stated by Charles Graham, of the Canadian Collieries, that his Company had introduced cutting machinery at Comox. That had all these appliances that could be used. As a matter of fact the seams of the Island were not sufficiently even to make such machinery adaptable.

Discussing the possibility of recovering the very fine volatile material at present wasted in washing, Thomas Graham said that the Minerals Separation Company now was experimenting with this class of the product of the Canadian Collieries. The results heretofore had not been altogether satisfactory but those engaged were confident that they would be able to work out a method for a substantial recovery by this process.

The Advisory Function of the Institute's Members.

An excellent paper on "The Relations of Geology to Mining in British Columbia" by Dr. S. J. Schofield and an address by H. Mortimer-Lamb on "The Relation of the Institute to the Government" marked Friday's Session. Dr. Schofield pointed to the geological characteristics of the chief mining districts of the Province and indicated other sections giving promise of reward to the prospector. Mr. Lamb urged that the members of the Institute put forth greater effort to co-operate with the Provincial Government in the formulation of its mining policies and in its administration of mining laws. Until the Institute took itself seriously in this respect it could not be expected that the Administration would take it seriously. The function of the organization was to assist, by friendly unbiased counsel, in the preparation of legislation that would stimulate the industry.

The Annual Dinner.

In the evening there was a dinner presided over by the retiring chairman, E. E. Campbell. The latter was tendered a hearty vote of thanks for his faithful service while in office. He was formally succeeded by Col. J. Leckie, C.B., C.M.G., D.S.O., who brought the proceedings to a close by delivering a most interesting illustrated lecture on "Campaigning in Northern Russia."

GEOLOGICAL INVESTIGATIONS IN ONTARIO AND QUEBEC.

(Part "E" Summary Report, C. G. S. 1919.)

Port Arthur and Nipigon District.

T. L. Tanton reports on investigations along the shore of Lake Superior between Port Arthur and Nipigon, including mineral deposits in Dorion township and vicinity and the Silver Islet Mine, which since Mr Tanton's visit has been re-opened. The Survey plans a detailed geological map, no dependable map of the district being yet compiled. Mr Tanton's work was preliminary to the making of this proposed map.

Ontario Oilfields.

M. Y. Williams report on the oilfields of Elgin, Essex, and the southern part of Kent Counties, Ontario, and his work in 1919 was undertaken to round off previous work. In regard to the Tilbury Field, Mr Williams notes that wells were abandoned prematurely in order to realise on the well casing for which high prices were offered early in the war period. It is stated that wells producing as much as 200 barrels of oil per month were abandoned in order that the casing in the wells might be sold. Salt water a short distance below the oil has been a serious problem in this field, and "according to the best available opinion, it was largely mismanagement of the salt water that caused the field to be closed down prematurely."

Oil in a Syncline of the Trenton.

An interesting note is one the occurrence of oil in a syncline of the Trenton Formation in Kent County, which is well illustrated by diagrams. This occurrence is stated by Dr. Williams to be of unusual interest, as it is the only commercial production from the Trenton in Canada, and because the oil occurs in a syncline. Credit is given to Mr. E. P. Rowe for accurately locating the syncline and deducing that it was the place where the oil would be found. This particular formation is free from water, or only partly saturated, and under such conditions, Dr. Williams suggests "the synclines should be sought, rather than the anticlines."

Townships west of Kirkland Lake, Ontario.

H. C. Cooke reports on examination of a strip of country 12 miles wide between the Matachewan and Kirkland Lake districts, which was not previously mapped. It was desired to ascertain whether this strip included the gold-bearing porphyries of Matachewan and Kirkland Lake, but the geological examination proved disappointing from an economic standpoint. No body of the porphyries mentioned was found at any point in the area, although carefully searched for.

Hurried examination of reported platinum finds in the western part of Otto township did not result in any valuable information, but the locality is possibly to be regarded as a good one for prospecting.

Mineral Deposits in the Ottawa Valley.

M. E. Wilson reports on graphite in the Renfrew district, pyrite in the Calabogie district, molybdenite in the Renfrew-Calabogie district and on celestite in Bagot township, Renfrew Co. This work is in continuation of the field work of the previous six years. An extended account of the occurrence of graphite at the important Black Donald mine is given, and the genesis of the ore body is discussed.

Peat Bogs.

A. Anrep has prepared a tabulation showing area, estimated contents and depth of thirteen peat-bogs in Ontario and Quebec, three of which, Thedford and Nellie Lake in Ontario, and Clair in Quebec, about ten miles east of Quebec City, contain in each case over three million tons of fairly well hummified peat-fuel. A separately published bulletin is to be issued which will contain a more detailed description with maps and diagrams.

THE LATE MILTON R. JENNINGS

Milton R. Jennings, Editor and Managing Director of the "Edmonton Journal", whose death has been so generally regretted by friends all over Canada, became an Associate Member of the Canadian Mining Institute in 1911, and was a valued member of that body. The "Daily Colonist" of Victoria, whose comment may be regarded as typical of Mr. Jenning's associates in journalism, states that by his death Canada loses one of its soundest writers, a man who "was an influence for great good in Alberta and wherever the newspaper he controlled circulated. He had the public welfare closely at heart, and will be sadly missed in the journalism of the Dominion."

A visitor to Toronto just now is Professor Gaichi Yamada, Assistant Professor of Metallurgy in the Kyoto Imperial University, who is touring Canada to study mining methods and processes.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

A wage reduction of 75 cents a day, or about 15 p.c., went into effect in the Cobalt district on February 16th and has been the cause of controversy. The workers technically admit the justification for the cut, but asked that it be spread over a period of three months, as stated in last week's Journal. They have intimated an intention to ask for a Board of Conciliation. However, insofar as this application was not made before the date of the cut, the reduction went into force, and should a Board now be requested and granted, the question would not deal with the matter of reducing the pay, but would be a question of whether an increase to the old rate should be made, or not. The mining companies point to the several closed-down mines as evidence of the difficulties under which the silver mines are being operated, and believe a Board of Conciliation would only be wasting its own time and that of the witnesses. Not only that, but it would magnify all grievances whether real or imaginary and without any visible material benefit.

At any rate, the reduction in pay is in operation, and the labor representatives themselves declare it is their belief that the best they could hope for would be a "moral" victory. There has been no intimation or thought of a strike, and such a development is not under consideration. The men are desirous only of vindicating their own point of view.

In regard to the proposal of the Ontario Government to increase the Mining Profit Tax, the mining companies, mine workers, and citizens in the mining districts are joining in a general protest against the proposal. They point to the fact that already these mines are paying an average of a little over ten per cent. of their net profits in taxes, and that this is actually double the maximum regarded as reasonable by a Royal Commission which recently dealt with a similar controversy. The various organizations throughout the district of Temiskaming, including the Town Councils, Boards of Trade, Associated Boards, the G. W. V. A., etc., are passing resolutions and addressing protests in general to Premier Drury as well as Hon. Harry Mills, Minister of Mines. A precis of the Bill is appended.

In the lateral work at the 410-ft. level of the Chambers-Ferland mine, some very rich ore has been encountered. The vein is about two inches in width, and in places contains values running as high as 5000 ounces of silver to the ton. The higher grade ore is being bagged, while the low-grade ore is being shipped to surface through the leased shaft of the Right-of-Way Mines from where it will be shipped at a later date to the customs plant.

At the third level of the Hudson Bay Mines, a large tonnage of medium-grade ore is being developed. The Company borrowed some $20,000 last Autumn with which to carry on work during the Winter. A force of about twelve men is employed, and the indications are that shipments will be resumed in the early Spring. The location of the ore now being developed promises definite extension of the life of the mine. At the time of writing, the result of a number of assays is being awaited.

Ore shipments from Cobalt during January were comparatively small, the following being a summary, supplied by Mr. A. A. Cole.

January ore shipments over I. & N. O. Railway.

SILVER ORE

Cobalt Proper.	Tons.
1. Beaver	30.00
2. Coniagas	62.91
3. Dominion Reduction	67.50
4. LaRose	88.03
5. McKinley-Darragh	84.07
	332.51

The above shipments were made to the following companies:—

CANADA

Deloro Smelting & Refining Co., Deloro	73.74
Coniagas Reduction Co., Thorold	188.27

UNITED STATES.

American Smelting & Refining Co., Perth Amboy	70.50
	332.51

PRICE OF SILVER.

Jan. 6th.	Highest	68.625

In connection with the transportation problems of the mining districts adjacent to the main line of the Temiskaming and Northern Ontario Railway, the chairman, George W. Lee, told a large audience in Cobalt, it was the intention of the Ontario Government to extend the railway. If the local organizations could settle their minds upon something within reason and direct a united request, he felt confident the Premier would be willing to authorize the extension asked.

Elk Lake and Gowganda.

The scheme, promoted by mining interests chiefly from the West Shiningtree and Fort Matachewan gold areas, to encourage the Government to construct a 90-mile railway from Westree to Swastika was not acted upon by the Associated Boards of Trade of Temiskaming, and favorable action resulting from the proposal is not immediately looked for.

THE GOLD MINES.

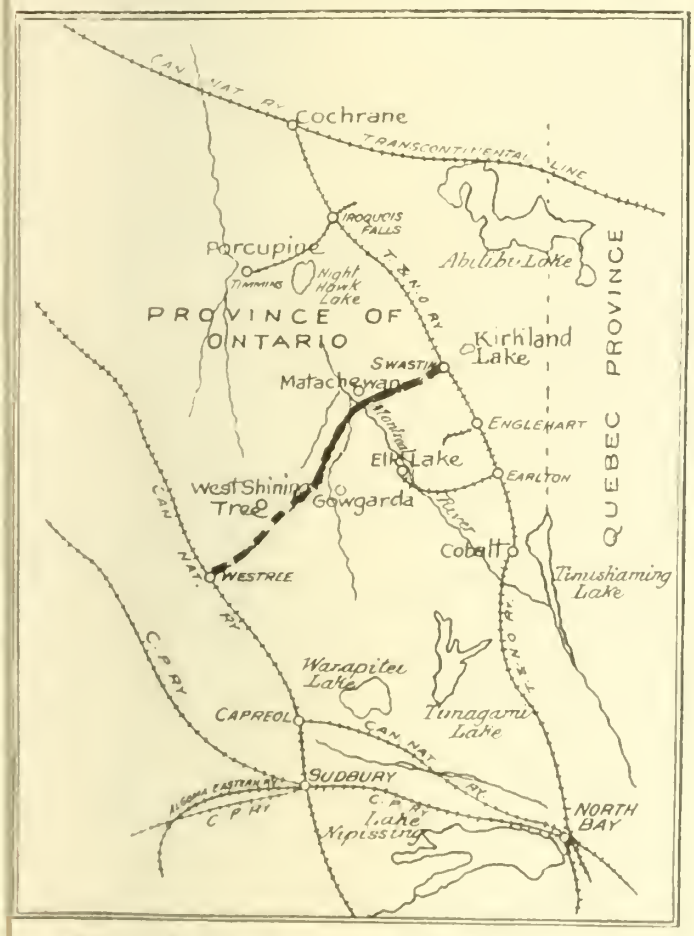
The Porcupine Field.

In an interview with A. F. Brigham, your correspondent was informed that labor is abundant and no further difficulty is expected in this respect. As many as one hundred men, seeking employment, have had to be turned away in a single day. Mr. Brigham believes that with a full supply of hydro-electric energy in the early Spring, probably within the next thirty days, no difficulty will be experienced in getting the required number of men to increase operations so as to handle upwards of 3,000 tons of ore daily. This will compare with an average of only a little over 1,700 tons during the past year, owing to labor supply being scarce during the first nine months, and a power shortage during the closing quarter.

The Hollinger Consolidated has an extensive program mapped out for the coming Summer. The question of housing an increase of about fifty per cent. of its employes is one which has to be dealt with this year. The construction of dwelling houses has been held in abeyance as long as possible owing to the high cost of material. Mr. Brigham declared such construction was not a good investment at present prices, but adequate steps would be taken to provide the necessary accommodation.

Reports are current that the McIntyre-Porcupine

has decided to make arrangements to increase its milling equipment to at least 1000 tons daily, as compared with its present capacity of 600 tons daily. This would enable the company to produce upwards of $3,000,000 a year as compared with a little over $2,000,000 yearly with the present equipment. Net profits have heretofore amounted to about fifty per cent of the total annual output, and by increasing these profits to around $1,500,000 a year, the earnings would amount to about 41 per cent on the issued capital of 3,600,000 shares. It is officially announced that the coal-mining enterprise, that is the Blue Diamond coal mine in Alberta which the McIntyre and Temiskaming



Route of Proposed 90-mile Link between the Canadian National and the T. & N. O. Rlys.

Company purchased jointly, is developing satisfactorily and an operating profit was realized during January.

At the Dome Mines a considerable amount of work has been carried on in connection with placing the entire mill in shape for full operation within the next thirty or forty days. With the ore-outlet system completed, and the mill tuned up, and with a large quantity of broken ore waiting to be hoisted, nothing stands in the way of operations at maximum capacity once the necessary power is made available.

Interests identified with the properties in the northeastern part of Whitney township which are joining in a consolidation to be known as the Porcupine Associated Gold Mines were in South Porcupine this week. The merger includes the Three Nations, La Palma, Dominion Porcupine and Jermey Veteran claim.

Kirkland Lake District.

Within the next few weeks, funds with which to carry on operations at the Tough Oakes mine will be available. A meeting is to be held within the next week or so for the purpose of completing the technical arrangements which will bring the Tough-Oakes into the merger with the Aladdin-Cobalt and the Burnside properties under the name of the Kirkland Lake Proprietary, 1919, and work will then proceed. It is believed, about three month's work will suffice to place the mine in shape to commence production. The ore already in sight is adequate to keep the mill running three or four months, while the proposed development on both the Tough-Oakes and the Burnside is expected to assure steady production from that time forward.

Although pumping operations were stopped some time ago on the Tough Oakes, a pump was installed on the Burnside property, and as the underground workings of the two mines are connected, no water has been allowed to remain in either one.

The Northern Ontario Light and Power Company has been approached on the question of erecting a power-transmission line from the sub-station at Kirkland Lake east to Mud and Crystal Lakes. Terms on which the work will be done have been quoted and it is thought the several companies owing property in that district may join in having the line constructed.

A meeting of the directors of the Crystal Lake-Lebel Gold Mines is being held this week in New York for the purpose of making arrangements to finance a scheme of exploration work. It is proposed to provide $50,000 with which to carry on the preliminary work so as to determine the extent of the development warranted by the veins proved on the property.

Larder Lake District.

Peter Kirkgaarde, of Toronto, has made application for an injunction to prevent the proposed deal whereby the assets of the Goldfields, Ltd., are to be sold to the Associated Goldfields, or the 30,000,000-share corporation known as the Canadian Associated Goldfields, Limited. Action has been taken as a shareholder among the minority holders who are averse to trading the assets of the property for what they claim to be watered stock on the new corporation. The solicitors for the applicant have expressed a desire to have the officers and directors of the Goldfields, Limited, up for a hearing at as early a date as possible.

It is also learned a petition has been signed by some 52 shareholders of the Goldfields, Limited, and presented to Premier Drury and Hon. Harry Mills, Minister of Mines, asking for a Government investigation into the affairs of the company, and the alleged evasion of certain phases of the law.

AMENDMENTS PROPOSED TO ONTARIO MINING TAX ACT INCREASING TAXATION ON MINING PROFITS

Following is a precis of a government bill, introduced by the Minister of Mines, at the current session of the Ontario Legislature. Determined opposition to the extent of this Act, so far as the taxation clauses are concerned, is being shown in northern Ontario, and business men have combined with the mining companies and their employees in protest against its unfairly discriminatory character.

The Act proposes an increased rate of taxation on profits as follows:

In other than nickel or nickel-copper mines four per cent on the excess of annual profits above $10,000

and up to $1,000,000, and seven per cent on the excess over $1,000,000.

In nickel-copper mines, five per cent on the excess of annual profits above $10,000 and up to $1,000,000, and seven per cent on the excess over $1,000,000.

Further provisions cover regranting of claims forfeited because of taxation arrears, at any time before 1st January, 1922, upon payment of taxes, costs and a penalty of ten dollars for every claim so regranted.

Forfeited claims shall not be open for staking or recording until the lapse of one year from date of forfeiture, or until declared open by Order-in-Council. Forfeited claims are to be held by the Crown for one year, subject to a right of redemption by making the required payments. After lapse of one year, if claims are not redeemed, they revert unconditionally to the Crown.

Sudbury Notes

C. I. M. & M. to Consider Mining Profits Taxation.

The Sudbury branch of the Canadian Mining Institute will consider the question of mining taxation at its next meeting scheduled for Feb. 26. Particular attention is to be given to the proposal of the Ontario Government to raise $100,000 more revenue by an increased tax on the mines of the province and in this connection has invited Balmer Neilly, secretary of the Ontario Mining Association, as speaker. Prof. J. L. Goodwin, late of the Faculty of Applied Science, Queens University, and who has been conducting prospectors' classes throughout the province under the auspices of the Ontario Bureau of Mines, will also be a speaker.

So far no move has been taken in this district to voice opposition to the increased tax proposal. Though according to the figures on mineral production issued with the annual report of the Mines department, the Sudbury nickel belt leads both the gold and silver camps in the value of production. Only three mines will be to any extent hit, and either one of them, could if the market was better, pay the whole $100,000 and hardly miss it. However, there are other small struggling properties in the district, including a couple of promising gold camps, and if the new tax scared away outside capital, this district would feel it as well as Porcupine, Cobalt and the others.

MONTREAL METAL QUOTATIONS.

Following are fair average prices for ingot metals (in less than car-load lots) at Montreal:

	Cents per pound.	
	Feb. 16th.	Feb. 23rd.
Copper, electro	17¾	17½
Copper, castings	17½	17¼
Tin	38	37½
Lead	6¼	6
Zinc	7¼	7½
Aluminum	35	35
Antimony	7½	7½

TORONTO COAL PRICES.

Toronto, Feb. 23. — There have been slight stiffenings of prices in two lines of coal during the past week. Smokeless coal is now quoted at from $8 to $8.50 and slack at $1.50 to $2.75. Lump still ranges all the way from $2.50 to $3.75 at the mine. Smokeless is around the $8.50 mark. There is still considerable difficulty in moving anthracite coal and the independents are getting but little over circular prices and in many cases having difficulty in moving coal even at circular prices. It is interesting to note that the prices being quoted for contract coal are from 75 cents to $1 above present spot prices, which proves that the present spot prices do not represent the true value of coal.

TORONTO MINING STOCK QUOTATIONS.

The Pioneer and Pillar of Civilization

By ALEXANDER GRAY, Montreal.

To ever-so-many well-meaning and perfectly fair-minded persons the world over, mining is taboo.

Off-hand discussion of the whys and wherefores of this wide-spread antipathy toward what has to do with the extraction of minerals from the Earth cannot alter the fact.

"A Mine! Not with my money!" is a familiar demurrer on the part of business men and bankers.

The glib generalization is: "More money has been spent in and upon mining fields than has ever been taken out of them."

So the mass of those in a position to ascertain the true worth of profit derivable from mineral resources, by diffidence or downright default, remained aloof while more adventurous and too frequently sinuous speculators have had what they term "the mining game" to themselves — the rasher element of the public as a rule being victimized. How much confidence and wealth have been dissipated by get-rich-quick "mining" schemes, as a consequence, never will be fully determined. All the Blue Sky Laws that can be placed upon statute books would not safeguard the willingly gullible. Inherent in human nature is the speculative element; were it not for it, the arts and sciences would be askew, wealth and industry minor quantities in a primitive setting.

Advanced thinkers, the greatest of the economists, at the moment are emphasizing that "mining is one of the two basic industries of man"; that "the other primary pursuit of the human race is agriculture"—but the latter is now almost entirely dependent upon the manufactured tools made from minerals". Of course, the Secretary of the Canadian Forestation Society did not exaggerate when he declared that "as a filler of pay envelopes and a provider of jobs, the forests of Quebec and Ontario are worth all the Cobalts and Porcupines ever uncovered between now and doomsday". He spoke as he thought and did not mean to be invidious; yet he merely re-echoed the prejudicial view that mining is somewhat of a non-essential, whereas the saner opinion of the better informed is that "politically and economically, mining is the most important business in which we are engaged. It is an industry which concerns the welfare and deserves the attention of every citizen." Without mining, agricultural expansion would not have made land values what they are, and Canadian forests would be more or less of a nominal asset instead of an assured source of wealth. To argue, however, that these forests excel in "worth" all the precious metals discovered or to be discovered in Canada, suggest that the gentleman who thinks so is too close to his subject to appreciate the relationship of mining to other industrialism. Another form of horizontal deduction was that expressed by Mr. Isaac F. Marcosson with reference to South African affairs. There—south of the Limpopo and Crocodile rivers, forests other than wattle plantations — are inconsequential — so they do not enter into this by Mr. Marcosson:

> "Last year the Union (of South Africa) produced £35,800,000 in gold and £7,200,000 in diamonds. The total mining production was, roughly, £50,000,000. This mining treasure is surpassed by the agricultural output, of which nearly one-third is exported. Land is the real measure of permanent wealth. The hoard of gold and diamonds in time becomes exhausted, but the soil and its fruits go on forever."

Again is mining relegated to the useful but doubtful quantities. Undoubtedly the land is immovable property—and until eternity. Because of the diamond, gold and coal fields of South Africa, owners of the land have a home market that takes two-thirds of their products. Australia, New Zealand and the Argentine compete with the farmers in beef and mutton. Otherwise, South Africa owes its progression to mining. Preferably, earlier colonists would have kept their country pastoral. They had the land lust and physiques developed in the open. Removed from racial rivalries other than with native tribes — all but one of which they mastered — they were "Nature's Noblemen" of a kind-fond of horseflesh, adept with the gun, raised cattle and sheep rather than follow fancy farming, trekked with their wool, traded their surplus crops with storekeepers, did their own tanning and wore veldschoen. When a prospector reported having found gold adjacent to what became the Witwatersrand Gold Fields, President Pretorious promptly had him deported as a menace. The agricultural people wished to evade the influx of a population inimical to them. Mining was not to be encouraged then as now by those who did not comprehend its potency in procuring working capital. Mauch who discovered gold in 1868, in the Eastern Transvaal, was regarded as a half-crazed prospector. More gold was reported in 1870, 1873 and 1882. When diamonds were found in 1867, and gold at the Witwatersrand, in 1884 in quartz and in 1885 in the pebble beds distinctive of the greatest of gold fields, South African civilization rapidly developed on a metallic basis, Kimberley diamonds having furnished initial working capital. The diamond and gold mines were the real pioneers of industry; for unequal distribution of rainfalls and recurring epidemics among cattle made precarious the occupation of farming. Billions of dollars in diamonds, more billions in gold, taken out of the earth necessitated great activity on the surface of the land.

Discoveries of diamonds, the rush to Barberton; then the Rand, substituted railways for the ox wagon. Conceding to land its everlasting worth, South African history of the past half century clearly demonstrates that man's ascent dates from the day he dug into the earth and secured materials from which he made the plow, the hoe, the ax and the sword, the coming of metal tools; that science and art were crude until metal devices formed from the earth's products", as well as the more precious metals availed of as money, were acquired in quantity.

Recently a writer familiar with details of industrial evolution as influenced by mining declared "it was the mines of England and Scotland that transformed the small British nation into the greatest of world surprises during the nineteenth century." Likewise it was mining developments which gave the United States the lead in iron and coal in the latter half of the century. When Germany got hold of the iron

ores of Alsace-Lorraine, it passed Great Britain in 1905 and became a world power. Floyd W. Parsons, writing in *The Saturday Evening Post* on this subject, argues that the struggle between Germany and Poland is over the Silesian coalfields, the greatest on the continent of Europe. Commercial domination of mining areas is going to be the test of national strength. Mr Parsons maintains that "the control and exploitation of the world's minerals during the next fifty years will provide the greatest political problem that confronts the nations of the earth."

In a single generation, Mr. Marcosson to the contrary, diamonds and gold gave to South Africa a larger space upon the map. It was not the trek-oxen that did it. Nor was it the settlers upon the prairies of the United States who pioneered the Far West. The westward movement began in 1848, when John Marshall discovered gold in the foothills of the Sierra Nevada nine days before Mexico ceded California. Marshall "struck it rich" on January 24th. The treaty of Hidalgo, by which the United States took over California, was signed on February 2nd. Of course the finding of gold was not known to Mexico. Otherwise, as Mr Parsons assumes, California might not so soon have dropped into Uncle Sam's lap. In three years, California was producing gold at the rate of $80,000,000 per annum. Nobody thought of acquiring agricultural or fruit lands in California. Within twenty years, the States from the Rocky Mountains west underwent exploitation for minerals. Farming followed closely in the wake, and yet it was mining that brought the railways and it was the railways that made farming possible. From California, the whole Pacific coast came under the scrutiny of the adventurous prospector. British Columbia got some of the overflow, and later the Yukon and Alaska. It was an Australian, fresh from California, who discovered gold in Australia in 1851. Until mining drew prospectors and capitalists to the Pacific, Canadian railways, telegraphs and coastal steamers were in nebulae. Gold lured men — and the finding of gold prefaced other discoveries, in many instances transcending those of the so called precious metals.

The Mining Engineer it was who realized the importance of such basic minerals as copper and iron. Marshall and Comstock are romantic figures. Years after California and Nevada began to yield metallic wealth, the idea germinated that there was a climate there capable of producing fruits for the nations. For as many years following upon the discovery of the Barberton and Witwatersrand gold fields, and of the Kimberley diamond fields, South Africa was a long way from being self-sustaining as to foodstuffs. It was one of my old partners, "Tom" Cue, who found gold in the Murchison country in Western Australia. Originally he was a "sheep man." Australia would be a country of sheep "runs" today in all probability were it not for the Ballarat and Bendigo gold fields and "squatter sovereignty" might have continued unmolested by statute tinkerers.

Eliminate mining from British Columbia and the breakfast-table necessaries would be in scant supply. The same applies to the Canadian Maritime Provinces. When La Salle, Champlain, and the other voyagers sought Canada, they were not looking for suitable soils. Columbus was after the wealth of the Indies

Cortez, Pizarro, and the other pirates, went after loot, not land. Phoenicians did not go to Cornwall for the flora of the Scilly Isles. They began to mine. As a consequence, Cornish miners and their Saxon prototypes are accredited with having introduced the real art of mining. The "Cousin Jack" and the "Taffy", as the Welshman is known, often have been ahead of the flag with the pick.

It may be sacrilege to say so, but the name Logan will live longer than Laurier; Dawson than Macdonald; Dana than Morgan. Unbiased statisticians hold that, measured by tonnage, the American mining industry is the biggest industry not only in the United States but in the world. Mr. Parsons states that the total products of the mines form 60 per cent of the normal freight carried by all the railways of the United States. It is owing to this that prevailing freight rates are so prejudicial to mining. President Warren of the Consolidated Mining and Smelting Company dwelt upon this in his remarks before the Canadian Tariff Commission. From now on margins of profit will be smaller. Economies must be all the greater. Jackling divined the worth of the porphyry coppers, but Ballot and Sulman put the recoveries where they never had been before — which is no disparagement of the Callow practice. Without flotation, the copper outlook would be blue-back. Low-grade porphyry rocks are the mainstay of the trade in the States, which control 60 per cent of the world's copper output. Canada's low-grade copper ores, and what is associated with nickel, have a larger mission, as evidence of which we have the appointment by the Granby Company of Professor J. Austen Bancroft of McGill University as Assistant General Manager. Desiring mass production and assurances as to the mining position, Dr. Bancroft has been chosen by this corporation. The appointment will be hailed with intense satisfaction. Not only has Dr. Bancroft served with distinction Canada's greatest University, but his field work for Granby, and on behalf of British Columbia mining corporations in general, has been a source of inspiration and enlightenment. That the McGill Faculty granted Dr. Bancroft a year's leave of absence, for the new duties to be assigned to him, was a graceful acknowledgement of the compliment paid to its Geological Department. Granby chiefs know what is coming in metal markets. Canada cannot afford to be caught napping when the United States plan expansion and are now actually producing more copper than all other nations combined. Moreover, besides the domestic production, the United States import nearly one-half of all the other copper for final treatment at American refineries. Altogether, the States control approximately 80 per cent of the world's copper production, predominate in iron and steel, excel in coal output — and the mineral industries provided the remunerative incentive for agriculturists, who have surer footing than when cattle ranching practically monopolized the ranges of the West.

But it was gold and silver that quickened the pace. To-day every natural resource is being taken into account, Canada having an object lesson in the decision to treat the masses of lower-grade iron ores in the States bordering on Canada. Heretofore much of the iron-ore mined has been selected and of higher grade. The plan now is to deal with the larger quantities of 30 per cent rock, never previously considered commercially. For this there is a precedent established in the utilization of lower-grade porphyry-copper rocks, from which flotation made possible recoveries in keeping with large capital investments. Until the porphyries appeared upon the stage, Nevada had existed upon its silver and gold mines. When Colorado disclosed the mineral wealth of Leadville, Central City, the San Juan and Cripple Creek, cattle roamed on a thousand hills and there was no thought of the productivity of the soils, or adaptability of the climate. Wyoming also was devoted to stock-raising, but its minerals, especially oils gave it an exalted status. The Mormons found a paradise in the Utah Valley, but mining raised the steam. Pennsylvania, Ohio, West Virginia and Tennessee developments are too familiar to require emphasis. Alabama iron and coal made that state a hive of industry. Arizona minerals, and more recently California oil, swelled the credits of those states. Nearer home, Cobalt, the Montreal River, Porcupine and Kirkland lake hastened settlement and enriched the province.

Mineral resources — soils if you will — cannot be denied priority in our national economies. Mr. Parsons, whose study of the subject has been so well told, claims "the early progress of man is really a tale of the gold of Ophir, the silver of the Laurion Mountains of Greece, and the copper of Mount Sinai in Egypt. Hannibal could not have conquered Rome were it not for metals obtained from the mines of Iberia. When Carthage and Rome fell, mining ceased, the dark days of the middle ages began, civilization halted." Arabs had centuries of advantage in trading to Sofala and beyond — and the Zimbabwe ruins attest their adventures in gold mining in what now is Rhodesia — a British possession sustained by mining enterprises. Phoenicians and Saxons exploited mining areas. Our own nickel kept the flag flying. History is replete with proofs that the more strenuous, profitable life originated with mining — and the sooner Canada enlarges its views and appraises its natural mineral resources, the sooner will needed capital be forthcoming.

A DINOSAUR IN THE UPPER CRETACEOUS OF ALBERTA.

Bulletin 120 of the Canadian Geological Survey is a technical description by Lawrence M. Lambe, of *Hadrosaur Edmontosaurus*, a dinosaur whose remains have been found in the Upper Cretaceous of Alberta on the Red Deer River. The report consists chiefly of anatomatical comparisons of the unusually shaped skull of the specimen with that of skulls of other members of this extinct genera.

TECHNICAL JARGON.

The way not to write technical reports is well illustrated by a South Australian press announcement, in which a mining expert is made to say: ".... You have a property of considerable value, and what I saw warrants a good development of very rich cubicular galena and carbonates, with gossan intermixed." There was more to the same effect; but "cubicular galena" looked so like the fabled ass in the lion's skin that after trying in vain to get any further than "cube," "cubic," "cubical," one turned to Webster in despair. Yes! There it was: "Cubicular—belonging to a bedroom." Really, the indelicacy of this kind of thing is not to be justified, even by the discovery of a new variety of lead sulphide. — Chemical Eng. and Min. Review, Melbourne.

BLUE SKY LEGISLATION. — ONTARIO VIEWS.

By R. E. HORE.

At a well attended meeting of the Toronto branch of the Canadian Mining Institute on Saturday Feb. 12, one of the chief topics of discussion was the sale of shares in mining companies. It was pointed out that Ontario has taken good care to protect the public from fraud and that the carrying out of the existing laws should leave little to be desired so far as companies incorporated in Ontario are concerned. Mr. J. P. MacGregor in introducing the discussion drew attention to the fact that such protection is lacking in the case of companies incorporated in other countries. Promoters of such companies can send salesmen into Ontario and sell stock without being required to conform to the law governing Ontario companies. It was suggested that legislation should be asked for to cover such sales of stock. The legislation of some of the United States was referred to in the discussion, and it was pointed out that in some States that sellers of shares must have permits and that these are only granted after the Government's questionnaire has been satisfactorily answered.

There was some difference of opinion as to whether the Blue Sky legislation has done any great good; but most of those who expressed their views in the discussion seemed of the opinion that such legislation is desirable. It is understood that the subject will be discussed at the Annual Meeting of the Institute in Montreal.

BRITISH EMPIRE STEEL CORPORATION, LTD.

It is officially announced that the directors of Dominion Steel Corporation, Ltd., Nova Scotia Steel and Coal, Ltd., and Halifax Shipyards, Ltd., have agreed upon a basis of consolidation and share exchange under the charter of British Empire Steel Corporation, Limited. Consolidated is subject to fulfillment of an agreement with underwriters for the provision of certain sums of new capital, after completion of which the several boards of directors concerned will again meet for the purpose of approving the underwriting. Following this, circulars disclosing the various agreements and the proposed basis of share exchange will be issued to the shareholders, and special meetings of the shareholders will be called for approval and ratification of the proposals and agreements.

The character of the financing and the basis of share exchange has not been made public, but it is understood closely to follow the proposals of last June, except that the arrangements are modified to suit the smaller number of constituent corporations to be included in the consolidation.

The corporations proposed to be merged, and their subsidiaries, have their producing operations entirely in the Maritime Provinces and Newfoundland, and decided economies in operation combined with increased efficiency in production, transportation and sales, are expected to follow unified management of a congerie of operations closely associated in character of production, and physically contiguous.

The Majestic Gold Mines, Limited, has been incorporated under the Ontario Companies Act, with one million dollars capital and head office, Toronto. The provisional directors are H. H. Davis, J. R. Rimball and J. S. Beatty, of Toronto.

EDITORIAL

POPULAR LECTURES ON MINING.

The recent discussion arising from the Ontario Government's proposal to increase the tax on mining profits should serve to draw attention to the necessity of telling the public more about the mining industry, and of the benefits that development of mineral resources bring to the community. Those engaged in mining very properly devote their attention to the problem of making their particular enterprise profitable to those taking part in it. It is not their concern that the development of a mine should profit the general public; but it is well known that it does. This being the case it may properly be argued that since development of mineral resources is a benefit to the community the industry should be encouraged. Those engaged in mining and those who profit directly from mining operations are well aware of the fact that mining companies are expending annually millions of dollars for labor and supplies. They know that the development of mining properties means new markets for supplies of all kinds for mining purposes and for the workmen and their families. Many manufacturers and merchants have good reason to know that mining activity means increased business for them. There are, however, a very large number of people who benefit indirectly from mining operations without knowing it. There is little endeavor made to enlighten these people and consequently they do not properly appreciate what benefit they derive from the operation of mines and they care little whether mining flourishes or not. They learn that some mining companies make very large profits by mining operations and they are inclined to favor any proposal which will give them direct and immediate benefit from these profits regardless of the future.

This being the case it may be well to consider whether those who are interested in mining should not take some action along the lines suggested in the February Bulletin of the Canadian Institute of Mining and Metallurgy. In an article in this bulletin, Mr. Geo. Mackenzie supports the proposal of President O. E. S. Whiteside that the laymen should be given opportunity of learning more about mining and metallurgical operations and that members of the Institute might well undertake to give popular illustrated lectures with a view to informing the public on the elements of mining enterprises. Mr. Mackenzie proposes that a series of lectures each telling of some phase of the industry should be prepared and a number of lantern slides made to illustrate the lectures. These might be used advantageously in many parts of the country. The proposal seems to be a good one and if carried out might result in dissipating some very faulty ideas.

THE MINING-PROFITS TAX IN ONTARIO.

There is now before the Ontario Legislature a proposal to increase the Provincial tax on the profits of mining companies. This naturally meets with opposition from the mining companies; but such opposition would doubtless be over ruled if only the mining companies were likely to suffer. The tax gatherers must get their money from the people who are reputed to be able to pay and having learned that some mining companies have made a lot of money during recent years they will endeavor to take as much of it as they can without wiping out the industries which make the money. The tax gatherer is not interested in the companies that are not making taxable profits and he has the support of large numbers of citizens who never give a thought to the fact that mining is a venturesome business and that it will not flourish unless there are possible large profits for the relatively small number of companies that succeed. Such people are envious of the successful operators and, being unaware of the risks taken and the difficulties overcome by the operators, they believe that they are entitled to share in the profits made even though they did not themselves risk any money in the ventures. They regard nickel, gold and silver deposits as the property of the Crown and consider that if there is any profit made in mining the ore the people of the Province should benefit from it. Though they do not propose to reimburse unsuccessful operators. The problem before the operators is to make it apparent that the general public receives large benefits from the development of mineral resources. These benefits are well known to

many people. The workmen employed know of them, the merchants and manufacturers in many towns and cities know of them. Everyone engaged in the mining industry and everyone resident in or in the neighborhood of mining communities knows that the development of an idle property into a producing mine is a thing to be desired, for it directly or indirectly benefits a large number of people who take no financial risk in the venture. Such benefits are the big contribution by mining companies to the welfare of the community and it is hardly good statemanship to discourage such ventures by penalizing severely those who succeed.

Throughout the world metals are sold at prices which make possible large profits for only a few fortunate companies. Even in such cases it is true that the money paid to workmen and others in the community far exceeds the money received by shareholders. Such companies could pay higher taxes; but is it wise to impose high high taxes when it is known that development of new properties depends so largely on the successful ones being allowed to keep the profits they have made by their enterprise?

Everyone who knows anything about the mining industry knows that those who develop mineral properties take long chances. Some can tell better than others whether a deposit is likely to prove valuable or not; but in the early stages of all mines there are times when it is very doubtful whether further expenditures will prove profitable or not. Such expenditures are then undertaken only because there seems a reasonable chance of making large profits. If the tax gatherers prevent the possibility of such profits the development of properties will naturally cease.

Those who realize that the development of mineral resources is a great benefit to the community will be displeased with the expressed intentions of the Ontario Government. They will have good cause to consider whether they should not take more active part in education of the general public with a view to enlisting support for their claim that mining should be encouraged because it is in the general interest. A number of those who would be affected by the proposed increased tax are actively taking part in opposing it and it is possible that the bill will be withdrawn. But the mere fact that the Government has seriously considered increasing the tax on profits should be sufficient to make it apparent that a large section of the public does not understand the rudiments of the mining industry. It is quite unlikely that the people of Ontario would approve of action that would kill the goose. It remains for those interested in mining to tell the rest of our citizens something about the development of mines and the accompanying benefits to the community so that the public will commence to view with disfavor these repeated attempts to injure mining enterprises.—R. E. H.

THE LEROY MEMORIAL FELLOWSHIP AT McGILL.

The "Canadian Mining Journal" is glad to be permitted to publish in this issue an account of the establishment of the LeRoy Memorial Fellowship for post-graduate studies in geology at McGill University, made possible through the collection of over eleven thousand dollars from 119 subscribers, whose names are also given.

A memorial of this character, to a scholar-soldier who died leading his men in battle, perpetuates not only the name of him in whose memory it is founded but the best traditions of the wedded races that compose the Canadian commonwealth. It is not so much singular, as significant, that McGill University should have had as its spokesman in acknowledging the endowment fund the soldier chosen to lead Canada's divisions in the epic conflict so recently and so victoriously concluded.

WIDER PUBLICITY FOR INSTITUTE PAPERS.

In the February Bulletin of the Canadian Institute of Mining and Metallurgy, Mr. Geo. Mackenzie makes a number of interesting suggestions as to ways in which the Institute might increase its usefulness to the mining industry. His remarks about publication of papers show a readiness to depart somewhat from the former policy of the Institute. Like many other societies the Institute has been inclined to hide its professional papers from the public eye until they become so aged that they have lost public interest. If the new Secretary finds support for his suggestion we may expect to see some account of the papers in the technical press and in newspapers in mining communities before the authors have forgotten that they sent them to somebody for publication.

It is, however, not only in promptness of publication that the present practice would be improved. A much larger and varied number of readers would be reached. And it is well to bear in mind that it is the Institute's propers business to give publicity to such papers. In publishing the papers in the official bulletin of the Institute and in the Annual Transactions the Institute is serving its members but not to any large extent serving the public. It is worth considering whether endeavoring to get into closer contact with the public. There was a time when professional papers were zealously guarded by societies as being prizes for the members only. It was sometimes stated as an inducement to a prospective member that the papers presented were so valuable that they were kept for the use of members until they became so old that they were useless. The privilege of being able to obtain copies of these papers was considered to be worth a great deal to members and prospective members were led to believe that they could make no great advance in their profession until they joined the society and learned its secrets. Now, the Canadian Mining Institute has not

been as great an offender as some societies, but there have been times when something of the old line technical society has been more in evidence than has the real object of the founders of the Institute.

If Mr. Mackenzie's proposal meets with the approval of members there will be doubtless more and better papers prepared and they will be more widely read. Wider distribution of anything that is good for the industry is an object worth striving for. In the past there has been some willingness to permit publication of the papers, but no great effort made to obtain publication. It is possible that some of the papers would not be found acceptable by the technical journals, but most of them have parts of general interest and some are of a character to interest a very large number of people who never see the official publications of the Institute.—R. E. H.

THE COST OF MINING.

Purchase and perusal of Prof. J. Ralph Finlay's revised work on "The Cost of Mining" can be confidently recommended. The book deals in a satisfying manner with virtually every branch of mining. The concluding chapter contains illuminating comment on silver-mining costs at the Cobalt mines, where the practice — in the earlier stages of the camp — is quoted as an example "of the absolute inconsequence of high costs per ton in precious-metal mining." Figures as late as those of 1918, relating to the Kerr Lake Mines, are compared with those of ten years earlier.

Prof. Finlay's remarks on "partial and complete" costs show much experience and insight. He says: "I know from experience that many operating men, though deep in details, are acquainted only with partial costs. Their point of view does not reach the *tout ensemble.*" Much of the partial and inchoate conception of costs of otherwise competent mining men is due to mistakenly conceived notions of secrecy still clung to by mine executives. Secrecy of this kind is always followed by a sure Nemesis, and the practice of some mining companies of keeping operating costs and what has been previously referred to in these columns as "ultimate costs", in watertight compartments; always ends in befuddlement of all concerned, leading to grevious errors and lack of team work in mine organizations.

The argument is summed up in Dr. Finlay's axiom: "The price of a commodity must be governed by its cost." This is precisely the information that many mining boards are not in possession of as regards their product. Dr. Finlay states he has never come across a mining enterprise where the real value of selling cost was calculated. The statement is not one that we are able to contradict. Selling cost is only correctly calculated when the calculation includes "all capital employed, with interest for the whole period of operating." How few mine accountants have ever attempted such a calculation, and yet how valuable is the, corrected conception of the financial standing of a mining enterprise that such a calculation discloses?

The recently-issued annual report of the Hollinger Mine showed that all development charges had been written off. No other procedure is of course correct, but nevertheless it is so unusual a procedure as to excite comment, a circumstance that in itself reveals a widespread misconception of what development is. In most cases it is nothing more than an operating charge. It is often miscalled "capital expenditure", or "maintenance" and placed to suspense accounts under various disguises, but it is a purely operating charge and must be added to current mining costs before payment of dividends from profits can be properly made.

A further quotation will illustrate how correctly Dr. Finlay states a fundamental principle of sound mine-accounting, and suggests that his really monumental work is a necessary addition to any mining engineer's library that does not already contain it. To quote:

"A sound business must be a paying business; one
" that is good for both interest and principal. The
" great fault with the mining business from the point
" of view of the moderate investor is that it is very
" easy for the sake of a fair amount of interest to lose
" the principal. There is no need of this. By studying out the vital question of the life of a mine with
" its concurrent rate of amortization, and by steadily
" refusing to believe that current construction is 'capital', one may eliminate overvalued properties very
" rapidly. *It is a good rule not to buy stocks in*
" *concerns that are too wise to issue full reports.* (The
" italics are ours). If there is any business in the
" world where a full knowledge of certain elemental
" facts is necessary for a safe and sane investment it
" is surely mining."

ASSOCIATED GOLDFIELDS MINING CO. LTD.

We are informed by Dr. Mackay, President of Associated Goldfields that development is proceeding very satisfactorily under the management of Mr. Geo. A. Gray, formerly chief Engineer at The Dome Mines.

The new shaft is now down about 175 feet, and the first station and ore pockets are being prepared. The sinking of the shaft will be carried on simultaneously with the cross cutting of the large ore body. Word from the mine shows that high grade ore is being encountered at present.

The work on the new Wendigo Power is progressing well. Over 500 feet of rock cut has been completed.

They have about 110 men on the payroll.

The application for an injunction by Fasken & Company, on behalf of P. Kirkegaarde restraining Goldfields Limited, from executing sale of their assets to Canadian Associated Goldfields, Limited, as passed at the special meeting of the shareholders, was dismissed with costs today.

The hearing was very brief and the bench commenting pointed out that no evidence was presented to substantiate the application. Mr. McMaster of Messrs. McMaster Montgomery & Bullen represented Goldfields Limited.

The LeRoy Memorial Fellowship at McGill University

Osmond Edgar LeRoy was born in 1873 at St. Andrews, Argenteuil County, Quebec, where his parents, Mr. and Mrs. Alexander LeRoy, still reside. From the Lachute High School he entered McGill University in 1891 and graduated from the Faculty of Arts with first-class honours in Natural Science in 1895. The year following his graduation was spent in post-graduate study at McGill and the succeeding two years as Headmaster of the Model School at Montreal West. From 1898 to 1902 he was Demonstrator in Geology at McGill; while occupying this position he spent one summer studying at Harvard University and the others in geological field work. He assisted Dr. Frank Adams in the preparation of a report on "The Artesian Wells and Deep Borings on the Island of Montreal", which was published by the Geological Survey of Canada in 1904. In 1901 he presented a paper on Rigaud Mountain, Quebec, before the Geological Society of America at Albany. In 1903 he received the degree of M.Sc. from McGill.

During the summers of 1901, 1902, and 1903, LeRoy assisted Dr. A. E. Barlow in his geological studies of the Sudbury and Temiskaming areas and, in 1902, was appointed to the staff of the Geological Survey of Canada.

In the autumn of 1903, he became Consulting Geologist to the Imperial Chinese Mines-Prospecting Administration, which position he ably filled for the succeeding three years. His keen interest in the geological problems of China was only equalled by the warmth of friendship of his Chinese associates.

Returning to Canada in 1906, he spent a few months on the Geological Survey, when he again resigned to engage in professional work for private interests in the Cobalt area where rich deposits of siver had then been recently discovered. During the winter of 1907-1908, he was acting Head of the Department of Geology at Queen's University. In 1908 he was reappointed to the Geological Survey and in the succeeding four years prepared numerous valuable reports and papers on the geology of several of the important mining areas in British Columbia. In 1912, he became the Geologist in charge of Field Parties; his enthusiasm for the work in hand, his organizing and executive ability, and his kindly personal interest in those associated with him, are reflected in the superior character of the work produced by the Geological Survey while he filled this position.

In January, 1916, he received a commission as Lieutenant in the 72nd Seaforth Highlanders of Vancouver. Upon the organization of the 196th. (Western Universities) Battalion, he transferred to this unit with the rank of Captain, and was placed in command of the British Columbia University Company. He accompanied the Battalion overseas; and when the 19th. Reserve (Saskatchewan) Battalion was formed, the command of F. Company was given to him. On May 25th. 1917, he reverted to the rank of Lieutenant in order that he might proceed to France where he joined the 46th. Battalion. In June 1917, because of his brilliant work during the attack on Lens he was promoted on the field to the rank of Captain. On the 26th. October 1917, while leading his men in the assault of Passchendaele, he received the wounds which caused his death on October 28th. The following is an extract from a letter of the Colonel of the Battalion to Captain LeRoy's mother.—"His service with the 46th. Battalion was a very gallant one; he had proved himself a true leader of men and we all had the greatest confidence in him as an officer and the greatest liking for him as a man and a comrade. His death is an irreparable loss to the Battalion and is deeply, very deeply, regretted by all and I wish to express to you my own sincere regret and sympathy."

In LeRoy's death, Canada lost not only a valiant soldier but primarily an unusually capable economic geologist. He possessed such a wholeheartedly genial personality that he was beloved by all those who were fortunate enough to know him. Few men have enjoyed the confidence of a wider circle of friends and acquaintances. In order that a fitting and permanent memorial to him might be established, some of his friends decided that a LeRoy Memorial Fellowship in Geology should be founded at his Alma Mater. A subscription list was opened in March 1920 with the result that $11,450 has now been paid over to the Governors of McGill University. This fund has been invested in such a manner as to permit the annual award of a LeRoy Memorial Fellowship of $700 to some worthy student desirous of pursuing post-graduate studies in Geology at McGill.

On receiving the LeRoy Memorial Fellowship for McGill University, Sir Arthur Currie wrote as follows:—

"McGill University desires to assure the donors that she accepts this gift with feelings of deep gratitude and pride, and will obey the conditions laid down. She regards the late Mr. O. E. LeRoy as one of her most outstanding graduates and recognizes that by his life and the manner of his death, additional lustre has been added to the name of his Alma Mater. She believes that no more worthy manner of perpetuating his memory can be found. As long as the name of McGill endures, the memory of LeRoy will be cherished, and the Fellowship will enable more and better services to be rendered by the Department of Geology, a subject which he had so much at heart and to the study of which he gave so much of his life."

"I would like to add that I am proud to have known LeRoy, Captain LeRoy he was to me. I knew him as one of the outstanding officers of the Canadian corps, and can most cordially subscribe to what his commanding Officer has said of him."

The list of contributors to the LeRoy Memorial Fellowship fund embraces 119 names, about three-fourths of whom are members of the Canadian Institute of Mining and Metallurgy:—

W. S. Johnson, Lachine, P.Q., $1,000.00; Frank W. MacLennan, Miami, Arizona, $543.75; Dr. Milton Hersey, Montreal, P.Q., $500.00; Mr. & Mrs. Alex. Le Roy, St. Andrews, P.Q., $500.00; J. W. McLeod, Thorburn, Nova Scotia, $500.00; Dr. E. P. Mathewson, 42 Broadway, N.Y., $500.00; H. P. DePencier, The Dome Mine, South Porcupine, $300.00; Col. R. W. Leonard, St. Catharine, Ont., $300.00; D. H. McDougall, New Glasgow, N.S., $300.00; C. V. Corless, Copper Cliff, Ont., $250.00; W. A. Carlyle, Ottawa, Ont., $250.00; Dr. J. D. Ross, Ottawa, Ont., $250.00; Colin L. Camp-

bell, Montreol, P.Q., $200.00; Weedon Mining Company, Montreal, P.Q., $200.00; W. Munro Archibald, Rossland, B.C. $150.00; E. E. Campbell Anyox, B.C., $150.00; Norman McL. Campbell, Montreal, P.Q., $150.00; W. Fleet Robertson, Victoria, B.C., $150.00; R. M. Wilson, Montreal, P.Q., $150.00; Frederick Cowans, Salt Lake City, Utah, $108.25; Royal Victoria Lodge, A. F. & A. M. No. 57 Q.R. Montreal, $105.00; Dr. F. D. Adams, Montreal, $100.00; Dr. J. A. Bancroft, Montreal, P.Q., $100.00; S. G. Blaylock, Trail, B.C., $100.00; C. M. Campbell, Phoenix, B.C., $100.00; C. L. Cantley, New Glasgow, N.S., $100.00; Col. Thos. Cantley, New Glasgow, N.S. $100.00; Sir John Carson, Montreal, P.Q., $100.00; A. R. Chambers, New Glasgow, N.S., $100.00; E. J. Conway, Anyox, B. C., $100.00; Angus W. Davis, Vancouver, B.C., $100.00; J. A Dresser, Contreal, P.Q., $100.00; T. C. Denis, Quebec, P.Q., $100.00; R. P. Doucet, Montreal, P.Q., $100.00; Chas. Fergie, Montreal, P.Q., $100.00; C. P. Hill, Vancouver, B.C., $100.00; J. Keele, Ottawa, Ont., $100.00; H. L. Kerr, Toronto, Ont., $100.00; S. F. Kirkpatrick, Ottawa, Ont., $100.00; E. C. Montgomery, Kimberly, B.C., $100.00; W. McInnis, Ottawa, Ont., $100.00; E. Orkin, Montreal, Que., $100.00; Dr. J. Bonsal Porter, Montreal, Que., $100.00; A. E. Robitaille, Fifth Ave., 44th St., New York City, $100.00; Capt. J. G. Ross, Montreal, $100.00; R. H. Stewart, Vancouver, B.C., $100.00; W. E. Segsworth, Toronto, Ont., $100.00; R. O. Sweezy, Montreal, Que., $100.00; O. E. S. Whiteside, Coleman, B.C., $100.00; Dr. J. A. Allan, Edmonton, Alta., $75.00; W. C. Mitchell, Montreal, Que., $75.00; Dr. L. C. Graton, Cambridge, Mass., $54.37; Professor J W Bell, Montreal, $50.00; M. F. Connor, Ottawa, Ont., $50.00; Geo. E. Cole, Haileybury, Ont., $50.00. W. H DeBlois, Tweed, Ont., $50.00; J. G. Dickenson, Cobalt, Ont., $50.00. Norman Fisher, Thetford Mines, P.Q., $50.00; E Hibbert, Sudbury, Ont., $50.00; W. V. Howard, Trinidad, B.W.I., $50.00; T. A. McLean, Montreal, $50.00; Dr. J J O'Neill, Gulmarg, Kashmir, India, $50.00. Dr Bruce Rose, Calgary, Alta., $50.00. Bruce Ritchie, Trail, B.C., $50.00; Hon. Geo. R. Smith, Thetford Mines, P.Q., $50.00; H. F. Strong, Haileybury, Ont., $50.00; I. G. Wheaton, Gowganda Ont., $50.00; N. M Ymll, Montreal, Que., $50.00; J. D Galloway, Hazelton, B.C., $30.00; Walter Adams, Montreal, $25.00. Dr F. J. Alcock, Ottawa, Ont., $25.00. G. L. Burland, Thetford Mines, P.Q., $25.00; W H. Burgess, Kaslo, B.C., $25.00; Chas Camsell, Ottawa, Ont., $25.00. Dr. W H Collins, Ottawa, Ont., $25.00. Alan E. Cameron, Edmonton, Alta., $25.00; Dr. W E Cockfield, Ottawa, Ont $25.00. Dr. H. C Cooke, Ottawa, Ont., $25.00. Alexander Dick, Montreal, Que., $25.00; A. O Dufresne, Quebec, P Q., $25.00; Dr. R A. Daly, Cambridge, Mass., $27.19. Geo. D. Drummond, Montreal, Que., $25.00; Professor R P. D. Graham, Montreal, Que., $25.00. Nancy Haultain, Ottawa, Ont., $25.00. F. W. Gray, Ste Anne de Bellevue, P.Q., $25.00. R A Johnson, Ottawa, Ont., $25.00. J C Kemp, Montreal Que., $25.00. Ernest K Koch, Montreal, Que., $25.00 W S Lecky, Ottawa, Ont., $25.00. Stewart J Lloyd, University of Alabama, U.S.A., $25.00; John McLeish, Ottawa, Ont., $25.00. Geo R McLeod, Montreal, Que $25.00. Professor J G. McKay, Kingston, Ont., $25.00 J McEvoy, Toronto, Ont $25.00. Professor D A Murray, Montreal, P.Q., $25.00. Geo Riley, Montreal Que., $25.00. H M Rosece, Anyox, B.C., $25.00. P W Racey, Vancouver, B.C. $25.00 Dr F H Sexton Halifax, N.S., $25.00. Alexander Gray, Montreal Que., $20.00; C S. Finnie, Ottawa, Ont., $15.00. Q J Maltby Montreal, Que., $15.00; J. MacIntosh Bell, Almonte, Ont., $10.00; H. H. Claudet, Ottawa, Ont., $10.00; S. J. Crocker, Vancouver, B.C., $10.00; J. F. B. Davies, Drummondville, P.Q., $10.00; G. S. Eldridge, Vancouver, B.C., $10.00; E Faribault, Ottawa, Ont., $10.00; H. Frechette, Ottawa, Ont., $10.00; Chas. H. Fox, Montreal, Que., $10.00; J. M. Forbes, St. John, Nfld., $10.00; Professor H. M. McKay, Montreal, Que., $10.00; E. R. Paterson, Montreal, Que., J. R. Pearson, Danville, Que., Professor N. N. Evans, Montreal, Que., $5.00; A. T. MacKinnon, Ottawa, Ont., $5.00; H. G. Roulean, Ottawa, Ont., $5.00; J. M. Turnbull, Vancouver, B. C., $5.00. Bank interest, $91.44. Total, $11,450.00.

ANNUAL SCIENCE DINNER AT QUEEN'S

The 20th Annual Dinner of the Engineering Society of Queen's University, Kingston, was held on the 17th February, and was notable because of the attendance of many graduates of the University who are now prominent in official positions in corporate and government service.

Major-General Macdonell, Commandant of the Royal Military College, after the toast to the King given by the President of the Society, proposed the toast to Canada, and spoke of the problems of assimilating the immigrants to Canadian ways of life. He urged that those present should assist to "Keep Canada Canada to the end".

Mr. Charles Camsell, Deputy Minister of Mines, spoke of the necessity of trained young men for prospecting and geological work in Canada. "We are proud of our past", said Mr. Camsell, "but we shall be prouder still of our future".

Mr. R. L. Peek, Managing Superintendent of the refinery of the British-American Nickel Company at Deschênes, did not favour specialization until after years of practice. Queen's men had benefited by the poverty of the University, which had taught them adaptability.

Mr. G. C. Bateman, Manager of the La Rose mine, Cobalt, referred to the present ferment in society, and suggested that a series of lectures should be arranged to be delivered at Queen's by Queen's graduates who have risen to positions of eminence in engineering.

Mr. Fraser D. Reid, Manager of the Comagas mine, urged greater attention to standardization in engineering.

Dr. T Kennard Thomson, with the aid of lantern slides, explained project for fuller utilization of the water powers of the St. Lawrence and Niagara Rivers, and urged the formulation of an international treaty that would permit of greater utilization of the possibilities of the Niagara River below the Falls. Dr. Thomson gave full credit to the accomplishment of the British Navy during the war, and showing the entwined Stars and Stripes and the Union Jack on the screen, said: "That is a League of Nations by itself which would ensure justice for the entire world."

Principal Taylor, Prof. W. L. Walcar and Dean Clark spoke to various appropriate toasts.

The Dinner was voted to be a complete success and as will be seen from the foregoing brief summarisation, taken from "Queen's University Journal" was in many important respects a notable occasion.

Oil Regulations in the North West

A Precis of the Order-in-Council of 11th February 1921.

The Canada Gazette of February 19th contains the new Regulations for the "Issue of Oil and Gas Permits and Leases in the Northwest Territories of Canada", approved by the Governor General in Council under date of 11th February, and superseding the former regulations, suspended by Order-in-Council dated 22nd January, and now rescinded.

The Regulations cover five pages of the "Gazette". A precis follows:

No Par-Value Shares Required.

Companies entitled to lease oil and gas locations must issue shares without nominal or par value. (This regulation has since been amended to protect companies having issued shares of stated par-value that acquired rights to oil and gas locations in the Northwest under prior regulations.)

Permits to Search.

Maximum area of oil and gas rights which may be acquired by an applicant under permit shall be 2,560 acres, or four square miles, and no person shall be permitted to acquire a greater area except by assignment. Such maximum area may be selected in not more than five separate blocks covered by five permits, but no person is permitted to hold under permit at the same time more than five locations acquired by application.

After expiration of twelve months from the date of permit, a person who subsequently abandons or assigns the same, may again apply for a permit, provided all liabilities to the Crown are paid up.

In case of dispute, permit will be issued to person who proves that he first staked the location, and made application to the mining recorders within the specified time.

The location shall be rectangular in form, except where a boundary of a previously located tract is adopted as common to both locations, the length not to exceed the breadth four times.

Specific instructions as to correct staking, and definite information is furnished as to the exact position of the location the application for a permit will not be considered.

Where the tract applied for is located on the margin of a lake or river, its least dimension shall be in the general direction of the water frontage.

Application for permit must be made within thirty days after staking, if situated within one hundred miles of the recorder's office, and one extra day is allowed for every additional ten miles.

A payment of fifty cents per acre, being the rental for the first year of location, must accompany every application.

Permittees shall within two years from the date of the permit assemble upon the location a substantial and adequate drilling outfit satisfactory to the Minister, to commence actual drilling operations, and must give full particulars of cost, date and exact location to the Minister. In default the permit lapses automatically, and may be re-opened for location after notices have been posted for thirty days.

Rental for second year of term shall be at the rate of one dollar per acre, payable in advance, but if drilling equipment has been installed within the first year, the second year's rental will not be required.

Rental for third year shall be at the rate of one dollar per acre but if drilling operations have been commenced prior to the commencement of the third year, the rental will not be required.

At the termination of the third year of the term of the permit unless the permittee can show that he has drilled one or more wells to a depth of at least 500 feet each on each location, or has expended in actual drilling operations thereon the sum of not less than $5,000, exclusive of the cost of machinery and casing, the permit shall be automatically lapsed and forfeited.

If oil in commercial quantity has not been discovered on the location the permittee shall, during the fourth year, continue his operations, and shall drill one or more wells to a depth of not less than 2,000 feet, or to such depth as the Minister may consider sufficient to determine whether or not oil in commercial quantity exists on the location.

If on the termination of the fourth year, oil in commercial quantity has not been discovered, the permit shall lapse.

If at any time during the period of the permit, oil in commercial quantity is discovered, the permit shall terminate and the permittee shall become entitled to a lease of a portion of the location not to exceed one-fourth of the area, upon due staking and filing as prescribed. The remainder of the location is reserved to the Crown.

Leases.

Term of leases shall be for 21 years, renewable for a like term, upon compliance with the regulations. Rental shall be one dollar per acre per annum. A fee of five dollars must accompany each application for either permit or lease, which will be refunded if the rights are not available, but not otherwise.

Until 1st April 1926 a royalty of five per cent. of the value of the oil production shall be collected by the Crown, after which date a royalty of ten per cent. shall be collected. Sworn monthly production returns must be made to the Minister, on pain of forfeiture for default.

A royalty on natural gas and products may be levied by Order-in-Council.

Lease shall only include the oil and gas rights, but sufficient surface rights for operations may be acquired at a rental of one dollar per acre per year, additional to lease rental.

The boundaries beneath the surface of a location shall be the vertical planes in which the surface boundaries lie.

No well shall be bored or drilled within 200 ft. of location boundaries, except by permission under prescribed regulations.

Before commencing operations on an acquired location, operator must inform the Minister of point of operation, number or designation of well, size and weight of casing, kind of drilling-rig, name and address of person in charge.

Operator shall at all times take reasonable measures to prevent injurious access of water to the oil-bearing formation, and, upon abandonment of well, precautions to prevent access of water must be taken. If water is encountered, well must be closed so as to shut water off from oil-bearing formation.

In case of discovery of gas, reasonable precautions must be taken to prevent waste and escape of gas. In default of taking of prescribed precautions the Minister may take action to prevent waste, all expenses being chargeable to the lessee, and for this purpose the employees and equipment of the lessee may be commandeered.

Additional regulations may be promulgated at the discretion of the Minister.

In case of abandonment of well, due notification of such intention shall be given before removal of equipment, and written information shall be given to the Minister of date of proposed abandonment, quantity and size of casing in well, and of casing proposed to be removed, depth at which water was encountered, and method taken to shut off same; depth at which gas was encountered, and whether any escape of gas will result from abandonment.

Assignment, transference or sub-letting is not permitted except by consent of the Minister.

If considered advisable the Government may at any time enter into possession of a location, together with equipment thereon, or any portion thereof, upon payment of compensation not to exceed the profit the operator would have earned. In case of dispute, compensation is fixable by a Judge of the Exchequer Court.

On locations that yield oil in paying quantity lessee shall use due diligence to maintain production.

Annual returns of days of operation, number of men employed, character of operations, depth attained, total expenditure incurred, quantity and nature of production, etc., shall be filed, under penalties and pain of cancellation in default.

Where application for permits and leases has been filed prior to issue of new regulations where leases have not been granted application is to be dealt with under the new regulations not to exceed five locations. If less than five locations applied for prior to issue of new regulations, applicant may ask for five in all. (Since amended).

Where the Minister is satisfied than an applicant is committing or attempting fraud, misrepresentation, or has unfair dealings with the public in connection with his applications, refusal or cancellation of permits or leases is at the discretion of the Minister.

Subsequent Amendments.

Since the regulations — of which the foregoing is a condensation — were gazetted, an Order-in-Council has been issued, which amends them in several particulars, the amendment with regard to stated value of issued shares as having already been noted.

Section 51, referring to applications made before issue of new regulations is amended to provide that applications so made, but not granted, shall be dealt with under the regulations in force at the time of the application.

The Order in Council also states that citizens of another country, the laws, customs and regulations of which deny similar or like privileges to citizens or incorporations of the British Empire shall not, by stock ownership, stock-holding, or stock control, own any interest in any permit or lease acquired under the provisions of the regulations.

The Chairman of the South Metropolitan Gas Company, Dr. Charles Carpenter, a Member of the Institution of Civil Engineers, recently stated at the Annual Meeting of Shareholders that the coal supply of Britain had never been of worse quality during the time its production and distribution had been under Government control. "One more example of the invariable result that the more completely an industry is in Government hands the less efficient does it become". The experience seems a universal one.

BOOK REVIEW.

THE UNIVERSITY IN OVERALLS—A Plea for Part-Time Study, by Alfred Fitzpatrick, Principal of the Frontier College, Toronto. With introduction by Dr. W. L. Goodwin, Queen's University, Kingston.

Among the educators of Canada that have emphasised the social and moral value of education, while insisting also upon technical education as a necessity, Dr. W. L. Goodwin has always been distinguished, and in university extension work Queen's University has been a pioneer. It is therefore fitting that Dr. Goodwin, as one who is at this time personally engaged in teaching prospectors' classes in the scattered mining camps of Ontario, and has represented the views of the Canadian Institute of Mining and Metallurgy in recent important conferences on education that have been held in Canada, should write the introduction to a book that pleads for still wider-flung extension of university effort.

From personal observation of the work of the instructors of the Reading Camp Association (now the appropriately-named Frontier College) the Editor can pay tribute to its value. During troublous years, when employers of labor looked with just suspicion on things that savored of propaganda and that might conceal hidden and malign motives under fair pretenses, the college-trained youths who act as instructors of the Frontier College in their unique educational mission in the remote lumber, mining and construction camps of our frontiers of settlement, have steadily won the favour of employers and workmen. The daily life of the Frontier College instructor is no bed of ease. He must work all day with those who are his pupils in the long evenings; and in direct social contact with the workers and the self-supporting character of the instructors, the work of the Frontier College in the field of education is not unlike the work of the Salvation Army in relation to more conventional forms of religious effort.

Mr. Fitzpatrick's new book, "The University in Overalls" suggests that the clearing of bush lands, the removal of liability to forest fires and summer frosts by extensive clearing and cultivation of such territories as the "Clay Belt" of Northern Ontario, should be made a department of organized national effort, and should not be slowly effected by the solitary toil and hardships of individual settlers, or by men gathered into camps as in wartime and separated from the society of women and family life. He suggests the creation of "clearing communities" where workers could live in small townships. This suggestion is not made to provide an outlet for immigration but to relieve the pressure on the cities. "Clearing and cultivating the land is the only profession in Canada that is not crowded", writes Mr. Fitzpatrick.

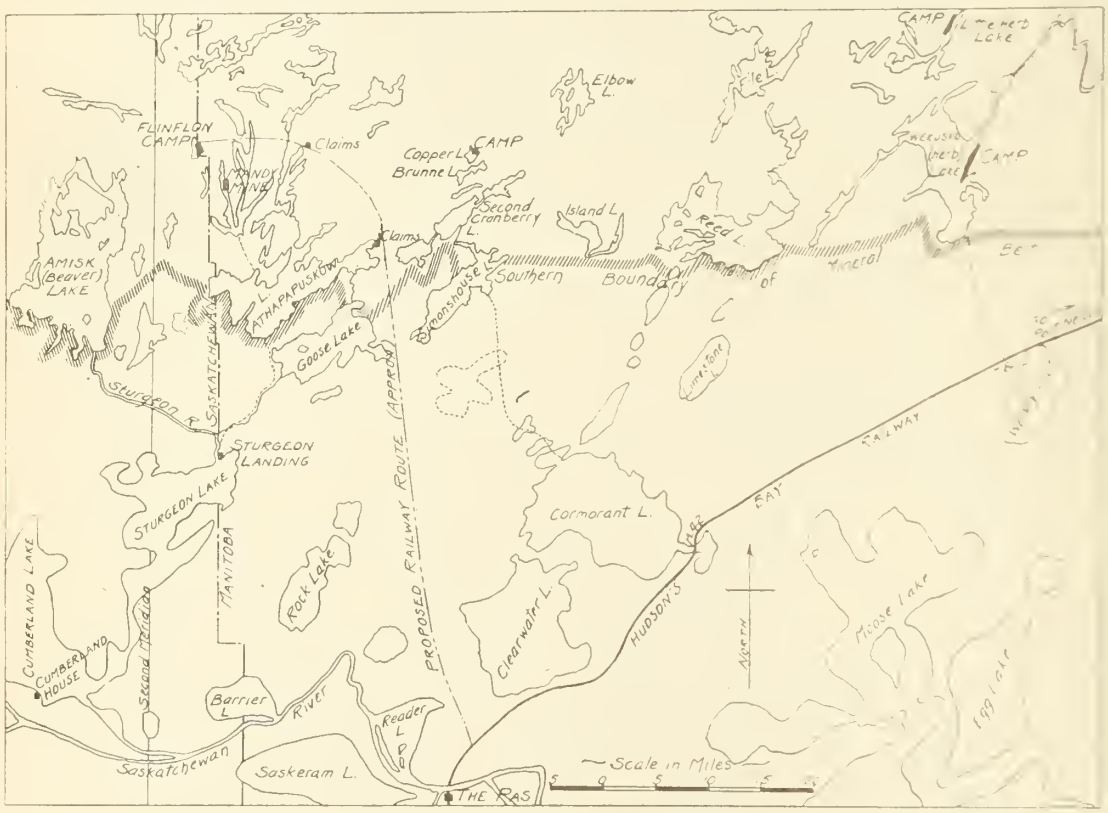
It is in Mr. Fitzpatrick's suggestions for enlargement of the work of the Frontier College that his book is most helpful, and, so far as the mining industry is concerned, mine companies and superintendents will make no mistake, and will reap much benefit if they will co-operate with Mr. Fitzpatrick and his workers — good, clean boys, headed by a man of real vision who is doing very much for the Canadianization of our foreign-born citizens and thereby stopping at its origin many possible future political and social trouble in this country.

The Flin Flon Ore-Body

By R. C. WALLACE, Commissioner of Northern Manitoba.

The Flinflon orebody is situated at the southeast end of Flinflon lake, which drains through a series of lakes into the Saskatchewan river. The orebody lies in township 67, ranges 29 and 30, west, approximate latitude 54 deg. 45' and approximately longitude 101 deg. 55' — four miles east of the second meridian, west. It lies practically on the boundary of the provinces of Manitoba and Saskatchewan, and is, in point of fact, cut at two places by the boundary line, lying, as it does, in the right angle between the north and south boundary line and the east and west correction line.

Flinflon lake is distant by air line 68 miles N.N.W. from The Pas, through which town the Canadian National Railway passes en route for Hudson's Bay.



The Pas is the distributing centre on the Saskatchewan river for the mineral field and for settlements on the Hudson's Bay Railway.

The summer route from The Pas is by way of the Saskatchewan river to Sturgeon Landing, which is the head of navigation for steamboat traffic, and thence by canoe to Flinflon lake. The total distance is 130 miles by steamboat and 60 miles by canoe, a total of 190 miles from railway communication. The canoe route can be shortened by using the summer road built by the provincial government from Sturgeon Landing to lake Athapapuskow. With light loads, however, the longer route is usually taken. The winter sleigh-road from The Pas is approximately 90 miles long. The property is near the well-established and historical canoe route from Cumberland House northwards through lake Athapapuskow and the Pine Root river to the Churchill river at Pukatawagan. The camp lies nine miles west of this route in a territory which was hitherto not frequently traversed between the Pine Root River valley and the Beaver Lake country.

Geological Features.

The orebody lies in amygdaloidal greenstones which are to be referred to the earliest volcanic flows in this district. They have been named by E. L. Bruce (who has mapped this area in detail for the Geological Survey), the Amisk volcanics, owing to their prevalence in the vicinity of Amisk (Beaver) lake. Associated with the greenstones, and probably somewhat later in age, although earlier than the granite intrusions, are quartz porphyries which are parallel in strike to the greenstones (326°) and which do not here display clear-cut intrusive relationships into the greenstones. There are also lamprophyric dykes which are apparently earlier than the intrusions of granite, probably earlier than the quartz porphyry flows, though later than the amygdaloidal greenstones. The later granite, which is found one mile southwest of the Flinflon orebody, and to which may be referred the granite porphyry intrusion immediately north of the orebody, has been named by Bruce the Kamims granite. This granite is intrusive, not only into the volcanics referred to above, but also into sediments that overlie

* A paper presented at the Western General Meeting of the Canadian Institute of Mining & Metallurgy, Winnipeg, October 1920, and reproduced from the Bulletin of the Institute for February 1920. (Cuts kindly lent by the Institute.)

the volcanics, but which are not exposed in the immediate vicinity of the Flinflon property. The Flinflon and other sulphide deposits of this district, as well as the gold deposits in the quartz veins, are to be referred to this granite as ore deposits representing deposition at lower and higher temperatures respectively.

During the process of shearing, which probably occurred in the earliest stages of the eruption of the Kaminis granite, the quartz porphyry offered greater resistance to the shearing forces than did the amygdaloidal greenstone. In the greenstone itself there are apparently units of greater resistance than others. In all probability the zones that suffered intensive shearing represent a volcanic tuff interbanded with the more massive lava flows. In the process of replacement by sulphides the more sheared zones have suffered much greater change than have the more massive members.

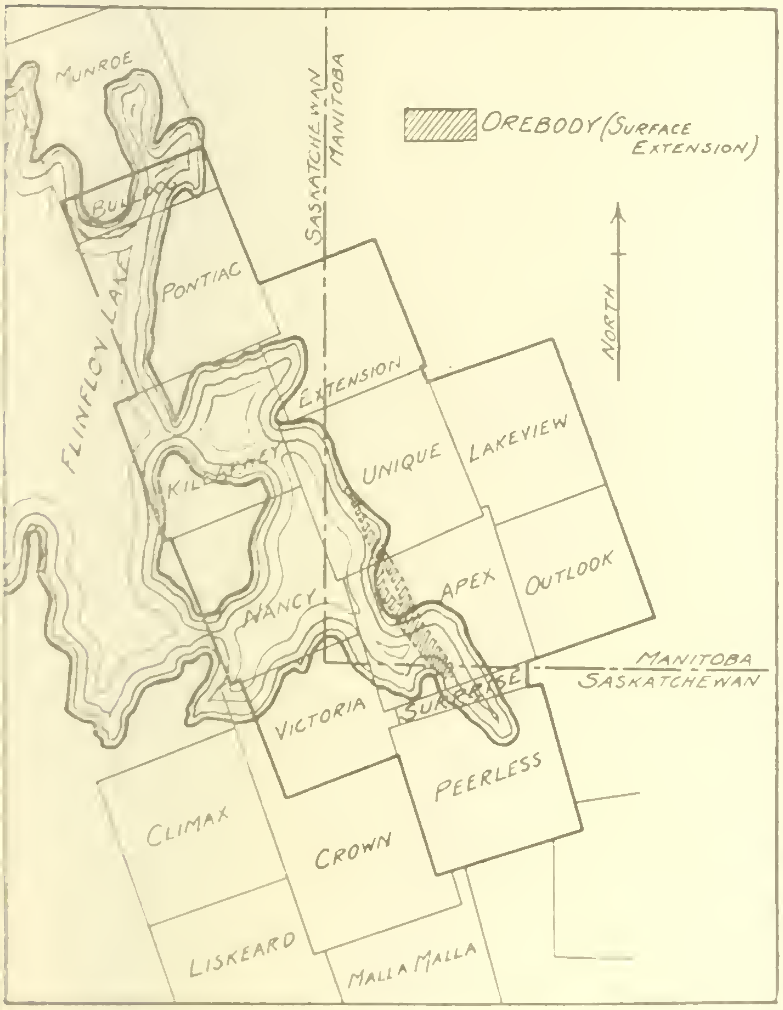


Fig. [illegible]—Group of claims comprising the Flinflon property

The Orebody.

Shape and Extent. — The orebody, which skirts the southeast shore of the lake, strikes with the country rock (324°) and dips approximately 70 deg. east. From the records of diamond-drill holes at the south end of the deposit, it would also appear that the orebody pitches at a low angle to the south. 'Horses' of unmineralized greenstone separate the orebody into more or less independent lenses. At the south end of the orebody a massive greenstone has been less affected by weatherings than the sulphides, and stands out as a prominent topographical feature on the property. It would seem, from the, as yet, incomplete drilling at the south end of the deposit, that this 'horse' forms part of a crescent-shaped mass of greenstone open towards the south. The deposit has a known length of 2,593 feet and has been proved to a depth of 900 feet over a length of 1,000 feet. Its greatest width transverse to the dip is 400 feet. This figure includes some narrow 'horses' of greenstone. Its greatest transverse width at the 900-foot level is 35 feet. From the results of diamond drilling and underground development work, the total tonnage has been calculated to be sixteen million, exclusive of the 'horses' of greenstone in the orebody. This estimate makes no allowance for possible ore under the 900-foot level or possible ore at depth on the line of pitch at the south end of the orebody. On the whole the orebody is more compact at the north end and shows a tendency to intermingle with inclusions of considerable widths of country rock towards the south end at depth.

Mineralogical Composition. — The minerals of the orebody are, in order of importance:

Pyrite,
Sphalerite, and
Chalcopyrite.

Gold and silver are apparently associated mostly with pyrite, the silver in all probability in the form of a mixed silver sulphide. Galena has been found in vugs in the otherwise unmineralized rock but does not occur in quantity in the orebody. Native copper is found in leaf form as a secondary mineral in the upper sulphide zone.

For practical purposes the ore is divided into two types: first, solid sulphides; second, disseminated ore. The solid sulphides occur in the centre and towards the hanging wall of the orebody and are in places in direct contact with the hangingwall. As a rule, however, a selvage of disseminated ores separates the solid sulphides from the hangingwall, while on the footwall there is found invariably a considerable width of disseminated ore. The hangingwall disseminated ore is found to carry small percentages of copper and a greater proportion of gold and silver than the disseminated ore on the footwall; in other words the deposition of pyrite is more extensive on the hangingwall side of the orebody, and the deposition of chalcopyrite is more extensive on the footwall side. As far as has yet been ascertained the same holds true, though to a lesser degree, with the solid sulphide, which gives the higher ratio in copper on the footwall side. The solid sulphides are bounded by unmineralized rock and the contact between solid ore and rock is generally sharp, [illegible] as a rule the contact between disseminated ore and solid sulphide is very distinct though in underground workings a definite gradation may be noted in places. The highest copper content of the deposit is found in the disseminated footwall ore which ranges from 3 per cent to 5 per cent copper, the copper ratio for the whole orebody, exclusive of 'horses' being approximately 1.9 per cent. A thin selvage of sphalerite separates the solid sulphide from the disseminated ore on the hangingwall side. [illegible]

which averages approximately 3.8 per cent of the whole orebody, is more abundant on the hangingwall side than elsewhere. While it might be expected that the gold would increase and the copper and zinc would decrease in depth, no indication of any such variation has been noted to the depth at which diamond-drilling has explored the property.

Origin. — The orebody has been formed by replacement of the rock which had already undergone intense mineralogical alteration during the shearing process. Where rock still remains (as in the disseminated-ore areas), its mineralogical composition would

g. 3.—View from the east. Section "F" is near No. 1 Shaft at the ft of the picture and Section "D" is near No. 2 Shaft in the centre. ie prominent "horse" to which reference is made in the paper can be en between the two shafts.

indicate that, in the main, the replaced rock was basic in character. The richest disseminated ore exposed by underground operation occurs in a typical chlorite schist. Bodies of quartz porphyry occur, however, in close proximity to, and apparently within, the orebody. At the end of the crosscut of the No. 2 workings, quartz porphyry forms the hangingwall in contact with the disseminated ore, the contact being practically vertical while the dip of the rock in the orebody is from 70 deg. to 75 deg. In the disseminated ore immediately west of the solid sulphides in the east end of the same crosscut, very siliceous bands, which represent either a siliceous rock of the quartz porphyry type or a subsequent infiltration of silica during the process of mineralization are found. That silica has, to some extent at least, been associated with the replacement, is indicated by the character of the rock that has been exposed by surface workings immediately east of the 'horse'. Here the sulphides have disappeared through weathering and there is left a highly porous pumiceous silica rock which would appear to represent the result of siliceous infiltration and replacement into a rock that was probably of an acid type originally. The bands of siliceous rock in the disseminated ore in the crosscut are of a similar character. The extent of shattering that the rock has undergone on shearing has been a factor of greater importance in facilitating replacement than has the actual chemical character of the rock itself.

Replacement has taken place at a fairly high temperature and by hydrothermic processes; on the footwall particularly, the rock has been highly sericitized. In the chlorite schist and in the sercite schist as well, irregular masses of talc are encountered in the underground workings. While such mineralogical changes indicate hydrothermal deposition, it is a remarkable feature in connection with the orebody that the contact between solid sulphide and unmineralized, unchanged greenstone is so distinct, as is actually shown in the crosscuts. While both quartz porphyry and lamprophyre are rather closely associated with the deposit, there is no evidence to show that either volcanic phase is connected with the deposition of sulphides. The Kaminis granite and its offshoots seem to be the parent body from which the hot solutions and the vapours emanated. Throughout the district, sulphide bodies frequently occur in close association with quartz veins carrying gold; elsewhere, however, the sulphides are pyrite, with relatively small percentages of pyrrhotite and only occasional chalcopyrite. It would appear that during the later stages of plutonic activity now represented by the granite, the deposition of sulphides was closely connected with the precipitation of a gold-carrying quartz.

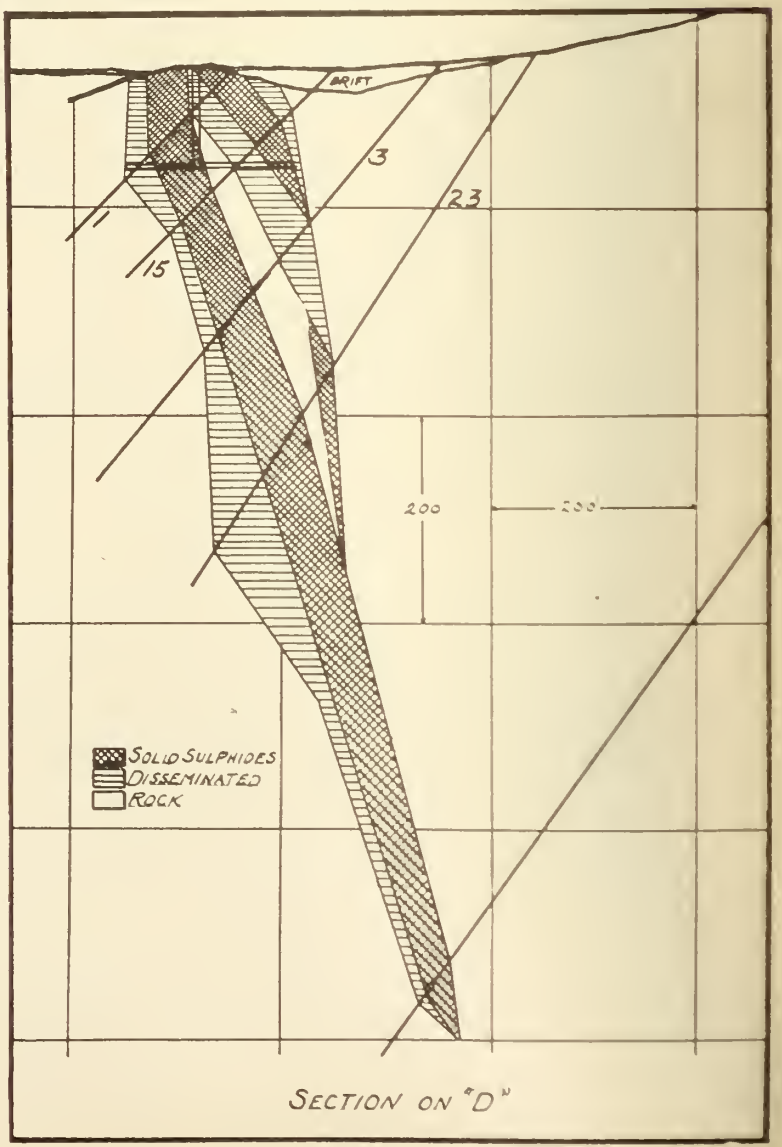

Fig. 4.—Section near No. 2 shaft as determined by diamond-drilling.

Development.

Discovery. — In the summer of 1915, the Mosher-Creighton party, which had been working northeast of Amisk lake, was guided, by information, to the Flinflon lake district and the Flinflon orebody was discovered. Some surface trenching was done in order to obtain an idea of the size of the orebody, and late in the summer the claims were recorded. The news of the discovery and the importance of the orebody were appreciated by other prospectors and in a very short time the whole country in the vicinity of the deposit was staked.

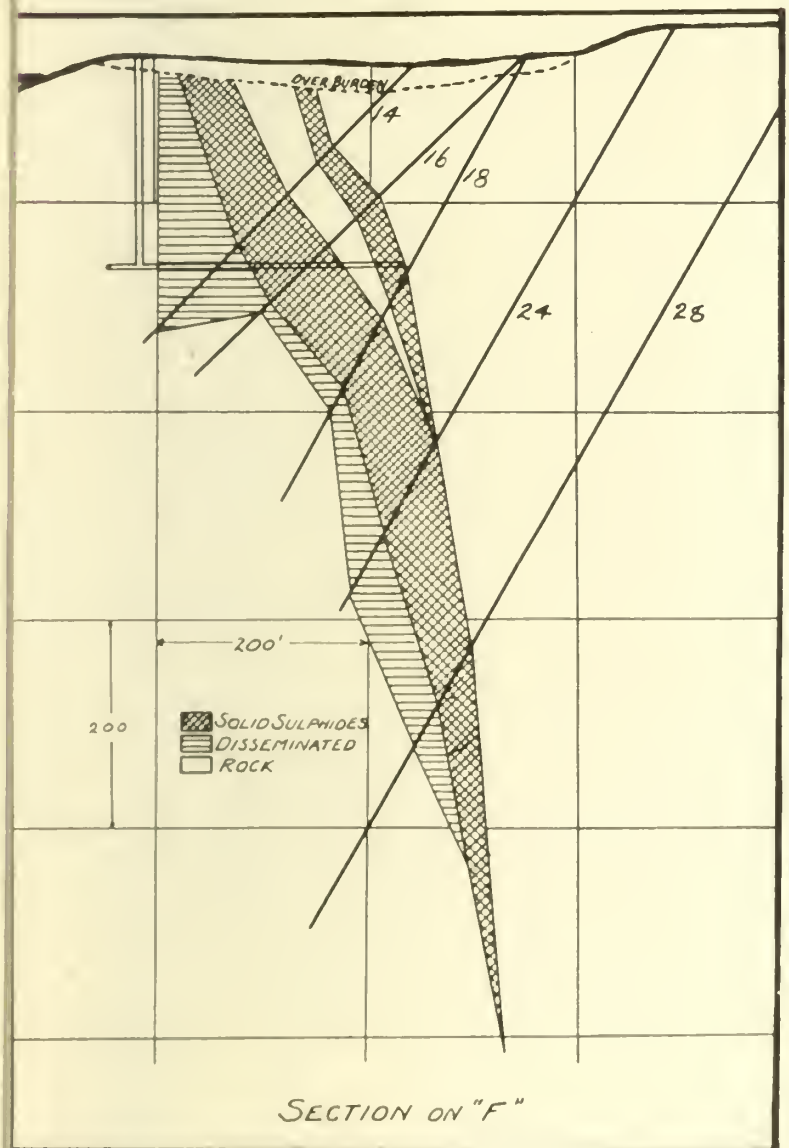

Fig. 5.—Section near No. 1 shaft as determined by diamond-drilling.

Development Work to Date. — During the winter of 1915-16, work was confined to surface sampling and cross-trenching. In March, 1916, two drills were at work and by July of the same year 6,000 feet of drilling had been done by New York and Boston interests, who, however, failed to reach an agreement with the owners. In the spring of 1917 certain Toronto interests entered into an agreement and diamond drilling was continued throughout the year and until July, 1918. In all, 11 holes were drilled representing a total lineal footage of 25,664 feet. In March, 1920, an option on the property was taken by New York and Canadian interests and since that date two shafts have been sunk over 500 feet apart at the south and north ends of the main 'horse'. The first shaft has reached a depth of 200 feet and at that depth there is 210 feet of crosscutting and approximately 100 feet of drifting southward. It was expected that the shaft should be entirely in the footwall but at a depth of 135 feet disseminated ore was encountered and the shaft continued in this ore to the 200-foot level. When the crosscutting is complete it will expose approximately 100 feet of solid sulphides. No. 2 shaft was sunk to the 100-foot level and a crosscut approximately 165 feet long was made at this level. Sinking is now being continued to the 300-foot level.

Mining and Smelting Facilities. — In operating the Flinflon property, a very large low-grade orebody, far removed at present from transportation facilities and industrial centres, there are many problems of major importance to be solved; these refer, in particular, to water-power facilities, metallurgical processes, availability of fluxing material, fuel and transportation. In order to present the situation as it is today, these various phases may best be discussed seriatim.

In order to develop water-power in sufficiently large quantity for operating a mine and smelter of 2,000 tons capacity at the Flinflon property, two sources of power are available. The one on the Churchill river at Island Falls is distant some 60 miles. A minimum production of 80,200 h.p. has been estimated for this fall. A nearer source of power, which will in all probability be adopted, is Birch rapids on the Sturgeon-Weir river, distant 35 miles from the property in a westerly direction. The minimum under present conditions is 3,270 h.p., but this may be increased at will by tapping the Churchill river at Frog portage at the headwaters of the Sturgeon-Weir water system. At periods of high water there is at the present time a natural flow of surplus water from the Churchill river into the Sturgeon-Weir system and thence into the Saskatchewan river. It is estimated that the available power can be increased to 20,000 h.p. by thus utilizing part of the flow in the Churchill basin.

The disseminated ore will offer no special difficulties in the furnaces. Generally speaking, it will concentrate fairly readily and will be treated in the reverbatory furnace. The solid sulphide (mixed pyrite-chalcopyrite-sphalerite) ore will present greater difficulties to the metallurgist. Experimental work may discover a method of concentration whereby it may be possible to recover all or the major part of the zinc. If this is not feasible, it will doubtless be treated in the blast furnace by pyritic smelting and only a limited portion of the zinc recovered. There is a great field for experimental work on this ore in order to devise the most suitable and economical method of handling and smelting the solid sulphides.

It will be necessary to add silica in considerable proportions and limestone in small amounts to the ore before smelting. Quartz veins that carry gold are more numerous on the west end of the mineral belt (Beaver lake) and at its east end (Herb lake) than elsewhere throughout the belt. The eastern district in particular is somewhat remote from the property

Apart from the gold-bearing veins there are siliceous bodies of other types in the mineral belt; in particular, quartz porphyry flows, felsitic intrusions into the earlier volcanics, and sediments with a high silica content. In all probability quartz flux will be obtained in part from the lean bodies of greater extent and closer proximity to the deposit. Magnesian limestones of Ordovician age occur in quantity within ten miles of the orebody. Pure limestones of Upper Devonian age are exposed at the northwest end of lake Winnipegosis. The use of this would necessitate a rail haul of 250 miles to the property.

Owing to the great distance from the eastern areas, Western coal will doubtless be utilized as fuel for the smelter. The success which has attended the use of pulverized coal in the experiments already carried out by Eastern copper-smelting companies, would indicate that powdered coal might be the cheapest and most available type of fuel for the smelter. It is not improbable, as well, that satisfactory electrical processes may be devised for an ore of this type many years before the deposit is exhausted.

The all-important question in connection with the development of this deposit is transportation. By air-line the property is 68 miles from The Pas, which is served by the Canadian National Railways. A railway by the most feasible route to the property would probably be 85 miles long. The province of Manitoba has displayed a very commendable interest in the deposit and in the furtherance of its development. The Board of Trade of The Pas had as their guests to the property during the month of September the members of the provincial legislature and other prominent business men in the province. The result of this visit has been that the members of the legislature have had the opportunity to become personally acquainted with the whole situation and to realize that without a railway the property cannot be operated. If, before the House meets, a deal is consummated on the property with sufficient guarantees of development, the question of the railway will be considered in the House on a basis of the province of Manitoba making arrangements to finance the building of the railway and its leasing when built, to the Canadian National Railway Board, which would then be responsible for its operation.

The heartiest acknowledgements are here made to the owners and the optionees of the Flinflon property for their generous assistance in furnishing details relative to the property and its development.

NOTES FROM SAULT STE. MARIE.

(By a Local Correspondent.)

Michipicoten.

The Norwalk and Grace mines, which have been under negotiation for some months with a well known group of mining men, have been pumped out and sampled, but no reports of the result have yet been received by the vendors. Some phenomenally rich ore has been raised from these properties and the prospects are good that the deal will be consummated.

Work preliminary to diamond drilling the McCarthy-Webb claims is being carried on by a large gang of men, and it is expected that the drilling will be in full progress before the Spring opens.

Mile 51, A. C. R. Ont.

Test-pitting and stripping is being done on a number of claims at this point, by Mr Geo. Carufel, with a number of experienced miners. This find was made some time ago, by Mr. Jno. Byrne, and apparently is a very promising one, with many of the earmarks of a permanent gold-field.

Northern Manitoba.

Mr. J. A. Johnson, who left Soo, Ont., on the 13th inst., for the Rice Lake district, for the purpose of thoroughly examining the properties lately taken over by the Canadian Mining & Leasing Corp., is expected back next week, in company with Mr. A. J. McEwen, who preceded him in these claims. An interesting report is expected from these properties.

Power Required for Revolving Tippet

By JOHN S. WATTS, New Glasgow.

The revolving tipple, which is almost universally used in colliery bankheads, is a machine, for which the power required may vary within very wide limits, depending upon the design, and particularly upon the accuracy with which the balancing has been done. This balancing requires both the accurate locating of the car in the tipple to bring its centre of gravity, loaded and empty, at the points which will cause the tipple to revolve by gravity, and the fitting of such balance-weights to the tipple as will bring its centre of gravity to its geometrical centre.

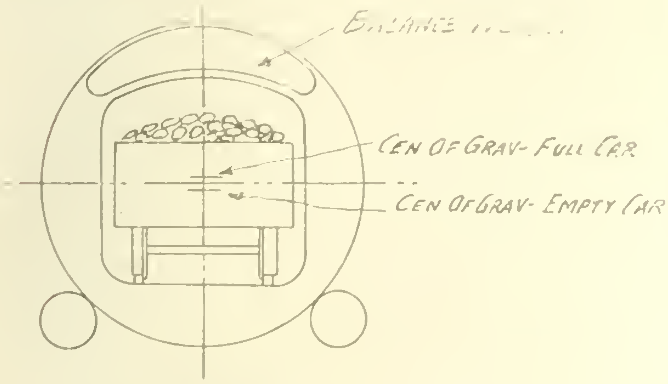

FIGURE 1.

Unfortunately from the nature of the conditions, it is practically impossible to check the accuracy of the balancing, or the location of the car, in the manufacturer's shop, and very rarely indeed, is any test made by the colliery engineers, who are usually satisfied, if the tipple performs its functions, without considering if the machine is efficient in the matter of the power used.

With coal at its present high value, and the high cost of the labor and material entering into its conversion into motive power, even a coal company will find it to pay handsomely to save all of the power possible.

The ideal to be aimed at is to have the tipple designed so that the centre of gravity of the whole of the revolving parts, including the loaded car, will be a little above the geometrical centre of the tipple, and, that, when the car is empty, the centre of gravity will be slightly below the geometrical centre.

The most satisfactory way to accomplish this is to balance the tipple itself, by fitting balance weights, to bring its centre of gravity to coincide with the geometrical centre. As the bottom of the tipple carries the rails, car-stop, trip mechanism, etc., it will be necessary to bolt weights to the top of the tipple rails, to accomplish this as indicated in figure 1.

The rails should be set at the height required to bring the centre of gravity of the loaded car just above the geometrical centre of the tipple as indicated in figure 1, and the centre of gravity of the empty car an equal amount below the centre line.

When the tipple has revolved about ninety degrees, the car will begin to empty itself and unless an apron has been fitted, as shown in figure 2, the centre of gravity will move to the left hand side of the vertical centre line, and power will be required to revolve the tipple. With the apron fitted as shown, the centre of gravity remains on the right hand side of the vertical centre line, and gravity will keep the tipple revolving until it has completed one half of its revolution, when the car will be completely emptied of coal.

At this point, the tipple may be described as being on a dead centre, as the centre of gravity will be on the vertical centre-line, but the inertia of the moving parts should be sufficient to carry the tipple past this point, without taking additional power.

Having passed this point, the centre of gravity has moved to a point above and to the right of the centre of the tipple, and gravity will cause the tipple to complete its revolution.

Under the ideal conditions outlined above, the power that will be required is simply that needed to overcome the friction of the moving parts. To calculate the amount of this power, we add together the weights of the moving parts of the tipple, and of the loaded car. This weight acts on a vertical line, and is resolved into two diagonal forces, as shown in figure 3. The amount of these resultant forces can be scaled off the triangle of forces in figure 3, and the total of the two resultants will be the pressure on the bearings, which multiplied by the co-efficient of friction will give us the resistance to be overcome at the surface of the roller shafts.

This resistance in pounds, multiplied by the peripheral velocity of the roller shaft, divided by 33,000, will give the horse-power required at the roller shaft, and adding about 10 per cent to this amount to overcome the friction of the driving gear, will give us the horse power required. Converting this into a formula we have

$$HP = \frac{W \times 2 \times \sec. \text{ang.} \times F \times d \times \pi \times R}{33{,}000 \times 12}$$

Where W = total moving weight, including loaded car, in pounds.
F = co-efficient of friction.
d = diameter of roller shaft in inches.
R = revolutions per minute of roller shaft.

The average tipple will have a weight of the moving

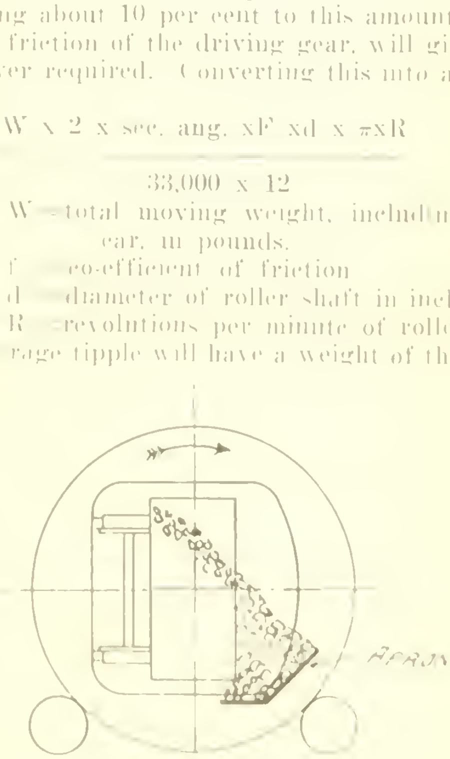

FIGURE 2

parts of about 5,000 pounds, and taking the car at 1,250 and the weight of the coal at 2,000 pounds, the total weight to be moved will be 8,250 pounds. The coefficient of friction of the roller shaft bearings should not exceed .2. The angle will be around 45 degrees, the diameter of the roller shafts, say 3 inches, and the speed of the roller shafts about [illegible] revolutions per minute. Substituting in the above formula we get

$$HP = \frac{8250 \times 2 \times 1.414 \times .2 \times 3 \times 3.14 \times 33}{33{,}000 \times 12} = 3.6 \text{ HP}$$

Adding ten per cent for the friction of the driving apparatus, we arrive at a total of 4 HP, which should be required only to start up the tipple.

As it is possible that a car may come to the tipple only partly loaded, it is desirable to have the driving mechanism capable of turning over the tipple with a partly-filled car.

The worst possible condition will be a car filled with coal up to the centre line of the tipple, and the additional work required will be equal to that which the coal above the centre line performs in a full car.

This can be calculated by multiplying the weight of the coal, assumed to have been left out, by twice the height of the centre of gravity of this mass of coal, above the centre of the tipple, in feet. That being the distance this mass would fall during one

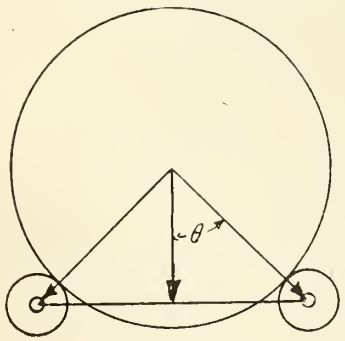

FIGURE 3

half of a revolution the foot pounds per minute will be the above amount multiplied by the number of revolutions per minute of the tipple. Putting this into a formula, we have,

$$HP = \frac{c \times 2 \times h \times rpm}{33000}$$

Where c=weight of coal left out in pounds
h=height of centre of gravity of "c", above centre tipple.

Unless the car is very high and narrow, the extra power required will not be more than about one-quarter horse-power.

Another disadvantage that is incurred, in using a badly balanced tipple, and one that is of more consequence even than the extra power used, is that the tipple depending entirely upon the friction between its rings and the live rollers, is apt to slip if the unbalanced weight is any appreciable amount, particularly in frosty weather. This will soon ruin a tipple, as the wear on the rings coming always on the same spot, soon wears a flat spot there, which makes it still harder to start. Also a delay at the tipple will hold up operations throughout the whole bankhead, and cause a serious delay.

WOMEN'S MINING ASSOCIATION.

The Toronto Branch of the Association of the Women of the Mining Industry of Canada was formed at a largely attended meeting of women held at the residence of Mrs. R. F. Segsworth, South Drive, Toronto, a few days ago. The organization is wide in its scope and promises great usefulness in its cooperation with the mining industry of the country. Briefly stated the objects of the Branch are to promote social intercourse, to render service to all connected with the mining industry and to encourage cooperation in work for the benefit of the community and of the country at large in all that pertains to the interests of the mining industry.

Not only will the new society include the wives and women folk of engineers and owners, but it will have in its membership all women whose men are mine workers. A Montreal branch of the organization will be formed this week in Montreal, and local branches will shortly be formed in the mining centres of the North, in British Columbia and in Nova Scotia. These local branches will then be drawn into a Dominion Federation which will affiliate with the similar organization now existing in the United States.

Toronto will have its hospital visiting committee to look after patients sent in from the North, and will also have a committee to search out strangers.

Officers Elected.

Officers for the year will be: President, Mrs. J. B. Tyrrell; Vice-Presidents: Mrs. D. A. Dunlap, Mrs. R. F. Segsworth (who goes as Toronto's delegate to the meeting for organization in Montreal), Mrs. Sylvester; Recording and Corresponding Secretaries, Mrs. J. Pat. MacGregor and Miss Miller; Treasurer, Mrs. V. E. Neelands; Councillors: Mrs. Tom Gibson, Mrs. Macqueen, Mrs. Robert Bryce, Mrs. W. A. Parks; Conveners of Committee: Mrs. Arthur Miles, Mrs. McEvoy and Mrs. Hanltain.

An interesting visitor at yesterday's meeting was Mrs. Frecheville, wife of the head of the English Society of Mining and Metallurgy. Mrs. Frecheville made a brief speech, explaining the workings of the women's branch of that society.

Now that the movement is started it is hoped that branches will be formed throughout Northern and other parts of Canada will be formed. The Canadian Mining Journal is asked to state that copies of the constitution and other information may be obtained from the corresponding secretary, Miss Miller, 21 Howland Avenue, Toronto, Ont.

"BUNK."

Copper Cliff, Ont.
February 28, 1921.

The Editor,
The Canadian Mining Journal,
Gardenvale, Que.

Dear Sir,

The reference to cubicular galena under the heading "Technical Jargon" is a good example of the "bunk" we sometimes meet in the technical reports. I guess "bunk" is right considering the meaning of cubicular, but the Funk & Wagnall's dictionary goes one better with the definition "suitable for lying on."

Yours very truly,
J. C. ROGERS.

PROTECTION AND POLITICS.

Those in Congress who have the interests of the coal industry at heart have been asleep on the job. The new emergency tariff bill, said to be at once the pest and pet of stand-pat Republicans, should contain protection for the coal industry. We suggest at least $5 a ton as the proper tariff on coal imports necessary to put this industry on a parity with field corn and hens' eggs. How anyone could have overlooked this crowning climax to the season's farce is more than we can understand. Maybe the votes of those who mine coal are not among those sought.—"Coal Age" New York.

Northern Ontario Letter

THE SILVER MINES

The Cobalt District.

The closing days of February found silver quoted at a price actually lower than any monthly average since the year 1915. Companies which commenced hoarding their bullion output a year ago have lost heavily, and are now faced with selling on a market between 55 and 60 cents an ounce, as compared with upwards of $1.20 an ounce at the time when they commenced to withold their product from the market.

There is a growing tendency now to believe that two factors can alone relieve the situation. One would be the adoption of bi-metallism by international Agreement, which it is thought may soon be formally proposed by Great Britain. This would probably cause a higher price to be fixed, depending upon the ratio decided upon. As for instance a ratio of sixteen of silver to one of gold would place a valuation of $1.29 an ounce on silver. The other remaining hope of relief lies in the possibilities of reducing the costs of production.

Workers in the Cobalt mines have voted by a large majority in favor of asking for a Board of Conciliation to deal with the question of the reduction in wages which went into effect Feb. 16th. The mining companies will agree to the proposal, but believe such a procedure quite useless. The decline in the price of silver to 56 cents an ounce during the past few days, as compared with the high point of $1.37 an ounce reached in January, 1920, in the opinion of the operators, privides ample justification for the reduction of 15 p.c. in wages. It is intimated that an endeavor may be made to do co-operative buying of supplies and provisions so as to enable the men to reduce the cost of living to as a great an extent as the cut in wages.

About 300 tons of ore, containing an average of about 15 ounces to the ton, has been broken in the Hudson Bay mine. A further substantial tonnage has been placed in sight, and arrangements are being made to resume shipments about the first of May. The work at the 3rd level, which recently opened up some new ore, is being continued with fairly promising prospects.

Work both above and below the contact is being continued on the Hargraves property, under option to the Kerr Lake. Some high grade ore was encountered soon after the work commenced, but proved to be only a small pocket. The Kerr Lake is working a total force of about 50 men, production having been entirely suspended last fall, and development work narrowed down to a minimum. The question of increasing the scope of operations in the Spring will be determined largely by quotations for silver as well as the extent of the decline in the cost of material.

Ore being shipped to the mill from the Bailey Silver Mines averages around 19 ounces of silver to the ton. Part of this is coming from work at the 5th level, and part from the dump. Mill heads have recently run as high as 16 ounces to the ton, but with 19 being about the average. The low price of silver is proving to be a serious handicap, however and a meeting was held in Toronto during the past week to discuss the question of how best to combat the difficulty. E. J. Bourne, manager of the mine, went to Toronto to attend the meeting.

South Lorrain.

Just now, the Haileybury Frontier is the only property operating in the South Lorrain district. The activity on this property depends more upon the demand and price for cobalt metal than it does for silver.

At the Keeley Silver Mines, although a large tonnage of medium-grade ore is awaiting treatment, and a 75-ton mill was installed last Summer and is ready for operation, yet it is considered quite uncertain as to whether or not the Spring will witness a resumption of work. A re-calculation of the resources may have to be made, based upon the lower price of silver. Both the tonnage available and the margin of net profit may be narrowed down considerably as a consequence. The extent of this narrowing down will depend on the extent to which production costs can be lowered.

Elk Lake and Gowganda.

A meeting of the shareholders of the Cane Silver Mines was held last week in Haileybury, at which the question of making arrangements to resume work was considered. Slight difficulties had previously arisen which caused a suspension of work some time ago. In discussing the matter with your correspondent, one of the interests in control of the stock declared the outlook quite promising for an early resumption of operations.

Following a reduction in wages at the Castle property of the Trethwey company in Gowganda, the men quit work. Few forces of men were soon engaged and sent to the property.

Arrangements have been about completed whereby the Walsh property will be re-opened this Spring. It is also learned the Silver Bullion property will be re-opened, both properties being under one control. Encouraging amounts of silver ore occur in the workings on these properties, and an effort will be made to place them on a producing basis. The work will be superintended by Robert Gamble.

The likelihood of any subsequent decision to provide railway transportation for the Gowganda silver are a selecting Elk Lake as the point to start from is added to by reason of an unfavorable geological report on the twelve miles or so of territory lying between Swastika and Fort Natachewan along the route which certain interests had advocated as more suitable than from Elk Lake. This leaves Elk Lake as a probable point of beginning, as the territory in all direction from Elk Lake is considered to be of good prospective merit.

THE GOLD MINES

The Porcupine District.

According to present plans, practically every milling plant in the gold mining areas of this part of Northern Ontario will be shaping up for operation with the next few weeks. Also the mills already in operation will be so speeded up as to double the present rate of production at the leading mines. Altogether, the output may attain an aggregate of about $1,500,000 monthly some time during the latter half of the year, from the mines of Porcupine and Kirkland Lake. A production of around $18,000,000 during 1921 is indicated.

Last week's report in the "Journal" that the McIntyre would increase its milling equipment has been confirmed, and additional grinding equipment is being ordered. This will enable the McIntyre to increase its earnings considerably. The physical condition of the property has been greatly strengthened during the past few months as a result of exploration and development work on what is believed to be the easterly continuation of what is known as vein No. 81 on the Hollinger.

Cornish miners imported to the Dome Mines last Fall from the Old Country, have developed into first class workmen, and have established a high degree of effici-

ency. Their first work on machines was not very satisfactory, but their willingness soon found them achieving satisfactory results, and they are now very efficient. It is believed that, beginning with the company's fiscal year dating from April 1st, the Dome will be in a position to operate at a cost of not more than $3.75 a ton, or a rate equal to about fifty per cent. higher than the pre-war cost. This indicates a large margin of net profit on the higher average grade of ore as found at depth.

Part of the mining machinery sold by the Dome Lake Mining Company is being installed on the North Davidson property where arrangements are being made to carry on a quite extensive program of exploration and development work. Previous diamond drilling is stated to have provided encouragement to go ahead with underground operations.

Official information is scarce in regard to results achieved in the cross-cut at the 250-ft. level of the Porcupine-Keora property, in the northern part of the township of Whitney. It is reported in usually well-informed circles, however, that while some of the stringers occuring over a wide body contained high values, yet the average gold content of the body is quite low.

The Kirkland Lake District.

The status of the mining industry as found in Kirkland Lake is summarized in more or less detail elsewhere in this issue of the "Journal."

Good results are reported at the Hunton-Kirkland where commercial ore is being opened up during the course of sinking a main shaft. This fact, taken together with the official statement that the treasury contains around 750,000 shares leads to the belief that no serious difficulties will be experienced in raising the money required to carry out the proposed development work.

Work is progressing satisfactorily at the Argonaut Gold Mine, at Beaverhouse Lake some twelve miles east from Kirkland Lake. The main, or No. 3 shaft is being driven to a depth of 500 feet, and is expected to reach that point within the next month or six weeks. Considerable encouragement was met with at the 200-ft. level and the program at the 500-ft. level is considered to be of much importance. Success here would have a vital influence on subsequent prospecting over a comparatively large area in the vicinity of the Argonaut, where favorable geological conditions occur.

The annual meeting of the Goldfields, Ltd., of Larder Lake, was held in Toronto during the past week, and the voting showed the Associated Goldfields seemed to control about 1,800,000 shares as against 135,000 by the minority who which are taking legal steps to prevent sale of the company's assets to the Associated Goldfields, or the newly incorporated Canadian Associated Goldfields, which has an authorized capital of 30,000,000 shares of the par value of $1 each.

During the month of January the Lake Shore mine produced gold to the value of $37,375. In doing this, the mill ran only 82 per cent. of the possible running time. A total of 1,674 tons of ore was treated, the average recovery being $22.32 per ton.

A feature of an official statement just issued by R. C. Coffey, manager, is a summary of work at the new level established at a depth of 600 feet. The station at this level has been completed, and two crossents as well as one drift have been commenced. Another feature is the increase in mill heads to $22.32 from a little over $18 in December.

British Columbia Letter

A thorough mineral survey of the Esquimalt & Nanaimo Ry. Belt, Vancouver Island, an area of over 2,000,000 acres, is to be undertaken immediately by the Canadian Pacific Ry. Company, through its subsidiary corporation, the Canadian Consolidated Mining & Smelting Co., of Trail, B. C. Engineers will be engaged to inspect all prospects that have not passed out of the hands of the Company and geologists will make reconnaissance of the mineralized zones of the district. The intention is to obtain as complete information as the application of scientific principles and knowledge will permit of its mining possibilities of preliminary to entering into an agreement with the Provincial Government for the elimination of what is commonly described as the "Dual Control of Minerals within the E. & N. Belt."

Hon. Wm. Sloan, Minister of Mines, has been working on the problem of bringing the minerals of the Belt within the sole jurisdiction of the Province since 1918. The progress made has not been as satisfactory as he could have wished because of the reluctance of the Company to release underground resources without a more exact knowledge of their economic potentialities. Considerable, however, has been accomplished.

The Company has been brought to realize that the present situation, requiring that title to mineral lands within the area, must come both from the Province and the Company, cannot continue. That this point is conceded is supported by letters from Mr. E. W. Betty, President of the C. P. R., stating that the survey referred to will be started without delay. It is assumed that if, as a a result of this work deposits of value to the Consolidated Company are found, that concern will undertake their development. The minerals of the entire section then would be turned over for administration solely by and under the laws of the Province.

Attention also has been directed to the possibilities of the mineral bearing zones of Vancouver Island. It is not improbable that this field work will disclose deposits as rich in promise, for instance, as the Sunloch Mine, Jordan River, is reported to be; in fact the prospects of finding large deposits of copper bearing ore are good. Should such expectations be borne out it would mean the establishment of a smelting, and possibly a refining plant, by the Consolidated Company on the Coast. That this corporation has been feeling its way towards such an extension of industry has been common knowledge for some time. It has under development a number of important properties on Vancouver Island. The discovery and opening up of another one or two within the E. & N. Belt would settle the question and, with a steady normal copper market, an important mining industry would be assured.

The Government's proposition to the Company, which no doubt will furnish the basis of negotiations as soon as the survey is completed, may be summarized as follows:

"That, as regards the mineral rights within the E & N. Railway Belt remaining unalienated, the Government is prepared to go practically into partnership with the Railway Company.

"The District to become fully under the operation of the Mineral Act as far as underground mineral rights are concerned; that such mineral rights be administered by the Government; that the cost of such ad

ministration be entirely borne by the Government and that the gross receipts of all revenue received by the Government from and on account of such mineral rights including taxes etc., be divided equally between the Government and the E. & N. Railway."

Correspondence gives details of the efforts made by the Department of Mines to obtain a decision from the Company. Clearly the matter was kept before the officials of the Company and quite as obviously the latter displayed anxiety not to be hurried into any adjustment that, from their standpoint, might be termed ill-considered. The ultimate result, however, were two interesting letters from Mr. Beatty, President of the C. P. R. The first reads as follows:

Montreal, 15th November, 1920.

The Honourable William Sloan,
Minister of Mines,
Victoria, B.C.

Dear Mr. Sloan:—

Your letter of the 3rd inst., relative to the negotiations pending with regard to the minerals in the unsold lands in the E. & N. Railway Company's land grant, was duly received.

You will readily concede that the matter is one of very considerable importance to the Railway Company. We are advised by persons competent to judge that in all probability there are valuable deposits of minerals in the land grant—the properties already being worked by the Consolidated Company, such as the Sunloch, are evidence of this fact.

In the circumstances naturally the Company desires to acquire as much knowledge as possible of the mineral values in their lands before concluding the pending negotiations, and with this end in view it is proposed, as early as possible, to do extensive exploratory work which will involve the expenditure of a large sum. We are arranging for the co-operation of the Consolidated Company in this connection.

I can assure you that the Company is at one with the Government in its desire to see the mineral resources of the land grant developed, and the negotiations can be continued when we have the data desired.

Yours very truly,
(Signed) E. W. BEATTY.

In replying to the foregoing Mr. Sloan said in part: "With regard to your statement as to proposed exploration of the mineral resources of the area in question I should be glad if you could let me have more exact information as to the nature and extent of said exploration, when it will be inaugurated when it is expected to be completed, and the expenditure likely to be involved."

To this came the following response:

Montreal January 25, 1921

Hon. Wm. Sloan, Minister of Mines,
Victoria, B.C.

Dear Mr. Sloan:—

I duly receive yours of the 29th ultimo.

It would be impossible at the present time to give any categorical answer to your questions, for the reason that the nature and extent of our operations and the amount of money which we will spend upon them will necessarily be determined by results and prospects as the work proceeds.

All I can say at the moment is that as soon as weather conditions permit, the Consolidated Mining & Smelting Co. will make a preliminary examination of the most probable mineral bearing lands in the belt and that their report and recommendation will receive our prompt consideration.

Yours very truly,
(Signed) E. W. BEATTY,
President.

COLLIERIES.

The coal production of the collieries of British Columbia for the month of January shows a decline in comparison with that of December in respect of the Canadian Collieries (D) Ltd. and the Crow's Nest Pass Coal & Coke Co. The former has dropped from 67,327 to 60,038 tons while the latter produced at Coal Creek in January 27,983 as against 42,800 for December and at Michel 23,544 tons in January, the December output being 26,744 tons. The Canadian Western Fuel Co., of Nanaimo, B.C., however, makes a better showing in January than in December the respective figures being 57,228 tons and 52,796 tons.

Following are the detailed figures for January:

Vancouver Island Field.

	Tons.
Canadian Western Fuel Co., Nanaimo	57,228
Canadian Collieries (D) Ltd., Comox	37,763
Can. Collieries (D) Ltd., South Wellington	6,441
Canadian Collieries (D) Ltd., Extension	15,834
Nanoose-Wellington, Nanoose Bay	5,174
Granby Company, Cassidy	19,532
	141,972

Nicola-Princeton Field.

Middlesboro Collieries Ltd., Merritt	9,503
Fleming Coal Co., Merritt	3,644
Coalmout Coal Co., Coalmont	3,712
	16,859

Crow's Nest Pass Coal Field.

Crows Nest Pass Coal Co., Coal Ck.	27,983
Crows Nest Pass Coal Co., Michel	23,544
Corbin Coal & Coke Co., Corbin	6,055
	57,582

An inquiry has been ordered by the Provincial Government into the cost of the production of coal by the operators on the coast of British Columbia, the cost of its transportation, screening and delivery by the dealers, the profits made by the collieries and the profits of the dealers. Alexander Henderson, K.C., a prominent lawyer of Vancouver, B.C., has been commissioned to make the investigation and his work will commence immediately as the time given to present a report is little more than a month. Mr. Henderson's commission comes as a result of a widespread agitation, centered in Vancouver City, against the high cost of coal, it being alleged that $15.00 a ton for domestic coal in a city within forty or fifty miles of the collieries must mean that someone, either the operators or the dealers, is making an excessive margin. The criticism has been answered by the operators by reference to the increased wages, high costs of supplies, and the exceptional difficulty attached to working the coal seams of Vancouver Island. Little has been heard from the dealers but they are said to be ready to defend their position. Mr. Henderson has been given wide powers and the result, there is no doubt, will be watched with close attention and keen interest by the general public of this Province.

There is another development to the litigation between the E. & N. Ry. Co. and the Granby Co. [illegible]

ed Mining Smelting Co. as to the ownership of coal rights in certain sections of the Vancouver Island Railway Belt. Recently a judgment was handled down that one of the two adjoining areas, the Dunlop Estate, belongs entirely, surface and under-surface, to the Granby Company but that the other, the Ganner Estate, in respect of the under-surface rights, belongs to the E. & N. Ry. Co. It appears that one of the mine entrances in connection with the Cassidy Collieries is on the Ganner Estate and the Court of Appeal has given permission to the operating company to use this approach to the workings located within its property, with the stipulation that no coal is to be taken from with Ganner Estate. In his argument S. S. Taylor, for the Granby Company, stated that, if access to the Company's workings was forbidden, 1,700 people would be thrown out of employment and plant representing an investment of $19,000,000 would be closed down. The question of the ownership of the underground rights within the Ganner Estate will be fought out in the courts to the final court of appeal, namely, the Privy Council.

Aluminum	35	35
Antimony	7½	7½

TORONTO COAL PRICES.

Toronto, March 2.—Conditions are unchanged in regard to the coal situation. The difficulty in moving anthracite coal still exists. The smokeless market runs at from $8 to $8.50, Toronto and slack is quoted at $1.75 to $2.75 at the mine. Lump coal ranges anywhere from $2.50 to $3.50, the quotations on both slack and lump depending to a large extent upon the grade of the product offered. Anthracite prices are: egg, $8.25; stove and nut $8.50 and pea coal $6.50 at the mine.

ASBESTOS CORPORATION OF CANADA.

The operations of the Asbestos Corporation of Canada in 1920 were the most profitable in its history, reflecting the heavy demand and high prices that have favored Canadian asbestos producers in recent years.

The President, Mr. W. G. Ross, in his report to the shareholders, referred to the business outlook as follows:

"The orders on the company's books are as great as the orders on hand a year ago. European demand has improved. In the United States, while requests of a temporary nature for suspension of shipments have been made, indications are that industries in which we are principally interested, such as the building and automobile industries, will improve.

"With regard to the latter, our special products are required for renewals, especially brake band linings. The commercial vehicle is becoming a greater factor in the transportation of commodities, and the use of motors of all kinds is increasing steadily, each succeeding year bringing greater needs for and users of cars, both passenger and goods."

Net income available for common stock dividends, after deduction of bond interest, renewals, and depreciation, compared with previous years as under:

	1920	1919	1918
Net income after deductions	$ 1,048,940	$ 1,008,071	$ 801,927
Dividends	582,500	530,000	190,000
Surplus carried for'd	466,440	478,071	611,927
Total surplus	2,052,831	1,586,390	1,205,819

PERSONAL.

"Mr. Carl A. Wendell, for the past few years Chief Engineer of the American Ore Reclamation Co., 71 Broadway, New York, and previous to that connected for several years with the U. S. Steel Corporation has been retained by the General Briquetting Company at 25 Broad St., New York, as consulting engineer, in connection with its flue-dust briquetting development. He will also specialize in coal washing and coal briquetting. Mr. Wendell has specialised in the reclamation of fine materials."

BOOK REVIEW.

COST OF MINING.—A Discussion of the Production of Minerals, with remarks on the Geologic, Social and Economic Foundations upon which it rests. By James Ralph Finlay. Third Edition revised and enlarged. 9 by 6 inches. 532 pages with Index. McGraw-Hill Book Co., New York.

Editorial recommendation of this work as a necessary part of every mining engineer's and mine accountant's library is made elsewhere in this issue, and need not here be repeated.

The book deals specifically with the cost of mining coal, iron ore, copper, lead, silver-lead, zinc, gold and silver, giving exact statistical information at specific localities and under definite geological conditions of occurrence. Generalizations under these heads are conspicuously absent.

In very illuminating fashion the application of general principles of geology, accounting and common sense to mining are discussed.

The work does not attempt to discuss mineral occurrences outside of the United States, except in a cursory manner, and the only extended reference to Canadian minerals concerns silver mining at Cobalt. The opening chapter, which discusses mineral production as a source of national power, puts forward some sane views as to the tremendous preponderance of such power possessed by the English-speaking peoples, and their ability to use mineral wealth by reason of a highly developed mechanical industry. One penetrating phrase which may not be as favorably viewed by certain sections of Canadian thought as it should be, is as follows: "One great advantage possessed by the Anglo Saxons is plenty of room. We are not oppressed by the terrors of over population. Why encourage that terror and bring it nearer by hastening the growth of population by promoting immigration in to these vast areas? We talk sometimes of 'undesirable neighbors.' Is not too great a multitude of neighbors of whatever kind essentially undesirable?" Which suggests a question that has an uneasy habit of intruding in considering Canadian emigration propaganda.

Prof. Ingall's more general remarks, however, form only a small part of his book, which contains a well ordered and selected collection of statistical date that is too condensed, and at the same time, too extensive to permit of reviewing except by actual quotation.

PERSONALS.

Mr. Wm. Frechville, of London, Eng., is in Toronto. Mr. Frechville is prominently connected with several mining enterprises and has on several previous occasions visited Canada. He is a past president of the Institution of Mining and Metallurgy.

Mr. G. C. Bateman, manager of La Rose Consolidated Mines, has been nominated as a councillor of the C. I. M. M. for the coming year.

Mr. C. V. Corless, manager of the Mond Nickel Co., will be president of the Canadian Institute of Mining and Metallurgy during the coming year.

A meeting of the Toronto branch of the C. I. M. M. is to be held on Saturday, Feb. 26. Proposed legislation for engineers will be discussed.

Mr. Jas. McEvoy, who has been examining coal lands in British Columbia, has returned to Toronto.

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc,

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of $5 an acre for SUPERIOR METALS, and $3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec north of the height of land, where important mineralized beltsare known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE J. E. PERRAULT,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, $75,722,603; Lode Gold, $100,272,431 ; Silver, $50,432,304; Lead, $43,821,106; Copper, $153,680,965; Zinc, $16,818,487 ; Coal and Coke, $199,123,323; Building Stone, Brick, Cement, etc., $29,991,757; Miscellaneous Minerals, $786,918; making its mineral production to the end of 1919 show an

Aggregate Value of $670,649,894

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods : For all years to 1895, inclusive $94,547,241; for five years, 1896-1900, $57,605,967; for five years, 1901-1905, $96,509,968; for five years, 1906 1910, $125,534,474; for five years, 1911-1915, $142,072,603; for the year 1916, $42,290,462; for the year 1917, $37,010,392; for the year 1918, $41,782,474; for the year 1919, $33,296,313.

Production During last ten years, $322,829,310

Lode-mining has only been in progress for about twenty-five years, and not 20 per cent. of the Province has been even prospected ; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

EDITORIAL

A Historical Meeting

Comment on the successful character of the annual meetings of the Institute in recent years has been so regularly required that similar remarks upon the most recent function at Montreal may savor of triteness, but there was a distinction about this gathering that was new, reflecting important happenings of the previous twelve months that have made mining history, and have marked new heights of progress from which clearer vision of our national future has been attained.

The historical nature of the meeting became evident, as the members successively heard that the preceding year had seen the highest mineral production value and the largest coal output in Canada's history; the largest numerical membership and revenue in the Institute's records; had witnessed the discovery of petroleum in the Far North, and the most intensive prospecting and accretion of new geological facts that any year has ever had in Canada; has demonstrated the notable value and undoubted permanence of gold occurrence in Northern Ontario, a wonderful enlargement of asbestos markets and some very cheering developments in regard to the zinc deposits of Gaspesia, and certain significant developments in Northern Manitoba and Alberta that were prominently brought out at the Winnipeg meeting, not neglecting to mention the rejuvenescence of mining in the Yukon that seems likely to follow the silver discoveries at Keno Hill in the Mayo District.

Concerning all these things the members received firsthand and advance information, and the ancient and honorable tradition of the Canadian Geological Survey in regard to the Annual Meeting of the Institute was loyally maintained and greatly strengthened.

Although death has thinned its ranks, there was a pleasing attendance of the Old Guard, and the discussions revealed that while able to command the latest information on mining matters, the Institute possesses members able to cite the struggles of the past, and to clarify present day problems by the wisdom that only experience can furnish.

The guests from sister societies, both in the United States and at home, were men of eminence, whose presence honoured the Institute, while their contributions to the discussions and social gatherings were cordial and in every way helpful.

The level of the topical discussions was up to the best traditions of the Institute, and it is doubtful whether at any time the members were privileged to hear a more authoritative consensus than the all too brief discussion upon the possibilities of the enlargement of the use of Canadian iron-ores and beneficiation processes. Operators, executives, research workers, pioneer iron ore miners and inventors gave their quota to the elucidation of an admittedly difficult problem, and those in Canada best qualified to express an opinion were joined by speakers of acknowledged eminence from the United States.

The meeting showed a disposition to look Canada's material supply problems in the face, as evidenced by the discussions on "blue sky laws", coal interchange and iron ore supply; and, if it should be suggested that no definite or satisfactory solution of the problems discussed was forthcoming it may be further remarked that no such result is to be expected overnight.

The retiring President and the newly elected President, the one in his valedictory and the other in his inaugural address, expressed a belief that the function of the Institute in regard to the general public was to educate and inform the public mind regarding our mineral problems, hoping thereby to ensure that future governments, which will be, as past governments have been, merely the reflex of public opinion, may adopt that understanding and fostering attitude towards the mineral industry which can only proceed from enlightened and sympathetic public opinion. Frank and sincere debating of our national problems serves no further purpose than to assure that correct [illegible] point among the Institute's own membership which is a result of analysis through discussion [illegible] gained. No difficulties are removed by avoidance. They must be faced and overcome, and the memories of the most recent gathering of the Institute [illegible] the primrose paths of optimism and must [illegible] space the narrow ways of the Hill Difficulty [illegible] at any rate that desire to be saved [illegible]

lieve the theologians, is a fundamentally necessary attitude.

It is not to be inferred from this Lenten attitude of the members that the Institute has suddenly adopted a self-castigating or ascetical policy, or that its feasts have become Barmecidian. In this respect the natural force of goodfellowship has suffered no abatement, and remains uniquely refulgent in that bright galaxy of sister societies which was toasted at the Annual Dinner.

MINERAL STATISTICS.

An objection which was not brought out in the discussion at Montreal relating to the transfer of the statistical work of the Department of Mines at Ottawa to the Dominion Statistics Bureau, is that the Order-in-Council by which this change is authorised over-rides the Act of Parliament by which the Department of Mines was created, and its duties specified, in 1907. Reference to this journal, in the issue of 16th April last, will possibly refresh the memory of our readers as to the original motive which impelled the Government — acting upon the advice of the Canadian Mining Institute — to create the Department of Mines. The question of mineral statistics was always prominently before the mining profession, and reference to the issue named will further disclose that as far back as 1886 the memorial presented to the Government pressing for a "Bureau of Mining and Mineralogy" confined itself entirely to the question of the desirability of compiling and disseminating accurate and accessible statistics regarding the mining industry.

Again in 1900, the memorial of the Canadian Mining Institute contained this reference to statistics, to wit:

"Statistical work is rendered necessary by the dif-
" ferent ways and units employed at present by the
" different provinces of the Dominion, and by the fact
" that existing statistics from any department of the
" Government are not inclusive of all the information
" that is available on any one material or subject."

The Act constituting the Mines Branch said; so far as statistics are in question, — "The functions of the Mines Branch shall be (a) to collect and publish full statistics of the mineral production and of the mining and metallurgical industries of Canada, and such data regarding the economic minerals of Canada as relate to the process and activities connected with their utilization, and to collect and preserve all available records of mines and mining works in Canada."

A little consideration of this carefully-worded clause, and of the wording of the Institute's memorial in 1900, and to go further back, of the wording of the memorial of 1886; will disclose a lucid and coherent idea running all the way through, and closely adhered to, which we believe to be as follows. That for the proper understanding and utilisation of our mineral resources statistics are essential, but they are not an end in themselves, being merely auxiliary to the administrative work of the Mines Branch in the same way that costs-sheets and other statistical information is required by the industrial manager and executive. It is furthermore all along recognised that — as in the parallel case of the industrial administrator — the form of the statistics and their nature must conform to the requirements and be suited to the needs of the administrative branch. To quote what is probably an extreme analogy, but not we believe an irrelevant one, it would be just as proper for the Dominion Statistics Bureau to take over the statistical work of the Auditor-General as to take over that of the Dominion Mines Branch.

In face of the specific wording of the Mines Branch Act, and of the equally definite request of the mining and metallurgical industries, which has not varied in thirty-five years, the suspension of this Act of Parliament by an Order-in-Council, without any consultation with the representatives of the industry, amounts to a flouting of the industry, probably not in the least intentional, but arising, as do so many other anomalies, from a plain inability to get the miners' viewpoint.

If there is any one thing that the Mines Branch has done well — superlatively well in fact — it is the collection and arrangement of mineral statistics, and we deny the possibility of dissent from this statement.

Furthermore, if the Mines Branch is to continue to perform its functions, it must continue to compile statistics for its own use, or how otherwise can it "collect and preserve all available records of mines and mining works in Canada"? This will necessarily mean that two departments of the Government at Ottawa will be engaged in the same occupation, and it is quite possible, indeed probable, that the two sets of figures will not jibe because they will be conceived from differing angles of view.

We believe the change contemplated is in every way inadvisable and unfortunate, and that if it is persisted in, it will only be temporarily, because the fundamental principle involved will in time be made quite clear, and that part of the administrative duties of the Mines Branch included under the rather misleading general term of "statistics" will be returned to it, as will other phases of departmental administration which in recent years have been divorced from their proper setting.

Apart from these considerations, however, we consider the chief objection to the change proposed is the arbitrary over-riding of a statute by an Order-in-Council, where the benefits supposed to be derived from the change are after all only a matter of personal opinion, and are not admitted by the industry chiefly concerned.

PERSONAL

Mr. W. A. Carlyle, Managing Director of the British American Nickel Corporation, is leaving for England during the week ending the 12th March, where, after taking a holiday on the Continent, he will resume consulting practice in London. Mr. Carlyle's departure from Canada will be very generally regretted.

Twenty-Third Annual General Meeting of the Canadian Institute of Mining and Metallurgy

Montreal, March 2nd to 4th 1921

(Reported by the Editor)

A Historical Meeting.

The 1921 Annual Meeting of the Institute was planned under difficulties because of the necessity at quick notice to abandon the plans for the Ottawa gathering that had been so nearly completed by the members of the Ottawa Branch.

There was general regret at the disappointment of the Ottawa Branch, who loyally and numerously attended the Montreal Meeting, accompanied by a looking forward to next year's gathering.

The Montreal Meeting was not marked by that recognition from the Corporation of the City or the Provincial Government that was a feature of the three most recent gatherings of the Institute; and, for some occult reason, the national status of the Institute is not so fully accorded to its gatherings in Montreal as is the case in other metropolitan cities in Canada. The absence of any important mining industry in the close vicinity of Montreal, and less obvious dependence upon the disbursal of wealth won from the mines, may account for the small bulk that the industry presents on the financial horizon of Montreal and the scant space that is devoted to it in the annual reviews of the large financial institutions of this great manufacturing centre. These observations do not, however, apply to the metallurgical industries, of which Montreal is now the most important centre in Canada, as the members were in part able to observe.

The new Secretary, Mr. G. C. MacKenzie, had an unusually hard task because of his recent induction to office and the change in plans; but, ably assisted by Mr. R. R. Rose, he is able to look back with much satisfaction upon a meeting that can properly be termed historical, for reasons that are elsewhere in this issue set forth.

Mr. C. V. Corless, President, 1921-1922.

Mr. G. C. Mackenzie, Sec.-Treasurer.

OPENING SESSION, WEDNESDAY, MARCH 2nd.

Presidential Address.

Mr. O. E. S. Whiteside, the Retiring President, read the address, which is printed on page 194.

Mineral Statistics.

Mr. John McLeish, Chief of the Division of Mineral Resources, Ottawa, read, according to time-honored precedent, the salient features of the Preliminary Report of Mineral Production for 1920.

Some new records were established, among them that of the highest total value of mineral production ever attained in any year in Canada. See the following tabular comparisons:—

	Value of Annual Mineral Production
1920	$217,775,080
1919	176,686,390
1918	211,301,897
1913	145,634,812

Mr. McLeish pointed out that selling prices had increased so greatly that values were not a safe guide to actual increase of production, but nevertheless there were a number of important increases in tonnage production during 1920, including the items of coal, copper, gold, nickel, zinc, asbestos, magnesite, mica, quartz, salt, cement and all structural materials. Particular attention was directed to increase of non-metallic minerals in Canada during 1920, which Mr. McLeish said gave evidence of "remarkable growth and development."

Mr. R. R. Rose, Assistant-Secretary.

The coal output, which represents 35½ per cent of the mineral output value of 1920, bulks very largely—partly because of the increased selling price of coal—but also because of an actual increase of 21½ per cent in production over 1919. Coal production in 1920 exceeded that of any previous year.

Mr. McLeish's Valedictory.

There was evidence of widespread regret, and dissent from the necessity or wisdom of such a course, when Mr. McLeish announced that this was the last occasion on which he expected to read the Preliminary Report. Owing its origin to the influence of the Institute, the Department of Mines had for 35 years — since 1886 — been in charge of the collection and arrangement of mineral statistics, and the members of the Institute had been uninterruptedly privileged to hear the annual statistics for Canada at the annual meetings in advance of general publication. The work had now been transferred to the Dominion Bureau of Statistics, in furtherance of the idea of centralization of statistics. Mr. McLeish expressed on behalf of the Department of Mines appreciation of the loyal manner in which—without legal compulsion—the mining industry had furnished the statistics of production and use that were necessary to his work of compilation, and asked that equally full support should be given to the new administration.

Dr W. G. Miller said the Department of Mines had collected and published mineral statistics so intelligently and accurately that he though it should be allowed to continue the work. The collection of mineral statistics in the greatest mining country in the world was delegated to the United States Geological Survey, and he considered that mineral statistics should be handled by mining men.

F. W. Gray emphasisied the need for continuity in arrangement of statistics, as in this, so far as comparison is concerned, their whole value consists. Mr. McLeish's tabulations had been used by the mining industry for years, and any alteration of their methodical arrangement would remove a landmark and destroy their usefulness to the profession.

T. C. Denis said it was desirable that the mineral statistics of the Dominion and the provinces should as far as possible be reduced to a common denominator, and in the past the provincial mine bureaus had worked in co-operation with the Department of Mines. The same co-operation might not prove possible under new administration.

Mr. T. W. Gibson took the opportunity to express his personal regret that Mr. McLeish's remarks were in the nature of a valedictory. Year by year it had been his pleasure and that of the members to listen to the Mr. McLeish's intelligent and lucid handling of the annual statistics. He knew that the new Statistician was endeavoring to set up a system of co-operation with the provinces, and so far as Ontario was concerned his efforts would receive sympathetic attention. Mr. Gibson said he had been in communication with Mr. Coats and his assistants for some time, but was not very hopeful that a practical system of co-operation could be worked out because of a viewpoint that differed greatly from that of the provincial bureaus. The amount of detail required by the Dominion Bureau was quite beyond what he regarded as the useful function of a provincial department of mines. For his part he desired to reduce the number of returns from mining companies to a minimum. If one set of returns would have answered all requirements Mr. Gibson said he would have been heartily in favour of adopting the forms, but he regretted to say that, so far, progress had not been marked, and he was a little doubtful of the outcome.

Mr. McLeish said the change had resulted from a desire for centralization, but he denied the merit of intensive centralization of statistics. He believed it was the intention to employ technical men, but he suggested that statistics were compiled for a purpose, and all phases of mineral resources should be gathered together. The idea of the government seemed rather to be that of getting away from the subject and devoting attention to a phase. At the time the Commission of Conservation was formed it was regarded by some as an error of judgment, for this reason; and, apparently, judging from the recent Speech from the Throne, there was an intention to return the work of the Commission to the several departments from which it had been gathered. Similar comment was

possible in regard to the Research Council. Research is not something that should be set aside. It is a part and parcel of administrative work. The idea of specializing on phases of departmental administration might lead to some palpably absurd arrangements.

Elaborating a former motion moved by Dr. W. G. Miller and seconded by Mr. J. W. Evans, a resolution was unanimously passed, moved by Mr. James McEvoy and seconded by Mr. C. V. Corless, asking that the contemplated Bureau of Statistics "shall not only supply the mineral industry with statistical reports as complete as supplied by the Department of Mines, but should also co-operate with the Provincial Bureaus to the fullest extent, and with the same sympathetic attention that has characterised the Department of Mines."

Mineral Production in Ontario.

Mr. T. W. Gibson, the Deputy Minister of Mines of Ontario, presented the figures of mineral production in that province for 1920, for compilation of which he stated that Mr. W. R. Rogers, the Statistician of the Bureau, was chiefly responsible.

The course of the mineral industry for the past decade has been as follows:

Value of Mineral Production—Ontario.

Year	Metallic	Non-Metallic	Total
1911	$29,102,867	$12,873,930	$41,976,797
1912	34,799,743	13,541,869	48,341,612
1913	37,507,935	15,724,376	53,232,311
1914	33,345,291	12,950,668	46,295,959
1915	44,109,679	10,136,000	54,245,679
1916	55,002,918	10,300,904	65,303,822
1917	56,831,857	15,261,975	72,093,832
1918	66,178,059	14,130,913	80,308,972
1919	41,590,759	17,293,157	58,883,916
1920	46,228,827	22,227,954	68,456,781

In regard to nickel, Mr. Gibson said that while the production might possibly never again in our time revert to the extraordinary output of war days, the pre-war production should be again reached and perhaps exceeded.

The output of silver continued to decline, but high prices had kept up the value. Silver would be mined for many years to come at Cobalt, but if the cost of production exceeded the market price, production would necessarily suffer. Mr. Gibson referred to the unpredictable character of the future of the silver market, reflecting as it did the mentality of the Orient, where centuries of oppression had made people desire to possess their wealth in portable form.

As to gold, this was the bright spot in the mineral industry of Ontario. The production had gone up, and although gold had a fixed price, he thought the extra remittances which came to Canadian producers through the premium of United States funds should properly be included in the table of values. The Porcupine Camp was a firmly established one, and Kirkland Lake was rapidly coming into prominence. One mine in this district had been recovering $25 ore for years. There was not part of the North American continent where gold mining had a brighter outlook than in Northern Ontario, and he did not think the industry was more than at the beginning of its importance.

Mr. Gibson referred to the failing supply of natural gas in Ontario, and the financial disabilities this had put upon the gas companies who were in many instances tied by rigid municipal contracts that imposed impossible financial burdens. He suggested that legislative relief from this difficult condition would be found necessary.

Mineral Production of Quebec.

Mr. T. C. Denis, Superintendent of Mines for Quebec, prefaced his remarks by regret that the Dominion Department of Mines was being relieved of its duties of collecting the statistics of the industry to whose interests it was devoted. The collection of mineral statistics had as its object not the mere compilation of figures, but was designed to feel the pulse of the industry.

Mr. Denis once again had the pleasure of announcing Quebec's uninterrupted upward climb as a min-

Mr. Geo. D. Macdougall, Vice-President, Mining Society of Nova Scotia.

eral producing province. The figures of mineral value following are self-explanatory:

	Value of Quebec Mineral Production $
1915	11,165,873
1916	13,287,021
1917	16,189,179
1918	18,572,595
1919	20,813,670
1920	28,223,141

Asbestos production reached 177,605 tons, valued at $14,674,572, the highest figures ever recorded, both as they relate to quantity and value, being an increase of thirty per cent in tonnage and thirty four per cent in value.

Mr. Denis pointed out that Quebec's mineral output being so largely non-metallic, had not suffered from the general collapse of the metal markets, and was benefitting from the return to peace time demand for

the structural materials which Quebec so largely provides. Further reference to the detailed figures will be made in later issues of the "Journal".

Prof. Dresser asked Mr. Denis if he had any official knowledge of the recent newspaper reports that the Province of Quebec contemplated placing restrictions on asbestos exports and mining leases intended to stimulate the fabrication of finished asbestos products in the Province.

Mr. Denis said he had not, but believed the newspapers in question were indication of a continuation of a campaign begun some years ago by the Eastern Townships Associated Boards of Trade. Ninety per cent of the asbestos mined in the Province was exported in the raw state, and processes of manufacture raised the value of the exported asbestos from $14,000,000 to possibly $100,000,000.

Alberta Coal Production.

In the absence of any official representative of the Alberta Department of Mines, the President stated that 1920 coal production had almost reached seven million short tons. The increase in the production, and the local absorption of domestic coal, were the striking features of the year.

From information received from Mr. Jas. A. Richards, the Inspector of Mines, it is possible to state that 1920 Alberta coal production totalled 6,908,507 tons, made up of 3,358,992 tons of domestic coal, 3,418,921 tons of bituminous coal and 130,594 tons of anthracitic coal. Comparison with previous year is as follows:

	Alberta Coal Production (short tons)
1918	6,148,620
1919	5,022,412
1920	6,908,507

Afternoon Session, March 2nd.

With Dr. F. D. Adams in the Chair, the afternoon was devoted to general business. This included a discussion of the proposed amendments to the By-Laws to provide for the appointment of an Executive Committee, a matter that will be later referred to the members to be dealt with by letter ballot. The necessity for a readily available Executive Committee, comparable to the usual provision in incorporated companies, was generally admitted. Two of the members were appointed to assess the opinion of the meeting for presentation to the members by the letter-ballot process referred to.

The Report of the Publication Committee was presented, and referred back to the Committee with authority to act.

On the matter of Engineering Legislation there was nothing said.

A request from Dr. R. C. Wallace asking for a motion defining the statutory business of the Annual Western Meeting, and referring to time and place of meeting, was referred to the Council.

The Secretary's Report.

The Secretary introduced a new feature by showing a series of graphic charts illustrating the attendance of Council Members at Council Meetings, a comparison of the growth of the Institute with that of the American Institute of Mining Engineers, the Institue's budget, and a curve showing how the members paid their dues, and how some did not.

Standardization of Breathing Apparatus.

F. W. Gray reported for a Committee which was appointed at the Winnipeg Meeting to make a recommendation for standardization of oxygen breathing apparatus, made by the Minister of Mines for British Columbia. The Committee, which was composed of Robert Strachan, Senior Inspector of Mines for British Columbia, Duncan MacDonald, Superintendent of the Mine Rescue Stations of the Alberta Government, and F. W. Gray, strongly recommended standardization both of apparatus and of training, and suggested that the Institute should request the Dominion Government to actively co-operate with the provincial governments in coal mining provinces to this end. No discussion took place, and no action was taken by the meeting, so presumably the recommendation will be dealt with by Council.

Evening Session, March 2nd.

The evening meeting was very well attended, with Mr. Balmer Neilly in the Chair.

Mr. F. E. Lathe (of the British American Nickel Corporation) read a comprehensive paper on "Principles of Copper Leaching and Precipitation". The paper covered methods of grinding and roasting, comparisons of solvents in present use, principles of solutions circulation, and the choice of anodes. Fused magnetite and ferro-silicon anodes have been found suitable for some South American plants. Mr. Lathe referred particularly to the difficulties arising from ferric iron, and with the current densities in the electrolytic deposition stage.

Mr. E. P. Mathewson said that current densities should be increased, and ferric salts should not be allowed to accumulate to the detriment of electrolytic deposition. Greenawalt's experiments indicated that he was on the right track, and promised a much wider application of leaching processes.

Mr. Carlyle referred to experiences at a leaching plant in Russia, where scrap iron was scarce. Granulated pig-iron from a pig-iron furnace was used, and was an ideal thing to handle.

Dr. Stanfield referred to the process of reduction of iron ores by gases, resulting in the formation of a fine metallic powder, which was a particularly suitable medium for copper precipitation from solutions. Mr. Lathe said sponge-iron had been used at Anaconda by Mr. Mathewson, who explained that while it formed an ideal precipitant, it cost too much to produce and scrap-iron had been reverted to.

Mr. P. E. Hopkins had been listed to read a paper on "Characteristics of Ontario Gold Deposits", but owing to ill-health was unable to be present, to the very general regret of the gathering, which would have welcomed the latest information on a goldfield that is daily assuming greater economic importance.

Public Treatment Mills.

Mr. W. E. Simpson, of the Miller-Independence Mine, read a lively paper on "Suggestions for the Better Development of the Mineral Resources of Northern Ontario". The necessity to return to a gold standard, said Mr. Simpson, was admitted, and Northern Ontario was the one place where increased gold production was quickly possible. He referred to the large extent of reputedly valuable gold areas where no work was being done, to other areas where one lone producer was operating, and to the fact that gold was being produced in quantity in two townships only. The evolution of most goldfields had seen leasehold titles,

that enforced operation, substituted for freehold titles. In Western Australia a title was forfeitable if three days suspension of operations took place, with a natural consequence that capital had been discouraged in that field. In Northern Ontario production could stand acceleration, and the extent of land being withheld from production is gradually increasing. The five cent acreage tax was more of an irritant than a source of revenue to the State.

Mr. Simpson advocated as a partial remedy the provision of public treatment-plants, or government-owned custom-mills.

Transportation played such an important part in Northern Ontario mining that Mr. Simpson estimated ten per cent must be added to mining costs for every mile that a mine was distant from a railway. He advocated the use of horse-tramways, built from local timber, and showed photographs of a rough-and-ready, but eminently practicable tramway of this nature that he had constructed. It was locally designated the "Muskeg Express".

Mr. T. W. Gibson defended the freehold system of tenure. Capital did not ask for anything so insistently as it did for secure tenure, and he instanced the United States as a great mining country where freehold tenure had been the uninterrupted custom. The five-cent acreage tax had resulted in returning to the Province hundreds of thousands of acres. No state could insist on every piece of land being developed. Passing a law requiring every man to develop his property would not improve matters.

Where there was ore present in sufficient quantity Mr. Gibson thought the idea of small stamp-mills was not a bad one. As to transportation, Northern Ontario was unusually well supplied with railways, and the influence of railways upon the opening-up of Northern Ontario mining districts was well known. There were districts now making valid claims for railways, and these claims would no doubt be attended to in due course.

Prof. Dresser said one difficulty in providing state-owned small stamp-mills would be to decide where they should go and how long they should remain. Where desultory prospecting had not proved successful, and reports of a glowing character come from a district, not better, but further away, the first prospected district is abandoned. A mill might strengthen the confidence of the prospector and lead to more intensive prospecting of the first-named district.

Mr. A. A. Cole said that from his experience with a small sampling plant he would judge there was need for just such mills as mentioned by Mr. Simpson. The Cobalt plant had received calls from as far as Port Arthur.

The question of power was an important one. The wood on a forty acre claim is not sufficient to bring that claim to a developed stage if used as fuel. The availability of electric power was of immense advantage. In the district north of Cobalt ten years ago there were two school teachers. Now there are ninety five, and fourteen new schools have been built in that district. These figures show that the country is growing.

Mr. C. V. Corless said he thought the Government would not be misled if it took Mr. Cole's advice as to locations where small stamp-mills could be usefully installed.

The evening closed with moving pictures of the operations of the Mond Nickel Company.

Thursday Morning's Session.

Under the Chairmanship of Capt. J. G. Ross, the meeting heard Mr. G. C. Mackenzie's paper on "Institute Service—Some Suggestions" the text of which appeared in the February Bulletin.

A good discussion followed Mr. Mackenzie's paper, which the President suggested could be profitably continued by letters to the Bulletin.

The question of membership by mining companies was debated, and there seemed to be a general disposition to deprecate financial contributions from companies to the extent that would restrict the independence of the Institute as the representative voice of the industry.

Remarks by the President of the A. I. M. & M. E.

Mr. Edwin Ludlow, President of the American Institute of Mining and Metallurgical Engineers, said that body was solely a technical society, but the Mining Congress was quite otherwise, being supported by the mining companies on a tonnage basis of financial assessment. The Mining Congress was primarily a political body intended to influence legislation. The A. I. M. & M. E. was trying to decentralize its branch activities, and the branches were helped by the local mining companies. Mr. Ludlow also referred to the Federated Council of Engineers, which has a membership of one hundred thousand. Mr. Ludlow did not know whether a Mining Congress upon the lines of the United States body would be found useful in Canada, but it had been distinctly useful on the other side. Its success was due largely to the personal ability of the Secretary, Mr. Galbraith, whose services were now regularly used for consultation by legislators where his special knowledge indicated the desirability. The Mining Congress was doing work that the mining engineers felt was entirely out of their line, and which they did not feel was part of the functions of a technical society.

"Blue-Sky" Legislation.

Mr. J. P. MacGregor, of Toronto, read a paper on "Blue-Sky Laws as they Affect the Mining Industry," and displayed before the meeting a typical promotion advertisement that had appeared in a Toronto newspaper.

Mr. MacGregor's address was an analytical treat, abounding in arresting epigrams, but based on very sound fundamentals. He said that all professional work sooner or later developed into executive tasks, and this principle was not confined to any branch of human endeavour but was common to all. He referred to the conditions of India and China previously mentioned by Mr. Gibson when speaking of the silver market—as arising from a lack of confidence in the government, originating from centuries of oppression and rapine, and constituting a society marked by the absence of capital, as we know it. Capital, in its essence, submitted the speaker, was confidence, and it was the Institute's duty to protect this confidence. The intent of the legislation proposed was not to deter men from taking a chance, but to see that the dice were not loaded. Prevention of the opportunity for offence was desired. Fraud, he admitted, was not definable by statute, but it was submitted that intelligence could detect fraud. The power that grants a charter of incorporation should continue its powers to prevent that charter being used as a means to fraud. The State should surely control its creature. The legislation proposed that no corporation should issue stock without disclosure of the relevant facts. Such legislation should pay its own way, in support of which Mr. McGregor

adduced interesting figures regarding similar legislation in Minnesota, where the preliminary test had in one year eliminated applicants for incorporation proposing to issue $150,000,000 worth of palpably fraudulent issues, or one-half of the total stock issues applied for in that year.

Mr. MacGregor believed that if the fundamental principles were held in mind a law of the simplest draftmanship would achieve the desired end.

Mr. MacGregor pleaded for a revision of popular opinion regarding law and lawyers. He said that we had so long been accustomed to righteous laws and equity in our courts that it had been assumed we were entitled to such equity, as much as a man is entitled to fresh air, but recent world events had shown that such was not the case. Law advanced as did the other arts of progress, and he instanced that the old law of partnership had been superseded by company law because its procedure was defined.

Mr. MacGregor said he was so convinced that the legislation proposed in Ontario was so clearly in the interest of the Institute, and so definitely within the scope of its duties that he moved the following Resolution:—

"That this meeting of the Institue do approve of the "principles of legislation commonly known as 'Blue "Sky Law' as being of help to the conservation of "Capital and for the prevention of fraud, imposition "and unfairness in the sale of securities and that it is "in the best interest of the mining and metallurgical "industries of Canada that legislation of this character "should be enacted in all provinces of Canada, where "such securities are offered for sale."

An animated discussion followed Mr. MacGregor's paper, which space will not permit of quoting verbatim.

Messrs. Gibson, McEvoy, Hore, Dr. C. K. Lane, Cohen, Godson, Schorman and Dowling took part. The application of the old proverb of *caveat emptor*, and the impossibility of parting a fool from his folly were spoken of. The consensus appeared to be that the legislation was more to be desired for the protection of the industry from imputations against its repute than for the protection of the "sucker," and after adding the words, "as outlined in the paper presented" (on the suggestion of Mr. Gibson) the resolution was passed without dissent.

Dr. C. K. Lane mentioned that some "wild-cat" work had incidentally benefitted the general fund of geological and other knowledge.

The paper on the Silver-Lead Deposits of the Mayo District, Yukon, by Dr. W. E. Coekfield, was read by title.

The meeting adjourned for a social luncheon, at which no speeches were made.

Thursday Afternoon's Session.

Mr. F. W. Gray synopsised a paper on "Canada's Coal Problem" which appeared in the February Bulletin, and was a continuation of the paper on the same subject read at Toronto last March, and of a paper dealing with the importance of the Western Coalfields read at Winnipeg in October.

The Radius of Transportation of Western Coals.

Mr. James McEvoy made a notable contribution to the elucidation of this problem by dealing with the radius of transportation of western coals as dictated by their economic worth at the point of destination. The problem of the use of western coal being so largely one of transportation costs, Mr. McEvoy, analysed the ability of the several grades to stand these costs applied upon their pitmouth costs.

He divided the western coals into the following divisions, and gave a figure representative of their relative heating value:—

	Figure Representing the Relative Heating Value
a. High-grade bituminous from Kootenay..	9
b. Sub-bituminous from Belly River	6
c. Lower-grade bituminous from Edmonton..	4½

The difference in heating value did not correspond exactly with the b.t.u's.

By means of charts Mr. McEvoy showed the economically transportable distance of the three grades of coal, and arrived at some illuminating conclusions, showing, for example that a purchaser could afford to buy "A" grade and pay freight for a thousand miles, and still have the same value as if he bought "C" grade and received it at the same point free of freight charges. Put in another way, if "C" coal is hauled a thousand miles with profit, it should be possible to haul "B" coal 1,666 miles and "A" 3,000 miles.

Regarding the possibility of supplying Ontario with the higher grade coals—which are situated at the greatest distance from Ontario—Mr. McEvoy said it resolved itself into a question of freight rates, which are supposed to be based on cost. He thought it was not too much to hope that train operating costs could be reduced by one-half for this class of traffic if the following conditions were fulfilled: (a) Powerful locomotives; (b) Maximum trainloads; (c) Through trains. The consumer would have to do his part by ordering his coal at those seasons in which the railways could handle it.

Mr. W. E. Simpson asked why the paper had ignored the question of oil and oil-shales, but it was explained these matters had been dealt with in previous papers, and were not properly included in a discussion of the coal-supply problem.

The President mentioned the recent widening of the distribution radius of western coal and commended the co-operative attitude of the people of Winnipeg who he said were more active in the campaign to use domestic-mined coal than even the coal operators themselves.

Mr. D. B. Dowling mentioned that the pressure for a deep waterway from the Atlantic to the Great Lakes had originated from the wheat growers of the West, and that the question was now before the International Waterways Commission. If the channel is enlarged not only will the western wheat come down to the sea by water, but the return cargoes could be coal from Nova Scotia.

Mr. Walter Herd, Mining Engineer of the Dominion Steel Corporation, by letter, confirmed Mr. McEvoy's point about the transportation of western coals, and stated that lignites and sub-bituminous coals could not compete economically with good bituminous coal, even if this had to be transported many hundred miles further.

The production of Nova Scotian coal might be increased to ten million tons annually as suggested by Mr. Gray, but it is questionable if it is desirable. Nova Scotia coal deposits are limited insofar as cheap production of the better quality coals is concerned, and an annual increase to the figure named would deplete the resources to such an extent that cost of production would materially increase in the not distant future. It would also deplete the metallurgical coal resources to an unjustifiable extent, and by the more intensive simultaneous working of superimposed seams, result in

considerable loss of coal in mining. Mr. Herd's remarks will appear in full in the Bulletin.

Dr. Lane emphasised the advantages that proceeded from seasonal freight-rates for coal designed to encourage transportation of coal in the seasons when it can be most economically handled. He considered interchange of coal products to be desirable, and spoke of the possibilities of Nova Scotia coal being sold in Boston.

The Search for Oil in the West.

Mr. J. Ness, of the Geological Department of the Imperial Oil Company, read a paper illustrated by lantern slides, on the "Search for Oil in the West," which, with Mr. Kindle's paper on the "Salient Features of the Geography and Geology of the Mackenzie River Oil Basin—also illustrated by slides—afforded the members an afternoon of rare enjoyment and profit.

The "Journal" hopes, by permission of the Institute, to reproduce Mr. Ness's paper with the photographs in full in a later issue. It was a moving tale of modern prospecting, of adventures by flood and stream, a real romance of applied science, and the applause which greeted the appearance on the screen of the oil, spraying upwards over the derrick, at the Fort Norman Well, indicated the appreciation of the gathering of the historical nature of this culmination of months of endeavour in a demonstration, ocular and incontrovertible, of the presence of petroleum in that far northern region.

Mr. Kindle's disclosure of the comparative mildness of the climate in the Mackenzie Basin, of the curving upwards of the isothermals and the timber line in this country, and the scenic landscapes he showed on the screen claimed the full attention of the audience. His pictures of the barren lands and the frontier of timber, and of native dwellings were equally enthralling.

Petroleum in the United States.

Following the two papers mentioned, Mr. W. A. P. Schorman, of the British-American Oil Company, showed a series of moving picture reels, prepared by the U. S. Bureau of Mines, showing the phases of the petroleum industry in the United States, from petroleum geology and search, to the great pipe-line systems of that country and the refining of petroleum into its products. As an example of the real educative value of the cinematograph, these pictures were revealing, as they enabled the mind to grasp the whole operations of the gigantic industry easily and without mental fatigue more completely than could have been achieved by much tiresome reading.

The Smoker.

With Col. J. J. Penhale presiding, the Smoker could not have been otherwise than a "howling" success, and it was.

The fun of the evening was a hilarious burlesque upon the granting of certificates to professional engineers on a fully agrarian basis. The osculatory benediction conferred by the Clerk of the Court upon Mr Denis was much admired, as was his graceful reception of this deserved favor. The orange-coloured transformation worn by the lady, toned exquisitely with the beard of the presiding officer. It was pretty good fooling, only it would be interesting to know if it was all fooling.

Friday Morning Session, March 4th.

In the absence of the author, Mr. A. W. MacDonald's paper on "Welfare Work" was read. This paper described the manner in which the related activities of the Dominion Steel Corporation's scattered collieries, iron-works, and ore and limestone mines, in so far as concerns all questions of employment, workmen's housing, and what is known as welfare work, had been placed under the general direction of a department of industrial relations.

Recreational facilities, employees' benefit societies, hospitals, children's playgrounds, sanitation, fire-prevention, first-aid work, housing, etc., were discussed in this paper. The object of the department is to reduce labour "turnover" to a minimum, to keep employees, once they are obtained, and to put them at the work they are most adapted for.

Mr. DeBlois of the Nichols Chemical Company emphasised the necessity to put a considerable portion of the responsibility for direction of such activities on the employees themselves, even to the extent of partial financial support, and the avoidance of any suspicion of paternalism.

Discussion on Increased Use of Canadian Iron Ores.

Mr. Cowie, of the Algoma Steel Corporation, opened the discussion by reading the brief presented by the Algoma Steel Corporation to the Tariff Committee of the Cabinet.

Since this statement has been presented, the Moose Mountain Iron Mine has closed down, and the Algoma Company would in all probability be compelled to close its ore mine. The situation was a most serious one. If we had in Canada, said Mr. Cowie, only one gold mine, one silver mine, one copper or one nickel mine producing, would we not all get together and try to keep them producing?

Mr. T. B. Caldwell — who received hearty applause upon rising — detailed his personal experience in the iron-ore mining industry in Canada. He had opened an iron mine at Wilbur, on the Kingston and Pembroke Ry. in 1880, and later had opened an iron deposit at Calabogie. Realizing that with the development of the great iron deposits of the Western States the Ontario deposits had become relatively small he had eventually become interested in the Temogami deposit, of the great value of which he was still convinced. He related the favorable opinion passed upon this deposit by the late Dr. Barlow and by Dr. Van Hise, the late O. LeRoy, and others.

There had been many discussions on bounties, but with such little result that he wished to suggest some other plan to interest the government. He suggested the Dominion Government should set aside a sum of money for the intensive testing and drilling of some promising iron-ore area. This he urged because he believed our iron ore resources were imperfectly known. Mr. Caldwell read a letter he proposed to address to the Government seeking an appropriation of $300,000 for studying the iron ore problem in Canada, and for drilling properties. He suggested that cost of drilling could be recouped from royalties imposed on iron ore shipped from the properties proved.

The Secretary said that for a long time he had earned his living by trying to make pig iron from Ontario iron ores, using magnetites from Calabogie and Central Ontario. Later on in Nova Scotia, he had used the local brown ore, and had attempted to use a highly siliceous magnetite of desperately poor quality in that Province.

As to bounties, he was absolutely sure the country

would never have been in a position to supply the iron and steel required for war purposes if it had not been for the initial assistance of the bounties. The system of bounties did most materially and efficaciously help our iron and steel industry. The matter had of course to be viewed from the national standpoint, but nevertheless he did not believe that at this time a request for a bounty would be favorably received. A deputation from British Columbia had visited the Government some years ago, but upon examination their representations were not found to be well founded, and it was no use making any proposition to the Government unless it was economically sound.

Most of our domestic ore supply is low-grade magnetite, high in sulphur, high in silica and sometimes high in phosphorous. It is not material favorably regarded by smeltermen. Beneficiation is therefore necessary. This means much planning and investigation, and much capital, and there must be a large tonnage of suitable ore in sight to justify this. Iron-ore deposits cannot be gauged as to quantity as one would gauge a silver or a gold occurrence. Beneficiated iron-ore provides a uniform and desirable product, but it is difficult to mix with other ores. Mixing is not attempted in the United States. An assured supply, sufficient to keep one or more furnaces working on beneficiated ore is necessary. The mistakes of the past should not be forgotten. An attempt has been made to beneficiate the Moose Mountain ore, but it had been an attempt to develop special machinery rather than a process. Other mines are closed down at present, including nickel and silver mines. The Government must be persuaded that the beneficiated ores would be used in Canada. They will not be interested in the export of beneficiated ores.

Mr. Caldwell's suggestion as to an appropriation is good.

Mr. B. Neilly said that the soundest opinion was that the iron and steel industry and national progress were directly related. There are Canadian ores that can be beneficiated, but not to meet American competition. How is the spread to be taken up? The discussion as to whether a bounty should be paid or whether an appropriation should be made he thought was immaterial, as it was the same thing. He mentioned that in the early history of the United States and of Britain also the importation or iron and steel goods had been prohibited in the interests of the home industry. He moved a resolution that:

> "Whereas the importance of the iron and steel industry is apparent, and only five percent of requirements is supplied from domestic iron ores, that this meeting go on record as advocating in principle the payment of a bounty on beneficiated iron-ores."

Mr. Goodwin said that so far we had attempted in Canada to smelt iron ores in furnaces of United States design, using United States practice, but our ores are dissimilar to those of the United States. Blast-furnace practice had been devised to suit local conditions in other countries. British furnaces are distinctive, and most radical departures from accepted practice have been carried out in Norway and Sweden. We should not assume that beneficiation is always necessary, but should suit our methods to our ores.

Electrical Smelting Progress.

Dr. Stansfield referred to his experiments in electrical smelting. There were two main difficulties in Canada, first, the supply of iron ore and secondly the supply of fuel. We had in Canada a considerable supply of electric power, and he had been experimenting for some years to devise a process to suit local conditions. It seemed now somewhat probable that the improvements which have been made in the reduction of iron-ore at temperatures lower than their melting point will bring the possibility of electric smelting into the region of practical operation. The process in general is to crush the ore, heating it, or mixing it with some form of carbon at temperatures about 800 degrees for hematite, or 900 degrees for magnetite, and making an iron sponge, which is the starting point for subsequent electrical furnace treatment. Dr. Stansfield said it seemed to him quite probable that before long

Mr. J. Stevenson Brown—One of the "Old Guard."

we should be able to reduce hematite ores so reasonably that their commercial utilisation will be possible. This would alter the complexion of the iron-ore situation in Canada, and the process might permit the utilization of low-grade fuels such as peat and wood.

Mr. Cowie said the increase in pig-iron production was a result of the bounties, and pointed out that the bounties paid by the Government during the bounty period was proved to have been returned by the increase in customs duties at the ports of Sydney, Sault Ste. Marie and Hamilton. Similar results might be expected to follow a bounty now.

Mr. Edwin Ludlow referred to a satisfactory grade of metallurgical coke which had been obtained from a mixture of the low-volatile coals from Jasper Park with the higher-volatile coal of Vancouver Island, at his suggestion. He mentioned that when looking over Vancouver he had noticed steel-ships building and was told the iron for their fabrication came all the way from Pittsburgh, which he hardly considered good business.

Colonel Dwight—whose connection with the Dwight-Lloyd process used at Babbit gave especial interest to his remarks—said that the problems confronting Canada in developing her natural resources were ones that appealed very strongly to confreres in the United States, as they were beginning to be troubled with similar problems.

Possibly all present were not aware that right alongside the development of iron ores in the Mesabi Range there had grown up a new enterprise for the beneficiation of taconite ores, which form an important part of the ore deposits of the Lake Region, and a problem that is now being attacked in a very serious way. Profiting by the experience in the low-grade porphry copper-ores, the Mesabi Company, financed by the well-known house of Hayden Stone & Co., who have had much experience and success, headed by Mr. Jackling, have undertaken to beneficiate these taconite deposits. They have gone at it intensively, have studied

Mr. H. Foster Bain, Director, U. S. Bureau of Mines.

the problem for several years and have tried many thousands of tests. After passing through all the different stages found to be necessary they are now proceeding with the construction of their first unit which will demonstrate on a fully-working scale the practical success of the enterprise.

Col Dwight gave a brief description of the process of beneficiation. Commencing with a crude agate ore containing 30 to 35 percent of iron, this is blasted out and gathered by steam shovels, crushed to a fine powder, concentrated in log-washers — modified by some electrical device that has been worked out, — de-watered, and passed over Oliver filters, after going through a Dorr classifier; is then mixed with the necessary amount of carbon and passed along to the sintering furnaces. The reaction was interestingly described by Colonel Dwight, who likened the process of the sintering to the burning of a cigar, the combustion proceeding from the top downwards and developing a temperature of from 1,000 to 1,200 degrees C., inducing a condition of semi-fluid mobility. The resulting sinter is not unlike coke, and in the case of magnetite is a material that responds very readily to the reducing action of the blast furnace.

In concluding, Colonel Dwight said that the application of this Mesabi development to Canad was *that if the other economic problems connected with the similar ores in Canada could be worked out, the beneficiation problem had already been solved.* He wished the Institute and the industry in Canada success in its endeavours.

Friday Afternoon.

In the concluding afternoon of the meeting, papers were read by R. L. Lindstrom on "Steel Castings for Mining Purposes" illustrated by lantern slides showing microphotographs bearing on the methods used to ensure sound castings for mining purposes and on annealing and heat-treating. Messrs. W. S. McKee and J. H. Blake presented a paper on "Manganese Steel Castings in the Mining Industry".

Excursions were made to the Davidson Steel Foundries at Turcot and to the works of the Dominion Engineering Works at Lachine. About 35 members accompanied these excursions.

At the Davidson works, the party was shown round by Mr. T. R. Davidson, General Manager, seeing the Snyder electric furnaces, the transformer-room, and the casting processes.

At Rockville, the newly equipped works of the Dominion engineering Works were seen, the party being shown through by the President, Mr. G. H. Duggan and his assistants. The Foundry and the Main Shop are not excelled in Canada. Castings of unusual size and fineness can be made, and the machine tools are of the largest dimensions. The manufacture of paper making machinery, and water-wheels, are this Company's especial work. Two water-wheel units, which were seen under construction in the shop, for the Cedar Rapids and Shawinigan Companies, are the largest of their kind yet constructed.

Non-Metallic Papers.

Papers were read during the afternoon with Mr. Denis in the Chair, on the asbestos industry by Capt. J. G. Ross, on Super Cements by G. M. Thomson, on Graphite, by V. L. Eardley Wilmot, Fluorspar by M. E. Wilson, and Mica by H. L. Forbes. Mr. J. Keele's paper on Brick and Clay was not read owing to his absence. Owing to the Editor accompanying the excursions a more detailed report cannot be given. Capt. Ross advocated an operators' organization to collate geological information, conduct an experimental mill, do research work in the interests of improvement in fibre recovery, and also give out some much needed information to the public of the progress of the industry. It may be noted here, in confirmation of Capt. Ross's views, that the asbestos industry is particularly suffering from the lack of general knowledge on the part of the public regarding the problems of the industry — much as the nickel industry suffered before operators took a thought and mended their public attitude — and much the same campaign seems likely to be waged against the asbestos producers, unless they enlighten the public as to the problems they face, as was waged against the nickel producers in Ontario.

The Annual Dinner.

This was held in the Montreal Club, a place that had pleasant memories to the Institute and has gathered some more. The President-Elect, Mr. C. V. Corless, was in the Chair, and at his table were seated Sir Arthur Currie; the President of the Engineering Institute of Canada, Mr. J. M. R. Fairbairn; Col. A. S. Dwight, President of the Federated Engineering Societies of the United States; Mr. H. Foster Bain, Director of the U. S. Bureau of Mines; the President of the A. I. M. & M. Engineers, Mr. Edwin Ludlow; the retiring President, Mr. Whiteside, Mr. A. P. Mathewson, Dr. W. G. Miller, Prof. A. A. Lane, of Cambridge, Mass., and Dr. F. D. Adams, of McGill University.

The Press.

Thanks are due to the Press of Montreal, both French and English papers, for the manner in which they reported the proceedings of the meeting.

The Presidential Address

Mr. O. E. S. Whiteside—Retiring President.

The Extension of the Institute's Activities.

In my address at the Annual Western Meeting in Winnipeg last Autumn I discussed the possible extension of the work of the Institute in the performance of what may perhaps be conveniently defined as social service; that is to say the sort of service that is designed not only to benefit the great industry that we specially represent, but through it the community as a whole. Let it not be forgotten, however, that this important function of ours has not been disregarded in the past, for the records of the Institute testify that so far as our capabilities admitted we have actively and effectively interested ourselves in public matters coming within our scope as a national mining body. That we should now seek to extend our activities, and thereby increase our usefulness in this direction is evidence of our virility. At least we have the satisfaction of knowing that the structure on which we may continue to build is a secure and firm one.

The Institute is the Voice of the Mining Industry.

The question is how shall we build? It seems to me to build effectively it is imperative that we continue strictly to maintain our representative character as an institution. We must speak and act not for any one class, not for capital, not for mine operators, not even for those who comprise the bulk and bulwark of our membership, the mining profession, but we must speak and act for the mining industry as a whole, and in our policies we must regard the mining industry not as an industry demanding or requiring special privileges or concessions, but in its relation to the commonweal. What we ask for in its name must be for the good of Canada, and by following that course at once disinterested and patriotic, shall we win respect and ready hearing, and set a needed example. For co-operation, which is the secret of accomplishment in human relationship, is only possible when selfish interests are forgotten or thrust aside in subservience to the common aim.

Bearing this always in mind we may next consider certain practical details and difficulties in connection with our programme. We have in Canada several countries in one; not one Government to deal with but many. The settled portion of this wide Dominion is confined within a comparatively narrow belt but stretches across the continent. Even in individual Provinces considerable distances separate mining camp from mining camp; and even in the same province interests are frequently diverse and may be conflicting These are some of the factors to be reckoned with, they complicate our problem. Furthermore, unlike Great Britain, and unlike even the United States, we have at present no opulent class of mining engineers, retired or semi-retired, able and willing to devote their leisure to altruistic work at the bidding of the technical societies with which they are associated we must perforce depend upon the gratuitous services of men usually occupying salaried positions, and engaged in work that makes insistent demand on their time and attention. That the Institute has never yet appealed in vain to its members for service is a matter for pride. The continued loyalty of the members of the Institute and their *esprit de corps* cannot be questioned. I conceive, however, that by means of special organization this spirit can be turned to even greater account than in the past. Our headquarters are in the East; but Montreal is a thousand miles distant from the great mining centres of Nova Scotia, and from two to three thousand miles distant from the Western centres of mining activity. It is more conveniently in touch with Ottawa, where legislation affecting mining in the Prairie provinces and the unorganized North-West Territories is enacted, and where under the auspices of the Department of Mines work in the interests of mining throughout the Dominion is initiated. That proximity is a decided advantage. But geographical conditions impose that our Headquarters, no matter where they are located, must necessarily be at a great distance from most of these localities in Canada in which mining is conducted. That is the disadvantage. Having regard to this it seems clear that special machinery is needed, or special provision should be made to enable the Institute to perform adequately its functions in the way of social service in those parts of Canada that are remote from headquarters.

Decentralization of Effort.

If as is considered so desirable and fitting, the Institute should stand in relation of adviser or counsellor to Government on all matters pertaining to mining, it seems almost necessary that for this work we should expand our system of Branch organizations to comprehend Provincial Divisions to which specific duties might be delegated; for it is manifestly impracticable, and not infrequently it would be impolitic, for Provincial Governments to be approached on strictly provincial issues in any other way than by a duly accredited body of members resident in that Province to the Government of which it was required to make representations. Safeguards naturally would be requisite against action not according with the general principles or policies of the Institute, but such restrictions should be readily definable. Already in the case of British Columbia, and, in effect, of that of Nova Scotia, we have precedent for the establishment of Provincial Divisions of the Institute. Such bodies acting in co-operation and concert with headquarters are capable, I believe, of affording a measure of service difficult of attainment by any other means. They alone could establish those intimate relations with their own Provincial Governments that is desired; the relation of counsellor, rather than that of critic, complainant, or

suppliant. In holding and stimulating locally the interest of members in the work of the Institute they would prove effective; and in assisting to forward the work initiated by Headquarters in connection with mining issues of Dominion-wide application they would be invaluable.

Co-operation with other Organizations.

In the prosecution of its duties having to do with the industrial side of mining and metallurgy, the Institute might well also go outside its own organization for assistance and support. Such bodies as the Manufacturers' Association and Boards of Trade might advantageously be invited to co-operate; and, as already suggested at Winnipeg, the powerful aid of the press should not be ignored.

The Problem of Coal Supply.

Of the great problems yet unsolved with which we in this country must deal, and deal adequately without delay, that of coal supply is the chief in the minds of many people. In the solution of this problem there is opportunity for the Institute to play a part. With the terms of the problem all here are doubtless familiar. Coal is the most essential of all raw materials. Upon its production in Canada in sufficient quantity to satisfy demand in Canada, depends in a very large measure our industrial independence and our national self-sufficiency. It is definitely known that our coal resources are greater than those of any other country save the United States only. But nature has played us a trick in distributing these resources unfairly, giving much to the extreme East, much more to the West, and none at all to the central, and, at present, the most thickly populated portion of our country. In consequence a very considerable proportion of the coal consumed in Canada—some twenty million tons or more annually—is derived from the coalfields of the United States, which by reason of their proximity have been able to supply coal to Central Canada at a lower price than that at which Canadian coal could be offered. No doubt no principle of political economy was violated by this arrangement. But first the War, with the fuel shortage incidental thereto in the United States, and, more recently, the fact that our balance of trade with our neighbour has been sadly on the wrong side, with a consequent penalization in the rate of exchange, has brought reflection that independence in the matter of fuel supply is very much in the national interest. I am convinced that that desideratum is in great part attainable. The problem, however, must be regarded as a national one, and must be so attacked. Its successful solution depends on the determination of all concerned to find it; and those concerned comprehensively includes the people of Canada. Whether the people of Canada as a whole realize as yet what a successful solution of the coal problem implied is open to question.

The Institute's Duty to Inform Public Opinion.

The task of moulding public opinion to a proper understanding and appreciation of this, to us, most vital of issues, is a task that the Institute might assume with the full assurance that it is one worthy of its highest endeavours.

GEOLOGICAL INVESTIGATIONS IN NEW BRUNSWICK AND NOVA SCOTIA.

(Part "F" Summary Report, C. G. S. 1919.)

Part F, Summary Report of 1919, Geological Survey, contains accounts of investigations carried on in New Brunswick and Nova Scotia by Messrs. W. J. Wright, E. R. Faribault, and A. O. Hayes.

Oil Shales.

Reconnaissance of the geology of the Moncton map area, and in King's County, New Brunswick, warrant certain corrections of the geological sheets, and indicate a much wider extension of the Windsor series than was supposed to exist.

The Albert series, the source of the oil and gas of the Stony Creek Field of New Brunswick, are estimated to contain at least sixty million tons of oil-shale. At Albert Mines, and at Rosevale, the quantities of oil-shale, in Mr. Wright's opinion, warrant the establishment of an oil-shale industry.

Investigations in Pictou County also indicate the existence of much oil-shale. In the vicinity of McLellan's Brook, Pictou County a number of seams of rich oil-shale are reported. If the yields reported to the Survey officers by owners of shale areas are correct, "this vicinity contains practically inexhaustible supplies of oil-shale well situated for development."

Gold Series.

Mr. Faribault reports on investigations in the Sable River map-area, Shelburne & Queen's Counties, the Carleton gold district, and the Kemptville gold district in Yarmouth County, and on a section of the upper part of the gold-bearing series at Cranberry Head, Yarmouth Co. All the gold mines in these districts are now idle. Mr. Faribault comments on the lamentable and desolate appearance of the de-forested and burnt-over areas of the interior of Nova Scotia, which because of climatic conditions, heavy precipitation and suitable soil offer possibilities for forest cultivation rarely met with elsewhere.

Salt and Coal Deposits.

A. O. Hayes reports on coal and salt occurrences in Nova Scotia, The Malagash deposit and the salt deposits of Nova Scotia and New Brunswick in general have been already made the subject of a memoir that has been previously noticed in the "Journal."

Particulars are given of borings for coal seams in the Ste. Rose and Chimney Corner areas of Inverness County. The analyses given in the Report show typical Inverness County coals, which are non-metallurgical in character, forming poor coke. They are, however, good domestic coals.

THE INCHCAPE BELL.

Lord Inchcape, the well known English banker, has some things to say about trade conditions in Britain that have an application not confined to the British Isles. Some of his statements are quoted:

"What killed the boom a year ago was that nobody, whether he was a manufacturer, or a customer, a Government, a private employer or a working man, seemed to bother about costs".

"Excessive profits snatched during a boom have always to be paid for later on. Excessive wages bring the penalty of unemployment"

"A maximum wage is never too much for a maximum output. But a maximum wage for a minimum output is fatal not only to the individual but to success as a nation"

"As a nation we have nothing to fear, industrially or politically, from any foreign rival. Our real dangers are internal."

THE HOWERY CREEK AREA. — A NEW GOLD DISTRICT.

By D. CUSHING, Sudbury

Northern Ontario has a new gold camp in the making, of which practically nothing is known as yet by the public, but which holds promise, that in a year's time, it may become quite a producer, and of more than one precious metal in paying quantities.

The camp in question is the Howery Creek area, which is located in the Sudbury Mining division. It is six mile from Willisville on the Algoma Eastern Railway, and 64 miles from Sudbury.

Gold was first discovered there in 1911 by James Bousquet. At that time the Porcupine camp was the centre of the mining interest, and outside of some assessment work, no attention was given to the new camp.

Today, however, it boasts of two excellent properties. The Howery Creek Mining Corporation and the Bousquet Gold Mines Ltd. Both are substantial concerns in good hands — people who are interested in real mining.

Compared with other camps. Howery Creek has features which may well be termed sensational, and they will be well within that category if the development of the ore bodies prove up to the showings of the systematic channel-sampling, which has been carried on. As an instance of this, figures given in a report on an assay of some ore from the Howery Creek property, made by T. J. Dee, Chicago, might be quoted. The Dee report showed the following mineral content:

Platinum, $18; Gold, $30; Silver, $4.50; Arsenic, 23.55 per cent.

These assays were from channel samples taken from the vein on the property, and show that there is sufficient mineral content of any one of three minerals to make the proposition a paying one, providing the ore body when developed comes up to the surfaces values.

A. L. Kemp, formerly of the Dome Mines, is the managing director of the Howery Creek Company. He took over the property, along with that now being operated by the Bousquet company, before the war and completed the assessment work on the whole. Mr. Kemp took up the property as a gold proposition, and the finding of the platinum and arsenic content were two subsequent and surprising features. The first of these came after the Ontario Government geologists had tipped him off to look for platinum. They stated that it might be found, owing to the fact that excellent platinum values had been secured at the Vermilion mine, situated some miles away and operated by the International Nickel Co. Mr. Kemp sent samples of his ore to Chicago and the assayers' report showed not only the platinum but the arsenic as well.

Even then Mr. Kemp did not realize the full purport of this as he lacked knowledge of the arsenic trade and did not appreciate its value. Some time later he was in Newark, N.J., and got in touch with a large dealer in arsenic there. He asked if there was a market for twelve tons of arsenic per day and was informed that arsenic was bringing 15c a pound and that the southern cotton fields provided a market for arsenic that it was impossible to supply with the present limited production.

It was on his return to the north that Mr. Kemp gathered together the fifteen channel samples and sent them to Chicago. The assays showed that fourteen of the samples contained platinum and the figures previously given are an average of all the fifteen samples.

Mr. Kemp also prepared a car of 108 tons taken from the vein on surface when test pits were sunk. This was shipped to the smelter and the return was $2.62 in silver and $29.35 in gold. He also took a car of 47.3 tons to the McIntyre at Porcupine and was paid $16.92 per ton for it.

"Arsenic is the thief of gold, I have learned that." said Mr. Kemp in discussing these shipments and outlining his plans.

Knowledge of this fact brought about a complete change in his mining plans. Instead of going in for gold mining, he will mine for arsenic, and the gold, silver and platinum content will be by-products, just as cobalt is a by-product of Cobalt Silver Camp, and copper is a by-product of Sudbury nickel mines.

At the time Mr. Kemp was speaking to your correspondent, he had in the C. P. R. yards, at Sudbury, a rotary-kiln roasting-plant, capable of handling fifty tons of ore a day. This he estimates will provide 12 tons of arsenic a day. He will first treat the crushed ore in the roasting plant to extract the arsenic and will then extract the precious metals by a cyanide system. He already has a complete camp erected with a 60 h.p. boiler and three drill compressor set up.

As for the geology, the predominating rocks are quartzite, greywacke, conglomerate and porphyries. The formation is said to be very similar to that of Kirkland Lake. This is more true of the Bousquet property than the Howery Creek. The latter is right on a Keewatin contact.

The Howery Creek Company has four claims in all, 163 acres. The vein has been stripped and trenched for 2,700 feet. It averages three to five feet wide. The vein passes over a hill and the development scheme calls for mining through a tunnel, driven into the side hill. The tunnel is now in 240 feet and is expected to stroke the ore body at 300 feet. It will then be 103 feet down from the surface.

The Bousquet property is right next to the Howery Creek and is the latest mining effort of Robert R. Tough, of Tough Oakes fame and who is also a leader in the Bidgood Gold Mines of Kirkland Lake. This company has six patented claims with a total acreage of 315.6 acres and several unpatented claims. The company is so far financed for the erection of camps, purchasing and installing the plant, etc., and sinking to 300 feet. The camps are now being erected. A plant is already on the way and consists of an 80 h.p. boiler and 5-drill compressor and 7 x 10 hoist. When the plant is ready, sinking will start immediately. The shaft, which will be a vertical one will be carried to the 300 foot level with a cross-cut at the 150 foot level. There is already a 40 foot incline shaft on the property which was put down for test purposes. The mineralized zone on the property is said to be 40 feet wide and has been traced for over a mile on surface. A series of open cuts at irregular intervals were made over a distance of approximately half a mile along this zone and channel samples are announced to have shown the following assays: 4 ft., $3.50; 12 ft., $5; 12 ft., $6.60; loft., $12.40; loft., $4.95; 3 ft., $20; 5ft., $13.

Harold Tough, son of R. R. Tough, is president of the company. It is capitalized at $2,000,000, with the par value of shares at $1. The company issued 275,000 shares to take care of development and this issue was taken up in Toronto. The Howery Creek is capitalized at $1,000,000 with its head office in Toronto.

SALE OPTION GIVEN FOR ATIKOKAN IRON MINE.

J. J. O'Connor, Port Arthur.

That the iron ore resources of Northern Ontario are about to receive the active attention of experienced iron-ore operators, was announced at the meeting of the Port Arthur City Council on the 1st instant.

Mr. J. Dix Fraser, representing the National Trust Company of Toronto, appeared before the City Council of Port Arthur, and asked for the ratification of an agreement, made by the National Trust Company, with Clement K. Quinn, of Duluth, Minn. at a meeting of the Council on the 1st inst.

Mr. Fraser asked for the ratification of an agreement made between the National Trust Company, and Mr. Clement K. Quinn, for the sale to the latter, of the properties of the Atikokan Iron Mine, situated on the Atikokan River, 127 miles west of Port Arthur, on the Canadian National Railway.

The City of Port Arthur has a one tenth interest in the mine and blast-furnace of the Atikokan Iron Company, the last-named being located at Port Arthur.

Mr Fraser stated to the City Council that the National Trust Company had granted to Mr. Quinn a ninety-day option to purchase the Atikokan Iron Mine, in order that he may make searches of title, and carry out preliminary work necessitated by the transaction. The agreement made between the National Trust Company and Mr. Quinn, was, necessarily made subject to ratification by the City of Port Arthur. The agreement was practically made complete, when the Council, by resolution, authorized the Mayor and City Clerk to "execute the request of the National Trust Company for the sale of the Atikokan Iron Mine."

Mr. Fraser stated to the City Council that the consideration was $1,500,000, payable $50,000 within one year and three months from the date of commencement of operations, and the balance of $1,450,000 in yearly payments of $100,000, the balance due bearing 6 per cent interest.

No intimation was given as to the probable date of commencement of active operations at the mine, as Mr Fraser stated he was not in possession of Mr. Quinn's proposed program, but, as Mr. Quinn has been given the right to carry on extensive operations at once, it is presumed that active mining will begin on the conclusion of the transaction, and that the Atikokan will enter the shipping class during the current year.

During the currency of the payments, mining is to be carried on subject to the approval of the National Trust Company's representative, Mr J Dix Fraser, who will act as an inspector. This is for the purpose of guarding against the possibility of taking out only the high grade ore, and abandoning the property at a later stage.

Mr Fraser also made the statement, that, while the furnace had been separated from the mine property, he had every prospect of a sale of that too, within a comparatively short time. He intimated that negotiations were well under way to that end, and would likely be successfully concluded.

Mr Quinn is one of the most enterprising and successful iron-ore operators on the Minnesota ranges with offices at Duluth, Cleveland, and on the various iron ranges of Lake Superior. His advent upon the mining activities on the iron-ore ranges of Northern Ontario is hailed with the greatest satisfaction. It is felt that his standing in the iron-ore world is a sufficient guarantee that mining and shipping of iron ore from Ontario ranges will soon be an actuality, and will lead to further, and more extensive operations on many of the iron ranges on the Canadian side of Lake Superior.

OBITUARY.

Charles E. Duncan, General Superintendent, Algoma Steel Company.

Mr. Charles E. Duncan, general superintendent of the Algoma Steel Corporation, Sault Ste. Marie, died at the General Hospital on February 26th, following an operation for appendicitis. His death, while not entirely unexpected, came as a shock to the wide circle of personal and business friends who held him in the highest esteem. His illness dated from the 19th.

Mr. Duncan was forty-eight years of age. He was an American citizen, born in Chattanooga, Tennessee, but he lived in Johnstown, Pa., most of his life, where he began to make steel as soon as he was old enough to work. He started on the Homstead Works of the Carnegie Steel Corporation, following in the same business as his father and working in every department of the steel and iron business, until he rose to be recognized as one of the best steel men in the country. At one time in his career, he was assistant general superintendent of the Bethlehem Steel Corporation, where he was personally highly regarded by Mr. Charles Schwab, the president of the company. Mr. Duncan knew the practical side of the steel making business as few men do. He commenced his work with the Algoma Steel Corporation of Sault Ste. Marie in 1909 and was general superintendent here until 1915, when he went to the Donner Steel Company of Buffalo, N.Y., and thence to the Pacific Coast Steel Company of San Francisco, where he was in the service of the United States government, which had taken over the plant. In April of 1920, when the late David Kyle died and Mr J D Jones, who at the time was general superintendent, was made general manager, Mr. Duncan was recalled and was engaged as general superintendent up to the time of his death.

The wide circle of friends who keenly regret Mr Duncan's loss, regarded him as a man of unusual capabilities. He was broad visioned and possessed an almost uncanny knowledge of steel. He was a man who could mix on intimate terms with both the most prominent executives in the business and the ordinary workers in the mill.

He was a well proportioned man, physically and mentally, and regarded with respect by every one who made his acquaintance. The officials of the Algoma Steel Corporation, especially, regret his decease, as he was an invaluable member of the executive staff.

He is survived by his wife, a son, Ellis of Johnstown Pa., his mother, two sisters and a brother, the four latter also of Johnstown. His father, J. M. Duncan, predeceased him by only three weeks.

Funeral arrangements were in the hands of the officials of the plant. Burial took place in Johnstown where the body, accompanied by officials of the Corporation, was shipped.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

Silver production of Ontario for 1920, coming almost entirely from Cobalt and Gowganda, amounted to 10,831,146 ozs., valued at $10,687,687, according to the preliminary estimates made by the Ontario Department of Mines. Added to this is a premium on exchange of upwards of 10 p.c. and which brought the total income to about $12,000,000.

During 1920, the Nipissing mine produced approximately one-third of the total silver output of Ontario, and easily held the leading place, this company alone accounting for 3,390,537 ounces.

The quotations for silver show a further weak tendency, and there is no very great encouragement for the closed-down properties to resume work this Spring. A decline in operating costs or an upward move in the price of silver will be necessary before any general resumption of work can take place.

The question of the possibility of a return to bimetallism is a live topic among certain mine operators. The chief contention in support of the scheme is declared to be that in a single stroke a great industry would be placed upon a stable basis, while at the same time the metallic value behind the great amount of paper currency would be greatly increased. The advocates of bimetallism declare this is one of the questions which Lloyd George discussed with Sir Auckland Geddes just prior the departure of the British Embassador for Washington. Whether the plan is feasible, or not, could possibly only be determined by international conference; but, should bimetallism be adopted it would stimulate silver production.

The Mining Corporation of Canada has officially announced its intention to immediately suspend producing operations because of the unprofitable selling price of silver. It is understood the Corporation intend to take the opportunity to improve and enlarge the treatment equipment in the hope of reducing unit costs. In carrying out this work it will be possible to find employment for at least a portion of the mine employees. In 1920, this Company produced 1,806,274 ozs. of silver, equivalent, plus exchange premium to a revenue of over two million dollars. The dividend for the first quarter of 1921 was passed.

Ore broken in the Hudson Bay Mines amounts to 3,000 tons instead of 300 tons as reported last week. The error occurred in transmission of the report. In addition to this, a further substantial tonnage is indicated, and milling will commence about May 1st. The ore contains an average of about 15 ounces of silver to the ton.

The O'Brien mine with 1, 179,706 ozs. was the third largest silver-producing mine in Canada during 1920. The physical condition of the property is not stated, for the reason that it is controlled by the M. J. O'Brien, Ltd., a private corporation which does not issue an annual statement.

A further wholesale surrender of Crown lands is threatened should a proposed amendment to the Ontario Mines Act be enacted. The amendment reduces the statutory work required to 200 days as compared with 240 days' formerly. Not only this, but whereas the old regulations have compelled claim-stakers to perform the first instalment of work within three months after staking, thus assuring activity the new regulation allows a full year within which to do the first instalment of work. This is likely to lead to a great amount of "blanketing, and the holding of large acreages by speculators which they may abandon at the end of a year if no sale is made. This is not good for the industry.

At the time of writing, it is not known whether the profit-tax on the mines is to go into force, or not. The bill was expected to come up this week for its second reading.

Government prospectors' classes opened in Haileybury on Tuesday, March 8th, under the direction of Prof. W. L. Goodwin. These classes will continue until March 18th, and are free of cost to all those who may be interested. The mining building of the Haileybury High School is being utilized.

Gowganda and Elk Lake.

Difficult transportation is reflected in the figures which show the output of silver from the Gowganda silver area during 1920. The Miller Lake-O'Brien produced 376,417 ozs. which plus the output from the Castle property of the Trethewey Company, brought the total up to about 450,000 ounces. In spite of the transportation handicap, however, a comparatively large amount of work will be carried on this year on properties near Miller Lake and Leroy Lake.

In connection with proposals for rail transportation to the Gowganda district, there is some dissatisfaction arising from a belief in some circles that this should come as a result of a line from Swastika, running in a westerly direction through Fort Matachewan, Gowganda and West Shiningtree. In other circles it is believed better to extend the Elk Lake branch of the T. & N. O. Ry. Those who have opposed the Swastika proposal are accused of knocking the mining industry. Likewise, a somewhat similar accusation has been directed against those who oppose the extension of the Elk Lake branch. The Associated Boards of Trade were asked to deal with the Swastika project, but decided to not pass favorably on the proposal. L. O. Hedlund, of Gowganda, writes to the "Journal" to say it was wrong to publish the statement that the Elk Lake Board of Trade passed a resolution in opposition to the Swastika-West Shiningtree proposal. However, such a resolution was passed, and was also endorsed by other Boards of Trade of the district, among them being the New Liskeard Board. In reviewing the prospective mineral resources through which a railway would pass, it is interesting to note H. C. Cooke, of the Geological Survey, Ottawa, recently practically condemned the area lying between Swastika and Fort Matachewan. From a mineral viewpoint the area is said to be of no economic value. On the other hand, the entire territory lying between Elk Lake and Gowganda, as well as Elk Lake and Fort Matachewan is of very considerable prospective merit. Not only this, but the cost of construction would be less than from Swastika, the distance being shorter. Your correspondent is endeavoring to assist the mining industry, including encouragement to provide transportation to Fort Matachewan, Gowganda, West Shiningtree, etc., and only seeks to gather information to show the manner in which this may be done to the greatest advantage. Discussion of the question will be welcomed.

Col. A. H. McKee, of Elk Lake, is mentioned as likely to be made a Commissioner of the T. & N. O. Ry. It is learned by the "Journal" that Premier Drury is favorably disposed towards this appointment. The choice is not definite at the time of writing, and the object of Premier Drury's mention of the matter is to bring forward expressions of opinion from the district.

One and Bullion Shipments.

During the week ended March 4th, the O'Brien was the only mine to ship ore from Cobalt, this company sending out one car containing 64,310 pounds.

During the corresponding period, the Nipissing made another heavy shipment of bullion, sending out 76 bars weighing 100,235 ounces. This makes a total of upwards of 400,000 ounces of bullion shipped by the Nipissing during the past two weeks.

THE GOLD MINES

The Porcupine District.

On Feb. 25th, the Hollinger Consolidated will disburse a dividend of 1 p.c. amounting to $246,000. This is the third disbursement to be made so far this year and is accepted as an indication that the company is definitely on a dividend-paying basis of 1 p.c. every four weeks, or at the rate of 13 p.c. annually.

Due to the remarkable progress being made in the Porcupine and Kirkland Lake gold areas, the output of gold from Ontario increased 11.7 per cent. over the record established during the preceding year. Ontario's share of the total output of the Dominion for 1920 amounted to 73.7 p.c. as compared with 65.9 p.c. during 1919. Not only this, but the general preparations now under way at the mines offer assurance that a further large gain will occur during the current year. It is believed this year's increase may reach upwards of 25 p.c., with the likelihood of further large growth during 1922.

During the last half of this year, the gold mines of Porcupine and Kirkland Lake are expected to be producing at the rate of close to three tons of gold bullion every thirty days, or something like $1,500,000 a month. All the mines are operating at the fullest capacity possible under the present hydro-electric power shortage, but this amounts to an average of about three-fifths capacity. The month of May is expected to witness all the leading mines working at full capacity.

The McIntyre-Porcupine is rushing plans to increase its milling capacity, and the outlook for this company is better than ever before in its history. Favorable developments along the two main ore-bodies at depth has offered every encouragement to speed up the installation of the new additions to the milling equipment, and an increase of fifty per cent in production is expected to be established as compared with the previous best record. This means that a big increase in the rate of dividend disbursements will probably be made, and a yield of 30 per cent on the company's issued capital is being estimated by careful observers.

Financial arrangements being made in connection with the Porcupine V. N. T. lead to the belief that the company will join the active operations within a very short time. The plan of work includes sinking the main shaft from its present depth of 600 feet to 900 or 1000 feet. Good ore occurs down to the present depth, with indications that ore-bodies increase in width and richness at greater depth is attained. The mill is designed to treat 100 tons of ore daily and can be increased to 150 tons daily by spending $50,000 on construction and remodelling.

Among the properties likely to be reopened this Spring is the Gold Reef where surface outcrops carry spectacular values in a comparatively narrow vein. Diamond drill tests have indicated a strong vein at depth. It is planned to sink a central shaft to a depth of 300 feet at which point lateral operations will be carried on.

As a part of the general preparations to operate at full capacity within the next month or sixty days, the Dome Mines has taken the added precaution to carry duplicate parts for its crushing equipment. Beginning with April, this enterprise promises to rise rapidly to a leading place among the great gold producers. In 1920, the mine produced $2,005,640. In doing this, a total of 295,220 tons of ore were treated, yielding an average of $6.80 per ton. In addition to this output, the company realized about 10 p.c. in exchange premium, which brought the total income to over $2,200,000 and the value to around $7.50 from each ton of ore treated.

Official announcement has been made to the "Journal" that the new mill on the Wright-Hargraves mine at Kirkland Lake will be started up about May 1st. It is not planned to operate the plant at full capacity during the first month or so, but to turn the equipment up gradually, accordingly as ore is drawn from the underground workings in cutting stopes and preparing ore chutes. The out look for this enterprise is exceedingly favorable.

High grade ore is reported to have been found in a 4-ft vein at the 700-ft level of the Kirkland Lake Gold Mines.

British Columbia Letter

Stewart B.C.

An active interest is being taken by the Alaskan authorities in the opening up of the Portland Canal District. C. W. Cheatham, superintendent for the Bureau of Public Roads in Alaska, in the course of a recent inspection of the work of the past season, stated that good progress had been made and that it was practically assured that a road would be constructed some distance up Fish Creek. This would provide for transportation for properties on the Alaskan side of the line. Work on a bridge across Salmon river at the mouth of Texas Creek has been suspended. The piers are in place and other material on the ground and as soon as the water begins to rise in the Spring the remainder of the work will be done. This will furnish an outlet for ore from a number of British Columbia properties. It also will give prospectors access to an immense unexplored area. Mr. Cheatham admits that much of the work being done will help the British Columbia camp but points out that the latter was the first to start and that it has directed attention to the mineral possibilities of that section of Alaska.

Hazelton B.C.

C. A. Bjornstad, of Walhalla N. D., vice president of the Kleanza Company, of Usk B.C., which is interested in mining and lumber properties in that district, has left the Province after an extended business visit. Discussing proposed work on the Walhalla group of mineral claims he stated that development would be carried out on a somewhat larger scale than heretofore. A tunnel will be driven on a low level and during the summer there will be considerable diamond-drilling done. Camp is to be established for the commencement of these operations as soon as weather conditions permit, which is expected to be sometime in March.

Penticton, B.C.

At a convention of the Associated Boards of Trade of Eastern British Columbia resolutions were passed endorsing the proposal that the government should

purchase locally-produced silver at a fixed price of 80 cents for two years; asking for the extension of the present provincial inquiry into the high prices of coal and coke, and into the prevailing high prices of explosives; urging a revision of provincial mining taxation so as to recognize the principle of depletion to a further extent; requesting that the coal enquiry now underway, should cover not only conditions at the Coast, but those also within the zone served by the Crow's Nest Pass Collieries; and asking of the Railway Board a revision of the freight rates on metals. The Convention was largely attended and a report was submitted by Commissioner Starkey covering the mining operations for 1920 in the Eastern Districts of British Columbia which proved that, notwithstanding adverse conditions, the past year has been notable in point of development.

Hedley, B.C.

No definite word has been received as to the plans of the Hedley Gold Mining Company, although it is confidently expected that the Nickel Plate Mine will be re-opened shortly. In the meantime interest in the community is centred on the reported discovery of a prospect close to the present mine that gives promise of developing into another real producer. T. Griffin, an old-time resident and one of the first drillers in the Nickel Plate, is the locator. The new property is said to have a showing about 100 feet wide on the surface from which government assays have given returns of $85 a ton in gold. Mr. Griffin expects a general assay to show at least $45 a ton. He is busy at present in constructing a trail and making other preparations for serious development.

Nelson, B.C.

Two new demands are being made upon the British Columbia Department of Mines by the B.C. Prospectors Protective Association through the Nelson Branch of that organization. One is that prospectors should be extended financial assistance to the extent of from $1500 to $2,000 for the development of properties favorably reported upon by District Mining Engineers and the other that stakes used in the locating of claims should bear a government metal disc. These requirements, and the arguments in their support, have been couched in resolutions and forwarded to Hon. John Oliver, premier; Hon. Wm. Sloan, Minister of Mines, and other members of the government.

The Queen Mine, the original producer of the Sheep Creek Gold Mining Camp, has been leased by C. H. Cassill, of Spokana Wn. He also has taken over the Ore Hill Group, Mount Vernon. The former consists of fifteen crown-granted claims and the latter of five similar claims. On the Queen Group is a 20-stamp Mill. The new operating company will be known as the Queen-Ore Hill Mines Company Ltd. which will be incorporated under the laws of British Columbia with a capital stock of $250,000. The sum mentioned in the transaction is $150,000, the final payment being due July 1, 1923.

Trail, B.C.

Ore receipts in gross tons at the Trail Smelter of the Canadian Consolidated Mining & Smelting Co. between February 7th and 14th incl. were 8,987. This brings the total for the year to 49,515 tons. Of the former the Company Mines contributed 8,746 tons, the biggest individual shipper being the Bluebell, Riondel, with 122 tons.

Greenwood, B.C.

The Providence Mine, near Greenwood, after several months idleness, is to resume operations. The plant is being put into condition and work is to be opened up on the 600 and 700 foot levels.

Victoria B.C.

The British Columbia Government has entered into an agreement with the Coast Range Steel Ltd., a new provincial incorporation, under the terms of which the government undertakes to pay bounties on pig iron manufactured in the Province from local ore to an amount not exceeding $1,50 per long ton. It is set out that British capitalists are ready to invest the necessary moneys "not exceeding ten million pounds" in the establishment of the industry upon the execution of the agreement and upon receipt of the report of engineers (now engaged in the Province investigating the iron ore resources) that conditions are suitable. These particulars were laid before the Provincial Legislature recently and it was further stated that the incorporation fee had been reduced to $50 in order to encourage the enterprise.

Provision is being made by the British Columbia Government for the distribution of powder to prospectors at a considerably cheaper figure than it now is available to them. This privilege, however, will be open only to "the bona-fide mineral prospector." It will not be open to those engaged in general mining operations. The concession is being made as a result of strong representations, backed by forcible arguments, from the B.C. Prospectors Protective Association.

There was a notable gathering at Nanaimo on the evening of Saturday, February 19th, when honor was done to the members of the Barton Team, Canadian Western Fuel Co. Ltd., which this year has won the Canadian First-Aid Championship. Hon. Wm. Sloan, Minister of Mines, was present. He presented to each member of the team a suitably-inscribed gold medal, at the same time expressing his appreciation of the achievement of the representatives of the coal miners of Vancouver Island. The interest they had taken in this splendid work was most praiseworthy. The Cumberland team , which had ranked high in the national competitions, also was to be congratulated.

Vancouver B.C.

Title to the Engineer Mine, Atlin District, again is the subject of litigation. Action has been brought by Walter L. Goodwin and associates against the beneficiaries under the will of Captain Alexander, who owned the property and had it under development at the time of his death. The plaintiffs allege that they located at the time that surveys were being made for the White Pass & Yukon Ry. and it was because the majority of the locators were engineers that the present mine was named The Engineer. It is alleged that documents relating to early assessment work and surveys for the crown granting of the property were mislaid in the Gold Commissioner's office at Atlin and were not recorded. Subsequently Captain Alexander located and the property has since fallen to relatives of the late Allen Smith, Philadelphia. Custody of the property has been entrusted to J. A. Fraser, Gold Commissioner, Atlin B.C., who, as a result, has been made a co-defendant. The action is in progress.

(Continued on page 202.)

MAJOR F. H. MOODY, B.A.Sc.

Major F. H. Moody, who has recently become associated with Powley and Townsley Limited, with head office at 907 Excelsior Life Building, Toronto, as Secretary Treasurer and Chief Engineer, will prove a most valuable acquisition in maintaining the pro-

MAJOR F. H. MOODY.

gressive policy of such Company. They deal exclusively in a most complete line of electric industrial and mine haulage equipment, also handle the highest type of battery charging and control apparatus and specialize in the sale of the Edison nickel alkaline storage battery.

Major Moody has had a varied experience that will prove both practical and useful in his new duties, an experience that will be of real worth to their already numerous and growing clientele.

Major Moody commenced his engineering experience in 1903 as machinist's apprentice with the John Inglis Co. Limited, Toronto. This was followed by the Mechanical and Electrical Engineering course at the University of Toronto, for which he received his degree of Bachelor of Applied Science (with honors) in 1909. The vacation periods were spent in practical work with the General Electric Company, Schenectady, N.Y., American Locomotive Company, Schenectady, N.Y., and International Steam Pump Company, East Cambridge, Mass. Following a year as Demonstrator in Thermodynamics at the University of Toronto, he was successfully Associate Editor "Canadian Machinery," "The Power House" and "Canadian Foundryman," Toronto; Associate Editor "Machinery" New York and "Canadian Railway and Marine World," Toronto, until July 1915, then he joined up with the 83rd Battalion for overseas service. He served three years overseas with the 116th Battalion C.E., with them he attained the rank of Major. Returning to Canada with that unit in March 1919, he became Assistant Chief Engineer, McLaughlin Motor Car Company, Oshawa, relinquishing that position in January this year to assume the above new duties.

It is suggested that a fusion of the British Columbia Division of the Canadian Institute of Mining & Metallurgy, the British Columbia Chamber of Mines, the Prospectors' Assn., and the Mining Bureau of the Board of Trade, all centred at Vancouver B.C., would be in the best interests of the provincial mining industry. The proposal is being considered. As these organizations all have the same object there is now much overlapping in their work which, of course, would be overcome by the formation of one large and active organization.

Present indications are that there will be a large delegation of British Columbia mining men in attendance at the Third International Mining Convention to be held at Portland Ore. early next month. Hon. Wm. Sloan, British Columbia Minister of Mines, expects to be present and, if he is able to make such arrangements, will deliver an address on mining conditions in his Province.

THE COLLIERIES.

The coal situation, from the standpoint of production, is not particularly bright on Vancouver Island at present. Output figures for the month of January are significant, only one large operating concern mining as much coal as in the preceding month. When to this is added the fact that the Pacific Coast Coal Mines Ltd. has been closed down for some weeks with no prospect of an immediate resumption and also that the Herewood Mine, Canadian Western Fuel Co. Ltd., is not now producing, it becomes evident that the trade is not in a healthy or flourishing state. With these two mines idle a considerable force of men has been added to the ranks of the unemployed and, from what can be gathered, it is quite likely they will be out of work for a more or less protracted period.

As has been suggested the explanation evidently is to be found in general slackness of trade. The idea that high prices, and consequent hesitancy on the part of the domestic consumer to make purchases, is responsible is scouted by most of those connected with the operating end of the business. They assert that the local demand for coal is influenced almost entirely by the severity or the mildness of the seasons. Of course this does not apply to that used for industrial purposes nor to that sold for shipping from the bunkers. The latter, one of the mainstays of the Island industry, is said to have fallen off recently.

Some operators declare that the Island Collieries must build up a greater foreign trade. They must, it is said, be in a position to successfully compete with the Utah State coal in the State of Washington and, with a water haul as against a long overland haul, also should be able to do in California. With such fields open there would be no question of the maintenance of a steady market that would keep the mines active to the limit of their productive capacity.

It is possible that the British Columbia Coal Inquiry, now in progress, will disclose some interesting information on the relationship of the Canadian Pacific-Coast coal industry to the home and possible foreign markets.

The discovery of a seam of coal, said to be ten feet in height, at a depth of four hundred feet on the Sumas Indian Reservation near Abbotsford, B.C., has occasioned some excitement in that district. Exploration is planned to determine the extent of the deposit and whether it can be developed commercially.

A prospect shaft has been sunk on coal outcroppings situated on Round Island, near Dodds Narrows, a few miles for the city of Nanaimo. John Arbuthnot, of Victoria, is interested in the property. He and his associates are said to control some 10,000 acres of lands in this section. They plan to instal the necessary plants for operations without loss of time and say that shipments of coal may commence within two or three months.

C. E. Miller, known as the "Coal King of the Klondyke", paid his first visit to the "outside" in twenty years a few weeks ago. He spent his vacation in Vancouver and Victoria. Mr. Miller went into the Yukon in 1897 and the greatest part of his time since has been spent in coal operations. It was while he was voyaging down the Yukon river on his first trip to Dawson that he noticed showings at Five Finger Rapids and Tantalus. At the latter point a mine was developed on a large scale and for ten years supplied the city of Dawson with fuel as well as feeding the bunkers of a fleet of river boats operated by the White Pass and Yukon Railway Company. The present workings of the Tantalus Mine now are being abandoned and the plant is being moved to a new slope. In the old mine the coal assays ran 16 per cent ash while returns from the new seam showed only 2.69 per cent ash. Moreover the material can be handled by gravity to the river landing-stage

---

THE REED-WEKUSKO MAP-AREA, NORTHERN MANITOBA

Memoir 119, Canadian Geological Survey, is a report by F. J. Alcock on the pre-Cambrian exposures in the Reed-Wekusko map-area, better known as adjoining the area containing the Flin Flon and Mandy orebodies, and a number of gold occurrences. Field work on which the report is based was done in 1917 and 1918. Full references to previous literature are given, including numerous mentions of the district in the "Canadian Mining Journal" by Dr. R. C. Wallace, Prof. deLury and others. A description of the district was also given by Dr. Alcock before the Canadian Institute of Mining & Metallurgy at the Winnipeg General meeting last October.

In addition to description of the geological features of the district, which is quite detailed, the Report contains references to climate, agricultural possibilities, and industries. The climate does not appear to be unduly rigorous, and gardening has been successfully carried on in the hot and sunny period of a short Summer, killing frosts being reported as not occurring between the middle of May and the middle of September. Interesting photographs of early native stone-implements are included. The district has been swept by forest fires. Fishing is an important resource of the district. The rivers have a small winter flow, which interferes with their power possibilities, and the nearest water-power capable of producing all the year round is Bloodstone Falls on the Churchill river, about 100 miles northeast of Wekusko Lake.

A summary of Dr. Alcock's conclusions on the economic geology of the district were contained in a report of the proceedings of the Winnipeg Meeting of the C. I. M. & M. (see page 904, issue 5th November 1920

TORONTO COAL PRICES.

Toronto March 9.—Very little anthracite coal is moving and generally speaking the consumption of coal to-day is considerably in excess of production, which means that reserve stocks are being eaten up and will have to be replenished shortly. Just when this point will be reached, however, is problematical. There has been some improvement in respect to enquiries at least but the movement of coal is very light. In bituminous coal from $2.75 to $3.50 is being asked for lump and $1.75 to $2.75 for slack, mine price. Smokeless is quoted at $8.50, Toronto, Canadian funds. Anthracite prices are unchanged. Stove and nut are are quoted at from $8.50 to $8.75: egg $8.25 to $8.50 and pea coal $6.50, mine prices in American funds.

HILLCREST COLLIERIES ANNUAL REPORT.

Net profits and amount available for common stock dividend after deduction of bond interest and preferred dividends in 1920, compare with previous years as follows:

	Profits	Available for Common stock Dividend	Percent earned on Common
	$	$	$
1917	91,211	25,562	2.55%
1918	110,295	60,288	6.02%
1919	112,641	72,581	7.25%
1920	168,704	126,025	12.6 %

During the year 1920 the dividend rate on the common stock was raised to seven per cent. The liabilities include a Contingent Reserve of $275,000, and the surplus stands at $260,077, compared with $219,051 at the close of 1919.

At a recent meeting of the German Geological Society following a discussion on recent discoveries of prehistoric human remains near Weimar, a member exhibited a photograph of an old Chinese bronze Moloch in which the head of one of the offered victims is portrayed with much exactness. The head is sharply distinguished from the Mongolian type, and the general artistic merit of the bronze is such as to warrant the conclusion that the sculptor had a living model. The head is noteworthy because it has all the characteristics of the Neanderthal man, the prognathous under-jaw, the strongly marked prominences of the eyebrows, and the low, receding forehead of the type. It was suggested that the artist actually modelled his work from a living Neanderthaler man.

Dr. KEMP LECTURING AT McGILL.

Dr. Kemp, of Columbia University, is giving several lectures at McGill University during the week beginning the 14th March, on some practical applications of geology.

PERSONAL.

Mr. J. B. Tyrrell accompanied by Mr. Wm Freeheville of London, England, is visiting Calgary and district.

EDITORIAL

The New Oil Regulations

If the purpose of the new oil regulations in the North West is to safeguard the possession of the oilfields by the Federal Government, this would seem to have been secured, so far as is humanly possible, by the drafting of the regulations, but is is doubtful whether they will bring about the best technical extraction of the maximum quantity of oil, over the largest possible period of time, at the minimum cost of production; or whether the system of granting licenses to search, and the subsequent granting of leases of selected locations, is such as will bring about speedy development of such reservoirs of oil as the North West may, by private enterprise, be demonstrated to contain.

The regulations are extremely onerous in that they require large expenditures to be made within a short time, and require, in addition, persistent and continuous expenditures of money and labour over a period, but, if and when the expenditures are made, and the searcher is rewarded by the finding of oil in commercially paying quantity, the Government reserves the right to three fourths of the prospected location. Possibly no legitimate exception can be taken to this reservation, seeing that, in any case, the Government owns the oil, but it seems reasonable that the person who finds the oil should be given first option of the leases of the adjoining three fourths location, and is entitled to some protection against drainage of his first leased quarter-location by holes drilled with that purpose in view around the discovery location.

There is also reason to criticise the nature of the unit of leasing, which is prescribed as approximately rectangular in shape, with subsurface boundaries that "shall be the vertical planes in which the surface boundaries lie". The difficulty, and probably also the inadvisability, of prescribing vertical boundaries to a fluid deposit, has been previously raised, and the United States Senate, because of acknowledged and flagrant deficiencies of customary leasing units for gas and oil, has committed to the United States Geological Survey the duty of formulating an appropriate unit.

The leasing laws both in Canada and in the United States were designed to apply to solid and stationary mineral deposits, and they have been unthinkingly applied to a fluid deposit such as petroleum, even in ungranted territories where individual ownership did not exist. But if the matter is considered, there does not appear any substantial reason — except that of convenience and of conformation to surface landmarks — to select geometrical figures plotted upon a map as leasing units for a fluid or semi-fluid deposit bounded by geological structures. The whole proceeding is utterly illogical.

It is, of course, obviously necessary that before natural leasing-units, based on geological structure, can be prescribed, the geological structure must be known and plotted. This would necessitate a through preliminary survey, and a good deal of drilling, by the lessor — in this case the Federal Government — and presumably, the Government will not undertake such a task. At the same time we can suggest no good reason why it should not.

The new regulations are designed to bring about the desired geological investigation at the expense and through the initiative of private enterprise, while reserving to the Government full possessory powers and the major advantage of any discoveries of commercial value. In the last resort the Government reserves the right of re-entry upon compensatory payment.

To have one's cake and eat it too has always been regarded as a difficult accomplishment, but the new oil regulations seem to attempt this.

In view of the remoteness of the oilfield of the Mackenzie Basin, and of the fact that the problem of transportation of the oil to market is by all odds the one most difficult of solution, some questioning of the advisability of the adoption of the rectangular leasing unit is suggested.

Would not the Government have better achieved its purpose if it had selected a suitable leasing unit of large dimensions, amounting in fact to a concession, and have allowed one operator only to have the privilege of working this concession on a royalty basis?

A little consideration of the things that will happen if the North West should prove to contain much oil will indicate that only large-scale operations, combining ownership of costly pipelines, will make possible an

industry of permanence and magnitude, and that, little by little, the big operator will absorb the smaller ones, and will by purchase and assignments and other means, eventually become possessed of the large and consolidated tracts of leases that are necessary to successful and profitable oil mining. We take it the terms are synonymous. In the meantime, however, there will occur much speculation and creation of values by the creation of titles and their bartering, that will represent no real assets, and will eventually have to be paid for by the ultimate consumer.

This last-named probability is not, however, the fundamental objection to the regulations it is desired to disclose. The real flaw suggested is that any attempt to set vertical boundaries to a fluid accumulation, without reference to geological structure, is a confusion of terms and an illogicality.

The business of the Government is to see that the Mackenzie Basin oil is put on the Canadian market at the first possible moment and at the lowest cost, and if, by giving oil-mining rights over large tracts to large oil companies, this object is best attainable, the Government, with an ungranted and promising virgin oilfield at its disposal, is in a position that may be likened to the awarding of a large construction contract. The contract for oil-mining should be given to the tenderer whose equipment and financial resources will guarantee the quickest and most permanent return in the form of royalties, and the contracting firm should be assumed to be merely the agent of the Government.

The only privilege the Government is really able to dispose of is the right of access to the oil-pools. It cannot guarantee the presence of oil, but it can grant the right of privileged access.

The situation has an analogy — only the physical conditions are reversed — in the leasing of mining rights to submarine coal. In this connection it has been abundantly demonstrated that the real privilege — the thing of intrinsic value—is the right of access at the shore to a deposit covered by the sea, and the division of the coal into leasing units — and not into mining areas — has been found to be a mistake requiring legislative correction. The original error arose through unthinking application of the customs of leasing mineral deposits under surface cover to the entirely different conditions of submarine deposits.

The granting of a number of licenses to search, unguided by any connection with the nature of the occurrence of the oil below, may lead to the drilling of wells in places where it would be better if they were not drilled, and maybe also to the drilling of too many wells; and if this should occur, the only gift the Government can dispose of — namely the right of access— may be squandered and made of less value.

The method which purely scientific considerations would indicate to ensure the maximum and least costly production of oil in the North West, is to lease areas with boundaries suggested by geological structure. If it should be objected that such a procedure would foster monoplies, may not the question be put whether oil-mining and sale under the unique conditions that exist in the North cannot best be undertaken by experienced companies having large financial resources and a thorough knowledge of oil transportation, of oil refining and technology, and markets?

In all the foregoing considerations—which are put forward merely as the detached viewpoint of an individual — it is assumed that the competent contractor suggested, operating on a scientifically selected and presumptive oilfield, would act merely as the agent of the Government, and would acquire no fee simple or inalienable possessory rights.

A GOLDEN OPPORTUNITY.

Canada's preferred position as a gold producer at this time is in striking contrast to that of South Africa and Australia, where the steadily dropping premium on new gold is eliminating those mines which have depended upon the premium for a profit. Samuel Montagu & Company's circular forecasts that if the price for South African gold drops to 85 shillings per ounce—that is to the normal price of gold—14,000 Europeans will be thrown out of employment by the closing down of mines, and that disaster will come to from one-quarter to one-half of the industry. Since 1915, the gold output of United South Africa has declined by 2,472,587 ounces, the record production of 4,867,604 ounces, in 1915, comparing with 2,395,017 ounces in 1920.

While sterling exchange seems likely to maintain its steady climb to parity in New York, there are no good grounds to expect similar immediate appreciation of Canadian exchange, and, while to the business interests of Canada in general the discount on the Canadian dollar in New York is regarded either as a monitor or an irritant—according to one's business—to the gold producer it is sweetness unalloyed, but, unless we are all mistaken in the nature of Canada's future, it is a condition that will persist only for a period. It is quite understandable, therefore, that Canadian gold mining companies will put out a maximum effort to increase gold production while the discount is in existence, even though their efforts will in themselves do much to restore our dollar to parity. The gold producer in Canada is uniquely situated in that he is able to combine real service to the country with equally real and tangible profit to himself. If there is any person able to plead guilty to being the culprit who pockets the exchange differential it is the Canadian gold-miner, and it is a pleasing occupation in which our governments, federal and provincial, ought to be aiders and abettors. Gold is a commodity, having a price relative to the demand for the metal, and there are gold deposits in Canada that are workable at a profit to-day that will not be so workable when our dollar looks the eagle in the face. It almost looks as if the present time were one during which the powers that govern this country should give to the gold-mining industry the maximum of aid and comfort and the minimum of restriction.

A DYING INDUSTRY.

We are officially informed that the Algoma Steel Corporation has closed down its Magpie Mine, owing to trade conditions, and that the prospects for reopening in the near future are not bright. The Magpie Mine was the only iron-ore mine in Canada in operation, and there is reason to believe that the mineral statistics for 1921 will show a smaller tonnage of iron ore mined in Canada than since these statistics were commenced, namely in 1886. The production in 1920 was the smallest since 1900, but the decline seems now to have proceeded to the point of complete extinction.

The discussion of the Canadian Institute of Mining & Metallurgy on this question now therefore assumes the aspect of an ante-mortem consultation. The remedy was indicated, but the family thinks it cannot pay the cost of the medicine. Meantime the patient has to all appearances died.

In the United States, where they have iron ore in great quantity, very accessible and of most excellent quality, some of the brightest minds in that country have commenced the task of developing, by beneficiation, the equally imposing reserve of low-grade ores that lie right alongside the more valuable deposits in the Lake region. In Canada, where our iron ores are not comparable either in quantity or quality with the Lake ores of present commercial grade, and where our need of intensive development of what we have is admittedly much greater, we are relinquishing even the little development of native iron-ores that stood to the country's credit, and some day, possibly, we shall be buying beneficiated ores from Babbitt

An example of the general futility of our methods was given by the field day of discussion which the House of Commons recently indulged in with regard to natural resources. After talking for many hours, and disclosing many different viewpoints, the motion suggesting action, and in particular suggesting action to assist the mining of iron ore in Canada, was lost. Dr. Manion who introduced the question of iron ore development said "a pound of action is worth a ton of oratory" whereat the House cheered, but proceeded forthwith to talk until after midnight, and ended by doing nothing. And meantime the one really practical attempt to mine our native ores ceases.

THE MACKENZIE OIL REGION

The story of the Imperial Oil Company's search for oil in Western Canada recounted at the annual meeting of the Canadian Institute of Mining and Metallurgy, last week, by Mr. J. Ness, of the company's staff, was a most interesting one. Stories of new mineral discoveries are always welcomed by members of the Institute, but unusual significance attaches to the discovery of oil in the far northwest. It is believed by many that exploration will prove the existence of large quantities of oil in the Mackenzie basin and the fact that the first well sunk at Fort Norman is a successful one gives good ground for optimism.

Those who made public their observations in the Mackenzie district have reported signs of oil in many places. The geologists who have worked in the district for the Department of Mines have indicated it to be a promising field for oil exploration. Mr. Charles Camsell, Deputy Minister of Mines, who knows the field well attaches great importance to the results of the work done during 1920 and considers the discovery at Fort Norman one of the most important mineral discoveries of recent years. Other geologists have also been much impressed by the discovery and the public generally has shown much interest in this possibly new source of petroleum. Under the circumstances the story told by Mr. Ness and the description of the salient features o the district by Mr. E. M. Kindle were listened to by a very appreciative audience. It is to be hoped that both papers will soon be published.

Fort Norman is far from civilization and if oil is found in large quantities it will be some years before it is marketed. Problems of transportation, while serious, will be met and overcome as the work progresses. At present Fort William is about 1,000 miles from the railroad. The rivers make access to the field possible and with improved facilities for crossing the portages the journey will not be a difficult one though slow. Provisioning will be costly during the period of exploration and the season for river travel short. Such difficulties will not prevent the development of the field; but they will make progress necessarily slow. The results obtained during 1920 will attract oil men from afar and if they are reasonably successful in finding oil; we may expect that means will be found of getting the oil to market.—R. E. H.

THE PROPOSED SWASTIKA-WESTREE RAILWAY LINK.

Editor,
Canadian Mining Journal.

Sir:—

In the advertisement, appearing in your journal, over the name of the Hon. H. Mills, Minister of Mines for Ontario, the statement is made that Ontario in 1919 produced 38 per cent of the total mineral output of Canada and that the output of mines and metallurgical works, of the province, during the same year was worth $58,583,916.

This is all very nice for the Minister of Mines to refer to as inducements to prospectors and capitalists to "Come in the water is fine". Seeing, however, that mines are admittedly a wasting asset, this creditable showing cannot be maintained without new and additional mines being added to the list of producers. The very fact that this production was, with one or two exceptions derived from properties situated adjacent to rail or water transportation should show to the most ignorant, the need of providing railway transportation facilities for the new camps.

For the last ten years, Gowganda have been asking for a railway, to-day West Shiningtree and Matachewan are added to the list of new camps in need of the "Iron Horse". As a result the people of Sudbury, Westree, Shiningtree, Gowganda, Matachewan, Swastika and a large majority of the people of Elk Lake are asking that the Government build a railway from Westree, Shiningtree, Gowganda, Matachewan, Swastika. This 80 mile line would aid the development of existing mines, assist in securing capital for the development of promising prospects, into more attractive prospecting and in general give to those interested in prospecting and mining a faith in the Government's intention to do its big towards promoting the mining

sion of the mining industry. A faith that at the present is mighty close down to zero.

The producing properties at Gowganda, conclusively proves that with ample capital intelligently expended, mines can be made out of a prospect. Exploration on the Wasapika, Westree, and Herrick have disclosed ore in commercial qualities. Trenching and diamond drilling at Matachewan have proved equally successful. Iron ore, partly developed, is also on the route of this proposed line.

It is rather peculiar, that the argument advanced by the Hon. H. Mills, that Ontario contains millions of acres in which the geological formations are favorable for the occurrence of minerals, should be considered as all sufficient inducement to the prospectors and mining men while the same argument, plus shipping mines and prospects partly and sufficiently develop to indicate their worth, are not good enough reasons, in the minister's mind for the construction of a few miles of railway.

Chas. L. Sherrill, in his report to the Hudson Bay mine stockholders in 1919, shewed conclusively the position of Gowganda, when he made the following statement:—

"Your Company has properties there (at Gowganda) that have high-grade Silver veins that merit further expenditure to prove if they will develop into producing mines, as soon as the government provides better transportation facilities into the camp."

When that is the position taken by an active mining company, that all ready owns property partly developed, what possible change will the prospectors have of securing capital to develop his holdings? To the prospector the finding of a ready purchaser who will develop properties of merit is of far more importance than are reductions in cost of recording and holding of mining claims, as it is the cash derived from sales rather than the ease by which claims can be secured, that attracts the prospector to any given district or province.

The providing of schools for prospectors will only serve to aid the provinces who strive to ease the burden of pioneers who assume the financial risks involved in converting raw prospects into producing mines.

British Columbia has for years recognized the just claims to asistance in the matter of roads to new mining camps. The Province of Manitoba is to-day surveying for a railway into the Flin Flon mining district, and without Ontario speedily gets into line, her trained prospectors as wel as capitalists, will go to assist the development of the provinces that are showing a desire to help them.

As stated above, Ontario has schools for prospectors, and the Ontario Public Service Commission recommends a special training college for magistrates. Why not also have a special college for the purpose of teaching cabinet ministers, the true relationship which the different industries bear to each other and to modern life?

Were this relationship thoroughly understood, the mining industry would not need to go begging for aid.

We insist that the geologist must have several years training before he can be trusted to report upon the geological and economic features of a district. The hard-headed business man will require a trained mining engineer's report before he will invest in a mine. We require properly trained men to carry on our small and comparatively insignificant affairs, but take the raw product from the law office, farm, or factory and without preliminary and suitable training put them, slap-bang, into the most important office that the people of the province or country have, expecting them to adjust and run, to everyones' happiness and satisfaction, the delicate and complicated machinery pertaining to a Government!

Gowganda, March 7th, 1921.

L. O. HEDLUND.

PERSONALS.

Mr. Sam. Sainsbury, the well-known Hudson Bay, prospector is telling some interesting stories of life in the far north, in articles which are appearing in the "Star Weekly", Toronto. Mr. Sainsbury, a few years ago, staked iron ore deposits on the Belcher Islands that are believed to be very valuable.

Mr. Robt. A. Bryce of Toronto has been appointed to represent the mine operators on a board of enquiry concerning a wage dispute at Cobalt.

Mr. R. C. Wallace, Commissioner of Northern Manitoba, is reported to intend resigning that position soon. He is Professor of Geology at the University of Manitoba and left the University temporarily to become the first commissioner. He has made a big success of his work and has been of material help in drawing attention to the mineral resources of Northern Manitoba.

Mr. Geo. C. Mackenzie, secretary of the C. I. M. & M., was in Toronto last week.

Mr. Jos. Houston, who has been recently in Mexico, is in Toronto. He intends to return shortly to Mexico City.

INCREASED GOLD PRODUCTION SOON.

While the winter is comparatively a mild one, it is still cold enough in the Northern Ontario mining districts to keep most of the snow and ice from melting. It is not likely to be many weeks now, however, before the streams are running in such volume that greatly increased power will be available. At the mines preparations are being made for the handling of much larger tonnages and before the summer is far advanced the gold mines of Ontario should be making a bigger production than has ever been possible before. There is not sufficient power for the present plants but additional milling facilities are being installed and the development of more water power is contemplated. This has been an exceptional winter; but an endeavor will be made to meet such conditions better if they should recur.

THE NOME GOLD FIELDS.

The famous Nome placer gold fields, discovered in 1898, have now produced gold worth nearly eighty million dollars. Much of the gold mined in this region is won by the use of dredges. Twenty-two of these machines were in operation in 1919 and made a total gold output of $450,000, and open-cut and deep mining in that year brought the value of the total gold output of Nome and other districts of the Seward Peninsula up to $1,360,000. In addition to the gold, about 56 tons of placer tin and 20 ounces of platinum were produced on Seward Peninsula in 1919. These operations are briefly described in a report entitled "Mining on Seward Peninsula, Alaska" (Bulletin 714-F), by George L. Harrington, just issued by the U. S. Geological Survey Department of the Interior.

The British American Nickel Corporation, Limited

W. A. CARLYLE, M. E.

During the past three years, despite the many diffienlties arising from the very abnormal conditions due to the war and its aftermath, a large and important mining and metallurgical enterprise at a heavy capital expenditure and complete in every detail has been developed in Canada. Three large plants have been designed and erected, the Mine and Smelter plants near Sudbury, Ont., and the Refinery, near Ottawa. These plants have already demonstrated that they will achieve a high degree of efficiency both in working costs, in the tonnage of ore they will handle and in the very pure refined metals produced. However, owing to the unprecedently bad market for all metals, the Compay, which recently had arranged for a new issue of bonds against which sufficient capital has been provided, has decided to cease operations for the time being, but will resume as soon as the demand for and prices of the metals become normal. With the great reserves of ore this company will operate for many years, it has the promise of becoming one of the most important producers of nickel in the world.

The following is a brief description of the three plants completed early in 1920 and of the initial operating experiences of this new nickel-copper producing Company, the head offices of which are at Ottawa, Canada.

Mining Property.

The mining lands owned by the Company comprise 17,590 acres in the famous nickel district at Sudbury, of which 12,590 acres are logated in the mineral bearing zone. Important deposits of nickel-copper ore have been found, and more or less explored on several properties, but the present Company confined most of the diamond drilling campaign to the Murray Mine, where a very large body of ore was thus disclosed, to which all recent mining operations are confined.

Murray Mine.

This ore-body, as determined by vertical drill holes, 200 feet apart, outcrops at the surface, and with a very uniform dip of 38 deg. from the horizontal, has been shown to extend 3,600 feet downward on the dip with a thickness varying from 40 to 140 feet of smelting ore. Within the area drilled by the drill holes lie 16,000,000 tons of ore averaging 3 per cent of nickel and copper, sufficient to keep the present plants running for 30 years, and the ore-body undoubtedly extends much farther beyond the holes, the deeper of which discloses a great tonnage of higher-grade ore, containing 4 per cent nickel and copper.

The ore typical of the district occurs in the norite rocks with a footwall of greenstone, and in places granite; and consists of pyrrhotite with some chalcopyrite (Fe. Ni.)S. It also contains a small but valuable amount of the rare metals of the platinum group, all of which will be recovered and separated in the refining process.

THE SMELTER

British American Nickel Corporation, Sudbury District, Ontario.

MURRAY MINE

British American Nickel Corporation Sudbury District, Ontario

Mine Plant.

At the Murray Mine a three-compartment inclined shaft in the foot-wall is now down about 1,200 feet with eight levels opened up, each half in the footwall and half in the ore. A unique method of mining the ore has been chosen that will permit the cheap extraction of at least 90 per cent of the whole ore mass. On each of five levels is a five-ton Canadian Westinghouse locomotive with Edison storage-batteries, running on 24 inch tracks laid with 36 lb. rails and hauling four 4-ton ore-cars of the Granby type. On each level is a motor-generator set for charging the batteries on the third shift. All of this plant is giving great satisfaction.

The drilling is done with Waugh No. 21 turbo-hammer drills using 90-100 lb. air and hollow steel for water feed. There is a large ore-pocket, with finger-gates below every second level, which loads the 8-ton skips in two compartments of the shaft.

On the surface all the buildings are substantial and well built. As enough electric power for the time being could not be obtained, it was decided to instal steam plants at the Mine and Smelter, but so arranged that every machine could later on be electrically driven. In the Mine Power House are three 1,000 H.P. Babcock and Wilcox boilers, 160 lb. pressure, equipped with Weir feed-pumps and large steel coal-hoppers with endless pan-conveyors, feeding the chain grates with slack coal. There is a powerful Allis-Chalmers steam-hoist of the latest design, hoisting at the rate of 1,500 feet per minute, and two Belliss-Morcom air compressors, each yielding, at 250 r. p. m., 2,500 cu. ft. of free air per minute at 105 lbs. Each is fitted with a barometric jet-condenser. There are also two other small compressors, one steam, the other, electrically driven, and. 6,500 to 7,000 cu. ft. air is altogether available.

The blacksmith and drill-sharpening shop is fitted in the most modern manner.

In the Shaft House the ore from the ships, after passing over grizzlies, goes through a 46″x48″ Buchanan-Blake-type rock-crusher into a flat-bottomed bin which feeds the 36″ belt, 300 ft. long, to the top of the Rock House, where the rock, after passing over a 2 inch screen, is distributed by a belt along a storage bin which in turn supplies the seven picking-belts. The equipment in this building is supplied by the Stephens-Adamson Mfg. Co. and the belts by the Dunlop Tire and Rubber Goods Co., Ltd.

Already the mine, although so newly opened up, is easily supplying 1,200-1,400 tons of mixed ore per day and 2,400 tons have been hoisted in two shifts. From 20-25 per cent of the material hoisted is picked out and sent to the waste dump. The smelting ore, coarse and fine, is taken in 35-ton ore cars 1¼ miles to the smelter ore-bins.

About 600 H.P. purchased from the Wahnapitae Power Co. is used for driving motors at the mine and smelter.

The Smelter.

In the Power House, the boiler room has six 1,000 H.P. Babcock-Wilcox boilers, working at 180 lb. pressure, supplied with superheaters and chain grates, also fed from steel bins filled by the endless bucket-conveyor. Weir pumps supply the boiler feed from a Cochrane reheater.

In the Blower-room are four turbo-blowers, 3,600 r. p. m., each direct connected to a steam turbine.

The Refinery at Deschenes, British American Nickel Corporation, Limited.

blowers and turbines being the Rateau-Battu-Smoot design and built by the Dominion Bridge Co., Ltd., Monreal. Two of the blowers each deliver 30,000 cu. ft. free air each at 36 oz. for the blast furnaces and two 36,000 cu. ft. each at 12 lb. pressure to the converters, the steam turbine for each of these being 2,200 H.P. Each turbine has its surface condenser complete in every detail with centrifugal pumps for returning the hot condensing-water to a cooling pond. One unit comprises a 1,100 H.P. turbine, driving one of the blast-furnace blowers, and a 550 K.W. generator, used when the Wahnapitae power fails,which can be used as a motor to direct-drive one or both blast-furnace blowers. On account of the highly superheated steam, 590 to 610 deg., it was found necessary to fit the steam governors of all the turbines with monel-metal parts, which has proved very satisfactory. After a considerable period of adjustment this blower plant is now running very sweetly. Two Westinghouse motor-generators, one 300 K.W. and one 250 K.W. as a reserve, suppy D.C. current to the motors of the electric locos, cranes and converters in the smelter building.

At Pump Lake two vertical motor-driven centrifugal pumps, with steam reserves, supply the water to the mine and smelter, at the last-named of which is a powerful steam fire-pump for the protection of all the property.

In the Smelter building are two blast furnaces, 50x360 inches at the tuyeres, and a third is on the ground. On a strongly-constructed crucible, 24 inches high, stands the single row of steel water-jackets, 14 feet long, 30 inches wide, inner plate ⅝ inches, outer ⅜ inches, with a water space of 5 inches. There are two 4½ inches tuyeres in each jacket, or 24 on each side of the furnace, which is tapped at either end, using a watercooled cast-iron spout for discharging into a settler 20 feet by 30 feet by 5 feet, lined with chrome and magnesite bricks, there being three settlers in all. The matte tap-holes (4) at first gave much trouble, but a syphon tap, invented by Mr. J. H. Gillis, Chief Engineer, solved this difficulty.

On the charging floor, standard-guage tracks on each side of the furnaces, lead to the supply bins and a specially-designed type of charge car drawn by electric trolley-locos gives great satisfaction. Each car is divided into four 4 ton compartments discharging one side into the four feed openings of the furnace while in the centre of the other side is a multibeam weighing device with which the proper weights of coke, ore and flux can be weighed into each section through the valve gates in the bottom of the supply bins.

In the converter aisle are two 60 feet span, 40-ton electric travelling cranes serving the three Pierce Smith basic-lines converters 13 feet by 30 feet, each with forty four 1½ inch tuyeres, electrically rotated. Steel ladles holding 20 tons of matte, or 12 tons of converter slag, are used, and the holes soon made in these by the corrosive matte are now very successfully repaired by fitting in pieces of steel plate by Thermit welding. A hopper, holding 16 tons of flux, fine ore or gravel, is placed by the crane on a Kron weighing device, at the end of each converter, where a weighed charge can be blown in with the Garr gun. The fourth converter is on order, the furnaces and converters having been supplied by the Canadian Allis Chalmers Co.

Smelting Practice.

This practice has many features different from that followed by the other smelters in the Sudbury District. The ore averaging SiO_2 24 per cent, Fe 35 per cent, CaO 3.7 per cent, MgO 4.3 per cent, Al_2O_3 6 per cent, S, 19 per cent, is smelted without any preliminary roasting and the only flux used is converter slag containing SiO_2 16 per cent, Fe 52 per cent, CaO 3.5 per cent, Al_2O_3 3.5 per cent, the charge consisting of 70 to 75 per cent ore, the balance flux with 10.5 per cent coke on the charge. The resulting slags contain SiO_2 35.5 per cent, Fe 30 per cent, CaO 5.5 per cent, Al_2O_3 13 per cent, and 0.24 to 0.34 per cent Nickel plus Copper plus Cobalt.

The low-grade matte from this furnace, containing 11 to 13 per cent nickel and copper is poured into the converters, and blown up to the usual matte containing 80 to 82 per cent copper and nickel and a trace of iron, which is transferred to an oil-fired furnace, and in running from thence through a strong stream of water is very successfully granulated, then wheeled into box cars and shipped to the refinery.

In the converter method, the flux mainly used is ore fines with some siliceous gravel or sand. One aim is to keep the silica in the converter slag as low as possible, it often averaging for days under 13 per cent, which eventually will become the regular practice. This slag is poured in part into large 20-ton cars, poured outside the building onto shallow beds lined with ore fines, broken up and lifted by locomotive cranes, using clam-shell buckets and sent to the smelter bins. Part of the slag is poured into the settlers.

The capacity of the blast furnaces is proving much greater than anticipated, as for the past three months, one furnace has averaged over 800 tons of ore per day, and 1015 tons of ore have been smelted in one day, counting in the ore used as flux in the converters. In the future, greater results will be achieved, especially if the ore fines under 1½ inches, now going to the furnaces, are sintered, a problem now being studied. The amount of flue dust is small, being caught in the dust flues and chambers. The smelter stack is 300 ft. high and 25 ft. inside diameter.

Railways.

The Company's railway system at these plants connects with the Canadian Pacific and Algoma Eastern Railways, and is equipped with the necessary standard locomotives and rolling stock.

Refinery.

Situated on the C.P.R. at Deschêne, Que., near Ottawa, where cheap electric power was available, and other advantageous factors existed, such as an excellent site, water and sufficient labor.

This plant has a capacity of 15,000,000 lbs. of nickel per annum, and at a comparatively small expense can be increased to from 20 to 24 million pounds. This metal is deposited electrolytically by the Hybinette process, and a very high grade product is being produced, containing practically no impurities but a little iron and copper and some hydrogen.

The matte from the smelter passes through two Wedge roasters, each with 8 hearths, and thence to the leaching department, where the copper in part is dissolved with H_2SO_4 and plated out in the electrolytic tanks, the cathodes being melted down and cast into 81 lb. ingots; about 55 tons of copper being produced per 100 tons of nickel.

The leached matte with fluxes is then smelted in especially designed electric furnaces using 24 inch ca-

cular carbon-electrodes, and nickel copper anodes, weighing 200 lbs., are cast in steel moulds. These furnaces, which are proving a signal success, were designed by Mr. Ivar Hole, a Norwegian metallurgical engineer These anodes then go to the nickel-depositing building which covers three acres, and not only is the nickel plated out, but a large amount of nickel-sulphate and also nickel-ammonium salt is being produced for sale to the nickel-plating industries.

The slimes remaining after the nickel anodes are dissolved are collected and concentrated, and will be refined in the precious metals department to yield metal-platinum, palladium, iridium, rhodium and some gold and silver.

In the power sub-station is a very fine electric installation, supplied by the Canadian Westinghouse Co., comprising with transformers, etc., five rotary converters of 4,000 amperes each, three with a range of 70 to 290 volts on the D.C. side. There is also a reserve 1,000 K.W. generator driven by a steam turbine, there being two 1,000 h.p. B. & W. boilers equipped with superheaters, Green's economizers and forced draft.

Personnel.

Smelter Manager—E. J. Carlyle.
Smelter Superintendent—O. E. Jager.
Chief Engineer—J. H. Gillis.
Refinery Manager—R. L. Peek.
Refinery Superintendent—T. Torrel.
Refinery Chief Chemist—F. E. Lathe.

The Situation at Inverness Collieries, N.S.

The Eastern Trust Company of Halifax has been appointed trustee for the creditors of the Inverness Railway & Collieries Ltd., and Messrs. J. A. Walker and Andrew MacKinlay of Halifax are appointed inspectors. The mine is working intermittently, owing to lack of orders.

It is understood that a proposal has been mooted to sink a deep shaft at the shore and drive out seawards with a cross-measure drift to a point connecting with the lowest level in the No. 1 Mine. By this means a good grip of the seaward coal would be obtainable, and the large area of pillar coal lying to the rise of the point of intersection of the proposed drift with the low level workings would be in part worked downwards to this point and sent out by way of the drift. Haulage and pumping problems could be much simplified by the method of winning proposed, if the necessary capital for the undertaking can be raised. The cost of extracting coal from the low levels under present conditions is virtually prohibitive.

The sinking of a deep shaft at the shore line, and the driving of a cross-measure drift with a rising grade proceeding seawards, intersecting superimposed seams at varying distances from the shore line, has been proposed on several occasions in the past for the economical winning of the submarine coal off the Sydney Field and off the Inverness shore, but the suggestion has never received serious consideration. The advantages that such a method would carry with it would include making all submarine coal lying between the shore and the point of intersection of the cross-measure drift into "rise coal" which could be dropped to the main drift by gravity haulages, pulling up the empties at the same time. All problems of pumping would be similarly simplified, although—except in the overlying coal seam nearest to the sea floor—there is very little trouble with water in submarine mining. The trouble is more apt indeed to arise from excessive dryness conducive to dust dangers, and it may be even necessary to lead water into the dry submarine areas. A drift such as is suggested would be of very large dimensions, and would probably be driven as a series of three or four parallel slopes, one being reserved for coal haulage, one for man haulage, and others for transmission of air, power and piping of various kinds. The expenditure required would be extremely heavy, but not heavier than such a slope as was constructed by the Nova Scotia Steel & Coal Company to win its iron-ore areas about two miles out to sea under Conception Bay, Newfoundland. A cross-measure drift would be free from many troubles associated with the working of superimposed coal-seams, and it could be made entirely free from coal-dust dangers with little trouble. The only serious objection to the method, where it connects a number of coal-seams (apart from the expenditure) is that explosions and inundations might be communicated from seam to seam. Explosions could be guarded against by stone-dust barriers and other precautions, but the question of inundation would require some study. The winning of a single seam by the cross-measure drift method is not however open to any of these objections, and it may be taken for granted that undertakings of this kind will become fairly common in the submarine coal areas in Nova Scotia.

The reference made in our issue of the 25th February (page 150) to the matter of hydraulic stowing of pillar wastes was not intended to convey the impression that such a method was applicable to the broken area at Inverness No. 1 Mine, at this stage of the mine's life, but to point out that if the same method of proceeding indefinitely to the deep, leaving ungotten pillars in the rear, was persisted in, it would lead to similar conditions at every submarine colliery. It is suggested that future winnings should be laid out with a view to utilising the flushing method of packing the waste. The most difficult problem will be to find the material for flushing, but similar difficulties have been met and overcome in other parts of the world, and some very unlikely flushing materials have been used for want of better ones.

The greatest drawback to successful submarine coal mining in Nova Scotia has been the lack of continuity of management, and the absence of a competent mind directed through a lifetime of familiarity and research to the solution of the cumulative problem of this unique field. It is one worthy of a life study, and there is no engineering problem down in the Maritime Provinces to be compared to it for difficulty, or for the honours that success would bring.

The Trenton Cuesta

By Watson KIRCONNELL, M.A., Kingston, Ont.

A new cuesta in old Ontario is the thesis of this short article.

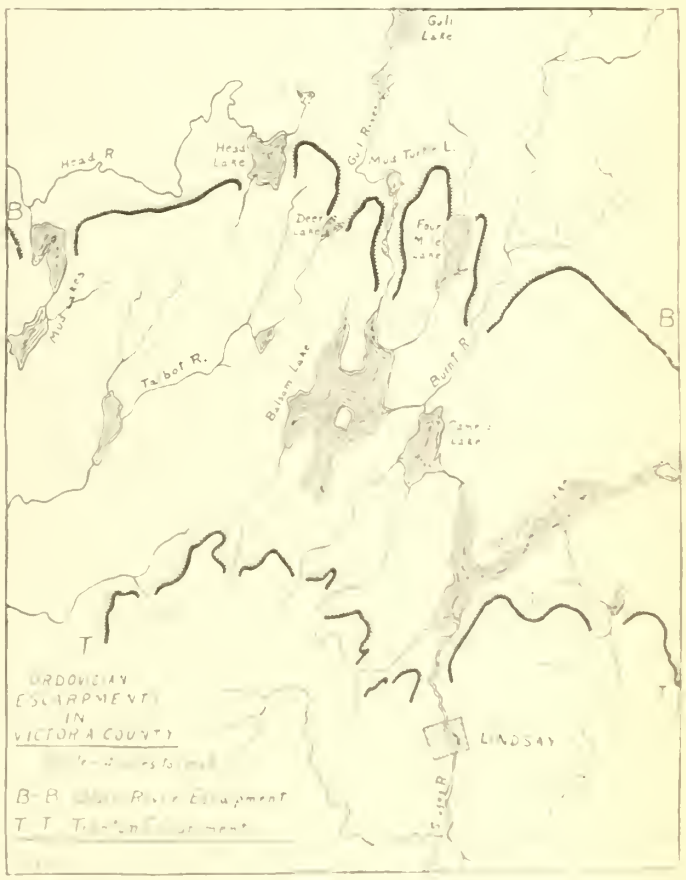
It has long been known that close to the junction of the Archaean oldland and the earliest Ordovician strata a pronounced cuesta with an inface of Black River limestones ran diagonally across central Ontario from Georgian Bay to Kingston. Dr. A. W. G. Wilson has described this Black River escarpment in some detail. (See Trans. Can. Inst., 1900-1, p. 160 and Bulletin, G. S. of A., Vol. 15, pp. 216-226.) But neither he nor Dr. A. W. Graban in his recent article (Geographical Review, April-June 1920, pp. 264-276) make any mention of any cuesta intermediate between the Black River formation and the great Niagara escarpment of Silurian limestones.

Apparently, however, the limited time and extended field of earlier investigators have concealed from them the existence in the southern part of Victoria County of a bold escarpment of Trenton limestone running approximately east and west, from fifteen to twenty miles south of the Black River escarpment. (See Map 1.) The length of this "Trenton escarpment", including its many windings and inversions, is practically sixty miles, within the borders of Victoria; and I have no doubt that in the adjacent counties to east and west it is coextensive with the Trenton limestones which it delimits.

My proof of this cuesta inface dates from September 1920, when I was looking for physiographical corroboration of the history of the "Algonquin" lake and river systems of Pleistocene times. My curiosity was soon inflamed by the unique character of a precipitous limestone cliff, obscured occasionally by glacial drift but often 150 clear feet in height, which ran across country in complete disharmony with any post-glacial drainage system; and I knew no peace of mind until, by walking and cycling, I had followed the escarpment to the limits of the county and established its continuity and identity.

It can be traced best by starting just at the left of the Grand Trunk Railway at Mackenzie's Crossing, four miles north of Lindsay. Here it appears on the Dark farm, crosses the Fenelon Township boundary and then turns west paralleling McLaren's Creek as far as the 2nd Concession of Fenelon. Here the so-called "Fenelon Hill" road is chiselled down the face of the cliff. On Concession II, Fenelon, McLaren's Creek passes out through a wide valley in the escarpment. The latter turns north here and is easily traced as far north as Lot 10, Concession III, where it strikes west until due north of Cambray village. Here great glacial deposits of sand and gravel obliterate it, but it is found again just west of Islay. From Lot 15, Concession I, Fenelon, it cuts across to Lot 7, Concession XI, Eldon, just west of the township boundary, where it shadows the Glenarm road quite prominently. Thence it runs north till a little past Glenarm, then bends around to the west as far as Lot 10, Concession VIII, Eldon, where the C.P.R. passes through it. On Lot 10, Concession VII a creek, tributary to Balsam Lake, passes out through a swampy valley. The cliff next proceeds up the 7th of Eldon as far as Balsam Lake Station, where it forms a very bold bluff before turning on a south-western stretch towards Argyle. At Argyle is another stream valley; but on Lot 11, Concession II, Eldon, the cuesta-front appears again and runs west into Ontario County on the 5th Concession of Thorah.

Every foot of this thirty-five miles of Trenton escarpment, west from the Scugog river to Ontario County, I have explored personally, on foot or by bicycle. East of the Scugog I have not followed it up so carefully; but I have located it at several points as far up as Pigeon Lake and have no doubt that it is practically continuous right across the county. The Scugog flows out through a wide valley; but the cliff reappears on the Brien farm, just north of Tillytown, and runs northeast behind Hay's Point. It is steep here, but not precipitous. Following Sturgeon Lake for some distance, it turns down steeply west of Emily Lake, reappears to the east of Emily Creek, and, after circling north a little, runs down the west shore of Pigeon Lake. Here, on Lot 18, Concession X, Emily, is the last outcropping which I have mapped personally.



The immediate inference from the existence of two clear escarpments in Victoria is that softer strata once intervened between the Black River limestones proper and the Trenton limestones proper. These softer beds were partially eaten away by the erosion of Tertiary times, leaving the imbricating edges of the hardest Trenton rocks as a cliff-front and, in front of this, the "Kawartha lowland" in which the Kawartha lakes, Balsam, Cameron, and Sturgeon, now lie.

It is also instructive to note that both escarpments are pierced by old Tertiary river valleys which maintain their identity through both cuestas and cliffs

the preglacial drainage system mapped out by Dr. Wilson. The most important of these valleys are those by which Gull River and Burnt River now enter the Black River cuesta from the Laurentian peneplain on the north. In both cases, but especially in the former, the old rock walls of the valleys, inverted from the main cuesta-front, can be traced southwards, parallel to the rivers, for several miles. Then, in the Trenton escarpment, on the exact projection of these ancient valleys, we find corresponding openings whereby these consequent streams flowed through towards the south-southwest, ultimately to join the Dundas master-consequent and pass out to the Erie lowlands. The glacial deposits are much heavier on the southern escarpment and the basset walls of its Tertiary valleys are more thickly masked than on the Black River cuesta, yet the unity of the old drainage system is quite clear.

The chief value of the mapping of the new "Trenton Cuesta", apart from the aid given in an imaginary reconstruction of Tertiary physiography, will doubtless be the drawing of a plainer distinction between the Black River and Trenton strata. Heretofore they have often been referred to in a single breath and grouped together as if little discrimination could be made between them. The discovery of a new escarpment, in no way smaller or less striking than that on the Black River frontier, will help to give the Trenton formation an individuality long denied it.

TORONTO NOTES.

In the Annual statement of the McKinley-Darragh-Savage Mines of Cobalt, Limited, which is now being sent out to the shareholders, a net loss of $40,574, as compared with net profits of $354,128 in 1919 are shown. The report points out that at the beginning of the year 1920 the price of silver was $1.31 per ounce, whereas at the close of the year it had fallen to 64¼ cents. As the average cost of producing silver during 1920 amounted to 85½ cents per ounce, the situation changed from one of operating at a substantial profit to one of operating at a steady loss, and on Jan. 1, 1921 it became necessary to close down the plant completely. The report declares it improbable that the ores left in the mine can ever be profitably produced at around the present market price. "The reopening of the mine, then, is conditioned on a real strengthening in the world demand for silver bullion" states the report. It is pointed out that a large tonnage of ore was broken in the mine during the period of high silver-prices, and this ore was profitable at that time. However, with silver around 60 cents per ounce it is unprofitable. The mine has approximately 25,000 tons of ore broken and, while a small portion of it might be profitable at present prices, the bulk would yield very little profit. There is also a considerable tonnage of unbroken ore remaining in the mine. The financial statement gives the current assets as amounting to $2,502,000 as compared with $2,739,864 in 1919. The current liabilities amount to $110,339, as compared with $101,479. Three dividends were paid during the year, amounting to $202,292, and these were of the same proportions as those paid during 1919. During the year a number of small ore-bodies were encountered as a result of development work, and the report states that these should produce a considerable tonnage of ore.

The Moore Filter Company, of New York, has commenced action in the Exchequer Court at Ottawa, against the Nipissing Mining Company of Ontario, claiming damages to the amount of $600,000, together with an injunction to prevent further use of the "Moore Filter," an appliance held to be "especially adapted for the filtration of precious-metal-bearing slimes." In its statement of claim the Moore Filter Company allege that the Nipissing Mining Company has infringed the patent rights to the Moore filter and has wrongfully used the filter in its business. Although thirty days have elapsed since the filing of the statement of claim, an order was made directing the plaintiff to furnish security for the defendant company's costs in the event of failure to succeed, and under this order the defendant company has ten days after service upon it of notice of the furnishing of such security within which to file its statement of defence. It is understood that the Nipissing Company is ready to file its defence and the case will likely go on.

In its allegations the Moore Filter Company claims that Canadian patent 85,610 was issued on December 29, 1903 to George Moore, then resident in Salt Lake City. The patent was for an "improved filter system especially adapted to the filtration of refuse." The patent right of George Moore was assigned to the Moore Filter Company, incorporated under the laws of the State of Maine, but with head office at New York, on April 27, 1907, and the company now claims the sole right to the patent.

It is charged that the Nipissing Mining Company has used and employed a filter system which infringed the patent of the Moore Company, and that although notified the Nipissing Company persisted in the using of such filter.

The Moore Company now claim $600,000 for loss of profits on the operation of the filter, an injunction preventing further infringement and the immediate destruction or delivery of all machines or appliances by which the Moore patent was held to have been infringed. The case is of considerable interest to the mining industry of Ontario.

U.S. GEOLOGICAL SURVEY ISSUES MAP OF OIL AND GAS FIELDS OF KANSAS

The United States Geological Survey, Department of the Interior, has just published a map of the oil and gas fields of Kansas. This map, which is on a scale of 12 miles to the inch, shows not only economic data of special interest to the oil man, but the township net, county boundaries, railroads, drainage lines and principal towns and cities. The oil fields are outlined in green and the gas fields in red, scattered occurrences of oil or of gas that are not of sufficient importance to be classified as fields are plainly indicated, the pipe lines are shown in a distinctive color, the locations of refineries are indicated and the names of the principal fields are given.

This map, which should be of extraordinary value to producers, refiners, and geologists interested in the Kansas fields, was compiled under the direction of G. B. Richardson of the United States Geological Survey, and was made possible by the cooperation of many of the producing companies and geologists whose interests lie in Kansas. The map is sold for 50 cents a copy and may be obtained from the Director of the United States Geological Survey, Washington, D.C.

The Great Fault of the Sudbury Nickel District

By C. H. HITCHCOCK, Sudbury.

The nickel formation (norite) of the Sudbury District is thought to be an intrusive sheet along the contact of the Upper Huronian sediments with the older rocks.

The folding of the district and subsequent erosion has produced an eliptical outcrop of norite, the longer axis being thirty miles long and the shorter axis sixteen miles.

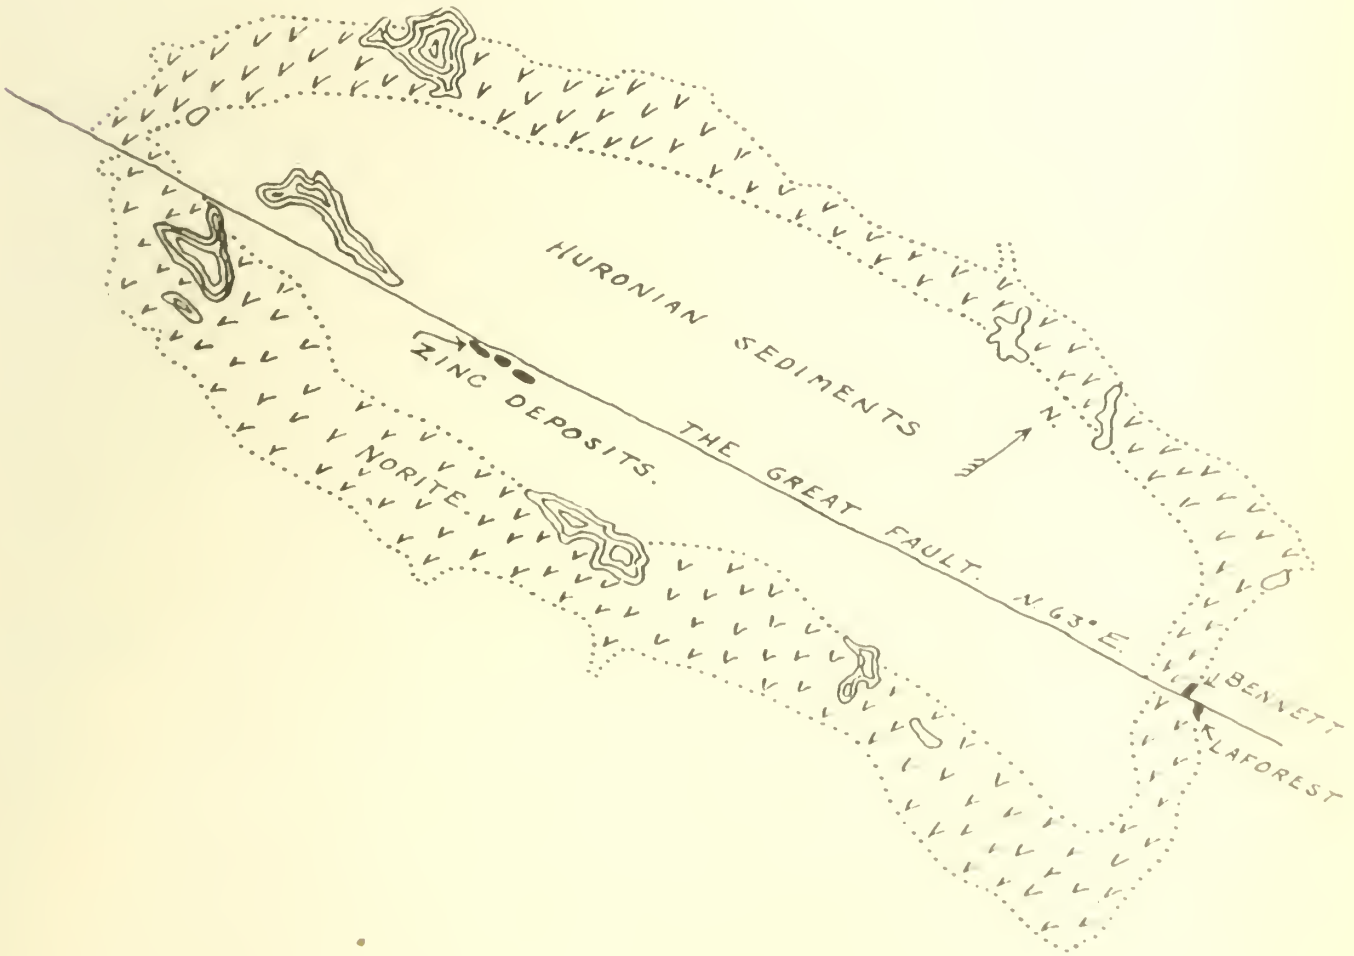
The past mapping has been very general, more so than most people realize. Many faults and hundreds of intrusive dikes have never been mapped at all.

In the southern part of Trill township just north of the Sultana Mine, basic norite rests against acid norite. The nickel formation appears faulted, the displacement amounts to approximately six thousand feet. In line with this fault on the opposite side of the nickel basin, in Capreol township just north of Clear Lake, the norite is faulted again, showing a displacement of two thousand five hundred feet. The Bennett and LaForest prospects are really the same ore zone but have been separated a half mile by the above fault.

As the strike of the fault in both Trill and Capreol townships is the same, namely sixty-three degrees northeast, and the direction of the displacement is the same, it appears very likely that this fault cuts the whole nickel basin for a distance of thirty miles.

An economic item of interest is that the zinc deposits south of Chelmsford are in exact line of this fault. It is possible that these deposits have a genetic relation to the great fault. Much of this fault zone in the center of the nickel basin is soil covered, therefore other zinc deposits may exist and the line of this fault may be a promising zone to prospect.

Although further field work could be done to verify or disprove the existence of this fault, from the observations I have made I believe it is a reality.



Map showing suggested Great Fault in Sudbury Nickel Area.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

Operations in the Cobalt district have narrowed down to approximately one-third the rate which prevailed one year ago. Current production has declined to less than half a million ounces monthly, and the total number of men employed does not exceed 650.

The poor market for silver is the great factor which has upset the equilibrium, and for the time being is almost wiping out an important industry. This factor is intensified by reason of the fact that the workers in the mines have not established as high efficiency as prevailed before the war, and in being unable to turn out an equal tonnage they are making it more difficult for the mines to continue operation.

Official announcement is made to the correspondent of the Journal that the Mining Corporation, which closed its mines and mills March 7th, will carry on certain repair work in its mill, and, by making certain alterations and the expenditure of about $20,000 will increase its milling facilities to 300 tons daily as compared with 200 tons formerly. Should the market for silver strengthen, the company will be in a position to resume work within the next two months and at a rate which holds out promise of reducing the cost of producing the metal. Among other things, it is planned to centralize underground work as much as possible. In doing this, instead of drawing ore from widely separated points, the Buffalo part of the property will be drawn from more extensively. The arrangements to draw ore from this property were completed just prior to closing down. The company has passed up its dividend for the first quarter of 1921, the object being to conserve finances for the time being.

In an official statement just obtained from the Aladdin-Cobalt, which controls the Chambers-Ferland mine, the reports recently presented in the Journal in regard to developments at the 410-ft. level are fully corroborated. Very rich ore has been encountered, some sections of the vein containing upwards of 10,000 ounces of silver to the ton. The general average of the 2-inch vein is around 5,000 ounces to the ton, while the wall-rock contains a quite large tonnage of ore which will run 100 ounces to the ton. The development is regarded as being important.

Announcement is made that the Moore Filter interests, of New York, are suing the Nipissing Mining Company for alleged infringement of the Moore Filtration Process, the figure set in the damage action being $600,000. Officials of the company preferred to not discuss the matter, with the exception of declaring that the whole question is in the hands of the Company's Toronto solicitors.

F. J. Bourne, manager, and Mr. Holmes, mill superintendent, have resigned from their positions with the Bailey Silver Mines, the resignations having been accepted as going into effect March 31st. It is learned that G. C. Bateman will be consulting engineer from that date forward and will have full charge of mining and milling operations. Mr. Bateman will continue to manage the La Rose.

Concerning a deal reported in certain sections of the press that the La Rose and Bailey Silver Mines were negotiating with a view to selling the Bailey mill to the La Rose has been emphatically denied by an official of the Bailey Silver Mines who gave the Journal correspondent authority to state that no such deal is pending and that the matter has not even been discussed in official circles.

It has just been learned that a hitch has occurred in the deal between the Aladdin-Cobalt and some of the interests identified with the Northern Customs Concentrator. It will be recalled that last year, these interests purchased for something like $175,000 a part of the Chambers-Ferland mine which is owned by the Aladdin-Cobalt. It now turns out that about $70,000 has been paid on the deal, but that the balance has not, and the property reverts back to the Aladdin-Cobalt. It is understood the latter company also retains the $70,000 received on account, as and for liquidated damages.

In his regular monthly report to the president and directors of the Nipissing Mining Co., Hugh Park, manager, states that during the month of February the Company mined ore of an estimated net value of $124,391, (which included $12,460 worth of cobalt) and shipped bullion from Nipissing and custom ores of an estimated net value of $234,374. The value of the silver produced was estimated at 54⅜ cents an ounce.

"There were no developments of an unusual nature during the month, says Mr. Park. Vein 241, found in January at the second level of 63 shaft, has received a small amount of drifting and results have been encouraging to date. The vein is averaging 1,200 ounces to the ton over a width of two inches.

"The low-grade mill treated 6,289 tons. The high-grade plant treated 149 tons. The refinery shipped 401,111 fine ounces of bullion.

Prospectors classes are being held in the mining building of the Haileybury High School, and the attendance is stated to be upwards of thirty at the time of writing. The course covers a period of only ten days, and will be concluded March 18th, according to present plans.

The annual report of the McKinley-Darragh mine has just been issued, and shows a net loss of upwards of $40,000. The statement declares it quite impossible to re-open the mine under present conditions. Costs last year approximated 85½ cents an ounce, a fact which makes it clear that operations could not be carried on this year with silver well below 60 cents an ounce. Dividends paid last year were taken out of the former surplus, according to the report, a fact which came as quite a surprise as it had been believed the company was making substantial profits during the first half of the year at least.

Ore and Bullion Shipments.

During the week ended March 11th, the La Rose Consolidated was the only company to ship ore from Cobalt, this company sending out one car containing approximately 69,126 pounds of ore.

During the corresponding period, the Nipissing made two shipments of bullion, one of 69 and one of 77 bars and amounting to a total of 146 bars containing 189,491 ounces of silver.

THE GOLD MINES.

The Porcupine District.

Although reports are current that the Northern Canada Power Company plans to take adequate steps to meet the future hydro-electric power requirements of the mines of the Porcupine district, yet nothing has been ascertained in official circles in regard to this important matter. It is believed no difficulty will be experienced once the spring break-up occurs, and throughout the Summer, but those who are vitally in-

volved in the big mining operations are anxious to learn to what extent the possibilities of recurrences of periods of power shortage during the winter months may be minimized. The experience of the past few months has been extremely costly, and the hope is expressed that everything possible will be done to prevent a repetition of such an unfortunate situation.

A. F. Brigham, general manager of the Hollinger Consolidated, told the correspondent of the Journal that his company is receiving about 1,500 K.W.s as compared with full requirements of close to 10,000. By utilizing auxiliary equipment which is costing the company from $800 to $900 a day to operate, an average of about 1,300 tons of ore is being treated daily. The Hollinger claims to have an agreement whereby the power company agrees to supply the full requirements of the mine, and in view of the present shortage, the Hollinger is taking action against the power company for damages. It is not known whether the difficulty may be adjusted before being brought to trial, or not.

A meeting of the directors of the Dome Mine is to be held this week, when it is understood the usual dividend of 2½ p.c. will be declared for the second quarter of the year. The question of distributing some of the surplus as a "capital reduction" is expected to be left over for a few weeks, and may be dealt with soon after the spring break-up by which time the mines and mill will be in full operation, a condition which will permit the directors to estimate with greater accuracy the extent of the distribution that may safely be made. It is generally believed the capital reduction this year will amount to about 20 p.c., in addition to the regular dividends of 10 p.c. This total return of 30 p.c., if actually decided upon, would represent a return of 10 p.c. on the shares at $30 each as compared with their par value of $10 each. It is learned that the big underground crusher at the 850 ft. level is now in operation, and no difficulty is expected to be encountered in feeding the mill at full capacity just as soon as the necessary power becomes available.

During 1920, the Davidson Consolidated treated 3,003 tons of ore from which a total of $11,210 was produced, or an average of $3.73 per ton. Current expenses were obviously greatly in excess of the value produced at such times as the small mill was operated. It is believed, however, that if present plans materialize in the Old Country, and with a cyanide plant installed, the value per ton recovered may be much higher. Messrs. E. C. and H. H. Sutherland of Toronto are at present in England in connection with the deal which is pending in connection with the sale of the Davidson Consolidated to English interests.

Kirkland Lake District

Official figures show the Kirkland Lake Gold Mines, Ltd. treated a total of approximately 40,812 tons of ore during 1920, and recovered $285,170. This shows an average of 112 tons daily and an average recovery of close to $7 per ton. No figures have been secured in regard to the cost of work, but from statements made from time to time during the year by officials, it is believed the average cost was held down to about the average grade of the ore. It is also understood the current year is to witness an increase in mill heads as well as an increase to close to 150 tons daily in which case the year 1921 offers promise of substantial net earnings. Developments at depth continue favorable.

It is intimated in official circles that the Ontario Government will spend considerable money this spring and summer on the work of improving the road through Lebel township from the Tough-Oakes mine. This work will be preliminary to macadamizing the three or four mile stretch as far east as Mud Lake during the following summer, provided the result of exploration and development work in that area proves to be satisfactory. At present good headway is being made on the various prospects, and with interest turning strongly in favor of gold mining a very active summer is looked for in this district.

About eight miles farther east from Mud Lake, the Argonaut Gold Mines continues to make good progress in its work. Last year, by operating a small straight-amalgamation mill on ore taken out during the course of development work, the company treated 4,637 tons of ore and recovered $26,678.25. This assisted to defray the cost of the large amount of exploration and development work done during the year. Average recovery being $5.75 per ton of ore treated by this process indicates a probable recovery of around $10 a ton just as soon as the property can be equipped with a modern mill.

Concerning the controversy between certain minority shareholders and the officers of the Goldfields, Ltd., of Larder Lake, it is understood an effort is being made to enlarge the case. As stated previously in the Journal, an injunction restraining the directors from carrying out a proposed deal with the Canadian Associated Goldfields, was refused on the grounds that not sufficient evidence was produced.

In the meantime, work on the Associated Goldfields' property is progressing at a good rate under the management of Mr. Gray, formerly of the staff of the Dome Mines and it is understood the efficiency of the work is improving.

A paper read by W. E. Simpson, of the Miller Independence Mines, at the Annual Meeting of the Canadian Institute of Mining & Metallurgy, has caused considerable discussion in the mining districts. The paper dealt with the need of public ore treatment plants at points of vantage in the mining districts, and also dealt with the ease with which patents are secured upon mining claims and the large amount of territory lying in idleness. Comment heard in the mining districts is generally favorable to the points brought out, one writer from as far as west as Schreiber pointing out that in his district the ideas expressed by Mr. Simpson covered the situation exactly as it exists.

PROGRESS OF MINING IN ALASKA.

To provide fuel for the use of the Alaskan Engineering Commission coal mining was continued in 1919 in the Matanuska field, Alaska, on about the same scale as in previous years. Near this field and also tributary to the Government railroad, is the Willow Creek gold district, where large auriferous lodes are being exploited. These mining developments are described in a pamphlet by Theodore Chapin entitled "Mining in the Matanuska Coal Fields and the Willow Creek District, Alaska," just issued by the U.S. Geological Survey, Department of the Interior, as Bulletin 714-D.

The copper mines of the Chitina Valley are the largest and richest thus far developed in Alaska. Their successful development has been made possible by the completion of the Copper River & Northwestern Railroad, which affords transportation to tidewater. The recent mining progress in this district is shown in a report entitled "Mining in the Chitina Valley, Alaska," by F. H. Moffit, issued by the United States Geological Survey, Department of the Interior as Bulletin 714-D.

TORONTO MINING STOCK QUOTATIONS.

Antimony	8

SKINNERS MINING MANUAL FOR 1921.

The "Mining Manual and Mining Year Book" for 1921 (Thirty-fifth annual issue) by Walter R. Skinner, editor of the "Oil & Petroleum Manual" has just been issued. Price 20s., net 21s. post free inland and 21s. 6 post free abroad. This reference work is the only annual book published dealing with mining and kindred companies operating in all parts of the world. This years issue contains full particulars of 1430 mining companies — gold, diamond, silver, copper, tin, iron and coal also exploration and mining investment companies arranged in alphabetical order. The Particulars given of each Company include the Directors and other officials, date of establishment, seat of operations, description of the property, with the purchase consideration, plant erected or in course of erection, present working results, ore reserves, details of capital, calls, dividends paid, and the financial position as disclosed by the latest accounts. Highest and lowest prices of the shares or the last three years, also latest price. Lists are also given of the officials, connected with the companies and comprise 3,530 Directors and 952 mining and consulting engineers, their addresses and the names of the companies with which they are connected. Other useful features of the book are the Supplementary Index of private dormant or Companies which have ceased to be of public or market interest; Crushing Tables and Outputs from the principal Gold mines showing tons treated monthly, results obtained, and yield per ton; also annual yields and Dictionary of Mining Terms by the use of which mining developments can easily be followed. A Directory of Manufacturers and Exporters of Mining Machinery is also included. The book can be obtained from all Booksellers, or direct from the Publishers, Walter R. Skinner, 11-12 Clements Lane, London, E.C., 4 and "Financial Times", 72, Coleman Street, London, E.C., 2.

We are glad to note that Mr. Skinner's Manual contains much more detailed information regarding Canadian mining companies than previous editions. There is a tendency to omit Canadian mining companies from directories and other compilations issued in London, because so many Canadian companies are financed and controlled from New York. We would suggest in future editions of this very trustworthy manual statistics regarding Canadian gold production, and mention of our asbestos companies. The attention paid by English capitalists to some very important Canadian resources is quite overshadowed by United States connections.

C. I. M. & M. Montreal Meeting

April 2nd and 4th, 1921

British Columbia Letter

THE METAL MINES.

Stewart, B.C.

The last shipment of 600 tons of ore from the Premier Mine, Salmon River, was brought over the snow in five days. Several shipments are expected to be added to what has been brought out before the winter trail breaks. Preparations still are underway for the installation of an aerial tramway, the work on which will commence as soon as the summer season opens.

Dawson, Y.T.

A placer mining claim situated on Crofton Gulch, Y. T., to which the Canadian Klondyke Company asserted ownership, has been pronounced the property of Mrs. Boyle by the Court of Appeal of Canada. Twenty years ago a concession was granted in the territory in which the claim is situated. The original holder of the concession was Col. Boyle. The placer claim was kept in good standing until 1920 when it was permitted to lapse. It then was re-staked by Mrs. Boyle. The legal point at issue was whether it then reverted to the Crown or to the Klondyke Company, which had acquired the Boyle Concession. If to the Crown, Mrs. Boyle's position is sound, and officials must accept her application for record. The Courts having so decided the astute lady is in possession.

Trail, B.C.

Receipts of the Trail Smelter, Canadian Consolidated Mining and Smelting Co. for the week ending February 21, were 8,665 tons of ore and concentrates, of which all but 100 tons come from Company properties. The Horn Silver Mine, Similkameen, accounted for 95 tons of the latter amount. The Nip and Tuck, Sandon, made a trial shipment. For the year up to date, the shipments at the smelter aggregate 58,145 tons, of which the Company's mine have contributed 57,084 tons. It, therefore, is clear that the independent operators of the interior of the Province have not been doing much as yet this year.

Nelson, B.C.

Discussing operations on the property of the Silversmith Mines, Ltd., old "Slocan Star", Slocan, B. C., John B. White, the president, explained that a policy of development and preparing for shipment when market conditions improve is being followed. Forty men are working underground and are developing and blocking out a large body of ore by means of drifts and

raises on the various levels. Further depth also is being sought on a minor ore-body. This is situated near where the new workings take off from the form a long crossent, now used as the working tunnel. Other work consists of driving under the old workings for the ore body previously mined above. When ore is encountered in the course of development, it is removed and stored, but otherwise there is no stoping. Mr. White emphatically declares that it is not the intention to run the Mill or to ship ore on the present market, "for at present prices we cannot operate our property on a sufficient profit to warrant taking out the ore."

Vancouver, B.C.

The commencement of work on a large steel plant is likely to start in British Columbia this summer according to H. H. Falconer, president of the Manufacturers' Association of the Province. He states that five representatives of the biggest steel operators of Great Britain recently returned to England satisfied that the Province possesses the iron ore and other resources necessary to assure the economical manufacture of iron and steel and that the market for the products is available. Within a radius of 100 miles in the interior of the Province, it is stated, all the necessary varieties of ore were located and examined. The iron plant, therefore, is to be situated in the interior and the steel mill on the coast. Mr. Falconer states that a proposed agreement has been submitted to the Provincial Government dealing with the provincial bounty, taxation, and other questions. If this is accepted by the Government, it is stated that the needed capital is ready for the investment.

J. J. Dickenson, manager of the Blue Diamond Mine, Cobalt, and G. H. Eaton, manager of the Coalspur Mines, Alberta, have been visiting British Columbia. They have been inspecting a number of metal and coal mines and, it is assumed, are looking over the western field generally with a view to locating promising investments.

A plant will be installed about two miles from Quesnel, B. C., for the extraction of platinum and gold from black sands, if the plans of S. J. Marsh reach fruition. Mr Marsh is the inventor of the method of extraction referred to and has been able to convince many practical mining men of the effectiveness of his patent. Himself an old prospector and a first class chemist, and having devoted years to experimentation on these sands, it is not unreasonable to believe that he has devised an economical means of recovering the values which long have been known to be contained in the placer ground of the Fraser River and some of its tributaries. Therefore the results of his work, to be tested soon on a commercial scale, are being awaited with interest.

THE KLONDYKE.

With the famous old placer creeks of Bonanza, Eldorado and Hunker having been practically dredged out the largest remaining dredge propositions in the Klondike proper, that is, within a radius of 50 miles of Dawson, are those of the North West Corporation and the Canadian Klondike Company, allied under the Granville Mining Company, which holds most of the stock of the two operating companies.

The North West Corporation operates in the Indian River watershed, while the Canadian Klondike Company is confined to the Klondike valley. Both are supplied with power from the large hydro-electric plant of the Canadian Klondike Power Company, situated at Glenboyle, 25 miles from Dawson, where the power is generated with water from the Klondike.

The North West Corporation owns two large dredges, one of the Marion and the other of the Bucyrus type. Each has seven and a half cubic foot buckets, with a capacity of 4,000 cubic yards daily. No. 1 dredge of this Company was installed during the early part of 1920 on upper Dominion Creek, and began operations there last summer. It formerly operated on the old Bear Concession, and later on upper Hunker Creek, under the Canadian Klondike Company and was the pioneer modern dredge of the Klondike camp. In its operations last summer, after being moved to Dominion, it met with decided success, and the outlook for it is considered very promising, as Dominion is one of the best of the famous old placer creeks of the Klondike camp yet undredged.

The second dredge of the North West Corporation was bought during the year from the Yukon Gold Company, and is being moved by sleighs from 60 miles below Hunker, where the Yukon Gold finished dredging out its Hunker Creek holdings, to Granville, on Lower Dominion Creek, where it will be assembled this year. It is the intention of the company to start operations there with the dredge as early as possible this season. The company has been preparing ground in this locality by stripping the overburden with hydraulics and by ground sluicing for years, and has a large area ready for work.

The Canadian Klondike Company has three mammoth Marion dredges, the largest in the entire North, and ranking among the largest gold-dredges in the world. They are located on the Company's ground, known as the Boyle concession, extending the full width of the Klondike valley, and from the mouth of Bonanza creek to near the mouth of Hunker creek, some eight miles in length. A large portion of this wonderful deposit of auriferous gravel has been turned over by the dredges of the company during the last several years, but the greater part of the concession is yet unworked, and some estimate it will require fully twenty years to work it out with the large dredges now there. Two of the dredges were working during the last season, 1920, and turned over a large yardage. The third dredge was idle because of not having been fully equipped with buckets and other parts, which were scarce and difficult to obtain during the war. Each of these large dredges has buckets with capacity of 17 cu. ft. and the daily capacity of each dredge is 10,000 to 16,000 cubic yards.

The Canadian Klondike Power Company's plant has two 3,000 K.V.A. generators with a total capacity of 8,000 horsepower, and has been generating about 3,000 horsepower during the summer. The plant operates the year round and supplies power to the city of Dawson as well as to mining operations in the creeks.

The North West and the Canadian Klondike companies employ about 250 men in the busy season of the year, and about 75 during the winter. A fine, large and fully equipped machine shop, located at the mouth of Bear Creek, eight miles from Dawson, does the repair work.

The North West Corporation has extensive placer holdings on Dominion Creek, Indian River, Quartz Creek and Sulphur Creek. It owns most of lower Sulphur. The dredging ground of that company and others

on Sulphur is estimated to be fifteen miles in length, while ground on Dominion suitable for dredging is estimated also at 15 miles, while Quartz has a mile and a half of dredging ground, and Indian River, for 20 miles, is supposed to contain much ground which with new processes will prove in time suitable for dredging. All told, it is estimated the North West and the Canadian Klondike companies have ground enough in sight of dredging value to keep their present dredges and probably others busy the next twenty years. F. P. Burrall is manager of the two companies.

THE COLLIERIES.

The Coal Inquiry ordered by the Government of British Columbia has been in progress a week without any disclosures of consequence. Commissioner A. Henderson has had the dealers of Vancouver City before him. They have told of the cost of handling the coal from the bunkers of the Collieries to the cellars of the consumers. Their profits, it has been testified, amount to 66 cents a ton. No testimony, apart from that of Moses Cotsworth, statistician, has been volunteered by the general public. The latter submitted figures based on records, he stated, and drawing attention particularly to the rise in the retail quotations on coal with the removal of Dominion Government control after the war and also essaying to establish that there has been a disproportionate rise in the cost of coal as compared to the advance in miners' wages. The commission has not yet taken up the matter of the collieries' costs. The feature thus far is the apparent indifference of the general public, the sessions held having failed to attract audiences.

The old question of settlers' rights to the coal underlying property within the Esquimalt & Nanaimo Ry. Belt, Vancouver Island, has again been raised. A deputation consisting of well-known residents of Nanaimo, Ladysmith, and neighboring districts, recently waited on the Provincial Government to ask for the re-introduction to the Provincial Legislature of the Settlers' Rights Act. The situation now is that the last Act of the kind was not signed by the Lieutenant Governor. Under the circumstances it is doubtful whether the settlers' request will be granted. The Act which remains inoperative provides additional time for the settlers to record their claim to coal rights and for the hearing of the same. If such claims are established before the Lieut-Governor-in-Council provincial leases to the coal are granted.

A considerable reduction in the wages of coal miners in the State of Washington has been announced. In all the mines, with two exceptions, there will be a cut of an average of an average of 23 per cent effective March 15 and the retail prices of coal will drop from fifty cents to $2.50 per ton. The two mines unaffected are engaged in the mining of coal for railroads. Between 3,000 and 4,000 men are affected by the order of the operators who explain that they are returning to the wage scale of October, 1919. They state that, if the order is not accepted, the mines will be closed. The executive board of the United Mine Workers of America, District No. 10, is considering the situation

EDITORIAL

Pan Extension Gold Mine

At the Institute meeting in Montreal, Mr. P. T. MacGregor of Toronto, spoke lucidly and convincingly in favor of "blue-sky legislation", and elicited from a well-known member of the Institute the penetrating observation that such legislation was not so desirable for the protection of the "sucker", because in the nature of things that credulous type cannot be altogether protected, but to protect the good repute of mining engineers. As an example of the type of mining promotion it was desirable to discourage, there was displayed a full-page advertisement of a stock offering in the Pan Extension Gold Mine, Rice Lake, Manitoba. In reporting the proceedings at this meeting, this journal did not consider it proper to publish the name of this flotation, it not having come under personal observation in the daily press of the East. In the "Montreal Star" of 16th March, however, and in one later issue, there appeared a full-page advertisement of the Northern Finance Company offering Pan Extension stock at fifty cents a share, this stock being, according to the advertisement, "in demand across the Continent." "As development progresses with the phenomenal showings in the mine, this stock", proceeds the advertisement, "should eventually advance to five dollars or ten dollars a share, as has been the case in other high-grade bonanza mines." "It is", the public is informed, "only a question of time and development." We beg to differ. It is a question of whether the ore is present in sufficient quantity in the property, and the "facts" disclosed do not make this convincingly clear.

Some typical "facts" may be quoted. Rice Lake is declared to be "The richest gold camp in the world." The face of the drift at the 120 ft. level "is considered one of the richest bodies of gold ore ever discovered. There is every assurance that the deeper development will block out millions of dollars of this extraordinary high-grade ore." "Pan Extension is the Leader in a great new gold camp. The drills are pounding away. Every shot a revelation of greater riches, and it looks as though Pan Extension will stand supreme as the richest gold mine in the World."

The advertisement contains the familiar offer of shares at a low price, after which "they will positively be advanced." There is nothing new or original in the literature, and we have seen this kind of thing more cleverly done.

There is not even missing the old gag about purchasers of shares in mining enterprises reaping rich returns, but for real touches of the promoter's humour we much prefer the literature of the Little Gem Mining Company in the Montreal newspapers some time ago, which invited would be gamblers to sit in at a little poker game promising that the pot they would win would be relative to the amount of the ante. Humour, candour and style were possessed by the drafters of this invitation, but it would be interesting to know how the pot turned out and who won it.

A request for further information made through the mail has brought a circular letter, which among other things states that Pan Extension is "actually shipping gold ore and proving to be the richest mine in Canada."

We are also in receipt of the "Mining Bulletin", dated Winnipeg, November 1920, composed of clippings from Winnipeg newspapers regarding Northern Manitoba mines, and using in that detached manner cultivated by mining promoters the opinions of such eminent mining engineers and geologists as Dr. Wallace, Dr W. G. Miller, Mr. J. B. Tyrrell and others. We are not able, however, to trace any connection between what these gentlemen are quoted as stating and the value of shares in Pan Extension.

A report on the property, dated 1st. September 1920, by Mr. John Beckman, is given in full, the gist of which seems to be that some very rich ore has been found at a depth exceeding 100 feet. Prof. Wallace is quoted as stating that "veins in this district are true fissures and extend deeper than man can mine." From this combination the assumption is made that this rich ore will "prove continuous and regular", and the examples of Cobalt, Cripple Creek, and Kalgoorlie are quoted as high-grade ore-bodies likely to be paralleled by the Pan Extension.

Without very much more detailed information than is contained in the advertisements and in the literature sent to enquirers it is not possible to say what chances a speculator would have of getting his own back again. Admiration for the restrained character of the statements made cannot be withheld, but some improvement could be suggested.

In a report on the Rice Lake District (see page 76, our issue of 28th January) Professor DeLury has this to say about the Rice Lake District: "It will be surprising if in future years the Rice Lake District is found to have no workable gold deposits. The duration of these years will be lessened if a spirit of co-operation is fostered, and active steps are taken to check exaggerated stories and illegitimate promotions, both of which have done the district an infinite amount of harm in the past."

Our readers will find no difficulty in assessing the accuracy of the Pan Extension advertisements or the legitimacy of the promotion, but who is responsible for safeguarding the credit of the Rice Lake District does not yet appear.

BRITISH COLUMBIA FORBIDS OPEN LIGHTS IN COAL MINES.

The action of the Minister of Mines of British Columbia in banning the naked light from the coal-mines of the province deserves unreserved commendation. The cause of every explosion in a coal mine, reduced to its simplest terms, has been the presence of naked flame. Whether the coroner's inquest has attributed the explosion to a blown-out shot, a sparking switch or commutator, an open light, or a damaged safety lamp; to sparks from contact of the pick with hard substances, or the sparks from colliding rocks; to gob fires, matches, or the various well-known reasons that have formed the melancholy burden of many an inquest, the presence of flame in some form has caused the mischief.

With the coming of the electric miner's lamp, the lack of illuminating power that was the greatest drawback of the oil-flame, safety-lamp, is overcome, as the approved types of electric miners' lamps combine maximum illumination with complete safety. The naked light is a fearful anachronism. Its use in any coal mine, whether reputed free from gas and dust, or not, is fraught with constant danger. It courts death.

There was a time when scientists debated learnedly as to whether coal-dust was a true explosive or not. Surely, after the explosion of the Chicago grain elevator, reported at the time of writing, following upon the explosion of the Port Colborne elevator, and that of numerous flour mills at different times, there should be little hesitation in considering the interior of a dusty mine (irrespective of the presence of inflammable gas) as an unfit place in which to use an unprotected flame. A little gas—just a little—increases the danger many times, and what coal-mine known to the miner can be guaranteed to be gas-free?

In the matter of requiring precautions against accidents in coal mines the government of British Columbia is commendably progressive, and we hope someday to hear that the use of naked lights in coal-mines has been unconditionably prohibited throughout Canada.

ANOTHER COAL SHORTAGE LOOMING?

It begins to look as if the United States and Canada were repeating the conditions of the early months of 1919 that brought about a shortage of coal at delivery points in the Winter of 1919-1920. The first quarter of 1919 saw buyers disinclined to pay current prices for coal, mines were closed down, production was curtailed, stocks were eaten up, and on top of all this came the switchmen's strike and complete over-taxing and incapacity of the railways.

At this time bituminous production is at a lower rate than at any time during five years past in the United States. Conditions in Canada are precisely the same. There is an unadjusted wage question connected with the railways of the United States that may cause trouble at any time. The only difference between conditions at this time and in the early part of 1919 is the partly accomplished fall in commodity prices and quotations for bituminous coal that are too low to last. High-cost mines, both here and in the United States, have been forced out of production, and many of them will remain permanently closed, as they were but the ephemeral children of war conditions. Mr. Cushing, head of the American Wholesale Coal Association, estimates the outturn cost of bituminous coal at point of discharging the railroad car has increased from an average of $2.56 to a minimum of $5.51, allowing nothing for selling costs and profits. This increase is represented by higher wages to mine workmen, higher costs of material and overhead, and higher freights. The mine owners are powerless to deal with all these factors of increase, and there has not yet appeared any power than can remove them. If buyers therefore hug the delusion that bituminous coal costs are going to return to pre-war figures, or figures approaching them, they must soon receive disillusion, and abstention from buying at this time—except where it is forced by cessation of operations as in the steel trade—is merely sowing the seed for foolishly high prices later, which will come as a result of a purely marginal shortage and transportation congestion. The buyer who takes advantage of today's quotations for bituminous coal, and gets his coal stored safely away during the favorable transportation weather of this time, will experience no regrets next Autumn.

Production cost of bituminous coal in the United States is estimated at $3.00 per ton. There are of course mines that can produce coal at less than this figure, but an average price of $3.00 per ton at the pitmouth may be taken as about rock-bottom at this time, and lower than prices at a later date. The mine that produced coal before the war at $1.00 per ton probably had an incorrect cost-sheet, and it is much to be doubted whether even the most favourably situated coal mines in the United States—and some of them are the most cheaply operated mines in the World—can today produce coal at less than $2.50 per ton, if its cost of production is calculated over the life of the mine. Any other method of calculation is incorrect.

It seems probable that the new level of commodity

prices which wil prevail for some years to come will depend more upon the selling price of coal than upon any other industrial factor. There is no likelihood of cheapening of coal production arising from the opening of new and plentiful coal reserves in any part of the known world, with the possible exception of the Alberta fields, so that this source of decline in coal production costs can be dismissed.

There is some hope that the cost of light, heat and power produced from coal may be lessened by more efficient modes of use, but this factor will probably not do more than offset the increase of cost of production arising from progressive lessening of the reserves of coal.

Those who undertake the task of reducing the labour cost entering into the cost of production of coal in the United States will find it difficult to overcome the contention of the coal workers that their earning powers are reduced by alternating periods of idleness and forced production, and, until this legitimate complaint of the coal-worker is redressed, little is to be looked for in this direction.

The railways also are victimised by the same unreasonable alternations in demand, and, judging by the few orders given in recent years for equipment or track material, the railways must be less prepared to meet any exacting pressure upon their carrying capacity than at any time since the war broke out.

The present reduced rate of bituminous coal production is therefore regrettable, inasmuch as it foreshadows the recurrence of the same costly scramble for coal supply that has upset industrial and domestic peace so often in the recent years. It is understood that some of the best minds in the United States have undertaken to study the problem of coal supply and distribution in that country, and the task is worthy of such men. In considering this matter it should be remembered that at no previous date in history has any nation ever attempted such a problem in transportation as is presented by the annual distribution of approaching 800,000,000 tons of coal, to suit a fluctuating and seasonal demand, over a territory so vast as that comprehended in the United States, and the territory of neighbours, north and south, that it supplies with coal.

SUBMARINE COAL MINING AT NANAIMO

In this issue will be found a short description of undersea coal-mining at Nanaimo, Vancouver Island that is of interest to coal miners on the Atlantic coast as it tells of the successful employment of the longwall method of extraction at what is, in Canadian practice, slight undersea cover. The abandonment of the undersea faces at their maximum seaward extension was not forced by any difficulties of extraction, but by a deterioration in the quality of the coal seam, which turned thin and dirty.

There is one other longwall operation under the sea, namely the workings of the Maritime Coal & Railway Company in the undersea extension of the Joggins Field Cumberland Co., Nova Scotia. In this instance the seam is quite thin, and dipping steeply seaward, but entire extraction of the seam has been found possible in the first working.

The longwall method is that more generally used in the undersea coal mines of the Cumberland and northeast coast mines of Britain. The suitability of longwall is conditioned to some extent by the nature of the sea-floor, and where clay or clay ooze is present, mining can be pursued under very thin cover without danger of the sea breaking in, but, leaving this consideration apart, the chief advantage of the longwall method of complete extraction is that it allows equal and unruptured subsidence of the sea-floor lying over the extracted area, whereas the "pillar and room" method tends to break the strata, and is especially inapplicable where the strata, is brittle or "short" in its character. If the pillar and room method is employed for the extraction of superimposed coal seams, the distortion and danger of breaking the superincumbent strata is of course much intensified.

PERSONALS

Mr. G. C. Bateman, manager of La Rose Consolidated Mines has been appointed consulting engineer for Bailey Silver Mines. This company operates the Bailey silver mine and a customs concentrating plant at Cobalt. Mr. Bateman continues as manager of La Rose.

Mr. F. J. Bourne, general manager of Bailey Silver Mines, Cobalt, has resigned. Mr. Bourne has played an important part in the development of methods of treating the ores of the Cobalt silver district. He was manager of the Northern Customs Concentrators Ltd. whose mill was recently taken over by Bailey Silver Mines Ltd. His several years of service have brought him recognition as a leading authority on the concentration of silver ores.

Hon. G. Howard Ferguson, Minister of Mines in the former Ontario Government is showing in the Legislature that he has not lost his interests in mining development of Northern Ontario. Mr. Charles McCrae of Sudbury and Mr. Mac Lang of Cochrane are also urging the Government to take a more active part in developing the North and are opposing the proposal to increase the tax on profits.

Mr. W. A. Carlyle has resigned as managing director of the British American Nickel Corporation. Mr. Carlyle came to Canada from London to manage the affairs of this company and had charge of the construction of the smelter at Nickelton and the refinery at Deschenes. He is a Canadian and was well known in British Columbia where he was at one time Provincial mineralogist. He had been practising in London as consulting metallurgist for some years prior to the formation of the British America Company during the war which had as its object the utilization of the Hybinnette refining process for the production in Canada of metallic nickel and copper and the recovery of the precious metals which occur in the ore. The company has suspended operations for the present.

Howry Creek Gold-Arsenic Deposits

(Can. Geol. Sur. Summary Report, 1917, Part "E.")

Gold was found near Howry creek in 1911, the discoverers being James and Charles Bousquet. In the next two years about one hundred claims were staked and some additional discoveries made. Since then the more promising claims have been examined and partly developed by prospective buyers; but mining operations have not followed, although it is expected that a small mill will be built this winter (1917) to treat ore from Bousquet property for the extraction of arsenic as well as gold.

The deposits occur on the north side of Howry creek, a tributary of Whitefish river, all being included in an area 6 miles long from east to west by 1 mile wide. They are conveniently reached from Sudbury by way of the Algoma Eastern railway, from mileage 64 on which a canoe trip of about two hours is necessary to cross Charlton lake and ascend Howry creek (See Figure 1).

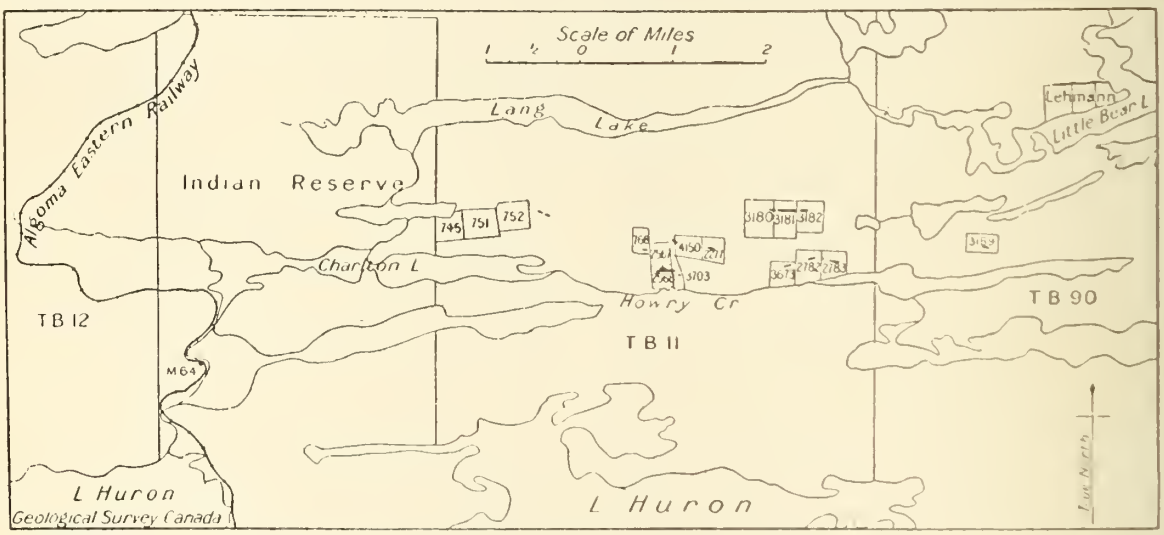

Figure 1. Sketch map of Howry Creek gold-bearing area showing the location of the more important mining claims and more promising ore-bodies (in heavy black lines).

The mineralized area is underlain by quartzite, greywacke, and conglomerate belonging to the upper part of the Gowganda formation and lower part of the Lorraine quartzite (Cobalt series). These formations lie on edge, strike east and west, and are interseeted by a few dykes and larger bodies of diabase (Keweenawan). The ore deposits are chiefly well-defined quartz veins with a general east-west strike and nearly vertical dips. They are composed of white quartz and ankerite carrying arsenopyrite and free gold as their chief eonstituents of possible commercial value. The wall rock, espceially if it is greywacke or conglomerate, is bleached, heavily impregnated with ankerite, and slightly mineralized with the same ore minerals as the vein-stuff for 2 or 3 feet on either side of the veins. One of the deposits (mining locations 3180-8182) is simply a broad sheared zone in conglomerate which has been hydrothermally altered and filled with a plexus of quartz veinlets.

All the deposits are probably the result of a single process of mineralization, since they resemble one another elosely in mineral composition. One vein at least occurs in the diabase, so mineralization must have taken place after the intrusion of that rock. Further than this, however, the age and source of the ore have not been ascertained.

The relative positions of the various deposits are shown in Figure 1. Specific descriptions of the best looking deposits follow.

Steep.—Mining location S3189. A system of sharply defined veins, represented in plan in Figure 2, has been found on this claim. The veins are composed mainly of quartz and ankerite, with sparing amounts of pyrite, arsenopyrite, hematite (specularite), and, it is said, some free gold. The greywacke wall rock between the veins is bleached, heavily impregnated with small crystals of ankerite, and probably slightly mineralized with the same metallic ores as are found in the veins. Very little trenching has been necessary to expose the veins, but in addition to this work a shaft 8 feet by 10 feet has been sunk on the largest vein to a depth of 30 feet. A representative sample from the dump made in sinking this shaft was assayed by H. Leverin of the Mines Branch and found to contain only 0·02 ounce of gold per ton.

Bousquet.—Mining locations S 2782, 2783, 3673. Near the middle of S 2783 an irregular vein shown in plan (Figure 3) has been trenched for 300 feet, and shallow test pits sunk in several places on it. The mineral association composing this vein is like that of the Steep veins, but it differs from the Steep veins in most other respects. Instead of a series of parallel, sharply defined veins there is a single, crooked, branching vein with rather indefinite walls and composed of vein stuff and schistified country rock. The wall rock is feldspathic quartzite instead of greywacke. The gangue of quartz, ankerite, and schistified rock carries free gold, pyrite, and arsenopyrite. The arsenopyrite occurs as the usual greyish-white variety and also as a darker iron-grey variety. It is the most abundant metallic constituent, being continuously exposed in massive form, 2½ to 18 inches wide, for a distance of 150 feet.

This vein was sampled systematically in 1916 by J. S. Wilson and Mr. A. L. Kemp. Some very high values in gold were obtained, but the average from all

the sampes taken indieates a gold eontent eonsiderably under $10 a ton. At present, milling experiments are being condneted with a view to recovering the arsenic as well as the gold.

Six hundred feet west of this vein and approximately in line with it is another of the same character 3 inches to 48 inches wide, which has been stripped for 190 feet. There is much less arsenopyrite present, but good gold values are reported.

Near the north line of S 3673 two smaller exposnres of the same character have also been found.

Black Fox.—Mining locations S 2568, 2703. These claims are underlain by massive white quartzite (Lorraine), through which extends from east to west a series of parallel quartz veins. The veins are from a few inches to 50 inches wide and are exposed at intervals for 400 feet at least, and according to report, for a much greater distance. Individual veins, however, appear to be short. Even the wide veins are only 100 to 150 feet long, terminating in a multiplicity of small stringers. They consist of pure white quartz, with a little ankerite; but, except for a few scattered patches of disseminated pyrite, no metalliferous minerals were seen and a sample collected from the walls and dump of a 10-foot test pit, when assayed by Mr Leverm yielded no gold.

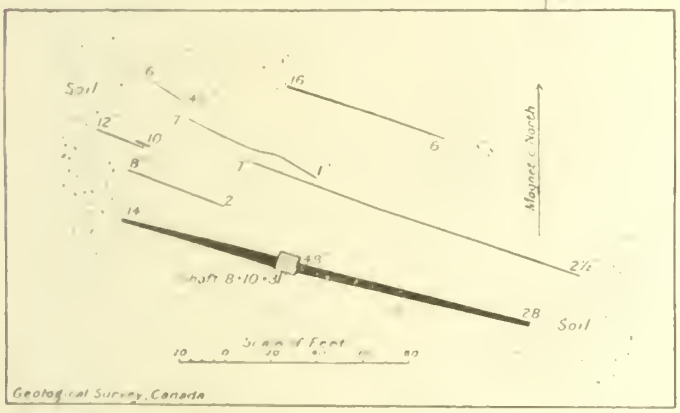

Figure 2. Plan of veins on the St-cp property (mining location S 3189)

Other Deposits.—A vein of the same general character as the Bousquet vein occurs on mining location S 2277. It occurs partly in quartzitic greywacke, partly in diabase. It varies in width from 3 inches to 6 feet and has been stripped for 280 feet. The wall rock is bleached and impregnated with ankerite, arsenopyrite and pyrite, but the vein itself is not so well mineralized as the Bousquet vein. It is reported to carry $6 in gold per ton.

Another vein 10 to 36 inches wide was seen on mining location S 766. It has been traced through the quartzite and along a quartzite-diabase contact for 270 feet. Gold is reported to have been found in it, and arsenopyrite is present in considerable quantity.

An ore-body somewhat different in character from any of the preceding was seen on locations S 3180 81 82. It is a schistified zone in Cobalt conglomerate which has been hydrothermally altered by vein-solutions and filled with many veinlets of the same general composition as the larger veins already described. Some of the veinlets cut across granite pebbles in the sheared conglomerate, indicating that mineralization took place after the rock had been schistified. The mineralized shear-zone is at least 40 feet wide and extends, according to information obtained, for half a mile east and west.

No quantitative determination was made of the gold content in the schist, but samples of the quartz veinlets were crushed and panned, yielding a small amount of gold. From the standpoint of size and convenient mining this deposit is much superior to any of the others, but the average gold content is probably too low to be profitably extracted.

The genesis of the Howry Creek veins is unknown, but their general similarity in composition to the ores of the Long Lake gold mine, which lies 25 miles towards the northeast, has been remarked by many persons acquainted with these properties. It is not

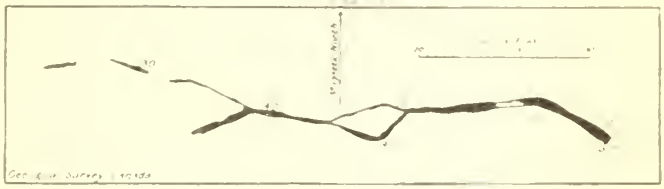

Figure 3. Plan of veins on the Bousquet property (mining location S 2783)

improbable that other gold-arsenic deposits may occur in this 25-mile interval which approximately parallels the contact between the Huronian sediments and the younger Killarney granite to the south.

SUDBURY NOTES.

By D. E. CUSHING.

Goudreau Gold Area.

The Goudreau gold area promises to be active this spring. J. P. Cline, of the Soo is now in charge of work on the Goudreau gold and some claims of his own. On the latter he has sunk a shaft 30 feet and it is said, encountered good values.

J. J. Brothers of the Soo just staked nine claims in Township 47 and the San Antonio Mining Co. 12 claims in the same area.

Proposed Extension of Mining Court's Scope.

Chas. McCrea, Sudbury's M.P.P. is again pressing his mining court bill in the legislature. Last year his measure was thrown out, but the howl which the mining areas set up won over many supporters and caused others to give serious consideration to the demands of the north. So that there is now a chance of the measure becoming law.

Mr. McCrea's bill in a word would allow the Mining Commissioner to deal with patented as well as unpatented claims. In other words it would extend the simplicity, directness and speed of the present popular mining court to the man whose property has passed from the Crown to him. The benefits are generally understood by the whole industry.

Sir Phillip Gibbs prophesies a new world war, "rather soon." In newspapers of the same date it is stated the United States Army has discovered a poison gas so deadly that three drops coming in contact with a person's clothes or skin will kill him and it is the pleasing intention to spray this noxious substance from bombs in airplanes. This is the kind of news that pales the ineffectual fires of Hell, and makes one wonder whether these fabled flames would not be a pleasant rebuke to a daft world as a place of permanent residence.

The Submarine Coal-Field of Nanaimo, Vancouver Island, B. C.

(By our Victoria Correspondent.)

Coal on the Canadian Pacific Coast was first discovered in 1835. The deposit originally directing attention to the coal possibilities of the country, was that situated on the north-east coast of Vancouver Island, doubtless the same as now is under development at Suquash. Specimens were brought in during the year named by the Indians to Dr. W. F. Tolmie, then stationed at Hudson's Bay Company's post, Fort McLoughlin, on Milbank Sound, and used in the following year by the first steamer on the coast, the "Beaver." The coal at Nanaimo was first discovered by Mr. Joseph W. Mackay (then in the H. B. Co's. service) in May, 1850, who was directed to it by the Indians in the neighbourhood.

The first producing mine of the Nanaimo Coalfield was worked by the Hudson Bay Company under the name of the Nanaimo Coal Company until 1861 when it was sold to the New Vancouver Coal Mining and Land Company Limited, an English joint-stock company with head-quarters in London. The first submarine workings were driven from No. 1 shaft, on which sinking operations were started in 1882. The workings from No. 1 shaft are now connected with Protection Shaft, which was sunk in 1891 and is situated on Protection Island about one mile from No. 1 shaft across the Nanaimo Harbour in a northerly direction; and with Newcastle shaft which was sunk in 1900, and is situated on Newcastle Island, about two and one half miles in a north-westerly direction across Nanaimo Harbour. The submarine area penetrated by the workings of these three shafts is upwards of five square miles on the upper or what is known as the Douglas Seam, and, in a more limited area, approximately two square miles, in the second, or what is known as the Newcastle seam.

The upper or Douglas seam is approximately 650 feet in depth in No. 1 shaft, 670 feet in Protection shaft and 324 feet in the Newcastle shaft.

This seam varies from nothing to thirty feet in thickness and is a high volatile bituminous coal. It is massive and broken by irregular joints, producing an irregular hackley fracture. It is black with a subbrilliant to brilliant lustre. It is fairly hard and weathers well. The dip is from 8 to 15 degrees.

The floor and roof of the Douglas seam vary in character from fine conglomerate to sandy shales. The roof consists chiefly of shaley sandstone with sandstone layers and lenses of fine-grained conglomerate. The beds overlying the Douglas seam are mostly sandstone fine grained, and sandy shales with thin beds of conglomerate. The rocks are well exposed along the shore line, but are almost all covered with a deposit of silt in the harbour.

The method used in working the Douglas Seam is pillar and stall mostly, but, where the seam is thin, limited areas have been worked on the longwall method.

The thickness of cover varies from about 350 feet on the north-westerly side of the Harbour to (1600) sixteen hundred feet on the north easterly side. Pillars have been extracted extensively in this seam and have been successfully worked under the thinner covering, numerous cogs are put in, making the method more like a longwall-retreating system, the roof being held up until floor heaves and meets it, very little caving occurring. Under the thicker covering, no cogs are used, except to steady the roof when stumps are being taken out.

The Newcastle seam is from 50 to 100 feet below the Douglas, the intervening measures being shale, and coarse-grained sandstone which sometimes merges into conglomerates.

The Newcastle seam averages about 3 feet 6 inches in thickness, is hard, of very good quality, and makes splendid coal for domestic purposes. It had only been worked intermittently until 1900, since which time it has been worked steadily.

This seam is worked exclusively on the longwall system. The floor is brushed for roadways, and they are carried approximately 36 feet from center to center. The floor, not being very hard, does not make good rock for building pack-wall, so roadside cog-packs are built, these being filled with rock. The mining dirt, together with the rock from the roadways, makes a fairly tight pack between the roadways. The general subsidence is about 18 inches, so by carrying sufficient brushing depth to make the main roadways about 7 feet 6 inches high in the first working, the necessity for re-brushing to make height after a settlement of the strata has taken place is practically avoided.

The undercutting is done in this seam mostly by "Pick-quick" cutter-bar machines, although a few mounted punchers are in use for difficult work.

The drilling is done by rotary compressed-air machines.

The working of this team by machines is very successful and about the following procedure is taken:

When the face is clear, the drilling machine goes along first, drilling holes at regular distances. After the driller comes the machine doing the undercutting. After the machine comes the faceman doing the blasting, and behind him the loaders. Long faces are carried mostly in a semi-circle and the cutting is continuous to the end of the face. After the run over the face is completed the machine is transferred back to the other end of the face by truck. More than one machine is sometimes worked on the different faces. Compressed air is used on the mining machines.

The workings of the Newcastle are in a good many instances right under the worked-out pillar-area of the Douglas Seam, and both seams have been worked out to a depth of undersea cover as thin as 400 feet.

There has been no serious inflow of water from the sea during the history of mining operations in the submarine field at Nanaimo. On several occasions feeders of water have been encountered, but after running awhile these feeders would gradually diminish in volume, and then cease running. On the whole the workings under the submarine area are dry.

The system of haulage in these mines is mixed. On the main No. 1 level from the bottom of No. 1 shaft, or what is known as the North Side, electric motors of the trolley type are used, and run inbye upwards of 2½ miles pulling out trips of cars, from 90 to 130 cars on each trip.

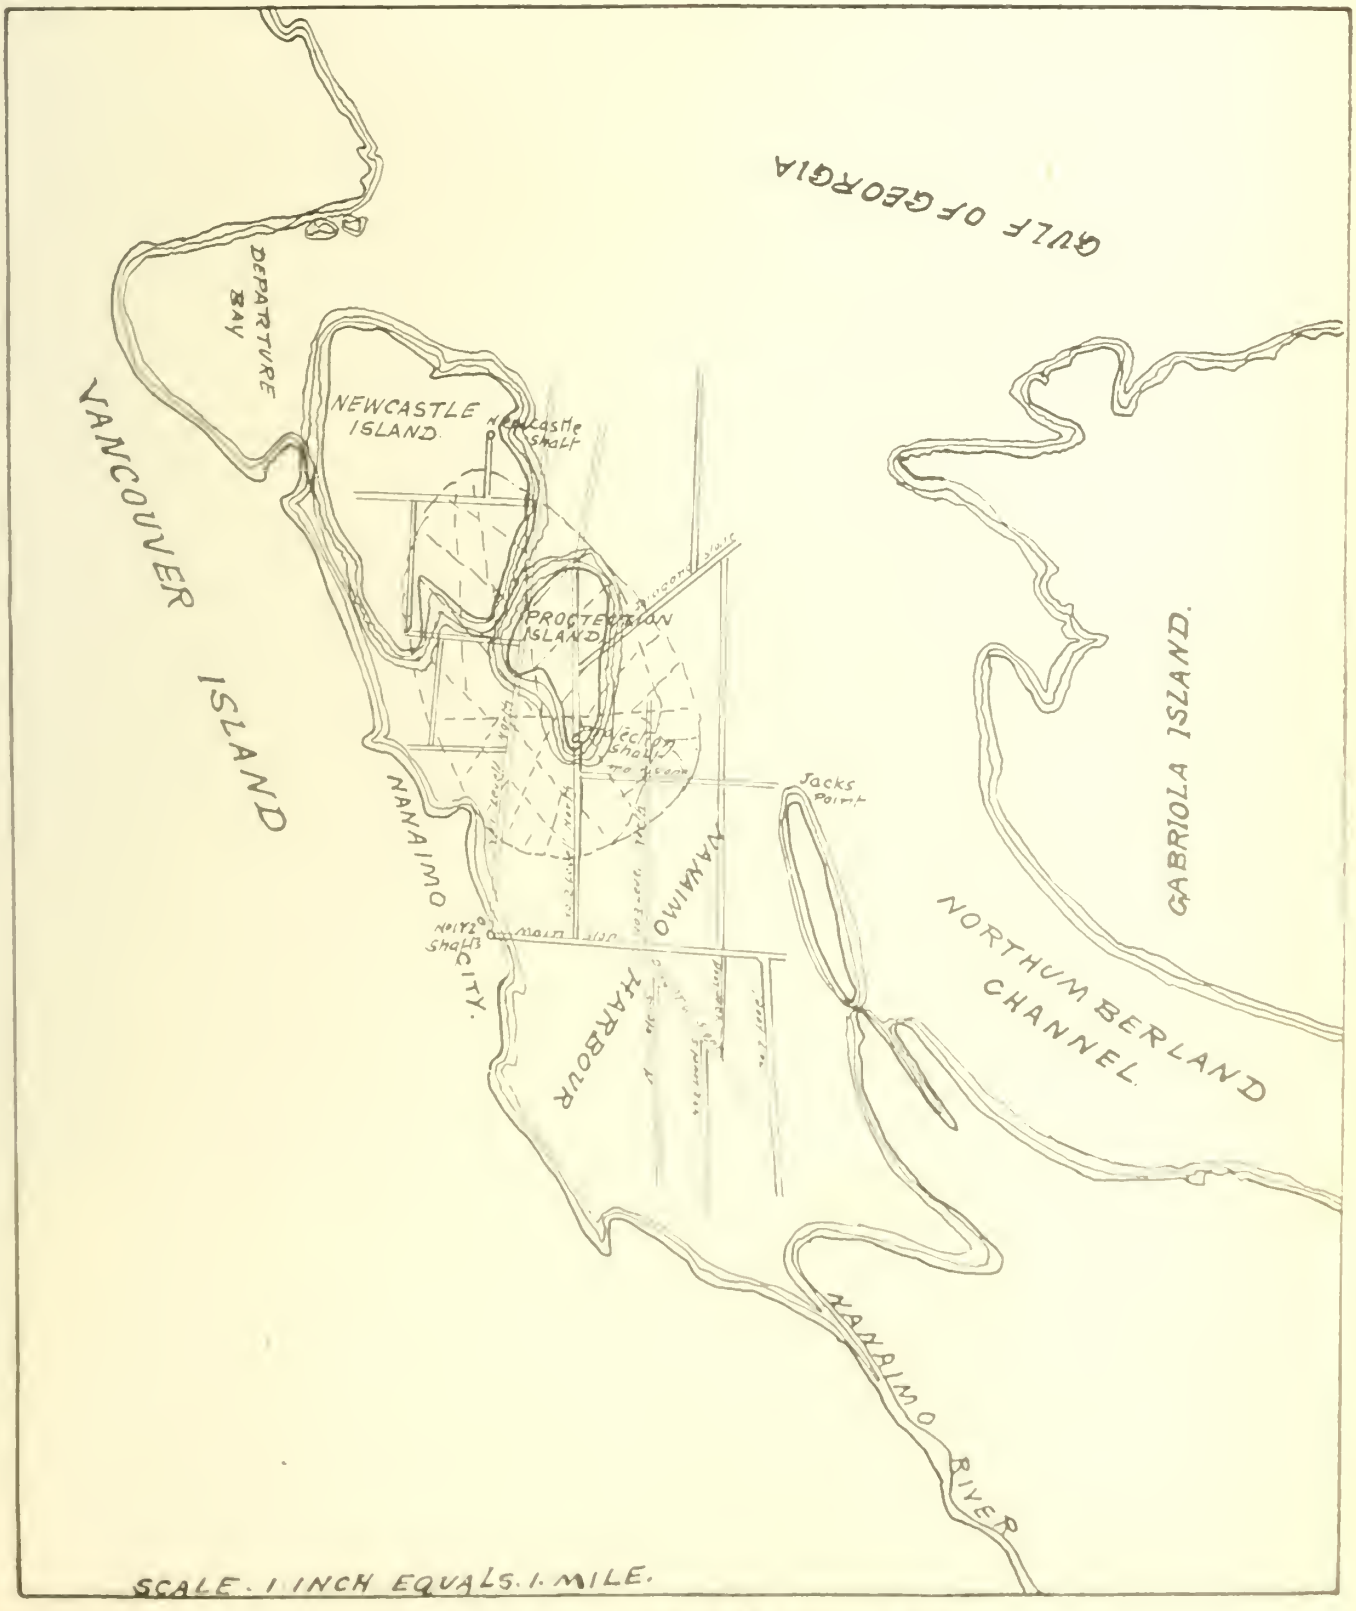
The local haulages feed to sidings on this level by means of gravity-inclines to the raise, and direct slope-haulage to the dip, the haulage in the immediate vicinity of the working face being done with horses and mules.

A few hundred feet from No. 1 shaft on the North Side a pair of slopes are driven to the dip for about 2,200 yards in the Douglas Seam, in an easterly direc-

tion. This is known as the South Side. About 1,000 yards down these slopes, diagonal slopes are driven to the right in a south-easterly direction. These workings penetrate an area known locally as "The Meadows", which is the inner part of the harbour and is situated between two forks of the Nanaimo River emptying into the harbour.

The workings to the left of these slopes are driven right through and connect with Protection Shaft on what is known as No. 3 North Level. The coal from Protection Mine at one time was hauled out along No. 3 Level and hoisted up these slopes to No. 1 shaft, but at the present any coal mined from the Protection area is hoisted on to No. 1 north level and taken out along that level to No. 1 shaft. The system of haulage on the South Side is endless rope, tailrope, and direct slope-haulage. The haulage near the faces is effected by horses and mules.

The ventilation is maintained by two fans, one situated at Protection Shaft and one at No. 2 shaft, sit-



Plan of the Nanaimo Coalfield of Vancouver Island

uated a few hundred feet from No. 1 shaft. There is also an emergency fan at Newcastle shaft. The fan at No. 2 shaft is a 72 x 90 inch double-inlet Sirocco fan, rope-driven, ratio 3½ to 1 and capable of producing 195,000 c. ft. of air a minute with a 4-inch w.g. It is driven by an engine of 350 h.p. A duplicate ventilation installation is kept in readiness for any emergency. This fan ventilates the South Side and part of the North Side workings.

The fan situated at Protection Shaft is a Guibal force-fan 9 x 18 feet, rope-driven at 70 revs. per minute by a 100 h.p. engine. This fan is capable of production 100,000 c. ft. of air per minute at a 2-inch w.g. and ventilates the North Side.

The fan at Newcastle shaft is provided for any emergency that may arise in the ventilating system on the North Side.

The No. 1 shaft and Protection Island shafts are downcasts, and No. 2 and Newcastle Island shafts are upcasts.

The location of these shafts is unique, and give a good sytem of ventilation, from which a high efficiency is obtained.

The Silver Islet Exportation Co. Limited

By J. J. O'CONNOR, Port Arthur.

The romantic interest that attached to Silver Islet during the years from 1868 to 1884, may be revived and largely enhanced by new history, following the present undertakings at this interesting wave-washed gem of Lake Superior. Working on the theory that all the wealth contained in the various veins that intersect the Islet, was not taken out during the former operations, Messrs. Jamieson and Peacock, of Duluth, Minn. secured control of this famous old property, and during the summer of 1920, they unwatered the old workings to some distance below the second level. All of the old workings above this level, were intensively explored, and minutely examined, demonstrating and confirming former reports as to the quantity of silver in the roof of the mine, together with the existence of contiguous veins that offered as promising results as the original developments on the junction of the Silver Islet vein, and what is known as the Macfarlane dyke. These workings extended to a depth of 1,265 feet, with extensive lateral development.

So convinced were Messrs. Jamieson and Peacock, by their experience of the past season, that this property merited further and more extensive exploration and development on a larger scale, that they have organized the Islet Exploration Company, Ltd., incorporated under the laws of Ontario, for the purpose of demonstrating their convictions. The company has a capitalization of $250,000, divided into shares of $10 par value each. This organization is more of the order of a syndicate, than a company, as such terms are commonly understood. There are no investors in this organization that cannot afford to face the results of possible failure. Everyone interested has ample means wherewith to meet the outcome of the enterprise, be what it may. All have been given the fullest information regarding the conditions encountered by Messrs. Jamieson and Peacock. They are going into the undertaking with their eyes open to the fact that they are taking prospectors' chances of finding great wealth, or, finding slightly more in the roof of the mine, than will recoup them for their outlay. It is practically a close corporation, there is no stock for sale, the men behind it are taking all the chances themselves.

The officers of the Islet Exploration Company, Ltd. are as follows: President, J. L. Washburn; vice-president, D. C. Peacock; secretary, A. MaC. Washburn, and treasurer, Frank E. Randall, all of Duluth, Minn.

This company has secured control of the whole of what is known as the "Woods Location" comprising about ten thousand acres in the township of Sibley, of which Silver Islet, lying about two-thirds of a mile off the main shore, forms a part.

Extensive development has been planned by the company, to be begun about April 1st. next. This work will consist of drifting on the dyke to intersect parallel veins that are known to exist, but which, thus far, have never been explored, but are believed to have as great possibilities in silver values as the original Silver Islet vein.

This exploration work will be started from the various levels of the old workings. The old shaft is in splendid shape, and, as was demonstrated last Summer with a pump having a capacity of one thousand gallons per minute, there will be no difficulty in controlling the water, once the mine has been unwatered. Silver Islet in the old days was known as a "dry mine." The old Cornish pump used in former operations, the logs of which, are still in position, had a capacity of only fifty gallons per minute, and met all requirements. It is also planned to do considerable development work in certain parts of the old workings that give promise of developing into rich pockets, as was the experience in former days, under similar conditions.

There is known to be a large quantity of high-grade silver ore in the roof of the mine. One hundred and eighty-five drill holes have been driven into it. This exploration demonstrated that there was over three hundred thousand ounces of silver in the roof. Silver Islet originally consisted of a bare speck of rock about ninety feet square, rising some nine feet above Lake Superior, and exposed to the violence of the elements. The silver in the roof will be the last to be removed from the property, when it is finally abandoned.

In addition to the work on the Islet proper, it is the intention of the company to prospect the main-land in an intensive way, and thoroughly investigate the veins intersecting the dyke zone, of which, many are known to exist, and on some of them considerable prospecting work has already been done with most encouraging results.

It may seem to some that this enterprise is somewhat like looking for "hidden treasure". The best informed, however, have confidence that these enterprising and experienced men will meet with the success their undertaking deserves.

THE LICENSING OF ENGINEERS.

According to the Mining & Scientific Press, the American Association of Engineers, through its local assemblies, is advocating the passage of licensing laws in every State. In Canada also there is an evident desire on the part of many to have such legislation. Engineers who may not be very strongly in favor of such legislation and who do not take an active part in the discussion of the proposals seem to wakening up to the fact that such legislation is coming and that in their own interest they will have to give the matter more consideration than they have done.

The Dolly Varden Mine

By Our Victoria Correspondent.

No mining property has attracted more attention in British Columbia during the past two or three years than has the Dolly Varden, Alice Arm District, northwestern coast of the Province. Coming after the dispute as to the payment of expenditures incurred in the construction of a railway from tidewater up the Kitsault River to the property, the result of which was a parliamentary investigation and the ultimate acquirement of the holdings by the Taylor Engineering Company, the exceptional success of the latter in its mine operations has been widely commented upon in mining circles in the West.

On taking control the Taylor Engineering Company entered on a programme of development so energetically that the railway, which had not been quite completed, was finished and in operation in the course of a few months; the mine was being opened up in such a manner and on such a scale that shipments of ore soon began to arrive at the townsite of Alice Arm en route to the smelter; and it early became apparent that the new owners were working in a considerable body of high grade silver-bearing ore.

3043

View on Dolly Varden Railway. Trout Creek is on the right.

3044

Ore in transit to tidewater.

On the 10th of June, 1919, the work of carrying the steel the few miles necessary to bring it in direct touch with the Mine was started and by the 1st of September of the same year the road had reached its inland terminus. This is a striking illustration of the celerity with which the Company took up the task of putting the property on a producing basis. In addition a 2,000 foot 2-bucket aerial tramway, with upper and lower terminal-bunkers, was ready for use.

Between the 1st of September and December 15th of that year (1919) the Mine delivered to the Granby Company's Anyox smelter approximately 7,000 tons of ore averaging 56 ounces of silver to the ton. There also was delivered a small quantity of high-grade sacked ore averaging about 1,000 ounces to the ton.

As to the work of 1920, perhaps the clearest idea of its character and the progress made will be obtained by quoting from the annual preliminary report of Mr. George Clothier, Government Mining Engineer for the District, who says in part:

"The mine department of this company has been steadily operating the Dolly Varden Mines all the year under the management of C. B. North. For the past seven or eight months while the railroad could be operated, shipments have averaged about 150 tons a day, the total tonnage for the year being 28,700 tons, yielding 870,000 ounces of silver. To accomplish this the railroad had to be practically regraded, heavier rails laid for several miles, additions made to the rolling-stock, storage and loading bunkers constructed at the dock and a high line built to them from the main railroad, mine power and equipment increased and mining systematized. In addition to this the railroad grade was extended nearly a mile beyond the mine towards its completion to the Wolf, about 2½ miles above the Dolly Varden. An hydro-electro-

power plant of 500 horse-power capacity was installed just below the Wolf. Ore bunkers were built along the railroad and rails laid to them in preparation for driving No. 6 tunnel this Winter.

"Little or no development-work has been attempted during the Summer, but an extensive programme has been laid out for this Winter. Several raises will be driven through from No. 5 to the No. 4 level; No. 5 level will be thoroughly opened up for the extraction of the ore bodies proven by diamond drilling between that level and No. 4. The new No. 6 level will be driven a distance of 300 feet or more and a raise put through from it to the No. 5 level, a distance of 450 feet. The completion of this work will permit all ore from any part of the mine being brought from the No. 6 level to the railroad bunkers."

BRITISH COLUMBIA LETTER.

The Metal Mines.

The Portland Canal Mining Division, in which the Premier Mine is situated, and the Unuk River District, further to the northeast, have a bright future in respect of mining. George Clothier, government mining engineer at Prince Rupert, B.C., who is making a brief visit to Victoria and Vancouver, makes this statement with the emphasis of confidence and enthusiasm.

A few weeks ago, Mr. Clothier went to Stewart to inspect the "caterpillars" which are hauling ore from

Drilling the ore-body—Dolly Varden Mine

the Premier Mine to tidewater. He found that these tractors are performing admirably. High-grade ore is being brought from the mine to the coast at the rate of about 60 tons a day and this is expected to continue as long as the snow holds. It is his opinion that the proposed aerial-tramway project will be carried through.

Of the Salmon River section, Mr. Clothier speaks with the utmost optimism. It is true that options have been taken on a considerable number of claims only to be permitted to lapse, but this was to be looked for. Mining in this district is not a poor man's job. Because a property, having been located, is optioned and, there being insufficient capital available to proceed with development, apparently is forgotten, we should not write "finis" to its history. This has been the case with a number of good prospects up to the present. There are other instances, however, where serious development has been undertaken, notably that of the Algunician Mining Company, which has expended at least, and no doubt considerably more, than $100,000 in actual exploratory and development work on various properties in the country. More of this kind of activity is what Mr. Clothier hopes to see and he is sure that, if it comes, the returns will justify the outlay, having in mind the general mineral possibilities of the section.

The same promising mineralized zone, Mr. Clothier asserts, extends beyond the Salmon River into the area drained by the Unuk River. This is a much greater territory than that which now is attracting attention because of the success of the Premier Mine. So far it has seen few prospectors. In the scattered instances where it has been penetrated by mining men the result has been the return of samples of ore much the same in character as those found in the Salmon River area, which means that they have been high in silver and gold values. The district is too remote, however, to rouse enthusiasm for the very evident reason that a discovery would have to be rich indeed to yield profits in the face of the transportation problem with which a miner would be faced.

Mr. Clothier, however, is ambitious to see the Unuk River territory opened up and prospected. He thinks that it holds mineral values that when found and developed will bring the northwest of British Columbia prominently before the eyes of the American mining world. To this end he is desirous of seeing a trail con-

The terminus of the Dolly Varden Railway

structed along the Unuk into the district. Such a trail would have to traverse American territory for a considerable distance. The possibility of the American Government contributing to the cost of this project was taken up with Governor Riggs, of Alaska. Whether the suggestion will be favorably considered is a question which, with the recent change in the political colour of the United States' Administration, may remain unanswered for some little time. In the meantime, however, the British Columbia has done considerable work along the lines suggested by Mr. Clothier and, no doubt as financial and other conditions permit, may be expected to continue this policy.

Stewart B. C.

The Columbia Group of Mineral Claims, situated on the middle fork of Glacier Creek, Salmon River District, have been optioned by W. W. Rush and Arthur Bagg to Major General R. G. Edwards Leckie. Development work is to start not later than June 1

Trail, B. C.

Ore receipts at the Trail Smelter of the Canadian Consolidated Mining Smelting Co. for the last week of February were 8,031 tons, made up exclusively of the products of the company mines. This brings the total receipts at this smelter for the first two months of the current year to 66,211 tons, over 11,000 tons greater than for the corresponding period last year.

Golden, B. C.

The Bunyan Silver-Lead Property, Bunyan Mountain, is to be opened in the Spring. It is stated that it is to be developed on a considerable scale, from 100 to 125 men being started to work as soon as weather conditions permit. The Brisco Mine, Columbia Valley, is another property in this locality which is to be developed.

3047

Trout Falls near Dolly Varden Mine.

Duncan, B. C.

Discussing mining conditions in the Cowichan District, Vancouver Island, Wm. M. Brewer, government mining engineer, recently told residents of Duncan that the chief mining area of the section is that of Mount Sicker and Mount Brenton. When the Tyee Mine, Mount Sicker, was first operated it was well managed but later on this was not so. Referring to the purchase of the Tyee, or Ladysmith Smelter, by Mr. Sieberling, of the Goodyear Tire Co., Akron, Ohio, he said that there had not yet been sufficient ore produced in the tributary district to maintain a customs smelter. Mr. Brewer suggested an amalgamation of the Tyee, Lenora, and Richard III Mines, all at present dormant, as a means of bringing about renewed activity. Granted sufficient capital, say a quarter of a million dollars, and good management the venture should be made a success. There was much ore in the Tyee which formerly could not be handled because of its low grade and the high cost of pumping. The mountain could be pierced, however, from the Lenora workings and the Tyee and Richard III unwatered. The development of the oil flotation process, he thought, brought the ore bodies of these properties, economically impossible under previous conditions, within the range of profitable treatment. In this connection reference was made to the value of this process as applied to the ores of the Britannia Mine. Without it this mine, one of the greatest of the Province, could not be run fifteen minutes.

The Cowichan Lake District, Mr. Brewer said, had the distinction of being the only part of British Columbia, in fact of the Pacific Coast outside of California, to produce manganese ore. It had been found at Hill 60 and at Shaw Creek. While the former workings were closed down now there was good reason to believe that they would be opened up during the summer.

With reference to Mr. Brewer's comments on the Mount Sicker and Mount Brenton properties, as well as to observations he made regarding the Blue Grouse and other mines and prospects at present inoperative but having promise, it should be stated that they are within what is known as the Esquimalt & Nanaimo Ry.

3047

The longest and highest trestle of the Dolly Varden Railway.

Belt. This area, over 2,000,000 acres in extent, is to be thoroughly explored by the Canadian Pacific Ry. Co., through its subsidiary concern, the Canadian Consolidated Mining & Smelting Co. All mineral in this section, not previously alienated, belongs to the Company. It is reasonable to suppose, therefore, that if the Canadian Consolidated is considering the development of the mineral located, or to be located, within this area it will have in mind the enterprise referred to relative to the unworked minerals of Mount Sicker and Mount Brenton.

It is evident from answers given by Hon. Wm. Sloan, Minister of Mines, to quesions asked in the British Columbia Legislature that some attention is being given to the obtaining of accurate information as to the iron ore resources of the province. He stated that a grant of $10,000 had been made to Mr. C. P. Williams, an English mining engineer of repute, to finance the exploration of all the known iron-ore deposits of importance. To use Mr. Sloan's words these funds were set aside to permit "the determining of the available tonnage of iron ores, coal and fluxes suitable for the manufacture of iron and steel and the accessibility of such deposits to transportation." This work was commenced in November, 1920, and is as yet unfinished. The area over

which Mr. Williams has been working includes Vancouver and adjacent islands and the southern portions of the province including the Kootenays.

There is a possibility that the Drum Lummon Mine, Hartley Bay, B. C., will be opened up on a larger scale than heretofore. Additional finances to the extent of $200,000 are said to be available in New York, most of which is to be expended in providing a mill and adding other new equipment. Glenville A. Collins, who is in charge, has left for the East on this business.

John Burns, who has been touring the West on behalf of the 24th Annual Convention of the American Mining Congress, to be held at Chicago, October 17-22, was a reeent caller on Hon. Wm. Sloan, Minister of Mines. He seeks to have British Columbia represented at this Convention in connection with which there is to be a National Exposition of Mines and Mining Equipment. It is suggested that the Province should arrange to have a very complete exhibit of her commercial and other minerals displayed at the Exposition. Mr. Burns appeared before the Northwest Mining Convention, which took place a few weeks ago at Spokane Wn., and explained the preparations being made for the Chicago Convention and Exposition.

THE COLLIERIES.

An amendment to the Coal Mines Regulation Act of British Columbia has been introduced to the Legislature by Hon. Wm. Sloan, Minister of Mines, which will entirely do away with "naked lights" in eoal mines in this Provinee.

The opening lines of the proposed amendment contain the essenee of the ehange. They read: "No lamp or light other than a locked safety-lamp of a pattern approved by the Minister of Mines shall be allowed or used underground in any mine."

As a matter of fact the regulations have been so strict of late years as to the use of open lights in conneetion with coal mine that they have seldom been found underground. Only where the gas content of the air has been infinitesimal have they been permitted at all. As a result eleetrie lamps have been adopted largely by the large collieries.

Now, however, the Minister of Mines has decided that the open lamp must go altogether. He has concluded that the danger to the underground workers is too great to warrant their use under any eireumstances. Even where conditions seemed absolutely safe there have been instanees of men receiving burns more or less serious because of the unprotected flame.

It is expected that, when the new regulation comes into effeet on July 1st next, the result will be the general adoption of the electric lamp in coal mining in British Columbia.

The coal production for British Columbia for the month of Febrnary, exclusive of the mines of the Crow's Nest Field, follows—

Vancouver Island District.

Mine.	Tons.
Canadian Western Fuel Co., Nanaimo	46,121
Canadian Collieries (D), Ltd.—	
Comox	34,847

Extension	13,946
Pacific Coast Coal Mines, South Wellington	Nil
Nanoose Wellington Co., Nanoose Bay	4,954
Granby Consolidated MS & P Co., Cassidy	21,681
Old Wellington Colliery (King & Foster)	135
Telkwa Collieries, Telkwa	Nil
Total	128,511

Nicola-Princeton District.

Mine.	Tons.
Middlesboro Collieries, Middlesboro	6,728
Fleming Coal Co., Merritt	3,239
Coalmont Collieries, Coalmont	4,420
Princeton Coal and Land Co., Princeton	794
Total	15,181

It seems probable that the near future will see extended development of the eoal areas of the Hazelton District, Northeastern, B.C. The ever-increasing priee of fuel-oil and its scarcity in the world's markets is causing renewed interest in all promising coalfields. The Telkwa river, Morice river, Zymoetz (or Copper river, as loeally known), Peace river, and Groundhog fields have attraeted attention and large-scale development may be expected before long. Undoubtedly these areas contain large quantities of good-grade eoal and but for the admitted transportation difficulties they might now be in the produetive elass. Some coal was mined by the Telkwa Collieries in 1920 and a short distanee from this property a new seam is being opened up. This seam contains some high-grade blaeksmith-coal and a small output will soon be marketed.

The eoal-mine of the Telkwa Collieries has been working more or less regularly, the shipments of coal for 1920 being estimated at 1,400 tons. Owing to the work of the Grand Trunk Pacific Railway at Telkwa in ehanging the railway-yard, the shipping-bunker for this eoal has been taken away, and at present the company eannot ship coal to Prince Rupert or other points as was being done. Meantime loeal shipments are being made, and as soon as the bunker is replaeed the regular shipments will be commenced again.

The property is now being worked by J. M. Gillespie, formerly manager of the company, who has a lease on all the holdings.

Mr. Gillespie also has a lease on the Aveling coal property, which is situated about 6 miles up the Telkwa river from the town of Telkwa and about 2 miles distant from the property of the Telkwa Collieries. Arrangements have been made to open up a seam of coal on the Aveling property and mining has been eommenced. Part of this seam contains a band of high-grade blacksmith-coal, and it is the intention to mine and ship this. By submitting samples to Vancouver orders have already been received for car-load shipments of this blacksmith-coal, and it is hoped that a considerable market for this class of coal can be secured. Analyses of this coal show it to be low in ash and high in fixed carbon.

Chu Chua Coal Mining Syndicate.—Trustees, W. H. Glass, 1507 North Thirty-ninth Street, Seattle, Wash., and H. W. Schuett, 400 Central Building, Seattle, Wash., and H. W. Schuett, 400 Central Building, Seattle, Wash., Local Secretary, C. E. Max, Kamloops, B.C. This syndicate has secured options on approximately 5,000 acres of coal lands about 2 miles south of Chu Chua, near Kamloops, B.C. A compressor operated by a 50-horse-power steam plant has been installed, a road built to a siding on the

Canadian National Railway slightly over a mile away, and camp buildings erected to accommodate about twenty men. Production has been started, working on a 3-foot seam of excellent coal.

The principal output from the Nicola Mining Division continues to be coal. The Middesboro Collieries and the Fleming Coal Company have both been operating steadily.

Coalmont Collieries.—Under the management of Messrs. Johnson and McLean, this company has developed the coal areas on their property, about 2·82 miles south-west of the town of Coalmont, on the Kettle Valley Railway. A new opening has been made in the mine and different seams blocked out. A new bunk-house and dwelling houses have been built and an aerial tram 15,000 feet long, with a capacity of 60 tons an hour, installed; also a tipple and screens at the railway and a plant to generate electric power for the mine and town.

Crows Nest Pass Coal Field.

Work has been steady throughout the Crows Nest coal-fields.

At Coal Creek and Michel the mines of the Crow's Nest Pass Coal Co. are all in good condition and no new developments have been made.

At Corbin work has been continued fairly steadily, the large portion of the coal coming from Nos. 3 and 4 mines, while some preliminary work has been carried out at Nos. 5 and 6, which are new mines. During the greater part of the year labour has been scarce.

Indications of fresh developments in the Upper Elk coalfield have been in evidence during the past few months, a party having started to reopen the holdings of the Northern Coal Company, but owing to lack of labour the work was continued until this spring.

The total output of coal for the past year is estimated at 827,670 long tons, which shows an increase over that of 1919 of 258,864 tons. The coke production totals at 51,492 tons, which is a slight decrease as compared with that of last year.

Vancouver Island Coal Field.

The Jingle Pot mine was closed down as worked out early in 1920 after producing approximately 800,000 tons of coal from an area of about 70 acres. The mine was opened in 1907 and owned by the British Columbia Coal Mining Company, Limited, since about 1915.

The Canadian Collieries (Dunsmuir), Limited, under the supervision of Thomas Graham, general superintendent has completed in Tsaable River section near Cumberland a total of 7,453 feet of diamond-drilling and 37,400 feet of roadways. Two diamond-drills were in operation. In the Wellington Extension field the company had one drill in operation and bored 1,000 feet on the Haslam flats.

The Granby Consolidated Mining, Smelting, and Power Company has completed the equipment at the Blanmel loading-dock near Ladysmith by installing a rubber belt-conveyor 1,300 feet long which connects the small storage-bins with the hold of a vessel at the wharf. In the coal-washing plant at Cassidy seven Overstrom concentrating-tables have been installed for the purpose of more thoroughly cleaning the slack coal than was possible with jigs alone. A new radial drill, a shaper, and other equipment have been added to the machine-shop. The main slope has been extended about 1,000 feet, thus reaching a total length of 3,500 feet, passing through that part of the field in litigation and into that section the title of which is not in dispute. A Dorr thickener is being installed near the washing plant; the tank of the thickener is 75 feet in diameter by 13 feet high on a concrete foundation. The ventilating equipment at the mine has been enlarged by the installation of a Sirocco fan with a capacity of 150,000 cubic feet of air a minute.

The East Wellington Coal Company is a new organization that has secured a lease on a royalty basis from the Canadian Collieries (Dunsmuir), Limited, of a tract of approximately 2,800 acres of land adjoining the old Jingle Pot mine and extending to the northward. This tract of land is for the most part virgin territory, presumably underlain by the Wellington coal-seam, but also includes the old East Wellington mine, which it is proposed to unwater. Up to the present time the work being done consists of clearing 10 acres for mine buildings, driving a new slope 611 feet, counter-slope 86 feet, crosscuts 155 feet, sump 6 by 12 by 30 feet, and erecting buildings for machinery.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

Suggestions are being made that the present is an opportune time to organize a "Silver League" for the purpose of advancing views which would encourage a general discussion of the question of bimetallism. It is not intended to advance views which would have for their sole object the encouragement of any form of preferential treatment of the silver mining industry, but, instead, to encourage an intelligent discussion of silver and silver mining in its relation to the large amount of paper money now in circulation not presented by actual metal reserves. It is pointed out that a joint discussion between the finance departments of the nations together with bankers and miners should result in determining whether bimetallism in some form is advisable, or not. The possibility of such a conference is now being dealt with by leading financial writers in the British Empire.

A New York metal authority makes this comment: "Proposals of the London "Times" and other leading British newspapers that "silver will have to be resorted to in some cases in order to provide a definite measure of value", is bound to have sensational influences on the silver of foreign origin."

A further significant statement made is this. "Bullion dealers say that if ever the Chinese banks begin to cover their commitments the market is likely to advance very rapidly, for the short account is enormous and the covering of it may turn the market into a state where offerings will be scarce and demand very heavy."

The foregoing statement holds out a hope of reversing the present situation. It is an actual fact that some of the large producers in the Cobalt field made shipments very recently, but a fact which has heretofore not been common knowledge is that a large part of these shipments were for storage and not to purchasers.

Advocates of bimetallism or the remonetization of silver point to the continued decline in production of gold. One marked instance of this is in the United States where the output has declined from $101,000,000 in 1915 to $49,500,000 in 1920. This decline has been quite general in all parts of the world, the one exception being in the Province of Ontario. Here the mines increased their output during 1919 and 1920 but the increase is only a mere drop in the bucket as compared

with the aggregate decline in the gold production of the world as a whole.

In scanning all mining centres of the world, there appears to be no big important gold-mining area that will stem the alarming decline in the production of gold which has heretofore stood as the standard of value—the yardstick of commerce. The one direction in which there appears to be a possibility of propping the standard up to a point where it may carry the vast amount of paper currency is towards bimetallism. The finger of necessity seems to be pointing in this direction.

Robert Dye has been appointed superintendent of the Bailey Customs Mill, the appointment having been made by G. C. Bateman, the newly appointed chief consulting-engineer. It is the company's plan to speed up operations so as to double tonnage coming from the Bailey mine for shipment to the mill. Mr. Dye is well known in Cobalt where he was connected with the Buffalo Mines, and more recently was in charge of operations at the Teek-Hughes mine, Kirkland Lake. For some little time, Mr. Dye was a member of the teaching staff at the mines branch of the Haileybury High School.

A Conciliation Board is sitting this week in Cobalt, in connection with the cut of 15 p.c. in wages which went into effect here February 16th. The Board is made up of Robert Bryee as representative of the mining companies, Arthur Roebuck for the employees and J. Godfrey as representative of the Department of Labour. The total number of employees has dwindled to between 600 and 650, as compared with normal forces of about 2,000 to 2,200. This fact in itself is strong evidence of the serious situation in which the silver mines find themselves, and seems to constitute reasonable justification for a wage reduction.

The Kerr Lake Mines, Ltd., will pay a dividend of 12½ cents per share on April 15th to shareholders of record April 1st. The disbursement will amount to $75,000 and is the first to be paid this year by the company. Total dividends paid by this company amount to $8,935,000. The first disbursement was made Oct. 4th, 1905 and amounted to 2½ cents a share. Profits reached the highest peak in 1910 during which year the dividend disbursements amounted to $1,200,000 an amount equal to $2 a share.

A quite general increase in activity among the prospectors of Northern Ontario is in evidence. Miners' Licenses are being renewed in large numbers, April 1st being the date by which renewals are supposed to be made.

At Haileybury, a new prospectors' association is being organized. The plan in view is to deal with all questions pertaining to the welfare of the prospectors. The idea appears to have originated during the course of the holding of Government prospectors' classes by Prof. W. L. Goodwin, at Haileybury. The class was concluded March 18th, and on the 19th a banquet was tendered Prof. Goodwin in the Vendome hotel. The Haileybury class was quite a success, about 40 or 50 having taken advantage of the free two-weeks course. It is now planned to cover all the mining centres of the district, the following being a list of the centres selected as well as the dates, all classes to be carried on ten days:—Swatstika, March 21st; Kirkland Lake, April 4th; South Porcupine, April 18th; Timmins, April 30th and Elk Lake, May 14th.

Elk Lake and Gowganda.

In the March Bulletin of the Canadian Institute of Mining and Metallurgy the question of railway communication with Gowganda and Westree is discussed. It is pointed out that the proposed line from Swastika to Westree would leave the Elk Lake Branch with very little business, and that the shorter route would be to extend the Elk Lake branch. This suggestion seems to coincide with sound opinion in the district of Temiskaming through which the railway operates.

Diamond drilling operations are being carried on at the White Reserve property in the Maple Mountain district. The work is being done under an option agreement with the National Mining Corporation, a concern with £2,500,000 of paid up capital for investment within the British Empire. J. B. Tyrrell, of Toronto is consulting engineer in Canada for the corporation.

Cobalt Ore Statement.

During the month of February, five Cobalt companies shipped an aggregate of approximately 450.34 tons of ore. A feature of the monthly report issued by Arthur A. Cole, mining engineer for the T.&N.O. Ry., is the fact that of the total shipments, 299 tons went to United States smelters as compared with 151.34 tons to Canadian smelters. Following is a summary, in tons of 2,000 pounds:—

SILVER ORE.

Cobalt Proper.	Tons.
1. Coniagas	86.69
2. Dominion Reduction	179.00
3. LaRose	76.55
4. Mining Corporation	43.99
5. O'Brien	64.11
	450.34

The above shipments were made to the following Companies:—

Canada.		
Deloro Smelt. & Refining Co.	Marmora	64.11
Coniagas Reduction Co.	Thorold	87.23
United States.		
American Smelt. & Refining Co.	Chrome	25.00
— — —	Perth Amboy	87.14
Pennsylvania Smelting Co.	Carnegie	186.86
		450.34

Price of Silver

Feb. 3	Highest	63.250
Feb. 26	Lowest	54.750
	Average	59.233

Ore and Bullion Shipments.

During the week ended March 18th, three Cobalt companies shipped ore, sending out a total of four cars containing approximately 262,334 pounds. The Coniagas was the heaviest shipper with two cars containing 130,963 pounds. The O'Brien sent out one car containing 64,000 pounds, while the LaRose shipped one car containing 67,371 pounds. The total was the highest in recent weeks.

During the corresponding period, the Nipissing was again a heavy shipper of bullion, sending out 137 bars containing 181,151 ounces.

THE GOLD MINES.

The Porcupine District.

All indications point toward an early "break-up" of the ice on the rivers and lakes of Northern Ontario. The breaking of the ice will signalize the return to an adequate power supply and an immediate increase in the tonnage of ore which the mills in the Porcupine district will be able to treat.

Estimates of the earning power of the Hollinger Consolidated are such as may cause added optimism in regard to the operation of this mine. The average grade of the ore is between $9 and $10 to the ton. The net profits are estimated at a minimum of about $4 per ton. The mill has a capacity for treating at a maximum of close to 3,500 tons daily and is expected to establish an average of 3,200 tons daily. This would show a total production of not far under $30,000 daily and with net profits amounting to $4 per ton would result in annual net profits of $4,672,000. This would be equal to close to 19 p. c. on the company's issued capital. An official of the Hollinger made the statement some time ago to the Journal correspondent that the mine might be expected to make a bid for the leading position in the world and for a five year period establish a world record. The time for this achievement has not yet arrived, but the adjustment in the supply of labor is regarded as one important step toward the return to the conditions under which it is expected this record may be established.

It has been intimated in official circles that an early announcement may be expected in connection with plans for the re-opening of the Porcupine V. N. T. Mines. Next to the Hollinger, Dome and McIntyre the operation of the Porcupine V. N. T. promises to occupy a position of leading importance in the Porcupine field. The present mill is rated at a capacity of about 100 tons daily. By the expenditure of $50,000 in remodeling the plant and with certain additions, the capacity may be increased to about 150 tons daily. Ore in sight in the mine contains an average of approximately $10 per ton, and occurs in quite large shoots. The main shaft is down 600 feet, at which point the grade of the ore is the highest so far developed in the mine. Plans for future work include sinking the main shaft to a depth of 900 or 1,000 feet, with main haulage levels at 600, 750 and 900 feet deep.

The question of further diamond drilling operations through the sand plains which lie to the west of the producing section of the Porcupine gold area is being considered by the English interest who hold a large acreage of territory in that district. Last year about 6,000 feet of drilling was done, and the underlying rock formation was found to encourage the belief that ore might be found.

At the 8th level of the Dome Mines, the large underground crusher is now in operation. It will be recalled that a break-down occurred last year which necessitated considerable delay and inconvenience in connection with handling the ore. Certain duplicate parts are to be kept on hand so as to guard against a recurrence of the difficulty. Everything is now in readiness to operate at full capacity, the date for the commencement of speeding up the work depending upon the spring break-up, and the advent of adequate electric power.

Kirkland Lake

Good headway is being made at the Lake Shore mine in driving a crosscut north at the 600 ft. level for the purpose of developing the downward continuation of the main orebodies at that depth. Arrangements for additional power are being made so as to be prepared to handle an increased tonnage of ore.

It is understood the Teck-Hughes has under consideration a plan to increase the capacity of its mill. In this way it is hoped to reduce the per ton operating expenses and thereby add to the margin of net profits.

Just as soon as the snow goes, the Ontario-Kirkland will commence installing its new mill. The management intends to have the mill in operation by early Autumn.

Supplies are being hauled to the Belgood property at Mud Lake so as to be prepared to carry on operations throughout the Summer. D. H. Angus has taken charge of the work at the Belgood.

A deal is being negotiated for the Kirkland Townsite property. Robert Lyman is among those interested in an option on the property, the price being $250,000.

Plans are under way to resume work on the Bourke's Gold Mines, which is controlled by Charles Millar, of Toronto.

Skead Township.

Rich samples of gold ore have just been brought out from the Crawford-Skead property. A shaft is being sunk, and at a depth of 18 feet the vein is said to be about six feet in width. Some coarse gold is showing. Work is also under way on the Skead Gold Mines and on the property of the Northern Consolidated Mining and Milling Company.

KIRKLAND LAKE PROPRIETARY.

(A London Comment.)

The "Financial Times" of London in its "Mining Gossip" column has the following comment on Kirkland Lake companies:

"Mr. Latilla has returned from his visit to Canada, and looks all the better for the change. His object in crossing the Atlantic was not moose shooting, but business. He tells me that he had an exceedingly busy time while at the other side. I gathered that he was quite satisfied with the prospects of the mining interests under his control there, but had not yet had time to correlate all his impressions. It is significant, however, that the prices of Kirkland Lake propositions have steadily improved since his return, so it seems reasonable to conclude that some good news will be forthcoming before long.

"Some time just before the war there was a boom [illegible] of Stock Exchange activity in Kirkland Lake [illegible] and with the present [illegible] appears to be [illegible] where the [illegible]

"The present Kirkland Lake Proprietary [illegible] ganization [illegible] about 1919 [illegible] company of that name, the Tough-Oakes Gold Mines, Limited, the Burnside Gold Mines and the [illegible] Syndicate, while the property of the [illegible] was also included. On the Tough-Oakes there was a 120-stamp battery. [illegible] of the [illegible] and Rhodesian Trust, London, Mr. Latilla explained the [illegible] [illegible] [illegible] tested."

"The latest news from the Tough-Oakes [illegible] [illegible] [illegible] parallel veins had been [illegible] about £300,000 [illegible] £75,000 [illegible] something like 19 p. [illegible]

"As far as I can [illegible]

Exchange, those behind the concern should have little difficulty in getting a move on in the volume of business done, with, of course, appreciation in price."

A circular issued by the Company to its shareholders in England informs them that a cable from Canada under date of 7th March states that a rich vein of silver, giving assays up to 10,000 ozs. with an average assay value of 5,000 ozs., has been encountered on the Alladin-Cobalt property. The vein is described in the cable as being as continuation of a vein from the Nipissing mine. In the neighborhood of this "purple path" to quote the "Financial Times," milling-ore containing 107 ozs per ton has been mined to the extent of 100 tons, and about the same quantity has been blocked out. The vein described as a continuation of the Nipissing vein is 3½ inches wide, striking south-east.

The "Capitalist" states that since Mr. H. G. Latilla returned from Canada to London there has been a remarkable revival in the shares of Kirkland Lake Proprietary (1919) Ld. whose shares were "still kicking about" at the beginning of March at just under five shillings. Since then many thousands have been bought at up to fifteen shillings, and rumor has it that the price is bound for at least £1. The story goes that Mr. Latilla has sold at a good price the whole of the Union and Rhodesian Trust's holdings of Kirkland Lakes to a Canadian group, which may, it is thought, later on offer to buy out the shares remaining in independent hands so as to transfer control of the properties to Canada and avoid British taxation.

MONTREAL METAL QUOTATIONS.

Following are fair average prices for ingot metals (in less than car-load lots) at Montreal:

	Mar. 23	Mar. 16

(Unchanged from previous week.)

ARGONAUT GOLD, LTD. A CORRECTION.

On page 217 of the last issue, in the Northern Ontario correspondence, the total tonnage treated by this Company in 1920 was correctly stated at 4,637 tons, but the amount received for the gold extracted from this quantity was $32,513.05, and not $26,678.25 as stated, making the average $7.01 per ton instead of $5.75. The correct figures are given by Mr. John E. Hardman, Consulting Engineer for the Company.

TORONTO COAL PRICES.

Toronto, March 23.—The coal situation is unchanged except that operators are cutting down production to meet the lessened demand. The market for bituminous lump is from $8 to $8.50, Toronto, Canadian funds with slack at 50 c. to $1.00 depending on quality. Smokeless is from $7.75 to $8.50. The anthracite market is at circular prices with very little demand and the independents experiencing difficulty in moving their coal. Operators on high-grade bituminous coal are running only one or two days a week and are "cutting the garment according to the cloth" with the the result that there is very little "demurrage" or "distress" coal.

Mr. H. Foster Bain is to be renominated as Director of the U.S. Bureau of Mines. Mr. Bain was among the Americans who attended the recent meeting of the Canadian Institute of Mining and Metallurgy in Montreal.

Mr. P. E. Hopkins of the staff of the Ontario Bureau of Mines will work in the Skead gold area this summer

THE SINGLING-OUT OF MINERAL INDUSTRIES FOR TAXATION IN ONTARIO.

By ALEXANDER GRAY, Montreal.

Unwise. Suicidal. — Unjustified.

Special Taxation may promote the welfare of politicians and those who are removed from punitive levies. To the degree outlined at Parliament Buildings, Toronto, it is not going to soften the asperities to which the mining industry in general has been subjected as a continuous performance. It will enable the provincial government momentarily to mulct the mines for the benefit of localities unrelated to mining—also there may be grim satisfaction in slaughtering the more prosperous—but no microscope will be required to locate on the map abandoned properties and plants, if tandem taxes are maintained at a rate that must veto enterprise, and at least discourage initiative. Between Ottawa Income Taxes and Ontario's carving of income that might not represent profits, it is in order almost for the graduate in mining and metallurgy temporarily to forget his profession. Certainly capital will not clamor for country where so little consideration is shown for those who take mining risks.

It will be recalled Cobalt had taxes and royalties pyramided upon it by the Provincial Government and the Temiskaming and Northern Ontario Railway Commission. What was not attempted by way of royalties when the rush was on, was an official oversight—if there was a flaw in the title, occasionally a misdemeanor was compounded on a basis whereby the "punishment fit the crime". It transpired however, the percentages prescribed could not be collected, that the companies concerned declined to work almost solely for the smelters and the Government. Those of the public who bought Right-of-way, City of Cobalt, Townsite, and other shares, unmindful or royalties, had reasons to regret it. Eventually the Government's share all-round shrunk,—concessions had to be made—otherwise the properties involved would have remained relatively inactive.

"The limits of the law," it is contended by unscientific economists, ought to be applied to mining corporations whose income is over a million. Admittedly that is frankly coercive. Letting smaller and less prosperous companies "off with a light fine," though, might necessitate the enactment of a series of Blue Sky Laws. "wildcats" would be pentiful. It has yet to be demonstrated that official confiscation of earnings creates enthusiasm or replenishes treasuries. Ontario mineral industries were just about to experience a revival of activity when announcement was made that the Governments are going after them with double-barreled shot guns. Regardless of the urgency of Canada's economic condition, and the necessity for accelerated production all around the immediate effect of the reactionary policy has been to deter capital and curtail production.

Discussing the double taxation policy of the Ontario Government in New York with one of Canada's most prominent bankers, he said: "Immediate action should

EDITORIAL

Coal Control in Ontario

The office of Fuel Controller of Ontario has been abolished. It is understood that this action was taken for reasons of economy, as the cost of the department was defrayed by license fees. Presumably, therefore, the Government of Ontario believes that there is no longer any necessity for direct government intervention in coal distribution.

Is this really so?

Ontario's fuel-supply problem existed before the war, and it exists now and will continue to exist so long as Ontario is a province of Canada. The war, which caused a congestion of transportation routes all over North America, did not reveal anything new about Ontario's fuel difficulties. It merely emphasised them.

Ontario, so far as coal supply is concerned, is merely an extension of the radius of anthracite and bituminous coal distribution of Pennsylvania, and the geographical situation of Ontario, on the periphery of the distribution circle, indicates that at any and at every time when the transportation routes of North America suffer congestion or breakdown, Ontario will suffer from a coal shortage because she is the last and least preferred applicant at the ultimate source of supply. So far from Ontario's fuel problem being solved, or even relieved, we venture to assert that it is only just beginning, and from now on Ontario will feel, with ever increasing severity, the iron bands of restriction of business expansion and manufacturing activity originating in inability to get all the coal that the Province could use.

When the Fuel Controller of Canada resigned his office he left as a testament one of the most carefully thought-out treatises on Canada's coal-supply problem that was ever prepared, but Mr. Magrath's advice has gone utterly unregarded.

We do not know whether Mr. Harrington has left any record of his conclusions upon the coal-supply question in Ontario, but we do know that the abolition of the office has not abolished the problem.

The House of Commons at Ottawa, before the Easter recess, debated the coal-supply question, and there appears to be some likelihood that a Committee of the House will be appointed to investigate the matter. We would take the opportunity to repeat a suggestion several times made in these columns, namely, that such a committee should be formed and should consult with representatives of the Canadian Institute of Mining & Metallurgy and the Canadian Manufacturers Association.

Some of the questions that need consideration may be noted. The enlargement of the coal inlet facilities of what is known in the trade as the "Niagara Gateway" mentioned in Mr. M. A. McInnis's paper on "Coal Transportation" presented to the Toronto meeting of the Institute in March 1920. The storage of coal—especially anthracite—to avoid the seasonal congestion and the coincidence of the heaviest demand for coal supply with the least ability of the railways and canals to carry coal. The substitution of coal gas, on a very large scale, for natural gas, utilising the existing natural-gas distributing and burning arrangements. The installation of coke-oven plants near large cities, providing gas-fuel and coke in substitution for anthracite. All possible enlargement of the use of hydro-electric power and peat-fuel. The practical application of Mr. Magrath's advice as to a permanent fuel authority in central Canada.

This list—somewhat disjointed and imperfect—indicates some of the practical local problems that need speedy and competent attention in central Canada. No mention is made, in this connection of what may be proved to be the maximum extension of the radius of distribution of the coal that Canada has in the East and in the West. This is another story. Apart altogether from considerations of this nature, Ontario has localised and pressing problems that may be summed up in one question, to wit: "If Ontario must import coal how can it be done so as to avoid periodic shortages, exorbitant costs to the consumer, and so as to obtain maximum comfort and economy in consumption?"

It is to be hoped that the abolition of the office of Fuel Controller in Ontario does not indicate any disinclination in that province to look these questions in the face. And it may be not irrelevant to suggest that all the preliminaries of another scramble for coal are now in the making in the United States. Confirmation of the point of view expressed in this column last week is to hand at the time of writing in a Bulletin of the United States Geological Survey, in which Dr. George Otis Smith and Mr. F. G. Tryon, respectively Director and Statistician of the Survey, point out that if business should suddenly resume at full blast "we know that the railroads will hardly be in a position to haul coal enough to rebuild stocks, meet current consumption, and handle other freight at the same time without signs of distress."

THE PAN EXTENSION GOLD MINE.

The latest advertisement of this flotation, in the Montreal "Star" of the 26th March, states that "Millions of dollars have already been made in Manitoba's mines, but this is only the forerunner of gigantic fortunes which will be accumulated by those who have the courage and foresight to invest in the rich working properties of the Province." We sincerely hope so, but it would be more to the point if the advertisement would vouchsafe in what Manitoba gold mines millions of dollars have been made.

The ore on the Pan Extension is stated to exist as "immensely rich chambers." This a new term in auriferous nomenclature. Possibly these chambers are related to the "bunk" that a correspondent of the "Journal" recently wrote about as being suitable for "lying on," the stuff that dreams are made on?

The 50 cents shares will positively be advanced to 75 cents after March 31st. Presumably this appreciation will take place on April 1st.?

"You can only win by investing" the reader is urged. But is Pan Extension an investment? The information given by the promotion literature would, in our opinion, indicate that it is distinctly a very ordinary gamble.

The subscription blank provided for the use of those desiring to purchase shares in the Pan Extension Gold Mines co., Ltd., contains the following significant clause, namely: "I hereby agree that I have relied on no representations other than those contained in the printed Prospectus and printed matter of the Company, receipt of which I hereby acknowledge."

The intent of this clause is at first reading difficult to comprehend, but we believe, after consideration, that it may be paraphrased as follows: "I hereby accept the representations contained in the printed Prospectus and printed matter of the Company." Such a clause, signed by an applicant for shares, would, we believe, absolve the selling agents from responsibility for statements made in reducing sales and take away any recourse the purchaser of shares might have to successfully protest—afterwards—that the prospectus information was false or misleading.

The clause is not more reassuring than the prospectus representations, and indicates, in our opinion, that Pan Extension shares are not a desirable purchase.

THE COBALT WAGE DISPUTE.

It is reported from Cobalt that the miners will not accept the settlement of wage dispute recommended by the Board of Conciliation. They contend that the cost of living at Cobalt has not decreased to such an extent as to warrant the proposed cut in wages. There can be little doubt however that the circumstances make wage reduction necessary, and that unless the men are willing to accept lower wages there will be little opportunity for them to work at Cobalt. At present only about 700 men are employed by the silver-mining companies. This is about one-third the usual number. Some of the mines will remain closed until conditions are much improved. Those now operating must reduce working costs, and as labour costs form a large proportion of these, the workers must accept some reduction in wages if they are to retain even what little employment the market conditions will permit at this time. It is unfortunate, but inevitable. The workers at Cobalt were given a fair share of the increased revenue that high selling-prices for silver brought to the mining companies, and it should be plainly evident that the mining companies cannot pay out more in wages than the revenues they are now receiving.

Annual Meeting, Mining Society of Nova Scotia, Halifax, April 5th and 6th 1921.

The Annual Meeting of the Mining Society of Nova Scotia will be held at the Halifax Hotel on the 5th and 6th of April prox. The provisional programme includes the following papers, which, it will be noted, are of timely and practical interest. The Mining Society of Nova Scotia has not met in Halifax since its headquarters were moved to Sydney in 1913, and an unusually good meeting is looked forward to. The members are hoping that a number of the Montreal members of the Canadian Institute of Mining & Metallurgy will attend. List of papers to be read, which may be added to, is as under.

"The New Coal Raising and Screening Arrangements at Jubilee Colliery." A.Dawes, Divisional Engineer, Nova Scotia Steel & Coal Company.

"A Mine Fire in Springhill." John C. Nicholson, Dist. Superintendent of Mines, Dominion Coal Company.

"A Description of the Longwall Method as adopted at Jubilee Colliery." John Murphy, Mine Manager, Nova Scotia Steel & Coal Company.

"Conservation of Compressed Air." James P. Cotter.

"Saving the Productive Power of Industrial Cripples by Vocational Training." Prof. F. H. Sexton, Halifax Technical College.

"Deep Undersea Mining, some of its problems and difficulties." A. S. McNeil, Supt. of Mines, Nova Scotia Steel & Coal Company.

"The Relation of the Mechanical Loading Machine to the Mining Industry." Hugh B. Gillis, Supt. of Mines, Dominion Steel Company.

"Central Station Power for Colliery Operations." K. H. Marsh, Electrical Engineer, Dominion Steel Corporation.

"Notes for Industrial Department of the Dominion Coal Company and the Dominion Steel Company." A. W. McDonald, Supt. Industrial Relations Dom. Steel Corp.

"The Opening of the Birch Grove Area." Robert Simpson, Colliery Manager, Dominion Coal Co.

PERSONALS.

Mr. M. M. Makeaver is visiting gold properties in Northern Manitoba. He is interested in the Rex property at Herb Lake.

Mr. R. C. Allen, vice president of the Lake Superior Iron Ore Association has resigned and joined the mining department of Oglebay, Norton & Co., Cleveland. Mr. Allen was for several years State Geologist of Michigan.

Mr. J. B. Tyrrell has returned to Toronto after a trip to the Western Provinces.

Mr. Arthur Hewitt addressed the Toronto branch meeting of the C. I. M. & M. on Saturday Mar. 26.

Mr. Robert Bryce has returned to Toronto from Cobalt. He represented the mine operators on the Board of Conciliation at Cobalt last week.

Coast Erosion of the Carboniferous Rocks of Cape Breton Island

The "Canadian Mining Journal" of 28th May 1920 contained a series of photographs of a prominent spur of the exposed Coal Measures in the vicinity of Glace Bay, Cape Breton Island, showing the progressive demolition from about 1900 of this spur by wave and frost action. By the courtesy of Mr. B. A. L. Huntsman of Sydney, we are enabled to show the remains of the spur at the end of January of this year. The photograph taken a year earlier is also re-produced for comparison, and by reference to our issue of last May, previously referred to, those interested may gauge the rapidity and extent of the erosion that has taken place in twenty-one years.

Winter of 1918-19. End of spur isolated. Notice face with cap on right-hand side of middle portion of original spur. Photo by Mr. Huntsman.

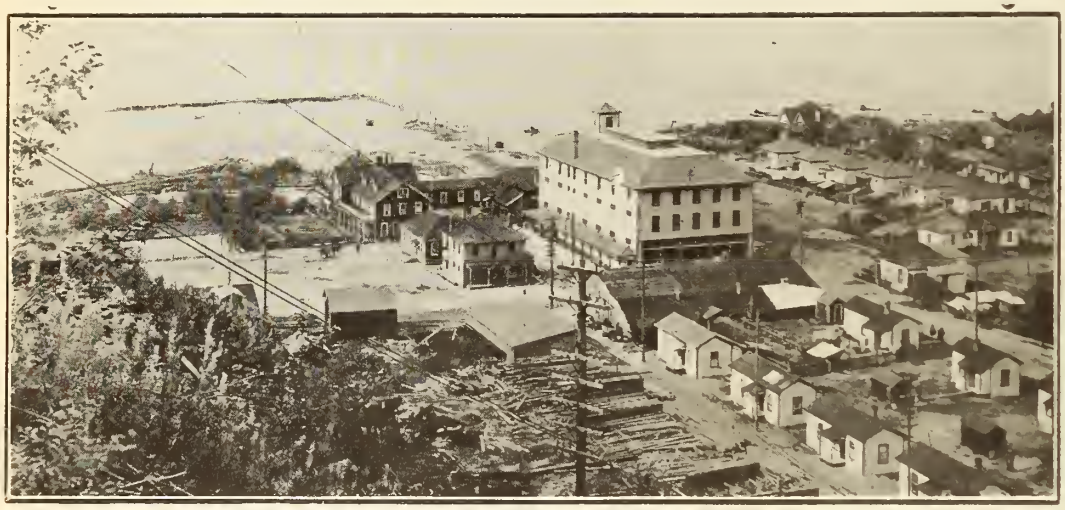
The Britannia Mine, Howe Sound, B.C.

(By our Victoria Correspondent.)

THE FIRE AT BRITANNIA BEACH, B. C.

Vancouver despatches reported a fire at Britannia Beach, Howe Sound, B. C., which we are informed by our British Columbia correspondent destroyed the concentrator of the Britannia Mining and Smelting Company. The electric power-plant, compressor plant, machine shops and the homes of the community were saved by the efforts of a small force of men under the direction of General Manager E. F. Donahue. The outbreak is believed to have been the result of a short circuit, and the flames had advanced too far, before being noticed, to be controlled. No official estimate of the loss has been given but is is placed roughly at over a million dollars. Mr. W. R. Quigley, vice-president of the Company, is quoted as stating the plant will be rebuilt.



Britannia Beach,
Howe Sound,
B. C.

The accompanying views show the concentrator when newly erected, and the manner in which the town-site is laid out on the beach will indicate how seriously a fire would threaten the community.

An historical account of the Britannia enterprise, by our British Columbia correspondent, is included in this issue.

Historical.

The first discovery of copper ore (chalcopyrite) made on the property now known as the Britannia mine, was in 1898. This was made by a party of trappers, and resulted in the staking of four mineral claims, which comprised the original holdings of the Britannia Copper Syndicate organized in 1899 by Howard Walters and associates, who had acquired 7/10ths of the group of four claims from Leo Boscowitz of Victoria, the purchaser of the claims from the original locators.

The Britannia Copper Syndicate was organized with capitalization of $250,000 divided into 400 shares of the par value of $625 each.

This syndicate performed considerable development work, and about 1904 sold a control of the capital stock to George Robinson, of Butte, Montana, and Henry Stearn, of New York, on a basis of $1,500 a share, who also later purchased the 3/10ths interest retained by Boscowitz; organized the Britannia Mining and Smelting Company Limited; purchased the Smelter built by Breen and Bellinger at Crofton, on the east coast of Vancouver Island; erected a concentrating plant, wharf and bunkers at Britannia Beach, Howe Sound; and connected with the mine-workings the concentrating mill by an aerial tramway two and a half miles long, built in two sections.

Operations were carried on under the management of George Robinson until his death, but concentration of the ore by water proved unsuccessful. With the then low price of copper, the ore was of too low grade to be profitably smelted direct, and it appeared as though the enterprise would result in failure. About that time the late G. B. Schley of New York acquired a control of the company, and commenced a policy of systematic development and thorough prospecting of the property. Although the mine was withdrawn from the list of producers from about 1907 to 1910, the results from the development work showed that there was about 400,000 tons of ore actually available of sufficiently high grade to be smelted direct. Owing to Mr. Schley's perseverance and indomitable courage, as well as his ability to finance the extensive programme for development which he outlined, the enterprise was changed from a possible failure to a success, and since the introduction of the flotation method of concentration, by which the enormous tonnage of low-grade copper ore occurring in the mine can be successfully treated, the Britannia mine ranks among the most important copper mines in the British Empire.

Since the late Mr. Schley acquired the control of the company, the original property has been so greatly enlarged by the purchase of adjoining mineral claims that today the holdings are represented by about 500 claims covering an area of about 20,000 acres in a solid block. For convenience, the present productive part of the property, or that portion from which the ore is being mined as distinguished from the claims being prospected, is subdivided into four divisions, known as the *Jane*, *Bluff*, *Fairview* and *Empress* mines, which adjoin each other and are all connected in the workings. The *Jane* is the most westerly, the Bluff is east of and adjoining the *Jane*, the *Fairview* is east of and adjoining the *Bluff*, and the *Empress* is southerly of and adjoining the *Fairview*.

The *Jane* mine is opened underground for a length of upwards of 1,000 feet from west to east along the strike of the mineralized zone; the *Bluff* extends for

800 feet east from the *Jane*. The *Fairview* mine extends for 2,500 feet east of the *Bluff;* and the *Empress* underground workings extend for 1,200 feet from west to east along the strike of the mineralized zone.

Development Work.

The underground workings today begin at the portal of an adit 9 feet high by 13 feet wide by about 4,000 feet long, at an elevation of about 200 feet above the sea, and a short distance from the shore of Howe Sound at Britannia Beach, the headquarters for the concentrating mill, electric power plant bunkers, terminals of the electric aerial and incline tramway and wharves.

This adit is termed the 4,100 foot level on account of being this distance below the outcrop of the ore bodies on Britannia Mountain about 4 miles easterly from the beach, and where the main mine workings are located. An upraise is being driven from the adit level to connect with the underground workings on the 2,700 level, or 1,400 feet above the 4,100. When this connection is made, the adit on the 4,100 level will be the main haulage way for the transportation of the output of ore mined.

The mine workings in the mine proper are best described in descending order from their start at the summit of Britannia Mountain, at an elevation of 4,530

The Concentrator of the Britannia Mining & Smelting Co.

feet above sea-level, where glory-holes are opened covering an area of about 1,100 feet from west to east and 400 feet from north to south.

This glory hole extends from the surface to the 250 feet level, at an elevation of 4,100 feet above sea-level, and the ore mined in it passes down a rock-raise to the 1,800 foot level, which is 2,500 feet above sea level, where the ore is drawn and transferred by electric train to the main rock raise No. 68, down which the ore passes to the 2,200 foot level, at an elevation of 2,150 feet above sea level, and which is at present the main haulage way.

The Mine workings originally were located on and above what is now the 1,000 foot level at an elevation of about 3,300 feet above sea level which was the main haulage way until the winter of 1915, when the log slide occurred that destroyed the mining camp and terminal of the aerial tramway on that level. Since then a main adit has been driven at the 2,200 feet above sea-level, which is at present used as the main haulage way and entrance to the underground workings. This adit is equipped with electric haulage and is 4,712 feet in length, 9 feet high by 13 feet wide, driven in a south 30 degrees easterly direction, crosscutting the formation. At a point 3,900 feet from the portal the No. 1 vein is exposed, on which the upraise, known as the No. 1 shaft, is located. This is a vertical upraise to the 1,000 foot level and is the main hoisting shaft for transporting men, timbers and supplies to the upper workings.

All of the ore is mined from the levels above the 2,200 and transported to the bins on that level by gravity down two rock-raises, the main one known as No. 68 rock-raise made on the No. 3 vein. This extends from the 850 foot level, at an elevation of 3,500 feet above sea level, to the 2,200 foot level and has connections on every level between these two. The other rock-raise is known as the No. 61 or auxiliary, and is made on the No. 1 vein from the 2,200 to the 1,000 foot levels, with connections at every level between.

In all there are upwards of 40 miles of underground workings in the mine proper.

During 1920 another section called the Victoria section of the mine, was developed, in addition to the *Jane*, *Bluff*, *Fairview* and *Empress* sections.

The total development work done on working openings during 1920 is represented by:—

Raises	1,454 feet.
Drifts	2,825 feet.
Cross-cuts	2,208 feet.
Chutes	1,094 feet.
Total	7,581 feet.

In addition there was diamond drilling on the 1,000, 1,200, 1,600 and 1,800 foot levels, totalling 5,696 feet.

Electrical power is employed throughout the vast system of works operated by the Britannia Company. This power is generated by water power developed by a system of reservoirs and dams on Britannia creek on the north side of Britannia mountain and Furry creek on the south, from which the water is carried by ditches and pipe lines to the power plants. These streams drain a very extensive area of mountainous country, and each creek has several tributaries and carries a very large body of water, flowing with a fall of nearly 4,000 feet within the comparatively short distance of about 3 or 4 miles.

The total water power used is 6,000 horse power. Electric motors are used for hauling ore trains underground as well as in the open on a switchback railway about 3 miles in length; hoists in the mine are operated by electricity in the main shaft from the 2,200 foot level up to the 1,000 foot level, of 1,200 feet vertically above the 2,200; also in the shaft from the 1,000 foot level up to the 500; while in the concentrating mill, machine shops and other parts of the works all the machinery is driven by electricity, and the towns and main mineworkings are also lighted by electricity — in fact, it is the power universally employed throughout the entire year.

The Britannia Mining Company was the first company in British Columbia to adopt the Mineral Separation Company's flotation process for concentrating the low grade copper ore that occurs on the property. This was done after thorough and systematic tests had been made, to ensure that the process would give sat

isfactory results. The first unit was erected at Britannia Beach with a capacity to treat 1,000 tons a day, and later this increased to about 2,500 tons a day, which is approximately the present capacity. Of this tonnage there is an appreciable quantity of the ore delivered on to the grizzlies at the top of the mill that is sorted out on the picking tables and shipped to the smelter direct. The remainder is first concentrated by jigs after passing through the crushers and rolls. The products of concentrates made by jigging represents about 40 per cent of the total product shipped to the smelter. The tailings from the jigs are transferred to the tube miles, crushed fine, and sent to the flotation cells, and the concentrates are shipped to the smelter, while the tailings, after being carried through launders, are deposited on the beach by means of a short tunnel driven from under the side of the mill to low tide mark, so that when the tide floods the material is carried out to sea.

The mill building is designed so that gravity is employed to the fullest extent possible in handling the ore, which is delivered from the 20 ton skips on the incline railway into the orebins at the top of the mill at an elevation of about 250 feet above sea-level. The ore then passes over the grizzlies from which the undersize passes direct to the jigs and the oversize to the picking tables, thence to the rolls and jigs, the tails from which are treated by flotation, and the concentrated product, which represents approximately 60 per cent of the tonnage, after being dewatered is shipped to the smelter at Tacoma, Washington.

The output for 1920 was as follows:

Tons of ore treated	697,897
Ounces of Gold produced	6,013
Ounces of Silver produced	90,672
Pounds of Copper produced	16,201,266

MINERAL IMPORTS AND PRODUCTION IN CANADA.

The April letter of the Royal Bank of Canada gives the sum of value of ten principal imports from the United States in the fiscal years 1914, 1920 and nine months of 1921. In the four items of mineral production and fabrication, the following imports are recorded:—

	Fiscal Years (In Millions of Dollars)		
	1914	1920	1921(9 m.)
Iron and Steel	$113	$182	$187
Coal	47	60	84
Petroleum	13	28	38
Non-ferrous metals	29	41	38
	$202	$311	$347
Total Value of Canadian Mineral Output	$129	$176	$217

Some allowance must be made in studying these figures for the decreased purchasing value of money, which has had the apparent effect of increasing intrinsic values, but, even making this allowance, the record is anything but creditable.. It is a fairly exact explanation of the 14 per cent discount on Canadian currency which now appears to be a stabilized rate, and likely to persist for a long period to come. When a major producing industry runs 130 million dollars to the bad, it is evident that Canada is a long way from self-sufficiency.

NOTES FROM THE NOVA SCOTIA COLLIERIES

The Dominion Coal Company's management announce that the outlet for production of the Cape Breton coal mines apart from stocking, is 125,000 tons monthly. The normal production of the collieries, with present working forces, is probably 325,000 tons monthly, so that only from one-third to one-half operation of the collieries is possible under present conditions of outlet. A stocking bank of 165,000 tons is reported to have been accumulated, and it is considered improbable that this will be added to this season. During similar trade conditions in previous Winters it has been usual to divide the available employment among the collieries, keeping them all in part-time operation, but the Company has closed one of its more expensive mines, and it is intimated that other collieries will be closed temporarily, and naturally selection of the mines to be suspended will be decided by considerations of cost of production. The policy of the Company indicates that the unbalanced character of the working organization, which is a legacy of the war and heavy enlistments of coal-cutters, still exists. This unbalanced condition, which consists in an actual shortage of miners and a surplus number of non-producing auxiliary employees, has been found very difficult to remedy, and, indeed, there is no remedy except that of dispensing with the services of auxiliary employees until such time as the ranks of the miners can be brought back to the necessary numbers. It goes without saying, moreover, that it is much easier to diagnose this ill than to apply a remedy. There has never been any appreciable varying of the productive capacity of the individual miners in the Nova Scotia coalfields during the past eight years, but the ratio of miners to auxiliary workers was upset by enlistments during the war period, and particularly in 1916 and 1917, has never been restored. There are reasons to believe this ratio may never be restored.

The St. Lawrence navigation has opened this year at an earlier date than has occurred at any time since shipments of coal from Nova Scotia to the Montreal market became at all important and it should be found possible to send coal up the River at an unprecedently early date. It should be noted, however, that navigation aids are not placed in the River, and that insurance companies impose certain limitations on the use of the St. Lawrence and Gulf routes before specified dates that are based on normal seasonal conditions. Giving due weight to these considerations, however, an unusually early appearance of Nova Scotia coal on the Montreal market may be looked for this year. Some relief to outlet conditions at the coal mines may then be anticipated.

A more uncertain factor is the extent to which the Nova Scotia companies will be able to reduce production costs, and it is becomingly increasingly evident that it would have been better for the miners, last October, to have refrained from demanding increased wages with the inevitable accompaniment of decreased employment, and to have adhered to the current wage scale. The ability of the coal companies in Nova Scotia to meet current competition in selling prices under the prevailing wage scale is a very doubtful thing. In so far as a number of the smaller and more difficult operations in the Province are concerned it is not possible, and it may be expected that the attempt to operate under current wage rates will in a number of instances be given up.

Petroleum Possibilities in British Columbia--The Policy of the Provincial Government

By our Victoria Correspondent.

There is an impression that oil cannot be recorded and title obtained to the lands upon which it is found in British Columbia. This is not so. Under the "Coal and Petroleum Act" of the Province, all unreserved oil-lands, title to which is vested in the Crown, are open to staking.

The catch, if it may be so termed, is in the word "unreserved" as there has been a considerable block of Crown Land in the northeast of British Columbia placed under reserve in respect of its oil values. Generally speaking, this is known at the Peace River Country and for years there has been a well founded belief that with prospecting, and the exploration of the promising locations, oil will be found in commercial quantities in this section of the Province.

That this opinion is sound has been very materially confirmed by the discoveries in the Fort Norman District, Northern Alberta. This region is adjacent to the Peace River Country, B. C., and is similar geologically. There, therefore, are stronger reasons than ever for the conviction, based on expert engineering advice, that led the Provincial Government to place a reserve on this area, its policy being to hold the oil, if it exists, for the benefit of the people. It is in line with this policy that Hon. T. D. Pattullo, Minister of Lands, has obtained for the past two years from the Legislature the funds necessary for carrying on explorations which, it is the intention, shall be followed up by active development at an early date. He and his colleagues have decided that, as far as this area is concerned, the speculator is to be barred and that the government, before it enters into negotiations with private interests, if it should decide that it is expedient so to do, shall have as accurate informations as possible of the value of the lands in question. In other words, it is proposed first placing the proposition outside the bounds of speculation and bringing it within the limits of an investment; as far as this can be done, of course, in dealing with the under surface oil content of any locality.

But the point to be made clear is that by no means all the Crown Lands of British Columbia are under reserve. By far the greater proportion of its sparsely settled, or altogether uninhabited territory, is open to the oil prospector. There are sections in the north and the northeast that are promising and the oil in which is available to the fortune staker. This is true, too, of considerable areas in the southwest of the Province. Under the circumstances it is not likely that the prospector is going to be discouraged. After all the Peace River Block is but a small proportion of the whole Province and, if the Government is successful in its development, there will be the satisfaction of establishing that oil in sufficient quantities to make it of commercial value exists to the west of the Rocky Mountains. And, if it is found in one place, why not in another of the same geological characteristics? There are other such sections in British Columbia outside the Peace River Block.

It is interesting to note that the present oil excitement in the Canadian West is not confined to the Fort Norman District. Reports declare that over 300,000 acres of land has been filed on and recorded for oil lease in the Ponce Group section of the Peace River. The area thus attracting attention is divided between British Columbia and the Province of Alberta. The part on the British Columbia side of the line is within what is known as the Dominion Peace River Block, an area of 3,500,000 acres ceded by the Province to the Dominion as a subsidy payment in connection with railway construction of about half a century ago. Oil lands within this Block, therefore, come under the regulations of the Federal Government and are not affected by the Provincial Reserve.

The Imperial Oil Company, having filed on some 36,000 acreas of the Prouce Coupe region, already is engaged in preparations for the season's prospecting. A complete drilling outfit, capable of going down four thousand feet, is being freighted over the winter trial. The first derrick and building are under construction. So far there has been no wild-catting in leases, the holders of leases evidencing no willingness to part with their holdings.

Report of Messrs. Dresser and Spicker.

To revert to the British Columbia Peace River Block, Hon. Mr. Pattullo, Minister of Lands, submitted to the Provincial Legislature recently the report of John A. Dresser, consulting engineer, and Prof. Edmund M. Spieker, of the John Hopkins University, who carried on geological survey work in that country during the summer of 1920.

Closer investigation was made of the areas described by the late Prof. Gwillim as being structurally favorable owing to the rolls and folds of bullhead sandstone, the geological equivalent of the oil or tar-bearing strata of the Lower Peace River, Athabasca River and of the Black Diamond Area in Southern Alberta.

The report confirms that of the previous year as to the oil-bearing character of the St. John shales and the possibility of oil accumulations of commercial value in the porous sandstone beds or in the upper parts of the Bullhead sandstones immediately beneath them, and suggests the most suitable points at which drilling may be started.

Promising locations were determined near the Gates of the Peace, on the Red River, on Lynx Creek, near the Southwest Halfway Creek; near the trail to Hudson Hope, while the anticlines of Miller Creek, Pine River, Table Mountain, Rocky Mountain, Lake, Moose Lake, Flat Creek, Canyon and Bullmoose Creek and the Boulder Creek dome, show possibilities.

The Boulder Creek formation is most promising, its dome-like shape making it almost perfect as a reservoir structure, while it is underlain within 1,300 feet of the surface by the lower sandstones of the Bullhead Mountain formation and the upper shales and limestones of the Pine River formation, a series of at least 300 feet in thickness, and probably more, which may contain petroleum; the extremely hard Boulder Creek member of the Bullhead formation has been cut away by erosion at the apex of the dome, and the amount of hard rock to be penetrated in order to reach the lower section is less than it would be elsewhere.

While no unquestionable seepages of petroleum were observed, a seepage of gas was found on the west flank of the Boulder Creek dome, northwest of the drilling location selected. The gas bubbles up intermittently through water in a hole at the base of the tree, the roots of the tree undoubtedly affording a channel through

which the gas escapes from the underlying sandstone to the surface. The gas is highly inflammable and contains a considerable percentage of hydrogen sulphide and gives a strong odor of sulphur dioxide when burned.

Referring to the absence of oil seepages, the report states that vast oilfields, today yielding millions of gallons exist without a single surface indication, so that their absence must not be taken as an unfavorable factor, provided the other features are favorable.

Summarized, the favorable factors are:

1. The presence of a number of formations in which oil could occur.

2. The presence of anticlines which dispose the possibly oil-bearing strata favorable to the retention of petroleum.

3. The comparatively reasonable depth within which the beds to be tested may be reached.

The Minister of Lands considers the report an invaluable guide to exploratory drilling operations, while it also furnishes a large amount of detailed geological information which should prove of great service.

ONTARIO'S COAL SUPPLY.

By R. E. Hore.

At a meeting of the Toronto Branch of the Canadian Institute of Mining and Metallurgy, held on Saturday, March 26, the chief topic of discussion was that of Canada's coal supply. The speakers confined their attention chiefly to the problem in Ontario, and more particularly in the city of Toronto.

Eastern and Western Canada have local supplies of coal and their problem is quite different to that of Ontario, which depends almost entirely on United States coal mines for its supply. As to whether Ontario might advantageously be supplied with Canadian coal, there is much doubt. Those who spoke at the meeting assumed that the probability is that our coal will not be used in Toronto and vicinity because of the high cost of transportation from the Eastern and Western coal mines. Starting with this assumption, some suggestions were made regarding protection in times when coal from the United States cannot be obtained in the desired quantity.

Mr. Jas. McEvoy outlined a plan for creating in Toronto a reserve supply of coal. He suggested that an endeavor might be made to build up a reserve of about one million tons which would be stored under water. He suggested using natural hollows which might be dammed and filled with coal which would remain under water until such time as it was required. This coal would be for use in case of emergency only and would properly be regarded as an insurance against stortage. Mr. McEvoy stated that the cost of such storage in the case of anthracite would be about $1.32 per ton and for a year's supply of bituminous coal about $1.00 per ton.

Mr. Arthur Hewitt, general manager of the Consumers Gas Co. called attention to the fact that a very large percentage of the citizens of Toronto are using gas for fuel. It would be a very serious matter if the supply of coal for making gas should fail for even a short period. His company uses about 300,000 tons coal per year in making gas for Toronto users and during the fuel shortage experienced much difficulty in keeping a reasonable supply of coal on hand. It is doubtful whether the people of Toronto fully realize how dependent they are for their daily needs on an adequate supply of coal. He thought that the cost of handling and transporting coal to and from a storage pile would be so high that it would only be advisable to attempt storage for very emergent situations, in which case a few dollars per ton additional cost might be considered of little moment. Under ordinary circumstances, however, any extra handling of the coal should be avoided. The men at the mines must work all the year round, and it would not be economy to push production hard at one season of the year if there is a possibility of spreading the work evenly over the year.

There followed some discussion on the possibility of bringing Canadian coal into Ontario. Some ventured the opinion that the territory between Winnipeg and Montreal will continue to be served most satisfactorily by United States coal. Mr. McEvoy, however, thought that the high-grade coals of the west might be brought further east than Winnipeg, and probably into Northern Ontario if the freight were handled in a way to permit reduction of freight rates. Heavier trainloads might advantageously be used. With reasonable freight rates the high-grade coals of the West would be able to compete with foreign coal for some distance east of Winnipeg. The bringing of low-grade coal to Ontario, however, is not likely ever to be a profitable business.

It was brought out in the discussion that Toronto uses about 2,500,000 tons of coal annually.

CHINESE CONDITIONS UNFAVORABLE TO SILVER FUTURE.

Messrs. Samuel Montague & Company's circular for March 3rd, contains the following note on the Chinese market for silver:—

"Reuter cables part of the address of the Chairman of the Hong-kong and Shanghai Banking Corporation at the annual meeting, which is hardly favourable to the future of silver. He said "China's trade balance is at present the governing factor of the silver situation. The prospect that China will be able to increase or even maintain last year's import of 98,500,000 ounces is at least doubtful. Speaking generally, the stocks of imported goods lying in Hongkong and China port are not excessive and do not exceed the normal pre-war figures. The markets of the interior are bare of supplies, justifying the anticipations that trade will soon resume its normal course. The prospects of the cotton industry in China are encouraging. The political unrest in China and the wide gulf between the North and South foreshadow a postponement of the establishment of a representative authoritative central Government. Financially the position is equally serious. The Government, in spite of large revenues from salt and Customs, is still in dire straits to meet its many obligations and administrative requirements, notably to pay its disproportionately large army. As regards the consortium, no loan can be considered so long as factional strife continues and the central Government's hold on the provinces remains in its present unsatisfactory condition. If this results in China borrowing at home rather than abroad, so much the better."

PEAT FUEL IN EUROPE.

Partly on account of the prevailing scarcity and high cost of coal in Europe, and partly as a result of technical advances in its utilization, peat is being increasingly used for fuel. One railway company in Sweden operating four hundred kilometers of line employs peat exclusively to fire its locomotives. A Norwegian coasting company uses peat fuel on its boats, and maintains a more regular service than when it used bunker coal, which could not always be procured. — "Living Age."

THE PROPOSED ONTARIO GOVERNMENT RAILWAY FROM WESTREE TO SWASTIKA.

(R. E. HORE.)

Hon. Henry Mills, Minister of Mines, and Hon. Beniah Bowman, Minister of Lands and Forests, are evidently favorably impressed with the arguments of those who are asking for the construction of a railroad to assist in the development of the areas which includes the Matachewan and West Shiningtree gold districts and the Gowganda silver districts. Both Ministers in reply to a petition for the railroad, presented on Friday, March 17th, stated that something should be done to improve transportation facilities in the area and indicated willingness to consider the project seriously. Premier Drury had expected to be present to receive the deputation, but was unavoidably detained at a meeting of the Waterways Commission. Hon. G. Howard Ferguson was present and promised that his group in the Legislature would strongly support the project if the Government should decide favorably on it.

A large deputation representing many and varied interests waited on the Government. The speakers presented many good reasons why the railroad should be built. They touched briefly on reasons why Governments should encourage development of natural resources and devoted their attention chiefly to the merits of the particular area which would be served by a railroad from Westree to Swastika. They pointed out that three promising mining areas would be served by this 90 mile road. They told of the pulpwood and timber resources that would be tapped and of the areas of good agricultural land that would be opened up for settlement. The speakers covered the subject well and presented a strong case. If the Government investigates the statements made it will find that the presentation was a very fair one.

It is a fair assumption that the present Ontario Government wishes to have the natural resources of the Province developed. It is reasonable to assume further that the Government is willing to do something to assist in the rapid development of resources. The petitioners presented their case as one group of partners in an enterprise asking for the co-operation of another group. The men from the north did not come to Toronto to ask for favors, but to indicate how the Government may play a big part in the development of mineral resources in the area.

It is not for the benefits that the community will derive that men engage in mining enterprises. The men who formed the deputation asked for the construction of the railway because it would help them to make money. It is well known, however, that the efforts of those who develop mineral deposits for their own profit necessarily result in many and large benefits to the community. The men who develop mines take many risks because they have a chance of making large profits. Whether they are successful or not the community benefits from their efforts. The community holds the preferred stock, guaranteed against financial loss. The men who spend money in mining enterprises have no guarantee that they will get their money back, much less any profits. The workman and the merchant and manufacturer run comparatively small chances of losing money in mine operations. The Government assumes no risks; but takes a share of the profits if they are large enough to attract the attention of Government to gatherers. This profit tax is, however, a relatively small benefit to the Province as compared with the benefits which the people of the Province derive from the millions expended annually by mine operators for labor and materials used in the work. The people of the Province receive these benefits and the Government being cognizant of the fact must be desirous of seeing the industry grow and prosper.

Then comes the question as to whether the Government should be active or passive. In the latter case some progress will doubtless be made; but in the former case much greater progress will be possible. In the development of new areas the Government can greatly assist the pioneers by providing adequate transportation. The Government is asked to do this because the people of the Province will benefit. It is true that the prospectors and operators will derive direct benefits from Government assistance; but no assistance that will not benefit the whole community is being asked for. The object of development of mineral resources is purely one of gain. The Government is not asked to believe that the men who engage in mining are so engaged because it is for the general good. They are engaged in mining enterprises for the purpose of making money. They ask the Government to share with them in the development of mineral areas because it is in their special interest. Their justification for expectation of Government assistance lies in the fact that their particular endeavor to make profits from mining enterprises is bound to result in benefits to the community whether they make money or lose it. If the Government to secure these benefits for the people of the Province, will supply needed transportation facilities there will be developed many deposits that are now idle. Other Governments in many lands have actively assisted in mineral development and we may reasonably expect that the present Government of Ontario will take some active part in developing mineral resources.

COINAGES.

It is reported that the French Mint did not strike a single piece of gold last year, but 3,000,000 two franc, nearly 20,000,000 one franc, and 8,500,000 fifty centime pieces were issued, and considerably over 100,000,000 nickel and bronze coins were struck.

Some of the American states still seem to mint a certain amount of silver. The Colombian Government has been authorized to have three million dollars in silver money and one million dollars in nickel money coined and placed in circulation. If the variety and quality of the silver coins be identical with those minted in 1918, the amount of silver required would amount to about 2,170,000 fine ounces.—Samuel Montagnu & Coy's Circular.

REPORTED DISCOVERY OF OIL AND GAS NEAR THE PAS, MAN.

Following the recent reported find of lignite in the Pasquia Hills district of Northern Saskatchewan (see page 118 our issue of 25th February) is a report of the finding of gas and oil in the same region. Despatches from The Pas, under date of March 22nd, state that Dr. R. C. Wallace, the Commissioner of Northern Manitoba is going to the district to investigate, and that drilling syndicates are already being organized.

Successive Stages in the Development of the Storage-Battery Locomotive for Mine Uses

Several Steps in the Improvement of the Accumulator Loccmotive Have Been Made in the Last Few Years. They Probably Foreshadow Still Further Developments in the Immediate Future.

By J. APPLETON, Ironton, O.

Development of the storage-battery locomotive during the last five years has been rapid and marked by enduring improvement. This applies not only to the locomotives themselves, which have been bettered in design and broadened in facilities for operation, but also to the method of applying them to the gathering and hauling of coal in the mines. Consequently operators have come to look upon these machines in a more favorable way and have enough confidence in them to consider their employment well worth investigation when any extension or development is contemplated. The early mistake of applying these locomotives to uses for which they were not suited has been corrected, and valuable lessons have been learned from this experience.

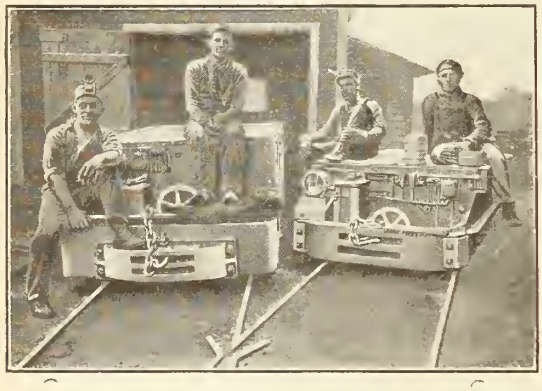


Fig. 1.—Two early storage battery locos. Still working satisfactorily after five years' service.

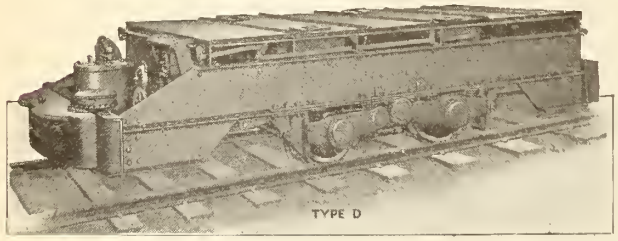

Fig. 2.—Low-type machine, equipped with radial housings and chain adjustment to compensate for wear.

Those who desire to keep up to date concerning modern practice in gathering and hauling coal should find much to interest them in a brief story of this development as shown by the experence of one of the several manufacturers in this line. From this can be obtained a good idea of the present and future status of the storage-battery locomotive in coal-mine service.

The storage-battery locomotive carries its own supply of power into the rooms and entries where no other source of energy is available. As the amount of energy that can thus be carried around is necessarily limited by the weight and chiefly by the space available (that is by the over-all dimensions of the vehicle) this machine must be so designed as to obtain the maximum results from this limited supply of power. Hence combined efficiency, mechanical and electrical, is of the utmost importance.

Operating where trolley-wire cannot be strung, or where the expense of its installation is prohibitive, the storage-battery locomotive replaces mules to great advantage. In some cases an additional saving is secured through not having to take down top or lift bottom to give the necessary height for these animals and their drivers.

For the purpose of this article the development of the "Ironton" storage-battery locomotive will be considered as typical of what has been accomplished by manufacturers during recent years in perfecting this

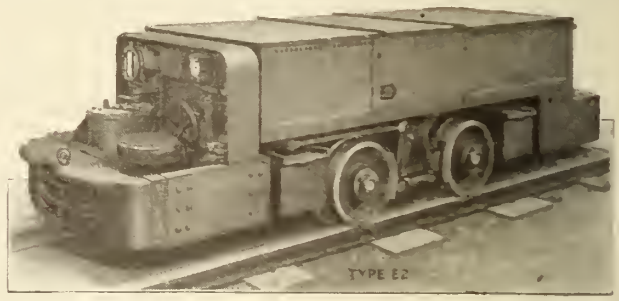

Fig. 4.—Narrow loco for use in restricted passages. Outside driver advantageous in removal of wheel.

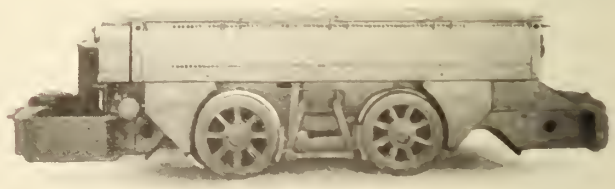

Fig. 6.—Gear-driven, storage-battery loco of large battery capacity. Both axles connected through worm-gears to single motor, and four wheels drive simultaneously.

means of applying electric haulage to the transportation of coal.

Fig. 1 shows two of the first Ironton machines of the storage-battery type. They were built in 1915 and are still in daily use and giving as good service as when they were installed. Of course the batteries, which were of the lead type, have been renewed. This picture shows both the low and the high machines. Both are chain-driven but are without the latter improvements that eliminated from this drive the difficulties and objection arising from lack of uniformity in the tension of the chain.

This difficulty existed whenever the locomotive was travelling over uneven track and other irregularities, for the warping of the support caused the distance between centers of the sprockets to vary. These later refinements also provided an easy and rapid method of taking up the slack as the chain gradually stretched from use and wear. These improved features are illus-

trated in Figs. 2 and 3. Both the low and high type of machine are again shown. The radial housings for the axle bearings and the eccentric adjustment for chain tightening are quite noticeable.

With increasing use of the storage-battery locomotive in gathering work, conditions were met which called for a type of machine that could be used in narrow entries or where timbers had been placed close to the track. The outside-wheel design met this situation admirably. It is shown in Fig. 4. The total width of this type is only a few inches greater than the track gauge.

Where the height will permit its use, the outside-wheel type has become popular, largely on account of the greater facilities for removing the wheels from the axles when such removal becomes necessary. A recent type of storage-battery locomotive introduces an entirely new feature—that of enabling the battery to be recharged while the locomotive is operating in an entry where trolley-wire is strung. This type of machine must not be confused with what is usually termed a combination locomotive, wherein a 250-volt trolley-type motor is used, both when the machine is operating with current from the trolley and when running on the battery.

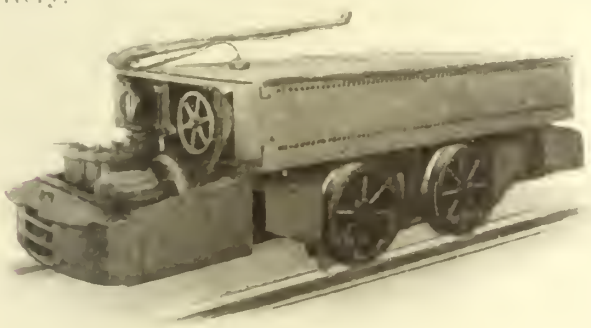

Fig. 7. Type that operates either as storage-battery loco. or trolley loco. All four wheels drive simultaneously, axles being connected through worm-gears to both battery and trolley motor.

In the type referred to a trolley-charging attachment is added to the storage-battery machine. This enables the battery to be replenished while running under a trolley. There are two advantages in this type of locomotive. Besides being able to do a limited amount of work on the trolley its scope as a straight accumulator machine is increased because of the additional battery capacity which is available.

This type of locomotive meets conditions under which the work is beyond the capacity of a gathering locomotive and yet is not of sufficient amount to warrant the installation of a main-line trolley locomotive. There also is the advantage of being able to charge the battery to some extent during working hours, thus reducing the time required to charge it afterward.

The latest development in design of storage battery locomotives for gathering and short hauls is shown in Fig. 6. Large battery capacity is available as the height has not been restricted to suit low coal.

In this type both axles are driven simultaneously by a single motor through worm gears. The drive shaft is direct connected to the motor through a flexible coupling, a universal joint being interposed between the worm gears. Experience and numerous tests have proven that accumulator locomotives in which each axle is driven by a separate motor do not develop the drawbar pull or tractive effort that can be obtained from machines in which the axles are connected and all four wheels are driven simultaneously.

As in the types previously described, all bearings are ball bearings; gears are fully enclosed in dust and oil-tight cases, and run in oil.

It is not expected that this type will supplant the chain-driven gathering types, which have been quite generally adopted. It will, however, be used in service where the chain drive is not as suitable as is the gear drive because of narrow-gauge track or other local conditions under which chain drive might prove objectionable.

Various attempts have been made to combine accumulator and trolley types in one machine. The chief objection to this type of machine was the extremely small battery capacity available and the low efficiency of the machine as a battery locomotive.

The first successful locomotive of the combination type is shown in Fig. 7. In this locomotive either the battery or the trolley may be used as the source of energy, each being independent of the other.

When used as a battery locomotive, the energy is supplied by a large-capacity locomotive-type battery (same number of cells as used for a straight-battery locomotive chassis of same weight) and a motor with windings suitable for the battery voltage. When used as a trolley locomotive, the energy is transmitted directly from the trolley to a 250-volt motor. In this design the low speed required for gathering is combined with the high speed desired for entry haulage. The axles are connected in the same manner as in the locomotive shown in Fig. 6 and all four wheels are driven simultaneously.

MONTAGUE GOLDFIELDS, NOVA SCOTIA.

Mr. J. Lindsay Allan, of London, representing an important British syndicate, has for the past three months been making extensive examinations and tests on the Montague Goldfields Company's properties at Montague. The tests have proved entirely satisfactory, as in addition to a 25 ton test from the "Skerry Lead," he has made tests from several leads in the south crossent at the 300 foot level of the main shaft. Two of the leads in question are illustrated in the Provincial Government's annual report on the mines of Nova Scotia, just published.

One of the leads is an entirely new discovery and has been named the "Coldstream." It is 26 inches in width and extends two miles in length and has been exposed to a depth of 200 feet. It is estimated that there is a quarter of a million tons of ore over this length and depth, tests of which gave nine dollars in gold to the ton. The ore from this lead can be mined and milled for about four dollars a ton.

The second important lead is the "St. Patrick," which like its adjoining lead "The Skerry" has now been proved to continue below the fault. It is 18 inches in width, and a test through the mill shows that it carries a gold value of about eighteen dollars to the ton.

Mr. Allan is leaving for London to complete arrangements for the erection of a new fifty stamp mill to handle this large body of ore. Concurrently with the erection of the new mill, electric power will be installed to operate the plant. In the meantime, preparations are being made to sink the main shaft which is now 300 feet deep, to a depth of 500 or 600 feet. Halifax "Chronicle."

NORTHERN MANITOBA'S GOLD FIELDS.

By REECE H. HAGUE, The Pas, Man.

The centre of prospecting for gold in northern Manitoba is the Wekusko or Herb Lake district, situated 100 miles north of The Pas, and reached from mile 82 on the Hudson Bay Railway by means of an eleven mile wagon road and eleven miles of water.

It was in the summer of 1914 that the first discoveries of gold were made in the district by a party of prospectors, most of whom are still in the locality, and who retain interests in companies which have been formed to take over some of the properties.

The Rex mine, situated at Herb Lake, is the only producing mine in Manitoba at the present time. It was discovered by a party of prospectors including J. R. Campbell, who is at present managing the mine for the company which is operating it.

The Rex was taken over in 1915 by Makeever Bros. of Boston and New York who also have extensive holdings in Mexico. Up to the present a sum of approximately $260,000 has been spent in exploration and developmental work on the property.

Makeever Bros. installed a Lane mill of 30 tons capacity and other machinery. For six months during 1918 the mill was operated and during this time $27,000 was recovered from the plates, and the concentrates sacked for future treatment. In December, 1918, the mine was closed down on account of the outbreak of influenza and unfavorable labour conditions. It was not until July, 1920, that operations were resumed and since that date work has been proceeding continuously.

The mill has only been running intermittently of late most of the labour being spent on shaft sinking. It is intended, when the shaft reaches a depth of 350 feet, to run the mill to capacity. The shaft is at present down to 280 feet being sunk at an angle of 70 degrees on the vein, which dips at that angle.

At the 100 foot level considerable drifting was done. Further drifting was done at the 210 foot level and will also be carried out at the 315 foot level. At the 100 foot level ore was removed by overhead stoping.

The vein, which runs parallel to, and some 200 yards distant from the lake shore, has been exposed for 1700 feet, the width at the surface and in the underground workings running from 2 to 20 feet. The strike of the vein is north east and the dip west. Values are uniform, averaging $20 a ton and improving at depth, the richest ore being secured at the 240 foot level where a porphry dike was encountered and some remarkably rich specimens secured.

A party of Winnipeg business men recently visited the Rex and other properties in the district. They went down the shaft and witnessed the mill operation and showed interest and appreciation of all they saw, returning to the city with many fine samples of free gold after a novel trip over lakes and portages, with the thermometer at 40 degrees below zero.

Half a mile from the Rex lies the Bingo property, on which sinking is in progress. The Bingo vein also strikes north east, and is thought by many to be a continuation of the vein passing over the Rex property. The vein on the Bingo has been traced for 1,400 feet and although small on the surface has strengthened at depth and the values improved, averaging, it is claimed $100 a ton.

Discovered the same season as the Rex, the Bingo was taken over in 1919 by a Winnipeg syndicate. No machinery, with the exception of a small engine to run the hoist, has been installed and shaft sinking has been carried out by hand.

The shaft is now down 150 feet and at 200 feet cross cutting will be carried out. It is intended to run some of the ore on the dump through the Rex mill at an early date.

It is anticipated that extensive work will be done on both the Rex and Bingo property this Spring and that machinery will be installed on the latter mine.

The show property of the district is the Northern Manitoba, about a mile from the Rex. No work has been done on this property for some little time but almost every piece of ore taken from the dump at the shaft head shows free gold.

The Northern Manitoba is controlled by a group of The Pas business men, the company being in a fairly good financial condition and it being their intention to resume work this spring.

A vein six to thirty inches in width has been exposed on the surface for 300 feet on the Northern Manitoba. A shaft has been sunk a hundred feet on the vein which dips 65 degrees east. Drifting has also been done and the quartz carries high values in gold in the fissures, associated with arsenopyrite and tourmaline. There is heavy arsenopyrite in the hanging wall to a width of six inches from the vein and here and there on the foot wall as well. On the south side there is a shear of 2 feet. For its width the vein is very persistent to the 100 foot level.

During 1918 a carload of ore from the Northern Manitoba was shipped to the Trail smelter and gave returns averaging $81.50 per ton. Machinery on the property consists of a 50 H.P. boiler, a three drill compresser-plant and a hoist.

The first discovery of gold at Herb Lake was made on the Kiski-Wekusko claims and was due to float being found on the lake shore and traced back to the Kiski. Three veins were stripped, and on one of them a vertical shaft was sunk to a depth of 53 feet. The width varies up to six feet and at the widest part of the vein north of the shaft the quartz is extensively cross-fractured.

Tourmaline occurs abundantly, mainly in irregular veinlets in the quartz. Copper pyrite, and occasionally galena, are found, but mispickel is the typical sulphide, occurring in places massive in the country rock. No. 1 vein has been exposed for a length of approximately 700 feet.

The company which controls the Kiski is a local one, and while no work has been done on the property for some considerable time, it is very promising and with the opening up of other claims in the district and improved transportation facilities, should make a mine.

The Apex group of claims have excited considerable interest. A dispute over the ownership is at present in progress in the Winnipeg Law Courts, an agreement for purchase having been made by a Winnipeg syndicate styling themselves the Mammoth Mining Company some time ago, and it being now maintained by the original owners that this agreement was not complied with, they are suing for a return of their property.

Professor R. C. Wallace, commissioner of Northern Manitoba, in describing the Apex group says that it is of interest in two respects. The claims are located well within the granite area, and the mineralization occurs, not in welldefined veins, but in a somewhat indefinite archlike zone. In what appears to be a line of weakness in the granite, extensive silification has taken

place, and arsenopyrite, pyrite and some chalcopyrite with gold have been deposited with the silica. The greatest width of silification is found in the Apex and Dawson claims, where the mineralized area has been prospected for 1,000 feet, the width averaging from 15 to 20 feet, with a greatest width in trenching of sixty feet. Values in channel sample are reported to range from $1.50 to $24.00 in gold. On the Discovery a pit has been sunk in a narrow quartz vein, the connection of which with the main vein cannot be traced owing to an intervening muskeg. Free gold is found in this vein. Eastwards from the Apex group and further from the contact, other quartz veins have been prospected. Such veins follow somewhat definitely the shear direction of the granite, and are of doubtful lateral continuity.

The Pas Consolidated Mines control the Dauphin-Elizabeth property, northeast of the Rex, on which a vein has been traced for 1,000 feet, which is six feet in width on the surface and three feet at the bottom of a 50 foot shaft which has been sunk on the property.

"This is a strong vein throughout, but the mineralization as disclosed on the surface, is somewhat sparing in arsenopyrite, chalcopyrite and galena" says Dr. Wallace. "Several veinlets have been discovered on the Elizabeth claims west, and one east, of the main vein. The country rock to the east is an acid lava, and to the west acid lava and coarse sediment."

A Winnipeg syndicate is at present engaged in stripping and trenching the Trapper group of claims, adjoining the Bingo.

The most northerly group on Herb Lake are the McCafferty claims, on which a double compartment shaft has been sunk on the vein at a point where the width is eight feet, including a horse two feet in width. The vein has been carefully stripped northwards for a distance of three hundred feet, and is said to have been followed for 1,600 feet. Four large shacks have been built on the property and a wagon road cut through to the lake facilitate transportation.

There are many other single claims and groups which show promise, and on which development work will no doubt be done, but space will not allow for a description of all.

Reference to the Herb Lake district would not be complete, however, without mention of a galena body which was discovered last summer, and on which stripping and trenching have revealed a very large body of ore carrying high values in silver and lead. Further work will be done on this property this summer, and the result is looked forward to with interest.

Other districts in Northern Manitoba in which promising gold properties have been discovered are the Copper Lake, Elbow Lake and Beaver Lake regions, in all of which good properties exist, and which will no doubt receive greater attention, when transportation facilities are afforded, but which are dependent to an extent on the building of the Flin Flon railway.

Beaver Lake was the scene of a rush in 1913, and while many claims have been allowed to lapse there are those who still cling on their properties in that district, convinced that it will come into its own in time.

Copper Lake was the scene of a spectacular high grade gold discovery on the Red Rose Claim owned by J. P. Gordon, which created considerable excitement in the Spring of 1919. A large amount of money was spent in diamond drilling a big dyke on Mr Gordon's property last Spring, and good gold and silver values were secured.

BOOK REVIEW.

ECONOMIC MINERALOGY.—A Practical Guide to the Study of Useful Minerals. By Thomas Crook, Chief of the Intelligence and Publications Section, Imperial Mineral Resources Bureau, London. 6 by 8½ by 1¼ inches. Stiff Buckram boards, 492 pp. with index. Numerous illustrations. Price, $8. Longmans, Green & Co., London and New York.

The aim of this book is stated to be to deal with the subject of mineralogy in such a way as to meet the needs of those who wish to restrict their attention to the utilitarian side of the subject. That is to say the book is designed to suit the needs of the practising engineer who requires to be informed as to the latest developments of the varied sciences that are included in the scope of the term mineralogy, but has not the time, and is under no real necessity, to equip himself with special knowledge of the individual branches. The work is a condensation of information not previously available in so convenient and digested a form. The chapters from one to seven deal respectively with crystals and their symmetry, the general physical characters of minerals, the practical elements of crystal optics, the chemical examination of minerals, the physical analysis of crushed rocks and loose detrital sediments, and the geology of economic mineral deposits. Chapters eight to eleven classify in alphabetical arrangement the useful minerals, and deals with them from the point of their economic uses. Each mineral is described, under the arrangement mentioned, as to its general, optical, chemical and blowpipe characteristics, with typical crystal forms and good illustrations. The three chapters are arranged into descriptions of Ore Minerals, Gem Minerals, and Miscellaneous Economic Minerals.

The concluding chapter consists of determinative tables, as follows:

1. Divided as to lustre into "metallic" and "Non metallic" groups, giving hardness, specific gravity, fusibility, colour, streak, and other characteristics.

2. Arrangement in order of specific gravity.

3. Arrangement as to colour.

Mr. Crook's work will undoubtedly be welcomed by a large class of readers that he refers to as "economic mineralogists" having aims utilitarian and economic rather than purely scientific. At the same time, Mr. Crooks has not by any means neglected the scientific aspect of his subject.

The book is excellently well bound, and is printed on thick, good-quality paper, and while the cost of the work is high, the cost of its production must have been also quite high. It can be confidently recommended. One interesting feature noted is the information given as to the origin of names given to minerals. The information as to the occurrence and distribution of each mineral described is complete, not only as to locality, but as to association with other minerals and nature of occurrence. The description of the Sudbury nickel deposit is a typical example of Mr Crook's ability to condense a good deal of accurate information in a very small compass.—F.W.G.

Graphite and Magnesite Industries in the United States During 1920

U.S. Geological Survey Reports Increased Tonnage but Decreased Selling Value.

The quantity of domestic flake and amorphous graphite sold by producers in the United States in 1920 amounted to 9,510 short tons, an increase of 28 per cent over the quantity sold in 1919.

The value of the graphite sold in 1920 was about $626,201, as compared with $778,857 in 1919. These figures are based on reports made by producers to the U. S. Geological Survey, Department of the Interior.

Operators in Colorado, Nevada, and Rhode Island reported sales of 4,694 short tons of amorphous graphite in 1920 at an average of $10.60 a ton. This was $3.52 per ton less than the average price in 1919.

The sales of crystalline graphite in 1920 amounted to 9,632,360 pounds, valued at $576,443, as compared with 8,086,191 pounds, valued at $731,141 in 1919. The average price per pound in 1920 was 5.9 cents; in 1919 it was 9 cents. Alabama led in the production of crystalline graphite, the sales in 1920 amounting to 4,894,648 pounds, or 51 per cent of the total quantity sold in the United States.

The sales reported from New York and Pennsylvania amounted to 3,552,687 pounds, or 37 per cent of the total in the United States, and the remaining 13 per cent was reported from California, Montana, and Texas.

The Acheson Graphite Co. reported the sale of 7,399,749 pounds of artificial graphite, which it manufactured at its plant at Niagara Falls, N. Y.

The domestic graphite sold during the six years 1915 to 1920 has been as follows:

	Short tons	Value
1915	4,718	$429,631
1916	8,088	935,471
1917	13,593	1,167,879
1918	12,991	1,524,254
1919	7,422	778,857
1920	9,510	626,201

Importations of graphite into the United States during 1920 were as under. The figures are subject to revision:

Country of origin	Quantity (short tons)	Value
Ceylon	9,204	$1,077,290
Madagascar	4,710	286,383
Canada	2,170	157,015
Mexico	3,659	131,832
Chosen (Korea)	810	29,936
Italy	137	5,072
Austria	58	1,195
Germany	30	2,502
Other countries	317	20,087
	21,095	$1,711,312

The Magnesite Industry in the United States During 1920.

The production of magnesite in the United States in 1920 increased 94 per cent in quantity over that of 1919. The entire output was made by two states, California and Washington. California mined 63 per cent more magnesite in 1920 than in 1919 and more than eight times as much as it mined seven years ago. Washington increased its production 109 per cent over that of the preceding year, making by far the largest output it has yet made. According to the United States Geological Survey, Department of the Interior, the total production of magnesite in the United States in 1920 was 303,767 short tons, which was valued at approximately 2,748,150. The following table shows the production by States:

Crude magnesite produced and sold or treated in the United States, 1913-1920.

	California		Washington	
Year	Quantity (short tons)	Value	Quantity (short tons)	Value
1913	9,362	$ 77,056	.....	.....
1914	11,293	124,223	.....	.....
1915	30,499	274,491	.....	.....
1916	154,259	1,388,331	715	$ 5,362
1917	211,663	2,116,630	105,175	783,188
1918	84,077	761,811	147,528	1,050,790
1919	50,020	504,973	106,206	743,442
1920	81,782	1,083,262	221,985	1,664,888

Most of the output of California was calcined and used as plastic material, only a small part being natural ferromagnesite used as a refractory lining of steel furnaces on the Pacific Coast. On the other hand, practically all the magnesite mined in Washington was dead-burned into synthetic ferromagnesite and used as a refractory lining of furnaces and smelters.

The largest producers of California were the Tulare Mining Co., and the Sierra Magnesite Co., at Porterville; the White Rock Mine, operated by Frank R. Sweasy, in Napa County, and the property of the Western material Development Company on Red Mountain, operated by C. S. Maltby.

The Northwest Magnesite Co., of Chewelah, Wash., was the largest producer in the United States. It shipped in 1920 more than 90,000 tons of dead-burned ferromagnesite, most of which was sent to steel companies and manufacturers of refractory product east of the Mississippi. The American Mineral Production Co., of Valley, Wash., sold its output crude to the Northwest Magnesite Co., whose quarries are nearby. The Western Materials Company operated the Double Eagle magnesite mine, near Valley, and shipped the calcined product to the American Refractories Co.

At the end of December, 1920, all the operations in Washington were stopped, principally, it is believed, on account of a lack of orders from the steel companies, many of which were idle or were not working full time. Some of the California producers were considerably discouraged at the end of the year on account of the high cost of labor and supplies, the high freight rates, and the competition of foreign material.

Imports.

The imports of magnesite in 1920, reported by the Bureau of Foreign and Domestic Commerce as calcined, not purified, amounted to 43,154 long tons, valued at $780,078. These imports came from the following countries:

Magnesite imported into the United States, 1920.

	Quantity (Long tons)	Value
Austria	...	$ 4
Germany	713	28,566
Italy	21,185	241,220
Czecho-Slovakia	3,829	126,827
Greece	4,000	38,418
Turkey in Europe	3,528	70,540
Netherlands	819	54,991
England	28	3,511
Scotland	190	13,720
Canada	6,028	184,060
Mexico	500	6,300
Venezuela	2,300	11,500
Australia	34	417
Straits Settlements	.....	4
	43,154	780,078

The magnesite imported from Italy was mined in Austria, and that from Czecho-Slovakia was obtained from the former Hungarian deposits. That imported from Mexico came from Santa Margarita Island and was calcined near San Diego, Calif. A shipment from Greece received in November was the first one to be sent from that country since 1916. The arrival of 2,300 tons from Venezuela in September, 1920, was a notable event, as the recorded imports of magnesite from that country are meager.

Although the quantity of magnesite imported in 1920 was nearly three times as great as in 1919, it was only about one-seventh of the quantity commonly imported before the war.

THE PRESIDENT OF THE CANADIAN INSTITUTE OF MINING AND METALLURGY.

An Appreciation of Mr. C. V. Corless, by the "Engineering & Mining Journal" of New York.

When the time came for decision as to what line should run at the top of this page, some doubt entered our mind. Is Mr. Corless a mining engineer or a metallurgical engineer, or does he belong in some of the newer classes such as "human" engineers or educational engineers? He qualifies for any of these titles, but we thought that "mining engineer" was the most all-embracing. Mr. Corless is another one of those Canadians: he was born on an Ontario farm in 1868, and has spent most of his life in his native country. His early years of manhood were occupied in teaching in preparatory schools, where he gained a reputation for his work in natural science, particularly biology. At the age of thirty, however, he had become convinced that progress along the lines which he had been following, and the fruition of his desires, required a separate income, which he did not command. No doubt feeling, therefore, as so many of us have, that digging gold out of the ground was a good way to acquire it, he decided on a course in mining and metallurgy at McGill University, in Montreal. In 1902, he was graduated with high honors, including a medal and a fellowship, and received the degree of B.Sc. in Mining.

In Canada, the summer vacations are longer than in this country, and the mining students almost invariably spend this time in practical work. One summer, Mr. Corless worked under W. A. Carlyle at the Le Roi mine at Rossland, B. C.; another was spent in the coal mines of Crow's Nest Pass; and his last "vacation" was spent in an inspection trip, with other students of his class, of the mines and metallurgical works of British Columbia, and in the preparation of a thesis on the geology and ore deposits of southern British Columbia. The year 1903 was devoted to graduate work under the Dawson fellowship, which he had received, the subject of his research being "Free Fall of Bodies in Water," a topic of great importance in the concentration and classification of ore pulps. For this work he won a Master's degree.

After leaving the university, Mr. Corless held his first position for only ten days. This was not because he was fired, however. The work he had accepted had been the inspection of railroad shops, and when he had the opportunity of examining some coal properties he lost no times in turning to his chosen profession. Many of our readers have heard the story of the man who was hired to kill some beavers which were damaging his employer's property. Joe had been on the job for some days with gun in hand, when friend Bill happened by to keep him company. Bill's bright eyes soon saw a beaver, but Joe was unmoved. "There he is, Joe; why don't you shoot?" he asked. "What do you think I am, Bill?" he replied, "that's the last beaver; and if I kill him I'm out of a job." Now, Mr. Corless, when he went to the given spot in British Columbia, had no trouble in deciding that coal was present, for he could see it; also that the seam was not workable, for that was equally evident. However, he lost no time in reporting his conclusions, and in a few days was again out of a job. This state of affairs was soon remedied, however, when he was offered an assistantship in the mining department of McGill. This was not exceedingly remunerative, but offered further opportunities for study.

A year later, in 1904, Mr. Corless, through his university friends, was given a position as mine superintendent for the Mond Nickel Co., the world's second largest nickel producer, and his connection with that company has continued to the present day. In 1908, he was made director and manager, and since that time has been actively in charge of hydro-electric development as well as the construction and operation of the Coniston smelter and an experimental flotation mill.

Besides his engineering activities, Mr. Corless has achieved a reputation as an educator and a welfare worker and has contributed many constructive papers to scientific societies and technical journals on these subjects. The latest honor accorded Mr. Corless is that of the presidency of the Canadian Institute of Mining and Metallurgy, a position which he assumed at the Montreal meeting early in March.

The peat fuel from the Alfred Bog is being used in Montreal with much satisfaction in open grates in conjunction with wood. The peat imparts a "body" to the wood, and gives a glow and heat that is cheerful. In burning, the peat gives off a pleasant odour, that to many people is an added attraction. It makes more ash than wood alone, but not sufficient to require too frequent removal of the ashes from an ordinary living room grate, and like wood ashes, the peat ash makes good fertilizer if used alone or mixed with leaf mould or manure. With hardwood becoming daily scarcer and, of course, dearer, there should be a good opening for peat fuel for open grate fires.

GENERAL DESCRIPTION OF STATUS OF THE MINING INDUSTRY OF KIRKLAND LAKE.

By J. A. McRAE, Cobalt.

The mines of the Kirkland Lake gold area, within the next sixty or ninety days, will be employing between 700 and 800 men, according to the present plans of the management at each of the proven mines.

The month of May is to witness the treatment of an aggregate of about 440 tons of ore daily, made up as follows:—

Company	Tonnage Daily
Kirkland Lake	140
Teck-Hughes	120
Wright-Hargreaves	120
Lake Shore	60
Total	440

To Treat 74 Tons Daily.

In addition to this, the companies mentioned will each proceed to increase the scope of their operations, while others will join the producing list before the end of the summer. As to this, the status of the industry at Kirkland Lake is being estimated as follows, as of the last quarter of the current year:

Company	Tonnage Daily
Wright-Hargreaves	180
Kirkland Lake	150
*Tough-Oakes	125
Teck-Hughes	120
# Lake Shore	100
Ontario-Kirkland	70
Total	745

Estimating an increase of 40 tons daily by increasing the grinding equipment.

The average grade of the ore to be treated is difficult to estimate. The average grade heretofore treated by the Lake Shore has been $25 to the ton. The Wright-Hargreaves is expected to average over $15 a ton, and the Lake Shore may be brought down to about $18 a ton. The Tough-Oakes is expected to average close to $15 a ton, while the Kirkland Lake, Teck-Hughes and Ontario Kirkland are expected to exceed $10 a ton. Were the whole tonnage treated to average $15 a ton, the daily output would reach about $11,175, or at the rate of $4,079,075 a year. Even though the average is brought down to a minimum of $12 a ton, the daily output would amount to $8,940 or at the rate of $3,263,100 a year. From these figures, careful observers are estimating an annual output at the rate of about $3,500,000.

These figures deal only with the mines with proven ore reserves, and do not take into account the other properties on which favorable developments are taking place. Neither do they include the Orr Gold Mines where a large tonnage of ore has been developed, but on which nothing has so far been done toward providing facilities for treating the ore.

Management of the Mines.

The management of each of the mines is in highly efficient hands, as may be seen by the following summary:—

Wright Hargreaves Mine, Albert Wende; Kirkland Lake, William Sixth; Tough-Oakes, or (Kirkland Lake Proprietary,) Charles A. Richardson; Teck-Hughes, D. L. Forbes; Lake Shore, R. C. Coffey; Ontario-Kirkland, Ralph Hurd.

The supply of labor is now entirely satisfactory, and the efficiency of the work has and is still undergoing an increase. Transportation is favorable and the supply of hydro-electric energy is adequate to meet all requirements.

Some Favorable Features.

A favorable feature in connection with the producing mines is the fact that Government geologists have been permitted to enter each mine, make surveys and examinations, and make public a general report which provides a means of studying the geological structure peculiar to each. The physical status of each property is quite well known to each mine manager and affords an opportunity to study all problems on a basis of correlation. This is of very considerable importance, and could only be added to by a presentation of statements by each company in relation to methods of ore treatment and experiments and the cost as applied to each department. By such comparison, some little rivalry would inevitably result—each perhaps endeavoring to establish a higher point of efficiency than the other, but the whole comparison and effort combining to create a maximum degree of efficiency in all branches of the work, whether in connection with mining or milling practice.

As yet, the Lake Shore is the only company which submits a monthly statement of progress and output. The other companies confine themselves to annual statements. As to this, however, some of the other companies are soon to offer more publicity. The correspondent of the Mining Journal has received official assurance that once the operation of the Kirkland Lake Proprietary is under way, a monthly statement may be forthcoming. The Ontario-Kirkland will also submit a monthly statement, following the completion of its mill, while the Wright-Hargreaves is also expected to consider such a policy once the mill is brought up to full capacity. The Kirkland Lake Gold Mines, and the Teck-Hughes have always been very frank about achievements at the properties and the results in their mills, and these two companies, too, are understood to be favorably disposed toward giving out a monthly statement. The reason for not having made a practice of this in the past at some of the mines has been due to the fluctuating conditions both in regard to labor and power supply, as well as the uncertainties caused by the adverse conditions arising out of the recent war.

A Leading Industrial Centre.

This summary is intended to convey a general idea of the status of the gold mining industry as found in the Kirkland Lake field. It goes to show that this field is the second largest gold-producing area in the Dominion, and is rapidly becoming one of the leading industrial centres of this part of Northern Ontario.

Another important point, without which a brief outline of the district would be quite incomplete, is the fact that the auriferous zone along which the proven gold-bearing deposits of commercial value lie, extends both East and West from the present producing section and offers excellent possibilities of considerable extension of activity, with very favorable prospects of additional mines being developed. The producing section, as yet, is confined to about two miles in length, and conservative mining engineers recognize the possibility of this length being ultimately greatly extended. Such is the proven merit of the field, and such are the enormous potentialities.

* To be known as the Kirkland Lake Proprietary (1919.)

GASIFICATION OF CRUDE LIGNITE.

In an article published in "Zeitschrift des Vereines Deutscher Ingenieure" on the gasification of crude lignite, the writer discusses the numerous failures which have arisen from the hasty erection of new works before awaiting the results of the experiments carried out in existing installations, and describes two of the processes said to have been adopted with success in Germany. It is pointed out that experiments have demonstrated the necessity of separating the different phases of lignite gasification—drying, distillation at low temperature, and gasification—in order to maintain the desired temperature, while at the same time reducing to a minimum the amount of heat consumed. Drying should be effected at between 100 degs. and 125 degs. C., distillation between 450 degs. and 550 degs. C., and gasification between 900 degs. and 1,000 degs. C. This separation of the processes assures a saving of heat in drying, a more thorough decomposition of the fuel in the distillation, and also the recovery of a greater quantity of tar. The foregoing fundamental principles are the basis of the two processes described in the article, the first of which has been introduced at the works of Thyssen & Co. The coal is dried and distilled in a tubular rotary furnace constructed according to the specification of the Institute of Coal Research at Mulheim, the operation of the furnace being based on the experience acquired by the coal distilling industry in Saxony and Thuringia. The temperatures are easily controlled, the resultant steam passing through a special pipe at one end of the cylinder, and the tar being recovered at the other end. The resultant coke is drawn of mechanically. The first experimental furnace was constructed for a daily charge of 50 tons of cannel coal, and was subsequently modified successfully for the gasification of crude lignite as delivered from the mine. The distillation gases which are not condensible are utilised for heating the furnace. The Thyssen works have now in course of construction a rotary furnace with a productive capacity of 100 tons per day.

The second process referred to is that adopted by the A. G. fur Brennstoffvergasung, a branch of the firm of Erhardt & Sehmer, the drying and the other operations being in this case carried out in separate apparatus. Distillation and gasification are effected independently, the apparatus for the last-named operation having a rectangular section and being provided with a movable mechanical grating. Distillation is effected in a special retort at a low temperature. It is stated that by this process it has been possible to treat successfully raw lignite from the Rhine and from Central Germany containing 50 per cent. of water, as well as peat containing 70 per cent. water, both classes of fuel being previously dried to reduce the water content to 25 per cent. One double gasification chamber will treat 40 tons per day; five similar double chambers treating 200 tons per day are sufficient to operate boilers having a heating surface of 800 square metres. The tar oil obtained by this process is stated to be very similar in appearance and composition to petroleum and to contain light oil (10 p.c.—25 p.c.), viscous oil (20 p.c.—35 p.c.), phenol (10 p.c.—50 p.c.), paraffin (5p.c.—25 p.c.), and pitch (5 p.c.—30 p.c.). Recent experiments suggest the presence of other useful materials in the tar. It is estimated that to obtain an amount of gas the combustion of which will furnish 10,000 calories, 7 kilos of lignite are required in direct gasification, 10 kilos when gasification is effected after previous compression, and 9 kilos when the gasification and recovery of tar are carried out by means of the new processes described. The amount of heat consumed in the production of one k.w.-hour is approximately equivalent to 6,250 calories in a gas turbine installation, including the amount of heat required to effect gasification. It is considered probable that the conversion of lignite into oil will lead to a more complete utilisation of this material; the oil is easily stored, and in view of its high calorific power it forms an excellent fuel.—"Mining Journal," London.

COAL AT KILKENNY, IRELAND.

(From London "Financial Times.")

A very encouraging step forward in the better development of the Irish coalfield has been made by the opening to passenger traffic of a new offshoot from the Great Southern and Western Railway main line to Castlecomer. The branch line extends over ten miles, and branches off Castlecomer Junction, between Kilkenny and Ballyragget. It was constructed during war time at a cost of over £100,000 for the purpose of getting much-needed coal from the Castlecomer Company's mines. Castlecomer itself lies in the midst of a rich and prosperous agricultural district, and hitherto it has been necessary to convey the coal by road to Kilkenny.

Probably the greatest importance of the opening of this new railway lies in the fact that it is symbolic of what might be happening all over Ireland if the Irish people once made up their minds to advance by their own economic efforts, instead of relapsing into unprofitable anarchy at the behest of the country's irresponsible youth.

As showing the productivity of the Kilkenny coal area, it may be remembered that the Royal Commission on Coal Supplies estimated that the coal still to be worked in the Leinster area was 180,000,000 tons. Last year, indeed, the output of three of its collieries was over 63,000 tons, and this year the output is expected to exceed that total. The Castlecomer Collieries, Limited, produce, in fact, two-thirds of all the coal mined in Ireland.

The daily output at the present time averages 400 tons. Two pits, the Eva and the Rock Bog, are now in operation, but a third will be producing largely as soon as the aerial ropeway to the leading station is completed.

About 600 men are employed in these collieries, and the coal to be handled economically throughout superior to, the best Welsh of that description. The installation of aerial ropeways, over five miles in length, from the pits to the railing point at Deerpark, four miles beyond Castlecomer railway station, enables the coal to be handled economically throughout.

Captain Wadesworth, the resident managing director expects that in the near future the demand may necessitate a delivery of over 500 tons daily in this way. This would be a small fraction of Ireland's total coal consumption, but a steady supply from a home concern must appeal to many Irish consumers during the next two years, when the English and Welsh coal mining industries are going through the turmoil of readjustment, with its concomitant inconveniences of fluctuating and uncertain supplies.

British Columbia Letter

La Touche, Prince Williams Sound.

The Girdwood Mine situated near La Touche, Prince Williams Sound, Alaska, is one of the most promising mining properties of the North in the opinion of W. A. Davis, the original owner, who has bonded his holdings on a royalty basis. He says that a 150-ton per day mill has been constructed. A slope has been driven from the beach a distance of 1900 feet and the ore body has been opened up to a vertical depth of 400 feet. The ore shoot is described as being 1000 feet long and in places 100 feet in width. The average assay returns is 2 6/10 per-cent copper, and in spots it runs to 4 per cent. The Girdwood is situated near the Beatson Mine, of the Kennicott Co., where there has been installed a mill with a daily capacity of 1600 tons a day, the concentrates going to the Tacoma Smelter. Mr. Davis expects that, as soon as market conditions become steadier, the Girdwood will put on a shipping basis.

Victoria B.C.

An announcement of exceptional importance to the mining industry was contained in the Budget Speech of the Hon. John Hart, Minister of Finance in the British Columbia Government. This speech was delivered a few days ago and Mr. Hart asserted that arrangements had been made to make allowance to mining companies operating in the Province for mine depletion in taxing their properties. For several years this concession has been sought but the government has not been able to see its way clear to concede it. The details of what it is proposed doing for the companies in this respect have not yet been placed before the legislature but further information is looked for shortly. It is felt that the attitude of the Administration will have an important effect. There is a possibility that the Hedley Gold Mining Co., for instance, might find it possible to re-open the Nickel Plate as a result because this Company adopted its present policy of inactivity on the ground that it was foolish to continue taking ore from the property, thus reducing reserves, when no allowance for depletion was made in the assessments and while operating costs were high and the purchasing power of gold extremely low. The relief afforded might be just sufficient to turn the scales. The same may apply to other mining enterprises. At any rate there is no doubt that the announcement of the Minister of Finance will be welcomed by mining interests throughout th Province and that further details will be looked for with some eagerness

The prospectors and mining men of British Columbia are being treated to lectures on the basic principles of mineralogy and geology by the government mining engineers. A. G. Langley, of the Kootenays, has been addressing large audiences at Cranbrook, Nelson, and elsewhere in his district. J. D. Galloway has been busy in the North and P. B. Freeland has been covering the Boundary Sections of the Province. W. M. Brewer also has a large district to cover. His addresses have been in Victoria, Duncan, Nanaimo, and Port Alberni. While the interest has not been particularly manifest in the larger cities there have been good-sized crowds out to hear the engineers in the smaller communities. All the engineers have described the minerals, their chemical composition, the peculiarities of the rocks of the various stages in the earth's development, and the methods of recognizing what are known as commercial minerals, as they occur in nature, in the simplest possible terms. It appears that the mining men appreciate the action of the Department of Mines in organizing these series of educative lectures. The Prospectors' Associations of Cranbrook and Nelson have spoken in the highest terms of Mr. Langley's addresses and the press of the Coast has commended the work Mr. Brewer is doing in his district. While it may be questionable whether the prospector is able to learn enough at these addresses (because they are necessarily sketchy, and superficial) to be of real value to him, there is no doubt that they are having the effect of stimulating a desire for knowledge and of bringing about a better understanding between the miner and the representatives of the Department of Mines in the field.

Cranbrook B.C.

The Southern Minnesota and the Washington Mining Company is planning to develop mineral claims, once known as the Lone Pine Group, which are situated on the summit of the ridge on the north side of the Similkameen river. They are on the international boundary line, a portion being in British Columbia; in fact the larger and more promising of the ore deposits have been found on the Canadian side. The ore body is reported to be extensive. Where the ledge has been opened up the ledge is ten or twelve feet wide and assays indicate that the ore carries strong values in silver, copper and lead.

Rossland B.C.

At a recent meeting of shareholders in the Molly Gibson Burnt Basin Mining Company it was decided unanimously to subscribe sufficient funds to permit the development of the property to continue. Officers were elected as follows: President, W. R. Bradent; vice-president, John B. Singer; general manager, M. E. Purcell; secretary, Irving J. Trembath; directors, M. E. Purcell, F. H. Jacobson, James Petrie, and John McNeely. The Molly Gibson is situated near Paulson and is considered to be a promising gold property

Nelson B.C.

It is considered a matter of first importance to the mining industry of the Kootenay Districts, British Columbia, that some facilities should be provided for the testing and treatment of complex ores. There are a great many varieties of this type of ore to be found in the eastern part of the Province. It was pointed out at the recent meeting of the British Columbia Branch of the Canadian Mining Institute that thousands of tons of ore were lying on the dumps because, owing to the penalties attached to its treatment by the smelters and because of the high costs and low market prices, it would not pay for shipment. Research work now is in process with a view to finding some simple economic method of handling the zinc content of such ores. J. R. Hunter, the member for the Slocan in the Provincial Legislature, dealt with this situation in an address before the Provincial Legislature and asked the Provincial Department of Mines to take cognizance of the seriousness of the condition. Now the Nelson Board of Trade has memorialized the Dominion Government, the request being that an ore-testing and treatment plant be installed at that point to facilitate the solution of the problem. In this memorial it is pointed out that a great many of the mine owners and prospectors are not in a position financially to undertake the experimental work necessary.

Mine operators are much interested in an announce-

ment that new freight-rates on zinc ores shipped to Midvale, Utah, and other smelters in that district become effective on the 1st of April. The changes apply to shipments from the Sloean, Ainsworth, and Lardo Districts of this Province. The rate will be $14 a ton when the ore value does not exceed $100 a ton and $16.80 when the value does not exceed $200 a ton.

Trail B.C.

Ore receipts at the Trail Smelter of the Consolidated Mining and Smelting Company from February 28th to March 8th inclusive totalled 8,107 tons. This brings the aggregate for the year up to the last date given up to 74,318 tons. Among the larger shippers among the independent properties were the Bluebell, Riondell, with 193 tons, the Horn Silver, Similkameen, with 232 tons, and the Paradise, Windermere, with 207 tons.

Grand Forks B.C.

It is stated by mining men interested in the Franklin Camp, near Grand Forks, that ores found in this zone contain the precious metals platinum, palladium, iridium, osmium, radium and ruthenium. The ore bodies also contain attractive values, it is stated in the base metals. The principal body in Franklin is a contact deposit of copper-silver ore, locally known as the Black Lead. On the government map by Drysdale it is shown to extend for at least four miles across the camp. Mining men of Franklin assert that the district contains the highest grade copper-platinum ores in the world.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

The market for silver continues poor, and the mines of the Cobalt district are marking time. The Nipissing, O'Brien, Coniagas, LaRose and Bailey are the only exceptions. These five companies continue to produce.

Under conditions where the cost of producing an ounce of silver is greater than the metal commands on the open market, directors show no inclination to continue the operation of mines. In 1920 the cost of producing silver from the McKinley-Darragh amounted to 85½ cents an ounce. There is nothing to indicate this could be bettered to any considerable extent this year, and it is obvious that with silver under 60 cents an ounce, it would be ruinous business to continue operations.

The fact is that when the cost of producing an ounce of silver reaches a point about equal to the value of the silver itself, and producers hoard silver, hoping to sell it a a higher price, it would really be better business for a mining company to close down, buy silver bullion from some other source and hold it for higher prices. In doing this, a company would not be exhausting its own resources on the gamble.

During 1920, according to the annual statement of the company, the LaRose properties produced 410,445 ounces of silver, the net value of which was $313,995. This compares with 289,317 ounces in 1919 valued at $356,124. Whereas the cost of producing silver in 1919 amounted to $1.05 an ounce, the company during 1920, by exercising extreme care and curtailing exploration work, was able to reduce costs to 73.27 cents an ounce. In spite of this care, however, the net profit for the year amounted to only $13,280. The company states that a number of outside properties were examined during the year with a view to purchase, but no development work was done on these outside properties, and no options are held. The general manager, G. C. Bateman, points out in the report that there are several sections of the original LaRose claim which will warrant further investigation, but that the work is not justified at the present time, on account of the low price of silver. Power shortage stopped work on the Violet claim and this has not yet been resumed. No discoveries of real importance were made on the Princess property; the known supply of ore being less at the close of the year than at the beginning, although a fair production is assured for 1921. In the new orebody located on the University, the values are made up of a substantial tonnage of medium-grade mill-rock in which high-grade stringers occurs.

At the annual meeting of the McKinley Darragh, the old directorate was re-elected. The meeting attracted an exceedingly small attendance. It was announced that the mine would remain closed until conditions were more favorable and profits could be realized by operating the mine.

The Board of Conciliation which has concluded its sitting in Cobalt, where the question of reducing wages by fifteen per cent was dealt with, was presented with evidence by the mine managers to prove the necessity for reducing operating expenses by every possible means in order to keep the properties operating. On the other hand, the employees presented evidence to show that the cost of living was greater than the wages would be if the cut went into effect. Evidence was contradictory in many instances. To those who heard the evidence, it became quite clear that one of two things would result, namely, either the mines would have to be permitted to reduce these costs or would curtail operations. In view of the dispute having arisen, however, the wage reduction announced for February 15th did not go into force pending the finding of the Conciliation Board. In an effort to adjust the dispute, the mining companies made a proposal, after the conclusion of the work of the Board of Conciliation, that former wages should be paid until the first of April, and the reduction of fifteen per cent then put into force. This offer was rejected by the employees, and the Board of Conciliation has been advised to proceed with the making of its report, although at one time it was thought agreement would have been found possible without this necessity. This action of the employees does not express any intention to prevent the enforcement of a reduction in wages, but they hope to defer it as long as possible.

A meeting of the newly organized Temiskaming Prospectors Association was held in Haileybury, March 26th, at which a constitution was drafted and officers elected. The object of this Association will be to win the general support of prospectors as well as mining men, for the purpose of advancing the welfare of the prospecting fraternity.

In regard to suggestions made by W. E. Simpson in a paper delivered at the recent annual meeting of the Canadian Institute of Mining and Metallurgy, having in mind the question of erecting public ore-treatment plants at central points in the mineralized areas of Northern Ontario, plans are being made to hold a meeting in Cobalt this week to which the local members of the Institute will be invited. Arthur A. Cole, mining engineer for the T. & N. O. Ry., and a former president of the Institute, is in favor of making inquiry into the the scheme and the matter will be discussed from all angles. At a later date, following the completion of preliminary plans, a general meeting of all those interested in such a scheme may be called for the purpose of deciding to what length the plan may be carried.

Elk Lake and Gowganda.

The question of improving transportation to Gowganda is a live topic in this district. The Government of Ontario has been criticized for having discontinued the construction of a macadam road. It has been urged to extend the Elk Lake branch to Gowganda and West Shining Tree with a view also to running a branch north to Fort Matachewan from Elk Lake. In certain parts of the press, the comment is made that in view of the Northern Light Railway Company having expressed its intention to build a light railway to Gowganda last year, the Government was justified in suspending the work of constructing a macadam road. However, the light-railway project appears to have fallen through, and the attitude of the Government is now being questioned. In Cochrane, the chairman of the T. & N. O. Ry., is stated to have announced that surveys towards the north were being resumed this Spring. It is stated some hope has been held out, of commencing next Autumn construction of the railway from Cochrane north to Kettle Falls., as a first step in the continuation of the main line to tidewater at James Bay. This would appear to indicate the intention of the government to direct attention to an extension of the main line rather than branches to such points as Gowganda and West Shining Tree. The attitude of the government towards these last-named districts is not altogether re-assuring.

ORE AND BULLION SHIPMENTS.

During the week ended March 24th, the LaRose was the only company to ship ore from Cobalt, this company sending out one car containing approximately 65,973 pounds.

During the corresponding period, bullion shipments were exceptionally heavy. The Mining Corporation sent out three shipments containing an aggregate of 197 bars weighing 200,064 ounces. The Nipissing shipments were even larger, amounting to 166 bars containing 220,643 ounces, as shown in the following summary:

Shipper	Bars	Ounces
Nipissing	166	220,643
Mining Corporation	197	200,064
Total	363	420,707

THE GOLD MINES.

The Porcupine District.

Although considerable rain has fallen, the general break-up has not yet set in, and the operating mines are still waiting for electric power. Rain, together with moderate winds from the south and a warm sun are combining to create a condition which indicates a rise in the water almost any day in the Mattagami river on which the hydro-electric power plants are located.

A meeting of the shareholders of the Porcupine-Keora is being held this week in Toronto for the purpose of considering a deal entered into by the directors with one of the large mining companies of Porcupine with a view to selling the Keora property. Assay plans and all data will be presented, and at the time of writing the prospects are very bright of the deal being consummated. In recent weeks, very little information has been obtainable in regard to the results achieved in the long cross-cut at the 250-ft. level where former diamond-drilling was stated to have indicated good ore-bodies. This week's meeting is expected to disclose information on the physical conditions of the property.

Development work at the 1,050-ft. level of the Dome Mines is unofficially reported to be such as to cause extreme optimism in regard to the future of the mine. Two bodies, each upwards of thirty feet in width, are stated to contain average values of well over $10 per ton. In some places the gold content exceeds $20 a ton, and the belief is being expressed that the Dome is steadily winning a place among the leading gold mines of the world, and that the results of operating the mill at full capacity on this higher grade of ore will be a quite favorable surprise for the shareholders. For instance, the mill has a rated capacity of close to 1,500 tons daily, but by conservatively estimating a daily average of 1,350 tons and a recovery of $7 per ton, the annual output would amount to approximately $3,449,250. Then estimating total costs at $3.50 a ton, which allows for a considerable increase over the pre-war figures, the annual net profits would reach $1,724,625. As against this, the company has an issued capital of something like $4,760,000, made up of some 476,000 shares of the par value of $10 each. These figures go to show that the indicated net profit of $1,724,625 would be equal to over 36 per cent annually on the company's total issued capital.

Interests identified with the Big Dyke Mining Company which controls what was formerly known as the McRae-Porcupine Mine, have secured an option on the adjoining Williamson-Forneri claims, in the township of Deloro. It is understood the company is making arrangements to resume exploration work at an early date.

Kirkland Lake.

Assay results just obtained from the King-Kirkland Gold Mines are favorable. The shaft has reached a depth of 80 feet at the time of writing, and twelve channel-samples taken across the vein at intervals of a few feet show an average gold content of $11.60 per ton. At the present point of operation the vein is the full width of the shaft. A small steam plant is being used, with which the shaft will be continued to a depth of 100 feet, at which point a limited amount of drifting and cross-cutting will be done. It is then proposed to turn attention to the "McGee" vein on the north side of the property and also sink a shaft there. Work throughout the entire Summer will consist of surface trenching and sinking shafts so as to determine the point most suitable for the installation of a large mining-plant and the sinking of a central shaft. The results as stated above are official.

The Queen Lebel is among the latest companies to be organized for the purpose of taking over and operating property in the Lebel section of the Kirkland Lake district. The company's property is situated immediately south of the east end of Gull Lake.

The Kirk Gold, a company owning property in Lebel township as well as in the Algoma district, has decided to commence work on its Lebel township claims. The two claims lie adjacent to the King Kirkland on the west.

The shaft on the Lebel-Oro has reached a depth of 50 feet, and commercial ore is stated to be showing in the shaft.

Arrangements are being made to resume sinking operations on the property of the Argonaut Gold, situated at Beaverhouse lake some twelve miles west from the producing section of the Kirland Lake district. The shaft was formerly sunk to a depth of 380 feet, with a station at the 350-ft. level. It is now planned to cross-cut at the 350 ft level to the known veins, as well as

to continue the shaft to a depth of 500 feet. During the course of this work, the ore taken out will be sent to the mill and a moderate production maintained. This will defray part of the expenses pending the completion of the exploration and development program, and the ultimate erection of a madern milling plant. The enterprise is being conservatively and efficiently managed.

Larder Lake.

Shareholders of the newly incorporated Canadian Associated Goldfields voted unanimously in favor of taking over the Associated Goldfields, Goldfields, Ltd., Harris-Maxwell and Tournenie properties in the Larder Lake district. Considerable friction exists, however, as between the control and the minority interests of the Goldfields, Ltd.

Boston Creek.

Orders have been received to suspend work for the time being on the Miller Independence Mines. It is not stated what object is in view, but a new plan of operation is understood to be under consideration.

TORONTO COAL PRICES.

Toronto, March 30.—Very little coal is moving and dealers continue to complain of lack of business, with a very light demand. Prices remain unchanged. Lump coal is quoted at $2.85 to $3.50 according to the mining district. Smokeless is $8.25 to $8.50, mine run and lump. Stove and nut are quoted at $8 net and egg at $7.50 net, while pea coal is selling at $6.25 mine prices, American funds.

PRACTICAL COAL MINING.—By George L. Kerr. Seventh Edition, 1921. Charles Griffin & Co., Ltd., London. Price sixteen shillings. 5½ by 7¾ by 2 inches. Stiff Boards, 778 pp. with index, 775 figures and diagrams.

Since this work was first published in 1900 it has gone through seven editions. It is a very practical work deals only briefly with the origin and geology Great Britain, and more particularly in Scotland. The work deals only briefly with the origin and geology of coal and the scientific aspects of coal substance studies, and devotes attention to the practical work of searching for coal and mining it. The chapter on "Sinking" is very complete, and reflects the much more difficult applications of shaft-sinking that have had to be tackled in British and European collieries when compared with the as yet shallow coal mines of this continent. In the same way, the chapters on Exposives and Mine Ventilation reflect the greater stringency of mine regulation across the sea. The smaller scope of the application of electricity to mine haulage and coal-cutting is also evident. The description of face conveyors, and the general adaptation of mechanical contrivances to the mining of thin coal-seams is good and complete.

The book is intended to meet the requirements of study for certificates of competency in coal mining in Britain, but it is not in any sense a "cramming" volume. With the proviso that the work deals fully and intelligently with coal-mining as practised in Great Britain, and does not cover some of the distinctive developments of coal-mining on this side—which in Canada seems more and more to reflect United States methods—the work can be recommended to coal-mining students without reserve.

The French Government has offered Italy six tons of coal per month for each Italian miner induced to go to France, and the Commissioner of Emigration of Italy is advising his people to emigrate to France. It is asserted that opportunities are better there than in America, both for steady work and high wages.

—F. T. Journal.

EDITORIAL

British Coal Miners' Strike

When the British coal miners went back to work in November last, no settlement had been arrived at except an understanding that a basis of co-operation would be worked out by the 31st of March with particular regard to the principle upon which surplus profits were to be dealt with. (*)

The issue at that time, and the issue at this time, is not one between the men and the colliery proprietors, but it is a constitutional question, and turns, in its essence, upon the extent to which private ownership is permissible.

The miners and the employers progressed in their negotiations a surprisingly long way. They had agreed that any surplus profit remaining after a minimum owners' profit (accompanied by a standard wage) should be divided between the miners and the companies. This is a step much in advance of anything ever seriously suggested in the coal industry on this side the Atlantic. It is very distinctly a limitation of private ownership, and admits a principle not hitherto conceded by employers in Britain. It would seem the employers had gone a very long way to seek conciliation.

The rock on which negotiations have split is that of national settlement of the wage question. Mr. Evans Williams, the president of the Mining Association of Great Britain, calls the difference between the miners and the employers one of fundamental economic principle. The men demand that "the whole industry shall be treated as one financial unit—just as if it belonged to one owner—all the profits and losses of the individual owner being pooled, and each receiving out of the pool a certain amount sufficient, presumably, to enable him to keep his colliery working without loss."

The coal owners are unalterably opposed to this principle, nor is it difficult to see why this should be the case. The miners desire to eliminate all the natural competitive features of the several British coalfields, and wish that an unremunerative colliery, say in the Forest of Dean, shall be maintained in operation out of the profits on the operation of a new colliery, say in the Yorkshire Coalfield. Mr. Evans Williams maintains that such a principle "would be suicidal to the industry." The reply of the Miners Federation to Mr. Williams's statement concurred in his explanation of the fundamental difference of opinion between the two contending parties. The miners insist on a national settlement. The owners state they "exclude the question of unification and a national settlement."

This is the issue, and it is a very grave one. The matters of de-control and subsidies are merely incidental to the main issue, which is the desirability and the feasibility of prosecuting a national "key" industry without regard to the cost of production or the necessity to conform to outside competition, fluctuations of demand and other expressions of the law of supply and demand hitherto regarded as immutable.

It is, of course, well-known that the miners' leaders hope to offset the question of foreign competition by achieving a world-wide federation of coal miners (and not coal miners only) and the explanation of much of their policy is to be sought for in the deliberations of the Miners Congress at Geneva. In this regard the attitude of the delegates from Canada and the United States towards the question of national control of raw materials at the conferences of the League of Nations is significant; as it reveals a distinct divergence of interest between European and American coal miners, arising from the superior competitive ability possessed by the coal industry on this side, based on coal resources that completely overshadow those of the rest of the world. Britain is threatened in her commercial supremacy by the superior natural resources of the American continent, now entering upon a stage of development that Europe cannot hope to rival. The British coal miner, hitherto, has been the mainstay of his country's commercial greatness. It is to be hoped he will not prove the main instrument in Britain's commercial declension, but it appears not unlikely to happen in that wise, because of a viewpoint that is not so much insular as European, and is chiefly mistaken in conceiving that the world revolves around Europe, when actually the balance of industrial power has shifted to the western hemisphere.

(*) For terms of agreement see page 943 issue 19th November.

NATURAL GAS CONSERVATION IN ONTARIO.

The bill now before the Ontario Legislature providing for control of the natural gas supply of Ontario by the Government is very thorough-going, but, under the circumstances of failing natural-gas supply in Ontario, the legislation is probably justified.

There is a subtle distinction between public ownership and public control that is difficult to define, but a good many well intended reforms have been wrecked, because this distinction has not been observed. Government control of public utilities is recognised as desirable, but public ownership of such utilities has proved disastrous in operation. The conservation of certain natural resources, such as oil, gas, transportation routes and water supply is apparently not possible except by government control. There is the exception, of course, that when private control achieves a monopoly on a national scale, the conservation of the resources controlled follows naturally, because the single and prudent vision of the monopoly takes the place of the divided and competitive viewpoint of many individual interests. The viewpoint of a government and the viewpoint of a complete monopoly are necessarily identical because, in each instance, one interest only is involved. This is why all really successful business connected with natural resources tends to develop towards unified control.

Public ownership, on the other hand, if accompanied by public administration, will necessarily fail, because a body that owes its existence and its continued life to a popular electoral vote, cannot in the nature of things administer questions connected with labour, wages and hours of employment. An elected government is not a free agent. It will—it must—subordinate equity to expediency, and it must seek votes, because it was created and exists by means of the vote. The ethical level of citizenship does not permit any elected government to pursue righteousness for righteousness's sake. It is possibly attempted, but it is never done.

The control of the private exploitation of natural resources by governments so far has proved to be the golden mean between the unrestricted excesses of individualism, as expressed through joint-stock corporations, and the equally unrestricted excesses of nationalization of resources, as expressed in communism.

Where the government is in fact the owner of a natural resource, and where individual rights have not been established, as is the case in regard to the petroleum fields of the Northwest, it would seem the part of wisdom not to repeat the waste of gas and oil that has taken place in Ontario, by permitting staking of many individual claims and the penetration of the surface cover of the oil accumulations by thousands of holes. Under the oil regulations of the Northwest, as they now stand, the location of the myriad holes that will be put down to tap the oil (presuming always that it is there) will not be guided by any co-ordinated desire to conserve the oil supplies, but will follow the well-known strategic rule of "getting there fustest, with the mostest men." The position that the government of Ontario now finds itself in is a fair indication of the position that the Dominion Government will eventually be forced into if widespread drilling follows the application of the new regulations. If eventually the Federal Government must assume control of the operation of the oilfields—as the technical advisers of the Ontario government believe Ontario must assume control—why not now? It is easier to punch an oilfield full of holes than it is to repair the damage that may result.

U. S. GOVERNMENT COAL QUESTIONNAIRE.

The Director of the U. S. Geological Survey has been instructed to question all large consumers of bituminous coal as to the stocks on hand at April first, as it is believed that consumers are unwisely burning up their reserves as was done in the Summer of 1919.

Wherever the questionnaire may be addressed to Canadian consumers it is advisable they should co-operate with the U. S. Government by answering at once.

The issuing of the questionnaire at this time is a significant commentary on the abolition of fuel control in Ontario, and on a rather premature announcement from Ottawa that owing to the comfortable fuel situation further expenditure on fuel organization is no longer necessary.

There will never come a time in central Canada when some form of fuel supervision will be unnecessary. The advice of fuel controllers and all the hard lessons of the past go for nothing as soon as the sun shines, and there happens to be more coal for sale than customers think they need. The United States Government apparently believes that actual ascertainment of the facts is better than mere assumption. That country has coal, and large parts of Canada have not. Can we afford to be less watchful than the United States?

THE DISCOVERY CLAUSE, ONTARIO MINING ACT.

Hon. Mr. Mills' Bill to amend the Ontario Mining Act was the subject of debate in the Legislature again on Thursday, March 31. The "discovery" clause was opposed by Hon. G. Howard Ferguson leader of the Conservative party, and by Malcolm Lang, Liberal member for Temiskaming. They argued that the prospector should not be asked to take an affidavit that he has discovered valuable mineral in place.

The "discovery" clause in the Mining Act has long been subjected to criticism. When a prospector stakes a claim he does not know whether his "discovery" is valuable or not. He thinks that he has staked a claim that may prove on exploration to be found valuable and he is ready to spend some time and money in finding out what he can about the mineral deposits on his claim. He knows from experience that he cannot do the necessary work to prove value before he stakes his claim; but that he must swear it is valuable in order to obtain the right to find out whether it is valuable or not. The "discovery" clause doubtless had some good results at Cobalt in the early days of prospecting there, for it made the prospectors dig feverishly in order to obtain

title to property which they considered valuable. But the same clause led to much trouble also and has ever since the boom days at Cobalt been a source of annoyance to the prospector. His own interest demands that he search for valuable minerals on his claims and if he is willing to search he should not be made to swear that his discoveries are valuable. It takes a long time and a lot of money to determine whether a mineral discovery is valuable or not. When a prospecter stakes a claim no man can demonstrate that the minerals on it will be profitably worked and until that has been demonstrated no one knows whether the deposit is valuable. Consequently the prospector is forced to conclude that the affidavit of discovery is merely a matter of form and that it is so commonly so regarded that he is justified in taking the affidavit as soon as he has found a little outcrop which might possibly on development prove to be a valuable mineral deposit. So with an easy conscience he takes his axe and squares posts and blazes lines around the forty acres he wants. But every time he records a claim he wishes that the Government would not insist on that discovery clause.—R. E. H.

MINERAL STATISTICS.

The Editor gladly includes in this issue a letter from Mr. R. H. Coats, the Dominion Statistician, which, very fairly, sets out the scope of the Dominion Bureau of Statistics. This is, in brief, as stated in Mr. Coats's letter, namely, "the co-ordination of statistics as a national system. . .planned as a harmonious whole". Mr. Coats also refers us to the first annual report of the Bureau for year ending March 31st, 1919, where, in regard to mining statistics, it is stated that those in existence before the formation of the Dominion Bureau of Statistics "are of good quality, but the methods followed are often at variance, and they are limited to the mining point of view."

It is not, in our opinion, possible to coordinate industrial statistics as a harmonious whole, as technical statistics are essential parts of specialized departments, and are inherently incapable of segregation or of being usefully coordinated. Mr. Coats is perfectly correct in stating that the mining statistics of the Department of Mines are limited to the mining point of view, and, if we did not mistake the spontaneous expression of opinion at the Institute Meeting in Montreal which followed Mr. McLeish's valedictory presentation of the mineral statistics for 1920, it is the desire of the mining industry to continue this limitation. Specialization of effort is the very essence of departmentalization in governments, and, until departments themselves are found unnecessary, we do not see any logical reasons for relieving any department of any phase of its administrative activities.

Mr. Coats's expresses the desire to co-operate with the industry, and his fair minded defense of the ideals of the Bureau which he directs will, we are sure, not be met in any captious or controversial spirit by mining men. If mining officials should oppose transference of the compilation of mining statistics, it is not because the aim of the Bureau is imperfectly understood; but because those who have been most in the habit of relying upon these statistics believe the idea of co-ordinating technical statistics under the plan known as the "Industrial Census" is an impracticable one, inasmuch, as in attempting to meet a supposed public demand in statistical information, it may vitiate the specialised character of technical information, as conceived by the designedly limited vision of mining students.

CORRESPONDENCE.

DOMINION BUREAU OF STATISTICS.

Ottawa, 26th March, 1921.

Mineral Statistics.

Dear Sir,—Your editorial of March 11th was written I think under some misapprehension as to the method of collecting Mining Statistics recently instituted by the Dominion Government.

First, the statement that the transfer of certain activities from the Mines Department to the Bureau of Statistics represents the over-riding of an Act of Parliament by an Order in Council is not descriptive of the facts. The Mines Department has an instruction to collect Mining Statistics, but the Bureau of Statistics has an even more explicit instruction to the same effect, and is given final power to carry out this instruction. Moreover, the general co-ordination of statistics as a national system is vested in the Bureau. The Order in Council was passed under the Statistics Act and Regulations, which lay down the following principles, namely, (1) that the official statistics of the country should be planned as a harmonious whole; (2) that in the numerous cases where the statistics of a subject are of concern to a particular department or to several departments the method of collection, compilation, etc., shall be matter of conference between the bureau and the departments concerned—the Bureau to report a plan to Council which on ratification becomes the *modus operandi* for the field in question. The present Order in Council is one of several that have been passed to define statistical relations and organization within the Government, covering such fields as agriculture, the fisheries, forestry, central power plants, railways, trade, etc., etc., all of which are working admirably, and have brought the statistical activities of some 33 Departments into team work. It aims at the clearing up of overlapping jurisdiction and the consolidation rather than the duplication of work—which is the opposite of what you fear.

There is a misunderstanding also in the inference that mining statistics are to be divorced from the Mines Department. The Bureau of Statistics becomes the collecting agency for mining statistics, but by the Order in Council the data collected are entirely at the disposal of the Mines Department, in any form the latter may prescribe, though such data will at the same time be made to conform to general statistical requirements, so as to relieve the mine operators from repeated requests for information, and so as to bring the statistics of mining into relation with the general economic survey of industry now carried out annually by the Bureau. In other words the "Mining Metallurgical and Chemical" Division of the Bureau is *de facto* and *de jure* at the command of the Mines De-

partment. In view of the speed which is necessary in getting out the preliminary annual report on mining production the report in question will probably be prepared in the Bureau of Statistics, but the final annual report on Mining Statistics will be a joint report of the Mines Department and the Bureau.

It is the hope also to work out a plan of co-operation with the Provinces whereby data may be interchanged on certain points and some duplication of work and conflicting statistics avoided. This is a many-sided problem, but I personally believe that closer relationships are feasible and could be made mutually advantageous. We have already, since January, 1920, a scheme of co-operation on monthly coal statistics with the Mines Departments of Nova Scotia, New Brunswick, Saskatchewan and Alberta whereby a joint form is used and provision made to eliminate duplication of collection, compilation, etc. A half-dozen of such arrangements would probably cover the main features of mining, and would in my judgment represent improved statistical organization.

No one could more highly appreciate than I the good work that has been done by the Mines Branch in the past. That work, of course, will not be interrupted (the same staff would have been employed had not the Mines Branch desired to retain them for other work), but there will be brought into immediate relation with it a large amount of subsidiary data of various kinds, and there will be placed at its disposal an increased organization for the analysis and elaboration of results. Intensive work in particular fields will be facilitated. If a project of this kind is opposed, as you say, by the mining industry, it can surely be only because the aim is imperfectly understood.

I trust you will not regard this letter as controversial. It would be unfortunate for the Bureau to carry on this work in an atmosphere other than that of cordiality on the part of those who will be affected by it, and I therefore leave it to your judgment as one fully seized of the supreme importance of co-operation and goodwill as adjuncts in getting out good mining statistics as to whether or not it should be printed. Had I known the question was to be discussed at the meeting of the Mining Institute I should have asked the privilege of a hearing for the Bureau's point of view.

Yours faithfully,
R. H. COATS,
Dominion Statistician.

The Editor,
Canadian Mining Journal.

MEXICAN GOVERNMENT RELIEVES SILVER MINES OF ALL TAXATION.

In view of the action being taken by the Ontario Government in the increased taxation on the mining enterprises of the province, information contained in Mexican papers just to hand in Toronto is of interest. In Mexico, in order to save the silver mining industry to the country, the Government there has decreed exemption from taxation on mines producing silver: exemption from customs duties on importation of explosives, machinery and supplies used in producing silver; exemption from taxation of a consular invoice, and adjustment of freight rates to the point 1910, or about fifty per cent of ruling rates. The production tax of five per cent is abolished as long as silver is below 60 cents per ounce.

CANADA'S GOLD PRODUCTION INCREASINGLY IMPORTANT TO THE EMPIRE.

The following quite interesting item is culled from Messrs. Samuel Montagu and Company's circular for 17th February.

"In a very interesting paper read on the 15th inst. before the Royal Statistical Society, by Mr. J. Bonar, LL. D., Late Deputy-Master of the Royal Mint, Ottawa, dealing with the Mint and the precious metals in Canada, the following remarks were made:— 'Contenting ourselves with what it known and consulting the large maps of the minerals of Canada published by the Dominion Government, we find quartz gold along the eastern coast of Nova Scotia, a small patch in the Beauce County of Quebec, a large tract mainly quartz in the Porcupine district of Northern Ontario, some patches between Lake Superior and Lake Winnipeg, traces of alluvial gold in Saskatchewan river, copper matte with gold in it at Rossland, British Columbia, near the frontier, alluvial gold in various rivers of British Columbia, as well as in the north corner of that Province at Atlin, and finally the Kluane district and the great field alluvial gold in the Klondike region of the Yukon Territory.'

"It is interesting to notice that Canada is drawing gold from quartz as well as from alluvial sources, and from points as much as 2,000 miles apart. Considering the poor extent to which the vast territory of Northern Canada has been prospected, it is reasonable to expect still more important discoveries, which in view of the lessening product on the Rand would be particularly valuable to the Empire."

We would comment that alluvial gold is not now an important feature of Canadian returns, and that production from rock-ores is, in the most conservative opinion, only just commencing.

ACETYLENE BLOWPIPE FOR REMOVING IRON FRAGMENTS FROM ORE CRUSHERS.

From the Engels Copper Mining Company, Engelmine, California, comes the information that this Company uses the oxy-acetylene cutting blowpipe for removing "hammers" and other "tramp iron" from ore crushers. "We have found this the quickest and easiest, as well as the cheapest way to cut the hammers out of the gyratory crushers" the Company writes.

Practically every mine, large and small, has as a part of its equipment a coarse crusher of some sort. Run-of-mine ore is fed to these crushers, and, even with the utmost precaution, hammer heads and other pieces of metal become mixed with the ore and get into the crushers. Where no preventative devices are used, foreign matter of this kind gets into the crushers quite frequently, and if not removed may damage or seriously interfere with the operation of the equipment.

The experience of the Engels Copper Mining Company suggests a fast, cheap and effective way of handling a difficulty that has been a source of more or less constant trouble in mining plants everywhere.

MONTREAL BRANCH C.I.M & M.

The Montreal Branch of the Canadian Institute of Mining and Metallurgy will meet in the Y.M.C.A. Building, 127 Drummond Street, Montreal, at 8.30 p.m. Wednesday, April 13th, when moving pictures of operating mines will be shown.

Revolving Screens

JOHN S. WATTS, New Glasgow.

The action of a revolving screen, in relation to the quantity of material that can be handled by a screen of a given size and speed, is dependent upon a number of variable factors, each of which vary the effect of the other factors, as will be seen by what follows. It is therefore impossible to give an empirical formula from which to calculate the capacity of a screen, which may explain who so little data has been published on this subject.

However, a study of the operation of the revolving screen, will enable us to state the basic laws upon which it works, and from them we can, given the nature of the material to be handled, arrive at a close approximation to the actual delivery that can be expected.

In any kind of screen the capacity is effected by the nature of the material being screened, particularly as to the freedom or otherwise with which the fines separate from the coarser particles. The relation between the percentages of fine and coarse material will vary the area required for a given capacity, and these factors combined govern the area of the screening surface required, just as it would in a flat screen, but in the latter, if the stream of material is the full width of the screen, the material, (which does not fall through) travels the full length of the screen, and the whole area is utilized to the full. On this account it is possible to find by test the capacity per square foot of flat screening-surface, for a given material, and to make a screen for a given quantity per hour, for the same material, simply means providing the area calculated from this basis.

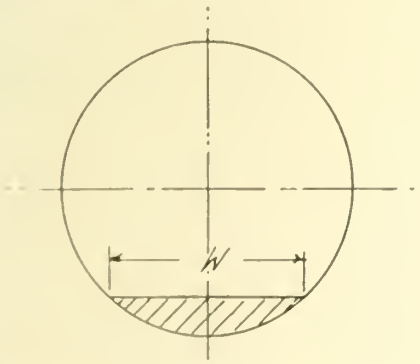

FIGURE. 1.

In other words it is possible to state that a given quantity, of a certain material, can be screened per square foot of screen with given perforations, provided only that the material is delivered to the screen in a stream the full width of the screen.

In a revolving screen, the question is complicated by variations in the diameter of the screen, its inclination, and its speed, all of which must be made to suit the quantity and nature of the material to be handled over and thro it, and it is obviously incorrect to assume that the whole area of a revolving screen, will in terms of capacity, bear any fixed relation to an equal area in a flat screen.

This is because in the flat screen, every part of the screen, is in action all the time, (when working to full capacity) whereas in a revolving screen, only that part of the screen, which is at the bottom, and is covered by the stream of material, is in action. On the other hand, in the revolving screen, not only is the material travelling longitudinally along the screen, but the screen itself is also travelling under the material, and causing the stream of material to traverse an area of screen, the total of which depends upon the diameter and inclination of the screen.

The effective screening area, of a revolving screen, or that area from which we may expect the same results, as from an equal area in a flat screen, is the width of the stream of material, passing through the revolving screen, multiplied by the length of the line travelled over the surface of the screen, by a piece of the material which does not fall through the perforations.

In the revolving screen, the width of the stream, as it is delivered onto the screen, is of no importance, as the action of the screen will spread out the material, until its upper surface is practically level as indicated in Figure 1.

Knowing the quantity of material to be handled, per hour, we must to find the width W, of the screen, decide on the speed of the material longitudinally along the screen.

This speed is a function of the diameter of the screen, its angle of inclination to the horizontal, and its revolutions per minute.

As the diameter and inclination of the screen also effects the length of travel of the material over the perforations, and therefore the effective screen area, it follows that we are compelled to adopt certain dimensions as a trial, and from the result cut and try, until we arrive at a satisfactory combination.

The distance through which a particle will travel, in a half a revolution is indicated in Figure 2, the action being as follows, starting with a particle at point 1, at rest relative to the screen, this particle will be carried upwards by the screen, to point 2, when it will slide downwards to point 3, and repeat the process again. A study of this motion will show that the particle advances, during one half a revolution an amount equal to the inclination per foot, multiplied by the diameter, or, L, in Figure 2. This assumes that the downward travel is instantaneous.

While the downward travel is not, in actual fact, instantaneous, the particles, owing to the friction of motion being always less than that of the rest, travel further down the screen than point 3, so that the actual advance is practically equal to that shown.

We may take it then, that the speed of the stream along the screen, longitudinally, is equal to the diameter of the screen, multiplied by the inclination per foot, and by twice the revolutions per minute, or expressed as a formula,

$$V = D \times L \times 2 \times R$$

Where V = Velocity in feet per minute
D = Diameter of screen in feet
L = Inclination in feet per foot of length from the horizontal
R = Revolutions per minute

As already shown, we must assume values for D, L & R, and cut and try. The points to remember are as follows.

Diameter.—Increase of diameter, other factors being the same, will increase velocity, and therefore increase capacity to convey material. Also increases

width of stream, making a greater percentage of the screen area to be effective, but this is partly counteracted by the increased velocity longitudinally, shortening the length of actual travel over the perforations. Increases the first cost, and horse power consumed in operation.

Inclination.—Increasing the inclination, will increase the capacity of the screen, regarded purely as a conveyer. Reduces the effective percentage of the screen area. Increases the horse-power consumed.

Revolutions.—Increasing the speed, will increase the capacity of the screen as a conveyor, without effecting any change in the percentage of effective screen-area. Increases the horse-power consumed.

In practice there are certain limitations, which experience has placed on each of the above factors, as follows,

Diameter, may be anywhere between 30 inches and 120 inches.

Inclination, is generally made between 2 inches and 2½ inches per foot, from the horizontal. Some makers prefer to get the inclination by making the screen itself tapering, forming the frustrum of a cone, which has the advantage of keeping the shafting and supporting-frame horizontal, but involves more difficulty in the manufacture of the conical-shaped screen.

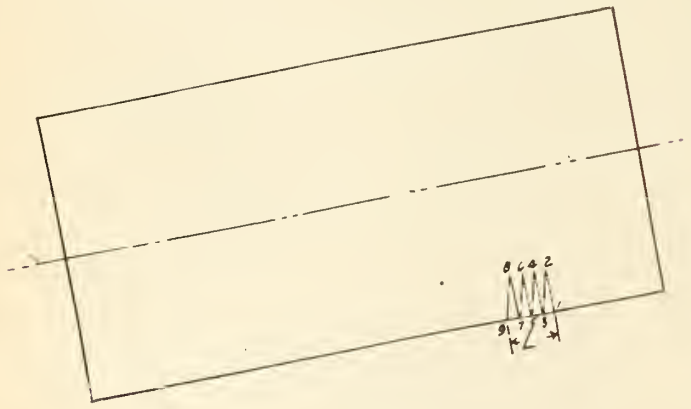

FIGURE. 2.

Revolutions, per minute, should be such as to keep the peripheral speed of the perforated screen between the limits of two to three-hundred feet per minute, the lower limit being preferable.

Having arrived at a tentative velocity of the stream, we can can calculate the width of the stream, by dividing the cubic feet of material (the total amount) to be screened per minute, by this velocity in feet per minute. The quotient will be the area of the stream, from which, knowing the diameter of the screen, we can find the width of the stream, W, in Figure 1.

Assuming that we know, or can determine by test, the capacity of a square foot of flat screen, of the mesh, and for the material in question, we can calculate the effective area required for the quality of material to be handled. This capacity varies so much, for the different materials, and sizes of perforations used, that it would take up too much space to attempt to tabulate them here, bu this information can generally be determined by reference to text books on the trade using the material in question.

Having the effective area required, if we divide this area by the width of the stream in feet, we will have the length of travel across the perforations, necessary to give this area.

A little study will show that the material travels in a spiral course relative to the screen surface, the pitch of the spiral being 2 x L, (Figure 1) in one revolution. The length of this spiral line, in one revolution, will be equal to the hypothenuse of a triangle whose base is equal to the circumference of the screen and whose perpendicular is equal to 2 x L, or expressed as a formula, the travel per revolution longitudinally will be

$$\sqrt{(2L)^2 + (\pi D)^2}$$

This distance per revolution is accomplished while the stream advances the distance 2L, and therefore if we divide the total travel required by $\sqrt{(2L)^2 + (\pi D)^2}$, and multiply this by 2L, we have the length of screen required. For all practical purposes, it is near enough to take the travel over the screen per revolution as being equal to the circumference of the screen, and this simplifies the calculation, the length of screen required then being P, we have

$$P = \frac{X \times 2 \times L}{\pi \times D}$$

Where X = length of travel over screen required L and D as before.

If this length is too great, we must increase the diameter, or decrease the inclination, or both, and check up the velocity of the stream again, to ensure that the thickness of the stream will not be too great to ensure effective screening.

The maximum thickness of stream depends entirely upon the class of material being handled, as if only a small percentage of the material will pass through the screen, the thickness should not be over say 6 inches, or even less if the fines adhere to the coarse. If a large percentage of the material will pass through the perforations, and the fines separate freely, the thickness can be increased up to 18 inches, as the stream will thin down rapidly as the screening progresses.

TAXATION OF MINES.

Commenting on the proposal to increase taxes on mining profits in Ontario, an editorial in the March 5 number of Mining and Scientific Press, of San Francisco says: "The prosperity of Northern Ontario depends upon its mines, and any legislative enactment that tends to discourage investment in mining property will retard the development of the industry."

The Natural-Gas Conservation Act of Ontario

(Prècis of a government bill introduced 23rd March, 1921.)

The Minister of Mines of Ontario has introduced a bill into the Legislative Assembly of Ontario which was read for the first time on the 23rd March. The salient provisions of the draft act are as follows:

The Minister shall control and regulate the production, transmission, distribution, sale and disposal and consumption of all natural gas produced in Ontario, and for that purpose shall have and may exercise the powers and duties specified. The Referee shall have and may exercise the original jurisdiction provided herein, as well as the appellate jurisdiction specified. Each shall have due regard to the provisions of any general or special Act or Letters Patent, or any agreement, franchise, bargain or arrangement whatsoever and by and between whomsoever made, but he shall have power to depart from or vary such provisions where he finds by enquiry that such action is necessary for conserving the supply or prolonging the service to consumers or furthering the search for and development of new sources of supply of Natural Gas.

It shall be a good and sufficient defence to any action or other proceeding brought or taken against any person producing, transmitting or distributing or selling natural gas that such person so far as regards the act or omission which is the subject of such action or other proceeding has conducted the production, transmission, distribution or sale of natural gas in accordance with the order or direction of the Minister or Referee, but no order shall be made which shall have the effect of destroying or suspending or limiting the contractional rights of any person or persons, company or corporation without such notice as the Minister or Referee may deem proper having first been given to such person or persons, company or corporation and without their being given a reasonable opportunity to present their claims to the Minister or Referee.

The Minister shall make such orders or regulations and give such directions from time to time as he may deem proper for the due conservation of the supply of natural gas in Ontario and its transmission to and distribution in such localities and to such consumers, for such periods and at such times as, in the opinion of the Minister, may best serve the general public and particularly the users and consumers of natural gas for domestic purposes.

The Minister may make orders or regulations for:

(a) The closing and cutting off of the supply of natural gas to any corporation, company or individual.

(b) The construction, alteration or use of any works, machinery, plant or appliance in and for the development or consumption of natural gas.

(c) The cutting off of the supply to consumers generally or to any consumer or consumers in any locality for such periods or at such times as he may deem proper.

(d) The limiting or restricting or taking away any right conferred upon any person to the use and consumption of natural gas without charge for the payment of such compensation to such person as he may deem proper in respect of such limitation, restricting or taking away.

(e) The allotting or supplying of gas to consumers or persons generally or to any consumer or consumers, person or persons in any locality for such periods or at such times as he may deem proper.

(f) The closing down and stopping up of any natural gas well or any works for the production, transmission, distribution or supply of natural gas.

(g) Requiring returns to be made by any person producing, transmitting or distributing natural gas and for prescribing the form of any such return, the particulars to be included therein and the intervals at which such returns shall be made.

(h) The appointment of such officers, agents, servants or workmen as may be necessary to carry out and enforce any order made by him under the Act.

(i) Compelling the installation of such appliances by consumers of natural gas, as he may deem requisite for preventing waste.

(j) Generally for the better carrying out of the objects and purposes of the Act.

The Referee may make orders for:

(a) Fixing rates to be charged for natural gas.

(b) Compelling the owner, lessee or licensee of a pipe-line to take gas produced by any person or corporation at such price, in such quantities and on such terms as may be fixed by the Referee.

Licenses may be issued by the Minister upon such terms and subject to such conditions, and upon the payment of such fees as the Minister may prescribe, to persons for boring, prospecting for, transmitting or distributing natural gas, and no person whether or not he is the holder of a license, lease or permit from any person or authority other than the Minister, shall bore or prospect for, produce, transmit or distribute natural gas in Ontario, who is not the holder of a license from the Minister permitting him so to do.

The Lieutenant-Governor-in-Council may appoint an officer to be known as the Natural Gas Commissioner.

Subsequent clauses provide for remuneration of the administrative officers, and the delegation of the powers conferred upon the Minister, and specify the right of the Minister and his officers to enter upon private, public and Crown property to carry out any works deemed necessary to enforce the intent of the Act.

Provisions are made for appeals to the Referee, and for stated cases laid by the Referee before the Appellate Division of the Supreme Court of Ontario. Provisions are made for costs of appeals. Penalties are specified for contravention of the Act. Power to administer oaths and take affidavits is given to the Commissioner.

Notwithstanding the provisions of the Ontario Railway and Municipal Board Act, works for the production, transmission and supply of natural gas shall not be deemed to be public utilities so as to give the Ontario Railway and Municipal Board any jurisdiction respecting the same.

The Natural Gas Act, 1919, is repealed but such repeal shall not affect any regulation or order heretofore made by the Ontario Railway and Municipal Board or by the Minister of Mines, or by the Commissioner under the said Act until the Minister or Referee shall by an order made by him under the authority of this Act, declare such regulation or order no longer in force.

Gold Mining in Ontario

A Plea for Recognition of a Partnership of Interest.

By R. E. HORE.

Gold mining in Ontario has become an important industry since the development of ore deposits at Porcupine and Kirkland lake. It has been demonstrated that our Pre-Cambrian gold deposits stand up well under development. The opening up of the deposits at considerable depth has resulted in many cases in the finding of even better ore than had been looked for. Prior to the development of the deposits discovered in 1909 at Porcupine, there was relatively little evidence that would give confidence that Ontario gold deposits would prove to be workable to great depths. Now there is proof of good ore at the lowest depths yet reached in the mines and more ground for belief that our gold deposits will be found to continue to great depths. This means long lives for the mines now operating and should lead to intensive search throughout Northern Ontario for similar ore deposits. It is reasonable to expect that the result of such search and development will be tremendous expansion in the gold mining industry of the Province. Already many promising discoveries have been made over a wide area and some of these will doubtless result in the swelling of gold production.

THE LAKE SHORE MINE

One of the newer and successful Gold Mines of Northern Ontario.

Gold mining had only commenced on a large scale in Ontario when the war came on and expansion was temporarily halted. The subsequent period of high costs and labor shortage also had a deterrent effect. The return to conditions favorable to the gold mining industry will have marked effects and before the present year is far advanced the industry will be making rapid strides forward. Increased production and more activity in development will soon be under way. It can fairly be assumed that conditions will become so favorable to gold mining that the industry will now become a very big factor in the growth of the Province. That it did so well under very adverse conditions is sufficient proof that it is economically well founded.

Our mineral resources are of little use until they are developed. Those who would develop them must take long chances, for a comparatively small number of ore deposits are found to be workable at a profit. The mines now operating profitably were developed by men who took great risks and were successful. They deserve no little credit for venturing in a field that was a few years ago quite unproven. They had little assurance of success, much less in fact than those who venture now with the results at Porcupine and Kirkland lake before them. Those who are willing to venture will find in Northern Ontario one of the best, if not the best, fields for exploration. The winning of wealth from the rocks is an arduous task and often unsuccessful; but it is an attractive enterprise because of the possibility of making large profits and because those profits come from making productive, an otherwise useless mineral claim. The prospector and the men who furnish the money for the development of gold deposits are performing service useful to the Province and they should receive recognition by every reasonable Government, assistance in exploration and development of new fields.

The benefits which the Province derives from the development of ore deposits are many. The chief essential in any mining enterprise is that it be conducted at a profit and the whole aim of those who engage in gold mining is to produce gold profitably. They do not spend their money and labor with the object of benefitting the community and they make no claim for assistance on such grounds. But it is well known that

the activities of mine operators bring benefits to the community and because of that fact the common interests of the operators and the community demand that the industry be encouraged. The community shares the benefits without running the risk of losses that those who develop the deposits do, and being in a sense a preferred shareholder the community in its own interest should endeavor to see that the industry prospers. If the Ontario Government takes this view and becomes actively interested in speeding up mineral development there should result very rapid growth in the gold mining industry of the Province. It may seem to some that those who ask the Government to assist in developing Northern Ontario are asking for favors that will be merely for the benefit of prospectors and mine operators; but this is not the fact. The men who develop the North ask for assistance as one group of partners in an enterprise desirous of having the other and larger group of partners in the enterprise take a more active part in the work. Their claim is that the results will be mutually profitable and they justify their claim by pointing to the advantages that the Province has already derived from the development of mining lands. From such lands no one derived any benefits until they were developed. This generation will derive benefit from Ontario mineral resources only insofar as those resources are developed in the immediate future. Now is the time to push development of Ontario's gold deposits and those who appreciate the great possibilities ahead are desirous that everything reasonably possible be done to encourage such development. To be satisfied with the progress that is being made is unwise. It is progress worthy of praise; but it is not the progress that should satisfy; it is not the progress that the Government should regard as good enough. There is evidence that the operators will soon be reporting much better progress and that this will be the best year by far for the Ontario gold-mining industry; but there is evidence also that the Ontario Government is not yet awake to the advantages that a policy of active participation in development of mineral resources would bring. To regard the mining industry simply as a source of money for the Provincial Treasurer is a narrow view. The mining industry brings benefits to the Province that far exceed in value any reasonable direct tax on the profits of such mining enterprises as prove profitable.

While disappointed with the Government's attitude in respect to mining profits, there can be little doubt that private enterprise will continue to build up the gold-mining industry in Ontario, and that the increasing importance of the industry will make it apparent that gold production is to be for many years a big factor in the prosperity of the Province. Northern Ontario is rightly regarded as the probable source of many millions in gold and it will be surprising if the Government does not sooner or later assume a more favorable attitude towards mining enterprises.

PORT ARTHUR, ONTARIO.

Mining Notes.

By J. J. O'CONNOR

Clement K. Quinn, of Duluth, Minn. has taken an option to purchase the entire holdings of the Graham-McKellar interests on the Atikokan iron range, adjoining the Atikokan Mine, on which Mr. Quinn secured an option about a month ago.

The Atikokan Mine includes 10E and 11E, on which all the mining operations so far carried on have been done. The properties included in this last option of Mr. Quinn, cover the remaining portion of the Atikokan range, and extend for some miles along the Atikokan River and Sabawe Lake, with the exception of a few isolated holdings.

Mr. Quinn's familiarity with the ores of the Atikokan is known to have induced him to undertake the control of the major portion of the range. He is no stranger to it, having thoroughly examined the mine, and extensions of the formation, by mining and shipping testing lots of the ores, to the furnaces. He is an experienced iron ore operator, being heavily interested in mining and shipping ores from the Minnesota and Michigan ranges.

The price at which the latest option has been taken has not been announced. The option on the Atikokan Mine is for $1,500,000. It is confidently believed that both options will be implemented, and that it is Mr. Quinn's intention to build up an extensive iron ore industry on the Atikokan range.

It has been announced that the product of Mesabi Iron Company, of Babbitt, Minn., will be placed on the market under the trade name of "Mesabi Sinter" about July 1st next, and that Clement K. Quinn & Company, of Duluth, Minn., will be the exclusive sales agents.

The 1921 season analyses guarantees of iron ores issued by Clement K. Quinn & Co. contains the analysis of Mesabi sinter. This analysis shows the sinter to be a high-grade Bessemer product, containing 64 per cent metallic iron, natural; phos. .027, and silica 9 per cent. There is no record of moisture. The sinter is crushed to about three inch size, with fines screened out. The sinter is very porous and is designed to be an ideal furnace product.

The fact that one of the most prominent furnace companies in Pennsylvania, that used the product of the Mesabi Iron Company's testing plant, at Duluth, and found it to be such a satisfactory furnace product, that they have now taken a substantial interest in the enterprise at Babbitt, should be a sufficient guarantee that the sinter is all that is claimed for it, and that it will give a good account of itself in the furnace world.

The coarse crushing unit of the new concentrating plant at Babbitt will be ready for operation May 15th. Production of sinter will begin on or about June 15th, and shipment to the docks at Two Harbours about July 1st.

All doubts regarding this enterprise appear to have been overcome. It has passed through the phase of the most exhaustive tests, and is now looked upon as a permanent industry that will prolong the life of iron ore mining in Minnesota for generations to come.

This undertaking is of paramount interest to Canadians, and should receive their closest attention and investigation, to the end, that our own ores may be subjected to the same treatment.

M. Boretella, of Atlanta, Georgia, has spent over two months in the examination of gold properties in the vicinity of Schreiber. Reports extant, are to the effect that he is well pleased with the result of his investigations. He is now leaving for Chicago to meet his principals, and expects to return in the early spring.

Mr. William Longworth, of Port Arthur, has just completed a road two and a half miles in length, from Schreiber to his claims, where he is doing mining work in the shape of drifting and cross cutting. He reports discovering new leads carrying tellurides and visible gold.

Gas Producer Power Plants

A Successful Installation at Charlottetown, P.E.I.

By H. E. WIDMER, Lacombe, Alb.

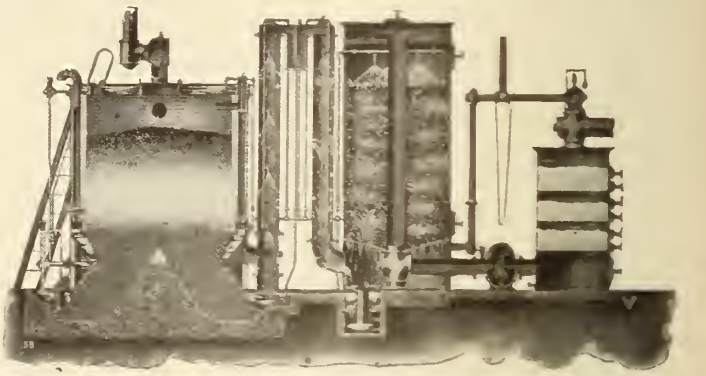
The power question is always one of paramount importance in industry. We are fortunate in having large hydro-electric plants scattered throughout the Dominion, but there are, however, many isolated municipalities and industries so situated that hydro-electric power is not available. In such cases the utilization of available fuels economically becomes a matter of vital importance.

The unprecedentedly high price of coal during the past few years has, of necessity, caused factory and power-plant owners to resort to every possible means of reducing the fuel consumption. These endeavors have usually met with decided success. In considering steam plants however there is a minimum consumption per horsepower per hour below which, practically, it is impossible to drop.

Canada and the States, abounding as they do (in certain localities) in extensive coal-deposits, have not been confronted with the fuel-cost problem as has Europe, until recent years. There the gas producer has solved the problem. As gas-producer power-plants require but 1¼ to 1½ pounds of ordinary bituminous coal or anthracite per brake horsepower per hour, it is readily perceivable why this type of prime mover is used so widely in England and on the Continent. The consequent comparative savings in fuel offer a decided argument in favour of gas-producer plants when determining the type of power installation.

The number of producer-gas power-plants is constantly increasing in the States. Large numbers of plants have been installed also for metallurgical furnace operations, to substitute for the waning supply of natural gas as well as other fuels which have risen abnormally in cost.

A problem which American gas engineers have had to combat is the troubles resulting from the use of bituminous coal. Soft coal contains a high percentage of volatile matter which, if not removed from the gas upon leaving the generator, will condense and clog the mains and interfere with the continuous operation of the engine. Mechanical means technically known as "tar extractors" have been employed many years with varied results. Such apparatus even at best usually is not entirely satisfactory when operating under varying loads and on different grades and types of combustibles. The only positive elimination of the tar



Sectional elevation of type "B" Akerlund gas-producer, adapted to use lignite.

constituents of bituminous fuels is its destruction directly in the generator itself. With the object in view, the Akerlund bituminous producer-system was designed more than a decade ago.

This producer unlike others operates on the down-draft principle; the heavy hydrocarbons upon distillation are forced by the downward suction to enter the incandescent fire-bed where they are decomposed and converted into fixed non-condensible gases. A common difficulty is thus easily overcome.

One of the interesting installations which Akerlund & Semmes, Inc., of New York, have made is a 500 H.P. producer-gas power-plant for the Maritime Electric Company, Charlottetown, P.E.I. The producer is oper-

Operating platform of two 100 h.p. type "A" Akerlund Gas-Producers in use for several years at the plant of the Simonds Saw Company Montreal.

ating on Nova Scotia bituminous coal, and was installed in 1917. The plant furnishes current to the municipality and inhabitants for light and power. The fact that it has given the utmost satisfaction in reliability and economy during this interval is evidence of its practicability.

The following are typical results obtained from the Maritime Electric Co.'s operation log:

24-Hour Test Covering Minimum & Maximum Loads.

Watch	K.W.	Lbs Coal	K.W. per hr.	H.P. per hr.	Lbs Coal per K.W.	Coal per H.P.	Coal per hr.
8-4	1000	2600	12.5	167.5	2.6	1.9	325
4-12	1220	3144	152.2	204.3	2.5	1.8	393
12-8	410	564	31.2	68.6	1.3	0.97	70.5
24 hrs	2550	6308	106.2	142.3	2.5	1.8	262.3
Average of seven tests, consisting of six series of eight hours each, and one of seven hours. Fifty-five hours:	3490	3978	63.4	84.9	1.1	0.85	72.3

Note: Tests made after adjustments to plant, following the first-noted 24-hour test. Ashes removed during 24-hour test were about 800 pounds.

Coal used: Lingan Seam, Dominion Coal Company, with following analysis:

Fixed carbon	55.5
Volatile	38.6
Ash	5.9
Sulphur	2.4
B.t.u's	14,000

The above tests were taken in the Spring of 1920, since which date the plant has been operated at a forty percent overload. At times it has been necessary to operate at only fifteen percent of rated capacity, under which conditions it has been found possible to maintain a fuel consumption of two pounds of coal per horsepower per hour.

The application of producer gas in furnace operations is extensive, possessing numerous advantages. The Simonds Canada Saw Company, Montreal, have operated two Akerlund anthracite producers about seven years, and have recently installed a third unit. The gas is used in the heat-treating of their products. The comparative economies occasioned by use of producer-gas in furnaces are always very attractive and often they are sufficient to return the plant investment within a year.

There are large deposits of lignite in Canada and the States. Often it is of such a grade that its performance under steam boilers is unsatisfactory. In the downdraft producer the various grades of lignite behave nicely—even Brazilian lignite containing 29% ash has given surprisingly satisfactory results. As in the case of ordinary bituminous coal, the consumption of lignite per power-unit is very low; it is almost in direct proportion to the b.t.u. value per pound of the lignite compared with 13,500 b.t.u. bituminous coal.

Summarised, the advantages of a downdraft gas producer are tar-free gas from bituminous coal, lignite, saw-dust, etc., economy, reliability, flexibility and simplicity in design and operation.

500 h.p. type 'B' producer-gas plant for municipal electric-lighting and power. Suitable for utilization of lignite.

Oil Prospecting in the Pas District, Man

By REECE H. HAGUE, The Pas, Man.

With the throwing open of The Pasquia Hills Forest Reserve for oil prospecting under the recent amendments to the Dominion Oil Regulations, considerable staking has taken place in this region.

The presence of large bodies of oil shales in The Pasquia Hills, which lie across the Saskatchewan border, some 40 miles from The Pas, has long been known. In the course of his report to the Geological Survey Department on the Basins of the Nelson and Churchill Rivers, William McInnes, of the Geological Department made several references to these shales. His report which was written in 1911 was published two years later as Memoir No. 30.

Mr. McInnes says, in describing the topography of the district: "The overlap of the cretaceous sediments is marked for a hundred miles west of Lake Winnipegosis by the bold escarpment of the Porcupine and Pasquia Hills, and farther west by the equally high but gently sloping Wapawekka Hills. A partial section of Cretacious rocks making up the Pasquia Hills was seen where the rocks are exposed in gullies worn by streams descending the northerly facing slopes. An estimated section along these gullies, compiled mainly from exposures observed in the trench worn by Nabi River, is as follows, in ascending order:

35 feet-40 feet.—Thick bedded, soft grey arenaceous oil-shale or thin bedded sandstone, holding the remains of fishes which seem to be Enchodus shumardi, large bi-valves, Inoceramus labiatus (Schlotheim) and foraminifera.

0 feet 6 inches.—Compact impure limestone with many casts of Astraea congesta, Conrad.

120 feet or more.—Soft, fissile, light grey (almost black when wet) oil-shales, holding the comminuted remains of fishes and many foraminifera.

15 feet.—Clay iron-stone in beds 6 inches to one foot in thickness, divided by thin partings of shale.

10 feet.—Soft fissile, grey shale that seems to be similar to the oil shales below.

"Overlain, to the surface, by 10 feet or more of boulder clay containing many boulders of limestone and a few of Pre-Cambrian gneiss and granite.

"Mr. Whiteaves, who examined the fossils from the section given above, expressed the opinion that they were probably of Niobrara age.

"The fossils enumerated have a wide range in the Cretaceous, but in Northern Manitoba Enchodus shumardi is most abundant in the Niobrara formation, which with the underlying Benton makes up the Colorado series of the upper Cretaceous. The occurrence of great numbers of foraminifera in the shales is also characteristic of the Niobrara beds of Northern Manitoba.

"The thickness of the Niobrara in Manitoba has been computed to be from 130 to 200 feet, comprising calcareous shales which pass downwards into the shale of the Benton.

Exposure on the Mabi River, showing shale A, eight inch strip of bentonite B, and fossilized zone C.

"The base of the section given above lies at a height of 400 feet or more above the bed of the Carrot River, where, at the rapid above the Red Earth Indian reserve, ledges are exposed that are thought to represent the Dakota division of the upper Cretaceous. They consist of 5 feet of very soft quartzose sandstone deeply stained with iron oxide, lying in undisturbed heavy beds that show false-bedding, and hold nodules and irregular masses of iron pyrites. In places the sandstone becomes a fine conglomerate in certain layers with pebbles of gneiss and other rocks, and in places it contains carbonaceous material resembling the comminuted remains of plants. The soft sandstone is overlain by hard, white quartz sandstone with distinctly red-purple tinge, which is strongly ripple-marked on some surfaces.

"Fifty miles further up the Carrot river from the rapid at which the sandstones are exposed and at an elevation of about 400 feet above that point, grey oil shales quite similar to those of the Pasquia Hills section form the low scarped banks of the river.

"There is thus an interval of 400 feet or more between the observed beds of Dakota sandstone and those of Niobrara shale. A great part of this interval, which on the side of the Pasquia Hills and in the valley of the Carrot river is covered by deposits of boulder clay and by later stratified sands and clays, is without doubt occupied by the shales of the Benton. Shales which, from their relative elevation, would fall into this gap, and which he considered to be of Benton age, were observed by Mr. J. B. Tyrell in the bed of the Saskatchewan below Birch islands."

The Carrot river, which joins the Saskatchewan 2 miles above The Pas flows past the Red Earth Indian reserve. From the crossing of the second base line westerly, the steeply sloping front of the Pasquia Hills rises from the flat land to the south of the river all along. The hills rise to a height of about 1,600 feet above the valley or 2,500 feet above the sea. The hills are made up for the most part of cretaceous sediments, though the base is probably formed of Palaeozoic beds and the summit is covered by varying thickness of boulder clay.

In describing his trip through the Pasquia Hills Mr. McInnes says: "The only exposures of rock in place met in the mountain, were found in the gulches eroded by streams flowing down the hill-slopes. They consist for the most part of soft, grey, fissile shales that contain a considerable amount of bituminous matter, enough to cause them to burn freely, with the emission of a strong odour of petroleum when heated in the camp fire. The best exposures were found in the valley of the Nabi river, where 140 feet or more of thick-bedded sandstone, holding the remains of fishes, bivalves, and foraminifera, are exposed in cliffs along the river; the species are characteristic of the Niobrara division of the Cretaceous."

Under the head Economic Geology Mr. McInnes says that in the newer rocks the oil shales of the Pasquia Hills are of some promise and the discovery of the occurrence of coal, north of Prince Albert, may be followed by the finding of seams of commercial importance.

Altogether more than 40 square miles of territory in the Pasquia Hills have been staked since December last when the new oil regulations came into force. Syndicates have been formed and it is understood that several drills will be on the spot at an early date.

A miniature boom, is in fact, being staged, and local hopes of a future producing oil field are high. Expeditions have been sent out by business men from The Pas, while interests in cities in western Canada have put up money for exploration work.

Many samples of shale have been brought into The Pas, which when lighted will burn freely. Samples of paraffin wax and fossilized remains of fish are also on view.

The expected break-up has interfered with traffic between The Pas and the Pasquia Hills for a time, and it is unlikely that any further parties will venture out until open water, when it is anticipated there will be a big rush to take up sections.

The Pasquia Hills are reached in the winter time by horse team and dog sleigh, and in the summer there is a water route running into the foothills, from whence the best method of travelling will, be by pack horses.

Stuking extends from The Pasquia Hills through to Mafeking, 70 miles from Dauphin, where boring for oil has been in progress for some months.

NOTES FROM NOVA SCOTIA COLLIERIES.

Dominion Coal Outputs.

Production of the Dominion Coal Company for the first quarter of 1921 has been as follows, March being estimated. (Long tons):

	Cape Breton.	Springhill.	Total.
Jan.	256,748	39,645	296,393
Feb.	227,030	43,123	270,153
March	206,000	36,000	242,000 (est.)
	689,748	118,768	809,546
1st quarter, 1920	816,050	119,397	935,447

The production for April will probably not exceed 175,000 tons from the Cape Breton mines, unless trade conditions will permit of larger operations than are at this time possible. The Springhill Collieries will probably not be so seriously affected, as the local demand and railway requirements provide an outlet.

Nova Scotia Steel & Coal Company's Output.

The Sydney Mines Collieries produced in March, 41,306 tons, comparing with 46,801 tons in February, production being fairly well maintained considering the poor demand for coal. Production for the first quarter of 1921 totalled 146,625 tons, comparing with 151,318 tons for the corresponding quarter of 1920. Operations during April are likely to be interrupted by poor demand.

WALL BOARD FROM INFUSORIAL EARTH.

Mr. Ivan A. Bayley, of North Sydney, Nova Scotia, writes as follows: "After experimenting for some time on the utilization of tripolite or infusorial earth, I have succeeded in producing samples of a remarkably efficient wall board. The tripolite, besides containing the necessary bonding material, is mixed with considerable quantities of sawdust which has the effect of adding pliability to the sheets and rendering them more open so that nails may be driven quite near the edge without danger of splitting or spoiling the sheets and makes sawing easy. These sheets are remarkably light in weight and are fire proof, and owing to the well known properties of tripolite, are great non-conductors of heat, cold or sound, and are very strong. These sheets can be made into any convenient size, and owing to the great strength of the binder used may be made as thin as one-quarter of an inch in thickness. As very large beds of tripolite and infusorial earth occur in Nova Scotia, Newfoundland and elsewhere in shallow lake bottoms and marshes, it thus becomes only necessary to drain off these areas and expose the beds to the natural summer drying when the tripolite can be piled in sheds and used as wanted. As both tripolite and sawdust are very cheap materials and the bond used being also very cheap, this process certainly seems to place a very valuable asset at the disposal of home builders. Further experiments are now under way with the object of producing sheets suitable for exterior work and roofing."

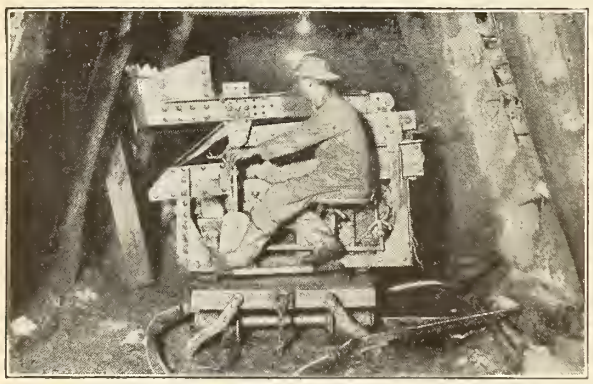
According to official returns of the Government Department of Agriculture and Technical Instruction 1,279,961 tons of coal at an estimated value of £1,271,906, irrespective of a large bulk of coke, were imported into Ireland during the year 1919.

The Hoar Underground Shovel

A Successful Mechanical Loader, Much Used in the Michigan Copper Mines, to be Manufactured in Canada.

The substitution of mechanical devices for loading mined material underground has during the war period made much progress in the United States and in Newfoundland. In the Michigan copper mines a number of devices have been evolved to suit local conditions, a brief account of which was given in our issue of February 6th last, and at the ore mines at Wabana in Newfoundland, the use of mechanical loaders has virtually superseded manual loading. A paper is to be read at the Halifax Meeting of the Mining Society of Nova Scotia in April, by Mr. H. B. Gillis, Superintendent of Mines of the Dominion Steel Company, that will deal with experiences in using mechanical loaders at the Wabana ore mines, where the great height of the ore-seam favors the use of these devices.

One of the loading devices that has found much favour in the Michigan mines is the Hoar Shovel, the invention of a Cornish mine captain long resident in the United States. The Port Arthur Shipbuilding Company is now building one of these shovels for the Canadian Mine Shovel Company, of Toronto, which is introducing the device into Canada. We have received some particulars of the Hoar Shovel that may be of interest to our readers.



The Hore Shovel in position for transport.

The Hoar loader has four principal parts, namely, the truck, the body, the table, and the dipper and dipper sticks. The truck is a substantial steel frame on which are mounted the swinging gear, truck bearings, wheels and rail clamps. The body of the machine is a structural-steel frame to which is rigidly fastened the power unit and which also supports the parallel steel tracks in which the table rollers run. The table is a cast-steel frame mounted on six hardened-steel rollers. It carries the bearings for the double dipper-stick. The dipper mechanism consists of two arms pivoted together so as to allow the dipper a range of flexibility in working the bottom.

The engines used are reversible air-motors, only three levers being used. They are double reciprocating —or in one sense, slide-valve double engines in exceedingly compact form. Two pistons operate, one inside of the other, and transmit a rotary motion to the engine shaft. When the pistons are placed in position in the cylinder, a hole or bearing at the center of the inner piston fits over the pin of the crank on the engine shaft. The outer piston has a lateral reciprocating movement: the inner piston has an up-an-down reciprocating movement. These movements are so arranged and timed that both pistons are always working in unison. The pistons take air through the two circular ports in the cover which have a cored-out connection to the throttle.

All running parts are renewable and all working parts are of wrought-iron, steel or brass. All parts subject to shock, such as table, truck, dipper-arm and rollers are of steel. Truck and body frames and dipper sticks are of structural steel. The wearing parts of the dipper are of special-composition, hard steel.

The shovel swings on double steel-ball bearings. High-grade bronze bearings on the axles add to the ease by which it can be pushed by hand.

All other machine bearings subject to heavy wear are bronze bushed and easily renewable. The hoisting rope is 2 x ¼ inch flat wire-rope tested to a four-ton working load. It is easily removed for replacement.

The Hore Shovel at work.

The Hoar Shovel is primarily designed for underground use. It works nicely in a 7 ft. by 7 ft. drift, but for open pit work, where the large-size steam shovels are not applicable and hand shovelling is necessary, it is excellently adapted, and is a great saving as compared with hand labour. The shovel works with compressed air, using about 300 cubic feet of free air per minute. It can be made to operate with steam, with very little change.

The machine is mounted on a truck, which, in turn, is mounted on eight-inch wheels in front, and twelve-inch wheels at the rear, to give clearance over a high car. The body of the shovel is swung in either direction through a complete circle on double ball-bearings by a reversible air-motor. A second reversible engine, through a self-locking worm gear, drives the table, on which the dipper stick is mounted, forward and backward, giving direct thrust into the breast, as well as the extension needed for dumping and trimming beyond the centre of the dirt car.

As previously stated, the Port Arthur Shipbuilding Company is constructing the Hoar shovel for Canadian sale, and is now working on a first order of six shovels. In Canada, the Canadian Mine Shovel Company of 202 Lumsden Building, Toronto, will handle the rights of manufacture and sale. The shovels are being made in the United States by the National Iron Company of

Duluth, and the patents are owned by the Hoar Shovel Agency, Inc. at Virginia, Minn.

The Hoar shovel is said to be well adapted for work in restricted spaces. Two men, according to the statement of a mining company that is using the shovel, can load sixty tons in a eight-hour shift.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt Field.

In the silver mining districts there is increasing evidence to show that the period of depression has about reached its worst. The quotations for commercial bar silver appear to be "dragging on bottom" as it were, while the cost of producing the metal has definitely commenced to decline. These are two essential factors in the production of any commodity—the value of the product and the cost of producing it. Once let the scales indicate a higher cost than the value, and industry ceases. That is precisely what has already occurred at a number of the important silver mines in Cobalt.

Now, however, with the balance in motion through the price of silver remaining steady while the cost of producing the metal is declining, conditions appear to have past the worst period, and better times appear to lie ahead.

Captains of industry in Northern Ontario take some little satisfaction out of the fact of knowing that the nature of the silver deposits in Cobalt are such as to make it possible to produce silver here just as cheaply, if not actually cheaper than any other part of the world. As a consequence, with everyone knowing that the world must require silver, and the silver mining industry must become stabilized in some way, the miners in the Northern Ontario field are confident of the early return to conditions which will signalize a general rejuvenation of interest and with a greatly increased scope of operations.

Favorable results have been obtained on the University mine of the La Rose Consolidated. A vein opened up late last fall has been yielding substantial quantities of high-grade ore. Close to 25 tons have already been shipped to the sampling plant, the average grade being 3,200 ounces of silver to the ton. In addition to this, a further substantial amount is in sight. The La Rose is also handling a large tonnage of mill rock, and the production for the current year offers promise of netting the company quite large profits.

Advice has been received by the Journal correspondent from South Lorrain that the Keeley Silver Mines will be reopened. Toward this end, pumping operations have already commenced. Just as soon as it becomes possible to enter the lower workings, it is planned to employ three machines on development work, and breaking ore. Last summer and fall the company installed a 20-stamp mill, but a shortage of hydro-electric energy in the fall prevented the utilization of the equipment. Although the power situation has improved somewhat due to curtailment at some of the Cobalt mines, yet the Keeley has remained idle throughout the winter on account of the season being quite unsuitable for resuming work. May 1st, however, is expected to find the mine under operation. As regards ore on the Keeley, it has been officially stated to the Journal that a large tonnage has been placed in sight, which contains values ranging from 40 to 90 ounces to the ton, and contained in a deposit averaging about three feet in width. This strong deposit and the high milling values are expected to enable the company to mine profitably in spite of the poor market for the metal.

Under the management of G. C. Bateman, it is officially stated, the work on the Bailey Silver Mines is being speeded up. Stopes have been cut in the vein at the 5th level where a large tonnage of ore has been placed in sight which averages around 20 ounces of silver to the ton. Meanwhile, a cross-cut is being driven for the purpose of locating the downward continuation of what is called the Big Pete vein. This work is well advanced.

Total silver production from Cobalt during March is estimated at approximately 500,000 ounces. The companies contributing to the output were, in the order of their importance: Nipissing, O'Brien, Coniagas, La Rose and Bailey.

The Crown Reserve is doing a limited amount of work on claims in the Gillies Limit. Some little encouragement has been met with in this work, but not sufficient to encourage more than quite limited operations.

In regard to the wage question in the Cobalt district, the Board of Conciliation had not yet brought in their report at the time of writing. It is understood the companies have decided to proceed with the wage reduction of 15 p.c. as of April 1st, either that or close down. The workers, however, at their latest meeting expressed the opinion that although dissatisfied with the reduction and unwilling to vote to accept the cut, they nevertheless expect the decrease to go into effect and are thus prepared to accept the inevitable. This was the gist of opinion expressed by each speaker. There is no threat whatever of a strike.

The first regular meeting of the Temiskaming Prospectors' Association was held in Haileybury, at which the following officers and council were elected:

President, J. Hill; Vice-President, M. B. Grover; Secretary, T. M. Strain; Treasurer, A. G. Kirkpatrick; Council: N. J. McAuley, Tom Montgomery, Harry Owen, and Lorne Howey, Haileybury; Wm. Smith and Dan Karney, of Cobalt and Peter Graham and M. McLeod, of New Liskeard. While this council represents only three towns in the district, it is understood other towns may be included accordingly as representation is required. Entrance fee is $2 and annual dues $3. The objects of the association are to promote and guard the interests of prospectors and the mining industry. The regular meetings are to be held in Haileybury at 8 p.m. on the last Saturday of each month.

Official announcement is made to the Journal that the Kerr Lake Mining Company has made arrangements to take over the Hargraves property. An option was secured earlier in the year, and had some little time to run, but the holders of the option have decided to take advantage of a clause which provides a discount for cash, and the deal is being wound up at once. In the meantime, the Kerr Lake is conducting exploration work on the Hargraves, having extended the underground workers across the boundary.

Disapproval of the proposed amendments to the Mining Act of Ontario was recorded by a number of leading prospectors at a meeting in Haileybury, particularly in relation to the working conditions. No fear is entertained that of allowing [illegible] people within which to perform the first assessment of

ment work will not operate to the best interests of prospectors and the mining industry.

The Journal has discussed this question on previous occasions, and has suggested a reconsideration of the bill now before the House, with a view to altering the wording so as to require the first instalment of work to be performed within the first three months following staking. With regard to this new bill, the Minister of Mines proposes to reduce the total assessment work to 200 days, of which 40 days shall be required to be performed each year for a period of five years. In spreading the total over a longer term of years than formerly, the amendment seems to be destined to benefit the prospectors, but in allowing a full year within which to perform the first instalment, a serious menace is created in that it would tend to minimize early activity in the newer fields. It would seem to be advisable to require half the first instalment to be performed within the first three months following staking, and the balance of the first instalment to be done within the following three months. This would prevent outside interests from staking out large blocks of territory in close proximity to new discoveries and holding them as a speculation for a full year without doing any work, and in the hope of making a sale before the first year passes.

THE GOLD MINES.

The Porcupine District.

Rain has been falling in all parts of Temiskaming, and the water is rising in the lakes and rivers. Warm winds from the south, and these occasional showers have caused the snow to sag and small streams are taking form, all combining to raise the water in the rivers, and by April 15th complete relief is expected in the power situation.

McIntyre-Porcupine has declared a dividend of 5 p. c., payable May 2nd to stockholders of record April 7th. This is the second disbursement to be made so far this year, and is taken as an indication that dividend payments are to occur with increasing frequency from this date forward. The May disbursement will amount to $180,514.15 and makes a total of $361,028.30 paid so far this year, and an aggregate of $2,355,683.50 since going on a dividend-paying basis. A discovery of importance is reported to have been made on the McIntyre, this time at the south side of Pearl Lake, under the mill.

A meeting of the stockholders of the Porcupine-Keora, being held this week, is for the purpose of considering and if approved, selling two of its mining claims to a company which is as yet unnamed.

The newly organized Allied Porcupine Gold Mines, with an authorized capitalization of 5,000,000 shares of the par value of $1 each, has been incorporated for the purpose of taking over the La Palm and the Three Nations properties, located in the north-eastern part of the township of Whitney. These properties were worked in the early days of Porcupine, and considerable encouragement was met with. Financial difficulties militated against a continuation of the work, and the properties have remained in idleness since that date. It is now proposed to commence work at as early a date as possible. Peter Kirkgaarde, of Toronto, has been appointed consulting engineer for the new company.

Both the Hollinger Consolidated and the McIntyre-Porcupine are making preparations to do considerable construction work this summer. Both companies, and especially the Hollinger, expect to take on greatly increased working forces, and will be obliged to provide the necessary housing accommodation. The Hollinger will build about 130 houses while the McIntyre expects to erect upwards of 25.

Shareholders of the Porcupine V. N. T. are awaiting with more than usual interest the holding of the annual meeting of that company in Toronto April 12th. At that time, information is expected to be forthcoming with respect to the probable course to be followed in connection with re-opening the mine.

Kirkland Lake District.

Production from the Lake Shore mine during February, according to the regular monthly report of the manager, R. C. Coffey, shows a considerable decline. The output for the period amounted to $24,068, the decline being due to the mill operating only 83 p. c. of the possible running time, as well as the ore averaging only $16.44 per ton, as compared with a former average of approximately $25 a ton.

Underground development on the Wright-Hargraves is being pushed forward as rapidly as possible, and general preparations are being made to have the entire plant in operation by May 1st.

It is reported in unofficial circles that one of the larger operating companies in the Kirkland lake district has evinced a desire to secure control of the Hunton-Kirkland Gold Mines. Negotiations have not yet reached a point where the details may be announced, and as yet there does not appear to be more than preliminary discussion of the question.

The Granby-Kirkland is considering the advisability of shifting its attention to the development of two claims in the central part of the township of Lebel, instead of on the property formerly worked in the north-western part of that township.

Larder Lake.

Underground operations have been resumed on the property of the Argonaut Gold, and the shaft is being continued to a depth of 500 feet from the present point of 380 feet deep.

Building Trunk Road.

The Northern Development Branch of the Ontario Government is calling for tenders for the work of clearing a right of way from Krugersdorf to Swastika. This work is for the purpose of connecting the Kirkland Lake, Boston Creek and Larder Lake districts with the Cobalt-Haileybury-New Liskeard districts by road, by way of Englehart and Earlton.

British Columbia Letter

The Collieries.

Coal production in British Columbia stands at about the same level for February, according to official figures, as that shown by the statistics for January. There has been a drop of about 12,429 tons, the output for January being approximately 216,575 as against 204,146 tons for February.

An analysis of the returns indicates that the falling off is attributable to the lesser production of the Canadian Western Fuel Co., Nanaimo, and the Canadian Collieries (D) Ltd., at Comox, and Extension. Due no doubt to the cessation of operations at Herewood, and to some extent to the comparatively little work in pro-

gress at Wakesiah, the Canadian Western Fuel Co's. production has dropped some 11,107 tons. The Canadian Collieries total for February is under that for January some 5,525 tons which is accounted for, as stated, by smaller production at Comox and Extension, the mine at South Wellington having aetually shown a little improvement.

The Granby Company's Collieries at Cassidy, Vancouver Island, is the only large coast producer with an increase. In January there were 19,532 tons produced at Cassidy and in February this went up to 21,681 tons, an increase of 2,149 tons. The Nanoose-Wellington Collieries are down a trifle.

In the Crow's Nest Field the situation has improved slightly, the output for January being 57,582 tons and that for February, 60,454 tons, an increase of 2,872 tons.

Market conditions from the viewpoint of the coast collieries changed little from what they were at the beginning of the year. Aside from domestic and bunker trade there is little foreign business. The Washington State market has fallen off, chiefly through the recent reduction in freight rates which permits Utah coal, which at least is as of good quality as that of Vancouver Island, to be distributed to American Pacific Coast consumers practically as cheaply as that coming from British Columbia.

The Crow's Nest Pass Company, and other eastern British Columbia collieries, are looking forward to better times. With reference to the former concern it is believed that its product is assured of a greater part of the trade of the prairie provinces than heretofore and, if the smelter demands for both coal and coke increase, which depends on the improvement of mining conditions, this company and others may be expected to enjoy a satisfactory year.

Following are the details of the output of British Columbia collieries for the month of February:

COAL OUTPUT FOR FEBRUARY, 1921.

Vancouver Island District.

Mine.	Tons.
Canadian Western Fuel Co.	46,121
Canadian Collieries (D), Ltd.—	
Comox	34,847
South Wellington	6,827
Extension	13,946
Pacific Coast Coal Mines, South Wellington	Nil
Nanoose Wellington Co., Nanoose Bay	4,954
Granby Consolidated MS & P Co., Cassidy	21,681
Old Wellington Colliery (King & Foster)	135
Telkwa Collieries, Telkwa	Nil
Total	128,511

Crow's Nest Pass District.

Crow's Nest Pass Coal Co.—	
Coal Creek	31,120
Michel	22,824
Corbin Coal & Coke Co.—	
Corbin	6,510
Total	60,454

Nicola-Princeton District.

Middlesboro Collieries, Middlesboro	6,728
Fleming Coal Co., Merritt	3,239
Coalmont Collieries, Coalmont	4,420
Prince Coal and Land Co., Princeton	794
Total	15,181

Prohibition of Naked Lights in Coal Mines.

Coal mining conditions in the Province of British Columbia were under discussion in the Provincial Legislature recently as a result of an amendment to the Coal Mines Regulation Act introduced by the Hon. Wm. Sloan, Minister of Mines, and providing for a further application of the principle of "safety first" in connection with underground operations.

In moving the second reading of the amendment Mr. Sloan stated that it would make compulsory the use of the safety lamp, of a pattern approved by the Minister of Mines, in all underground workings in the coal fields of the Province. The effect would be to do away entirely with naked lights.

This action, he said, had been contemplated for a number of years and had been definitely determined by the accident of 1917 on Vancouver Island when four men were snuffed out in a mine that had been considered free from explosive gas. These fatalities, and the circumstances attending them, had served to emphasize that a mine may be safe today and tomorrow develop dangerous gaseous conditions.

During the war it had been difficult to obtain deliveries of mine equipment, etc. Owing to this uncertainty legislation was postponed, the various operating companies being notified that it was the desire of the Department of Mines that the safety lamp should be used in coal mine workings. The result was that 98 per cent of the coal produced in British Columbia was mined under safety lamp conditions.

In the year 1815, Mr. Sloan continued, Sir Humphry Davy, an eminent British scientist, designed the safety flame lamp the principles of which are found in all the safety flame lamps of today. The Davy Lamp was a boon to the coal miners of that time and was considered all that could be desired until mining development required the velocity of the air currents underground to be increased. Then it become evident that this lamp was not safe in an explosive atmosphere with a current travelling at the rate of six feet a second. There had been many improvements made and the present Wolf Lamp, of the new types, was that chiefly used at the present time. This was a double-hooded gauze pattern and a recognized safety flame lamp. These were safe, however, only when not misused. There had been a number of cases of accidents due to the careless handling of the Wolf Lamp. It was to be remembered that it was liable to breakage, particularly under conditions at the "face" and in mine haulage.

The underground workers, it was stated, while of necessity using the safety lamp would prefer the naked light where conditions allow it, principally because of its convenience, it being worn in the cap.

There were two noteworthy stages in the development of illuminants used in coal mining. The first was that already referred to—the invention of Sir Humphrey Davy in 1815—and the second in 1915 in the perfection 100 years later of the Edison Safety Mine Lamp. This lamp had been approved after exhaustive tests by the United States Bureau of Mines. It had won favor with the miners because it had been proved absolutely safe in explosive atmosphere and because the same could be said of it as regards fire hazards. It had a large area of illumination and was convenient. The lamp was worn in the pit cap in the same way as the naked light. It gave a constant and a steady light and produced less eye strain than any other form.

In further pointing the need of the amendment proposed Mr. Sloan said that of twenty-[illegible] coal mine dust

ters in the United States, disasters where fatalities aggregated 100 or more, the naked light had been in use. This light now had been replaced by the Edison electric lamp with the results that there had been a marked decline in the number of accidents resulting from gas explosion.

During 45 years of coal mining in British Columbia, there had been 618 lives lost through underground explosions, 90 per cent being in mines using naked lights.

During 25 years of coal mining in British Columbia 257 miners had suffered more or less serious burns and injuries through gas explosions in the mines.

The amendment, which would have the effect of removing the naked light, marked the beginning of a new era in the history of coal mining in the Province in-so-far as the application of legislation to safety conditions was concerned. British Columbia would be the first coal-mining country in the world to pronounce against the naked light by statute. It was a policy, he was confident, which would be adopted, sooner or later, by all governments charged with the responsibility of protecting the lives of the underground workers in the coal mining industry.

SUDBURY NOTES.

D. E. CUSHING.

Sudbury Syndicate Formed.

Gold has been found on all sides of Sudbury, at Shining Tree, Long Lake, Howry Creek and Goudreau, and now an effort is to be made by Sudbury business men to try and bring the gold camps closer to home. With this in view 100 business men have put up $100 each and are banded together under the temporary name of the Hudson Bay Mining and Development Co. The sole object of the company is to thoroughly explore the district immediately surrounding Sudbury with the hope of striking a gold property.

Tom Saville, an old prospector and the finder of the White Rock of Shining Tree, is to be the field man of the company and this interesting pioneer work will be undertaken immediately. Plans are to take to the field as soon as the snow is off the ground. A large contact runs through this district and mining men are of the opinion that gold in paying quantities should be found.

Goudreau Gold Claims Active.

When Major J. H. Rattray of Cobalt purchased the McCarthy-Webb claims at Goudreau, he awakened a keen interest in this mining camp with the result that since that two other deals have been concluded in that camp.

The latest was the purchase for $50,000 of the Cabin claim, which was acquired by J. A. Johnson of the Canadian Mining and Leasing Corporation from The Algoma Exploration and Development Corporation. This property is half a mile from the McCarthy-Webb claim and adjourns the Morrison No. 1 claim which has been purchased by the Lake Superior Corpn.

Considerable surface work has been done on the Cabin claim but no sinking. Mr. Johnson will send an engineer in immediately to lay out a plan of development of the property.

The Canadian Mining and Leasing Corpn. is the owner of property at Rice Lake Manitoba and expects to have a stamp mill going on its property there, in a couple of weeks.

Shining Tree Properties Being Developed.

The indications are that the Shining Tree gold camp, along with those of Kirkland Lake and Porcupine, is facing a great march forward during the Summer. Large quantities of machinery are being rushed into the camp and though the sleighing is about gone, teams are still going hard to get in all the supplies that have been unloaded at Westree.

Mining men just out from Shining Tree for Easter state that small gangs are at work on all the properties, setting up machinery and unloading supplies.

The Wasapika is at present centring activities on the setting up of two 100 h.p. boilers, so as to have them ready for active operations in the spring. A stamp mill has also been taken into the property during the Winter and is yet to be erected. Manager George Rogers claims that he will have the first mill in the camp going.

Manager Stevens of The Herrick, an old Porcupine pioneer, is installing another boiler and has a program of development laid out that will entail sinking to the 500 ft. level. The camps on this property are excellent and the treasury is reported to be strong.

The White Rock is controlled by Sudbury men. Another boiler is being installed and the company is looking around for a stamp mill. A strong fissure-vein runs across this property for half a mile and assays show rich ore in places.

A rich new find is reported on the claims of Messrs. Burke and Langtier, in Churchill Township. Considerable coarse, free gold is to be seen over several feet of this vein, which has been opened up for 500 feet and is standing up well.

TORONTO NOTES.

At a meeting of bond and debenture holders of the British America Nickel Corporation held in Toronto last week, the opposed scheme of reorganization was endorsed.

Opposition developed at the meeting of the holders of first mortgage bonds during the morning. However, out of $5,972,000 bonds which were represented, holders of $5,347,000 voted in favor of the resolutions having to do with the plans for reconstruction. Representatives of M. J. O'Brien, Ltd., voted against the resolution in respect of $625,000 of bonds. The Chairman at this meeting was W. D. Gwynne, and he declared the "extraordinary resolutions" adopting the scheme of the reorganization as carried by the necessary majority. At the meeting of debenture stockholders in the afternoon, $8,552,050 of 6 per cent debenture stock was represented, and the resolutions carried unanimously.

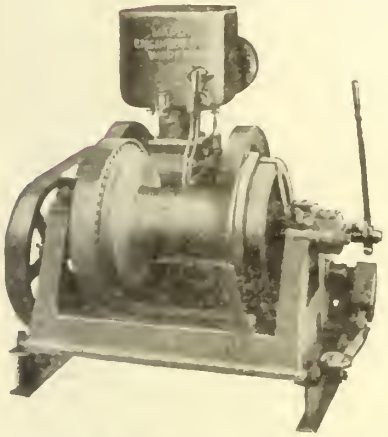
Try to Postpone Meeting.

An effort was made during the morning on the part of M. J. O'Brien, Ltd., at Osgoode Hall to have the holding of the meeting postponed. Mr. Justice Rose granted an exparte injunction until April 7, but one that might be dissolved on 24 hours' notice. Strachan Johnston, K.C., who appeared for M. J. O'Brien, Ltd., expressed fear that the meeting, unless enjoined, would vote on "extraordinary resolutions" which, it was suggested, would wipe out the minority bondholders of the issue of March 15, 1916. The meetings, however, were held with the above-mentioned results.

GASOLINE HOISTS

IDEAL FOR PROSPECTORS

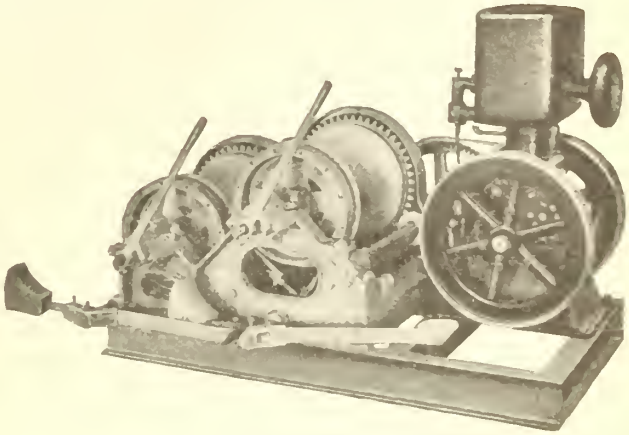
For Developing Claims, and for Operating Small Mines, Quarries, etc.



Single Drum Hoist
For Pit Work and General Purpose Work
Made in Two Sizes, 6 H.P. and 10 H.P.

What One Customer Says.

"—You can fully believe that no money could purchase our machine from us if we were unable to replace it." —(Name on appication.)



Double Drum Hoist
For Derrick Work
Made in Two Sizes, 6 H.P. and 10 H.P.

GASOLINE HOIST SPECIFICATIONS
For both Single and Double Drum Machines

Note—All the above specifications are for our standard machines fitted with the standard size of Gasoline Engine, as listed at the left of above schedule.

AN UNSOLICITED TESTIMONIAL

Dear Sirs:-

Regarding the 6 H.P. Single Drum "MARSH" Gasoline Hoist that I purchased from you last August I take pleasure in advising you that this machine met the requirements perfectly and would say that it is giving entire satisfaction in every respect.

I am using this Hoist in my coal mining operations, for the purpose of hoisting the coal about eighty feet. At present I hoist one-half a ton of coal per load and hoist about ten tons every 90 minutes, with one man operating Tipple Head and Machine.

The cost of operating this machine for the work as specified is approximately 50 cents, possibly less.

Yours very truly,
(Name given on request.)

The new financing arrangements which the bond and debenture holders voted on involve the issue of $24,500,000 in income bonds of three classes: $6,000,000, first income; $6,000,000, "A" income, and $12,500,000, "B" income. Of the first issue, $4,000,000 will be hypothecated for debts to Canadian and Norwegian banks, and the balance held in the treasury. The second $6,000,000 will be exchanged for 15-year first mortgage bonds, and the $12,500,000 issue will be exchanged for $10,000,000 debenture stock, and the remaining $2,478,000 will be issued to satisfy certain claims of Norwegians, who were prominent in the organization of the corporation.

In the Ontario Legislature last week, the House considered Hon. Harry Mills' bill amending the Mining Act, when Hon. Howard Ferguson took the view that a man staking a claim should not be called upon to make an affidavit that he has discovered valuable mineral, but should only be ready to go ahead and do the necessary work. Malcolm Lang, who has had considerable experience as a prospector, said he had always been opposed to the "discovery" clause.

It was announced on Saturday that the option on the Flin Flon copper property in Northern Manitoba had been allowed to elapse. The option had been secured early last year by the Mining Corporation of Canada, associated with Colonel W. B. Thompson, of New York. It was stated in Toronto last week, by interests close to the parties concerned, that the hope of preceeding with the arrangement had not been given up, but that present conditions by way of low price of copper and the financial situation generally had made it unwise to proceed with the deal at the present time. A year ago, it is pointed out, copper was selling at 19 cents, while now it is below 13 cents and several of the copper producing mines have closed down owing to lack of business. Copper prices rose to 36 cents during the war, but ruled around 23 to 25. The metal was in great demand, bringing activity and profits to the larger mining enterprises. Flin Flon is a big property on the border between Manitoba and Saskatchewan. The Commissioner for Northern Manitoba has recommended that the Government of that province build a railway from La Pas to the property at an estimated cost of $2,500,000, the undertaking being contingent on the guarantee of the Flin Flon syndicate, that the purchase of the property would be proceeded with in March, 1921, and that the mine and smelter would be operated on the completion of the railway on a basis of at least 2,000 tons of ore per day. Last October the prediction was made that the ore body would run to about 24,000,000 tons.

The Keora sale deal, under which the two main claims of the company are to be sold to a newly organized concern, to be known as the South Keora Mines, Limited, was approved at a largely attended meeting of shareholders in the King Edward Hotel on April 4th last. The proposals as submitted by the directors went through with only one shareholder voicing opposition, the vote being practically unanimous in favor of the project. Three of the directors of the new company are now members of the Keora board. Keora receives by way of payment 2,000,000 shares out of the 3,000,000 at which the new company is capitalized. The remaining 1,000,000 will be offered to the public at 30 cents a share and the money used for development purposes.

TORONTO COAL PRICES.

Toronto, April 6.—The coal market remains quiet with an evident desire on the part of consumers not to make contracts. Very little coal is moving. Bituminous is quoted at $2.75 to $3.25 U. S. funds, mine, for lump and $2 to $2.25 for slack, with smokeless laid down in Toronto for $7.75. The price of anthracite coal in Toronto is $15.50 generally throughout the city.

BRITISH AMERICAN NICKEL CORPORATION.

The plans for reorganization of the British America Nickel Corporation were approved at meetings held in Toronto on Thursday, Mar. 31. $24,500,000 in bonds of three classes will be issued in exchange for outstanding bonds and to satisfy claims of some parties who took part in the organization of the company.

Some objection to the plan of reorganization was aired in Osgoode Hall on the day of the meeting, representatives of M. J. O'Brien Ltd. asking for an injunction to protect that company's bond holding. Apparently however there was little opposition from any other bondholders and the scheme already announced has been approved.

With this reorganization affected the company should be in shape to resume operations again when the market for nickel and copper improves. At present the company is not operating its mine, smelter or refinery. It was reported that development work would shortly be resumed at the Murray mine, but this has been denied and the company has not announced that such work will be undertaken.

Keora.

Shareholders in Porcupine-Keora Gold Mines Ltd. will be asked shortly to consider a proposal to sell two of the company's claims to a new company which the present company would control by stock ownership. The company would retain ownership of three claims and of its present mining plant.

British-American Oil.

The annual meeting of British America Oil Co. Ltd. was held in Toronto on Mar. 31. A quarterly dividend at the rate of 8 per cent per annum is payable April 1.

The company has secured a number of oil leases in the West, including some at Fort Norman. Development of such properties is not at present a big factor in the company's business; but may become so if important fields are developed.

The officers are S. R. Parsons, president, A. L. Ellsworth, vice-president and secretary-treasurer.

The Mining Society of Nova Scotia

29th Annual Meeting.—Halifax, N. S. April 5th, 6th, 1921.

The Mining Society of Nova Scotia is the *doyen* of the mining organizations in Canada. The members guard very jealously its identity as a society, and its autonomy of action, and are proud of the Society's long record of service.

In 1913, owing to the decline of gold mining, and the rise of the coal-mining and steel industries, the preponderance of mining interest in Nova Scotia shifted to the coal and steel centres of the mainland and Cape Breton Island, and the Headquarters of the Society were moved to Sydney, the several coal and steel companies having guaranteed financial support.

The first meeting held in Sydney in the Spring of 1914 was unqualifiedly successful, and was attended by a deputation from the Canadian Mining Institute headed by the late Mr. G. G. S. Lindsay, a gentleman who during his presidency showed vision in regard to the policy of the Institute and energy in forwarding that policy, characteristics which rendered his early demise a great loss to the Institute. As a result of Mr. Lindsay's vision, ably seconded by Mr. H. Mortimer Lamb, the Institute shortly afterwards received by affiliation an accession of something over 120 members, almost exclusively technical men engaged in practising as miners, metallurgists and engineers.

After the successful meeting of 1914 there came the unheralded storm of war, which absorbed the energies of the members of the Society to such an extent that annual gatherings of the traditional type were regarded as inadvisable until the Spring of 1917, when meetings for the reception of papers were resumed.

The Halifax meeting in 1921 was the first gathering of the Society since 1913, and the evident vitality of the organization after eight years of change and stress must have convinced the members of the local government and others in the provincial capital that the translation of headquarters has been justified by the present health and vigor of a technical organization that has always been consulted by the provincial Mines Department when expert advice was needed. In this regard the Mining Society has come to be regarded as a wise counsellor, a condition that represents an ideal that might be aimed at by the Canadian Mining Institute in the larger sphere of federal legislation.

The communications of the Mining Society of Nova Scotia, and the discussions thereon, are more intimate and practical than those of larger gatherings, and the Halifax Meeting once more exemplified that papers are only of value—or rather are of greater value—inasmuch as they afford opportunity and scope for discussion. It matters little whether the subject discussed be local in its application, or not, the principle seems to become clearer *that the discussion is the thing*.

The papers read at Halifax were of more than local concern. They included discussion of such general interest as the preparation of coal for market, the fighting of mine fires, the relative merits of longwall mining, the efficient use of compressed air in mining, the civil re-establishment of the cripples of industry, the working of coal under the sea, the extent to which mechanical devices can be substituted for hand labor in

loading coal and ore underground; the extension of central electric-power-stations to mining, and the wider use of electrical power in mining and mining transportation, with which was correlated the electrification of railways; and industrial welfare work.

Almost any one of the subjects or papers menti-oned would form the basis of a topical discussion, which if held say at the Annual Meeting of the C. I. M. & Metallurgy next year, or at the annual western meeting next Autumn, would, because of publication and perusal prior to the date of these meetings, evoke an intelligent symposium of matured and widely-drawn opinion that is not in any other way to be brought about.

The Council of the C. I. M. & Metallurgy might with possible profit consider whether the proceedings at the annual metropolitan gatherings should not be confined to papers and subjects of national import, and of outstanding merit, and to the presentation for discussion of papers of similar character presented in the first instance at divisional and branch meetings.

The papers read at Halifax deserve a wider publicity and a better fate than can be secured to them by such desultory publication in the Bulletin as space considerations will permit, and final entombment in the Transactions of the Institute, after but one opportunity—and that a limited one—given for discussion and the citation of the additional facts that wide discussion always calls forth.

We submit there must be some better way by which to draw closer the ties of membership in the Institute, to bring out the community of problems and interest of the fraternity, to encourage young writers, and also writers of deserved eminence, to enrich the Transactions, and to ensure that communications to the Institute achieve more effectual publicity, evoke more definite action and bring more *kudos* to the Institute than has yet been found to result from the course marked out by the dead hand of precedent.

Will the Institute please wake up and discover that from now on the motive power of the organization and the source of the best material for a distinctive volume of annual transactions is to be found not in the annual metropolitan gatherings, but in utilising and carefully cultivating the resources of the branches, and of the operating men who compose the branches?

It should be the much-prized privilege of the Council to select for presentation and adequate discussion at the Annual Meeting one or more papers of merit presented to the branches during the year. What an opportunity is here presented to the Council to unify the membership in lines of thought, (which must always precede action) and to make the least-known branch member feel that, if he really has anything to add to the general fund of knowledge, his voice may be heard by all members; and his thinking may result in action by the Institute as a unit.

Proceedings of the Meeting

Meetings were held in the Board of Trade Rooms in Halifax on the 5th and 6th of April. About fifty members were in attendance at the sessions. Arrangements for the meeting were made by a committee of Halifax members, namely: Messrs. Harry Wylde, C. H. Wright and Saunders, and other Halifax members in attendance included C. C. Starr, Professor F. J. Sexton, and Mr. Hiram Donkin, the Deputy Commissioner of Mines for Nova Scotia. The Montreal delegation—which might have been larger—was composed of the Secretary of the C. I. M. & M., Mr. G. C. Mackenzie, Mr. E. Godfrey, Canadian Explosives Company, and the Editor. A very representative gathering of miners and steel men were present from the Sydneys and the Pictou County fields. An approximate list of those present at the meetings will be found elsewhere in this issue.

Opening Session.

With George D. Macdougall in the Chair—in the absence of Mr. A. J. Tonge, the retiring president, who is in England—the proceedings opened on the morning of the 5th. The Secretary reported gross funds to the Society's credit of $1,229.

The election of officers resulted as follows: President, George D. Macdougall; Vice-President, C. M. Odell; 2nd vice-President, Alex. S. McNeil; Secretary-Treasurer, E. C. Hanrahan; all by acclamation. The ballot for members of Council resulted as follows: T. J. Brown, D. H. McDougall, Thomas Cantley, F. W. Gray, Hugh B. Gillis, Walter Herd, F. H. Sexton, H. J. McCann, W. H. Graham, Robert Drummond, Malcolm Blue, F. E. Lucas, J. S. Whyte, R. E. Chambers, F. E. Notebaert, Alexander McEachern.

Name of Society to Remain Unchanged.

The letter ballot regarding the proposed change of name of the Society to include the word "Metallurgical" showed a majority against a change, so that the title of the Society will now remain without alteration.

The President-elect, Mr. George D. Macdougall, of New Glasgow, delivered the presidential address, which follows:

PRESIDENTIAL ADDRESS.

"It is a matter of sincere regret to me," "as I know it is to you, that your President, Mr. A. J. Tonge is not present at this annual meeting, as we certainly would have expected, on account of his long and intimate connection with the mining of coal, an address of much value and interest.

"We may perhaps consider, that on account of the general business depression, that our meeting is held under very unfavorable auspices. As the coal mining and steel manufacturing enterprises, with which the majority of us are associated, are particularly depressed at the moment, we might well be expected to reflect that depression.

Conservation of Fuel and Power.

"We must in all our consideration keep in mind that the coal mining process is daily increasing in difficulty owing to depletion of more easily won land areas and dipping of seams to seaward, making for more distant working areas, greater difficulty in transportation and generally greater costs of production.

"I trust, however, that that is not the spirit in which we find ourselves, but rather we, realizing conditions

Mr. Geo. D. Macdougall, President, Mining Society of Nova Scotia.

as they exist, will dedicate ourselves anew to the problems confronting us, that we shall use our energy, our knowledge and resources of our society to devise ways and means to improve the general situation.

"In this connection, I think that much remains to be done in the conservation of power and of fuel used in the industrial as well as the domestic field.

"It is well known that the coal consumed for general domestic purposes is wastefully burned. To remedy such, in certain sections of the United States, community heating has been established. Central stations supplying hot water pumped over determined areas, have not only simplified the problem for the householder and businessman, but by the greater efficiency have decreased the cost, and saved considerable fuel. The extent to which such application can be made, should we consider this method, will of course be to various sections of the province, determined by conditions pertaining, as while the percentage of efficiency should probably be the same in all localities, the money saving will be greater in sections farthest removed from the pit head.

Gasification of Coal.

"Another possible economy may be effected through gasification of coal. By this it would be intended that coal would be carbonized in retort by-product ovens, the gas being purified of its tar and ammonia, but not of bensols, would be used for cooking, heating and lighting purposes in industrial plants or in domestic furnaces. If considered advisable the tar could be refined, producing hard and soft pitch, light oils, carbolic acid creosote oil and other products, or when carried to ultimate refining would give innumerable dyes, drugs, etc., etc. The ammonium sulphate is a fertilizer, and its sale would reduce operating costs according to sulphate market prices.

"It should also not be overlooked that use of electric power is becoming more common in the home for heating, and projected cheap power from our provincial streams will lessen, more and more as years go by the use of coal for domestic purposes.

"Neither should we overlook the possibilities of recovery of oil fuel from the rich shales of our province. What has been accomplished in the old world, is possible in this. With the revival of trade, will surely come the demand for those oil products which in the past few years have entered so largely into the industrial life of nations, and to meet those demands, every available sources may be taxed again. The oil shale deposits of this province therefore may possibly play an important part in the problem, and they merit more attention than has been given them in the past.

Use Low Grade Products.

"Possibilities of greater economy exist in the coal mining industry itself. Some points worthy of consideration in this connection are the utilization to a greater extent than at present of the waste or lower grade products of the mine in the development of of power, and the economies and increased efficiency to be derived from a more general application of electric power to the mining operations.

"In the industrial field and more particularly in iron & steel manufacture, the greatest possibilities exist, and it must of course not be forgotten, that the question is an economic one requiring large expenditure of capital on which justifiable returns must be assured by saving in fuel consequent upon this outlay.

"Generally speaking in Nova Scotia steel plants to day, coal after being washed of its impurities is carbonized, and resultant coke used as blast furnace fuel, while middlings from washer are available for general fuel purposes. Coal is gasified by process of destructive distillation to give gas fuel required for Open Hearth steel production, and coal is used in a solid or gaseous form for heating purposes at the rolling mills. Coal also is used to a considerable extent in generating steam for power purposes, and for other incidental uses. It is true that at the blast furnace plants, the tunnel head gases are used in boilers to generate steam, and that at the plant of the Dominion Iron & Steel Company, a most modern by product coke oven plant provides for the surplus gas to be used for heating steel at the rolling mills.

The Ideal Situation.

"The ideal situation however which we would have before us is the manufacture of steel to the stage at least that steel is now being manufactured in the province, from the quantity of coal required to furnish the necessary coke for blast furnace, and utmost economies practised in each operation. I realize that such a consideration has not been attained, nor am I prepared to

say that such desired results are in sight, but I really think the chances of reaching a high standard, even if difficult to attain, are better assured of accomplishment if we are not easily satisfied.

The means of accomplishment are essentially of an engineering nature, and include principally,

Carbonization of Coal and recovery of by-product.

Cleaning of Blast Furnace gases.

Use of gas engines for electric and blowing power.

Use of Blast Furnace gases in Boilers for Steam Turbines as may be required.

Use of Coke Oven gas or Blast Furnace gas, either pure or mixed, for Open Hearth Furnaces, Mixers, Heating Furnaces or Boilers.

Motor drives on all rolling mills, as well as general application of electric power for all possible purposes.

Recovery of all heat possible from furnace off-gases.

General use of modern labour saving machinery.

Modern economical design of furnaces, mills, as well as a well proportioned and laid out plant for proper handling of raw materials and product.

"These items while not complete, indicate the magnitude of the problem, but this should not be a deterrent to our giving it the generous consideration it deserves. There are undoubtedly other features of our industrial activities, which might be similarly considered all with eventual conservation of our fuel as an objective. You will pardon me, I trust, for speaking so particularly, but one is quite apt to speak along lines with which one is most familiar, hence the subject chosen. With you I have every confidence in the mining and metallurgical future, as well as the future of our Province as a whole.

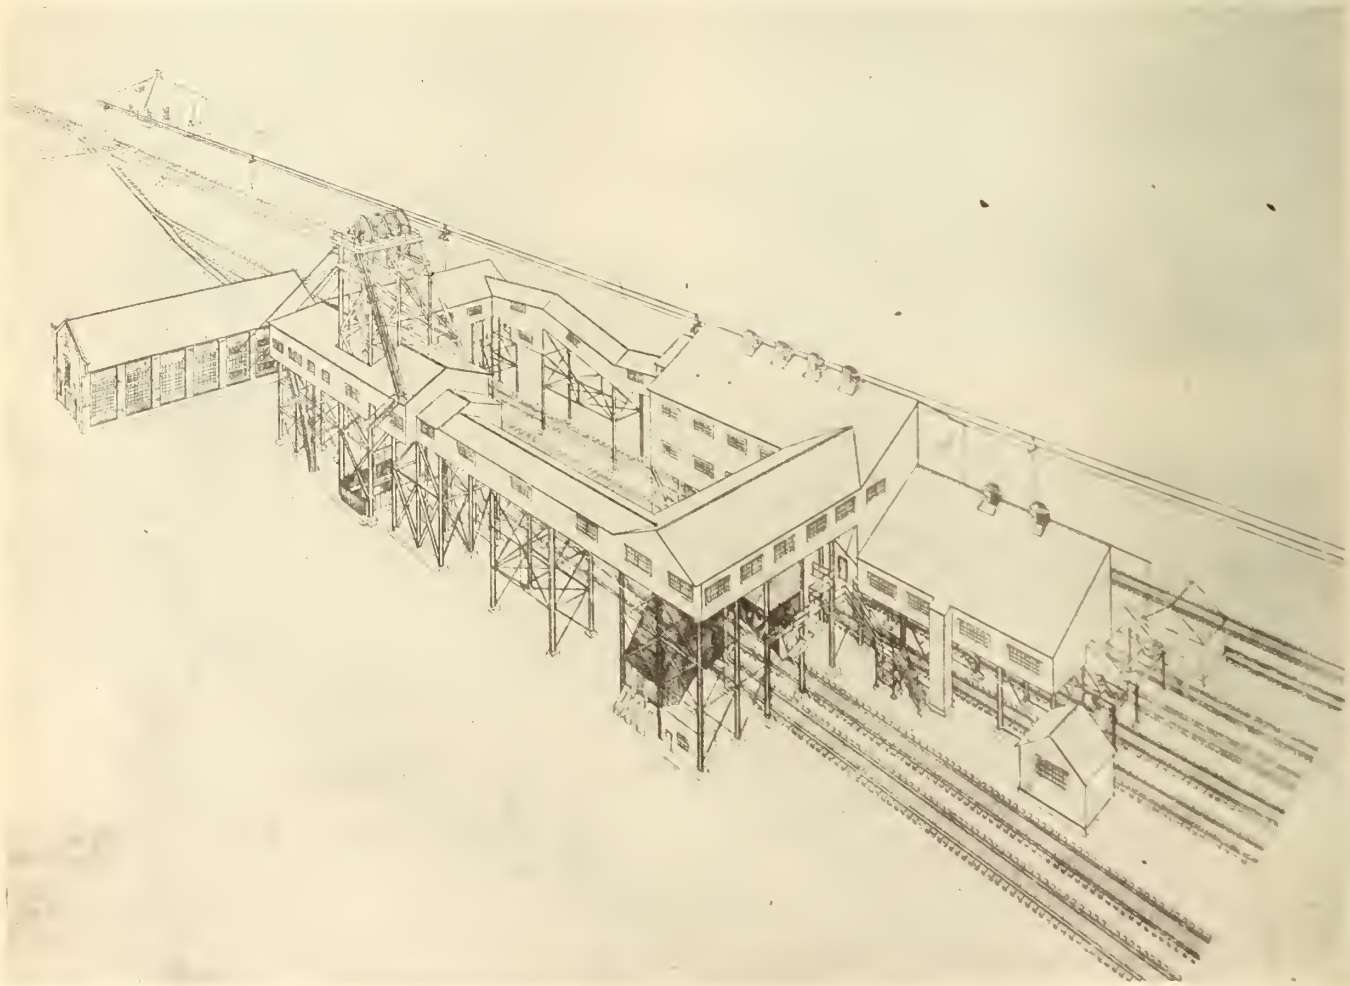
"It should be the duty of each and all of us, in every way as our opportunity offers, help, aid and assist in that future that it may be the most successful, that our province may occupy the high position we desire it should attain."

New Bankhead at Jubilee Colliery, Sydney Mines

Mr. A. Dawes, Divisional Engineer of the Nova Scotia Steel & Coal Company, presented a description, with a full set of plans, of the new coal-raising and screening arrangements at the Jubilee Colliery of the Nova Scotia Steel & Coal Company at Sydney Mines, now in course of construction.

The Jubilee Colliery operates on two seams of coal, respectively 560 and 740 ft. deep. The first bankhead was a temporary wooden structure, constructed of material largely picked up from other collieries. It was inconvenient in design and expensive in operation, and the growing output required a new bankhead of modern design.

The new layout consists of two electrically-operated hoisting engines, one for each seam; a structural-steel headframe, ninety feet high, a steel and concrete bankhead, with tipples and screening apparatus, and new surface buildings. The layout is designed to handle a daily output of 2,000 tons, but as not more than 1,000 tons daily is anticipated for some time, the construction being undertaken is designed for that output, and the other half of the layout will be added when the necessity arises. The expenditure presently undertaken



An Isometric Projection of the Pithead Arrangements at the Jubilee Shaft of the Nova Scotia Steel & Coal Co., Sydney in process of erection at this date.

is expected to reach $38,000. The new construction is proceeding concurrently with the operation of the old arrangements, and when the new work is completed the necessary turn-over will be made at a week-end. A saving of twenty workmen is anticipated, and a net saving of thirty-five percent on a daily output of 1,000 tons is expected to be shown, as compared with present costs of handling and preparing coal for market and other uses.

Coal Hoists: Two single-geared Vulcan hoists, driven by Westinghouse A. C. motors of wound-rotor type, working from a 2,200 volt, three-phase, 60-cycle current. Motors are respectively 550 h.p. and 350 h.p. for lower and upper seams. Gears are machine-cut, herringbone, working in oil-bath. Drums are cylindro-conical, with small diameter of seven feet and large diameter of ten feet. Automatic braking is provided by an auxiliary air-engine to guard against overwind, overspeed or power failure. Hoists will be housed in a brick building 97 ft. 6 ins. by 39 feet.

Structural-Steel Headframe. This structure will have front stays, departing in this regard from the usual type of back stays, this being decided by local conditions. Total height of headframe to centre-line of pulleys is 90 ft. and estimated weight of steelwork in headframe and bankhead is 460 tons. Structural steel is being fabricated by the Canadian Bridge Company.

Screening Arrangements. Full cars run by gravity and are automatically dumped into weigh-tanks. Empty tubs continue by gravity until picked up by a creeper conveyor which raises them to a height sufficient to allow them to return by gravity to the cages for sending back into the mine. Platform cages and skip-hoisting devices have not been considered for this mine. Screening arrangements are those usual in the Sydney field, and special care has been taken to avoid breakage of the coal, and for the loading of box-cars, railway business forming a large part of the outlet for Jubilee seam coal. Ottumwa conveyor-belt box-car loaders are being used.

Bankhead floors are of concrete, over triangular-mesh reinforcement. The whole structure is roofed in from the weather, protection from the elements being necessary in the exposed position of the Sydney Mines plants—which overlook the Atlantic—and adequate provision for lighting and removal of the coal-dust is provided. The structure is intended to be fireproof, and in designing it, the Company's engineers have endeavoured to build a structure that will not be unsightly.

The reader of the paper and the Nova Scotia Steel & Coal Company were thanked for presentation of the information to the Society, and congratulated on the permanent nature of the new surface arrangements at Jubilee Colliery.

A Mine Fire at Springhill.

Mr. John C. Nicholson, District Superintendant of the Dominion Coal Company for the Waterford District, and formerly Manager at Springhill Mines, read a paper describing the fighting and extinction of a mine fire at Springhill in 1916.

This fire broke out on November 26th, 1916 in the pipe-slope of No. 3 Mine at Springhill, at a point 1,050 feet from the mine mouth. This slope contained an eight-inch steam line running from the boilers on the surface to a mine pump at the 3,200 ft. level. The temperature of this slope was very high, and all the timber and coal dust was dried out by the radiated heat from the steam line. After ineffectual attempts to extinguish the fire with water from a two-inch line led from the surface, continuing over three days, it was found necessary to seal the mine, an operation shortly followed by a slight explosion that blew out the stoppings, sealed with clay were put in, and pipe led through each stopping to enable air-samples to be taken for analysis. Mr. Nicholson quoted a great number of analysis results showing the process of the extinction of the fire by accumulation of the products of combustion and the formation of an atmosphere incapable of supporting combustion. The "Journal" hopes to be permitted to reproduce Mr. Nicholson's paper in full at a later date, giving the progressive analyses, which illustrate how exactly the conditions in the fire area can be deduced from the percentages of oxygen and monoxide.

The operation of reopening and recovering the mine was accomplished by stages and by the building of stoppings in advance by men wearing smoke helmets (not oxygen breathing-apparatus). Oxygen apparatus were impossible because of the extraordinary heat, which reached at times 160 degrees, and the tarry products of coal distillation fouled the apparatus in a remarkable manner. Smoke helmets, with hose leading to cool air, enabled men to stand up to the onerous conditions of building the stoppings. A typical analysis, indicating the possibility of opening a stopping is as follows:

Co_2	7.0%
O	0.7%
Co	—
CH_4	11.9%

Mr. Nicholson called the attention of the members to the valuable assistance of systematic air-analysis, which he believed had not received the attention its usefulness deserves.

The genesis of this fire was doubtless in the heated condition of the pipe-slope, originating in the steam line. A turbo-compressor unit has since been installed at Springhill, and compressed air is used to operate the pumps, so that it is unlikely these conditions will recur.

Mr. Nicholson's paper is a readable, clear, and workmanlike account of the extinction of a mine fire, under difficult conditions, and he was heartily congratulated on making such a valuable contribution to the Society's transactions.

Opening of the Birch Grove Area, Cape Breton.

Mr. Robert Simpson, Manager of the Dominion Coal Company's No. 21 Colliery, presented a paper describing the opening of this district. The Dominion Iron & Steel Company purchased the areas of the Cumberland Coal & Railway Company in the Birch Grove area during the litigation between the Coal and Steel companies previous to the formation of the Dominion Steel Corporation, and the area was first opened up by Mr. D. H. MacDougall, now President of the Nova Scotia Steel Company, and later, the area came under the control of the Dominion Coal Company as a subsidiary to the Corporation.

The Birch Grove area consists of a narrow tongue of coal running inland from the sea at Morien Bay, having a dip of 30 degrees on the northern side of the synclinal basin, flattening out for 300 ft. in the trough, and rising gradually at about one in ten to the southern outcrop. From crop to crop at the point where the Birch Grove collieries are situated is only 2,500 ft. The seam is from 5 ft. 9 ins. to 6 feet thick. The shafts, Nos. 21 and 22, are slope openings. All the colliery operations are as far as possible electrically driven. The mines have always been operated reasonably cheaply, and the plant was designed with regard to the comparatively short life which the mines will have, because of

the limited reserve of coal at this point. Mr. Simpson's paper described the equipment and method of mining in full detail.

Visit to Halifax Shipyards.

The afternoon of Tuesday was spent in a visit to the plant of the Halifax Shipyards. The visitors were shown over the works, and afterwards entertained by Mr. J. E. McLurg the General Manager. About 1,230 men are at the present time employed at the Shipyards, and two 10,500-ton freighters for the Canadian Government Mercantile Marine are in process of building. One, the "Canadian Cruiser" will be launched in June, and the other, the "Canadian Contractor" about September next. A rather interesting feature, in connection with the British Empire Steel Corporation, and in view of the fact that the majority of the visitors were members of the staffs of the companies included in the merger proposal, was the presence, undergoing repairs, of a number of the freighters of the Dominion Steel Corporation, and two locomotives from Sydney Plant undergoing rebuilding. The ship-plates in use were also rolled at Sydney. The opinion was expressed by the visitors, in their thanks to Mr. McLurg, that while shipbuilding in Canada was passing through a period of hard testing, the Halifax Shipyards, because of its excellent site, geographical location, and its corporate connections, and its proximity to centres of artisan population, possessed more of the necessary elements of permanence than most of the shipbuilding enterprises in Canada.

In the course of the remarks referred to, the President of the Mining Society, Mr. George D. MacDougall, referred to the excellent work being accomplished in Nova Scotia by the co-operation of the Workmen's Compensation Board with the Nova Scotia Accident Prevention Association, and mentioned that Mr. McLurg was his successor as President of that Association, and congratulated him upon the evidences of solicitude for the safety of workmen to be seen upon the plant.

The Annual Dinner.

About seventy-five members and guests of the Society attended the Annual Dinner on Tuesday evening. The Lieutenant-Governor of Nova Scotia, Hon. McCallum Grant was present, with Hon. E. H. Armstrong, the Minister of Public Works and Mines; and the President-elect was in the Chair. The Secretary of the C. I. M. & M., Mr. Mackenzie, responded to a toast to the Institute. Mr. Armstrong referred to the close connection that has always existed between the Mining Society and the Mines Department. Hon. Robert Drummond, the veteran editor of the "Maritime Mining Record" received an ovation when he rose to speak.

MORNING SESSION OF THE 6th.

At the opening of the Wednesday meeting, Hon. Robt. Drummond, of Stellarton, said that the continuity of the Society's Transactions had apparently been broken by affiliation with the Institute, but is was explained that these were included in the annual volume of the Institute, not yet published for 1920. Therefore, save such papers as had been published in the "Bulletin", the papers read at the Glace Bay meeting in May 1920 had not yet been printed for distribution. Mr. Drummond thought the "Bulletin" could not possibly publish the papers presented before the Society, except by spreading their appearance over many months, and he deplored also the lack of full publication of the discussions upon papers that had previously been available when the Society had its own volume. Mr. T. J. Brown mentioned that at a previous date when the Mining Society had been merged with the Institute the question of inadequate publication of the papers and discussions of the Mining Society had led to reversion to separate organizations and he believed that the Mining Society would always desire to have an available record of its

The Graving Dock, Halifax Shipyard, Ltd.

own proceedings. Mr. F. W. Gray, as a member of the committee that recommended the terms of affiliation, stated that the question of publication was very clearly dealt with in the record, and mentioned that the Publication Committee of the Institute was at present considering how best to deal with the ever-growing number of valuable papers that are presented to the Institute and its branches. Mr. G. C. Mackenzie said that the Council would be glad to deal quickly, and as desired, with any recommendations on publication submitted by the Council of the Mining Society.

Longwall Mining at Jubilee Colliery, Sydney Mines.

Mr. John Murphy, Manager of the Jubilee Colliery of the Nova Scotia Steel & Coal Company, described the longwall method adopted for the mining of the lower Jubilee seam, which varied in thickness from two feet to four feet six inches, with sandstone roof and fairly hard bottom. Gateways were centred thirty feet, side pack walls being built from 4 ft. to 6 ft. wide, on either side of an 8 ft. gateway, which is brushed to give an average height of 6 ft. Thirty feet of face is given to each miner. Leading headways were driven with a Sullivan "shortwall" machine, places being 20 ft. wide with 50 ft. pillars intervening.

Undercutting on the longwall faces is done with a Sullivan bar machine electrically driven, undercutting 4 ft. 6 ins., which in this mine has been known to cut 120 ft. of face in nine hours. Horse haulage is now used, but later, when operations are more extended storage-battery locomotives will be used, both for gathering and for main haulage purposes. Haulages of this kind have proved very successful in the upper seam at the Jubilee shaft. Ventilation is easily effected, as packwalls are very tight.

No gas has been noticed in the mine since the longwall method was adopted, although it was present before. Freedom from gas is attributed to the well-directed and sweeping character of a ventilating current proceeding along the longwall faces.

Questions which were debated following the reading of Mr. Murphy's paper dealt with the relative merits of longwall when compared with the pillar-and-room system of extraction that has been so closely adhered to in mining in Nova Scotia collieries. Mr. Murphy believed there was no reason to fear additional difficulties with ventilation in longwall workings that had been a long time in operation, and, generally speaking, there was less loss of air and lower water-gauges in longwall mines than in pillar-and-room workings, especially where the pillars were left standing. Mr. J. C. Nicholson referred to the excellent results obtained by longwall mining in superimposed thin seams in the Joggins Field. F. W. Gray believed that general adoption of longwall method would be necessary to enable extraction of the superimposed submarine coal seams in Cape Breton. The room-and-pillar method, whether pillar drawing followed quickly upon the first working or not, tended to disturb strata to a greater degree than the longwall method. A very successful longwall operation had for years been carried on by the Dominion Coal Company in its No. 10 Emery mine, but a modified system of longwall had proved unsuccessful, and eventually pillar and room had been reverted to in a 4 ft. 6 ins. seam. Longwall, if adopted in all should

T. J. Brown, North Sydney.

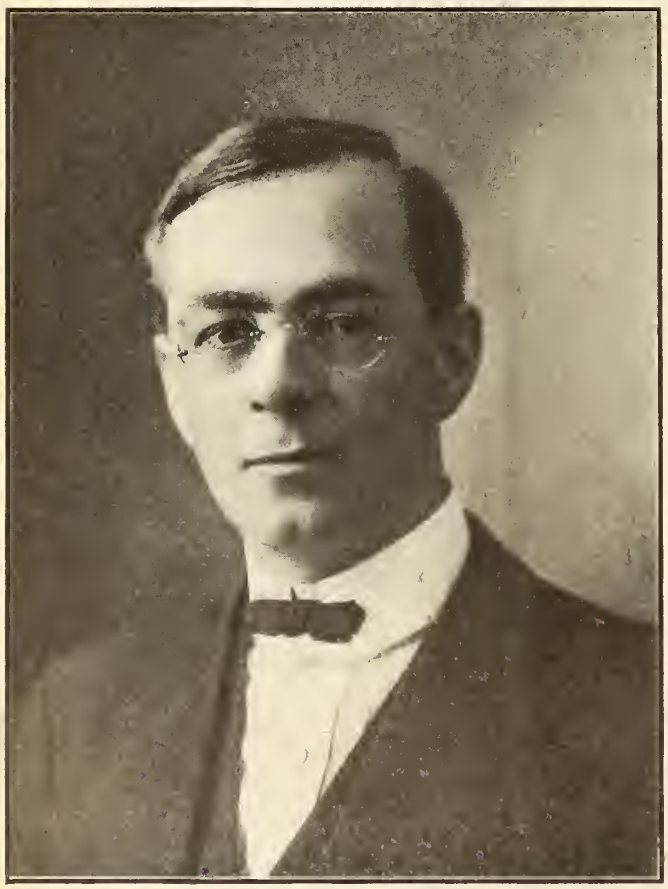
Alex. Macdonald, Glace Bay

be really and truly longwall, and not a mixture of two systems of extraction. Mr. T. J. Brown distinguished between subsidence and disturbance. He believed longwall allowed for equal subsidence, thereby avoiding distnrbance.

Conservation of Compressed Air.

Mr. J. P. Cotter, the Cape Breton representative of the Canadian Ingersoll-Rand Company read a paper on conservation of compressed air, which urged elimination of friction by making air-lines of proper size, and emphasised the necessity of avoiding preventable air-losses by metering the pressnres and carrying out systematic tests to detect leaks. He strongly recommended the use of after-coolers to ensure dry air, avoid water-hammer and the other numerous troubles that are associated with compressed air that is not dry and cool.

Mr. G. C. Mackenzie instanced a case that came under his observation where an insufficiency of air-pressure for power-hammers in a steel plant had been entirely remedied by increasing the size of the air-line. It was suggested that large-sized air-lines were very expensive, and it was fnrther suggested that where air-transmission was required over long distances underground it would tend to be superseded by electricity. Mr. Cotter replied that air-losses were also expensive, and he mentioned a compressed air-line in Europe, operated from a Taylor water-fall compressor, that conveyed compressed-air for 140 miles, with only an 18 lb. drop, in pressure due to transmission for that distance. Mr. Alex. MacDonald said the Dominion Coal Company had appointed inspectors of air-lines, and found that careful watching of the air-lines gave profitable results. He said one difficulty was to get a suitable valve for the machine connection. Mr. W. H. Graham, Construction Engineer of the Dominion Steel Corporation said skimped installations spelled decreased initial costs, but also expensive operating conditions, and small airlines were poor practice. Mr. Hiram Donkin said Mr. Cotter pointed out very succintly the necessity for eliminating friction in transmssion of compressed air, which he considered a self-evident requirement for economy and efficiency.



Prof. F. J. Sexton, Halifax.

Saving the Productive Power of Industrial Cripples by Vocational Training.

Prof. F. J. Sexton, whose work in connection with the vocational training work of the Department of Soldiers' Civil Re-establishment, has gained him a sympathetic hearing wherever he goes, contrasted the waste of war and of industry. The Canadian Expeditionary Force had suffered 55,000 deaths, and 250,000 casualties, out of a total force of 500,000 men. In the same number of years the industrial fatalities in Canada were 20,000 and the casnalties were 250,000. He pointed out that injured men lose their self-confidence and nerve, and gradually lose heart and descend in the scale of employment. He paralleled the arguments for the rehabitation of disabled soldiers with that of the disabled artisan. He explained how the science of occupational therapeutics had helped the soldiers in hospitals. A period of vocational training, averaging about eight months, has usually served to fit a disabled

Harry M. Wylde, Halifax.

soldier for a chosen occupation. By the co-operation of employers (which Prof. Sexton said had been cheerfully granted in Nova Scotia) disabled men had been trained for over 300 separate occupations at an average cost of $1,000. Thirty thousand had successfully completed courses, and three-quarters of them had held their places. The Department of Soldiers Civil Re-establishment was being rapidly demolished. It included many trained instructors, and he suggested that a nucleus from this organization should be retained for industrial vocational re-training. With regard to cost, the matter was partly national and partly of provincial concern, and also a matter of corporate industrial concern. The United States Government had already given a grant for vocational training of industrial cripples, stipulating that the individual states should spend dollar for dollar with the Federal Government. Over half of the states in the Union were co-operating with the authorities at Washington in this regard. If the Workmen's Compensation Boards were permitted by changes in the respective provincial acts they could usefully spend money in the vocational training that would result in great eventual saving, and in taking men entirely off the compensation funds in time. The Dominion Government had already set a precedent by assisting the provincial governments in technical education, and they might well include the vocational training of the cripples of industry.

William Donkin, Deputy Commissioner of Mines, Nova Scotia.

WEDNESDAY AFTERNOON SESSION.

Mr. Alex. S. McNeill, Superintendent of Mines of the Nova Scotia Steel & Coal Company, read "Notes on Mining Coal in the Submarine Areas at the Princess Colliery." Mr. McNeill said he had started out to prepare a paper on "Deep Undersea Mining, some of its problems and difficulties," but had found the subject was too large to prepare a paper upon in the time at his disposal, and he had been hindered by illness. Mr. McNeill's paper reviewed the history of the Princess Mine, probably the oldest operating mine in North America. The present shaft was sunk in 1868, and took until 1876 to complete, being at that time the most considerable engineering feat in coal-mining on this side the Atlantic. It is hoped, at a later date to publish Mr. McNeill's paper in full, but it may be stated that it detailed conditions of coal-mining that are unique. The roof in the Princess Mine is not good, and the floor consists of a plastic clay that weathers and flows or squeezes upwards to the roof in the room spaces intervening between the pillars, "seemingly with almost any proportion of pillar to room where the cover is 1,000 ft. or over." "To take this heaving bottom up" said Mr.

P. T. Henderson, Glace Bay.

McNeill, "accelerates its movement, and there are places filled by this upheaval from top to bottom. On the whole it is best not to touch it, but to gain any required height by brushing the roof."

The main haulage at Princess Mine is a perfectly straight road, 10 feet wide by 6 feet high inside the timbering, and extending 12,000 feet from the pit bottom to a point further out under the sea than any other submarine operation in Cape Breton. The cover is about 1,100 ft. at the face of this deep. At present, the coal is hauled from the new deep by plain rope haulage, operating a trip of 40 boxes, to a point about 9,400 ft. from the pit bottom. The coal is brought from the lower levels to this point a further distance of 3,000 ft by an auxiliary plain rope, fan-driven haulage.

"It is interesting to note that a plain-rope haulage is capable of operating over a distance of 9,400 ft. under a condition of 8,000 feet of eight percent grade and 1,400 ft. of six and a half percent grade, the road being straight. The writer thinks that this distance may serve as a example of the "ultimate" that may be accomplished by this system of haulage for similar conditions, and from this, possible conclusions may be drawn by any who contemplate plain-rope on haulage ways having a similar pitch. In other words, the best that could be done with a plain-rope haulage in this case was to get 40 empty pit-tubs weighing 1,000 lbs. each, to drag a one inch rope a distance of 9,400 feet." Due attention was paid to keep the rope from dragging by providing very wide rollers spaced every 50 feet. A motor-driven haulage, with engine installed at the head of the deep, is proposed for this deep.

The ventilation problem at the Princess is complicated by leakage and short-circuiting of air through fallen workings, in process of crushing at many points, rendering the keeping of tight stoppings very difficult. Mr. McNeill forecasted the necessity to supplement the ventilation of this mine by installing "booster" fans underground, in addition to the surface installation.

An attempt is to be made in No. 10 District South to take out the pillars almost simultaneously with the advance of the rooms. Levels are to be spaced 600 feet apart, headways carried up every 200 feet, rooms 16 ft. wide with pillars 30 ft. wide. Experience in pillar drawing indicated that in this mine, where the cover exceeded 1,000 feet, "some method must be adopted whereby pillars can be removed simultaneously with the advance of the workings."

Mr. McNeill's paper was properly regarded as an important communication, and the discussion that followed was taken part in by men who realised how much of the future of the submarine mining in Cape Breton depended on the improvements in practice that may arise from the pioneer operations of the oldest and most extended undersea mining operation in Nova Scotia.

Mr. J. C. Nicholson stated that coal had been mined at Springhill Mines under a cover of 2,500 ft. with the seam pitching 22 degrees, probably the greatest cover, accompanied by the heaviest pitch, of any mine in Nova Scotia, and only exceeded in Canada by conditions at Fernie. The conditions at Princess Colliery seemed to be abnormal, and associated with the heaving soft bottom, and not quite what might be expected from considerations of cover alone. He advocated retreating pillar-and-room system. At Springhill a system of retreating balances, with the drawing face of the pillars extending obliquely and completely across all the balances (self-acting inclines in rising headways) and the levels, had worked very successfully under the onerous conditions of pitch and weight of cover mentioned.

In answer to a question it was stated that the water-gauge at Princess was 4½ inches. Loss by leakage was fifty percent. Fan had a capacity of 250,000 c. ft. per min. but did not operate at full capacity.

Mr. Alex. MacDonald thought the great difficulty to be apprehended at Princess was that of ventiliation. He forecasted greater use of electricity in auxiliary haulage, fans and pumps.

Mr. John Murphy thought that if the longwall system was applicable to the conditions at Princess, the sticky bottom would make a very tight seal, and that under longwall conditions the ventilation problem would be simplified.

Hon. Robert Drummond mentioned his visit to Scotland recently where he had seen a mine that was working coal under the Firth of Forth. The "take" of collieries operating on either side of the Firth was 7½ miles, the Firth being 15 miles wide. Coal was being mined on a system of longwall advancing, with barriers, to protect the slopes, eighty feet wide. Asked what was the chief trouble facing the management he was told it was to get the men to and from their work. No fears were expressed regarding ventilation. Had not paid any dividend since the mine was opened, and did not expect to pay any dividend for fifteen years, but were laying out the mine for operations for one hundred years. Mr. Drummond suggested that two men from Nova Scotia should be sent over to see this particular operation.

F. W. Gray said depth of cover at Princess was not great, as there were many instances of coal being mined at much deeper covers without serious hindrance from weight of strata, nor were conditions at depths approaching or exceeding 1,000 feet in the neighbouring collieries in the Sydney field, found to be so onerous as at Princess. The conditions were evidently abnormal and presumably local, and could not be taken as an accurate criterion on which to base opinions regarding the recovery of the remaining submarine coal in the Sydney district. This presumably extended beyond the limit of mining, or at least, the balance of probabilities pointed to this conclusion. The use of roller-bearing axles for such a haulage as Princess suggested itself. The problem of the submarine coalfield, apart from the peculiarities of the Princess conditions, was that of transmission of power for long distances underground; and a much greater use of electricity underground, and some revision of ideas regarding the admissibility of electric appliances, and their statutary regulation seemed likely to be required. Thought that Mr. McNeill was modest when he stated that his paper was a recital of ordinary practice. It was very distinctly an account of extraordinary difficulties, unique in fact, and he considered the Scotia management were to be thanked for disclosing the extraction conditions of this mine, and inviting a discussion which might well be helpful. Mr. McNeill's statement that some method must be adopted whereby pillars can be removed simultaneously with the advance of the workings was in effect a description of the ideal extraction sought by a longwall system, and it was further suggested that the ventilation problem was a result of extensive pillar-and-room operations in which withdrawal of the pillars had been found impracticable.

Mr. McNeill said one difficulty in regard to longwall —even should it be found adaptable to conditions at Princess, and this was difficult because of the nature of the roof and the lack of packing material—was that a longwall face must be kept continually moving in order to prevent it from roof-falls, and continuous operation in some states of trade was difficult to arrange. Mr. Murphy suggested the trial of stepped longwall-faces. Mr. D. H. McLean, the Manager of the Princess Colliery gave further intimate details of the behavior of the roof and floor.

Central-Station Power for Colliery Operations.

Mr. Carl H. Marsh, Chief Engineer of the Dominion Steel Corporation, read a paper on "Central-Station Power for Colliery Operations." Mr. Marsh recited the difficulties attending coal-mining in Nova Scotia that made fuel economy and moderately-priced power a more urgent necessity than in mining districts with

easier physical conditions. The power requirements for mining purposes in Nova Scotia outweighed all other uses, and the increased economies possible with electric power, when compared with other prime movers, indicated that capital would earn most excellent returns in central power-stations for colliery operations. Such plants could be designed to use inferior grades of fuel, indeed some poor-quality seams might be operated entirely for power-plant consumption. With a number of electrically-operated collieries under one management, it is usually possible to arrange for fairly constant power demands throughout the 24 hours, especially where heavy pumping can be accomplished on the afternoon and night shifts.

Assuming annual station-output to average 60 per cent of rated capacity, operating costs, with coal at four dollars per ton delivered, would be about one cent per k. w. hour. Adding fixed charges, the cost would be about two cents. In times of slack demand, necessitating operating for a small current delivery, the cost would probably reach 2¼ cents per k. w. hour at the powerhouse, or about 2¼ cents per electrical horsepower delivered to the collieries through transformers, transmission lines and a distributing system. Construction of central power-stations larger than really necessary was to be guarded against, and with present high construction costs, colliery operators cannot usually expect inefficient but serviceable steam equipment to be replaced by new expensive and more economical electrical equipment until such time as the steam equipment becomes inadequate or inoperative.

Interconnected power-plants, as for example, in a district where collieries and steel plants are centred, are plainly advisable. That coal operators might advantageously sell power rather than coal was suggested as a matter worth consideration.

The President mentioned that as no part of Nova Scotia was further than thirty miles from the sea the question of condensation water was not difficult. He referred to the development of provincial water-powers as at St. Margaret's Bay and Sheet Harbour, and the possibility of the electrification of the Canadian National Railways; a matter that had been dealt with in a previous communication to the Society by Mr. Vincent McFadden. The hydro-electric power was not a competitor of coal-raised power. The province needed them both.

Mr. C. H. Wright, of the General Electric Company, said a scheme for electrification of the Canadian National Railways in Nova Scotia was already worked out, and it proposed one of the largest power stations near the Springhill Mines. Power stations should be interconnectable, and odd frequencies were to be strongly condemned. A standard of 60 cycle frequency was desirable, and was rapidly being adopted in the United States.

Hon. Robert Drummond mentioned the heavy fuel expenditure required for the haulage and pumping at the Inverness Collieries, and the operation of the railroad, and suggested that utilization of the Lake Ainslie waterpower would assist in helping the Inverness coal industry to survive, and would make it possible to open up the inland areas at Ste. Rose.

The general question of non-explosion motors and guarded switch gear was discussed, and it was stated that European practice in this regard was further advanced in adapting electricity to safe use in coal mines than it was on this side.

Relation of Mechanical Loaders to the Mining Industry.

Mr. Hugh B. Gillis, Superintendent of Mines and Quarries of the Dominion Iron & Steel Company, presented a paper describing the use of mechanical loaders at the iron-ore mines at Wabana, and discussing the possibility of adapting these devices to colliery requirements in Nova Scotia, which will be published in a later issue of the "Journal." As Mr. Gillis was unable to be present, his paper, and one by Mr. Angus W. MacDonald of Sydney were not discussed. Mr. Macdonald's paper was presented at the March Meeting of the Canadian Institute of Mining and Metallurgy in Montreal, and was noted in the issue of the "Journal" of March 11th (see page 191). The subject was the welfare work of the Dominion Steel Corporation.

Owing to the pressure of papers the Society was unable to take advantage of an invitation from the Imperial Oil Company to visit its refining plant on the other side of Halifax Harbour at Imperoyal. It is understood that the visit would have been fully worth while, but, as will be noted from the foregoing account, the Society had a long list of valuable papers to hear, and they wished to give them adequate discussion.

A notable feature of the meeting was the number of operating executives who attended the meeting and read papers bearing directly on their everyday experience. The discussions were taken part in by men whose business it was to solve the problems that were selected for review, and it would be difficult to find a gathering of men that could with more accuracy describe themselves as a technical society of miners. So far as "professional qualifications" are concerned the membership of the Mining Society of Nova Scotia cannot be impugned.

A partial list of those present at the meeting follows:

Geo. D. MacDougall, General Supt., N. S. S. & C. Co.

C. M. Odell, Engineer, Dominion Coal Company.

Alex. S. McNeill, Supt. of Mines, N. S. S. & Coal Co.

W. H. Graham, Supt. Construction, Dominion Iron & Steel Co.

T. J. Brown, Consulting Mining Engineer, North Sydney.

Neil Nicholson, Deputy Inspector of Mines, North Sydney.

G. A. McHattie, Asst. Engineer, Acadia Coal Co.

D. H. McLean, Manager, Princess Colliery.

W. Campbell, Supt. of Open Hearths, N. S. S. & C. Co.

Archie Ferguson, Inspector, N. S. S. & Co. Co.

Alex. MacDonald, District Supt. Mines, Dominion Coal Co.

E. G. Mackay, Supt. Iron & Steel Dept. Sydney Mines

P. T. Prendergast, District Supt. Mines, Dominion Coal Co.

J. P. McNeill, Manager, Florence Colliery, Sydney Mines.

John Murphy, Manager, Jubilee Colliery, Sydney Mines.

Thos. H. Hartigan, President Indian Cove Coal Co.

J. C. Nicholson, District Supt. Mines, Dominion Coal Co.

Professor F. J. Sexton, Halifax

Isaac Greenwell, ex-Manager, N. S. S. & Co. Co. Sydney

D. H. MacDougall, President, N. S. S. & C. Co.

Hon. Robert Drummond, M.L.A., Editor "Mining Record"

A. R. Chambers, Mining Engineer, N. S. S. & C. Co.

H. M. Wylde, Canadian Explosives Co., Halifax

(Continued on page 308)

SALE OF SHARES ACT, MANITOBA.

Commissioner has Power to Protect Public Against Fraudulent Promotions.

By REECE H. HAGUE, The Pas, Man.

It is astonishing how many reliable mining men, when questioned regarding their attitude towards wild-catting, remark:—"Let them go to it. Every mine is a wild cat until it is proved up, and it was wild-catting that has made many of Canada's greatest producing mines what they are today."

A certain amount of wild-catting is unavoidable in opening up new mining districts, it is true, but there is a vast difference between the optimism of the prospector, who invariably exaggerates his find, and the deliberate misrepresentation of conditions existing on a property for purposes of stock promotion.

It is optimism which imbues the prospector with the spirit enabling him to carry on and overcome almost insurmountable difficulties. Without optimistic prospectors Canada would never have produced a mine.

On the other hand it is the pessimism of the mining engineer which is responsible for protecting the large interests and the general public against the deep laid schemes of the professional mine-promoter.

The gullibility of the public is universally recognized and although it is impossible to protect them altogether, it is the duty, not only of the government, but of legitimate mining men, to offer what protection lays in their power.

That there is a sucker born every two minutes, as is so often maintained, seems to be born out by experience and notwithstanding the frequent warnings given the public, every get-rich-quick scheme ropes in a few more of the sucker fraternity, who listen open-mouthed to every proposition for making a million on a shoe string and fall invariably.

Even the most stringent laws for the protection of the public and the discomfiture of the men who prey upon their gullibility, afford loopholes, and it is probable that a great time will elapse before any scheme offering complete protection to those members of the community who fall an easy mark to the "assurance of great gain" type of advertisements will be evolved.

Certain of the provinces have enacted legislation of a protective nature for would-be investors in questionable mining stocks. During the past year several mining companies were refused permission to offer stock for sale in the province of Saskatchewan, including the Pan Extension, to which reference was made in an editorial in this journal recently.

In March 1920 various amendments were made to the Sales of Shares Act of Manitoba. These amendments provided that any company formed within the province must apply for and obtain a special certificate allowing for the sale of its shares, stocks and bonds or securities other than development shares, upon filing proof with the Public Utilities Commissioner that development work referred to in this section, and so far carried out, has demonstrated that there is a reasonable prospect of a return on the investment to the purchaser of such shares, stocks and bonds or securities.

Before such special certificate is granted the Commissioner shall require a prospectus of the company to be filed with him, setting forth the amount paid for the property in cash or stock, the amount of vendor or treasury stock, the names of the directors of the company and a description of the property, with such reports as are available. All advertising must conform to the facts set forth in the prospectus and must specify that the prospector is on file for reference at the office of the Commissioner.

In the event of mining companies failing to comply with the regulations as set forth it rests with the Commissioner to take steps to bring them to book. Legal authorities state that the Commissioner's powers extend to advertising done in other provinces by companies granted their charter in Manitoba.

While it is natural that many companies will sail close to the wind it is the duty of the government to see that these laws are complied with and to make an example of any companies which ignore them.

Having vested themselves with these powers the government should handle them wisely. Untold harm to a district can be done by indiscriminate advertising on the part of stock promoters, and it is in the interests, not only of the public, but of the mining profession, that further legislation of a protective type should be evolved and strictly adhered to.

One of the most reprehensible practises carried on largely by certain stock promotion companies is to extract one portion of a competent mining engineer's report and display it in their advertisements, absolutely ignoring preceding or succeeding paragraphs which might convey an entirely different impression. If a mining engineer's report is quoted in advertisements it should be quoted fully, and accurately or not at all. In the writer's it would not be going too far to make misrepresentation of a mining engineer's report a criminal offence.

NOTE.—If the Commissioner, as noted by our correspondent, has power to extend his inquisition of stock issues to representations made outside the Province of Manitoba, it would be very much in order to check up the literature of the Pan Extension Gold Mine. Our esteemed contemporay, the "Northern Miner" says "This is the Manitoba outfit that has been trying to lure servant-girl money out of Toronto by means of the most extravagant exaggerated advertising, assaying 2,000 pounds pure bunk to the ton." It is further pertinently remarked that advertising of the Pan Extension type will undermine the confidence of business men in the highly promising fields of Manitoba "faster than years of careful effort will build it up." A Winnipeg correspondent, for whose fairness and ability to form a judgment we can vouch, informs us that Manitoba is now the resort of "about all the sure-thing, confidence men from the U.S.A., who have sold more than forty millions of stock, face value, in unproven claims." Another friend of the "Journal" who is legitimately interested in the development of gold mines in the Rice Lake District, writes that "fabulous tales of wealth spread broadcast through the press by entirely wrong methods" are deterring capitalists from taking advantage of the many real opportunities that do exist in Northern Manitoba. If the Government of Manitoba does not protect the reputation of its potential mining areas against the horde of crooks that have foregathered there, a sad reckoning is coming to many people.—Ed.

Mr. A. W. Newberry has returned to New York. He arrived in Toronto a short time ago after being for some time in Nicaragua.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

From this date forward there is promise of an increase in activity in the mines of Cobalt, the turn for the better having become noticeable this week. In contrast to a gradual narrowing down in work, and reduction of staffs, there is now a tendency to add to the number of men, and the outlook is better than since near the beginning of the year.

Provided silver continues to command around 57 cents an ounce, plus from 10 to 12 p.c. premium on United States funds, the mines now in operation will continue to realize sufficient profit to encourage them to operate. These include the Nipissing, O'Brien, Coniagas, La Rose, Bailey, and Chambers-Ferland.

Among the closed-down properties which may be counted upon to be among the first to join the active list is the Mining Corporation. This company is making quite extensive alteration to its mill, and by the expenditure of about $20,000 will provide facilities to treat close to 300 tons daily as compared with 200 tons formerly. These alterations may be completed within the next four weeks, and at that time the company is expected to reach a decision as to whether work is to be immediately resumed, or held in abeyance pending a return to lower operating costs, or a higher price for silver. The question is a difficult one, and during the course of interview with a number of mine managers, your correspondent finds opinion swings strongly to the belief that the most economical policy is to keep these old mines in operation even though the cost of work is almost as great as the value produced. It is contended that the cost of re-opening old mines after a period of idleness is quite excessive and that the better plan is to mine the ore and produce the silver, even though it may for the time being amount to only really a conversion of treasury dollars into silver bullion. Provided the treasury may be sufficiently strong, the bullion may be held in storage, to be sold if possible at a point which may leave a margin of net profit.

At the Coniagas Mines, work is being carried on at full capacity. This enterprise represents one of the most remarkable achievements in the history of silver-mining in the Cobalt district. This mine, in spite of the poor market for silver, is being operated successfully on ore which contains an average of only eight ounces of silver to the ton. By most strict economy and the highest possible degree of efficiency, this company appears to be holding costs down to between $3.50 and $4 a ton, a record which is lower than any other in Northern Ontario with the possible exception of the Dome Mines at Porcupine. Were this company to endeavor to reduce the scope of its work, the per ton cost would automatically increase and perhaps lead to a shut-down. However, this point is fully recognized, as a consequence of which work is going ahead at full capacity and the adverse situation which has closed other mines has been successfully combatted at the Coniagas.

A strengthening in quotations for silver to around 75 cents an ounce would probably lead to such mines as the Temiskaming, Beaver and Kerr Lake resuming production.

A stabilizing influence in Cobalt has been the finding reached by the Board of Conciliation which recently took evidence here in connection with the wage reduction. All members of the Board, including the representative of the men, expressed the opinion that the mines were really obliged to make the cut, and this reduction of 15 p.c. was sanctioned unanimously, the lower rate to go into force at April 1st. This will reduce by from three to five cents an ounce the cost of producing silver. A note on the findings of the Board is contained elsewhere in this issue of the "Journal."

At the 410-ft. level of the Chambers Ferland mine good results continue, and a quite large amount of high-grade ore has been taken out. As stated officially some time ago, the silver content amounts to upwards of 5,000 ounces at times, while the wall-rock also contains good milling values. The ore occurs close to the boundary of the Nipissing.

A shipment of concentrates made from the Bailey during the past week was the most important shipment to date from this property since the consolidation of the Bailey-Cobalt and the Northern Customs into what is now known as the Bailey Silver Mines. This company is meeting with very promising results, and officials of the company express themselves as being well pleased wth the new management under Mr. G. C. Bateman.

The Peterson Lake Company has under consideration a scheme to raise additional finances with which to conduct work pending more favorable conditions for production.

South Lorrain District.

Pumping operations on the Keeley Silver Mines, preparatory to a general resumption of work on this property has caused renewed attention to be directed to that district. The only other property under operation is the Haileybury Frontier, where work is being done with the object of recovering cobalt metallics and cobalt oxide, with silver as a by-product.

There are a number of promising properties in this district, and should the Keeley achieve the success which its comparatively large amount of ore of a good grade would tend to indicate, it is considered quite reasonable to expect to see a number of other properties re-opened for exploration purposes.

Elk Lake and Gowganda.

Permission has been received to increase the authorized capital of the Silverado Mining Company to 3,000,000 shares of the par value of $1 each, as compared with 1,000,000 shares of $1 each. This company owns a large group of mining claims in the Gowganda district, some little distance south west from the Miller Lake section. A large number of veins have been opened up in which native silver occurs. It is planned to place the company in a position where a comprehensive scheme of exploration and development work may be carried out this summer.

Ore and Bullion Shipments.

During the week ended April 8th the O'Brien was the only mine to ship ore from Cobalt. This company sent out one car containing approximately 61,000 pounds of ore.

During the corresponding period, no bullion shipments were made, although the Nipissing is at date of writing sending out a large consignment made up of 76 bars weighing 99,881 ozs.

THE GOLD MINES

The Porcupine District

For the first time since the depression of gold mining by war conditions, the gold producers in Northern Canada are placed in a position to operate at full capacity. Great mining plants which were erected some years

ago, but which could not be operated because of shortage of men, high costs of operation and, more recently, a shortage of hydro-electric power; may now be worked at full capacity.

Mines in the Porcupine district alone are equipped to produce close to three tons of gold bullion every thirty days, and the work of speeding them up is already well under way at the leading mines, and is being planned at the smaller properties.

The Hollinger Consolidated has been taking on larger forces of men, and as a part of the plan to feed the mill at full capacity of an average of 3,200 tons daily, 30 additional mining machines have been placed on order. At this property, the engineering staff alone exceeds 30 members, while the clerical staff also ranges between 30 and 40. The number of underground workers when running at capacity will exceed 1,000 men. The present management has adopted a policy of establishing main haulage-levels at every 125 or 150 feet below the 425-ft. level, to prevent congestion where the main haulages lie to widely-separated intervals. Accordingly, haulages have been established at the 425, 550, 675, 800, 950, 1,100 1,250, 1,450 and 1,550 ft. levels. Heretofore, the 425 ft. and the 550 ft. have been the main haulage levels and the greater part of the $40,000,000 so far mined has been taken from the ore-bodies lying about these levels. Accordingly as required, however, main haulages will be installed at the lower levels above mentioned.

Within a very short time, the McIntyre-Porcupine will bring its mill up to full capacity of 600 tons daily. In the meantime, also, additional equipment is to be installed, while underground arrangements are being made to provide about 1,000 tons of ore daily when required. The result of work at the lower levels, and the decision to enlarge the mill, offers promise of the McIntyre running the Dome Mines a close race for the position of being the second largest gold-producer in Canada.

The Dome Mines is making preparations of great magnitude, although officials remain exceedingly reticent in regard to what may be expected. Considering the adverse conditions in the power situation during the past winter, the company closed a prosperous fiscal year on March 31st. Milling operations average only about half capacity, and at this rate the dividend of 10 p.c. was provided as well as adding to surplus. It will be about six weeks before the annual statement becomes available, however, and until that time the details of the past year's work will not be possible to secure. In view of the showing made as gathered from the more or less meagre details available, the Dome will establish an exceedingly favorable record with its mill running at full capacity.

At a special meeting of the stockholders of the Porcupine-Keora, a scheme was ratified whereby the company will sell two of its claims to a newly organized three million share company, of which the Porcupine-Keora will hold two million shares. The remaining million shares will remain in the treasury to be sold as a means of providing money for further work. The president of the company refused to issue a statement in regard to the values encountered in the long crosscut at the 250-ft. level, and some of the shareholders expressed open dissatisfaction over this attitude. The president, however, would not yield, and merely stated that further work would be required before a conclusive statement could be made.

Kirkland Lake District.

Good results are reported at the Teck-Hughes. Mill heads are stated to have been increasd to upwards of $11 a ton, while the coast of operation is being held down to under $8 a ton. In new orebodies recently developed, the gold content is said to be higher than the average heretofore encountered, and the future of the enterprise has taken on favorable aspects.

Albert Wende, general manager of the Wright-Hargreaves returned this week from Buffalo and will proceed immediately with the final arrangements to start up the newly-installed mill.

The shaft at the King-Kirkland has reached the 100-ft. level, and assay results have continued favorable to that depth. A mud-seam is present in the vein, and considerable importance is attached to this. Considerable water is flowing through the mud-seam at the first level and this has necessitated pumping operations.

Larder Lake District.

In connection with a petition recently presented to Premier-Drury by about forty of the stockholders of the Goldfields, Ltd., the following is a memorandum for Hon. H. Mills, Minister of Mines, from the Provincial Secretary, Mr. H. C. Nixon, under date of March 5th.

"You will recall forwarding me copy of petition received by you from the stockholders of the above company, praying for an investigation into the physical and financial affairs for reasons set forth.

Attention to this matter has been somewhat delayed by the fact that the Ontario Companies' Act does not provide for any method by which investigations into the physical and financial affairs of the company can be made except by virtue of section 126 which provides, that there must be a petition by one-fifth in value of the shareholders of the company.

I would suggest however, that the petitioners appoint a small committee and that this committee draw up a set of interrogations either with or without the help of the Department.

The Department can then demand that the company answer these interrogations."

The above is interpreted as an indication that the Ontario Government intends to offer assistance to minority stockholders in mining companies.

Boston Creek District.

A meeting of the shareholders of the Miller Independence Mines is being held for the purpose of deciding upon a scheme to further finance the work. The company still has about 100,000 shares in its treasury, but of the 56,000 shares sold during the past year or so at $3.80 net to the treasury, some of the purchasers have defaulted in payments, and the company has been temporarily embarrassed. For the time being, therefore, all work has been suspended at the mine, and will only be resumed following an adjustment of the present situation. In the statement sent out by the secretary of the company, the remark is made that conditions at the mine never before warranted operation to such an extent as at present. The suspension of work is temporary and purely due to finances.

FINDINGS OF THE CONCILIATION BOARD AT COBALT.

Messrs. John M. Godfrey, Robert A. Bryce, and A W. Roebuck, constituting the Board of Investigation and Conciliation appointed under the Industrial Disputes Act to adjudicate in a dispute between the employees at the silver mines at Cobalt and the mine

operators, have reported findings to the Minister of Labour under date of March 28th. Seven hundred workmen are stated to have been directly concerned. The dispute arose as the result of a notice sent out by the employers on January 8th, announcing a reduction in wages of 75 cents per day effective after the 15th February. The reason given for the reduction was that the decreased selling price of silver made it impossible to work the silver mines at a profit. The report and recommendation of the Board is as follows:

"Various conferences took place between the employers and the employees and a proposal was finally made by the employees that the reduction in wages should be distributed over a period of three months, at the rate of twenty-five cents per month. This proposal was refused by the employers and a Board of Conciliation was then requested by the employees and granted. In the meantime the proposed reduction had not been put into effect.

After hearing the statement of both parties to the dispute, it was proposed by the Board that a private conference should be held by the Board with representatives of the employers and the employees for the purpose of considering an amicable adjustment of the dispute. This conference took place on Wednesday the 25th of March.

During the course of the discussion it was proposed as a solution of the difficulty that the employers should continue paying wages at the present rate until April 1st, 1921, after which date, in view of the low price of silver, the reduction of seventy-five cents a day should become operative.

This proposal was accepted by both parties subject to it being confirmed on behalf of the employees at a mass meeting to be held in Cobalt on Sunday, March 27th, 1921.

This mass meeting of the employees was held on the 27th day of March, and was attended by about two hundred and fifty employees of the seven hundred affected. The meeting rejected the proposed settlement.

The Board regrets the rejection of the settlement which had been approved by the Committee representing the employees and which was the best which could be obtained in view of the present difficult situation.

The Board recommends that the reduction in wages of seventy five cents (75c) per day be deferred until the 1st of April, 1921."

The wage reduction became effective at April first, and no complaint has been heard. The unanimous finding of the Board discounts the influence of a small faction that strenuously opposed the reduction in face of all the unmistakable signs of depression in the silver market.

MONTREAL METAL QUOTATIONS.

COAL PRICES

Toronto, April 13. Production in the bituminous fields continues to go lower, the total, according to figures in possession of Toronto dealers, representing a reduction of fifty per cent as compared with December last. Continuation of this lessened production means that there must be a stronger market before business reconperates, and this depends upon the buyers. Smokeless is quoted at from $8.00 to $8.50 and lump at $7.50 to $8.50 according to quality. Toronto prices. Slack is $6.25 to $6.75, Toronto, Canadian funds. There is a fairly free movement of anthracite especially by the line companies, while the independents are having some difficulty in moving domestic supplies, especially steam sizes. It is complained that the household consumers are not co-operating with the retail dealers in putting in their winter supplies of coal, as a result of which the retail dealers are likely to have their yard stocks at capacity.

SUDBURY NOTES.

D. E. CUSHING.

From statements made by I. F. Hellmuth at the hearing in regard the M. J. O'Brien injunction against the refinancing plans of the British American Nickel Corporation, it would seem that much depends on the decision of Mr. Justice Middleton as to whether the injunction proceedings shall be made permanent or dissolved. In reserving his decision, the judge intimated that the interests should get together, and undoubtedly he is working to that end, for Mr. Hellmuth, as spokesman for the National Trust Co., trustees under a bond mortgage, made it quite plain that his clients were fearful of delay in reaching a settlement, and he was quite positive that a delay of one month would mean the wrecking of the Corporation.

The whole affair seems to size up as a battle of financiers, and this point was quite plainly brought out by the O'Brien interests in defending their injunction proceedings. They stated that the refinancing plan was really a move on the part of interested Norwegian capital to get a better security for their money. The Norwegian interests hold $10,000,000 debenture stock and the O'Brien counsel pointed out that at present there is not a sixpence of security for this.

The same interests are also the holders of most of the twenty millions of common stock. The contention set up was that the reorganization would give to certain Canadian security holders, a degraded security and at the same time place the unsecured Norwegian holdings on a parity. It was also contended that a claim of the Bank of Commerce, $2,000,000, which has no security on the assets of the company, was being put ahead of that of the plaintiffs.

In the meantime certain underground work is being undertaken at the property, starting on a small scale and to be increased steadily so that there must be those in the company who can see some daylight ahead.

The Bousquet Gold mine at Howery Creek is starting operations this week. The shaft has been sunk to the 300-ft level. It is intended to undertake lateral work at the 100-ft. level.

OBITUARY.

J. L. Englehart.

J. L. Englehart, late Chairman of the Temiskaming & Northern Ontario Railway Commission died, in his seventy-fourth year, at Toronto on the 6th April, and was interred at Petrolea.

Mr. Englehart became Chairman of the T. & N. O. Commission in 1905, and held the office for fifteen years. He has taken a leading part in the development of the oilfields of Ontario. He obtained the charter of the Imperial Oil Company in 1880, and is stated by Mr. Stillman, president of the Company, to have been the sole surviving member of the original incorporation who continued to occupy a seat on the board. "For many years past, however," Mr. Stillman states, "Mr. Englehart devoted his energies and his great abilities to objects of a public and philanthropic character." Mr. Englehart's benevolence had endeared him to very many. His name was given to the well-known divisional point on the T. & N. O. Ry., and few men have been more closely connected with the development of mining in Ontario, or have devoted more conscientious attention to public duties and private charity.

FUTILE PROSPECTING FOR COAL.

The Sudbury "Star" states that at Chelmsford, in an area twelve miles west of Sudbury, on the line of the Canadian Pacific Railway, diamond-drilling is proceeding in a search for coal. As the formation is Upper Huronian, the "Star" is not far wrong when it states that "from a geological standpoint the proposition is considered a joke". Mr. McVittie is stated to have carried drilling operations in a search for coal to a depth of 3,007 feet. If ever the rocks at Chelmsford included organic material capable of carbonization, this must have reached a stage of complete graphitization. Such occurrences in pockets are not inconceivable, but that any bedded coal-seams could exist in the neighborhood of Sudbury, is not conceivable to students of coal substance. The Editor of the "Journal" has been asked for advice on the advisability of searching and staking for coal in such unlikely neighbourhoods as Kingston, Ontario, and Swastika, Ontario. What's the matter with Alberta?

EARLY SPRING HELPS GOLD MINERS.

The warm weather last week made a big impression on the lakes and rivers that supply water to the power plants that drive the mining and milling machinery at the gold mines. The mine operators have been preparing for the event and hundreds of workmen are at hand ready to take part in the increasing of production. On Wednesday word was received that a full supply of power is now available and the people of Timmins knowing what that means, are preparing for a busy year. At the Hollinger the supply of power will now permit the production which was hoped for long ago; but which owing to shortage first of labor and then of power has until now been impossible. The Hollinger should in a few days be treating 3000 tons of ore per day. Increases not so great but also notable can be made in a short time at the Dome and McIntyre. Other properties in the Porcupine area will help to swell the production of gold this summer and the mines at Kirkland Lake will also make much larger production.

PERSONALS.

Mr. Robert J. Bell has resigned the position of general manager of the Maritime Coal & Railway Co. at Joggins Mines, and will take a short rest. Under Mr. Bell's direction the Maritime Company has successfully mined thin coal-seams under the sea by long-wall, using electric coal-cutters. There is not probably in Nova Scotia a coal-mining operation so difficult that has been better managed. The operations of this Company are now rendered difficult by the fact that the miners' union is demanding adherence to the increased scale of wages arranged by the so-called "Montreal Agreement" last Autumn, which it is probable the smaller mining companies in Nova Scotia will find themselves unable to pay.

Mr. John Preston, Superintendent of Power for the Nova Scotia Steel & Coal Company, has resigned that position.

Mr. J. B. Tyrrell has returned to Toronto after spending some weeks in Alberta and the Western States.

Mr. Jas. McEvoy of Toronto is in Mexico examining mineral properties.

Mr. Bert Latilla has arrived at the Lough-Dakes mine, Kirkland Lake.

New Caledonia Mineral Production

Nickel and Other Substances.

A Note by Dr. W. G. MILLER, Toronto.

As is well known, the French island colony of New Caledonia in the South Pacific at one time controlled the world's markets for both nickel and cobalt. With the development of the nickel industry in the Sudbury area of Ontario, New Caledonia came to play only a minor part but continued to have a successful nickel business. Cobalt occurring in such large quantities as a by-product in the Ontario silver deposits, discovered in 1903, resulted in the total destruction of the cobalt mining industry in the French colony for a considerable time. During the year 1920, however, owing to the high price that has been asked for cobalt metal and its compounds, mining of the ores of this metal was revived in New Caledonia and 66 tons of cobalt matte were shipped.

In addition to nickel and cobalt, New Caledonia has been famed as a source of chrome ore. The Tiebaghi mine is one of the world's best known producers of this ore.

During the last two or three years the island has become a producer of manganese ore and a small quantity of copper ore has also been exported. Phosphate is shipped from some of the adjacent islands.

In the last pre-war year, 1913, the value of the minerals, mattes and ores exported from New Caledonia was approximately $1,700,000, doubtless a low valuation, which is equal to say $33 per capita. As less than 40 per cent of the population is white, the per capita mineral production of the island compares more than favourably with that of most other countries. The mineral production of Canada, for instance, in 1913, is given as $18.77 per capita and that of the United States as $25.16.

For export purposes in 1920, ores and mattes in New Caledonia were valued approximately as follows:

Nickel Ore.	the moist ton.
5.74 per cent and under	62 francs
6 to 6.24 per cent	75 francs
6.25 to 6.49 per cent	80 francs
6.50 to 6.74 per cent	85 francs
Nickel Matte.	**the kg. of metal contained.**
40 per cent and under	2.50 francs
40 to 45 per cent	2.70 francs
45 to 50 per cent	2.80 francs
50 per cent and above	2.90 francs

(The nickel in a 50 per cent matte is thus valued, for export purposes, at approximately 25 cents per pound, par of exchange.)

Cobalt Ore.	the moist ton.
4 per cent and under	80 francs
4 to 5 per cent	100 francs
5 to 6 per cent	130 francs
6 per cent and above	170 francs
Cobalt Matte.	**the kg. of metal contained**
25 per cent and under	5 francs
25 to 30 per cent	5.50 francs
30 to 35 per cent	6.00 francs
35 per cent and above	6.50 francs

(Approximately 56 cents per pound for cobalt in a 35 per cent matte.)

The older of the two prominent companies operating in New Caledonia, with refining plants in Europe, is La Société le Nickel. It was incorporated in 1880 with a capitalization of 6,250,000 francs. In 1898 the capital was increased to 10,000,000 francs, in 1912 to 15,000,000 and in 1918 to 20,000,000, divided into 80,000 shares of 250 francs each. The net profits during the ten years 1908 to 1918 ranged from a low of 3,122,000 francs to a high of 7,321,000, showing that the company has met with much success in its operations.

There is an ad valorem tax of 3 per cent on all ores and mattes exported from New Caledonia.

The following is a free translation of articles in the *Bulletin du Commerce* of Nouméa on the mineral production of New Caledonia, December 17th and 24th, 1920, and later issues. Weights are given in metric tons. The value of the statistics is enhanced by the data given on the production of individual companies and the quantities of ore and matte shipped to various countries.

"The value of our mineral exports for 1918 was 2,149,110 francs less than for the year 1917 (i.e. a complete war-year) and the value for 1919 showed a further decrease of 2,999,684 francs as compared with 1918, or a total reduction of 5,148,794 francs for the two years following the war.

"It is useful to publish the value placed on our ores, and mattes, according to their metal content, for export purposes, from the year 1917:

Nickel Ore.

	1917	1918	1919
	frs.	frs.	frs.
From 5.75 to 6%	69	69	69
From 6 to 6.25%	75	75	75

Nickel Matte.

	frs.	frs.	frs.
From 40 to 45%	2,700	2,700	2,700
From 45 to 50%	2,800	2,800	2,800
Above	2,900	2,900	2,900

"The following tables gives the countries for the six last years to which our minerals have been exported and the amounts in tons:

	Nickel Ore. Tons.	Nickel Matte. Tons
1914.		
France	23,380	
England	14,126	2,494
Belgium	16,346	2,157
Germany	7,906	
United States		305
Australia	96	
1915.		
France	14,935	1,109
England	36,611	600
United States		3,519
1916		
France	7,806	783
England	20,129	800
Japan	2,713	
United States		3,852
1917		
France	2,880	200
England	15,836	1,170
United States	2[illegible]	1,191
Japan	3,276	

1918.		
France	12,259	400
United States	.....	3,537
Japan	3,352	.....
1919.		
France	1,509	1,000
England	52	.....
United States	.....	2,508
Belgium	.....	304

"The tables given above clearly indicate the different countries to which our minerals are exported and also show that France plays only a secondary part in the nickel industry. As regards the mineral chrome almost the total exportation has been to the United States, principally, and to England a smaller quantity.

"Foreigners thus hold almost a monopoly in nickel-refining and a complete monopoly in the manufacture of chrome-steel.

"During the year 1914 our producing exporters of the ores and mattes given in the tables above were the following:

	Nickel Ore. Tons.	Nickel Matte. Tons.
1914.		
Sté Le Nickel	54,699	2,194
Hauts-Fourneaux	11,059	2,762
De Béeade	15,623	.....

Nickel Ore.

The exportation from 1907 in tons and in francs:

	Tons.	Francs.
1907	101,707	3,559,068
1908	120,028	4,200,939
1909	82,028	2,486,780
1910	115,342	3,087,465
1911	120,059	3,601,709
1912	74,312	2,526,444
1913	93,190	2,858,635
1914	94,154	2,824,020
1915	48,576	1,562,716
1916	30,679	1,706,935
1917	32,018	2,506,584
1918	15,600	1,150,768
1919	1,560	112,165
1920	91,534	.....

"The exports of nickel made by La Société des Hauts-Fourneaux from Nouméa to the United States Nickel Company of New Brunswick, owing to various causes, were approximately 1,800,000 francs (1,412 tons) less in 1918 than the production in 1917.

"The figures for the value of nickel ore given in the table should receive a little consideration as the differences shown in value and quantity do not seem absolutely exact. It must not be overlooked, however, that our Departments of Customs and Mines encounter the greatest difficulties in obtaining accurate statistical information regarding the values of the ores exported by the companies interested.

"The amount of nickel ore exported in 1919 is shown as 1,560 tons, compared with 15,600 tons in 1918. This difference is to be attributed to two causes: the first is that La Société le Nickel, the only company which for several years has exported nickel ore to either France or England, must have a considerable stock on hand; the other is the lack of boats. It has been impossible for this company to charter boats for New Caledonia.

"It is moreover certain that the exportation of nickel ore will decrease more and more, owing to the high cost of transportation and the development of the smelting industry at Thio and Nouméa. Fortunately the change in our mineral industry has stopped the costly shipment of ore containing only 7% metal.

"The time when New Caledonia exported from 120,000 to 140,000 tons annually is past.

Nickel Matte.

Exportations in Tons and Values of Nickel Matte.

	Tons.	Francs.
1910	768	705,197
1911	2,993	2,137,622
1912	5,098	3,600,033
1913	5,862	3,753,791
1914	5,287	3,625,567
1915	5,529	4,219,798
1916	4,935	4,371,215
1917	6,318	7,582,550
1918	3,937	4,998,559
1919	3,812	5,563,019
1920	4,509	.....

"The following is a comparative table showing the countries to which our mattes were shipped from 1913 with quantities in tons:

	France	England	Belgium	U. S.	Total
1913	938	1,500	3,424	.....	5,862
1914	...	2,523	2,458	305	5,287

Note—All the above specifications are for our standard machines fitted with the standard size of Gasoline Engine, as listed at the left of above schedule.

AN UNSOLICITED TESTIMONIAL

Dear Sirs:-

Regarding the 6 H.P. Single Drum "MARSH" Gasoline Hoist that I purchased from you last August I take pleasure in advising you that this machine met the requirements perfectly and would say that it is giving entire satisfaction in every respect.

I am using this Hoist in my coal mining operations, for the purpose of hoisting the coal about eighty feet. At present I hoist one half a ton of coal per load and hoist about ten tons every 90 minutes, with one man operating Tipple Head and Machine.

The cost of operating this machine for the work as specified is approximately 50 cents, possibly less.

Yours very truly,
(Name given on request.)

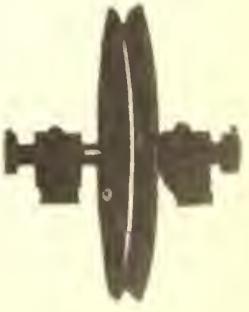
MARSH ENGINEERING WORKS, LTD.

Established 1846

BELLEVILLE, ONTARIO

Sales Agent: MUSSENS, LIMITED, MONTREAL
TORONTO, WINNIPEG, and VANCOUVER



Overhead Sheaves
With Shaft and Boxes

ed the following result is obtained, giving approximately the production from our mines:

	Amount Exported Tons	Amount Treated by our Smelters Tons	Total Tons
1916..	30,679	60,000	90,679
1917..	32,000	70,000	102,018
1918..	15,611	62,600	78,214
1919..	1,560	60,000	61,560

"These figures are interesting to compare with those of former years before the smelters were in operation and the crude ore only was shipped to France and foreign countries."

SHAFT SINKING.

The "Journal" is in receipt of an interesting brochure from the E. J. Longyear Co. of Minneapolis which, among other things, mentions contracts carried out by this company at the Flin Flon mine, in Manitoba, at the Ankerite shaft in the Porcupine field, and the Morrison Shaft at the Goudreau Mine of the Nichols Chemical Co. The views given convey a somewhat Arctic idea of Canada, but a company with the name of Longyear should feel at home in such conditions, Longyear City, on Advent Bay, Spitsbergen, six hundred miles within the Arctic Circle, being, we believe named after Mr. Longyear, and possessing the distinction of being the furthest north of any mining enterprise of its magnitude.

At Flin Flon, the Longyear Company sank two shafts, and cross-cutted and drifted on the ore body at the one hundred, two hundred and three hundred foot levels.

EDITORIAL

National Limitations

The proceedings of the parliamentary fuel-committee are proving useful in disclosing varying points of view, which is always to be desired, so that corrections in fact may be adduced which may modify opinion. Mr. H. E. Vaughan, vice-president of the Canadian National Railways, when he complained that Nova Scotia coal operators will not sell coal at a price which will compare favorably with the quotations of American operators, evidently assumed that this was a matter subject to the volition of the coal operators. Here Mr. Vaughan is entirely in error. So are many others, as is evident from newspaper comment on this incident, and there is an impression abroad that the high selling cost of coal in Nova Scotia is caused in the first instance by incompetence of management and in the second intance by "a desire of the operators for excessive profits". Mr. Vaughan compares an f.o.b. price of $7.00 per ton at Sydney, Nova Scotia, with a delivered price including freight, duty and exchange —at Port Arthur of $6.75 per ton for U. S. coal. This seems, and is, a wide differential in favour of U. S. coal, but not unnatural or unreasonable, if the conditions are examined.

Coal sent from the United States to Canada amounts to two and one half percent of that country's production. At this time, with steel production at the lowest ebb in relation to capacity in history, quotations for United States coal for Canadian delivery are unrepresentative, and represent dumping and distress sales. It is also well known that coal coming to Lake ports is an outward—practically a ballast cargo—in the iron-ore trade, and coal in this instance indulges in what the trade calls "a free ride". Canada, at this time, represents to the United States coal-trade (which is not clearly distinguishable from the steel trade of that country) a convenient outlet for disposal of coal, with selling prices a secondary consideration. In other words, the export of coal from the United States to Canada is a sideline. It is not the sole support of the coal interests, and indeed, the United States could lose all the Canadian coal business and never notice it. The bituminous collieries of the United States can lose more coal production in a week of enforced idleness arising from the slackness in steel demand than would supply Canadian requirements for a year. That is one phase of the matter.

The cost of coal production is from two to three dollars a ton greater in Nova Scotia than it is in the United States, and it must always be that way. The reason lies entirely in the easier natural conditions of coal disposition and extraction in the United States, where coal is present in greater abundance, of better quality, and can be more cheaply mined than anywhere else on Earth.

If Canadians wish to remain Canadians, they must accept Canadian limitations. The ultimate cost of coal to Canada is not to be measured with the yardstick of dollars and cents. If it is argued that to abandon such a yardstick is an economic sin it may be argued with equal cogency that Canada's whole national status is possibly an economic sin, but it is a darling sin to many people, and thousands died for its perpetuation.

Coal is being mined in Nova Scotia under conditions of natural difficulty that would break the heart of the average mine manager in the United States. Few people realise that there is not a bituminous mine in the United States at a greater depth than one thousand feet. There are only a few mines left in Nova Scotia that are not at much greater depths than this. And yet we have a sneaking regard for the competency of Nova Scotians, and we believe the prosperity of the Nova Scotia coal trade is not a matter of indifference to Canada, seeing that it is all the coal we have to call our own in that part of Canada where most of the Canadian population resides—at least at this stage of national evolution.

The British Empire merger is being blamed for sky-blazing prices and eliminating competition. We have an idea that is the reason for the merger. Once before, in 1893, the coal trade in Nova Scotia was resurrected by a merger, that of the Dominion Coal Company. The necessity was no less at this time, because, to put the matter very badly, a stage has now been reached in Nova Scotia when the cost of the production of coal exceeds that price for which it can be sold. A chief

probably the chief reason for this condition, is that coal was sold too low in the past, and in this regard the railways were the chief oppressors.

For eighty years, that is from 1830 to 1910, the coal output of Nova Scotia increased by a geometrical progression of 78 percent. per decade. Had this increase continued through the decade ended with 1920, that period should have shown an output of 81 million tons. It actually amounted only to 55 million tons. There is reason to believe that the production for the current decade may not greatly exceed that of 1911-1920. It certainly will not if the Canadian consumer refuses to make allowance for the difficult natural conditions under which coal is mined in Nova Scotia. It would be much more to the point if the people of this country would cease talking about its illimitable resources, and would realise that, in sober fact, our natural resources are in some of their most notable phases, distinctly limited in quantity, relatively expensive to develop; and that, unless we make the best of what we have, unless we put our one talent to work, we shall in due time, be relieved of ownership of even that which we now have.

There are certain economic laws that are as inexorable and as ruthless as the laws of biology. One of these laws is that continued economic dependence brings eventually political subservieney. Those who everlastingly look to another country for cheap goods may not wish to see Canada lose her political autonomy, but they are working to that end, some thoughtlessly, others from desire for ease, and others maybe from conviction. The last-named class are at least honest, and they form the least considerable danger to national autonomy.

It would be refreshing if some clear-sighted parliamentarian would combat the loose talk of our "illimitable" resources, would analyse that irritating lie that our resources have "not been even scratched", and similar hyperbole. Uniformed optimism is dangerous. Needless pessimism is foolish. We need someone in Parliament that will tell this country of the glorious future it will have *if*—and it is a large if—its people will realise that its resources are not greater than its needs. Also that we might just as well be without any natural resource we possess and do not utilise.

THE PROPOSED INCREASE IN ONTARIO PROFITS TAX.

There seems now to be a possibility that the proposal to increase taxes on profits of mining companies in Ontario will not result in unfavorable legislation. There has been a great deal of opposition in the Legislature to the Government's bill and predictions are made that it will be withdrawn. It is to be hoped that consideration of the possible ill-effects of the measure will make it evident that the Government should not press for its passage. Productive enterprises are having difficulties enough aside from those that are avoidable.

PUBLICATION OF C. I. M. & M. PAPERS.

The monthly review in the Institute's bulletin for April raises a point discussed in the account of the proceedings of the annual meeting of the Mining Society of Nova Scotia in the last issue of the "Journal", which was written before the "Bulletin" was out. The Secretary of the Institute asks that reading of papers should be made secondary to the discussion, and suggests the prior printing and distribution of papers to this end. It would appear that there was general agreement as to the desirability of this course.

A further advantage from prior publication is that the information contained in the papers presented to the Institute is given quick publication, and the advantage attendant is well illustrated by the two papers on the northwestern oil prospects by Messrs. Ness and Kindle that are reproduced from the April "Bulletin" in this issue. Owing to the fact that the "Bulletin" is a monthly publication, limited in space content, it was not possible to publish these papers therein under a period of one month from the time of reading. Some consideration might be given to the question whether withholding of publication of such papers in the technical press until after their appearance in the "Bulletin" has advantages to the individual members that outweigh the suppression of the duty the Institute owes to the public at large.

There has been significant agreement in the addresses of the officers of the Institute extending over the past two years that the Institute had not altogether lived up to its opportunities in educating the public in mining matters, which, put in another way, means that the publications and discussions of the Institute have failed to secure that circulation among the public at large that only the periodical press can give.

It is fairly evident that the number of papers which will be presented at Institute meetings from now on, at headquarters and branch meetings, is far beyond the capacity of the Bulletin to hold, even were it doubled or trebled in size. The worth of some papers consists largely in their timeliness and topicality, and such papers, if not published at once, are soon not worth publishing. So far as the public press is concerned, information is only "news" while it is new. We doubt whether is is fair to an author to delay publication of such a paper, and it certainly robs the Institute of that publicity which, if not seized today, is gone tomorrow beyond hope of regaining.

We can scarcely regard the fact as one considered as desirable by the members of the Institute that its members are far better informed of the papers and discussions read before the Institution of Mining & Metallurgy and other British technical societies than they are of their own Institute's proceedings. Full text of papers, with verbatim report of the discussions, appear in the British trade journals within two or three days of the actual presentation.

This journal does not conceive it to be its function to quarrel with the rulings of the Institute. It has hitherto, and will continue to abide by them, but while we believe every loyal member of the Institute is willing to give of his best to the Institute's proceedings, still, if he has anything to say he wants the public to hear it. *What is still more important, he wants the public to hear about the Institute before which his paper is read.* This is really the main point.

Canada is so vast, her mining camps so scattered, that every available avenue of publicity for the Institute's affairs should be hailed with gladness, because it is lack of publicity, lack of interchange of technical information and news, lack of cohesion arising from the great distances that intervene between the Institute's members, lack of freshness and recent contact, that is the Institute's heaviest handicap.

The Bulletin is a link between the members, and the more it adheres to the idea embodied in its name — which was not unthinkingly chosen—the greater will be its usefulness as a bond of communication, news, "shop" and friendliness, but its inability to contain all the technical papers that are presented to the Institute should be admitted. If, on the other hand, a paper is of such admitted excellence that it is destined for the Annual Transactions without intermediate appearance in the Bulletin, the author must wait twelve or maybe eighteen months before his paper appears. Inclusion in the Transactions, no matter how select and honouring such selection may be made, is no consolation to an author who wrote something that was worth while and was sufficiently human and afflicted by life's little vanities to wish to see his work in print and in circulation among those who would be likely to notice his little venture.

The Editor of this journal has probably attended more of the annual meetings of the Institute in the past two years than anybody else, and has endeavoured to report the proceedings as fully as possible. No objection has been made to his doing this, and no restriction has been placed by the Institute on the extent to which the proceedings were reported, but it has only been by special favour and request that he has been allowed to handle the actual manuscripts, and reproduction of the text is forbidden. The logicality of this distinction is hard to see. Many technical societies take care to have a plentiful supply of separates for distribution before the reading of a paper, with the result that all such papers receive special notice and often complete reproduction from the daily newspapers and the technical press. The reluctance of the Institute to divulge its papers has quite opposite results, and it loses a good deal. What it gains, or hopes to gain, by forbidding quick publication of papers has never been satisfactorily explained, and possibly it has never been thought out. Or again, the original reason may have lost its cogency.

The past-President, in his retiring address, said the Institute considered itself the voice of the mining industry in Canada. How can that voice be heard if it is silenced to all but the limited membership of the Institute itself? And how can the public be interested and informed if publicity is discouraged?

BRITISH COAL STRIKE.

The persistence of the miners' leaders in Britain in placing a constitutional question before a question of wages and hours led to a well-merited rebuff. The country was quick to see the weak point in the miners' case. The railwaymen and transport workers were unenthusiastic over the prospect of a general strike, and indifferent, if not hostile, to the protestations of the miners, because they are well aware of the preferred status of the miner alike in regard to remuneration and working hours and general working conditions. Mr. Lloyd George's brief request that the railwaymen and transport workers would state the reasons for their desperate action was a rapier-thrust that pierced through the wordy fog and vagueness with which the miners had surrounded an ultimate purpose that was by no means vague.

The miners' leaders have not a single vision to the needs of the British miner, or the British nation. Their thinking is continental, and is confused with the communist idea. They counted on outside aid. They desired to alter the law of private ownership in Britain, and they pursued this seditious and subversive aim by confusing their followers with vague terms summed up in the word nationalization. One English paper states that the bluff was called. There was no bluff, so far as the leaders of the miners is concerned. There was, and is, a deliberate and dangerous purpose, and it is a tribute to the clear-thinking of the British people that they detected this malign intent and rose to oppose it. The cause of the miners' strike will be found recorded in the minutes of the Miners' Congress at Geneva.

NICKEL COINAGE.

The Government is to be congratulated in introducing nickel coinage. The amount of the metal which will be required for an issue of five-cent pieces will not be a matter of great importance as an aid to production, but Canadians generally will be pleased that the country is making use of a metal that has found much favour in other countries because of its intricate merits as a coinage metal, and which is, moreover, a distinctive Canadian product.

It is to be hoped that the design of the new coin will be more artistic than the copper one cent piece. This is without doubt one of the ugliest coins ever minted. From the viewpoint of artistic execution it has not a redeeming feature. Put side by side with specimens of the beautiful French and United States coinage it is revealed as lacking in beauty to a painful degree.

"CORRESPONDENCE-SCHOOL MINING ENGINEERS."

A well-known mining paper recently referred to "correspondence-school mining engineers" in slighting terms, and suggested these gentlemen should perform their mining engineering by correspondence. The Chesterfieldian warning against attacking a class is well illustrated by this attitude, for mining students who have taken correspondence courses, in Canada at least, are a large and influential body of men. To many aspiring miners in Canada there was no other way in which technical education in mining could be obtained except through correspondence lessons. To be classed among correspondence-school men in Canada is to be included among men who added to their daily work in the mine (no eight hour day at that) considerable expenditure in money for correspondence-school fees and nightly study under conditions not always conducive to mental effort. Were all "correspondence-school engineers" to be deleted from the roll of the mining profession in Canada it would be a sick looking list, and, if we mistake not, there would be some notable names missing in the United States also.

A college degree in mining may be a greater tribute to the old man's purse than to a young man's ability, and it is not part of the tradition of our institutions of learning in Canada to despise the men who did their best with the meagre facilities the country has afforded, and in more than one instance have risen to eminence in technical attainments and to affluence that has enabled them to endow colleges, the necessity for which they have learned from bitter personal experience.

The desire for elevation of the technical professions, for severer tests in professional attainment, and for elimination of the fakir are noticeable and commendable tendencies of these days, but there is some danger that the possession of a college degree may come to be accounted as equivalent to the possession of personal qualifications for leadership, which, as all industrial executives know, it certainly is not. Many a man who was forced by stern necessity to content himself with the education that a correspondence course would afford will strain his pocket to give his boys a chance, that was denied to himself, by sending them to college, but it will be taking a good deal for granted to say the sons will be better men than their fathers.

Our contemporary, in referring to "correspondence-school mining engineers" probably had in mind a thoroughly disreputable class of pretenders that infest some mining centres. Such men are conspicuously absent in Canada. Our only object in making this comment is to point out that the large list of mine officials that have taken correspondence courses in this country are doing their mining engineering, not by post, but on the job. They are, moreover, doing it pretty well and saying darned little about it.

We do not desire to belittle the high status which a fully qualified mining engineer should reach. His studies cover as wide a range — if not wider — than those of medical men, lawyers, and other typical closed professions. They cannot, however, be measured by the same yardstick, and pharasaism is about the last thing that the mining engineer desires to cultivate as a professional characteristic.

THE FLIN FLON DEAL.

There has as yet been no official statement given out concerning the reported sale of the Flin Flon Property, Northern Manitoba, to a syndicate which includes the Mining Corporation of Canada and English interests. There seems however to be a strong probability that the Flin Flon mine will be developed by Canadian and British Capital. The enterprise is one of great magnitude and the negotiations now under way will have an interest for a large number of people other than the contracting parties. The future of the Pas mineral district will be largely determined by the progress made at Flin Flon.

WESTERN TOUR OF C. I. M. & M. SECRETARY.

Elsewhere in this issue will be found the itinerary of the western tour proposed to be undertaken by Mr. G. C. Mackenzie, the Secretary of the Canadian Institute of Mining & Metallurgy. It is a document that speaks for itself, and will speak still more eloquently at 5.05 a.m. (daylight-saving time) some fine morning after the night before, unless the Institute has fallen upon the dumps of decadent desiccation. We wish the Secretary success in his endeavour to unify the membership.

UNITED STATES BITUMINOUS OUTPUT TO DECREASE BY 100,000,000 TONS FROM 1919 FIGURES.

One of the best informed men in the coal industry, who is in touch with conditions throughout the country, predicts the 1921 output of bituminous coal will be 100,000,000 to 125,000,000 tons under that of last year.

This means a production for the present year of 430,000,000 to 455,000,000 tons. Last year's production was well above average with 556,563,000 tons. 1919 production of 458,063,000 tons was light because of the carry-over from the banner year of 1918, when production ran up to 579,385,820 tons.

The drop this year will be due to heavy production through the latter part of 1920. Industries accumulated large stocks, while curtailing operations then and later. The railroads, which consumed about 20 per cent of our output or 113,574,127 tons, will consume about 20 per cent less this year, due to the 30 per cent drop in traffic. Also the foreign demand, which took about 21,000,000 tons of high-grade coal last year, will probably be extremely small this year.

The railroads paid an average price of $4·20 per ton for their coal in 1920. This official estimates they will pay less than $3 and possibly close to $2.50 per ton at the mines, in 1921. He states roads are contracting for Illinois coal at $2·85. A 1,000,000-ton contract for another grade was recently closed at less than $3 per ton.—"Boston News Bureau."

The Search for Oil in the West

A NEW LEAF IN CANADA'S RECORD

A paper read before the Canadian Institute of Mining & Metallurgy, at the Annual Meeting, Montreal, March 3rd, 1921, by J. NESS, of the Geological Department of the Imperial Oil Company, Limited, and reprinted from the April bulletin of the Institute.

Being the record of a continental search for petroleum, extending from the "Cities of Alberta to the Arctic Ocean", based upon and guided by geological deductions, following up by intensive prospecting and deep drilling the trail marked out by the Canadian Geological Survey; adding thereto the most recent teaching of oil geology, and culminating, after years of work and the expenditure of much money, under unique conditions of climate and transportation, in the proving of a gushing well on the verge of the Arctic Circle.

Introduction

WITHOUT undue exaggeration it may be said that the eyes of all Canada are fixed on a spot in the far-away Northwest Territories where the derrick of Imperial Oil, Ltd., marks the first well to successfully tap the alleged fabulous oil-resources of that little-known region.

This venture has taken hold of the public imagination to such an extent that one can hardly lift a newspaper without seeing some aspect of the case discussed, whether it be the fatherly interest of the Government in a new source of potential revenue, the avaricious plans of the speculator to dip into the public purse, the problems of development and transportation which confront those most vitally interested, or the legitimate curiosity of the scientist in happenings which may conceivably add to his knowledge.

It is but natural to assume that the interests of such an institute as this are purely academic and that no time need be spent in dealing with the commercial issues. We will, therefore, attempt to give a short résumé of the activities of our geologists, the broader results of their field work, and the steps being taken to follow up and test their conclusions with the drill.

When it is stated that the area which Imperial Oil is testing extends from the plains of Saskatchewan on the east to the foot-hills of the Rockies on the west, and from the international boundary on the south to within the Arctic circle, it will at once be recognized that the geological aspects are many and various and can only be indicated, or dealt with superficially.

It appears, however, that this vast extent of territory may be conveniently divided into three groups, in which the geological features are so dissimilar that each carries its own particular problem. First, we have the Cretaceous rocks of eastern Alberta and Saskatchewan, practically undisturbed and heavily covered by glacial material. Secondly, the folded and faulted Cretaceous of the foot-hills belt, the outer folds of which give a certain amount of promise structurally. Thirdly, the Devonian of the Mackenzie valley in which oil has recently been struck.

Eastern Alberta and Western Saskatchewan.

So much has already been written regarding the geology of the plains area that we need only briefly recapitulate the outstanding features.

Speaking briefly, the structure of this area is monoclinal, although there are certain local irregularities and undulations, and evidence of two general lines of folding. The first of these, which is the continuation of the structure found in the Sweet Grass hills of Montana, probably extends north to Bow river. The second crosses the Alberta-Saskatchewan boundary south of Macklin and trends northwest.

The efforts of the Imperial Oil geologists have centred upon these known, or assumed, lines of folding or faulting which previous investigation has indicated as likely to repay attention; but a general survey—of necessity, hurried and incomplete—has been made of the whole region as far north as Lac la Biche, south to the international boundary, east to Battleford and west as far as the Cretaceous rocks are exposed.

Most of the exposures in this vast area were visited and examined, a task entailing in many places, more travelling than actual geological work, owing to the dearth of rock sections. Hundreds of square miles have been traversed without a single outcrop of bed rock being seen, the streams having simply cut their courses in the extremely thick glacial deposits. Nothing revolutionary was discovered during these surveys, the previous work in the area leaving little to the imagination.

Attention was devoted principally to the selection

of suitable locations for testing the oil possibilities, those areas where the minor folding and crumpling would conceivably create conditions suitable for the accumulation of oil, and the supposed crests of the broad arches which bring the sands of the Dakota nearest to the surface being studied in detail.

Previous development in this area has resulted in the hope that oil will be found in commercial quantities provided the drilling is carried to a sufficient depth. Various gas horizons have been successfully tapped and "shows" of oil have been encountered, and it is only by exploring the lowest beds of the Cretaceous and, if necessary, the Devonian, that these hopes will be either realized or dissipated.

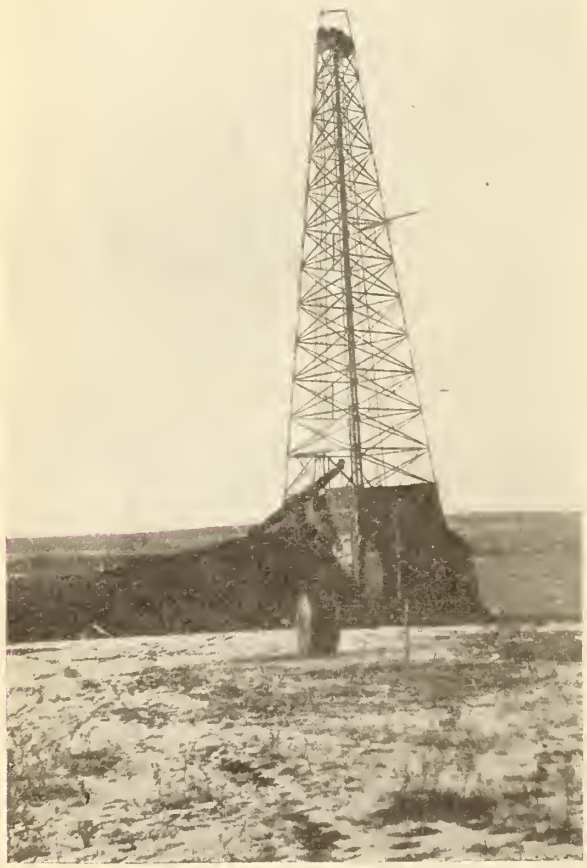

Fig. 1.—The well at Tit hills, near Czar, Alta. This well, the first drilled in Western Canada by Imperial Oil, has now reached a considerable depth.

Fig. 2.—Blairmore (Dakota) sandstone, practically vertical, at Mountain Mill, Alta. This is a good illustration of local disturbances in the Foothills area.

The drilling now in progress, or under consideration, should prove to be a fairly conclusive test. Work is being carried on at the following locations: In Saskatchewan, near the international boundary, south of Cypress hills; on the Saskatchewan river, north of Swift Current; at Muddy lake, southwest of Unity; in Alberta, south of Monitor in the Misty hills, and near Czar at Tit hills.

Apart altogether from the commercial aspect, the drilling of these wells will be of immense interest to geologists. Starting in the Bearpaw (Pierre) or the uppermost beds of the Belly river, they should, if carried to completion give a reliable and unique record of the Cretaceous sediments below these horizons and furnish interesting information regarding the attitude and character of the underlying Devonian.

Foot-hills Belt.

Although exploration in the foot-hills belt was also confined largely to rocks of Cretaceous age, the problems arising differed greatly from those of the plains. At the same time, the two areas have much in common, principally in the amount of attention that has been devoted to them by oil-men and geologists, and the abundance of literature that both have given to the public. Many prominent geologists have dealt with the various aspects of this area, and one need only turn to their reports to obtain an edifying account of their researches. The "oil-man" has also contributed a literature of his own, widely read and highly coloured, consisting of prospectus and share certificate, which, during the boom of 1914, enjoyed a short-lived popularity akin to that of a "best-seller." We may, therefore, be absolved from entering into any long-winded description of the geology of the foot-hills, taking it for granted that the subject is familiar to all.

The geologists of Imperial Oil set out on their mission well grounded in the general features of the territory. They knew that the Cretaceous rocks had been intensely folded and faulted in proximity to the

Rockies, and that, as one travelled eastward the effects of the great upheavals, complementary to mountain building, gradually diminished until the sedimentary rocks were eventually found in such an attitude as to give favourable structure for the accumulation of oil. Not only so, but rocks, recognized elsewhere as bituminous, were known to underlie the area within convenient reach of the drill.

Starting from the international boundary, they followed and mapped these outer folds into the Peace River district and traversed that river from above Hudson's Hope to 30 miles below Peace River Landing, the development around the latter place giving this a special interest.

As in eastern Alberta, the activities of the geologists were directed mainly to those points which previous research, either by the scientist or by the driller, had brought into prominence.

We have already mentioned the Calgary "boom" which was marked by a great deal of rash speculation and misdirected "wild-catting." There were certain redeeming features, however, notably the development

Fig. 3—Typical exposure of the Gates sandstone on Peace River. The beds are almost horizontal, the dip being measured in feet per mile. The Gates sandstone belongs to the Benton

Fig. 4—Highly folded and contorted beds of St. John shale (equivalent to part of the Benton) in the central portion of the disturbed belt on the Athabasca river west of Edmonton, Alta.

of Western Canada's first producing oilfield in Turner valley, west of Okotoks. The vast amount of drilling that was undertaken by the various mushroom companies at this time neither proved nor condemned southwestern Alberta as an oil-producer. Most of the wells were located at the whim of the driller and without any regard to geological conditions, whilst those which might have given a fair test were abandoned, owing either to drilling troubles or to lack of funds. The bursting of the bubble left the field discredited to a certain extent in the eyes of

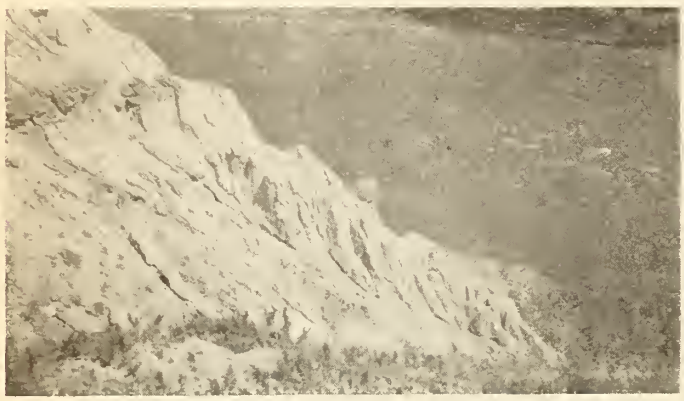

Fig. 5—Belly River sandstone on Waterton river near Pine creek, Alta. This exposure is on the eastern flank of the Twin Buttes anticline on which drilling is at present being done.

the public, but still interesting to the well-informed oil-man.

That Imperial Oil still have faith in the future of the area may be gathered from the fact that they have acquired scattered leases over a large area on representative structure, and are drilling, or preparing to drill, a series of wells that should prove an ample test of the foot-hills belt.

On a structure designated the Twin Buttes anticline, two wells are being drilled, one within a few miles of the international boundary and the other slightly to the north. On the Willow Creek anticline, west of Nanton, a third well is being drilled, whilst an endeavour will be made to deepen a well, taken over from another company, in the same territory. All these wells started in Benton shale and production would be looked for in the Dakota, although sandy places of the Benton might give 'shows' of oil.

Thanks to the enlightened policy of the government in throwing open the forest reserves to oil investigation, other promising areas have been made available and will probably be tested in the vicinity of Coalspur. Here the structure exposes Belly River strata with very steep dips, and gas seepages have been noted. Deep drilling will probably be necessary, but the chances of obtaining production from the Benton, or even from the lower beds of the Belly River, are not to be overlooked.

Favourable indications for oil are found near Pouce Coupe, the rocks at the surface being probably equivalent to the Lower Pierre of eastern Alberta. A test will, in all probability, be made there.

Regarding the present field of activity at Peace River, nothing need be said in addition to the reports of the government geologists, and the people interested. Success, if it does come, will probably be attained in the Devonian, the Cretaceous rocks having been drilled into, and through, without exceptional results.

There are other structures in the vast area under review that offer possibilities of oil and gas production. It is hoped that other companies will be sufficiently impressed with their possibilities to test them, so that in the near future we may know whether this area is destined to become a producer of oil or not.

Mackenzie River Basin.

Exploration of the basin of the Mackenzie dates back to the latter part of the eighteenth century, since

Fig. 6—Upper part of Smoky River shale (probably equivalent to Lower Pierre) along a tributary of Muskeg river, on the east flank of the outer anticline.

which time periodic attempts, more or less successful, have been made to traverse its fastnesses and collect information regarding its extent, physical features, and mineral wealth. The full story of these adventures is written in the pages of Canadian history and the illustrious names of those early *voyageurs* are perpetuated in memorials not made by hands. Needless to say the geologist was well in evidence and such names as Dawson, McConnell, Bell, Tyrrell, Dowling, Camsell and Kindle, to mention only a few, are closely connected with the activities of the pioneers.

The first investigation of the area on behalf of the petroleum industry, however, was not undertaken until 1914, when Dr. T. O. Bosworth, latterly chief geologist of Imperial Oil, Ltd., covered the whole

Fig. 8—Oil pool near the well at Windy point on Great Slave lake.

Fig. 7—An exposure of Tar sands on the Athabaska river, near McKay.

district "from the cities of Alberta to the Arctic Ocean." On his return to civilization he wrote "The expedition in Northern Canada has been entirely successful and findings of great importance have been made," a view amply borne out by current events.

Although the war intervened to hold up development, the project was naturally not lost sight of, and in 1919 two rigs were shipped into the country to locations previously made by Dr. Bosworth, one at Windy point on Great Slave lake and the other, destined to become famous, at a point 40 miles downstream from Fort Norman on the Mackenzie. Along with the drilling crews were two parties of geologists who devoted the short season at their disposal to a more careful study of the rocks in the vicinity of the drilling operations.

Both drilling and survey work were continued during 1920, the former coming to a rather successful conclusion in August, and the geologists finding themselves merely on the verge of great areas demanding careful study and painstaking work before their geological history can be written.

The Tar Sands.

In travelling northward on the great waterways, the Devonian formation is first found at Crooked rapids on the Athabaska. Associated with these limestones are "tar sands" regarding which a word may be permissible.

The natural oil indications along the Athabaska river are probably the most extensive and conspicuous in the whole world. For a distance of 100 miles a bed of tar sand from 150 to 220 feet in thickness, is almost continuously exposed along the sides of a gorge-like valley, and in many parts cliffs of the tar rock rise steeply from the water's edge to a height of 200 feet. From the exposures on the Athabaska and its tributaries, and by deduction, we may reasonably assume the existence of the tar sands over an area of 10,000 square miles, probably the largest deposit of asphaltum in the world.

The tar sand is a sandstone formation saturated with a dark viscous oil. Originally the rock must have been an ordinary bed of current-bedded sandstone, with some shaly courses, and plant-bearing in places. Courses of finer sandstone or sandy-clay rock, seams of lignite and thin lenticular seams of concretionary limestone are occasionally found, while, at the

Fig. 9—Blocks of dolomite from Windy bay at landing, Windy point, Great Slave lake.

base, there are sometimes ferruginous pebbly beds with little oil.

As seen at the outcrops, it is a black or dark-brown rock containing from 10 to 30 per cent (by volume) of heavy oil; it is soft and somewhat plastic and, in some instances, oil can be squeezed out by hand. In places, heavy, tarry oil issues slowly from the cliffs and accumulates in holes dug in the outcrop. Chemical analyses show this oil to be of fairly good grade, the chief trouble at present being that it is so viscous that it cannot be pumped from the wells.

It has been supposed that the asphaltic material seen at the outcrops of the tar sand is the residue from a vast body of oil from which the light constituents have evaporated. This assumption has led to the drilling of a number of wells back from the outcrop of the sand, with the hope of finding a lighter grade of oil. These hopes have not been realized, however, as the oil found was almost as viscous as at the outcrop of the sand.

Fig. 11—Highly bituminous Hope shales, the producing horizon of the well at Fort Norman. This photograph was taken at Old Fort Good Hope, where these beds are well exposed.

It seems possible that, eventually, an oil industry may be established in the Athabaska tar sand region, but whether this will be the result of totally unique methods of extracting the oil from the wells to circumvent its high viscosity or whether the chemist will devise a means of extracting the oil from the sands by retorting, will only be demonstrated by the march of events.

Slave Lake.

Nothing need be said of the geology along the waterways until we come to Slave lake. Travelling eastward from Fort Providence along the shores of that lake, no solid rock is found until after passing Slavie point. On the east side of this is a deep bay about five miles wide, having a beach formed of limestone fragments which have been derived from outcrops under the water near at hand. Crossing the bay we reach point Brule, where the land stands at a higher level. A raised beach, or really a succession of raised beaches, of limestone debris, occurs at this place and is traceable eastward for some miles.

At point Brule the waves of the present lake have cut into the older shore line, forming a cliff about 18 feet high, capped by loose stones. The lower part of the cliff is composed of fine grey limestone, fissile in parts, smelling strongly of petroleum and containing ill-preserved corals, alveolites, brachiopods, and gasteropods. The same rocks are exposed beneath the water.

At Windy point there are heavy beaches, old and new, consisting of limestone fragments (all more or less petroliferous) but the solid rock is not exposed. About 1½ miles from Windy point, however, the solid limestone is again seen beneath the water and then for two miles further the only evidence is in the beaches.

We now reach a portion of the shore where for three miles the solid rocks are conspicuous, forming a ragged coast-line with scars of limestone reaching far out into the water. The beds are still dipping in the same direction but the rock consists of a rough bedded dolomite-limestone of crystalline structure and porous texture, saturated with fluid petroleum which is seeping into the waters of the lake, giving rise to a distinct film of oil on the surface at most parts of the shore for several miles.

Where met with inland, for a distance of half a mile, the rock exposures contain small pools of asphalt and oil. Gas seepages have been noticed on the shore and small sulphur springs exist.

There is no evidence of structures, and the thickness of the beds is unknown. They have been referred to the middle Devonian and denominated "Slave Point limestone" and "Presqu'ile dolomite" respectively, and would probably correlate with the

Beavertail and Ramparts limestone of the Mackenzie.

In the valley of the Hay river, Cretaceous beds, approximately of the same age as the Loon River shales, are found, and also members of the upper Devonian correlated with the Chemung and Portage.

The well now being drilled at Windy point should give some interesting data regarding the thickness and character of the underlying strata.

Mackenzie River.

Stratigraphy.—The rocks of that part of the Mackenzie basin to which special attention is now being drawn range in age from Silurian to Tertiary, with a varying cover of Glacial and Recent material. As the Silurian does not enter largely into the present developments it may be dismissed in a few words.

In "The Mackenzie River Basin", by Camsell and Malcolm of the Geological Survey, reference is made to the "Palaeozoic, not sub-divided", which is found in

Fig. 12—Cretaceous deposits on Little Bear river, near Fort Norman. An 8 foot seam of coal is exposed at the base.

a range of mountains crossing Great Bear river at the rapids and extending northwest and southeast beyond the range of vision. Mount Charles, in this range, is said to consist of interstratified conglomerates, quartzites, and magnesian limestones of Palaeozoic age.

The interpretation given to these beds by our geologists is as follows, commencing with the lowest exposures:

Fig. 10—Unloading the boiler at Windy point, Great Slave lake.

	Feet.
Thin-bedded, black, hard, brittle limestone, with bituminous odour when freshly fractured	50
Pure white gypsum with lenses of bituminous shales	50
Highly cavernous, soft, brownish-red dolomite	150
Sandy, grayish limestone with fragments of chert, grading into a heavy, gray, fossiliferous limestone brownish and red in places	1,000
Red and brownish, brecciated, siliceous limestone with much chert. Red colour due to hematite	400
Grayish, brecciated, siliceous and cherty limestone	300
Break in evidence—	
Thick series of thin-bedded, sandy, grayish and buff limestone, becoming more massive and thick bedded near base. No fossils	1,800
White, very hard, almost quartzitic, marblelike limestone	100-200
Sandy, buff limestone and reddish-weathering sandstone	40-60
Extremely hard, pure white, thin-bedded limestone	50-60

Most of this section would approximate to rocks of Niagaran age, the three last mentioned beds, however, are included in what we have termed the "Bear Mountain series," the upper part of which may be Helderborgian and the lower part Monroe. In view of the controversy regarding the interpretation of the upper contact of the Silurian, we must hesitate to fix any definite horizon, leaving it to future, and more detailed, investigation.

These sections were obtained in the Franklin mountains, east of Fort Norman and in the Bear Mountain range which parallels the Mackenzie below its confluence with the Great Bear river.

As in the Silurian so in the Devonian much has still to be done before a complete table of its constituent parts, and anything approaching definite correlation, can be attempted. Neither is it certain that the nomenclature adopted by our geologists will be permanently associated with the beds to which they have been referred. What has been accomplished must

Fig. 13—Unloading the scows at Oil creek in 1919.

only be considered as preliminary investigation into a very interesting and complex problem, and due allowance made for the hurried nature of the survey.

The "Bear Mountain series" is composed of the following beds:

	Feet.
White, very hard, almost quartzitic, marblelike limestone	100-200
Sandy, buff limestone and reddish-weathering sandstone	40-60
Extremely hard, pure white, thin-bedded limestone	50-60
Massive, buff, shaly, cavernous and brecciated dolomite with indistinct bedding	200-225

As previously stated the greater part of this series has been interpreted as Silurian, the line of demarcation between that system and the Devonian being doubtful.

The "Lower Ramparts shale and limestone" is next in order, consisting of:

	Feet.
Hard limestone with olive green colour and bituminous odour	300 + —
Gray-green arenaceous shales, grading into a shaly limestone above. Thin calcereous seams contain chonetes	250 +

These are correlated as Oriskany and Onondaga.

The succeeding beds are termed "Ramparts limestone" and described as:

	Feet.
Compact gray limestone, well bedded into three or four main courses. Fossiliferous	100-300

By reason of the fossil evidence this is considered as being equivalent to the Hamilton.

The "Beavertail limestone" follows:

	Feet.
Dark, bituminous limestone, thin-bedded and in part largely made up of alveolites. Brachiopods in lower part	300-400

Being fairly hard, this limestone forms some rock features and is well exposed in places. It is highly bituminous and smells very strongly, especially when freshly fractured. It weathers to a dark colour and where it passes under water bubbles of gas arise. It has been correlated with the Tully of the Eastern States.

Perhaps the most important member of the series occurs next, namely, the "Hope shales" which have been classed with the Gennesse-Portage series.

	Feet.
Black, bituminous and carbonaceous shales. Plant remains in upper half. Rhynchonella in calcereous seams in lower. Concretions and thin beds of hard sandstone abundant	800-1,000

The shales smell strongly of bitumen, especially when freshly broken. The odour is perceptible from afar off. Where exposed they are undergoing slow combustion to such a degree that even the loose talus fallen from the banks is uncomfortably warm. In some places where these rocks pass under water, gas is bubbling up, and small flames arise from pieces of the rock placed in a log fire. On cooling these pieces turn red.

The shales are well exposed in many places, sections of from 75-200 feet being observed, often burnt to a bright brick-red colour from top to bottom. The upper part of the shales contains fossil plants, sigillaria, lepidodendron (?) and calamites. At intervals there are thin seams and lenticles of hard concretionary bituminous limestone. In the lower part there are some seams of calcareous shales containing rhynchonella in abundance.

On testing samples of this shale, which is the source of the largest show of oil in the Fort Norman well, a yield corresponding to 2½ gallons of oil per ton was obtained. In conjunction with the underlying limestone, we have here a remarkable series of bituminous rocks, of such a character as to form an admirable oil-generating formation.

Above the shales just described, we have the "Norman series," the lower part correlated with the Chemung and the upper with the Catskill. This series has been subdivided as follows:

	Feet.
Lower Norman sandstone (inconstant)—	
Bluish-green, poorly indurated flaggy sandstone, massive in places and jointed	0-300
Lower Norman shales—	
Dark blue plastic shales	250
Norman limestone (inconstant)—	
Thin-bedded, hard, argillaceous, impure grayish limestone	0-50
Upper Norman shales—	
Dark blue, soft, plastic shales with thin sandstone members	1,200
Upper Norman sandstone—	
Bluish-green, thin bedded to massive sandstone	300

Slight evidence was also found of a possible third sandstone member but this could not be substantiated.

The sandstones of this series, though rather fine, are soft and very porous, and are indeed excellent oil sands. Generally the rock is heavily charged with oil and for several miles along the river quite a considerable quantity of oil is seeping out from it. On following one of the creeks for a distance of 18 miles, several hundred feet of strata containing these green oil sands was passed over, and beneath them, in due course the bituminous shales and limestones were found.

The "Norman series" was considered to be the highest representative of the Devonian found in the area, the data given being based on the examination of sections between Fort Norman and Old Fort Good Hope.

In this region the Devonian, which throughout a great portion of the country lies nearly horizontal, has been thrown into a succession of strong folds. These are exceptionally well displayed, as the denudation has proceeded to just such a degree that the arches in the hardest limestone series stand out as mountains of from 1,000 to 2,000 feet in height. Between the antielines, the hard beds sink beneath the surface in troughs or synclines which are generally areas of low relief as the overlying shales are not capable of forming rock features.

The main folding of the Devonian took place in Pre-Cretaceous times, and after the folding, there occurred a period of denudation in which the land surface was carved into mountains with valleys between. Subsequently the Cretaceous deposits have been laid down in these lowlands around the mountains by seas and lakes, but the mountains themselves were probably not submerged. Later there has been some further slight folding, probably along the old axes, by which the Cretaceous and Tertiary beds are disturbed from the horizontal.

In still later times the great ice-sheet passed over the land and "plastered" it with deposits of boulder-clay, sands and gravels. Thus between the mountains there is a lack of evidence regarding the Devonian formation, the ground being occupied by forest, muskeg, boulder-clay or deposits of Cretaceous and of Tertiary age. The Cretaceous beds present are supposed to correlate with the Benton of Alberta and consist of:

Fig. 15—The well at Oil creek before it became famous. The "stadia" canoe in the foreground was used by the company's surveyors.

	Feet.
Black plastic shales with many sandstone members and concretions	100-800

They are found in the Franklin mountains and on both sides of the river for a considerable distance down stream, occupying the extreme flanks and troughs of the limestone structures.

Tertiary sediments are met with around Fort Norman, where, resting unconformably on the Cretaceous they occupy a basin of considerable extent. They are said to consist of:

	Feet.
Grayish and light sandstone with many large concretions; conglomeratic in places. Beds of lignite, plants and shells	100

The Glacial and Recent deposits have already been referred to. They consist of Glacial till with boulders, sands and river deposits of varying thickness, and are widely distributed over the area, only the higher mountains remaining uncovered.

Petroleum.

The evidences of petroleum are many and widespread throughout the region, and consist of bituminous rocks, burnt shales, pools of asphalt and seepages of gas and oil. It was considered that ample justification was forthcoming for the assumption that an oil-field of respectable dimensions awaited the drill, the reasons annexed being:

(1) The presence of strata capable of generating oil.

(2) The presence, above this, of porous strata capable of holding the oil.

(3) Geological structure such as to facilitate the concentration of the oil.

(4) Surface indications of gas, oil, and bitumen.

One word of caution may be added, however, to allay any excessive spirit of optimism regarding the area. It is well known in oil geology that oil is usually found in anticlines or up folds of the rocks. Such folds are found in the Mackenzie basin, but most, if not all of these so far found, have been eroded down to, or below, the Hope shales, which appear to be the source of the oil. In other words the crests of the folds on which the big production would be expected, have been eroded and the pools of oil which

Fig. 14—Hauling the boiler into place at Oil Creek.

Fig. 16—Winter quarters at Oil [illegible]

doubtless existed here in Pre-Cretaceous time have been, to a large extent, lost. Only the flanks of the folds remain for exploration.

The first test-well in the Mackenzie basin was located on the delta of "Oil creek" about 40 miles below Fort Norman, and drilling commenced in the late summer of 1919. At this point the presumed oil sands are near the surface and the well was designed to furnish information concerning the nature, thickness, and lower limits of the oil-bearing strata, no great production being expected. The record of the well, which was started in the Lower Norman sandstone, shows indications of oil from 80 feet downward throughout the remainder of the Norman series and

Fig. 17—The garden at Oil creek, where potatoes, peas, lettuce, radishes, turnips, carrots, etc., were successfully grown.

the underlying beds. As the depth increased the showings grew larger, until finally a flowing well was encountered at 783 feet in the Hope shales. After flowing for 30 minutes the well was successfully capped. Since there were no facilities by which the flow could be measured, definite figures are not available.

The importance of the strike is largely discounted by certain authorities because of the fact that the production was obtained in shale and not in sandstone. It should be noted, however, that besides getting production in the shale, the well proved the overlying sandstones to be oil-bearing to a certain extent, and justified the further development of the area with a view to testing their capabilities as commercial producers. Until this is done, we must exercise caution in dogmatizing regarding the ultimate issue.

Development.

Perhaps a word is necessary regarding the vexed question of the transportation of the crude oil from the field to the refinery, wherever situated. This aspect of the case has been widely discussed, and

Fig. 19—Striking oil. The well was begun with a 10-in. and finished with a 6-in. casing. On striking the deposit, the oil flowed for thirty minutes out of the 6-in. casing; after the flow had subsided the well was capped and a 2-in. "choker" and valve put in. The photograph shows the oil gushing out of the 2-in. pipe. It is of about 38 degrees Baume and is rich in light products.

practically every known means of transportation suggested, with the possible exception of the submarine.

It is, of course, perfectly clear to anyone who gives the subject more than superficial attention, that no company or individual producer will ever dream of

organizing any seheme of transportation before the resourees of the field have been thoroughly tested, and an idea obtained of the ultimate produetion. To do otherwise would be foolish in the extreme.

The difficulties and dangers of travel in these northern regions have been fully experienced by our drilling and geological parties during the past years. Their tales of shooting the rapids, storms on the lakes, hardships and delays at the portage, mosquitoes, and the long Arctic night, would not disgrace the pages of Fenimore Cooper, except that the 'noble red man' has now forsaken his tomahawk for a more highly commercialized form of 'scalping.'

That the initial produeer in this new field is 1470 miles from Edmonton, the nearest eity, 1,170 miles from MeMurray or 1,430 miles from Peace River, the nearest railway points, that insuperable barriers to continuous river travel are encountered in the rapids at Fort Smith and Vermilion, that the open season on the lakes is limited to 3½ months and on the rivers to six months, that labour is searee and expensive, and the country, as yet, ineapable of supplying suffieient food for its present population, are all factors whieh must be faced and overcome in any scheme for the development of the area.

Those whose interests are, or may be, conneeted with the solution of these problems can safely be left to deal with each difficulty as it arises and every need as it becomes clamant, and, should these northern territories eventually become one of the world's oilfields, there is no doubt but that their product will find a way, however devious, to the market.

Fig. 18—Timber on Bear Island, where the company's No. 2 well is located. The log cabin may be seen in course of construction in the background.

Fig. 20—Shooting the rapids at Smith with an empty scow. According to the pilot these particular rapids had never before been 'shot'.

PERSONALS

James Cumberford, of Amherst, has been appointed general manager of the Maritime Coal, Railway & Power Co. of Joggins Mines, succeeding R. J. Bell. Mr Cumberland was born in Scotland, and his mining experience includes work in South America. N. T. Avard, for twelve years accountant and secretary-treasurer of the Maritime Company, is appointed assistant manager. Mr Bell has been general manager for eight years, and during his term of management he has very successfully developed a difficult property.

Mr. J. E. Hammell has returned to Toronto after making a trip to Prince Albert and Winnipeg in connection with negotiations concerning the Elbe Flow property of which Mr. Hammell and his associates are the chief owners.

Mr. W. A. Carlyle, formerly managing director of British America Nickel Corporation, is in France.

Mr. J. B. Tyrrell, who recently returned from a trip to Alberta, is now visiting mines in Ontario in company with Mr. Frechville of London.

Mr. R. E. Hore, of Toronto, is compiling a book on mining companies operating in Ontario.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

The price of silver has shown renewed strength during the past week. The quotations for the metal have become the barometer which, more than ever before in the history of silver mining in Cobalt, is to regulate the extent of work. So close is the margin between profit and loss that a slump in price threatens the welfare of operating mines, while a rise in quotations holds out promise of the closed-down properties being able to operate.

The directors of the Nipissing Mining Company announce that the dividend for the second quarter of 1921 will be 3 p.c., instead of the usual 5 p.c. This reduction is due to a decline in net profits realized during the first quarter of the year. In recent years, the Nipissing has paid dividends at the rate of 5 p.c. quarterly, plus two bonuses of 5 p.c. each, making up a total of 30 p.c. a year. Just how long the reduced rate of 12 p.c. will be continued will probably be determined by the price which silver is to command on the markets. The company has a surplus of close to four million dollars, but is apparently desirous of preserving this for the time being.

A fire during the past week broke out in the shafthouse of the Nipissing at its Meyers shaft, and completely wrecked the structure. A large quantity of the better grade ore being treated by the Nipissing has been coming from this shaft, and until the shafthouse is replaced by a new one, the production figures may be under normal.

Concerning the Chambers-Ferland mine of the Aladdin-Cobalt Company, which has now come under the control of the Kirkland Lake Proprietary (1919) Ltd., some detailed information has been received by the correspondent of the Journal. H. G. Latilla and Conrad E. Jorgenson, who recently visited the property, and returned to England last month, have issued a statement in which this information is offered:

"This property (the Aladdin-Cobalt) immediately adjoins the famous and highly successful Nipissing Company's Mine; for some time past that company has been carrying on extensive development work right on your boundary — and at recent dates have in three cases followed rich silver veins into your ground. They are very good neighbours and at all times have assisted as in every way possible.

"The position to-day is most interesting as the veins in the three cases referred to are on the fringe of an important tract of undeveloped ground owned by your company, situated in the very heart of Cobalt.

"To make matters clear — In one place the Nipissing Company has broken a quantity of valuable ore within our boundary, the silver value of which it is not yet possible to estimate. At another place it has entered a portion of our ground estimated to contain 175,000 ounces of silver. In both these cases we have arranged with the Nipissing Company to raise and mill the ore, charging us only exact cost—their costs being the lowest on the field. This work is now progressing.

Concerning the foregoing, enquiry at the mine office of the company goes to show that further favorable results have occurred since the above statement was made. Charles Richardson, resident manager of the mine informed the "Journal" that the company is now shipping about 25 tons of ore daily to the Bailey Customs Mill, in addition to bagging a substantial amount of high-grade ore.

Nothing official has so far been secured as regards the likelihood of the Mining Corporation resuming work. Unofficial reports have been in circulation to the effect that the mine would be re-opened some time in May. This company is receiving a good deal of publicity on the strength of it having been identified with the syndicate which recently dropped an option on the Flin-Flon property in Northern Manitoba. It has since been reported that the Mining Corporation, together with certain English interests, has opened negotiations with a view to securing a new option. At the time of writing, it is officially stated the deal has not actually been completed. Incidentally, it is announced from Winnipeg that the Provincial Government of Manitoba is willing to construct a railway to the mine provided the holders of the option will advance a million dollar bond as a mark of good faith.

The report of the Manager of the Nipissing Mining Co for March is as follows:

"During the month of March the Company mined ore of an estimated net value of $156.775 and shipped bullion from Nipissing and custom ores of an estimated net value of $336.584. The value of the silver produced was estimated at 56-7/8 cents per ounce.

There were no underground developments of unusual interest during the month. The Low-Grade Mill treated 7,330 tons. The High-Grade Plant treated 90 tons. The Refinery shipped 592,518 fine ounces of bullion."

Arthur A. Cole, mining engineer for the T. & N. O. Ry., submits the following statement of ore shipped over the railway from Cobalt during March:

ORE STATEMENT.

(In tons of 2,000 lbs.)

SILVER ORE.

Cobalt Proper	Tons
1. Bailey Silver Mines	25.41
2. Coniagas	65.48
3. LaRose	122.46
4. O'Brien	32.00

The above shipments were made to the following companies:

Mar. 22nd.	58.750
Mar. 5th.	52.625
Average	56.023

Elk Lake and Gowganda.

Not more than 100 men are engaged in the Gowganda district, although this Spring promises to witness a moderate increase in the scope of work. At the time of writing about 75 men are employed altogether at the Miller Lake-O'Brien and the Castle. A number of other small operations are either started or will soon be working, among them being the Powerful, Thompson Gowganda, Silverado, Gowganda Enterprise, etc.

Gowganda is paying a heavy price for not having been given railway transportation facilities. Despite the fact that the Miller Lake O'Brien developed one of the richest silver-veins in the world, and in spite of many

hundreds of promising veins in which silver occurs in encouraging quantities, the cost of working property in the Gowganda field has proved to be a burden which has prevented even a moderate degree of success. As pointed out at the recent annual meeting of the Canadian Institute of Mining and Metallurgy, by W. E. Simpson, the question of transportation is one of the problem which must be solved if mining progress is to continue. Mr. Simpson pointed out that the cost of working a mine is added to the extent of one dollar a ton on all the ore treated, for each mile a mine may be removed from railway transportation. Provided this works out, it is obvious, therefore, that the wagon-haul of 27 miles from the railhead to Gowganda has added at the rate of $27 to the cost of treating each ton of ore taken out. The burden is something which not even the richest mines could carry for any very great length of time. And, the present slump in connection with work in the Gowganda district is due more to the lack of good transportation than to lack of merit in the mineral possibilities of the area.

South Lorrain.

High-grade ore has recently been encountered on the Haileybury Frontier property, and a substantial quantity has been bagged ready for shipment. The property was originally opened up for the purpose of taking out Cobalt metal, and with the expectation of recovering low silver values as a by-product. Those who control the enterprise, also control the Haileybury Silver and are making a bid for the Forneri property.

Captain D. Stairs, manager of the Keeley Silver Mines has arrived at the property, and this mine will join the producing list at as early a date as possible to get underground work under way and preparations completed to send ore to the 20-stamp mill which was installed last summer and fall.

During the week ended April 15th, the La Rose Consolidated was the only company to ship ore from Cobalt, this company sending out two carloads weighing approximately 125,886 pounds.

During the corresponding period the Nipissing continued to send out silver bullion, and on April 11th sent out 77 bars containing 100,511.29 fine ounces.

THE GOLD MINES.

The Porcupine District.

Big achievements are marking the activities at the leading gold mines of the Porcupine district. During the past two weeks or so, the Hollinger Consolidated has increased its production by nearly 100 p.c. This big increase, together with the headway being made at the Dome and the McIntyre, has created general enthusiasm.

An unexpected incident of the week is the decision of the directors of the Porcupine V. N. T. Mines to defer for a further period the date of re-opening the mine and mill. This decision was reached in the belief that economic conditions will still further readjust themselves to the advantage of gold mining. While this decision is regarded as being the better part of wisdom, yet it is contrary to what had been anticipated by those shareholders who have been waiting patiently, or impatiently as the case may be, for the mine to resume work. It has been pointed out officially, however, that the Porcupine V. N. T. is in a strong physical condition, and that its favorable situation in relation to labor supply, railway transportation and hydro electric power may be considered excellent. It is reported this week, that certain mining interests said to be identified with the Hollinger Consolidated have made a bid of 10 cents a share for the control of the Porcupine V. N. T., but it is understood the offer has been rejected. It is intimated that 10 cents a share would be acceptable for stock remaining in the Company's treasury, but the present control would not be willing to relinquish control at that figure.

It has been decided to erect about 130 new houses in Timmins, the location chosen being on the plains to the west of the town. Contracts have already been let, and the work will proceed as rapidly as possible. It was recently stated the present ball-grounds might be used for the purpose, and a new field for sports established somewhere else, but this plan has been abandoned for the time being. The new dwellings are being put up by the Hollinger for the accommodation of its employees.

A number of new mining operations are being planned at Porcupine, and a number of more or less important deals are pending. Among these may be mentioned the Goldale Mining Company which is taking over a large acreage of mining land formerly held by the Bewick-Moreing interests.

Mining Inspector J. C. MacMillan, expressed the belief to your correspondent that the gold mines would reap great benefit from the fact that the new men being added to their forces have had previous mining experience. The silver mines have laid off approximately 1,200 men within the past year, while the nickel mines of Sudbury have also laid off many hundreds of men. These workers, or a large part of them, are available for the gold mines which are now speeding up to full capacity. The benefit of being able to engage full forces would in itself be important, but is made doubly so when these full forces are made up of experienced miners.

Kirkland Lake District.

Official advice to the "Journal" confirms earlier rumors that the Tough Oakes Gold Mines will resume work immediately. In a detailed report, Messrs. Latilla and Jorgenson, of London, England, who recently visited the properties, state that work will commence about the end of April, and development will be carried on aggressively. By the end of August it is believed the development work will have placed sufficient ore in sight to warrant a re-opening of the mill, at which time this mine will join the producing list and will treat from 110 to 140 tons of ore daily.

It is reported unofficially that negotiations have been opened between the Ontario Kirkland Gold Mines and the Hunton-Kirkland, in which the first named company is making a bid to secure control of the company. No details have been secured. In the meantime, the Ontario Kirkland has commenced the construction of a new mill which is designed to treat 100 tons of ore daily.

According to information by mail, a special general meeting of stockholders of the Miller Independence Mines, Ltd., was held on Saturday, last, at the Phillips Hotel, Dayton, Ohio, Mr. Wm. Stroop, president of the company, occupying the chair.

To comply with the legal formalities in determining whether a quorum was present, a poll was taken prior to the opening of the meeting and it was found that out of a total of 577,000 shares issued, more than 116,000 were then represented directly or by proxy, which number was considerably increased by later arrivals, all of which indicates the personal interest being taken in the progress of the enterprise.

The object of the meeting was to discuss means for financing the company by the sale of treasury stock, or through other channels, so that the company's Treasury could be kept well supplied with funds ahead of every other consideration.

Mr. John C. Schaeffer, secretary and treasurer, read the financial statement, and an active discussion ensued in which Judge O. B. Brown, Mr. Tomlinson, Dr. H. V. Dutrow and other stockholders took prominent part.

The general inclination was in favor of a "pooling" of all stock until such time as $50,000 could be obtained through the exclusive sale of treasury stock, and various means were suggested of collecting all existing stock issued, either through re-naming the company, re-capitalization, or by adopting some method of re-organization.

The additional cash now required is for an extensive campaign of diamond drilling, the appliances and crew for which are all ready to start, and for the installation of a small test mill for treating ore extracted during development by the preliminary treatment process of crushing, concentrating and amalgamation.

A committee of five representative stockholders was appointed to co-operate with the directors in an advisory capacity and to report to a further general meeting of stockholders to be held on the 23rd of April, which would be considered as an adjourned meeting of the one just held. The five stockholders of the advisory committee were selected to represent the interests of the districts in which they reside, two from Dayton and one each from Germantown, Springfield and Xenia, all in Ohio.

CANADIAN INSTITUTE OF MINING AND METALLURGY.

Secretary-Treasurer's Western Tour 1921.

The following itinerary will be followed as closely as circumstances will permit, and unless advised, by wire, to the contrary local secretaries may expect the Secretary-Treasurer on the dates specified. If it is desired to hold meetings at other points than Branch headquarters the Secretary-Treasurer should be advised in ample time.

Leave Toronto,	Tues.,	May	10th,	10.00 p.m.

LIGNITE BRIQUETTES AT $11.50 PER TON.

The Attorney-General of Manitoba stated that in the Legislature on the 15th April that lignite briquettes from the plant at Bienfait, Saskatchewan, would be delivered in Winnipeg at an inclusive cost of $11.50 per ton. Seventy thousand dollars was included in the Manitoba estimates as that province's share towards the excess cost over estimates of the briquetting plant caused by rise in material costs. The Saskatchewan Government and the Dominion Government are jointly contributing towards the excess cost, as they have done toward the first expenditures.

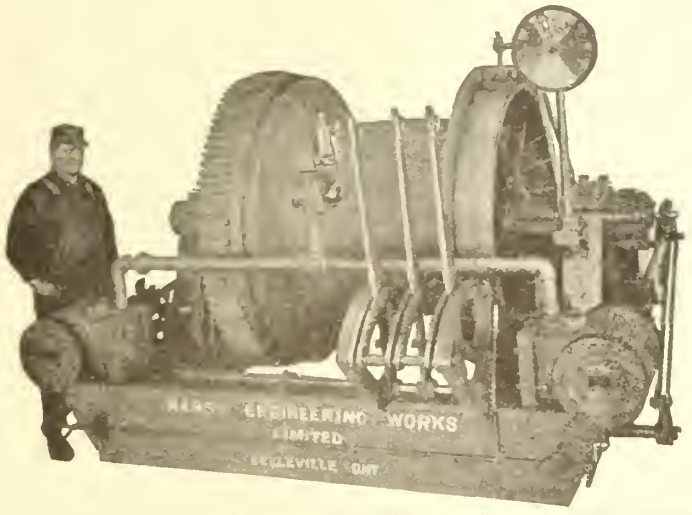
TYPE "F"
MARSH MINE HOIST
STEAM or ELECTRIC

STEAM POWER

The twin cylinders develope 55 Horse Power with a liberal allowance of 25 per cent friction loss.

The 40" Drum will lift 5100 lbs. at a speed of 360 feet per minute.

Shipping Wt., 20,000 lbs.



Friction Drive, 40" Dia. Drum, Reversing Links, Cast Steel Gears.

ELECTRIC POWER

Will take any size motor up to 100 Horse Power.

Using a 100 H. P. motor, the 40' Drum will lift 6000 lbs. at a speed of 550 feet per minute.

Shipping Wt., 17,700 lbs.

TYPE "F" MINE HOIST is the largest and most powerful Mine Hoist that we build at the present time. The large choice of drum diameters, as listed below, and the equally large choice of rope speeds makes this Hoist adaptable to most any depth now being worked in Canada.

All gears in these **TYPE "F" HOISTS** are made of the best grade Cast Steel, all parts proportioned to give the maximum strength without undue weight.

The Depth Dial is arranged to suit the depth of the mine where the hoist will be used.

These Hoists are made with either Friction Drive as shown, or with the Drum keyed fast to the shaft, so it cannot revolve in either direction except by power.

SPECIFICATIONS OF TYPE "F" MINE HOISTS
FRICTION DRIVE

STEAM POWER

Based on 100 lbs. Steam Pressure in the Boiler. If 125 lbs. pressure is used, add 25 per cent to the load lifted, the rope speed remaining the same.

Diam. of Drum	Length of Drum	Depth of Drum Flange	Weight Lifted in pounds	Rope Speed in feet	Estimated Shipping Weights	Telegraphic Code Words
24"	36"	18"	8000	226	18500	Bilker
30"	"	15"	7000	360	19000	Edelic
36"	"	12"	5600	325	19500	Edership
40"	"	10"	5000	360	20000	Efficient
48"	"	6"	4200	420	21000	Egelliad
54"	"	3"	3800	485	22000	Eklund

ELECTRIC POWER.

Based on the use of a Motor of 100 Horse Power rated capacity. If a smaller motor is used, the load lifted will be reduced in proportion, the rope speed remaining the same.

Diam. of Drum	Length of Drum	Depth of Drum Flange	Weight Lifted in pounds	Rope Speed in feet	Estimated Shipping Weights	Code Words Without Motor
24"	36"	18"	13750	240	16100	Mingow
30"	"	15"	8000	440	16300	Minhet
36"	"	12"	6600	500	17000	Mirror
40"	"	10"	6000	550	17500	Mizzen
48"	"	6"	5000	660	18400	Mohair
54"	"	3"	4460	710	19000	Mohawk

NOTE.—In the Electric Hoist we can readily reduce the Rope Speed to any desired figure thereby increasing the Weight Lifted in like proportion.

BUY IN CANADA. SAVE THE DUTY AND EXCHANGE.

SUDBURY NOTES.

D. E. CUSHING.

A certain amount of work is being carried on at the Murray Mine of the B.A.N.C. while the future of the Corporation is being fought out by the leading financial interests.

It is pretty hard to see daylight at present and many local people interested in its success think that a less pretentious scheme of financing will have to be devised. The O'Brien interests lost and gained in their application to make permanent their injunction proceedings which tied-up the financial re-organization meeting. Mr. Justice Middleton dismissed the application but in doing so issued a warning that the O'Brien interests had cause and suggested some settlement. This led Mr. I. F. Hellmuth, Counsel for the Trust Company to declare that he would advise his clients that they go no further with the scheme.

And so matters stand, where the next step will come from or what the next move will be no one knows. There are reports that the big industry is gone but these bearish reports have no foundation in fact. There is too much capital tied-up and though the proposition has been a loser financially so far, it is no different than any other mine in this regard. It is the rare property that makes money while developing. The consensus is that money was spent on the property with rather a lavish hand, also that certain development work must be done to make for efficient mining and to ensure a continuous supply of ore for the smelter, and this with real efficient mining and good business administration, should, when markets for copper-nickel improve, make for a great and paying industry.

The International Nickel Company has turned loose another large body of men. Since the last curtailment, the men have only been working part time. This was to ensure all that they would have enough to live on. However with the advent of Spring, the older employees were put on full time and the surplus of younger men turned loose. There are many rumors about in regard to the Company. One is that there are to be important changes in organization and another that the latest curtailment is but a prelude to a complete shut down.

Certainly the International has a tremendous supply of nickel matte on hand for which the market at present is non-existent. Not long ago Mr. Agnew stated that he hoped the market would pick up in six months, but he pointed out that their main hope for a market was from the auto and steel industry and that these industries would have to go ahead first.

TORONTO NOTES.

Flin Flon Mine.

Reports from Winnipeg and Prince Albert indicate that a new deal regarding the Flin Flon mine has been arranged. The Toronto company which is reported to be one of the purchasers has not yet given out any statement concerning the truth of the reports and it will probably be some days before the results of the negotiations are known. Mr. J. E. Hammell is at present in ths West and is believed to be actively engaged in arranging a new deal.

According to the report from Winnipeg the syndicate which has secured an option for one year on the property includes the Mining Corporation of Canada and British interests represented by Mr. Eric C. Rose of London. The Mining Corporation was interested with W. B. Thompson and associates of New York in the option which expired April 1. A large sum was spent in developing the property last year and the results are understood to have been very good and confirmatory of the evidence previously obtained by diamond drilling. It would not be surprising if the report that

the Mining Corporation was satisfied with the results obtained should prove to be correct. This belief lends significance to the reports now appearing in the papers and many will believe that a new deal has been or is being arranged.

Porcupine V.N.T.

At a meeting of shareholders held on April 12 the question of reopening the Porcupine V.N.T. mine was discussed. It was decided that it would be necessary to postpone the resumption of operations until conditions improved. The company needs a large sum to carry out its plans for development and eqnipment and will not attempt to proceed with its plans until money is more plentiful and costs lower.

Major J. Macintosh Bell, vice president, reported that the mine is in good shape. The Associated Gold Fields of Australia is largely interested in the enterprise and is expected to assist in financing it. The directors of Porcupine V.N.T. Gold Mines are Sir Henry Pellatt, Major Bell, J. W. Bain, J. H. Black, R. T. Shillington, W. H. Stafford and Capt. Denis Stairs.

Kirkland Lake.

It is reported that operations will shortly be resumed at the Tough-Oakes mine. The Wright-Hargreaves is expected to put its mill in operation about May 1. With these two companies and the Lakeshore, Teck-Hughes and Kirkland Lake companies actively mining the main ore deposit of the Kirkland Lake area will be the source of a very large annual output of gold.

EDITORIAL

THE SCOPE OF THE ENQUIRY OF THE FUEL COMMITTEE.

The reference of the parliamentary committee on the fuel supply of Canada instructed them to enquire into "all matters pertaining to the future fuel supply of Canada", and for that purpose empowered them to question witnesses and require the production of records.

The main object of such an enquiry as the Committee was directed to conduct might be expected to educe the facts concerning the extent and availability of fuel resources in Canada, their stage of development, and their ability to supply the future population of this country.

Up to now, however, the Committee has concerned itself more with the cost of Canadian coal to the National Railways, rates of miners' wages, housing conditions, corporation finance and the finding of freight business for the Canadian Mercantile Marine than with the major questions of reserves, development and future output of power from our fuel resources.

As an example of the attitude of the Committee, it may be mentioned that after much debate among the members, (some of the Committee being unable to see the relevance of the request to the warrant of the Committee) it was determined to require the personal presence of the auditors of the coal companies whose representatives had been examined, and the production of the original mine-cost sheets for each month from 1912 to date. For the Nova Scotia coal companies concerned alone this request requires the bringing to Ottawa of between 3,000 and 4,000 sheets of complicated calculations, any one of which, properly studied, might occupy the time of the Committee for days. It may be further mentioned that complete information on the coal mine production costs of Canada, to within quite recent months, is in the hands of the Government at Ottawa, through the returns required to be made to the Fuel Controller, and a mass of information, which covers production, sales, distribution, mining, transportation and retailing costs, is available in concise and understandable form in the office of the Fuel Controller.

Without minimizing in any way the capacity of the Fuel Committee, it is quite evident that if it undertakes a thorough-going inquisition into the entire business of the coal companies of Canada its sittings will be interminable, and even then but little of practical helpfulness in enlarging the development of Canada's fuel resources will be brought about, as the enquiry, so far so far we are able to assess its results, has led to criticism and discouragement of the few companies in Canada who are really helping the fuel problem by producing fuel.

The apparent diffidence of those intimately connected with the production of coal in giving out statements of cost is the natural fear that by disclosing the nakedness of the land too openly they may discourage Canadian people in belief in national fuel competence and may hearten our competitors in the United States to further continue their invasion of competitive coal markets in Canada and elsewhere. We doubt very much whether the broadcast publication of the admittedly abnormal costs of coal production at this time is in anybody's interest, except that of the United States producer of coal. It is an additional bolt for his quiver.

One fact that has so far escaped the observation of the Committee is that the high cost of coal production in Canada today is—so far as the century old industry in Nova Scotia is concerned—that coal has been sold in past years at prices below the cost of production because the coal companies have proceeded under the erroneous belief that the cost of coal consisted in the addition of the out of pocket expenses of labour and material expended in its production. They left the reckoning of depreciation, depletion of reserves, redemption of capital, disaster reserves, and the cumulative costs of undersea mining to posterity, and unfortunately, this generation happens to be that posterity. In the United States coalfields that supply Canada with coal today a similar error is being committed, and while the central provinces of Canada have reaped the doubtful advantage of getting an essential article for many years at less than its true cost the same kind of reckoning is on the way for the United States and its customers, although that reckoning may be deferred longer because of the unparalleled opulence of the coal reserves of the United States.

Another fact that the public does not grasp [illegible]

the high cost of coal production at this time, and the disappointingly gradual nature of the sealing-down of that cost, is a direct and foreseen result of the disorganization of the working forces at the coal mines in Canada that resulted from disproportionate enlistment of coal miners during the War.

The coal-mining industry today in Canada is paying, in high production costs and public discredit, for the sacrifices it made during the war. Conversely, the coal-mining industry in the United States, is reaping the reward of huge production during the war period, and of the circumstances connected with the entrance of the United States into the War that enabled it to draft men into its coal-mines, and not out of them. Not until the coming of new generations of miners, or until immigration has repaired the losses of the war, can coal-mining in certain parts of Canada hope to function as efficiently as it did in 1913.

PROTECTION OF PROFESSIONAL REPUTATIONS

The provision of the Professional Engineers Act of Ontario requiring that mining properties shall be reported upon by qualified engineers would seem, at first sight, to afford some hope of protection of the investing public against the supporting of fraudulent mine promotions by the reports of fake mining engineers. But is there any necessity for such a safeguard? Persons who commit frauds are not scrupulous in using the reports of qualified mining engineers, and, as everybody knows, they do it repeatedly by detaching opinions from their context and making entirely unauthorised use of written opinions without regard to the date of such opinion or its accompanying qualifications.

It is the fraudulent use of qualified opinion that is to be guarded against, and, for the purposes of the crook, the more reputable the name he misuses the greater the lure. That is why he uses it. As a factor in promotion literature the reports of pretenders to engineering ability are not important.

A speaker at the recent Annual Meeting of the C. I. M. & M. in Montreal, taking part in a discussion upon "blue-sky laws", very properly said that, from the standpoint of the engineer, the protection of his repute was of greater importance than the protection of the public against financial fraud. After all, in such matters as mine valuation, the probity of the examining engineer and his business acumen are assets not less to be desired than scientific competence, and there is no person that so innocently lends himself to the studied iniquities of the fraudulent promoter as the scientist. That is why an idea of professional qualifications which is based too exclusively on the possession of scientific knowledge, or upon a prescribed course of apprenticeship, will always meet with a certain degree of indifference from capitalists who have learned to put great stress on the personal equation and on ordinary horse-sense.

THE PROFESSIONAL ENGINEERS ACT OF ONTARIO.

The Professional Engineers Act of Ontario received its first reading on April 6th. It provides that no person can lawfully practise as a professional engineer, or collect fees for his work and advice in professional duties, unless he is a registered engineer under the provisions of the Act.

The mining industry is interested in a general way, inasmuch as most branches of engineering are represented in the daily routine of the mining engineer, but it is specifically interested by reason of the wording of the Act, which includes in the interpretation of the term "professional engineering", the advising on, the reporting on, the designing of, the supervising of the construction of, and the appraisal of "mineral property, mining machinery, mining development, mining operations, gas and oil development, smelters, refineries and metallurgical machinery".

So far as can be gathered from the rather indefinite drafting of the concluding provisions of the interpretation clause, the actual operation of mining properties and metallurgical works is not limited by the Act, so long as this proceeds under the direction of a professional engineer. The Act does not lessen the force of the Ontario Mines Act, the Stationary and Hoisting Engineers Act, or other well-established industrial statutes.

Apparently, therefore, the Act, so far as mining is concerned, will principally affect that class of men in private practice as consulting and reporting engineers, and will be inoperative and impossible of enforcement, because the gentleman who pays the piper calls the tune, and no law can be enforced to limit a capitalist in his selection of a man for the purpose of advising on and reporting on the value of mineral properties, or for the designing of mining structures, mining machinery and metallurgical processes.

It is pleasing to note that the scope of the term "professional engineer" is less cosmical than the definition which was attempted in a draft of a similar enactment in British Columbia, and included all branches of geology, both economic and pure research.

While the object of engineering status legislation is salutary, it being, we understand, intended to protect the public against incompetents and pretenders to engineering knowledge, there is a danger that it may come to be regarded as the refuge of the mediocre, and it may even be interpreted to the repression of invention and initiative if the letter of the Act be followed to the exclusion of its spirit and intent. For example, it is prohibited that anyone but a registered professional engineer shall advise upon and design metallurgical processes. How many epoch-making inventions have been evolved by men who were not professional engineers? To take but one example, that of the clergyman who invented the Capell ventilating-fan which bears his name; under the Professional Engin-

eers Act of Ontario, as drafted, that gentleman would have been refused the opportunity to develop his invention, as well as membership in a professional engineering society, both of which were freely granted to him in Britain. It is not recorded that the profession suffered thereby.

The Act proposes the limitation of the illimitable, the definition of the indefinable, and the specification of "engineer", which is a science inherently unspecifiable, in a paragraph. We imagine that if the Act is made law in Ontario it will prove as unenforceable, so far as mining matters are concerned, as similar acts on the statute books of Nova Scotia and Quebec.

MINING IN MANITOBA.

The "Journal" is informed by a correspondent in Manitoba that the overdone and far-fetched promotion advertising of mining flotations that has been a disgraceful feature of Winnipeg newspapers in recent months has had the inevitable result of killing public interest in the progress of mining in Northern Manitoba, and of frightening away enquiring investors. Hundreds were invested by persons who were promised millions in return, and naturally the millions are not forthcoming. In the Rice Lake district, in particular, quite a little money has been spent in furtherance of promotion schemes, but mines are not usually worked and developed by brokers. Dr. Alcock and Prof. DeLury have both been careful to point out that there are some really promising prospects in this district, but that no financial success is to be looked for until cooperative effort succeeds individual operation of properties, and until facts are substituted for fiction in the prospectuses issued by persons who are much more interested in mining the public than they are in mining gold out of the ground. A friend of the "Journal" writes in part as follows: "Surface indica-"tions and geological formations in this district can "not fail to impress one, and it is altogether unfortu-"nate that we cannot get legitimate assistance to go "ahead. It will undoubtedly come in the very near "future, but, for one reason or another, many good "mining properties have passed into the hands of out-"side capitalists when it was too late for those on the "spot to realise what opportunities were missed, "chiefly for the reason that stock promoters made "things look absolutely ridiculous to the business man, "whereas they had a good honest proposition all the "time..... We have too much evident wealth in "Manitoba to have it fooled with any longer."

The body primarily concerned in this matter is the Manitoba Government, which has a duty to perform in protecting the good repute of the Province. The protection of the public against fraudulent mining stock-issues is admittedly a difficult task, but it is one that many persons sincerely believe devolves upon the government that issues the charter of incorporation. The duty of protecting the good name of a province is, however, very plainly that of the provincial government. Whatever legal means the Province of Manitoba may now have of squelching the lying advertisements that have been scattered abroad throughout Canada and the United States should be quickly used, and if the statutes are insufficient to protect the repute of mining in Manitoba, new enactments should be considered.

In appointing a Commissioner for Northern Manitoba, and in arranging for widespread publication of geological reports that tell the truth about mineral prospects in that largely unprospected territory, the Government of Manitoba has acted well and wisely. In this regard no province in Canada has improved its opportunities more quickly and more judiciously, but, unless quick steps are taken to "check exaggerated stories and illegitimate promotions" (to quote Prof. Delury) the good work of the past will go for naught, and Manitoba will get a bad name.

There are citizens of Manitoba who have put good money into the development of mining prospects, and they have refrained from publishing prospectuses or seeking to interest the investing public until they could honestly state that they had proved a body of ore that justifies the development of a mine. The probity and legitimate enterprise of these men should be protected against the operations of about as fine a collection of unscrupulous promoters as North America can show, if the literature now emanating from Winnipeg is any criterion.

MR. RICKARD ON DISCUSSION OF TECHNICAL PAPERS.

In "Mining & Scientific Press" of March 2nd, Mr T. A. Rickard comments on the March bulletin of the Institution of Mining & Metallurgy, which contains 12 pages of discussion and 17 pages of original contribution. "This proportion" states Mr. Rickard, "is a normal one with our mining engineering friends across the Atlantic, and indicates a healthy interest in what is being published by their society." He deplores the failure of papers read before the A.I.M.M.E. to elicit discussion, and asks, "Are we afraid, too tired, or too busy, to criticize, to comment, or to give credit where credit is due?"

"In Toronto cellars there are large quantities of minerals which might be interesting in a museum, but are of no value for heating purposes. Apart from the injustice to the consumer, there is waste of power in carrying these specimens from the mine to the home." Thus comments a Toronto newspaper. The reference is presumably to anthracite. We suggest the use of gas fuel, obtained from coke ovens, using bituminous coal, and yielding by products. The day when anthracite will be exhibited as a museum specimen in Toronto is one that our grandchildren may see. They may also amuse themselves by reading of the current practice of the Twentieth Century in burning fuel for communal uses in a vast number of individual fire receptacles. The use of solid, or "raw" coal, will be looked back upon as a not less inexplicable practice. Even at this date it is an expensive anachronism, and a thorough-going public nuisance.

The Passing of a Canadian City.

By C. M. CAMPBELL.*

Phoenix, in the province of British Columbia, is, by the grace of the laws of that province, classed as a city. Incorporated over twenty years ago, with a population of 800, it gradually increased until it contained over 2,000 residents. In the last few years, however, citizen after citizen has packed up his belongings and moved elsewhere and its present claim to notice is the fact that it is completely abandoned. When the results of the coming census are published it will hold a record that it is hoped will be approached by no other community.

Worked-out and deserted lode-mining camps in British Columbia are few and usually commemorate an industry of small size. In the case of Phoenix, with its schools, churches, banks, graded and paved streets and other attributes of city life, the industry was of such a size as to give the camp a prominent place among the world's mining districts. Ores from Phoenix supplied the entire tonnage of the Grand Forks smelter, for years the largest smelter in the British Empire and the second largest in the world; an appreciable part of the tonnage smelted at the Greenwood smelter, also a smelter of the first magnitude; nearly the entire tonnage smelted at the Boundary Falls plant and a million tons of the total smelted to date at Trail. From these ores, amounting to 16,000,000 tons, about 350,000,000 pounds of copper and $16,000,000 in gold and silver have been produced, having an aggregate value of $65,000,000.

For many mines the shipment of a carload of ore is an event of some importance, while the shipment of a trainload at a time is worthy of record. The Phoenix output was on such a scale that, for the greater part of two decades, with almost clockwork regularity, year in and year out, four train loads, comprising over 4,000 tons and often over 5,000 tons, were sent down the hill every twenty-four hours.

That Phoenix appeared on the map when it did is one of the results of the building of the Dewdney Trail through Southern British Columbia. Prospectors, using that trail as a base, penetrated the Boundary District and located the chief claims about Phoenix in 1891, at almost the same time as the locations were staked on the slopes of Red Mountain, which afterwards caused such a rush to Rossland. Due to the lack of railway facilities, the Phoenix properties were much slower in being developed and it was not until 1900 that shipments began and the city was incorporated, taking its name from one of the claims included in the townsite.

Looking North over Phoenix, B.C.

Among the mining companies operating there the chief place must be given to the Granby Consolidated Mining, Smelting and Power Co. Financed chiefly by Eastern Townships capital it took its name from Granby, Que., the home of the late Mr. S. H. C. Miner, its first president. The controlling interest was later sold to New York parties. MacKenzie and Mann were also identified with Phoenix, in connection with the organization known as the Dominion Copper Co., which was later absorbed by the B. C. Copper Co. This company in recent years, as the Canada Copper Corporation, opened up the big mine near Princeton, B. C. The Gold Drop mine, owned in Montreal and the Snowshoe mine, owned in England, after being operated by the original companies, or leased, were later taken over by the Granby Co. The Phoenix Amalgamated Co., organized by Sherbrooke, P. Q., capital, was latter sold to the Consolidated Mining and Smelting Co. of Trail.

*Resident manager, Granby Consolidated Mining & Smelting Company, Grand Forks, B.C.

In the early days nearly all the inhabitants were English-speaking. The fact that Eastern Townships money was heavily invested and that the Eastern Townships Bank did all the banking resulted in a large number of young men from that area trying their fortunes in the west. Large numbers of Nova Scotia men were also coming west in those days and any man from Cape Breton or Antigonish would find himself at home in any western mining town. They not only manned many of the collieries but formed a very appreciable part of the population of the metal camps. The picturesque figure and kindly nature of William Yolen Williams, one of the early superintendents, drew many men from North Wales. Added to these were men from the neighboring States and other parts of Canada and the Old Country. Later an appreciable number of Swedes and a few Finns and Italians decided to make Phoenix their home and the gradually increasing shortage of labor resulted in the names of a large number of Austrians appearing on the payroll. There was some anxiety when the war broke out as to how the Austrians would act and while a few were very pro-German, and moved out or were interned, the great majority were quite peaceably inclined and gave no trouble whatever. Quite a number were, in fact, Jugo-Slavians and several of these returned to their Old Country and served with the Servian army.

Early in its life the Miners' Union took a decided stand on the Chinese question and no Oriental ever resided in Phoenix. On one occasion one of the young men of the town, with a gift of impersonation, dressed up as a Chinaman and sauntered down town in the twilight. His welcome, however, was such that he dropped his disguise with all possible speed.

The Doukhobors came to the valley below Phoenix about 1908. Work about a mine, however, was not in their line, though they could frequently be seen about in the summer peddling vegetables. Eastern Canadian illustrated journals have recently been publishing eulogistic articles and photographs dealing with their simple life and quaker-like habits. There is no use denying that they lead the simple life, that they are a well built race, cleanly to a large extent, appear to be good natured when allowed to disregard the laws as has been the case to date, and are industrious as far as their own needs are concerned. There is, however, as much difference between the Quakerism of John Bright and that of Peter Veregin as there is between day and night. The War tested a good many classes and though the Quakers did not appear as fighters on the firing line they justified their existence in many other ways. Beyond donating a few pounds of jam, which gift was coupled with a request for the remission of certain taxes, the Doukhobors did nothing for the Allies during the War; while due to the increased value of their products they did considerably for themselves. Though the Doukhobors have been in Canada with us for a quarter of a century, and members of this community, born in Canada, have reached man's estate, only a few of the boys have received a rudimentary education. They are still Russian peasants. The authorities have played a supine part, for if they had insisted on education in the first place, instead of eventually, there would be no Doukhobor question today.

Looking East from Phoenix, B.C.

The religion of the Doukhobors is based largely on a combination of ignorance and fanaticism and their motto would appear to be "Ourselves Alone". This combination has had a logical result in that a section of this race, living by the Granby River, live in an unkempt state and habitually go about in a nude condition. They have developed such a stage of fanaticism that they believe that when one dies the body should not be wasted by burial but should be left for the animals to devour. They have therefore been convicted in the courts for non burial of the dead and are under suspended sentence. Whether they have given

over this practice or not is not known; no more dead Doukhobors have, however, been left by the main highway.

Canadians who sympathize with the Doukhobors, and who accuse their neighbors of intolerence, and people of this class have been found in high places, should remember these things. They should also remember that during the period the Doukhobors have lived here no births have been registered as called for by law; no marriages have been legally performed or deaths properly reported. Their religion forbids them to kill. When this is taken literally and is applied to vermin of all kinds the result can be imagined. There is some encouragement in the fact that the thin edge of the wedge is entering here and they are now reported to have put gophers on the black list. They are praised to the skies as agriculturists, yet, for the reason mentioned, their work is confined to the vegetable kingdom. Dairying, poultry-farming and cattle-raising mean nothing to them, and land and products suitable for these industries are wasted. Even their crops run decidedly lower per acre, and vastly lower per capita, than those of the average farmer.

Most Canadian cities have some distinctive feature which they are not slow to advertise. Vancouver and Montreal take justifiable pride in their parks. Stanley Park gives one a first hand impression of the beauties of the coast forests, while from the summit of Mount Royal, at an elevation of 700 feet above the valley, a wonderful panorama is unfolded.

Soldiers' Memorial, Phoenix.

For natural beauty of surroundings, Phoenix, the highest incorporated city in the Dominion, takes second place to no Canadian city. Originally covered with a thick forest, all roads leading from it pass through more or less heavy bush. In particular, a drive along the road to the No. 7 mine, along the 4400-ft. contour, takes one through the timber for 10 miles with no sign of habitation except at the extremities. In the spring the glades are yellow with curly lilies; pink orchids can be picked up by the roadsides while yellow violets are dominant in many sections. In the right season you are almost sure to drive into a family of grouse which scatter among the branches above at your approach. There they remain so still that when driving under you can reach out from your car and almost stroke them.

From the hills around Phoenix one looks out at an elevation of one mile over the valleys 3000 feet below. To the north one can see range after range of heavily forsted and unnamed hills stretching to the horizon; to the east the snow capped ranges beyond the Arrow Lakes and the mountains about Rossland and to the south the mountains about Republic, an old and, at one time, an important mining camp. To the west the serrated peaks beyond the Similkameen stand clean cut against the sky while the huge mass of "Old Baldy", on the southern slope of which lies the old Caribeo-McKinney mine, the first lode dividend payer in British Columbia, dominates the landscape as it dominates the South Okanagan, when viewed from another direction.

In the winter it often happens that the mist settles down in the valleys and one looks out over a sea of clouds, with the distant mountains forming the far shore and the nearer ones the islands. Sometimes they rise and give Phoenix a fog bath and when they recede a little they leave a coating of hoar frost over the snow and over the trees. When the sun comes up into a cloudless sky and distributes its rays over the white clouds below and over the untold millions of glistening crystals covering a snow coated land the spectacle is one of indescribable brilliance. The memories of these views will be carried by former residents of the big mining town as long as they live.

The high elevation referred to resulted in one of the pleasantest climates in the Dominion. The season of high and uncomfortable summer temperatures was absent. It was always pleasant to get away from the hot valleys and feel the refreshing breezes as one ascended the hill. When the grass would be dry and parched below the summits would be green and dustless and Phoenix housewives would be out gathering wild strawberries or huckleberries. A walk about the hills

A Bonspiel in Progress at Phoenix.

could also be made without annoyance from mosquitoes for, in common with all the other parts of the Boundary, there was an almost entire absence of that plague. The occasional cold spell in winter was also tempered by the elevation and it was seldom that the mercury dropped below zero. The average of the December, January and February readings showed 24, 17 and 25 degrees above zero. Few thaws occurred and the result was a thoroughly enjoyable winter.

The cooler summer greatly limited the extent of gardening operations. Radishes, lettuce and green peas would do particularly well, but such vegetables as carrots and potatoes seldom attained full size. Truck farmers from the valleys were, however, usually on hand with an ample supply at reasonable prices. Perennial plants and bulbs were in their element and citizens who cultivated these flowers will miss the thousands of blooms that beautified the gardens and hillsides.

For the motorist especially the location was excellent. Though only about 40 miles of good roads extend to the east they extend as far as Christina Lake and nothing

more beautiful than this lake can be found beyond. Southern B. C. roads seem to have a supply of good road material always available and there are some wonderful stretches of excellent roadway passing scenery more wonderful still. West of Phoenix one can travel for hundreds of miles through the Kettle, Okanagan, Similkameen, Nicol aand Thompson valleys with the greatest comfort and pleasure.

Phoenix was what is known as a low-grade copper-mining camp and as such it holds the world's record for mining, *at a profit*, ores of this type lower in grade than any that have been mined before or since. The figures submitted represent ore with a recoverable value of about four dollars per ton. In the early years much higher-grade ore had to be handled but before long costs were reduced to such an extent that ores from which only three dollars, and even less, could be recovered were successfully mined.

The value of a camp like Phoenix means vastly more to the country in general than to the shareholders of the different companies operating there. Of the total recovery of $65,000,000, the operating companies received about $9,000,000 in profits and salvage for property, which cost about $1,000,000, and equipment, which cost close to $4,000,000, or a net return, during 20 years of development and operation of about $4,000,000. As all property was originally obtained free from the government the million dollars referred to approximates the profit to the prospectors and the small companies who turned their claims over to the larger concerns.

The Phoenix camp was only the starting point of a long chain of industries. The ore loaded in the cars meant an expenditure of $16,000,000, and of this only $9,000,000 was paid in wages in Phoenix and of this the great bulk was expended in different parts of Canada and elsewhere for the necessaries of life. The remaining $7,000,000 was spent for mine supplies. For many years 80 boxes of dynamite were used per day at one of the big mines alone and in all over $3,000,000 was handed over to the powder companies, whose plants are on the Pacific Coast. Fuse and caps from Cornwall, England; mining machinery and machine drills and parts mainly from Quebec and the United States; drilling-steel mainly from Sheffield; coal and coke from Fernie; pipe from Quebec and the United States; manganese steel from Hadfield's, Sheffield; rail from Pittsburg; timber obtained locally; customs duties and freight represent some of the further expenditure of $4,000,000.

After being loaded on cars the railways were paid $6,000,000 to haul to the different smelters. The expenditure for smelting and converting to blister copper averaged about $1.50 per ton or a total of $24,000,000. The chief supply used at the smelters was coke, which averaged 14% of the ore charge or 2,240,000 tons. This means that the entire output of a fair-sized coal mine, with accompanying coke plant, was used to supply the fuel required in smelting Phoenix ores. For coke alone the cost was $10,000,000 at the ovens with an extra freight charge of $6,000,000. The remaining $8,000,000 of the smelting charge was paid in wages and for supplies and, as before, the great part was eventually spent outside the district. There is still $10,000,000 of the total unaccounted for and this was paid to the railways for transporting the valuable blister copper across the continent, to the refiners for treating and marketing and to the Dominion and Provincial governments for taxes.

The heavy expenditures for railway freights will be noticed. Mines, and the various industries depending on them, supply, in many countries, half the tonnage hauled by the railways, and this tonnage is uniform throughout the year. In Southern B. C. this proportion has been exceeded and the Crow's Nest Coal fields together with the Slocan, Rossland and Boundary ore districts and the shipments from the different smelters, averaging well over $10,000,000 per year of high grade exportable freight, have kept many o train-crew busy. Notwithstanding this a leading member of the United Famers' organization, in the recent election in Yale, stated that as the farmers were such heavy shippers they should have special consideration from the railways. There is many a railway that the farmer uses that would be still unbuilt were it not for the mining industry.

The amount received by the Dominion Government in duties and taxes, directly and indirectly, must also have amounted to millions of dollars, for the average duty on imported machinery was close to 30% and the taxes in recent years have been heavy. Notwithstanding this the copper producer has to his credit the fact

A Phoenix Home (now abandoned)

In the distance the clouds can be seen to have settled down on the valleys and resemble a lake

he has never received any government bounty or protection, in any shape, on his products. Not only does he pay excessive duty on foreign machinery with the exception of certain smelting equipment and the American price plus the duty on Canadian machinery, but he also pays higher prices for his food in order that that great theoretical free trader, the Canadian rancher can control the local market and use it as a dumping ground for a non-exportable product. This is a condition of affairs that is approved not only by the Conservative party but also, as evidenced in the recent Yale

election, already referred to, by the Progressives and Liberals who united in indorsing a candidate who spoke strongly in favor of maintaining the present duty on fruit. The result has been that Phoenix citizens, living in Southern British Columbia, famed as a fruit-growing district, probably held the world's record for the consumption, per capita, of second and third-grade apples.

The copper industry of Canada has, while perhaps not intentionally, at least actually, played the part of a public benefactor. Considering the money invested, the past results and the future prospects, it will be acknowledged, if the different operating companies are checked over, that it would have paid them better to have put their money in the savings bank in the first place. Their attempts to better their own circumstances and at the same time develop the country, have not only received no encouragement from the Ottawa Government in particular but, in the matter detailed in the following paragraphs they have, especially in recent years, been treated with a large measure of contempt.

Phoenix was the location of some of the most important work done by the Geological Survey of Canada. A map of the entire Boundary District, showing the surface geology, was prepared by Brock in 1902. In 1908 LeRoy and Drysdale studied the geology of Phoenix in minute detail and their conclusions were of the greatest use in the mining industry. The geology of Phoenix was extremely difficult and had baffled previous geologists who had tried to size up conditions in a short time. It is not too much to say that this detailed report saved the different mining companies at least $100,000 and if these conclusions could have been arrived at some years earlier, the saving, due to the fact that less outlying property would have been purchased and less development done, would have been several times that figure.

The Geological Survey is the foundation, not only of the mining industry but of other basic industries as well, as their functions include reports on water supplies for irrigation and domestic purposes and the mapping of the forest areas. One would think that the valuable work done by this small body of men would have been so appreciated by the different governments that they would have assisted the Survey to the limit of their power. If there is one lesson the late war taught it is the value of a scientifically-trained corps of men. Of those mentioned as identified with Phoenix, Brock was selected as chief geologist to accompany the Allenby expedition to Palestine, while DeRoy's ability was used to advantage in connection with the organization of the Western Universities Battalion and later, as a brilliant captain of infantry, he laid down his life at Passchendaele. Such was the type of service rendered by the Geological Survey during the war.

The work requires highly trained and capable men. At times it is dangerous—Drysdale, the third geologist connected with Phoenix, was drowned while exploring in East Kootenay. Most of the time the members are away from civilization and their families. They are naturally not allowed to take advantage of information that comes to them in the course of their work and until recently their salaries were in the same class as those of ordinary clerks. They are still such that members are rapidly vacating their positions even for college work, which has not been considered particularly remunerative in recent years. The number of geologists for the whole Dominion has now dropped to nineteen, and as British Columbia stipulated when joining Confederation that the Survey should be maintained in that province eight of these are in B.C. The number is rapidly decreasing and as a member resigns the pennywise policy is not to replace him so that in a short time we will be without a Survey worthy of the name. In fact, that is the present situation.

A Phoenix mining company which spent over half a million dollars in recent years in a fruitless attempt to acquire other properties applied for the advice of a geologist in some special work. It was promised by the Minister, but was never given. Not only is it impossible to get any help of this kind but new publications of the Survey are getting fewer and fewer. The catalogue lists page after page of titles that are all out of print. An important map like that of the Kamploops Sheet has been out of print for 20 years. The topographical and geological maps of the Survey have been of vast assistance to prospectors, particularly in Northern Ontario and Northern Manitoba, where the maps of the Survey are the only maps ever issued and where one would quickly be lost in the ramifications of the watercourses were it not for the detailed maps provided. The lack of prospectors, frequently complained of, is due, to a large extent, to the lack of maps showing likely prospecting areas. The lack of traffic for the railways, and consequent enormous deficits, is not going to be remedied in the least by the suppression of the most important department concerned with the investigation of our natural resources. If the present interest in the Fort Norman oil district results in the location of commercial oil-fields, it will be on account of the fact that Geological Survey many years ago covered this territory, mapped it and marked it as a likely oil-field.

Forty years ago the government had Dr. Bell make annual trips into the territory tributary to Hudson Bay. This work was long ago abandoned and we know less about that district now than we did then. In the meantime we have built a railway practically into Port Nelson and spent millions of dollars on harbor improvements there. We have now stopped all work and are going to continue Dr. Bell's explorations and find out if the railway hadn't better be re-located to Churchill and the Port Nelson proposition abandoned. For the sake of saving a few thousand dollars in maintaining a Survey we have lost millions due to deterioration of the present road and probable re-location.

It was brought out at the recent mining convention at Vancouver that Dean Brock, while Director of the Survey, had six different Ministers in charge of his department in sixteen months. Minister of Mines continues to replace Minister of Mines with amazing rapidity and it is doubtful if the Director can do more than keep track of them. Senators, prairie lawyers, ranchers, and anybody to whom the work is likely to be uncongenial are all given this portfolio and few have been in office long enough to get interested in their department except apparently to curtail expenditures. There is little consolation in the fact that such names as Logan and Dawson will be known in this country and in other countries long after the names of the politicians who have acted as Ministers of Mines have passed into oblivion.

Labor troubles may be said to have almost passed Phoenix by. With the exception of a few weeks shutdown in 1907, while wages were being readjusted to the lower price of copper there was never any troubles whatever. During the entire period of the War and afterwards the men carried on during day shift, night shift and graveyard shift and on Sundays and holidays when necessary, with practically their old time efficiency and

although wages were raised as occasion demanded there was never any time lost on account of local labor troubles.

The easy adjustment of labor matters and the co-operation of the citizens with all parties and the usual absence of cliques, the bane of small communities, made Phoenix, aside from other advantages, a very desirable place in which to live. "There was always a good bunch in Phoenix" was a remark often made by those familiar with conditions and the manner in which they could get together was never better shown than in the construction of the big rink. Realizing the unsatisfactory nature of the old structure and the need of something better to take advantage of the fine winters, $10,000 was subscribed by nearly 400 residents in ten days and the finest rink in the interior erected. The shareholders never received a dividend and never asked for one. The profits for the first few years were put back in improvements and when the war came all profits, amounting to several thousand dollars, were handed over to the Patriotic Funds. It is also worth noting that, early in 1915, all employees voluntarily assessed themselves one day's pay per month for war purposes and this program was carried out through the duration of the War and for some months afterwards as an aid to influenza sufferers. Phoenix was one of the very first cities in Canada to adopt this scheme and in this case it was commendable as so many of the citizens were of foreign origin.

Phoenix was always fair to the different political parties and Socialist, Liberal and Conservative members have all represented that place in parliament. Political meetings, though few, were always well attended and appreciated. The outstanding meeting of this character, which is still talked about wherever old Phoenicians gather together, was the one about 1905 when Mr. W. W. B. McInnis talked on Socialism. Phoenix was then the headquarters of the Socialist party in the Interior and every Socialist off shift, and they were many, was at the meeting to stand up for his party. Mr. McInnis, in these days, was unexcelled as a powerful and ready platform speaker, and much to the entertainment of his audience, not Socialists, he was altogether too much for the combined efforts of his adversaries. Though unsuccessful on that occasion the Socialists later had their revenge when they elected their representative. Another well remembered meeting was when Tom Hardy, a local politician, spoke on behalf of one of the candidates. Tom's English was of the topsy-turvy variety and on every occasion when this was in evidence he was loudly cheered and when he finally started to discuss "the *exercise* duties of the *physical* year" the applause was literally "loud and prolonged."

The mining man, however, is not greatly interested in politics. Actively engaged mining engineers in the different legislatures are conspicuous by their absence or small representation. Their organization, the Canadian Institute of Mining and Metallurgy, flatters itself that it sometimes influences the Dominion and Provincial Governments in mining matters and doubtless it does, when its advice is agreeable to the Government, which is not as often as circumstances would seem to justify.

The stereotyped phrase "wild and woolly west" could never have been applied to Phoenix. While it is true that at one time there were 17 saloons there, all open 24 hours and all provided with the different gambling devices, it is also true that nobody ever carried a gun and the law was enforced without difficulty by one day-policeman, one night-policeman and a magistrate. In those days fully 30 professional gamblers led a parasitic existence and the ease with which, for years, the miner would hand over his money was rather astonishing. Probably the most exciting event that ever happened was the time when "Tuck" Collins tossed an imitation stick of dynamite, with lighted fuse attached, into the crowded back room of the Brooklyn Hotel and yelled "Fire".

A ROW OF MINERS' COTTAGES AT PHOENIX.

Safety First slogans were not invented in those days but the principle of self preservation is inherent and, as the fuse was short, the speed with which the room was cleared was remarkable.

No pork barrel appropriations were ever made for Phoenix, nor were any ever suggested. The Federal building was a rented frame structure which probably did not cost more than a thousand dollars. Notwithstanding exaggerated ideas prevailing in the early days in regard to the mineral resources the municipal authorities kept expenditures within bounds and when the last meeting of the council was held it was announced

that the corporation was not only free from debt but a few hundred dollars to the good. This in itself is no mean achievement and is worthy of record.

During the past summer the few remaining citizens, before abandoning their homes, made arrangements for the erection of a monument in memory of the men who made the supreme sacrifice in the Great War. A modest granite shaft now stands, at an elevation of 4700 feet, on an outcrop of rock, beside the highest point on the roadway over the divide between Greenwood and Grand Forks. This is the only stone structure ever erected in Phoenix and long after all the buildings have rotted away; the waste dumps and glory holes have been hidden by a new forest growth and the deer have returned to their former haunts, this shaft will remain as a memorial, not only to the men who gave up their lives in Flanders but also to the place they came from.

COAL PRODUCTION IN THE UNITED STATES COMPARED WITH NOVA SCOTIA.

The parliamentary committee of fuel resources now in session at Ottawa has devoted much of its time to elucidation of the diferences between coal mining in the United States and in Nova Scotia.

The following table will repay study.

Bituminous Coal Production.

	United States		*Nova Scotia*	
	Production	Increase over 1865	Production	Inc. over 1865
	Long Tons	Per Cent	Long Tons	Per Cent
1865	24,790,000	..	635,000	..
1870	29,950,000	21	830,000	30
1875	48,200,000	95	830,000	30
1880	66,830,000	170	1,050,000	65
1885	102,180,000	300	1,380,000	110
1890	141,620,000	460	1,950,000	200
1895	177,590,000	610	1,980,000	210
1900	243,410,000	880	3,230,000	400
1905	351,120,000	1,300	5,003,000	700
1910	445,810,000	1,700	5,740,000	750
1915	473,000,000	1,800	6,650,000	950
1918	605,000,000	2,300	5,200,000	720
1920	556,000,000	2,100	5,700,000	800

It might be fairly deduced from the above table that coal-mining is being conducted in the United States under conditions of unparalleled ease and ability to extend. This is precisely the case. There is no historical precedent for such a rate of increase in coal production, nor for such enormous quantities of coal actually mined and consumed within a given period.

The following table compares Nova Scotia with the United States on the production of 1905.

	United States		*Nova Scotia*	
	Production	Increase over 1905	Production	Inc. over 1905
	Long Tons	Per Cent	Long Tons	Per Cent
1905	351,120,000	..	5,003,000	..
1910	445,810,000	27	5,740,000	14
1915	473,000,000	35	6,650,000	13
1918	605,000,000	72	5,200,000	4
1920	556,000,000	58	5,700,000	14

The result of the war period is clearly shown in this table. In 1918, the United States was able to mine more bituminous coal (and more anthracite) than before or since, whereas the production of Nova Scotia declined. This was a direct result of the necessity of Canada to take men from the mines. The United States, on the contrary, were in a position, by reason of their truly selective draft, to draft men into the coal mines, and, realizing the need for coal, they did so. The contribution of the United States to winning the war is better expressed in terms of output of bituminous coal from 1915 onwards than in any other way.

The high cost of coal production in Nova Scotia is at this time due more to the disorganization of its working forces by enlistment than to any other cause, and it is a cause that must persist in operation until by natural birth increase, or immigration, the shortage of skilled miners has been made up. The idleness of collieries due to slackness of present demand has no bearing on this condition of affairs. It is quite possible for a condition of force disorganization to exist concurrently with a trade slackness involving idleness of collieries. If, when the collieries work, they have too few miners and too many non-producers, it merely aggravates the difficulties of the coal operators, who must choose between discharging hundreds of employees permanently or trying to give them all partial work.

PERSONALS.

Mr. S. C. Thompson has been appointed consulting engineer of Kirkland Proprietary Mines Ltd. and is making an examination of its properties: Sough-Oakes and Burnside, at Kirkland Lake.

Mr. Wm. Frecheville and Mr. J. B. Tyrrell are visiting mines at Kirkland Lake.

Mr. John Callahan is in Porcupine in connection with negotiations concerning the Gold Island property.

Mr. G. C. Bateman, manager of La Rose Consolidated Mines will address a meeting of the Toronto Board of Trade next week. He will speak on the Mining Industry.

Mr. Balmer Neilly will address a meeting of the local Board of Trade of Guelph on Wednesday, April 27. Mr. Neilly will show how the Province benefits from the activities of mine operators.

Wm. Fleet Robertson, provincial mineralogist, has been unable to attend to his official duties for some days because of illness. During his absence J. D. Galloway, Resident Mining Engineer, Hazelton, B.C., is Acting Provincial Mineralogist.

R. W. Thomson, resident mining engineer, Kamloops, B.C., who has been ill for several months is reported on the road to recovery. At present he is visiting the coast taking the rest necessary for recuperation.

The Toronto Branch of the Association of Women of the Mining Industry of Canada will hold a meeting on Wednesday, April 27, at the residence of Mrs. D. A. Dunlap.

Mr. A. F. Brigham, general manager of the Hollinger is in Toronto. He reports that the mine is now operating at full capacity and 3,300 tons per day is being treated. A contract has been let for construction of 150 workmen's houses and for a bunk-house for unmarried employees.

Mr. W. C. Campbell, mining engineer, has returned to Toronto from Mexico. Mr. Campbell was on the staff of the Ontario Bureau of Mines at Cobalt in 1906 and 1907 and had charge of the topographical mapping of the silver area. Before going to Mexico, he was in Africa for some years.

Mr. Frank Stevens has returned to Toronto after being for some time in Mexico.

International Mining Convention.

Portland, Oregon, April 5th to 9th, 1921

(Reported by our Victoria Correspondent.)

"The Mining Industry in Relation to Business," by Mr. Edwin Ludlow, president of the American Institute of Mining and Metallurgical Engineers, New York City; "Prospecting Past and Future," by Mr. T. A. Rickard, editor of the Mining & Scientific Press, San Francisco; and "Protection for the Promoter" by Mr. Sidney Norman, Editor of the Northwest Mining Truth, Spokane Wn., were among the notable contributions to the International Mining Convention held at Portland Ore. from the 5th to the 9th of April.

The Convention was attended by representatives from the States of Washington, Idaho, Montana, and Oregon; the Province of British Columbia, and the Territory of Alaska. There was a registration of delegates of between 600 and 700 and two Sessions were held practically every day from the 5th when Manager Henry M. Parks called the Convention to order until the business was brought to a close with the usual congratulatory exchanges on the following Friday evening.

Mr. Ludlow's Address.

Mr. Ludlow declared that the inhabitants of this country are directly dependent on the production of agriculture as well as of copper, lead and coal. The products of farms as well as of mines of America must find a market at a higher price than the cost of production. He traced the commercial history of the past few years, pointing out that the United States had been heavy exporters with the balance of trade very markedly in their favor. Under present conditions if trade was to be maintained it must be based on barter rather than credit. Europe owes the United States fifteen billion dollars. Never before had a depression been experienced in this country at a time when the nations of Europe were not financially able to take advantage of the fall in the value of securities during such periods to purchase the same in large quantities. Local production has been keyed up by war efforts far beyond the local power of consumption. There also was to be considered as a very serious adverse factor the matter of exchange. This might be simply explained by the statement that a South American merchant with ten thousand dollars in United States currency to invest would be able to purchase thirteen thousand dollars worth of goods in England, more in France and twenty thousand dollars in Germany. The condition was further aggravated by the prevalence in the United States of a "buyers strike." A cotton grower sold his produce at a materially reduced figure in comparison with war prices and went to a store to buy cotton goods only to find that war prices still maintained. He therefore refrained from purchasing. Much the same condition was to be found in all lines and the manufacturer would have to consider the advisability of reducing his prices.

In Europe cotton, wheat, copper and coal were badly needed, but they could not be obtained from America unless the trade was based on barter rather than credit. This brought up the question of the tariff and "whether a tariff wall would be built around this country to protect the manufacturing interests, rendering it impossible to extend that assistance which is needed not only to the majority of our people, but to the war-ridden nations of Europe who have nothing but the work of their hands with which to pay for the raw material needed. It is hoped that Congress will examine carefully the question whether the manufactures who are demanding this protection have done their share towards reducing the cost of living. Copper, lead, zinc and the products of the farm already are selling not only below 1914 prices, but below the cost of production and coal is arriving at this point."

Higher Tariff Will Hurt Mining.

Mr. Ludlow concluded by sounding a solemn note of warning. Mining and agriculture were basic industries, he said, and their future should be based solidly on good business principles and not on the protection of favored industries. If the tariff wall were built for the protection of the products of the mines and farms the production of those industries must be reduced to meet the needs of American alone. In the war of the survival of the fittest that would follow, railroad rates would handicap the industrial advance of the West. Many of the higher-cost mining projects would be closed down, and besides, the industrial recovery of Europe would be immeasurably delayed.

Mr. Rickard on Prospecting.

An exceedingly polished and instructive address was that for which Mr. Rickard was responsible. He referred to the many accidental discoveries of important mineral deposits in the past and then went on to deal with the scientific process of development. As instances of the latter he called to mind the persistence of the search of James S. Douglas in sinking a deep shaft on the United Verde extension, even after a first disappointment; also to the opening of the Suan concession in Korea by British and American engineers. In referring to proposed easy ways of locating ore underground he spoke of "The Divining Rod" the "magnetic needle to find masses of iron ore." "The method of measurement of electric resistance whereby the resistance of the earth circuit between two points is measured in order to detect abnormalities that point to the presence of ore bodies," "the telephonic method," in which the passage of electric currents in the earth is observed etc. He continued "The Hazel Twig as a means of divination may yet have as its successor some accurate method of finding ore, the Alchemy of one age is the chemistry of another. I am quite prepared to believe that honest scientific investigation will succeed in devising a way of obtaining guidance for the miner in his prospecting by detecting and measuring the emanations, resistances and other intangible reactions of matter on matter in such a way as to indicate not only qualitively but quantitively the presence of ore at a distance underground ever while it remains for the prospector to use the methods on which he can rely rather than allow himself to waste time and break his heart on schemes that are either fraudulent or fraudulent. The core-drill and diamond bit are well-tried tools, the shaft and the prospect hole will not deceive. After all the best instrument of investigation is the pick. There is intelligent curiosity in the point of it, there is strength in the handle of it, there is rhythm in the swing of it.

Mr. Sydney Norman on "Blue-Sky Laws."

Mr. Norman spoke very strongly regarding the ill effects of new-style legislation now in force in some thirty states of the Union. He went into the subject very exhaustively and maintained that the small promotor who is responsible for so much of the mining development of the past, was being driven out of the business. Illustrations were given to point to the absurdity of some of the method adopted in some states in connection with the enforcement of this legislation. It was his argument that if this legislation continued as at present it would mean the strangulation to a large extent of mining development. He advocated if Blue Sky legislation were at all necessary that it should be unified in its application to the United States, its administration being placed in the hands of a Federal Board.

This matter was the subject of much discussion the next day, the outcome of which was the passage of a resolution endorsing the principle advocated by Mr. Norman and calling upon these in authority to take concerted action to the end indicated.

Coal Mining in the West of North America.

Considerable attention was given to the coal mining industry, the three phases, Mining, Preparation, and Distribution of the coal of Washington and Oregon states being dealt with quite exhaustively by several speakers. Mr. Watkin Evans, consulting mining-engineer of Seattle Wn., took up the geology and the resources of the two States mentioned with brief references to the coal fields of Alaska, British Columbia, Idaho, Wyoming, Utah and California. Mr. S. H. Green, Manager of the Pacific Coast Coal Co., Washington, discussed methods of mining coal in flat and steeply-pitching coal seams. Perhaps the most interesting feature of this was his account of the unwatering of deserted workings in that mine. It had been found that sixteen million gallons of water were present in these workings and it was felt that it was a menace to life while remaining there. In removing it drill holes were bored from below through the cover of from four hundred to five hundred feet, gate valves being placed on these holes in the lower workings. In this way the water was drawn out as it could be handled and without difficulty. It was found that the space above immediately the water was taken away filled with "black damp," carbon dioxide.

Mr. E. R. McMillan spoke on the preparation of coal, including a description of types of tipples, screens, and the various jigs used in the screening and washing of coal in the Northwest. This was followed in the afternoon by two interesting papers, one by Ralph Gault, a fuel engineer, on "Utilization of Coal," including hand-firing, automatic stokers, and carbonization with special reference to powdered coal for steam generating. A. W. Perley of the Oregon-Washington Railroad & Navigation Co. then opened a discussion on the locomotive fuels of the Northwest. A paper that may be mentioned in this connection but was delivered later is that on the low-temperature distillation of coal by Kirby Thomas, consulting mining-engineer, New York City. All these addresses as will be noted are co-related and will be published as a unit, the intention being that at the next International Convention the same subjects will be handled in their application to the coal-mining resources and industry of British Columbia and the Canadian Northwest.

Gasification of Coal.

There appeared to be marked unanimity of opinion as to the desirability of the abandonment of present wasteful methods in the burning of coal. Solutions suggested were the treatment of coal by low-temperature distillation methods, the recovery in that way of by-products and then its use for domestic and general industrial fuel purposes.

British Columbia Day.

British Columbia day, Thursday, was marked by the assumption of full control by the (B.C.) delegates. Mr. Nichol Thompson, occupied the chair in the afternoon, and there were with him on the platform among others, Hon. Wm. Sloan, Minister of Mines for the Province; and Messrs. A. M. Whiteside, Vancouver; E. E. Fowler, Nelson; Fred Starkey, commissioner of the Associated Boards of Trade of Eastern B.C.; and J. M. Mulholland, President of the Prospectors' Protection Assoc., Nelson B.C.

Address of Mr. Sloan.

Mr. Sloan, addressing a fully attended Convention, said:—

When I am privileged to meet a gathering such as this, it always seems to me that, after all, there are some compensations in being a Minister of Mines. There is nothing more inspiring socially, and in respect of education, than these Conventions. There are nowhere to be found better citizens, more progressive businessmen, than among those whose business is mining. And you may search through the mining districts of the world without finding a better type of man, a man with a higher sense of his citizen responsibilities, and a man more loyal and true to his home country than you will find in the American West.

This is an "international" convention. These days the term "international" has more significance almost everywhere else than where we are privileged to live. Nationals in Europe, great and small, are squabbling and quarrelling over questions that no doubt are of importance to them. An international gathering there would be attended by ceremony and formality. But here, what do we find? We always feel as much at home among you as on the other side of that imaginary line. We are one because our language is the same, our habit of thought is the same, our culture has progressed among similar lines, and our heritage, the great and glorious land of America, brings to us the same problems and the same possibilities in the work of the development of its vast resources.

I should like to extend a cordial invitation to you all to come to British Columbia. We would be glad to have you, and because we might both find it good business. With that we must all agree. Besides I do not think some of you credit our Province with anything like all it has to offer. British Columbia covers an area of 390,344 square miles, equal in extent to the States of Washington, Oregon, Idaho and Montana. One of our great Canadian Statesman, about half a century ago, referred to our Province as "a sea of mountains." There was some point to this remark. It only now is being understood that this "sea of mountains" possesses a world of mineral wealth, only a very small proportion of which has been developed.

You will admit that we have not done so badly when I say that the mineral production of the Province from 1852 to the end of 1920 is estimated at $706,230,519. This for a large country, with a population of but 500,000, a figure which has grown from a few thousand when mining records first were taken, seems to me to be a creditable achievement. While, however, much has been done by a few the great task is ahead. I need only add, on this point, that we represent a country of tremendous latent mineral possibility in which there is plenty of scope for legitimate industrial endeavor.

Last year British Columbia's mineral production is estimated to have reached a monetary value of $35,580,625.

Its gold output totalled $2,707,698, a decrease as compared to the previous year.

Its silver production increased in quantity, 3,404,926 oz., as compared to 3,403,119 ozs.

Its copper production also increased from 42,459,339 lbs. to 42,773,660 lbs.

Its lead output showed that the monetary value of the 1920 output was greater by some thousands of dollars than that of 1919, viz., $1,540,471 as against $1,526,855.

Its zinc production jumped from 56,737,651 in 1919 to 76,765,268 lb. in 1920, an increase in value of $1,602,843.

The total output of its collieries increased from $11,975,671 in 1919 to $14,038,470 in 1920.

The aggregate increase in the value of the mineral production of British Columbia during 1920 over 1919 was $2,284,312.

You will gather from these few statistics that our mining industry has been advancing. I venture to say that out showing as to output at least compares favorably, figuring proportionately with that of the chief mineral producing States. We have been going ahead steadily in recent years. From 1911 to 1913 the production in dollars was $86,236,270; from 1914 to 1916, $98,126,795; and from 1917 to 1919, $112,089,179. After the slump of 1919 we felt proud to be able to point to a decline of less than 20 per cent, as compared to decreases ranging from 40 to 60 per cent in the cases of the chief mining States on your side of the line. These facts are not pointed to in a spirit of self-gratulation but rather to show that our Province, big in area, small in population, with its mining future before it, has been holding its own and besides getting a little further forward year by year in the work of developing its minerals.

We are faced with a decline in gold production. As a matter of fact every gold-producing country has been meeting with that condition. I am pleased that we seem, however, to be getting back to the conditions that will permit both placer and lode-gold mining to be prosecuted with more assurance of profit, in the future.

In discussing silver it is possible to assert, without reservation, that the future is full of promise. The new fields of the Salmon River and Alice Arm regions are attracting wider attention as their possibilities become more apparent. The Premier Mine is only one of the properties of the Salmon River zone to be heard from and I say this advisedly. After a very considerable expenditure in drilling, development, and general exploration, the directors of the Premier have agreed on further expenditures in plant and equipment. And if one paying mine has been proved, it is reasonable to suppose that others will be developed, especially when surface indications are so numerous and so encouraging. What is said of this district may also be applied to Alice Arm. There the Dolly Varden is being developed. In the four last months of 1919 it shipped 7,000 tons of ore averaging 56 ounces of silver to the ton, and also was a large shipper in 1920. Further development is in progress on this and other properties. But when considering the silver camps of British Columbia do not let us overlook the Slocan and other sections of the Kootenays of Eastern B.C. The mines, and the possibilities, of these districts, are of great importance; the former furnish the greater part of the silver production of the province and the latter offer opportunity to the prospector and the operator. What I have said is only to illustrate what is happening in the various fields in British Columbia, and to those desirous of obtaining further information I would recommend them to read the reports of the various district engineers, as published in the annual report of the Department of Mines.

In referring to the copper, lead and zinc production of our province we must pay a tribute to the enterprise of such concerns as the Canadian Consolidated, the Granby Consolidated, the Britannia Mining Co., and the smaller operators of the Interior and of the coast. The former company has opened up a wonderful Mine in the Sullivan, of Kimberley, a property that is taking a leading place in America as a producer of zinc and lead. It also has gone a long way at the Trail smelter to solving the problem of the economic treatment of silver-lead-zinc ores. The Granby Company at Anyox has evidenced enterprise in the installation of by-product cooking ovens, opening up in this connection certain coal areas on Vancouver Island. The Britannia Mining Co., Howe Sound, has become in a few years one of the biggest producers of copper in the Province. These, however, are but a few outstanding instances where capital has come to the aid of the prospector, and the small operator with success and there are numerous cases where similar industries but await the necessary development to become as notable and as successful enterprises.

I do not hesitate to say that our Government is alive to the importance of the mining industry and has shown it in many practical ways.

It has placed competent mining engineers in the field.

These engineers advise prospectors and operators as to promising fields and as to the best means of opening up locations.

The Government gives financial aid in the construction of trails and roads to properties recommended by these engineers as having merit. There have been constructed and maintained since 1917 mining roads and trails of a total mileage of 3,901.

Mineral exhibits are being placed at the six established mining centres of the province, special attention being given to the rarer minerals so that the prospector may become acquainted with them and thus be better able to recognize them in place.

The Mining Engineers have been spending a part of the winter months in delivering lectures of a practical character to the prospector and the mining men.

It may be mentioned, too, that the Government has an appropriation for the purchase of powder for distribution to prospectors and miners at as near cost as possible. With regard to capital, so essential for continued and increased development, we realize that capital must have a legitimate return, and to that end our mining laws are founded on stability and are recognized throughout this continent as fair and equitable. This also it may be stated in our policy with regard to the important question of taxation.

Other important work that the Government has in hand is the improvement of underground working-conditions both in coal and metal mines, particularly from the standpoint of the safety of the lives of the workers. That we already have had success is shown by the fact that in 1919 there were but twelve fatal accidents in the coal mines and six in the metal mines of the province. This works out to a percentage of 2.2 in connection with the coal and a percentage of 1.2 in connection with the metalliferous industry.

We are improving the equipment of mine-rescue stations all the time, keeping them thoroughly up to date and maintaining close touch with your United States Bureau of Mines as to the latest developments in safety appliances, and mine-rescue apparatus. When something new and better than we have is tested and declared practical we do not hesitate or lose any time in securing it. The policy of the Department of Mines in this vital matter is to take the lead, and we wish to continue along that line.

On my suggestion I may state that a conference is to take place in September under the auspices of the United States Bureau of Mines, at St. Louis for a discussion of the question of standardizing mine-rescue apparatus, and particularly methods of use. I feel that at least there should be a standard method of training men so that those who learn to handle apparatus at one mine can go to another and take up their work without interruption. Consideration I think too will have to be given to the men who undertake this training and these are questions all of which will be considered at the conference referred to. Invitations to attend this conference have been sent to representatives of Great Britain, France and Belgium; and other provinces of Canada will also be represented.

Again I say it is a pleasure to be with you. After all the histories of the country to which we have fallen heir have much in common. Those common interests are recognized and also appreciated by the circumstance that to-day you have set apart as British Columbia's day. There are no stories more interesting than those told of the English, and Spanish navigators who first cruised the waters of the North Pacific. The tales also of the first pioneer settlers in this great valley of the Columbia are of particular interest for according to popular fiction, sport, or rather lack of sport had some bearing on the final division of this territory, now a great state. However the fact remains that for years after the first trading-posts were established, these pioneers of Oregon of Washington and of British Columbia were not divided. It was a region jointly occupied by the great nations to which we belong. The 49th Parallel then was recognized as a boundary only as far west as the Rocky Mountains. Not until 1846 was the boundary finally fixed as it now stands. This is in fact a geographical line not a line of fortification the necessity for which will never arise as between our people. Three-quarters of a century has lapsed since then and what a change! Oregon, Washington and British Columbia then possessed but 3,000 settlers. Now their joint populations will run to the 3,000,000 mark.

If this can happen in the space of the lives of many individuals it is safe to predict still more wonderful things for these great and comparatively undeveloped countries to which we belong. The future is assured. We are passing through an unsettled period, a temporary manifestation of war aftermath. In other parts of the world it is assuming a more serious aspect than in America. Elsewhere the very pillars of civilization are threatened and the menace is not altogether absent on this continent. We must and will successfully combat those elements that are bent on destruction to save for the coming generations all that we have achieved socially, industrially and scientifically, and to preserve all that we most treasure in our national life.

With a practical realization of the spirit of co-operation between us and with a joint concentration on the problems of developing our mining and other [illegible] industries, the extension of our commerce and the stimulation of [illegible] prosperity, success is assured, and [illegible] our [illegible] mutual destiny will be fully realized.

Problems of the Prospectors.

"The problems of the prospector" was a subject [illegible] entertainingly handled by Mr. J. W. Mulholland, [illegible]

sident of the B. C. Prospectors Protective Ass'n, Nelson, B.C. He commended the Government of the Province for the various steps taken to encourage the prospector in his search for mineral, but declared that the real old "*sour-dough*" was now but very seldom found. He soon would be as extinct as the dodo. Mr. Mulholland gave various explanations chief among which was that the pioneering efforts and the genuine worth of the prospector had not been recognized. He thought that the merchants and the business men would be well advised to more often heed the prospector's request for grub stakes. The day was when the prospector had no difficulty in finding necessary financial support, but that day had passed.

Mr. S. S. Fowler's Address.

Mr. S. S. Fowler dealt with the "Mining Industry of Southwestern British Columbia". By means of a map Mr. Fowler illustrated the country whose mining industry he outlined. He told of its development during the past sixty or seventy years. The opening of the Rossland Mining Camp, first discoveries in the Slocan, the origin of the now great smelting industry at Trail, the first locations at Kimberley, where now is situated the wonderful Sullivan zinc-lead mine, and other historical matters of interest in connection with this district were touched upon. Mr. Fowler traced the development of the district by means of improved transportation facilities. The first smelter at Trail obtained its coke from Pennsylvania, an exceedingly costly arrangement, and it was this that led in a measure at least to the construction of the Crow's Nest Pass Railroad and the opening up of the coal fields of the Crow's Nest. Here first-class coking coal was found and the greater part of the fuel necessities of the smelter since have been provided by these collieries. There have been constructed in this district alone 13,000 miles of railroads, and established besides some 370 miles of steamboat transportation. One of the most striking of Mr. Fowler's statements, however, was that of the seven hundred odd million dollars worth of mineral produced by the province up to 1920, three hundred million came from the East Kootenay district.

Nelson, B.C., was selected as the place of meeting for the 1922 International Mining Convention. Mr. F. Starkey extending an invitation on behalf of Nelson, which was enthusiastically accepted.

COLLIERY CONSUMPTION IN NOVA SCOTIA.

The Report of the Mines Department of Nova Scotia for 1920 fiscal year records a consumption of coal at the collieries of 8·6 per cent. If the coal sold to workmen is included, the percentage of output thereby rendered unavailable for commercial sale, reaches 11 per cent. This is a better performance than that of 1919, when colliery consumption reached 9.2 per cent and, with workmen's coal included, a total of 11·7 per cent.

There is a wide difference in the showing of the individual plants. The Acadia Coal Company, with a colliery consumption of 16,790 tons and an output of 539,641 tons, is credited with the remarkably low figure of 3·2 per cent. Comparing these figures with those of 1919 indicates that there may be an error in transcription, and that the figure should really be 5 per cent. In either case, the performance is a notable one, and indicates the results that can be obtained from a modern power plant such as is possessed by the Acadia Coal Company at the Allan Shaft. The Nova Scotia Steel & Coal Company, with a colliery consumption of 5·5 per cent, did extremely well. The Dominion Coal Company's figures disclose colliery consumption of 9·3 per cent at the Cape Breton mines, indicating an output disproportionately small to the extent of the power equipment. It is probable that with a normal output of 4,500,000 tons, instead of that actually recorded of 3,222,725 tons, the consumption of coal at the boilers would not be much increased. The Springhill Mines show a colliery consumption of 13 per cent. If the workmen's coal is added, the amount of output available for commercial sale is reduced by 16 per cent. This reflects the conditions of mining steeply-inclined seams, under very deep cover, characteristic of the Springhill mines. An even severer drain is shown in the case of the Inverness Colliery, where the colliery consumption reaches almost 18 per cent, and with workmen's coal added, 22·7 per cent of the coal raised. To put it another way, the quantity of coal required to operate the Inverness Mine in 1920 was almost identical with the quantity used by the Nova Scotia Steel & Coal Co. at Sydney Mines, but the output was 629,637 tons in the case of Scotia, against 180,502 tons in the case of Inverness. The Maritime Coal & Railway Company has a colliery consumption of only five per cent, an exceptionally creditable showing under the conditions on that property. The proportion of the output from the Nova Scotia coal mines which is required to provide motive power for mining operations and domestic heating for the mine workers has steadily risen since 1915 as follows:

	Per cent.
1915	8·5
1916	9·8
1917	11·4
1918	13·7
1919	11·7
1920	11·0

The reason for this apparent inefficiency is not clouded to those who know that in 1915 the working organizations of the mines was intact and properly balanced, that in 1916 commenced the drain by enlistments which culminated in the extreme disorganization of 1918, and that any improvement shown in 1919 and 1920 is due to such partial restoration of the working forces as has been found possible.

For comparison it may be stated that the boiler coal used at United States bituminous collieries amounts to but 2·16 per cent of the output. Good European practice, which includes very deep mining and very thin seams, shows colliery consumption of about 7 per cent.

SAULT STE. MARIE.

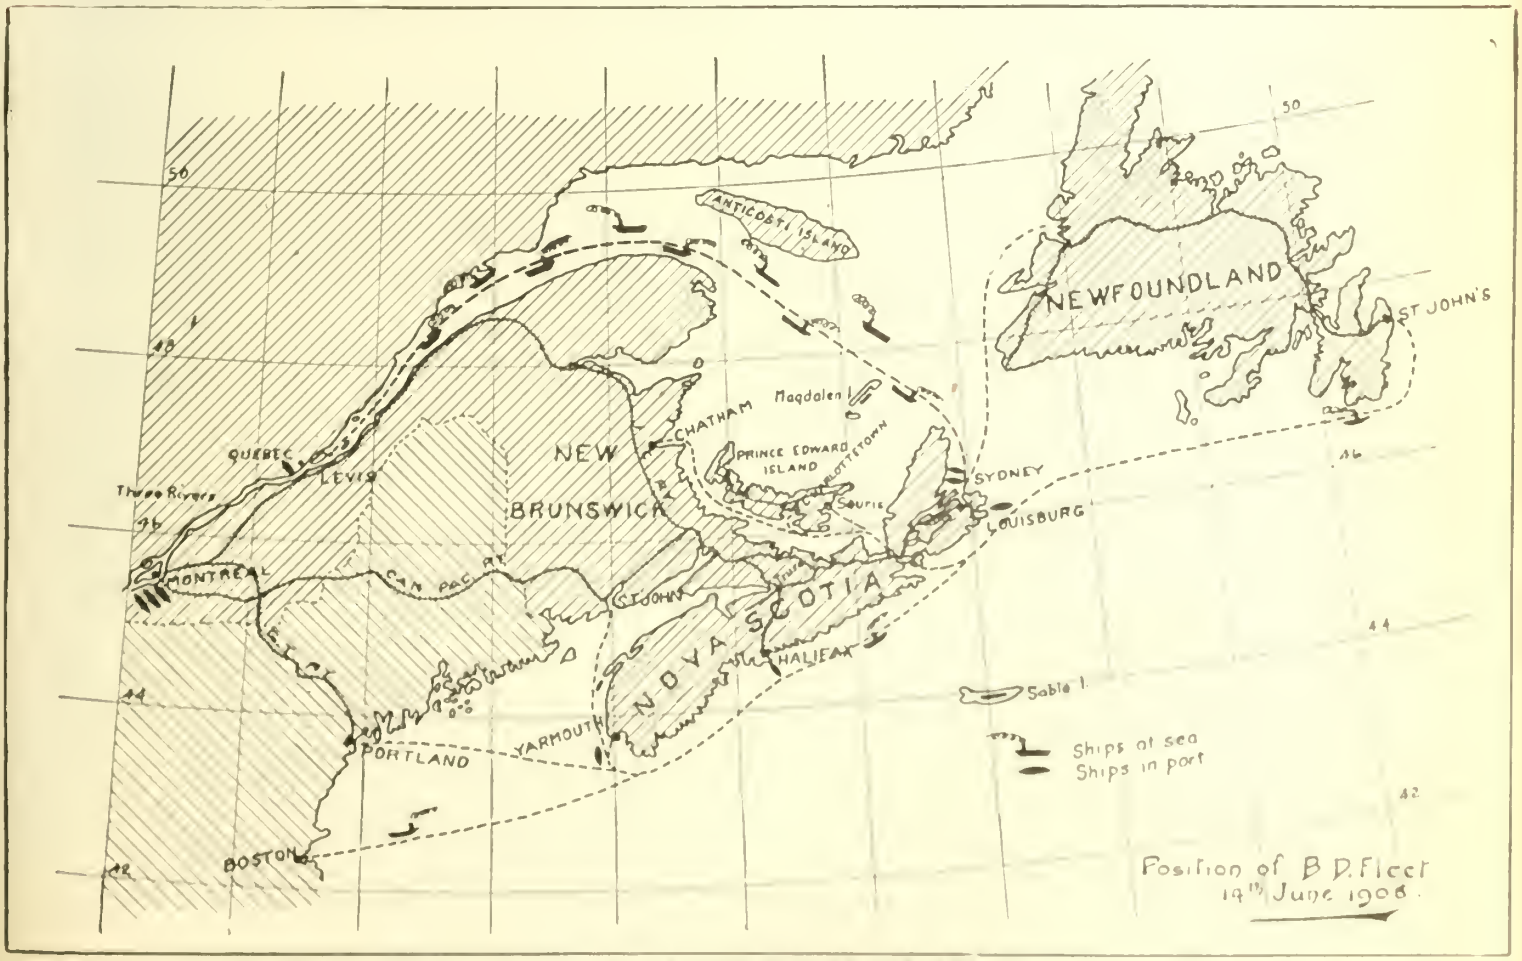
The presence of amygdaloid copper-ore in the strata underlying the City of Sault Ste. Marie is reported to have been disclosed by a churn drill being used to put down an artesian well for water for a drewery. The occurrence is reported by Mr. J. B. Miller, who states that he panned the sludge from the drill-hole and found traces of copper in the progress of the hole from a depth of 200 feet to a depth of 420 feet. The despatch from the Sault, as reported in the Sudbury "Star" states that when drilling operations were commenced the government geologists asked that samples of the drillings should be sent for examination as taken from various depths, not with any idea that a mineral deposited existed, but for general information. Samples have been forwarded as requested.

NOVA SCOTIA COAL AND THE ST. LAWRENCE MARKET.

The first boat from Cape Breton loaded with coal for St. Lawrence ports was the S.S. "Maskinonge" which sailed ex Louisburg for Quebec on the 14th April. The accompanying diagram may be interesting as a reminder of what the St. Lawrence coal markets meant to the Cape Breton mines before the war. It is re-produced from a description of the Dominion Coal Company's operations, written by the Editor of the "Journal" in 1908, and now out of print. The date was picked at random, and the disposition of the coal-carrying vessels which is shown may be regarded as fairly typical of the extent of the coal-freighting bnsiness before the war diverted trade from its normal channels.

The largest quantity of coal shipped from the Cape Breton collieries to St. Lawrence ports was in the Summer of 1915, when a quantity of between 1,900,000 and 2,000,000 tons was sent up the River during the season of navigation. The coal-consuming capacity of the St. Lawrence ports has greatly increased since that time, and it is probable that a market for 3,000,000 tons of bituminous coal exists in the Province of Quebec, that, were national considerations given proper weight, should all be supplied from Nova Scotia.

The possibilities of the Transcontinental Railway, from Quebec to Winnipeg, as a distributor of Nova Scotia coal sent to Quebec City by water, have not been realized. During a recent transportation congestion in the United States (sometimes referred to as a coal shortage in Canada) Nova Scotian coal was sent to pulp mills in the neighbourhood of Cochrane, and landed there at a price which was lower than United States coal delivered over the T. & N. O. at that point. The recent shortage of hydro-electric power has revealed the Porcupine gold-mining district as a possible large user of coal, as a stand-by and auxiliary to hydro-electric power, and a study of the map will show that the water-route to Quebec and the straight line of the Transcontinental Railway offers some attractive possibilities in the extension of the radius of distribution of Nova Scotian coal. The matter is not less interesting in view of the recent disclosures of the important diversion of western wheat through United States Atlantic ports. Whether North America were divided into two countries or not, it would seem that the vicinity of Cochrane were distinctly within the radius of economic distribution of Nova Scotian coal. There is the incidental consideration, which weighs very lightly with some people, that Canada is a separate political entity burdened with a heavy public debt, with desperately unprofitable public-owned railways, and containing unproductive coal-mines and idle miners. Under these conditions, there are some people who venture to believe that the country should test and find out what may be the economic limit of distribution of our own coals. The people in the West two years ago had certain ideas regarding the extent of economic distribution of western coal, ideas which today they remember only to laugh at.



IN THE DAYS BEFORE THE WAR.

This map was drawn for inclusion in a description of the Dominion Coal Company's operations, published in the "Journal" in 1908. On the date selected, taken at random, the Dominion Coal Company's fleet totalled [illegible] tons, comprising 19,000 tons steaming loading in port, 27,300 tons at sea loaded, 19,000 tons in port discharging and 21,000 tons steaming to port in ballast. The market for Nova Scotia coal in Montreal and district is much larger to-day than it was at that time, and is probably not less than three million tons annually.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

Silver quotations continued steady into the fourth week of April, and there is a general feeling that the panic caused by the precipitate decline was instrumental in forcing the price of the metal to a much lower price than is warranted by the law of supply and demand. Now that the market appears to have become stabilized, and it is found that world production of silver has declined to an alarming degree, it is believed not altogether improbable that an early upward fluctuation in quotations may be looked for. This is considered by mining men as the inevitable result of the working out of the law of equilibrium. As to the soundness of these calculations, time alone will bring the verdict, and the result will be of vital importance to Cobalt.

Although the Nipissing report contains the information that the result of development work during 1920 was unsatisfactory, and reports a decline of ore reserves to 3,568,000 ounces as compared with 6,354,000 ounces a year ago, there are certain favorable results which hold out promise for the future.

In 1920, the mine produced 2,631,323 fine ounces of silver valued at $2,543,024. This is somewhat lower than the preceding three years, but compares quite favorably with the average from 1908 up to 1917.

A favorable feature of the ore reserves is the fact that the estimated high grade ore comprises the greater part. This is made up of 1,851 tons containing an average of 1,183 ounces of silver per ton or a total of 2,188,903 ounces, as compared with low grade amounting to 70,814 tons containing an average of 19.5 ounces or a total of 1,379,224 ounces. The average grade of the whole reserve is 49.1 ounces. This compares with an average of 41.6 ounces in the ore treated during 1920.

Another favorable feature is that in spite of adverse economic conditions during the year, the company produced its silver at a cost of 37.4 cents an ounce. This compares with 35.6 cents an ounce during the preceding year. It leaves the company in a position to maintain a very satisfactory margin of net profit even with silver at the present low price.

About 15 p.c. of the total value of the monthly production from the Nipissing mine is made up of cobalt, as shown in the figures for the past two months. This metal swelled the company's income to the extent of $837.20 a day during March, as compared with $4,388.90 a day in silver. It is obvious, therefore, that cobalt has become a very valuable by-product from this mine.

Concerning the fire which destroyed the shafthouse at the Meyers shaft of the Nipissing, a temporary headframe has been installed and operations are being maintained at normal capacity. Beyond the cost of the fire, the company has not been embarrassed by the mishap, according to official advice to the "Journal", and this may be taken as a denial of the earlier unofficial reports that there might be some delay caused by the fire, with a consequent reduction below normal output.

Work on the Hudson Bay Mines will remain suspended until the price of silver goes up or the cost of operation declines. That is the official announcement received to-day in response to an enquiry. It will be recalled that this company borrowed some $20,000 last fall, with which to carry on development work during the winter, and it was intended to commence treating ore about May 1st. Considerable ore was developed, amounting to from 3,000 to 4,000 tons containing about 15 ounces to the ton, as well as a further substantial amount being indicated. However, the slump in the price of the metal upset the company's plans with the result as above announced.

The Chambers-Ferland mine of the Aladdin-Coblat continues regular shipments of about 25 tons of ore per day to the Bailey Customs Mill. In the meantime, a moderate amount of high-grade ore is also being encountered. In the new consolidation in which the Chambers-Ferland comes-under the control of the Kirkland Lake Proprietary (1919), Ltd., the work of superintending the operation of the Chambers-Ferland will be in the hands of Chas. A. Richardson.

In an interview with Major J. Mackintosh Bell, the correspondent of the "Journal" was informed that although operations have been resumed on the Keeley Silver Mines, the property will not be placed upon a producing basis until the market for silver strengthens. Major Bell declared that about 500,000 ounces of silver has been blocked out in ore containing between 25 and 30 ounces of silver to the ton. One ore-sheet contains from 45 to 90 ounces of silver to the ton, but, following the operation of the mill, it is planned to establish average mill-heads of between 25 and 30 ounces. For the time being, development work will centre at the 360-ft. level.

Work on the mill at the Mining Corporation is going ahead at a satisfactory rate, a force of about thirty men being employed. It will require another four or five weeks to complete the alterations, and the mill will then have a capacity for treating about 300 tons of ore daily. An official of the company was asked to-day if the mine would be re-opened immediately after these alterations to the mill may be completed, but it was stated any announcement as to the date of re-opening would be withheld for the time being and when made would be governed by the price of silver at that time. The fact of such extensive changes being made in the mill, with the obvious intention of increasing the efficiency of the plant, is being pointed to in Cobalt as reasonable evidence that the company anticipates an early resumption of production.

Gowganda and Elk Lake.

The hydro-electric power supply is back to normal at the Miller Lake-O'Brien, and operations have undergone an increase during the past week. The arrival of spring has brought with it a better outlook for the whole district, among the smaller properties being opened up appearing the following: The Gowganda Enterprise, McAlpine, Powerful, etc., while others mentioned as likely to resume, being the Saunderson, Silver Star, Hewitt Lake, Silver Bullion, Walsh, Collins and Silverado.

Another consignment of high-grade ore is said to be in course of transportation from the Castle property in the Miller Lake district, to the railhead at Elk Lake.

Exploration work by use of two diamond drills on the White Reserve property at Maple Mountain has been suspended, according to information reaching here. The property has been under option and under exploration by the National Mining Corporation, which concern is represented by J. B. Tyrrell, of Toronto. No official advice has been received as to the cause of the suspension of work.

Ore and Bullion Shipments.

During the week ended April 22nd, two Cobalt companies shipped ore, the Coniagas being the heaviest shipper with two cars to its credit.

Following is a summary:—

Company	Cars	Pounds.
Coniagas	2	131,275
O'Brien	1	64,000
Totals	3	195,275

During the corresponding period, the Nipissing was the only bullion shipper, this company sending out 39 cars containing 50,104,63 fine ounces.

Asbestos by Airplane.

It has been arranged to ship approximately 20 tons of asbestos by airplane from the Rahn Lake property to Elk Lake. The property is near Mount Sinclair, in the township of Montrose, about 35 miles north-west from Elk Lake. The undertaking is looked upon more in the light of an experiment rather than a practical or economical method of transportation. The cost of importing a machine together with an experienced pilot will obviously be such as to discourage the general use of airplanes on such small contracts, but the time occupied, and so on, may prove to be of value in estimating the possibility of aerial transportation where machines and pilots may be retained in regular operation.

THE GOLD MINES.

The Porcupine District.

The Hollinger Consolidated Gold Mines is operating at full capacity for the first time since the completion of its present milling plant. The entire equipment is in use, and during the past week the plant strained a capacity of over 3,200 tons of ore daily. This information was secured officially from Mr. A. P. Brigham, the company's general manager. Mr. Brigham was reticent, however, as to the probable yield, and when asked if the mine were now in a position to make a bid for world leadership, he expressed the opinion that: "it would be best to wait and see". The plant is expected to treat an average of at least 3,300 tons daily, and there is a possibility of attaining a maximum rate of about 3,500 tons of ore daily. Should this prove to be the case, and with the ore running about $10 a ton, it is obvious that the Hollinger is at this moment actually challenging the world's greatest gold-producers for the position of leadership.

During the course of an interview with Major J. Mackintosh Bell, vice-president and managing-director of the Porcupine V. N. T. Mines, the "Journal" correspondent received the information that although the amount of development work done on the property is not very extensive, yet the ore blocked out contains approximately $1,000,000. One very favorable feature is the fact that at the lowest level reached (600 feet deep), the vein on which the shaft is located has a width of 12 feet and contains average values of $11.50 per ton. The company has about 550,000 shares in its treasury, but it is the wish of Mr. Bell to encourage the directors to advance $200,000 with which to re-model the mill and place the mine on a solid basis of production. Of this, $50,000 would be used to bring the mill up to 150 tons daily capacity, and the balance to be used in continuing the main shaft to a depth of 900 feet and establishing three main development levels, one at 600 feet and the others at 750 and 900 feet. "It is my opinion that in the Porcupine V. N. T., we have a mine which is second in importance only to the three leaders the Hollinger, Dome and McIntyre" is a statement made by Mr. Bell.

It was recently stated that the Crown Trust Company had taken up $100,000 of mortgage bonds issued by the Northerown Porcupine Mines, Ltd. This has led to more or less confusion, the statement being in error. The facts of the situation are these: The mortgage bonds of $100,000 were issued as a means of providing funds with which to carry on development work pending the time when the company's mill could be operated, a closing down having been necessary during the winter owing to the shortage of hydro-electric power. Further, the Northerown Porcupine Mines is a consolidation of the Porcupine Crown and the Thompson-Krist properties. The Northerown has an issued capital of 3,000,000 shares of which 2,000,000 are held by the Porcupine Crown and 1,000,000 by the Thompson-Krist. This being so, when the decision was made to issue mortgage bonds of $100,000, it was left to the Northerown to take up 66 2-3 per cent., while the Thompson-Krist was supposed to take up 33 1-3 per cent. It is learned that the Porcupine Crown immediately took up its share, but the Thompson-Krist has not been able to take up its one-third, owing to not having funds available. Accordingly some other arrangement will be required provided the amount of money required exceeds the sum put up by the Porcupine Crown. As regards the Crown Trust Company, this concern is merely acting as trustee for the bondholders. A trust company cannot very well invest its funds in mining property, and the foregoing explanation is intended to set at rest any mis-apprehension which may have been aroused among the shareholders of the Crown Trust Company.

A deal has been closed for the Tommy Burns property, situated in the south-eastern part of the township of Shaw. Arrangements are being made to explore the property by employing diamond drills.

Kirkland Lake District.

About May 1st the cross-cut at the 600-ft level of the Lake Shore is expected to reach a point where the downward continuation of the rich orebody as found at the 400-ft. level is expected to occur. A rich strike was reported during the past week in certain newspapers, but in an interview yesterday with R. C. Coffey, mine manager, the reports were stated to be erroneous. Mr. Coffey expressed the opinion that it was very unfortunate that such reports are given wide circulation without any attempt being made to verify them. Such erroneous reports are entirely contrary to the wish of the Lake Shore Company. Mr. Coffey told the "Journal" that additional grinding equipment had been purchased and, just as soon as it could be installed, would increase the capacity of the mill to 100 tons daily as compared with the present rate of 60 tons a day.

The annual statement of the Argonaut Gold, Ltd., has just been issued for the calendar year 1920. The report shows a production of $32,513.05 as a result of having treated 1,637 tons of ore in its testing plant. The ore taken out of the mine during the year, contained an average of $10.01 in gold per ton, of which $7.01 per ton was recovered by use of the straight amalgamation stamp mill which was used solely for test purposes. It is pointed out that one ore shoot has a length of 200 feet and is six feet in width, containing an average of $15.75 cents a ton. The report states that a new modern mill is proposed and will be erected just as soon as developments justify the work, and at which time the percentage of recovery will be much greater than with the present testing mill. At the 550 ft. level, at which depth high values were indicated by diamond drilling, active development is now under way and the results will be available for the annual meeting which will be held May 11th. The report shows 715,430 treasury shares still unissued and available to finance further work.

GOLD MINES OF NORTHERN ONTARIO NOW PRODUCING AT RATE EQUAL TO ONE-THIRD OF THE TOTAL OUTPUT OF THE UNITED STATES.

(By J. A. McRAE, Cobalt.)

The production of gold from the district of Temiskaming, in Northern Ontario, which embraces the Porcupine and the Kirkland Lake fields, has increased rapidly since the first week in April, and the mines of this district are producing gold at a rate equal to more than 30 per cent of the total current yield of the United States. Moreover, there is every indication that a further increase will take place, and by the end of 1921 the rate of output promises to amount to more than 40 per cent of the total output of the United States.

To deal alone with the mines now producing, these figures comprise a general idea of the current rate of production:

Company.	Daily Tonnage.	Value per Ton.	Daily Output.	Rate Per Year.
Hollinger Con.	3,200	$10.00	$32,000	$11,680,000
Dome Mines	1,400	7·00	9,800	3,577,000
McIntyre-Porcupine	600′	11·00	6,600	2,409,000
Lake Shore	60	25·00	1,500	547,500
Kirkland Lake	140	9·00	1,260	459,900
Teck-Hughes	120	10·00	1,200	438,000
Totals	5,520	.....	52,300	$19,111,400

In addition to the producing mines as of the middle of April, there are a number of other properties on which first-class mills have been built and which will be in operation at an early date. Of these, the Wright-Hargreaves will commence work about May 1st, while the Tough-Oakes will be started up about the last of August. These mines will add the following to the gold production of Northern Ontario:

Company.	Daily Tonnage.	Value Per Ton.	Daily Output.	Rate Per Year.
Wright-Hargreaves	160	$15·00	$2,400	$876,000
*Tough-Oakes	140	15·00	2,100	766,500
Northerown	120	10·00	1,200	438,000
**Schumacher	200	6·00	1,200	438,000
Porcupine V.N.T.	150	10·00	1,500	547,500
Totals	780	.....	$8,400	3,066,000

*Controlled by the Kirkland Lake Proprietary (1919), Ltd.

** Allowing for a proposed increase to 150 tons from the present of 100 tons.

These mines all have substantial ore reserves, ranging from a few hundred thousand dollars in the case of the smaller mines to a high point of over 40 million on the leading mine, the Hollinger Consolidated. The figures presented are not based upon conjecture, but are submitted on the strength of previous achievements and taking into account the per ton of the ore in reserve.

As time goes on, further growth seems probable. There are a number of small mills throughout the district which are not mentioned in the foregoing statement. Also, there is a new mill of 100 tons daily capacity now in course of erection at the Ontario Kirkland mine. The idle mills include a 50-ton mill at the Croesus, 40-ton mill at the Hill Gold Mines, 30-ton mill at the Argonaut and a 30-ton mill on the Canadian Associated Goldfields, a 30-ton mill at the Davidson and a 100-ton mill at the Dome Lake.

Therefore, taking into account the mines already producing at the rate of $19,111,400 and the mills which will be re-opened this summer likely to add $3,066,000, the indicated production from the district of Temiskaming will amount to $22,177,400. In addition to this may be the operation of some of the smaller mills referred to. There is also a probability of a substantial increase in the size of the McIntyre-Porcupine mill, together with the possibilities of the Hollinger and the Dome still further increasing the capacity of their plants above the figures given.

These facts all go to indicate a probable annual yield at the rate of over 22 million and a possible increase to a rate of close to $25,000,000 in 1922. As compared with this, the total production of the whole of the United States in 1920 amounted to only 59 million, and with current statements indicating less than that amount this year.

Another factor which promises to add somewhat to the foregoing figures for Ontario is the exchange rate as between Canada and the United States. Gold commands full value in New York, while the New York funds command a premium of about 12 per cent in Canada. For the time being, therefore, the premium adds this percentage to the net value of the product of the gold mines of this country. This premium may or may not continue for a long time. In any case, the yield of the mines is large, while with the premium the dividends of the producers will be added to the full amount of the premium.

This situation, having in mind the present known mines, holds out great promise for industry in Northern Ontario. Not alone does it assure prosperity during the life of the proven mines, but may reasonably be expected to comprise a drawing card, so to speak, and result in intensified exploration in the vast stretches of promising territory lying on all sides of the proven areas, and, in that way, lead to the discovery and the development of mines quite as good as those which now go to make up this remarkable aggregation of going industries.

Engineers of leading ability express the opinion that only a mere fringe of the gold-bearing territory has so far been developed. This being so, it may not be unreasonable to look to the future not only with hope of further favorable developments, but with a good measure of assurance that gold-mining activity will greatly increase and be accompanied with increased production.

That is the situation as found at present in this part of Northern Ontario, these assertions being based upon actual achievement and entirely conservative opinion, shorn entirely of any attempt to add color and to pyramid hopes based upon mere anticipation.

MONTREAL METAL QUOTATIONS.

TORONTO COAL PRICES.

Toronto, April 25. —Coal is coming through a little more freely, but there is still a very small movement. Coal dealers in Toronto are advising householders to put in their coal for next Winter, which measure, they say, is necessary for the householder's protection. Anthracite is quoted at $11.36 New York funds for stove and nut, and $11.10 per ton for egg coal. In bituminous coal, smokeless is quoted at from $3 to $3.25 at the mines, with lump about the same and slack $2.00 to $2.25 at the mines, based on New York funds and exclusive of freight charges.

COPPER COMPANIES CURTAILING OUTPUT.

The protracted dull market for copper has forced copper mining companies to greatly decrease production. Most of the large producers have found it impossible to continue operations at even much reduced scales and every week brings announcements of more companies ceasing production. Those that are still operating their mines find it necessary to make big cuts in wages. At the present high costs few of the companies could operate even if the demand for metal were considerably improved.

British Columbia Letter

With the opening of the mining season in those parts of British Columbia which are snow and ice bound for a considerable part of the year the annual exodus from the south of prospectors, miners, and promoters is taking place. To the Peace River, the Atlin, the Cassiar, the Portland Canal and Alice Arm, and to the Yukon Districts, men interested in the business of mining are directing their steps.

The placer-gold possibilities of the Peace and its tributaries have yet to be thoroughly explored. Official reports indicate the possibility of another field and not a few sourdough prospectors are determined to continue the search. In 1908, Wm. Fleet Robertson, provincial mineralogist, on the subject, said: "Among the camps now existing, or formerly operated, situated in and indicating this gold belt, may be mentioned the Klondike—at its northwestern extremity, as far as is yet known, and following in succession, in a southeasterly direction, Atlin, Dease Lake, Omineca, Cariboo, Big Bend and Upper Columbia River—with, at a wider distance apart, in an east and west direction, the camps of Wild Horse Creek in East Kootenay and Granite Creek in the Similkameen." There are wide and practically unprospected areas between some of these points but it is the country drained by the Peace and Finlay Rivers, and particularly the section of the Ingenika River, to which the attention of the gold-seekers is inclined.

Much activity is expected in Atlin if the litigation now hindering the operation of the famous Engineer Mine is cleared up. While placer-mining and hydraulicking on the well-known creeks of this district has been on the decline of late years the possibilities of successful lode-mining have become better appreciated and it is probable that some promising silver, as well as gold, properties will be developed.

Considerable prospecting for placer gold may be expected in the Cassiar District. On Thebert Creek hydraulicking is being undertaken on a large scale with good prospects and it is considered likely that ground held under lease and some not yet taken up, on this Creek, Dease Creek, McDame Creek and other waters of the locality will be inspected by engineers during the season.

Of the Portland Canal District much already has been said but it is significant that the directors of the Premier Mining Company have decided to proceed with the construction of an aerial tramway from their property on Salmon River to tidewater. This will be at least 11 miles in length, one of the longest installations of the kind in America, and a work that will cost about $250,000. This is conclusive proof that the extensive development of the Premier Claims, by diamond-drilling, stripping, tunnelling has convinced the owners that they have an ore body which in extent and in value will well repay this and other heavy preliminary expenditures. It is reported that the Algunican Mining & Development Company has shut down work on the Spider Group, and that the men have filed liens on the property and equipment for the amount of their wages for several months. W. A. Meloche, the enterprising head of this concern, is said to be engaged in the organization of the Northern Light Exploration Syndicate to take over the Northern Light, Spider, Cobalt and Lake and O'Leary properties. If this re-organization is successful the development of the Spider and other claims will be continued. The success of the Premier Mine, however, will serve to sustain confidence in the Camp and there will be a large influx of prospectors and miners this year. In considering the present situation in the Portland Canal area and the future outlook it is well to bear in mind the words of George Clothier, government mining engineer, in his annual preliminary report for 1920. He said: "A great number of properties have been undergoing exploration and development and, though there necessarily have been some disappointments, the percentage of those on which results have been favourable is encouragingly large. As was to be expected, there were many "broker and promoter operators" who incorporated companies last winter on anything with stakes on it, and in the majority of cases there was nothing but the stakes. It is worth noting that the public fought shy of promotions not backed by the report of a competent mining man, and therefore the 'boom' for that kind of mining did not materialize."

Already conditions are reported to be improving at Alice Arm. While no official word has been received yet as to the plans of the Dolly Varden Company there is no doubt that, if the metal market is considered satisfactory, shipments will be resumed. Meanwhile development work will be continued. Prospecting and mining on a small scale will go on in both the regions drained by the Kitsault and the Illiance rivers. In these sections there are many promising silver properties. The Yukon will be busier, according to report, than for some years. Gold dredging is expected to take on a new lease of life as a result of new regulations passed by the Dominion Government for the purpose of facilitating that work. It is the Mayo District, the new silver camp, however, that is expected to do most for the far north from the standpoint of mining. Not only are the properties now in operation to be continued but new locations on Keno Hill, Rambler Hill, Mount Cameron and Lookout Mountain are to be opened up by the Yukon Gold Mining Company and other Companies.

Anyox, B.C.

Notwithstanding the lack of market for copper and the closing down of most of the large producers of America the mine and smelter of the Granby Consolidated Mining & Smelting Company continues in operation. Last December the employees agreed to accept a reduction in wages rather than have the plant closed down and, as a result of the amiable understanding reached between the employed and the employers, it has been possible to maintain the industry. H. S. Munroe, general manager, recently referred to this achievement with satisfaction. He said that wages had been reduced in accordance with a sliding-scale agreement. When the price of copper rose about 14 cents the wages would automatically advance. Living costs for married families he stated had fallen about 25 per cent since December 1st last.

Spences Bridge: B.C.

Gold has been discovered on the old Yale—Cariboo road between Spences Bridge and Asheroft. The find is credited to the Ellingsen Brothers, of Asheroft, who are said to have taken from their claims a number of nuggets. The section already is extensively staked and the original locators are proceeding with development.

Co. aggregating 101,898 tons. This is a figure 35 per cent greater than that for the opening three months of the previous year. Of the total 99,970 tons came from the company properties. It is quite clear, therefore, that the independent operators, affected by the low prices offered for metal, are doing no shipping, although there is considerable development in progress. A shipment of 784 tons is credited to the Blue Bell Mine at Riondel during the month of March.

The recent decision of the directors of the Consolidated Mining & Smelting Company, of Trail B.C., to pass a quarterly dividend and the report of J. J. Warren, the President, read at the meeting held at Montreal, have excited considerable interest in this Province. Mr. Warren showed that the net profits for the twelve months ending December 31st last declined to $291,349 against $1,161,605 in fifteen months covered by the previous statement and $949,245 in the full fiscal 1918 period. He referred to the drop in metal quotations and to high operating costs, including wages, fuel and freight charges, and concluded with the following interesting statement regarding the labour situation:

"With the beginning of the new year wages were cut about 12½ per cent. While many of our workmen have been zealous, much greater efficiency became noticeable as unemployment elsewhere became prevalent and men began to realize the importance of production at low cost. Some materials have fallen in price but powder steel and fuel, main essentials of the company's operations, still remain at or above war prices and freight rates have been reduced but very little."

Victoria, B.C.

British Columbia wants an Iron and Steel Industry. For years far-sighted men have declared that the industrial future of the Province is dependent on the commercial utilization of the magnetite deposits found on the coast and in the interior. They have pointed out from the hustings in political campaigns, from Mining Convention platforms, and through the Press that future industrial development, and the achievement of greater population and prosperity, depends on the establishment of this basic industry. It has been conclusively shown that the iron ore is available in the necessary quantity, that it is of the essential quality, and that the coal measures are at hand needed for the furnishing of the required coke. The Provincial Government has offered a bounty on pig-iron produced in the Province from local ore and also on pig manufactured locally from foreign ore. The same government now has underway a systematic exploration of the iron-ore resources of British Columbia. But the only real sign of action so far is the incorporation of a Company, with headquarters at Vancouver, B.C., and said to be backed by adequate British capital, the objects of which are to inaugurate the desired enterprise. Other British capitalists are said to be interested and to be investigating. But are yet nothing tangible has been done. Now comes the report, apparently well authenticated, that the Northwest Iron and Steel Company, of Spokane Wn., will begin construction of a 25-ton a day electric-iron plant in Stevens County, Washington, close to the boundary of the Province in a few weeks. Fred M. Williams, president of the Company states: "There is no iron-furnace on the coast north of California. The consumption of pig iron on the coast is 500 tons a day. Financiers of the northwest have been giving their attention to the possibility of a steel plant in one of these States or in British Columbia. It is difficult to conceive of any enterprise of more value. Before a steel plant can be established there must be iron furnaces and the first unit of our plant we hope to have in operation this fall. The cost of a steel plant will run into millions but the idea that an iron furnace requires big capital is erroneous. Our first unit, with its equipment, will cost less than $50,000. The important requisite to success is sufficient high-grade iron-ore with ample electric power and a sufficient supply of other material. All these are at hand. We have 300 acres and a ledge 60 feet wide that has been traced 4,500 feet. The ore carries 63 per cent metallic iron. We will use the electric process which makes the finest and purest pig-iron. There are two or three sources from which we will be able to secure ample electric power.

EDITORIAL

THE NORMAN OILFIELD.

Mr. E. M. Kindle, Chief of the Division of Paleontology, has written for the "Journal" of this issue some suggestions to prospectors in the Mackenzie River Valley that he is well qualified to give, as those who heard his enthralling, but modest, description of journeyings in the Northland, given at the Montreal meeting of the Institute, will readily testify.

From the wider viewpoint of the economic value of the Norman oilfield, it is worthy of especial note that Mr. Kindle believes the development of any oil which may be proved to be recoverable can only be recommended as an undertaking for companies prepared to spend very large sums on experimental wells, and in working out a satisfactory scheme for transporting the oil to market.

There can be little doubt, to those who will study the facts given by Mr. Kindle as to the remoteness of the Norman oilfield, the climatic conditions, shortness of working season and the limited hours of daylight that only experienced oil companies, with enormous financial resources and a thorough knowledge of oil transportation, oil technology and markets, can hope to make a commercial success of an oilfield "unique in the difficult commercial problems it presents".

If the Government desires to reap the utmost financial advantage from the Norman field, without relinquishing any of its possessory rights, it appears to be a case for employment of a competent contractor empowered by the Government to develop the presumptive oilfield under the most favourable conditions that it is in the power of the Government—as the holder of all land and mineral rights—to concede. The leasing of a number of scattered points of access to the oil accumulation to a large number of individuals is, we believe, an illogical proceeding. It is generally agreed that a monopoly is synonymous with efficiency, and the only objection to monopolies has been that when they undertook to fix the selling prices of commodities, the efficiency was so pronounced as to make the public uncomfortable. It has never been maintained that monopolies were inefficient in technical operations and, as a case in point, while many people object to Lord Shaughnessy's suggestion of consolidation of the Canadian railways on political grounds, it is fairly generally conceded that greater efficiency in technical operation of the railways would be the result of unified control. So far as the Norman oilfield is concerned, the Canadian Government now possesses all the advantages that proceed from monopoly of possession. Why then should the government dissipate that undoubted advantage by splitting up the unproven oil field into a thousand conflicting operations?

The Canadian Cabinet doubtless realises that quicker, larger and more permanent financial returns from any oil that may be in the Norman district could be obtained by giving a large concession to a large company, but such a step would probably be a most unpopular one. That is not, however, any indication that it would be a bad thing for the country, although admittedly it might be a bad thing for the Government, politically that is.

Those who have observed the progress of industries must admit individual operation has too often resulted in commercial failure, and that the evolution of many large and strong corporations of today has proceeded from the consolidation, as a means of self preservation, of a number of weak and indigent small companies. The tragedy is that the process includes the loss of much money to the original investors, and the eventual payment by the consumer of the successive enhancements of property valuation that consolidations must occasion. Such an evolution must take place in the Norman field if it should be proved that oil obtained there can be brought to market. Why should such an expensive process be regarded as necessary and, what is even more illogical, as being in the nature of right conduct?

THE BRITISH COAL STRIKE

Despatches from Britain regarding the progress of the coal strike are a marvel of reticence. Reading between the lines it is possible to deduce that conditions would be a great deal more serious were it not that the demand is lessened by the cessation of iron and steel making which had virtually caused the present depression before the coal strike was called.

The political nature of the miners' strike has been made clear by the refusal of the Federation to accept any settlement that did not include a national pooling

of profits for the support of indigent districts.

A new kind of pool has been suggested by Mr. Frank Hodges, the Secretary of the Federation. This is, using Mr. Hodges's own words, that the "miners and coal owners (if the coal owners had the coordination and wit within their own ranks) should determine what the price of coal should be, and prevent any owner from selling it at a halfpenny less". Mr. Hodges prefaced this suggestion by saying it was "a dreadful way". It is rather. The ideas of the miners are altogether what the Englishman would call " a bit shocking."

It is significant that in some mining districts the mines have been allowed to flood by forcible restraint of the maintenance forces, whereas in other districts, the miners have been careful to see that no lasting damage is done to mines. The mines that have flooded are chiefly those that suffer from difficult mining conditions, and from partial exhaustion, and are the least likely to be recovered because of the financial disability of the owners. More modern mines have not been allowed to suffer in this way, and it is plain that little sympathy will be forthcoming from the better-disposed miners when the bitter complaint is heard that the opportunity for employment at many mines has been destroyed by the action of those whose livelihood depends thereon. To pump out a good mine is only a matter of time and money, but pumping out a poor mine will not be undertaken readily.

CONSOLIDATED SMELTING COMPANY'S 1920 REPORT.

The report of the directors of the Consolidated Mining & Smelting Company to the shareholders, signed by the president, Mr. James J. Warren, is a frank statement of adverse factors beyond the control of the management. Inventories, that pitfall of recent years, were written down by $624,000, to meet the fall in metal prices. The fall in prices on the monthly production of the Company represented a drop in income, as between August and December of 1920, of over $300,000 per month. Despite this drastic diminution of revenue the Company had to pay higher prices for fuel, and an increase in freight rates that affects the net earnings to the extent of $40,000 per month. In face of such occurrences, the president does not over-state the facts, in the light of the balance-sheet, in reporting that the staff of the company "met the unexpected and almost baffling developments of the year with courage and resourcefulness".

The workmen of the Company have suffered a wage reduction of 12½ per cent, and credit is given to them for increased efficiency under the difficult conditions prevailing.

The report mentions important discoveries of ore in the Sullivan Mine, and it is stated as most important that diamond drilling on the bottom level of the mine has cut the high-grade lead-ore body, which was so profitable in the upper levels, at a point 8,700 feet from the portal of the lower tunnel. While further development of the Sunloch and Coast Copper properties has been suspended until the copper market improves, it is stated these properties promise to provide a very large tonnage of copper-ore high enough in grade for profitable results under normal conditions of metal prices.

Mr. Warren states that current market-prices of metals are below the cost of production of most producers, which can only be a temporary condition. There can be but little doubt of the accuracy of this forecast so far as the base metals are concerned. Although prediction of the course of the silver market is quite impossible, it being largely a reflection of crop conditions and political affairs in the Orient, the tendency of the base-metal markets is noticeably stiffened within the past few days, as must naturally be the case following the extended and prolonged curtailment of production that has taken place since the Autumn of 1920.

The report of the general manager, Mr. S. G. Blaylock, states that metallurgical processes have made great strides during the year, and mentions that the concentrator is now capable of handling 900 tons of Sullivan ore per day, "with results very much ahead of anything thought possible last year, and with the certainty of still further improvement".

So far as it is possible to judge from written reports, and without actual knowledge of the operations reviewed, the shareholders of the Consolidated Company should be satisfied with what is evidently a record of efficient management and all-round good team-work during an unprecedentedly difficult period.

PROPOSED GOVERNMENT CEMENT PLANT IN ONTARIO.

The Government of Ontario proposes the establishment of a cement plant. There is no known reason why a government can hope to make cement more cheaply than the ordinary industrial corporation, and there are many reasons—all too apparent at this time—to believe that government operation of a manufacturing industry will result in a greater unit cost for material delivered. The chief reason for high prices of cement in recent years has been the increased cost of coal. Indeed the chief reason for most high manufacturing costs is attributable to fuel costs at the point of ultimate delivery. The cost at the pitmouth is one of the least of the factors in this delivered price. The Government of Ontario would be much better employed in looking after the coal supply of the Province, and the eventual cost of cement to the taxpayers of Ontario will be smaller if the office of Fuel Controller is revived, and the proposal to erect a government cement factory is killed.

MACKENZIE RIVER BASIN MEMOIR.

Attenton is called to the issue by the Department of Mines at Ottawa of a revised edition of Messrs. Camsell's and Malcolm's report on the Mackenzie River Basin. A note on the contents of this memoir will be found elsewhere in this issue. It contains an excellent map, showing geological formations where they have been determined. The Survey is to be highly congratulated in being able to issue such complete information for public use at short notice.

CORRESPONDENCE.

Pan Extension Gold Mine.

The Canadian Mining Journal,
Gardenvale, Que.

Dear Sirs:

Having read your editorial in your journal regarding the Pan Extension Gold Mining Company, I think that you have misrepresented and exaggerated it to a great extent. For instance, you say that there has been 40,000,000 shares sold by different companies, and that the general public are being defranded out of their money. If the truth was known, not half of that amount has been sold, and I doubt very much if all the stock that has been sold or controlled by all the different companies since Rice Lake District became known, would total 40,000,000.

You also say that this stock is being put on the market by Americans. I would like to know who these parties are, as I only know of two. I would be pleased if you would supply me with the name of the party who you say is developing a claim in Rice Lake, and who is supplying you with all the information. Furthermore, I wish to say that the Pan Extension Gold Mining Company is the only gold mining company who have been really developing their property in Rice Lake. It appears to me that your editorial is written more from a prejudiced standpoint than for real information, also the essays which have been given by the Pan Extension Gold Mining Company to the general public, are absolutely true and correct. We would advise you to write to Ottawa for information regarding this matter.

Yours truly,
W. A. Morden,
Sec. of the Marigold Gold Mining Co.

Note: The opinions expressed in recent issues of the "Journal" on the financing of mine prospects in Northern Manitoba were made advisedly, and were chiefly based on the reports of officers of the Government of Manitoba and of the Canadian Geological Survey. The only statement contained in Mr. Morden's letter that is pertinent to the comment made by the "Journal" is that "the Pan Extension Gold Mining Company is the only gold mining company who have been developing their property in Rice Lake". If, under such circumstances, stock has been issued on Rice Lake properties amounting to forty million dollars in face value, or only half that amount, does it not look as if the general public had been handed a lemon? We do not doubt that the assay values of samples from the Gold Pan Extension Mine may be correctly quoted, but this does not justify a belief that Pan Extension "will stand supreme as the richest gold mine in the World", that it contains "chambers of gold", that it will rival Cripple Creek and Kalgoorlie, and that "there is every assurance that the deeper development will block out millions of dollars of this extraordinary high grade ore". The point we have endeavored to make is that the promotion literature emanating from Winnipeg has advertised prospects as though they were developed mines of proved richness. The extraordinary clause in the subscription blank, assuming personal liability and releasing the selling agents of Pan Extension shares from responsibility for the statements made (see page 246 our issue of April 1st) strengthen our conviction that purchase of Pan Extension shares is a very ordinary gamble. Mr. Morden's letter does not remove that impression. — Editor.

SALE OF ATIKOKAN BLAST FURNACE AT PORT ARTHUR, ONT.

J. J. O'CONNOR.

News of the sale of the Atikokan Iron Company's blast furnace, at Port Arthur, has been received with the greatest satisfaction. It has long been felt that the fact of this furnace lying idle has been one of the greatest handicaps the iron-ore resources of Northern Ontario had to contend with in interesting capital in their development.

Now that this furnace is to be put in blast, the operation of local iron-deposits is assured, and the building up of a permanent iron-ore and pig-iron industry, together with all the collateral lines of endeavour that naturally follow such an industry, are within the grasp of this community.

Mr. J. Dix Fraser, Superintendent of the Atikokan Iron Company, arrived here on the 16th, accompanied by John E. Hogan, of Chicago. They met the Finance Committee of the City Council on the 18th, and laid the proposed agreement of sale before that body, asking for ratification thereof by the City Council. In a special session of the City Council held on the 19th, called for this purpose, a resolution of the Finance Committee recommending the sale of the Atikokan Iron Company's blast furnace at Port Arthur, was duly ratified, the consent of the City of Port Arthur being necessary owing to the fact that the City has a substantial monetary interest in the property.

The name of the purchasers of the blast furnace is withheld for financial reasons, for the present. Mayor Matthews is in possession of this information, and is eminently well satisfied with their bonafides, financial strength, and experience to carry out such an undertaking.

The new undertaking involves the development of iron ore deposits in Minnesota, adjacent to the International boundary, the construction of a few miles of railway to connect with Port Arthur, Duluth & Western Division of the Canadian National Railway, at, or near Gunflint Lake, and the heavy placing of this division in a condition to accommodate heavy traffic. Mr. Hogan has left for Toronto to consult with Mr. D. B. Hanna, President of the Canadian National Railways, pursuant to the carrying out of the necessary connections and betterments.

It is the intention of the City Council to submit a By-Law to the electors in the near future, to fix the assessment of the blast furnace under an agreement for a fixed number of years.

Suggestions to Oil Prospectors in the Mackenzie River Valley*

By E. M. KINDLE, Geological Survey of Canada.

Unless all signs fail, the opening of navigation in the Mackenzie river basin this season will witness a northern migration of oil prospectors, unprecedented in western Canada. A large proportion of those who are likely to make the long journey to the new oil-field below Norman on the lower Mackenzie will probably have little or no knowledge of the conditions under which they must live in this region. (See map, Figure 1). A few suggestions and some bits of geographical information from one who has spent two seasons in the Mackenzie valley will perhaps be helpful to many who go into the great Northland for the first time.

It may be well to remind prospectors who go into the Mackenzie valley expecting to spend a year or more, that while they will find a genial summer climate, they will need to provide with some care for the sub-Arctic winter conditions which follow the seductive smiling northern summers. One of the most important of these provisions for Winter is a cabin (Figure 2). It should be clearly understood that there are no road houses or other establishments furnishing public accommodation anywhere in the Mackenzie valley.

The environment of the North exercises a selective influence on the human as it does on the other kinds of animals found within its bounds. The man who lives in the North as a trapper must in winter be able to visit his traps and sleep in the open at a temperature of 60 below. Losing a trail in the spruce forests (Figure 3), is likely to mean freezing in Winter and starvation in Summer. He must have a keen sense of direction and the ability to estimate accurately the limitations of his canoe. An error in estimating the hazard of a rapid or the strength of a gale results in

* Published by permission of the Director of the Canadian Geological Survey.

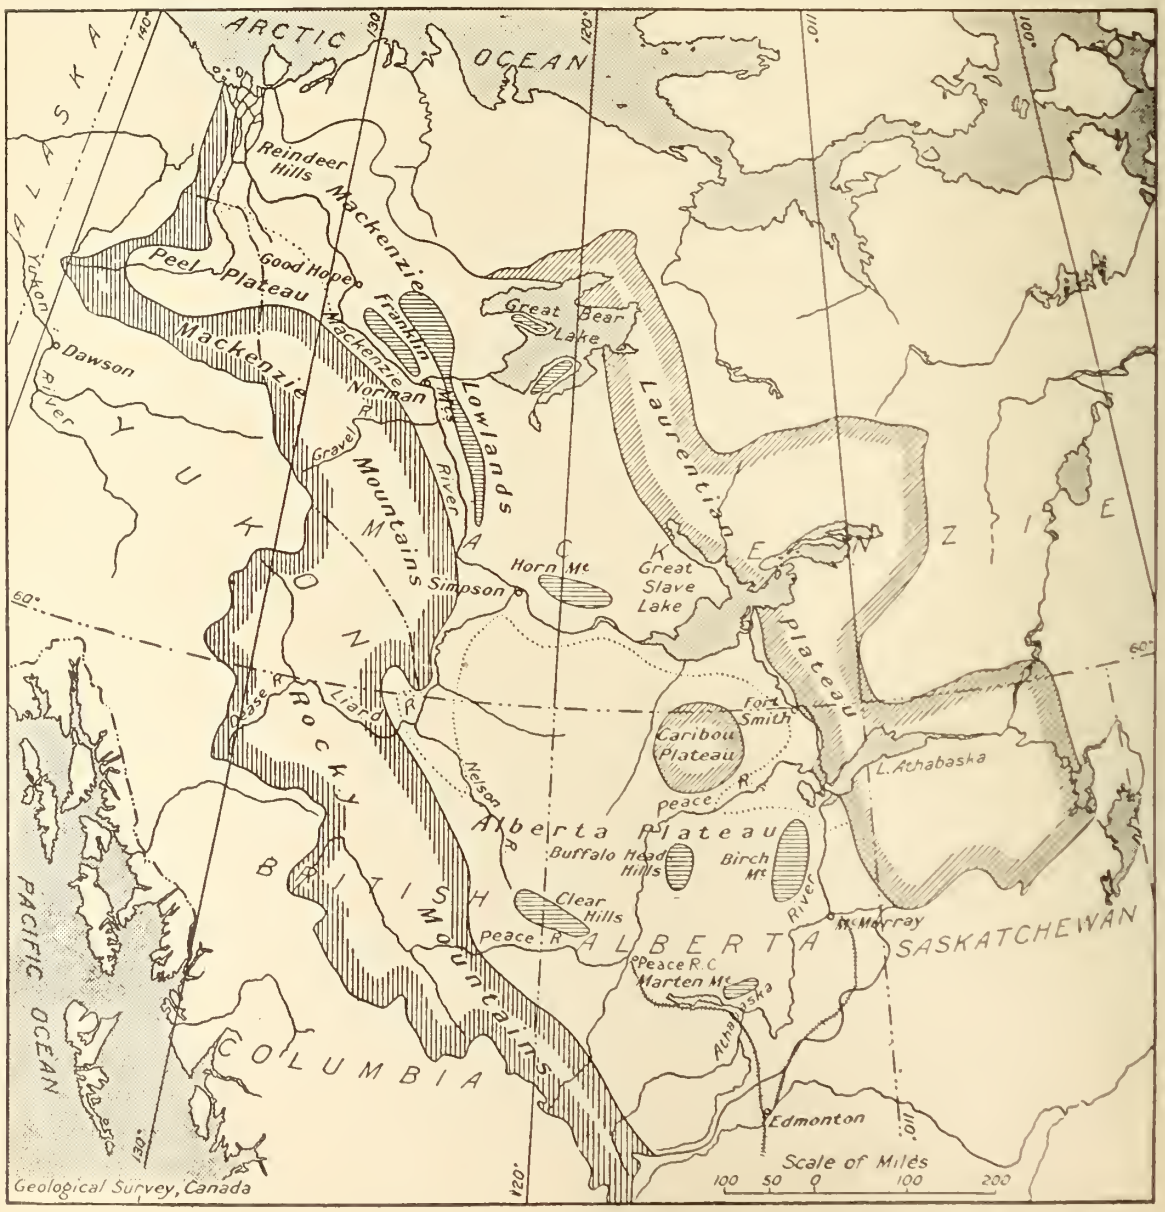

Fig. 1.—Diagrammatic Map of the Physiography of the Mackenzie River Basin. (After Camsell and Malcolm).

his elimination from the field of adjustment to northern conditions. So the white men whom one meets on the northern rivers and lakes represent as a rule a selected group of men who have proven themselves fit to cope with conditions which quickly weed out the human weaklings.

Outfitting.

Edmonton is the logical place for outfitting if one wishes the advantages of large and well-stocked stores, but most of the provisions required for an expedition into the N. W. Territories can be obtained either at Peace River Crossing, or McMurray. At one or the other of these points the north-bound traveler takes final leave of railways and hotels and must be prepared to depend entirely on his own resources. After provisions the next most important items for the outfit are one or two heavy woollen blankets or some form of sleeping-bag and a mosquito-proof tent. No experienced man will neglect the latter and the nearly equally important items of light-canvas gloves and head nets in outfitting for any part of the northern wilderness. He who does neglect these precautions against the universal mosquito pest of the Northwest will have good cause to regret his negligence and probably decide that he would have enjoyed just as much a sojourn in the super-heated climate of tradition.

One of the things which should be included in the outfit of the prospector going into the Mackenzie basin is a geological map of the region. This may be obtained by writing the Director of the Canadian Geological Survey at Ottawa for a copy of Memoir 108. Another small but important item of the outfit is a pocket compass. The northbound traveler may be reminded here that his compass readings require correction as he journeys north in somewhat the same way as does his watch on a transcontinental trip. At Ft. Smith the needle points not even approximately north but 33° 23′ east of north. At Ft. Norman the declination east is between 41 and 42 degrees.

Transportation.

Any approach by rail to the Peace or Athabasca rivers, which are the great waterways leading toward Great Slave and the Mackenzie, must be through the city of Edmonton. This thriving modern city was a very few years ago only an obscure trading-post of the Hudson Bay Co. on the Saskatchewan River. A railroad was completed a few years ago from Edmonton to Peace River Crossing on the Peace River, which is about 312 miles northwest of Edmonton. Another railroad extends north from Edmonton via Lac La Biche to the head of navigation on the Clearwater River (Fig. 1). This railway ends near McMurray; from that point to the Arctic coast steamer navigation on the Mackenzie is interrupted at but one point, the rapids at Fort Smith, where there is a portage of 16 miles. It should be noted however that while the latter route is the most direct the service beyond Lac La Biche is frequently discontinued for considerable periods because of the condition of the road bed. The Peace River route is longer and involves a fourmile portage at the Vermilion chutes which the McMurray route avoids, but the railway transportation is more dependable. The distance from the end of the railroad at Peace River Crossing to the oil well is about 1500 miles, and from McMurray about 1200 miles. Telegraph service extends to Peace River Crossing and to McMurray but not beyond

Fig. 2.—A Trapper's Cabin, Mackenzie River Valley.

Fig. 3—Spruce Forest on Slave River.

Fig. 4.—A Mackenzie River Steamer opposite Norman.

Fig. 5.—Canoeing on the Slave.

Two lines of steamers have for a number of years been engaged every Summer in bringing out the winter catch of fur and taking in the yearly consignment of supplies to the trading posts which are located from 100 to 200 miles apart throughout the Mackenzie river system. (Figure 4.) A third line began operations in 1919. These steamers make only a single round-trip to the most northerly posts. Two or more trips are ordinarily made to points on the upper Mackenzie. The companies operating steamers on the Mackenzie in 1920 were the Hudson's Bay Company and Northern Trading Co. Ltd. Both of these companies have offices in Edmonton.

The round-trip steamer rate quoted by one of the transportation companies this season from Ft. McMurray to the oil well, including meals and berth, is $300. A freight rate which has been quoted between these points (north) is $10.25 per hundred.

During the winter season the only communication between the Mackenzie Valley and the outside world is maintained by dog sledges or carioles which carry the mails in and out of the Mackenzie Valley once a month. Only first-class mail, however, is carried on these.

Fig. 6.—Trapper's Boat with a Year's Outfit.

It may well be understood that to the inhabitants of the Mackenzie Valley the great seasonal events of the year are the opening and closing of navigation on the waterways of the basin.

The ice of Great Slave Lake blocks the navigation of the Mackenzie River for nearly a month after the great river is free of ice. Owing to this fact navigation on the Mackenzie is limited to about three and one-half months. The record of the ice break-up at Rae on Great Slave Lake entered in the Hudson's Bay Company journals and published by Russell shows the break-up during 6 years (1857-1859 and 1883-1885) to have ranged from May 30 to June 23. The general direction of the wind in spring, however, drives the ice toward the southern shore so that steamers seldom venture into the lake before the first of July.

The Mackenzie at Simpson, which is near latitude 62°, opens between May 4 to May 20, averaging from the 10th to the 15th, according to Captain Mills, who has spent several years at Simpson and has run steamers on all of the navigable waters of the Mackenzie basin. Because of nearly dead water in the Mackenzie for a long distance, the head of the river opens two-and-a-half or three weeks later than at Simpson. The opening of Great Slave Lake generally occurs, according to Captain Mills, between June 16 and July 2, or six weeks later than the Mackenzie below Simpson.

Fur constitutes the sole commercial product of the country, and prospective travelers in the Mackenzie valley may be reminded that the transportation companies were established solely for the purpose of getting the fur out of the country, and a limited amount of provisions in each season to the trading posts, not for the accommodation of the traveling public.

The approximate distances between the trading posts on the Mackenzie river system north of the end of the railroad at McMurray are indicated in the following table:—

Fort McMurray to	Fort Chipewyan	190 miles
" "	Fort Fitzgerald	280 "
" "	Fort Smith	296 "
" "	Fort Resolution	490 "
" "	Fort Hay River	570 "
" "	Fort Providence	660 "
" "	Fort Simpson	835 "
" "	Fort Wrigley	995 "
" "	Fort Norman	1155 "
" "	Oil Well	1201 "
" "	Fort Good Hope	1330 "
" "	Fort Arctic Red River	1570 "
" "	Fort McPherson	1635 "
" "	Fort Seenie	1735 "

A company has been organized which proposes to build a railway around the Slave river rapids between Fort Smith and Fitzgerald. At present however all freight must be transported across the 16 miles between these two points by wagon or tractor.

Steamers will leave Fort Smith for the first trip down the Mackenzie about June 24. Departure from the same point on the second trip will be about July 26.

The Mounted Police have the authority to turn back any individual whom they consider for physical or other reason unfit for the trip. The inspector at Fort Fitzgerald, which must be passed by all persons entering the Mackenzie Valley, is required to take certain personal information regarding each individual going beyond that point. This interview may include a request for evidence that arrangements have been made with some power-boat for return transportation or that a contract for a year's supply of provisions has been secured.

It is necessary to begin the return trip from Norman not later than September 28th if a winter sojourn is not planned.

It is reported that aeroplane service to the new oil district will be available for those who do not mind paying $1000 for the round-trip. The Imperial Oil Company is preparing to use planes for the purpose of taking in its own employees.

Canoe Travel.

It is very probable that many persons wishing to go north this season will find it impossible to secure accommodations on the steamers. Such persons will however, find it possible to make the trip north by canoe, and to make very good time with the aid of the river current. (Figure 5). The return trip of course cannot profitably be made in this way since the journey is up stream. A man skilful with tools can build his own boat on the river bank at Peace River Crossing. (Figure 6).

In the northern latitude where daylight lasts about 24 hours in June it is feasible for large canoes to travel day and night if the party wishes to speed up. The mosquitoes are less active during the cool nights which

is often another incentive to night travel. The writer has covered the 200 miles stretch between Fort Smith and Resolution by day and night travel in 2½ days. This method for short periods involves no hardship, if the night is divided into two or more watches with only one man at the paddle, while the others sleep or study astronomy from the bottom of the canoe.

The northern rivers disclose only half their charms to the man who knows them only in the bright forenoon and afternoon sunlight. It is after the long-delayed sunset that the great, gloomy, unexplored spruce-forests assume their air of greatest mystery and fascination. The dark-green tops of the tall, slender spruce trees are apt to be first outlined sharply against a rose-tinted northwestern sky. This may fade to various shades of purple, green or gray, but not into the darkness of southern latitudes. At midnight there is plenty of light for safe canoeing but not enough to be sure whether a dark object on the bank a few hundred yards

Fig. 7.—Vermillion Rapids, Peace River.

away is a moose, a bear or only a black stump. Frequently the canoeman will see in the dim light near the shore a huge finger-like apparition waving furiously in the strong current and pointing downstream as if some river god were pointing the way and admonishing the voyageur not to tarry in his kingdom. An occasional booming splash breaks the midnight stillness as some stately spruce undercut by the river drops into the stream with a portion of the bank. If the mass of earth and stones on the roots is large they may anchor it on the river bottom and after the spring break up of the ice has stripped off its branches it may become one of the weird looking vibrating finger boards. The quiet solemnity of the night is sometimes broken by bird notes.

The approach of sunrise, which comes in June about 2 o'clock on the Slave, brings with it not only a feast of color for the eye in the northeastern sky, but a rich blending of odors which at sunset gave no evidence of their existence.

There are only two points on the entire Mackenzie river where the canoeman needs any special advice in regard to avoiding rapids. One of these is opposite the site of Old Fort Wrigley. Here the river splits on a rocky island. Loaded canoes and scows should take the west channel. The narrow eastern channel is rather swift water. The other locality is the Sans Sault rapids. Here also the canoeman should take the west side of the river keeping near the shore. The Vermillion chutes, (Figure 7) and the Smith rapids on the Slave are always portaged.

Geographical Features.

The Mackenzie basin embraces a vast area representing some 680,000 square miles of territory in Northwestern Canada. Extending over nearly 17 degrees of latitude it necessarily includes a considerable variety of physiography. A great central plain bordered on the east by the Laurentian plateau and on the west by the Rocky mountains and their northern extension, the Mackenzie Mountains represent the major physiographic features of the region. The mileage of the new oil well is equivalent to the distance from Ottawa to South Florida. Since there are no roads and very few trails, travel in the Mackenzie valley is strictly limited to the waterways. Everywhere dense forests of spruce and poplar, muskeg or small lakes cover the lowlands near the rivers. These generally render travel across country nearly impossible or extremely slow.

In all the 1200 mile stretch of lake and river between the end of steel at McMurray and the oil-well, the traveler will see only eight or ten Indian villages (Figures 8 and 9) with two or three fur-trading stores (Figure 10) at each to interrupt the virgin forest. The total population of the entire Mackenzie district will probably not exceed 5000. Probably less than 150 of these are whites, the remainder being Indians, except 200 or 300 Esquimaux.

Anglican or Roman Catholic Missions are maintained at most of these villages.

The Royal Canadian Mounted Police is represented by about a dozen non-commissioned officers and men distributed throughout the Mackenzie valley.

The Mackenzie river trip includes a wide variety of scenery. Anyone who can feel the pull of the great Northland, and who wishes to see what lies beyond the northern outposts of civilization, can hardly fail to enjoy a summer trip to the lower Mackenzie, provided he does not expect the kind of accommodations provided on the St. Lawrence or Hudson river boats.

Two government Indian agents, who are also mining recorders, reside in the district. Gerald Card is the agent at Fort Smith and T. W. Harris at Simpson. Both of these gentlemen perform various other official duties and still find time to extend the most kindly hospitality to the geologists who pass their posts. It may be added that dispensing hospitality in the most generous way is a characteristic of nearly all the white men the writer has met in the Northern trading-posts.

Agricultural development is limited to the gardens of the fur-trading posts located about 160 miles apart, along the Mackenzie. These gardens, however, demonstrate that potatoes and various other vegetables can be grown successfully as far north as the Arctic Circle.

Large game is rather scarce near the Mackenzie, but excellent white fish and inconnu are abundant both in Great Slave lake and the Mackenzie. Fish constitute the principal source of food supply for the Indians.

Fig. 8.—Indian Feast and Cabins at Fort Norman.

Oil Development.

The tar springs of the Athabasca region were noted as early as 1789 by Sir Alexander Mackenzie in the "Voyages through North America to the Frozen and Pacific Oceans." The first report of the Canadian Geological Survey on the Mackenzie river valley by McConnell published in 1890 described the oil prospects of the region. His report states that "The Devonian rocks throughout the Mackenzie valley are nearly everywhere more or less petroliferous, and over large areas afford promising indications of the presence of oil in workable quantities. The rock is in several places around the western arm of Great Slave lake highly charged with bituminous matter and on the north shore tar exudes from the surface and forms springs and pools at several points."*

Nearly every geologist who has since visited the region has commented on the oil seepages found in certain areas. The discovery of oil in the Mackenzie valley is therefore not a new thing.

The first attempt to exploit the oil of the Mackenzie valley was made during the summer of 1920 by the

*R. G. McConnell, An Exploration in the Yukon and Mackenzie Basins, N.W.T., Can. Geol. Surv. Ann. Rept., New Series, Vol. IV., part D, 1888-89 (1890) p. 31.

Fig. 9.—Indian Camp on the Peace River.

Fig. 10.—Hudson Bay Co. Store at Ft. Norman.

Imperial Oil company. The results secured from their well, which is located 45 miles below Norman on the bank of the Mackenzie, is reported to have been announced by C. O. Stillman, president of the Imperial Oil Ltd., as follows:—

"On August 25, at a depth of 783 ft., oil was encountered, which flowed out of the 6-in. pipe for thirty minutes, when the well was capped and shut in. Any estimate as to the amount of oil this well would produce is only a guess, as there was no tankage available, and an accurate test could not be made."

Various other far less conservative statements have also reached the public, but these are seldom if ever accompanied by any hint regarding the difficult commercial and physical problems which have yet to be solved before the Mackenzie river oil can be utilized.

The success of this first well is likely to lead to undue confidence on the part of oil prospectors in the commercial results which may be expected. It does not mean that Mackenzie river oil can be marketed at any early date. The 1200 miles which separates the new oil well from the end of the nearest railway presents a transportation problem of very great magnitude. Its solution is not likely to be attempted until numerous wells have demonstrated the existence of a large and very rich field. The existence of an oil field which will justify the huge outlay required to build a pipe line or work out any other adequate scheme of transportation has not yet been proven. It is evident that this Norman oil field, however rich it may prove to be, is unique in the difficult commercial problems which it presents. Its proximity to the Arctic Zone, short working season, and great distance from centers of population, present obstacles which the prospector with limited capital will do well to consider carefully. At present the development of this oil can only be recommended to companies which are prepared to spend very large sums on experimental wells and in working out a satisfactory scheme for transporting the oil to market.

MACKENZIE RIVER BASIN.

Revised Geological Survey Memoir.

A revised edition of the report by Charles Camsell and Wyatt Malcolm on the Mackenzie River basin has just been published. Descriptions are given of the waterways, transportation facilities, climatic conditions, and commercial possibilities.

The Mackenzie basin, covering as it does some 680,000 square miles of territory in northwestern Canada, necessarily embraces a great variety of topographic forms. Its longer axis, about 1,350 miles in length, conforms in its direction to the trend of the main physiographic features and strikes northwestward. In width it ranges from 300 miles at the mouth of the river to 900 miles near the centre of the basin.

It includes within these boundaries three main physiographic provinces, each of which runs almost the whole length of the basin and has characteristics which sharply distinguish it from the adjacent provinces. The three provinces are; a rugged, mountainous highland on the west, known as the Cordilleran region which is a continuation of the mountainous region that forms the backbone of the North American continent; a relatively more subdued, but rocky, and partly treeless plateau in the east known as the Laurentian plateau and which is part of the great plateau that almost encircles Hudson Bay; and between these two a broad, almost level, forested plain through which the trunk stream flows northwestward to the Arctic ocean. The last is the northward continuation of the Great Central plain of North America.

The plain is underlain by sediments of Devonian and Cretaceous age and to a smaller extent by Silurian and Tertiary sediments.

From the point of view of oil possibilities the Devonian and Cretaceous formations are the most important. There are several known oil seepages from the Devonian rocks and the boring by the Imperial Oil Company on the Mackenzie 45 miles below Norman, in which a strong flow of oil was struck, was made in sediments of this age. The oil struck in wells on Peace river occurrs in sandstones of Cretaceous age. The bituminous sands of Athabaska river are also of Cretaceous age.

Sediments of Devonian age concealed in places by Cretaceous and Tertiary rocks, extend from near the Mackenzie delta southward to beyond lake Athabaska, a distance of a thousand miles. These sediments are divisible into two series; the upper consists mainly of shale and is of Upper Devonian age; the lower consists mainly of limestone and is of Middle Devonian age.

The Middle Devonian rocks are exposed in a broad belt on the north and south shores of Great Slave lake, in the mountains lying to the east and west of the Mackenzie, and in the ridges crossing the Mackenzie near the mouth of Carcajou river, and elsewhere. It is from the Middle Devonian rocks that the oil seepages of Windy point and near Fort Good Hope issue.

The Devonian sediments exposed on the lower Peace river, Hay river, Liard river and throughout the greater length of the Mackenzie belong to the upper series and in all probability rest upon the Lower Devonian rocks throughout the greater part of the area. The boring made 45 miles below Norman starts in sediments of Upper Devonian age.

Details of structure have not been worked out. Anticlinal folds are common and enter into the structure of such features as the Rock-by-the river-side and the several ridges trending east and west near the mouth of Carcajou river. The structural features of Franklin and Bear mountains conform in a general way to the trend of Mackenzie mountains and it is not improbable that local undulations occur in the intervening broad valley through which the Mackenzie flows.

The discovery of oil below Norman is regarded as an event of great importance. It has aroused world wide interest and will lead to a more careful investigation of the possibilities of this little known part of Canada.

The report, which is accompanied by a geological map on a scale of 50 miles to 1 inch, may be had from the Geological Survey Ottawa.

SCOTIA COAL OUTPUT IN APRIL

The production of the Nova Scotia Steel & Coal Company's collieries for April was 31,718 tons which compares with 51,377 tons in April 1920. During the month the Scotia Colliery has not worked, and the Jubilee Colliery has been largely idle. The production for the first four months of the year totals 181,870 tons, comparing with 208,695 tons in the corresponding period of 1920.

Canada's Coal Problem

(A Further Study).*

By F. W. GRAY.

At the Annual Meeting a year ago, the writer read a paper on "Canada's Coal Supply," and at the Winnipeg meeting in October followed up this paper by adducing the later statistics of production and supply then available, and emphasising the quite obvious importance of the Western coalfield to Canada, arising from the concentration of 99·3 per cent of our coal reserves west of the Souris lignite beds.

In the events of the year that has intervened there has been much to encourage those who urge that the problem of Canada's coal supply should be viewed first from the standpoint of national independence and defence, and that apparent commercial standards should be relegated to their proper position of lesser importance. The word "apparent" is designedly chosen. The cost of coal to Canada has for some time been largely determined by the purchasing power of our paper dollar, and this is, in its turn, largely set by the ratio between the coal we produce and the coal we import, so that, paradoxical as it may seem, apparent cheapness from the individual viewpoint may be the rankest prodigality from a national viewpoint.

The domestic production of coal during 1920 was the largest in our history and this is a matter for unreserved congratulation. As compared with 1919, we found 2½ million tons of coal, the equivalent of a $25,000,000 gold shipment to New York in support of national solvency.

Nevertheless the 1920 production was 5 million tons below the production capacity of the existing coal mines, a quantity that applied to domestic requirements would have been equivalent to a further gold shipment to New York of not less than $50,000,000, ignoring the stimulus to our internal economy that would have proceeded from the mining of this coal at home.

The output capacity of existing collieries is, however, by no means the capacity of domestic coalfields situated within proved economically-possible transportation distances of home markets.

The maximum possible production of the existing coal mines of Nova Scotia and New Brunswick has, for the purposes of the foregoing calculations, been placed at 8 million tons per annum, but there is no insuperable difficulty in raising this production—given time and expenditure — to 10 million tons. Such a production would make the Maritime Provinces and Newfoundland, Quebec as a whole, and a considerable area of Ontario completely independent of extra-national sources of supply. In making this statement, it is of course contended that anthracite is not a necessary import in any Canadian territory within economically-possible transportation distance of domestic bituminous-coal mines.

The production of the Western coalfield is anything that Canadian opinion and support likes to make it. There is no limit fixed by the availability of coal, either in regard to quality or quantity.

The gap—the apparently unfillable gap, under existing conditions of transport facilities—is Ontario. Even Ontario could be made accessible to Nova Scotia coal by a deep water-way from the sea to the Great Lakes, and in all probability will so be made accessible by a succeeding generation.

For the present, therefore, Ontario must look to the United States for coal, and, in recent years, Ontario could not look elsewhere for coal seeing that even in those Canadian provinces plentifully supplied with coal, or situated within reach of the coalfields, the consumption exceeded the domestic production.

It is a proper thing that Ontario should import coal, because it is a necessary thing, but is is submitted that it is an improper thing from a national standpoint that the other provinces should import coal from extra-national sources, because it is unnecessary.

Two recent newspaper despatches may be quoted as instancing typical viewpoints that are based on error and are subversive of national interests.

One despatch from Ottawa, dated 18th January, states "That the danger of a coal famine in Canada this winter, has been entirely removed, unless something should happen to interrupt importations of hard and soft coal from across the United States border, is the view expressed today by the Dominion authorities."

A second despatch, from Washington, quotes a U. S. Senator, speaking in a debate on a bill that proposes the raising of a higher tariff wall against Canadian goods in the United States, as remarking: "Canada, as she has always done, will continue to buy where she can buy cheapest, and if she can buy cheapest in the United States, she will continue to buy from us."

The impression given by the Ottawa despatch is that it reflects a resignation in official circles to continued dependence upon the United States for coal, and this can only be based upon an unfortunate disbelief in the possibility of independence.

The jibe of the U. S. Senator galls deep because it is true. That cheapness does not altogether consist in a relatively smaller outlay of money is not any less true.

These instances are quoted because they reflect a widespread opinion, that it is the duty of the Institute to inform and correct.

The foregoing review about sums up the existing situation, which the writer submits is unsatisfactory in the following particulars:

a. Coal output in Canada is disproportionately small in regard to the extent of the domestic coal reserves.

b. The domestic output has not kept pace with the population of the country, and the growing consumption of coal per capita.

c. That while some dependency on the United States for coal is inescapable, there is no good reason for the annually increasing dependency of recent years.

d. That there does not yet exist a unified public opinion in Canada that will demand the use of domestic mined coal to the maximum point of substitution for imported coal.

Before considering possible remedies, the following facts regarding the relative coal resources of Canada are submitted, not as anything novel, but as bearing on

* A paper presented at the Annual Meeting of the Canadian Institute of Mining and Metallurgy, Montreal, March, 1921.

the question at issue.

The coal beds of Canada, with a content estimated at 1¼ thousand billion tons, are about equal to those of the whole of Asia.

Canada has 17 percent of the world's coal reserves, and 71 per cent of the reserves of the British Empire.

With a consumption per capita that will ultimately exceed that of less northerly countries, Canada has a production of 2 tons per capita. Britain and the United States have a production of 6 tons per capita.

The coal consumption of Canada has always been restricted by insufficient supply, nor have the combined domestic production and imports in recent years met the requirements of the country. Manufacturing has been restricted, selling prices have been unnecessarily high, and the country has never been on "easy-street" in regard to coal supply. With present population, and potential manufacturing ability, Canada requires not less than 40 million tons annually. The historical maximum production of 16 million tons in 1920 is entirely inadequate. With a population of 10 millions, Canada should use 50 million tons of coal annually, if she is to achieve maximum manufacturing ability, freedom of political action, and domestic comfort.

In regard to the attitude of the United States towards our coal supply, it may be suggested that because of the exaggerated dependence of recent years that Canada has suffered through neglect to develop her own coal beds, we attach too great importance to what is, after all,(a matter of quite insignificant value to the United States. That country has an annual coal production which exceeds 600 million tons without having attained anything like the maximum possibility of production. The tonnage that the United States exports to Canada bulks small in that country's business, but to Canada it is a matter of economic life or death, and has probably the most important bearing on our continued political independence, being indeed our most pressing internal problem. We need not fear any criticism from informed opinion in the United States if this country develops its coal producing capacity to the utmost, but we do risk some justifiable and pitying criticism from the informed and well-disposed among our neighbors, and something worse from the ill-informed and hostile minority that is clamorous in inverse ratio to its numbers, if we continue to drop behind in the great international game of industrial emulation in which coal and iron are the king pieces.

What are the remedies and what of the future?

There are three territories to consider, namely:

a. Eastern Canada, tributary to the Eastern Coalfield.

b. The "Gap of Ontario."

c. The Provinces West of Fort William

Two trade outlets are open for coal in the East, the home market (including Newfoundland), and the overseas export market. It does not seem an unreasonable aim that the Maritime Provinces and Quebec, including all the Railways that serve this territory, should be supplied with domestic mined coal. The larger and more stable the market the more cheaply will it be possible to mine coal in Nova Scotia, and it may be permissible to contend that on no national grounds can the purchase of coal from extra-national sources for national transportation lines be excused or defended without grave inconsistency.

The export trade, in view of the limited quantity of the coal reserves in Nova Scotia, is probably not one to be encouraged to a point of national deprivation, but it has never reached that point, and what promised to be the commencement of a permanent and profitable trade with Europe was quickly killed by the ill-advised export embargo of last summer.

Export trade is desirable at the favorably situated Nova Scotia mines and will probably develop later, and irrespective of conditions in Europe that are now passing and are losing some of their urgency. The record of the operators of Nova Scotia is sufficient to show that they have always paid first attention to the home market. No Nova Scotian coal has been offered for sale in the Montreal market since about 1916, but it will appear again in the summer of 1921.

In Europe, the nationalization of coal mines is a burning political question. Millions of men, including not few Canadians have fought and died for the coalfields of Europe. The coalfields of the Maritime Provinces is a lone and singular deposit in all Canada for a space of 1,800 miles. In this distance it provides the sole source of all the means of modern national defence that we have any right to call our own. It is producing, and has produced for six years, less than it did in 1913, yet the only definite action taken in regard to this incalculably precious national asset during this whole period has been the imposition of control and embargo.

The record is one that shows not indifference, because there is no necessity to apply such an epithet to men who have doubtless done their best to pilot the ship of state, but it does show, plainly that the primary national importance of coal supply has escaped the attention of our statesmen.

As to the "Gap of Ontario" there is little to be said except to urge the lessening of the gap by the maximum extension of the radius of distribution of the eastern and western coalfields, and to support any favorable engineering opinion on the feasibility of a deepening of the St. Lawrence waterway.

In regard to the Western Coalfield, in which is included the continuous deposits of Saskatchewan, Alberta and British Columbia, and the detached fields of Vancouver Island and Northern British Columbia, the conclusion cannot be avoided that here lies the future workshop of Canada.

In his classic work on the "British Coal Trade," Prof. H. Stanley Jevons, writing before the war, (in 1913) in regard to the untapped coalfields of the world stated:

"We have to recognize that the Malthusian check "to the increase of population operates in a totally dif"ferent manner when people of any region change by "the aggregation of capital and spread of education "from a purely agricultural community to a manufac"turing nation with an organized modern commerce "A great stimulus to such a change will come "wherever coalfields exist, and the population will "thrive and develop upon the coalfields of the world, "almost like flies upon honey."

Edwin C. Eckel in an important recent book on "Coal, Iron and War" points out that under modern conditions, given the possession of raw materials, the industrial growth of a community need not be slow but may even be compressed into a period so short as ten years.

The application of these two mature opinions to the conditions in the Canadian West emphasise the obvious. Hitherto our dependence on extra-national sources of

fuel has been associated very largely with the industrial eminence of Ontario, which is based on Pennsylvanian coal; but the new orientation which we see in the West promises an infinitely larger industrial growth over the western coal beds. Here, in the writer's opinion, will be founded the great pillars that will in the days to come support an industrial fabric transcending all present imaginings, and will, if wisely guided ,prove "the most stable guarantee of our political permanence as an independent people." The coalfields of the West are large anough to build a nation on.

The most hopeful sign in this connection is that the people of the West have realised their coming industrial importance, and those who were privileged to attend the Winnipeg meeting of the Institute realised that, whatever may be the case in the East, there has been formulated in the West that first requirement for a successful coal industry, what we will call a "coal conscience" among the general public.

It is evident however, that rapid as may be the growth of population in the West, the outlet for coal there is smaller than the existing capacity of the collieries unless an export trade is found possible. British Columbia is favorably situated, and its export trade is growing and is assured by the lack of good quality coal, except in Vancouver Island, along the whole length of the Pacific seaboard of North and South America.

The possibility of exporting Alberta coal to the States lying immediately south, and to outside points via Vancouver is not by any means a remote one, and the extent of this trade is limited only by the market available.

The writer suggests that the present lop-sided arrangement of coal interchange between ourselves and the United States may be restored to a point less endangering to national safety, and less humiliating to national pride, and at least to the fifty-fifty basis that formerly obtained, by the following procedure that is submitted as possible, namely,

(a) Complete independence of imported coal in the Maritime Provinces and Quebec, and in part of Ontario, achieved by enlargement of the Nova Scotian production.

(b) A moderate export trade from Nova Scotia to overseas points.

(c) Complete independence of imported coal in all Canada west of, say, Fort William or Fort Francis achieved by enlargement of transportation facilities, and recognition by the western railways that coal has become a permanent and growing feature of rail transportation in the West, both eastwards and westwards of the Alberta bituminous areas.

(d) Organized effort to secure export markets for Alberta coal, both southwards into the States and through the ports of Vancouver and Prince Rupert.

(e) Enlargement of the export market of Vancouver Island coal.

WRIGHT-HARGREAVES.

Another important event in the history of Kirkland Lake gold area has taken place. The mill at the Wright-Hargreaves was put in operation on April 27th. It is an up-to-date mill and cyanide plant of 150 tons capacity and will help to swell greatly the gold production of the area.

COAL RESOURCES OF BRITISH COLUMBIA.

(By our Victoria Correspondent.)

With public opinion roused over the retail cost of coal needed for industrial and domestic consumption in the Canadian Northwest, and particularly in the chief Canadian coast cities, there is much interest taken in proposals that fuel be brought in from interior Provincial points, and even from the Province of Alberta, to compete with the product of Vancouver Island.

At present the coal of the Island is used, to the exclusion of practically all the other products, in Vancouver, Victoria, and most other cities of the British Columbia Coast, and, as well, is found competing in the markets of the State of Washington. It also holds the greater part of the mercantile business of the Northwest.

The recent Commission of Inquiry, held under authority of the Provincial Government, has drawn attention to the conditions under which mining is carried on in the Island fields. Although the evidence taken was conflicting in some cases there appeared to be marked unanimity of opinion that the collieries, under the circumstances, were not getting too much for their product. The high costs of material, the high wages in comparison with pre-war scales although not out of proportion to other advances, and the difficulties encountered in winning the coal because of faulty and dirty seams, were given as the chief reasons for the rise in the prices at which coal had to be sold in order to assure a fair profit.

While the collieries were able to give convincing testimony, submitting figures in support of their position, the consuming public is not satisfied that coal cannot be furnished them at a better rate than from $12 to $15 a ton. Their advocates point to the proximity of Vancouver, Victoria and other centres of population to the coal and argue that such prices cannot be justified when the mines are but a short water-haul from the consumers. If the coal of the Island cannot be produced more reasonably, why not get it from the Nicola-Princeton District, or from the Crow's Nest, or from the adjacent province of Alberta? It is understood that already one of the collieries of the Nicola District is shipping to the Coast and placing the product on the market below that of the Island. The shipment of Crow's Nest coal to the coast would seem to be scarcely practical when it is remembered that mining costs there are not much below those of the Coast, and there is the addded expense of transportation to be figured. Some of the coals of Alberta, however, might be so transported and placed on the market in open competition with better chances of success. In some of the mines of that Province, not far from the Provincial border, the recovery of the coal is an easy and inexpensive matter, comparatively speaking, and it is quite possible that Island coal will find a real competitor from this source. This depends, of course, on the continuance of the existing economic conditions.

It must not be assumed that the coal fields at present under development comprise even a substantial proportion of the whole of the resources of British Columbia of this character. There are extensive areas in the Crow's Nest Pass District, in the Flathead River Section, in the Peace River and Groundhog Counties which have not yet been exploited. D B Dowling, of the Canadian Geological Survey, places the

"probable reserve" of the Province in coal at 76,034,942,000 metric tons.

There has been much said of the coal production possibilities of the Peace River Region. Reports of prospectors are to the effect that there are large outcroppings to be found along the banks of the different waterways, one of the chief mentioned being the Carbon river. Analyses of these coals have been most satisfactory, in fact experts concur in the opinion that the fuel found in this section, if the seams on development hold to the quality of samples taken from the surface, would be ideal for steaming purposes. Little official knowledge, however, exists regarding either the quality or the probable extent of these deposits, no doubt for the reason that lack of transportation facilities, and the plenitude of coal in parts more accessible, has made the prospect of their development very doubtful. Conditions, however, have been changing rapidly of late. The Pacific Great Eastern Ry. is at the portals of Fort George and, however unlikely its extension to the Peace River Country may seem now, because of provincial financial stringency, there is no doubt that, having got so far, the demand for traffic for the road, and the attractiveness of the northern field, will force a continuance of the line into this superlatively fertile region agriculturally, and exceedingly promising zone mineralogically.

C. F. J. Galloway, an English coal mining engineer of repute, went through the Peace River territory some years ago. He had time for little more than general observations but his report is most interesting. The coal bearing formation, he finds, extends along the Peace River from near Parle Pas rapids to Hudson Hope, or a distance of about fifty miles. Formations on the south Pine and the north Pine rivers also are mentioned so that the possible area of coal formation amounts to several hundred square miles.

A number of coal seams are noted by Mr. Galloway as outcropping along the Peace River Canyon and on Gething Creek, but these are not, in the majority of instances, of any considerable thickness. He classes the coal as "high-carbon bituminous", an excellent grade of coal, low in ash. An analysis of a typical sample is given as follows:

Water	2 per cent
Vol. Combustible matter	20.2 "
Fixed carbon	72.2 "
Ash (non-coking)	5.6 "

In this connection, Mr. Galloway says:

"These analyses show the coal to be of very high grade. While not comparable with the best Welsh Admiralty steam-coal it is equal to a high grade of steam-coal from that field, and compares favourably with the best West Virginia coals, being altogether of an exceptional quality for Western America."

Another large field awaiting development, but at present economically impossible because of transportation difficulties, is what is known as the Groundhog, situated in Northern British Columbia. The coal bearing formation, as far as has been indicated by prospecting, covers an area of about fifty miles in a north-westerly and south-easterly direction, with a width of about thirty miles. At one time there were some coal leases held in this field covering some 600 square miles but many of these have since reverted to the government.

A number of the many coal seams discovered have been more or less prospected by tunnelling, and some are so situated as to assure good commercial mining conditions. While the prospecting has been somewhat superficial, and the development nothing more than what is possible by hand, no diamond drilling having been attempted, there is no doubt that there are many seams that admit of easy mining, and that, generally speaking, the field has great possibilities.

The coal has been classed as anthracite, although some of it is more nearly described as semi-anthracite. It is excellent coal, though the ash content is somewhat high. Some of the seams, however, are lower in ash, running from 5 to 10 per cent. The latter would make a first-class domestic fuel and probably would be able to successfully compete for the domestic market in the Prairies and northern British Columbia. Some of the semi-anthracite of the Groundhog no doubt is well adapted for steam-raising purposes.

BRITISH COLUMBIA COAL OUTPUT FOR MARCH.

From our Victoria Correspondent.

There was a slight increase in the production of the British Columbia Collieries in March as compared with that in February. The mines of Vancouver Island report an output of 134,837 tons as against 128,376 tons for the previous month, an advance of 6,660 tons. In the Crow's Nest Pass District the improvement was a trifle more marked, the March production being 68,739 as compared to 60,454 tons, or an increase of 8,285 tons.

The collieries of the Nicola-Princeton District have not been getting as satisfactory results according to the monthly statistics. The Middlesboro Collieries turned out 4,564 tons in March and 6,738 in February, dropping 2,164 tons. The Fleming Collieries fell off 1,455 tons. The Coalmont Collieries, however, did better, the output for February being 4,420 tons and that for March 5,477 tons, an advance of 1,057 tons.

Following are the complete figures for the month of March:

Coal Output for the Month of March, 1921.

Vancouver Island District.

Mine	Tons
Canadian Western Fuel Company	17,547
Canadian Collieries	
Comox	10,567
Extension	17,691
South Wellington	8,234
Pacific Coast Coal Mines	Nil
Nanoose Wellington	1,976
Granby	15,822
Old Wellington (King and Foster)	199
Total	135,036

Nicola-Princeton District

Middlesboro Collieries, Middlesboro	1,561
Fleming Coal Co.	1,781
Princeton Coal and Land Co., Princeton	Nil
Coalmont Collieries, Coalmont	5,477
Telkwa Collieries, Telkwa	Nil
Total	11,820

Crow's Nest Pass District

Crow's Nest Pass Coal Co.	
Coal Creek	36,291
Michel	25,908
Corbin Coal and Coke Co., Corbin	6,540
Total	68,739

SALE OF FLIN FLON GIVES IMPETUS TO NORTHERN MINING.

By REECE H. HAGUE, The Pas, Man.

No greater impetus to mining in Northern Manitoba could have been given than the recent sale of the Flin Flon property which has been taken over by the Mining Corporation of Canada and British capital.

When the Col. W. H. Thompson syndicate of New York allowed the twelve months option which they had on the property to expire, it was feared locally that it would be a long time before a purchaser would be found, as many copper mines on the Continent were going begging and the copper market was in a phenomenal state of depression. The syndicate's option expired on March 31st and less than a fortnight later word came through that the property had been sold to other interests.

The terms of the sale have not yet been made public but it is thought that the purchase price is in the neighbourhood of $1,500,000, similar to the price asked of the Thompson syndicate, with payments extending over a period.

The Flin Flon property has been the centre of attraction in Northern Manitoba ever since its discovery in 1914 and a sum of $750,000 has been spent on it by various companies which have it under option.

As a result of diamond-drilling the ore body has been calculated to contain a minimum of 16,000,000 tons of ore carrying values in gold, copper and silver to the extent of $7.09 a ton with copper estimated at 12½ c. a lb. In all 25,664 feet of diamond drilling has been done on the property, checked by cross-cutting and drifting in the 100 feet, 200 feet and 300 feet levels. While the drills did not continue below the 900-foot level, the ore-body extends below that level over a length of at least 100 feet and, when drilling ceased was 30 feet in width. Below this level and at the south end of the ore-body, at depth, not yet explored by drilling, there is undoubtedly ore not considered in the figures given, which can only be estimated by further work.

In addition to the values given above the ore contains 3.80% zinc but it has not yet been established what value, if any, of the zinc can be economically recovered.

In the course of a report submitted to the Manitoba Provincial Legislature the Commissioner for Northern Manitoba, Dr. R. C. Wallace, said:—"The total costs, including mining, delivery of waterpower, fluxes and fuel, smelting operations, refining, marketing, interest on capitalization, depreciation and sinking-fund have been estimated as, at a minimum, $4.08 per ton at pre-war prices on an operating basis of 2,000 tons per day.

"The total period of operation of an ore-body of 16,000,000 tons on a 2,000 ton per day operation basis is 27 years. If an additional period of five years be assumed for railway construction, power development, opening up of mine, construction of smelter and solving metallurgical difficulties, a period of 32 years may be taken as the duration of operations on the Flin Flon property, without taking into calculation any additional ore which may be discovered below the 900-foot level.

"The total number of men required for mining operations, smelter, mining of fluxes, power plant and transportation, would be approximately 1,000. The relatively long period of operation would attract married men to the town, and up-to-date school facilities would of necessity be provided. The town would be placed in the centre of a district in which the opportunities for prospecting are very good, and a very considerable mining population, not directly connected with the operation of the Flin Flon property, would become residents in the town. The development of other properties in the district would of course add to the population to an extent which cannot now be estimated. Apart from this last consideration, the population of the mining town may be conservatively estimated at from 3,000 to 5,000 people in five years after the completion of the railway."

The interests which have secured the Flin Flon property are endeavouring to induce the Manitoba provincial government to construct a railway to Flin Flon, and in this regard they are backed by The Pas Board of Trade and the whole of the Northland. When the property was under option to the Col. Thompson interests, the Government had an initial survey of the proposed line made at a cost of $15,000, on the understanding that if the syndicate did not exercise their option they would re-imburse to the Government the cost of the survey.

The Provincial Treasurer announced that in the event of the syndicate putting up a guarantee of $1,000,000 the government would bring the matter of the railway before the house, but it is thought that in consideration of the fact that the property has been taken over by Canadian and English interests these terms might be modified.

One of the strongest arguments advanced in favor of the Manitoba legislature building the railroad is the example of the Ontario Government railway. The Temiskaming and Northern Ontario Railway was built by the Government of Ontario with the expressed object of opening up the northern clay belt, through which the transcontinental railway now passes, to agricultural settlers. It was known that there were possibilities of mineral discoveries, but no discoveries of importance had been made when the decision was made to proceed with the railway. Since the construction of this railway the production of gold, silver and cobalt from T. & N. O. Ry. territory exceeds $260,000,000. The annual production of gold from the Porcupine camp alone is $12,000,000. The direct returns to the Province of Ontario in royalties and taxes amount almost to $5,000,000 since the railway was built. The yearly operating profits on the railway are $500,000 and 25 per cent of the capital has already been returned.

In reviewing these figures Professor Wallace says:—"Owing to this policy of development in northern territory, the Province of Ontario stands first as a mining province in the Dominion and has greatly added to the standing of the Dominion as an economic unit in the British Empire. No one dares criticise Ontario's policy in connection with her northern railway at the present day. What Ontario could see 17 years ago in mineral wealth in that area where the railway has been projected was small indeed in comparison with what Manitoba has proved up, even before the railway was discussed."

Even though a railway to Flin Flon is not commenced this Summer there are indications that there will be considerable activity in connection with mining in Northern Manitoba. The sale of the Flin Flon has given an impetus to mining generally in the district.

and it is expected that the open water will see an influx of prospectors and mining engineers.

Little actual mining work can be done in the Flin Flon area until the railway is constructed and a smelter erected, but prospecting will continue and it is quite probable that many other prospects will be uncovered. Up to the present prospecting in the district has principally been done around the lake shores and little is known of vast areas of mineralized country.

At Herb Lake mining will continue as heretofore and it is thought that the search for oil will be carried out by many individuals and syndicates in the Pasquia Hills region. Altogether the coming Summer promises to be the most active in the history of the mineral development of Northern Manitoba.

FORECASTING HOLLINGER ACHIEVEMENTS.

ALEXANDER GRAY.

Because it is officially announced that the Hollinger Mill has gotten its capacity stride, or thereabout, the off-hand assumption is the management may "go after a world record."

While admitting the tonnage being milled is the greatest yet as a continuous performance, the management at the same time is discreetly non-commital as to what it may or may not accomplish in the matter of gold production.

To achieve "a world record"—were anything to be gained by that—however gratifying it might be to the chief owners—is not to be so easily attained when it is considered that New Modderfontein Mines with a 1920 record of profits amounting to £1,716,840, and Government areas, with a record of £1,633,325 in profits, have a lead it will be difficult to deprive them of.

Hollinger Consolidated last year reported profits of $3,792,341. It crushed only 53 per cent of the possible running time. At the moment it is not ascertainable whether New Modderfontein and Government Areas were correspondingly handicapped. All three companies profited by reason of the premium upon gold. Granting, however, that the two largest producers at the Witwatersrand fared better than Hollinger in the supply of labor and whatever accelerated production, the outstanding fact is that Canada's premier gold mine has some distance to go before it beats the record.

By capacity crushings without interruption and with every possible facility, Hollinger is capable of contributing $10,000,000 or more per annum. Spectacular "stunts" never have been attempted by the Hollinger Directors, though, and it is inferable that their grade of ore will be lowered somewhat when maximum crushing is being secured. In due course a total production of about $10,000,000 is likely, but New Modderfontein and Government Areas gross is much above that impressive aggregate.

Considered in connection with its restricted running time, Hollinger Consolidated sustained its claim in 1920 to pre eminence as one of the three or four greatest gold mines. Automatically as the tonnage milled increases, Hollinger profits should be larger, yet there is a limit beyond which forecasts ought not to be stretched, for the Hollinger Company were harrassed for ten years—and operating conditions are not altogether satisfactory. For example New Modderfontein has almost 9,000,000 in proven ore reserves and a possible further 16,000,000 tons. The average grade is lower than that of Hollinger. Last year, however, the New Modderfontein working revenue was 52 shillings and nine pence on 968,500 tons crushed, and the average profit was 30 shillings and ten pence. For the Government Areas, the working revenue was thirty-nine shillings and three pence, and the per ton profit, eighteen shillings and three pence on over 1,300,000 tons crushed. In the same period Hollinger crushed only 650,205 tons so comparisons of operating results are made difficult. At any rate Hollinger's grade of $10.20 averages from a dollar-and-a-half to a dollar-and-seventy five cents higher than that of either of two Rand producers. Consequently, if the Ontario mine can attain to a crushing of a million tons and over, it will have a larger place in the sun—and that without eclipsing either of its great contemporaries. For the time being this should suffice. Hollinger has to look ahead, get twice as many machines to work, pile up ore reserves—and those familiar with the vein systems thoroughly appreciate that the mines never have had a chance to demonstrate to the full their immense value.

So, why worry about "going for a record—a world record!"

PERSONALS.

Mr. E. V. Neelands of Toronto will leave shortly for Columbia, South America. He will spend several months there on exploration work.

Mr. F. W. Schumacher, of Columbus, Ohio, is in Toronto. He is interested in the Schumacher gold mine at Porcupine which has been idle for some time. It is not yet known whether the property will be operated this summer.

Mr. Cyril Knight, Assistant Provincial Geologist, will spend the coming summer at Cobalt continuing the underground study of the geological features of the Cobalt silver deposits on which he was engaged last summer.

Mr. A. G. Burrows and Mr. P. E. Hopkins will map Skead township and neighbouring gold areas this summer. Mr. Burrows will probably spend a few weeks in the Gowganda silver area.

Mr. E. L. Bruce, professor of mineralogy at Queens University will make an investigation of the Lake St. Joseph area, Northern Ontario, for the Ontario Bureau of Mines this summer. Some iron ore deposits occur near Lake St. Joseph, which is an expansion of the Albany river near its head.

Mr. E. M. Burwash, assistant professor of geology at the University of Manitoba, will explore an area along the Ontario Manitoba boundary this summer for the Ontario Bureau of Mines.

Mr. and Mrs. Freeheville of London, England, are in Toronto. Mr. Freeheville has returned from a trip to Northern Ontario gold mines.

MEETING OF MINING WOMEN'S ASSOCIATION TORONTO

We are courteously informed by Miss Nancy M. A. Miller that the Toronto Branch of the Association of the Women of the Mining Industry of Canada had a largely attended and enthusiastic meeting on the 26th April at the residence of Mrs. D. A. Dunlap, when Mrs. Freeheville, before leaving for England, addressed the meeting. Several new members were elected, and plans for the coming year's work were gone over.

Northern Ontario Letter

THE SILVER MINES

The Cobalt District.

Silver mining in Northern Ontario has appeared to settle down into a fairly steady groove in Northern Ontario, and a very considerable increase in the amount of work being done is noted. This applies especially to the Gowganda district.

In Cobalt itself, the scope of work has been increased to a moderate extent owing to the Mining Corporation of Canada having resumed operations on its Buffalo mine. This company now has a force of about fifty men on its pay-roll, and in addition to re-opening the Buffalo mine has been remodelling its mill. This work in the mill will be completed before the middle of May and will provide facilities for treating 300 tons of ore daily as compared with a former rate of 200 tons daily. Officials continue to be reticent with regard to the probable date of resuming work in all branches, but, in Cobalt, it is generally believed a start may again be made during the second week in May.

At the annual meeting of the Nipissing Mining Company, the tenor of the remarks made by officials provided reason for believing that production from this property may be somewhat lower than during the past three years. The company expresses its intention to secure oil lands of merit, if possible, as well as being constantly in the field in search of new mining properties.

Rumors have been current in Cobalt that a move might be made to resume work on the Temiskaming mine. Local officials were not aware of any such decision when interviewed by the Journal. It is learned, however, that J. P. Bickell, president of the Temiskaming has just returned East from a business trip to the Blue Diamond coal mine in Alberta, in which the Temiskaming is interested.

The recent cut in wages, together with a small reduction in the price of dynamite and with higher efficiency from the mine workers all combine to hold out probabilities of the cost of producing silver undergoing a substantial decline during the current year. This situation, of course, is quite as important as had costs remained unchanged with a substantial increase in the price of silver. It seems to mark a general steady movement toward conditions which promise to offer greater encouragement for all property owners to feel justified in resuming work. The situation is a great deal more re-assuring than was the case two months ago.

In connection with the operations of the Trethewey company on its Castle property in the Gowganda district, the information reaching Elk Lake would tend to show that this company is meeting with very satisfactory results. It was recently reported that a plan might be adopted whereby the number of shares of the Trethewey would be increased so as to provide a means of raising money with which to erect a small mill on the property. In view of the present favorable reports, certain shareholders are found expressing the belief that the company may be able to finance itself from current production of high-grade ore.

According to advice received by the Elk Lake board of Trade from the Ontario Government, plans are being made to further improve the road from Elk Lake to Gowganda. The first nine miles of the 27-mile stretch is said to be in good condition, and repair work will proceed from this point. The object is to make the road suitable for travel by motor trucks and automobiles. This would offer important advantages to those who are commencing mining operations in that field.

The price paid for the Hargraves property, by the Kerr Lake Mining Company is understood to have amounted to something over $16,000, according to New York advice. This is understood to be sufficient to about cover the debts of the Hargraves company.

The Ontario government has dropped its bill which had for its object an increase in the tax on the profits made by mining companies in this province. A united opposition from all over Northern Ontario was supported by both Conservative and Liberal parties in the Ontario House to the end that the bill was set aside for the current year. This is what mining men requested, and due credit is given to the press of the North, as well as other mining and financial journals in Canada for providing much valuable comment. The leading figures in opposition to the bill were Hon. G. Howard Ferguson, Conservative leader; Hartly Dewart, Liberal Leader; Charles McCrea, M.P.P. (Conservative) for Sudbury and Mac Lang, M.P.P., (Liberal) for the Cochrane district.

Another bill now before the House proposes to provide legislation which would give wide powers to engineers. This is known as the "Professional Engineers Act", and would establish rules which would debar any other than members of this association from practicing in the province of Ontario. As far as giving engineers the right to certain letters which may be used exclusively by the profession, the feeling in the mining districts seems to be strongly in favor of the measure, but there is an exceedingly strong undertone against that portion of the bill which would prevent practical miners from practicing even under their correct status as "practical miners". To give engineers the right to add "Registered Professional Engineer", or any letters designating such status seems to meet with general approval, but if any attempt is made to prevent others from practicing without use of these letters, there will probably be a storm of protests come out of the North where many practical men are achieving important success for themselves and the companies which they represent.

According to a statement made to the Journal representative by an official of the Silverado Mining Company of Gowganda, this concern was originally capitalized at 1,000,000 shares of the par value of $1 each, of which 415,000 shares were issued in payment for the property. "The treasury stock", says the statement, "at the beginning of the present year was sufficient to cover the operations of the Silverado as originally planned, but the acquisition of the four valuable properties and the treasury assets of an adjoining company necessitated an increase of capitalization. After paying for this new property which was exclusively on the basis of a transfer of shares, the Silverado to-day has more than 2/3 of capital stock in the treasury with full ownership of its properties and no outstanding liabilities. The total amount of property which the company now holds is 560 acres. At the present time, we are engaged in surface work and putting up new buildings, but in the course of the present year we expect to continue our underground work."

At the Keeley mine, underground operation are now in full swing. A force of about 30 men makes up the crew for the time being. It is intended to carry on

development work at the 360-ft level, pending a strengthening in the demand for silver at which time the mill will be started up.

Ore and Bullion Shipments.

During the week ended April 29th no shipments of ore were reported from Cobalt to outside points.

Bullion shipments were also nil, although on April 30th the Nipissing sent out 38 bars containing 50,265 ounces of silver.

THE GOLD MINES.

The Porcupine Field.

May has ushered in the beginning of an era of big production for the gold mines of the Porcupine district. The four producers are turning out gold at the rate of $1,500,400 for the 31-day period, or at the rate of over $18,000,000 a year.

Production at the Hollinger, based upon 3,300 tons of ore daily in which the gold content is $10 a ton, is at the rate of $1,023,000 for the current month.

Production from the Dome, based upon 1,100 tons of $7 ore daily is at the rate of $238,700 a month.

Output from the McIntyre-Porcupine, based upon 580 tons daily or ore containing $11 a ton, is at the rate of $197,780 a month.

The Northerown Mines (which is a consolidaton of the Porcupine Crown and Thomson-Krist properties) is just nicely under way and has an indicated daily tonnage of 120 tons containing $11 a ton, or a monthly output of about $40,920.

The production from these four mines gives the indicated aggregate as given in the opening paragraph of this letter.

In addition to the value of the output as above given, the companies dispose of their gold in New York, and in that way a premium of upwards of 10 p.c. is added to the total as above given.

Imposing as the foregoing brief summary may be, it is interesting and important to keep in mind that a further increase of about 1,000 tons may be added daily and, on the basis of $10 ore, would add at the rate of over $300,000 monthly to the output. This increase will come as a result of the Dome speeding its mill up to full capacity of 1,450 tons daily, the McIntyre completing its milling additions, the Schumacher starting up its 200-ton mill, the Porcupine V.N.T. getting under way at 150 tons daily and some use being made of the 100 ton mill on the Dome Lake.

Altogether, it would appear as though the mines of Porcupine will produce at the rate of over $20,000,000 per annum during the coming year.

A first-mortgage bond issue made by the Northerown Mines, which was reported to have been taken up by the Crown Trust Company, in Montreal, is stated to have been taken care of by the Porcupine Crown Mines, with the Crown Trust Company acting only as trustees. Of the $100,000, the Porcupine Crown was supposed to take up two-thirds and the remaining one-third to be taken up by the Thompson-Krist. The Porcupine Crown took care of its share, but the Thomson Krist has not been able to provide the funds to cover its obligation.

The Kirkland Lake Field.

The Kirkland Lake district is making remarkable headway. The correspondent of the Journal has just concluded a visit to all the important operating properties in this area, and the impression is left that the mines of this field have met with results which strengthen their physical condition to a greater degree than is generally understood by other than those who are in constant touch with progress.

At the 600-ft level of the Lake Shore mine, the No. 1 vein has been cut and has a width of upwards of 12 feet. The mineralization has increased considerably as compared with the 400-ft level, and this vein promises to be equally as rich as the No. 2 vein in which values have averaged over $25 to the ton. The machines were just entering the No. 2 break at the time the writer visited the property and it was too early to learn the width and mineral content of this body at that horizon. It is interesting, however, to keep in mind that this No. 2 vein as opened up at the preceding level, namely 400 feet deep, is among the richest veins ever opened up in the gold mining districts of Northern Ontario. On this vein at the 400 ft level one stope has been opened up over a length of 350 feet and has an average width of 11 feet in which gold values average upwards of $28 to the ton. In this stope there are approximately 18,800 tons of ore already broken with an aggregate gold content of over half a million dollars. A second stope, 300 in length is also being opened up at the 400-ft level. It has been noted that during the past two months the mill heads at the Lake Shore have been quite low, amounting to $13.35 a ton during March. This caused some uneasiness among those not familiar with the work. The fact is, however, that during recent years the company was unable to carry on the desired amount of development work owing to a shortage of labor, and with the present changed conditions a lot of energy is being directed toward development. As a consequence of this, the volume of ore coming from development work is alone sufficient to keep the small mill running at full capacity and is making it impossible to treat any of the higher grade ore from the stopes. The development ore contains a certain amount of waste rock, but it is necessary to treat all this material which is coming from development. It is obvious, therefore, that there is general cause for optimism among those who are concerned in this enterprise. In a word, with the small 60 ton mill, the gold being produced is financing the Company in the work of developing the mine as well as providing funds for moderate dividend disbursements and funds for enlarging the plant. In due time the shareholders will reap the full benefit of this policy.

Blasting out the excavations for the new 100 ton mill on the Ontario Kirkland has commenced, and this company expects to have its plant running before the end of September. Underground developments are favorable and ore resources promise to enable the company to establish mill heads of around $15 to $18 a ton.

With a crew of about 80 men employed, the Teck Hughes Gold Mine is treating close to 120 tons of ore daily, or nearly 1½ tons per man employed. This is the secret of low costs at this property, and compares with less than one ton per man on certain other small operations. This company is finding the great volume of its ore is located on the central and eastern part of its property. This is important for the reason that it reduces the danger of the ore dipping off the property at depth.

The mill of the Wright Hargraves is now in full operation. At the time of the Journal correspondent's visit, the plant was being tuned up and was then treating about 125 tons daily. It is not intended to crowd the plant to full capacity of 160 to 180 tons daily until

such time as stopes may be opened at the various underground levels.

On the Kirkland Lake Gold Mines, it is being found that at depth the ore-shoots have a greater length than on the preceding levels. Work is proceeding at the 700 and 900-ft levels, and a drift at the 700-ft level has been in ore to a greater distance toward the west than was the case in the long west drift at the 400-ft level.

BASE METAL SALES AND CONSUMPTION IN CANADA.

The annual report of the Consolidated Mining and Smelting Company of Canada contains some interesting figures relating to the sales and consumption of the base metals in Canada, as reported by Mr. Rugh, the Sales Manager. The statement is as follows:

"The sales of base metals for the year 1920 were as follows:

	Lbs
Lead	19,064,000
Zinc	31,470,000
Copper	5,036,000

Lead.

The domestic demand was good during the first half of 1920 and continued strong well into the third quarter. Signs of weakness developed and the price commenced to fall in the month of August. From then until the close of the year the market prices dropped almost continuously, accompanied by a light demand.

Zinc.

Sales for Canadian requirements were uniformly good with a steady demand throughout the first three-quarters of the year. During the last quarter conditions were somewhat similar to those affecting lead. As our production of zinc was considerably in excess of the consumption in Canada we were obliged to ship our surplus to the United Kingdom, France and the Orient where it was sold through very satisfactory connections which we established in 1919, in London, England, and in Kobe, Japan.

Copper.

During the early part of the year sales were restricted owing to strike conditions in Rossland — and the non-receipt of ore from independent shippers. Later, when this condition had passed, the market prices fell and the demand declined, with the result that a considerable quantity of this metal had to be carried over the year end.

Outlook for 1921.

At the opening of the year the outlook was not favorable for the sale of normal quantities of our metals, but the demand over the first quarter having exceeded expectations we think we are justified in the belief that the Lead, Zinc and Copper requirements for 1921 will closely correspond with the Canadian consumption of these metals for the year 1920. We look forward confidently to an increasing demand in the Orient for our Lead and Zinc, which owing to very high purity, are rapidly coming into favor.

We estimate the Canadian consumption for 1921 as follows:

	Lbs.
Lead	48,000,000
Zinc	25,000,000
Copper (Ingot-Cake)	14,000,000
Copper (Wire Rods)	32,000,000

SUDBURY NOTES.

D. E. CUSHING.

The old Mackenzie and Mann smelter, erected in 1905, which has stood idle since 1912, has been sold by the City of Port Arthur to American interests and the outlook is that the iron industry will again get under way at the head of the Lakes.

The names of the purchasers have not as yet been announced, but will be made public shortly when the matter comes before the people of Port Arthur for ratification. The price is a million dollars. Within four years $200,000 will be paid. If operations are to then continue, the balance must be met and half of it must be in cash.

The city of Port Arthur came into control of the blast furnace by the purchase of the first issue of bonds.

Not long ago the Atikokan mine was optioned by Duluth interests but it is not thought that the two deals are connected.

Another property has opened up in the Howery Creek area, which gives this new gold camp three excellent prospects under development. The Bousquette and Howery Creek Co. were the first two in the field and this week saw a third, managed by Mike Athella of Matheson, get under way.

This newest property is located on the West River, near Hockin's mill. It is known as the Powell property and a boiler, drills and a compressor have just been taken in. Before May is very old a start on shaft sinking will have been made. The shaft has been carried down some distance by hand-steel, and assays across the width of the shaft show an average value of $12.50. This property is about two miles from Willisville on the Algoma Eastern Railway.

The Howery Creek Co. is working twenty-four hours daily on driving its tunnel to cut its main ore-body. Just recently when the tunnel was 199 feet in, it cut a hitherto unknown ore-body, the vein of which is 18 inches wide. Samples have been sent to the assayers, but the reports have not as yet been received. However, some of the ore was panned and it showed fine gold. A new Waugh-Dreadnaught drill has just been installed, and about nine feet daily is being made in driving the tunnel, which is five by seven feet. The tunnel is now in over 100 feet and must be carried to the 300-ft. mark to cut the ore-body aimed at. This will open up the ore-body 100 feet down. There are some mining men who question the wisdom of driving 300 feet to save 100 feet of hoisting, but Manager Kemp thinks the plan has its advantages. During the winter the company took in most of its plant. They were unfortunate in that a part of it broke through the ice while being teamed across the lake and sank. It will be recovered later. In the meantime a concentrator and a new kiln for the roasting of the arsenic ore, is now on the way in. The capacity of the plant is 100 tons.

The plant of the Bousquette is about ready to go ahead and immediately two drills will be started on the shaft to carry it from the 25 ft. to the 300 ft. level. Mr. Robert Tough, who also controls the Bidgood at Kirkland Lake is in personal charge of the work. He says there is every promise of the area being an excellent gold producer.

LAKE SUPERIOR MINING INSTITUTE MEETING.

The Lake Superior Institute will hold its annual meeting on the Marquette iron range, Michigan. This is the first meeting for some years, the Institute having discontinued the holding of meetings during the war.

Mr Douglas Wright will map an area west of Bourkes Mines, this summer. Mr Wright has previously mapped an area to the east of Bourkes.

A NOTE ON PRODUCTION AND MARKETS FOR NOVA SCOTIA COAL, WITH SOME REGARD TO ONTARIO.

By the Editor.

The highest output attained by the coal mines in Nova Scotia was 7,263,485 gross tons in 1913, which represented an output capacity of 7,500,000 tons, there having been a lack of demand in the late Summer and Autumn of that year.

The capacity of the mines for output in 1921, with uninterrupted work, and a full complement of face-workers, is about 6,500,000 tons, the difference of one million tons between the capacity of 1913 and this time being the result of exhaustion of some of the older mines within the eight years intervening, the suppression of capital expenditure by war conditions; and the deferring, from the same causes, of much of the usual advance development work underground.

The probable output, in 1921, under expected trade conditions, allowing for slack work in the Spring, and anticipating a brisk demand by Autumn, will probably reach 5,500,000 tons.

If it should prove possible to make heavy expenditures on new collieries during the near future, and if a sufficient number of face-workers could be made available, it should be possible, within a period of not less than five years from the commencement of a programme of intensive expansion of outputs, to restore the capacity of the coal mines to that of 1913, namely, 7,500,000 tons.

The maximum output that could be obtained from the Nova Scotian mines, with hope of maintenance for a period of years that would justify the initial expenditure, is estimated at 10,000,000 tons annually. It is unlikely that such an output could be obtained within less than ten years, and in seeking the attainment of a figure that means virtually doubling the present capacity of the Nova Scotia coal mines, it would probably develop that the chief difficulty would be to get a sufficient number of suitable workmen.

Before seeking to increase outputs to the maximum, operators would require to be satisfied if a market for ten million tons of coal annually were available.

A normal distribution of the present maximum production of 6,500,000 tons would — basing the distribution on pre-war business and the figures of 1920 — be about as follows:

	Tons
Used in Nova Scotia, including railways, colliery consumption, and metallurgical uses	3,300,000
New Brunswick and P. E. Island	900,000
St. Lawrence Ports	1,500,000
Newfoundland and St. Pierre	300,000
Local Bunkers	500,000
	6,500,000

Presuming that the steel industry were to work to full capacity, and not allowing for any increase in blast-furnace capacity or larger resulting coke-consumption over that of today under normal operation, the use of coal in the Province of Nova Scotia would reach 4,250,000 tons annually.

The consumption of New Brunswick and Prince Edward Island may be calculated, at a slight increase over the average of many years past, as being one million tons annually.

Newfoundland and St. Pierre de Miquelon will continue to require as much coal as in former years, and this may be put at 300,000 tons annually.

Bunkering has become an increasingly important part of the Nova Scotia coal-trade, and the coals of the Province proved their entire suitability for steamships' bunkers by wide use during the war. An annual outlet of 500,000 tons for this purpose is not over-stated.

The Boston market is not one that can be counted upon at this date, but it is also not one that can be definitely counted out. There are some possibilities in the future coal interchanges of Canada that may make the Boston market once more an important outlet for Nova Scotian coal.

The general export trade is also an uncertain factor, and until the nations of Europe settle down and international amity is more completely restored, it is not possible to say whether Europe will prove a market in which Nova Scotia can compete against the export coal of the United States. It should be remembered in this connection that Nova Scotia's coal reserve is a small one, and that there are a number of individual nations in Europe that have coal reserves which exceed those of Nova Scotia. An annual figure of 250,000 tons may be calculated as approximating the moderate export market that oversea demand will give to Nova Scotia coal mines.

The greatest and most potential outlet for Nova Scotia coal, and, from a national viewpoint, the most satisfactory and thoroughly logical, is that supplied by the growing population along the St. Lawrence River and valley, along its whole length from the opening of the Gulf to a point that is yet to be determined, but is certainly not limited by the Port of Montreal.

The final report of the Fuel Controller estimated the annual coal requirements of the Province of Quebec at 3,900,000 tons of bituminous coal and 1,700,000 tons of anthracite. There is no doubt but that a proper use of bituminous coal would avoid the necessity of using anthracite for many of the purposes of domestic heating and cooking, but, ignoring this certain development of the future for the purpose of present calculations, it is safe to say that the province of Quebec requires 4,000,000 tons of bituminous coal annually, and it is also safe to say that it would be an extremely good thing for Canada if the whole of this quantity were supplied from the coal-seams of Nova Scotia.

Summarising the foregoing figures, the following table shows the potential market for Nova Scotia coal, which, it will be noted, is almost entirely confined to Canadian needs.

		Tons
Nova Scotia		
Steel-Plant uses	1,550,000	
Colliery uses	750,000	
Domestic uses	750,000	
Railways	1,100,000	
		4,150,000
New Brunswick and P. E. Island		1,000,000
St. Lawrence Valley (Prov. of Que. only)		4,000,000
Newfoundland		300,000
Ships' Bunkers		500,000
Foreign Export		250,000
		10,200,000

Comparison of this potential market with the estimated maximum output of the province of Nova

Scotia will show that the supplying of Ontario (except in that triangle of the Ottawa and St. Lawrence which has more affiliations with Quebec than with Ontario as a whole) is not a matter of practical current politics. The Fuel Committee now sitting at Ottawa has directed some questioning to elucidation of the possible supplying of Ontario by Nova Scotia coal, but, so long as the province of Quebec is partially supplied with coal from the United States, and not wholly by coal from Nova Scotia, it will be unnecessary to devote attention to the supplying of Ontario with coal from Nova Scotia.

Central Ontario is probably the only part of Canada in which the importation of coal from the United States is thoroughly justified, except in regard to such limited quantity of anthracite as it may prove possibly for the people of Quebec to buy in the future, having regard to the high price of anthracite which will prevail, and to the improvements in fuel consumption which Quebec could bring about by full use of its water-powers and by gasification of bituminous coal for communal uses.

In view, therefore, of the probability that the coal mines of Nova Scotia cannot hope to do more than supply the coal requirements of the future in the Maritime Provinces and the Province of Quebec, and in view of Ontario's perpetual problem of fuel supply, it is not amusing, but tragic, that Ontario should have decided it no longer needed a central fuel authority. A fuel problem is inherent in the geographical and political condition of Ontario, and the inability of the leaders of political thought in Ontario to grasp the menace of this problem gives cause for real uneasiness of mind.

So long as the Dominion of Canada retains its existing political boundaries, a national menace, associated with and arising out of the fuel insufficiency of Ontario, is ineradicable. Ontario never needed a central fuel authority as much as she needs it today, but the future will bring a need still more insistent, and a menace that those who desire to see Canada continue free and flourishing cannot help but view with ever-increasing fear of what it portends.

TORONTO COAL PRICES.

Toronto, May 2.—Demand for coal is still uneven and consumers are buying only to a limited extent. Slack is selling in Toronto at $6.25 to $6.75 and lump at $7.50 to $8.00, Canadian funds, depending on the quality. Smokeless coal is quoted at from $3 to $3.25 at the mines based on New York funds and exclusive of freight charges. Anthracite prices remain unchanged at $11.35 for stove and nut and $11.10 for egg, New York funds.

GOVERNMENT WILL SEND PARTY TO BELCHER ISLANDS.

It is understood that the Dominion Government will send a party to the Belcher Islands, Hudson Bay, this summer to examine thoroughly the iron ore deposits there. It is known that very important deposits have been discovered and that these may form the basis of an iron-mining industry in the far North. Private reports are said to state that large bodies of ore of good grade have been located. It will probably be a part of the work of the men sent north this summer to examine into and report on the methods of getting the ore to market.

EDITORIAL

THE INSTITUTION OF MINING AND METALLURGY LINKS UP WITH THE INSTITUTION OF MINING ENGINEERS.

At the 29th annual dinner of the Institution of Mining and Metallurgy, Mr. Frank Merricks, the president, announced that, at the request of the Institution of Mining Engineers, consideration had been given to bringing about closer co-operation between the two principal mining institutions in Britain, and that henceforward the Institution of Mining Engineers would be housed in the new house of the Institution of Mining and Metallurgy, with union of the libraries and other services of the two institutions under one secretariat and with a joint advisory committee.

Mr. Merricks's remarks are quoted as hopefully significant of many good things for the future. He said:

"The fact that only a few months ago there were "two mining institutions in London with a combined "membership of over 6,000, who were to all intents and "purposes friendly strangers was a regrettable state "of affairs. The fact also that at the end of these few "months it has been possible to remove that barrier, "and to bring the two institutions together, must be "considered a fine and notable achievement. I hope "that in the near future it will be possible to carry co-"operation still further, and to link up the various "mining institutions of the Empire under one imperial "federation. By so doing, the mining profession would "speak with one voice, and with the united power would "exercise great influence on matters affecting the min-"ing industry. With such an imperial federation of "mining engineers, I hope also that in the near future "it will be possible for the president to be drawn from "one of the federated institutions of the Dominions, "with a chairman of the Council in London, and for a "special meeting to take place in the country of the "president of that year. Perhaps this may appear to "be ambitious, but I feel confident that it would be a "great benefit to the mining profession and industry "of the Empire, and I look forward to the day when "that ideal will be fulfilled."

We believe Mr. Merricks has correctly interpreted the sentiment that actuates the mining societies in the Dominions, nor does the history of the past seven years indicate that his vision is too ambitious. There has been a tendency among members of the mining profession to decentralise their energies. It is an ancient and honourable profession, and the concept of Mr. Merricks that the mining engineer should have one voice and should guide his own policies, standing upon his own traditions, is one that will find most hearty accord among those to whom he has addressed himself.

WHAT DO MINING ENGINEERS THINK ABOUT ENGINEERING STATUS LEGISLATION.

The discussion arising from the introduction in the Ontario Legislature of the "Professional Engineers Bill" should serve to draw attention to the fact that the mining engineers of Ontario are being represented as desirous of having such legislation passed. It would be instructive to know what authority there is for such statements. There is no Ontario association of mining engineers and Ontario members of the Canadian Institute of Mining and Metallurgy are not known to be in favor of such legislation. It is true that some mining engineers believe that engineers should be licensed or registered and that they have endeavored to make the provisions of the proposed bill such that it will not meet with very serious objection from other engineers. But there is little evidence that the mining engineers of Ontario are strongly supporting the bill and considerable doubt as to whether they would take any interest in it except for the fact many of the United States are providing by law for licensing of engineers. Mining engineers in their own interest must recognize that such legislation whether desirable or not, is popular and they must see to it that it is made as harmless as possible. It looks as though we might get it without wanting it, or at least without asking for it.

Commenting on the popularity of the licensing laws in the United States, the "Engineering and Mining Journal" says that it finds engineers "lukewarm or indifferent on the subject, and concerned only that the licensing legislation, taken as inevitable, shall be as well planned and thoughtful as possible." Somewhat the same situation exists in Ontario and it will be found that some of the mining engineers who have taken most interest in the proposed legislation have been interested chiefly in having the most objectionable features removed from the draft bill. The mining engineers of

Ontario, as such, have not expressed their opinion.

The editorial writer in "Engineering and Mining Journal" commenting on the question in the United States asks "what does the mining engineer think of the system of licensing?" The same question might well be asked in Ontario. The average mining engineer does not think about it at all.—R. E. H.

MINE PROMOTION LITERATURE IN MANITOBA.

The "Journal" welcomes the comment which appears in this issue from the Commissioner of Northern Manitoba and the secretary of the Gabrielle Mines, Limited, upon critical references in this column to certain mine-promotion literature emanating from Winnipeg.

The Editor believes with Dr. Wallace, and is glad to have Capt. Millican's confirmation, that the mining men of Manitoba (and of Canada as a whole) are overwhelmingly opposed to widespread dissemination of exaggerated mine-promotion advertisements. To put the matter in its lowest terms, it is a natural attitude, because the industry of mining and all connected with it suffers from the repercussion of a lie, and the mining engineer or promoter is not primarily concerned because the credulous investor may be hurt, but because the repute of the industry may be injured.

Dr. Wallace truly says that the future of Manitoba's mining fields depends upon the building up of confidence on the part of investors, and everyone who has followed his work as Commissioner knows that much of the confidence of investors in this new field has been built up by Dr. Wallace himself. It is the desire of this journal, and of the reputable profession that it strives to represent, to strengthen the hands of an administrator in whom the province of Manitoba rightly reposes full confidence.

This journal would be the last to deprecate that genuine enthusiasm which is the prospector's chief asset, and the germ of all mining enterprise. The potentialities of the mineral belt of Northern Manitoba warrant much optimism, and no comment that we have made has been intended to belittle the intrinsic value of the mineral deposits or the future of mining there. Enthusiasm does not tend to fraud, nor did enthusiasm originate the mendacious promotion literature that has come out of Winnipeg. It was prepared with a deliberate intent to deceive, and is remarkable not only for studied inexactitude, but for the steps taken by those who have distributed the literature to absolve themselves from the future wrath of those credulous enough to accept the advertised statements as being true.

The essential soundness of Dr. Wallace's view is expressed when he states: "I have faith—born of knowledge — in the sense of the mining community of Manitoba". So has this paper, and for that very reason it has ventured to draw the attention of the mining men of Winnipeg to false representations concerning Manitoba mines that have had wide circulation outside Manitoba, knowing that to do this would be the shortest way to a remedy.

Not least to be blamed are the newspapers that accept payment for advertisements that are palpably intended to deceive. A well-known Montreal daily gave its readers a sensible editorial recently on the folly of buying oil stocks, advertised by utterly reprehensible and unwarranted statements, but almost simultaneously with the editorial there appeared an oil puff in the advertising columns, an ethical inconsistence that awakens cynicism in the discerning reader. Separated as the editorial and advertising policies of a newspaper may be, yet it is inevitable the uninformed reader should assume that large and imposing display advertisements carry with them the sanction and approval of the editorial staff.

WORKMEN'S COMPENSATION.

Without desiring to criticise the wisdom of workmen's compensation enactments, which stand on our statute books as a reflex of public opinion, and represent one of the advances in social responsibility that mark our times, it is permissible to point out the cumulative nature of the expenditures required. In Nova Scotia, as in Ontario, the history of workmen's compensation has been that of progressive enlargement of the application of the principle that the worker is entitled to be compensated for injuries sustained in the course of his employment out of the revenue raised by the product of that employment. In Nova Scotia the enlargement noted has led to inclusion of occupations that were at first excluded, to larger rates of compensation, to the inclusion of medical aid and nursing, and to increasing cost of administration. It is not probable that this tendency to enlargement will be lessened, and it certainly will not be reversed.

The most satisfactory feature in what the Nova Scotia Compensation Report for 1920 calls a "monopolistic state-board system" is the elimination of all legal expenses and the fact that all monies collected by assessments on the payrolls is paid without diminution — except for administration expenses — to the parties intended to benefit. It is the unnecessary expenditure on litigation arising out of compensation claims that is so distasteful and so harmful a feature of the compensation laws of the province of Quebec, and is responsible for the pressure that is being brought upon the legislature of that province to adopt the system of administration by a provincial board that is now customary in virtually every other province in Canada.

There are so many points on which it is possible for employers to disagree with their workmen, and vice-versa, that operating executives would secretly, if not openly, welcome a system that avoids the necessity for all dispute and all legal recourse in compensation claims. The Board in Nova Scotia is able to claim that it has disbursed compensation assessments raised on an annual payroll of $73,000,000, extending over four years, without expending a cent in solicitors' fees. This is not a remarkable achievement in administration, because it is inherent in the nature of the system, but it is an achie-

vement that stands out in these days of disputation. Once the principle of workmen's compensation is admitted, it is a right and logical procedure to adopt the best method of carrying out that principle, and that is why the appointment of a competent board as paymaster and sole referee has supplanted all other methods, or is about to.

ONTARIO MINE TAX BILL WITHDRAWN.

The proposal to increase taxes on mining companies operating in Ontario has met with so much criticism that the Government might well be doubtful of the result if it were presented for a final reading. It would appear that it had been prepared without very full knowledge of the facts and that its withdrawal means that the Government is now convinced that the mining companies are already making fair contribution to the Provincial treasury, and that the proposal to increase taxes was not well advised.

CORRESPONDENCE.

The Editor,
Canadian Mining Journal.

The Pas, Manitoba,
May 6th, 1921.

Mine Promotion Literature in Manitoba.

Dear Sir:—After reading carefully the various articles and Notes in your Journal of recent issue, with particular reference to Manitoba, I have reached the conclusion that your condemnation of certain promotion practises, while not a whit too severe in particular cases at issue, may be misread to apply to a larger public than the case would actually justify. Not one swallow, nor two, make the summer, nor does one robin, however perky, give us gloomy winter. I am probably in a position to interpret fairly the desires of the great majority of men interested in the mining development of Manitoba, whether in actual practice in the field or in the none the less essential work of attracting capital to the Province for mining development. The general sense of the mining men in the Province is overwhelmingly with you in your position with reference to exaggerated promotion literature. Perhaps you have not given due weight to this fact in your discussion of the Manitoba situation.

For the future of Manitoba's mining fields the building up of confidence on the part of investors, particularly mining corporations, is imperative; without it there will be no progress. It is for this reason that as at least one means of checking untoward movements the "Sale of Shares Act" was put on the statute books and amendments which I was invited to assist in framing have from time to time been added to meet new conditions. It is one of the important duties of the Public Utility Commissioner of the Province to administer this Act and I feel satisfied that any delinquent may be safely left to be dealt with by him. In that connection it is cause for serious misgiving that a resolution before the Provincial Legislature at the present session calling for the abolition of the Public Utility Commission received a majority vote. It is to my mind imperative that this Act be administered, not directly through a government department, but by a commissioner responsible only to the Lieutenant Governor-in-Council and otherwise independent in every sense of the word.

In the long run, however, it is not restrictive legislation, but the good sense of the mining community, that is the most potent factor in eliminating objectionable practices. I have faith—born of knowledge—in the sound sense of the mining community in Manitoba for whom much is at stake; moreover, there are districts in the Province in which the mining men would keenly resent and are in a position justly to resent criticism levelled at the Province at large. For this reason, Mr. Editor, I do not feel that we need attach too much significance to nor give way unduly to despondency into which I confess I sometimes fall on witnessing the vagaries which may now and then afflict the minds of the men who dream of gold mines and the use to be made of them.

Truly yours,
R. C. WALLACE.

The Editor,
Canadian Mining Journal.

Winnipeg, May 3rd, 1921.

Dear Sir,—I note with a great deal of satisfaction your article appearing on page 333, in the Apl. 29th. edition of the JOURNAL, under the caption "Mining in Manitoba." I furthermore wish to compliment your publication on the stand it has consistently taken in regard to what might be termed "wildcat" mining promotions. Furthermore, I am not the only one, nor is the Gabrielle the only mining company in this province, by whom your article have been read with a great deal of appreciation.

Ever since the first discovery was recorded in 1911, we have been steadily endeavouring to develop our particular property through the united efforts of mostly original shareholders from whom nothing has been kept back, and to whom we have never yet issued any reports of a misleading nature, whether reports were, from time to time, good, bad, or indifferent.

Last year we succeeded in raising sufficient capital from the sale of treasury development stock to do a considerable amount of further surface-development work, but, as matters now stand, and chiefly owing to a condition of affairs such as you describe them, we do not feel justified, in fact it would almost be impossible, in placing additional stock on the open market. Consequently we shall be forced to let the property remain more or less idle this summer, although a recent discovery of platinum in small quantities would warrant our proceeding vigorously with additional work in order to honestly ascertain whether there are legitimate hopes of increasing values.

On the other hand, disgruntled stock holders in various companies who have been induced to invest through the medium of lurid advertisements are very apt to take a stand that all mining companies are more or less the same, and the general atmosphere surrounding the mining situation in the Rice Lake district now is not one that would lead our provincial legislators to exert any undue efforts to further the interests of the district generally, although I will say that they have given us every assistance warranted under the existing state of affairs.

However, it is hoped that very soon we may see things considerably changed, and that through the efforts of your own and other publications taking the same decided stand, some sane method of systematic

development may be evolved in this territory where the experienced prospector still waxes very enthusiastic and where additional development is warranted according to all reliable reports which have been compiled to date. To quote further from Prof. DeLury's report referred to in your article above mentioned "In conclusion, it might be stated that the general impression left after an examination of the district is that it will be surprising if in future years the Rice Lake district is found to have no workable gold deposits. The duration of these years will be lessened if a spirit of co-operation is fostered and active steps are taken to check, exaggerated stories and illegitimate promotions, both of which have done the district an infinite amount of harm in the past."

The writer had the pleasure of meeting Prof. DeLury last summer on his trip through this district, and the impression gained was that he was quite sufficiently impressed to warrant even a stronger statement, which we all hope time and honest endeavour will amply justify.

It may be of interest to your readers to know that further steps are now contemplated by both the federal and provincial governments to greatly improve the methods of summer transportation which have, to date, been a great draw-back to the whole of the district. It is hoped that, very soon, a waterway will be established via the Hole (Wanipigow) River which will be accessible for power-launches and barges from a point above the old government dam near the mouth of this river, to which point freight can be transported over a proposed new wagon of truck-road from Bad Throat, where there is now sufficient depth of water to allow of Lake Winnipeg boats landing.

Yours truly,
CHAS. A. MILLICAN.
Secretary, Gabrielle Mines Ltd.

MR. R. R. ROSE GOES TO THE HOLLINGER.

The Bulletin of the Canadian Institute of Mining and Metallurgy for May contains the following announcement regarding Mr. R. R. Rose:

"This month the Institute loses the services of Mr. R. R. Rose, who has left Montreal to accept a position at the Hollinger mine. Mr. Rose was appointed Acting-Secretary of the Institute in October, 1919, at the time Mr. H. Mortimer Lamb was forced, through ill-health, to relinquish his position as Secretary. Taking charge of affairs at somewhat short notice, Mr. Rose at once proved himself a man of unusual all-round ability, and the Institute owes him a deep debt of gratitude for the part he played in assisting it through a most difficult transition period. Mr. Rose, however, is essentially an out-door man. The mine appeals to him more strongly than the office, and he has been unable to resist the call. We take this opportunity of assuring Mr. Rose that every member of the Institute, and especially all members of Council, who are in the best position to judge, deeply appreciate his valuable services to the Institute, and wish him every success."

The part played by Mr. Rose as Acting Secretary of the Institute is not at all overstated in the Bulletin. Undertaking duties that were entirely strange to him, during a very difficult time, Mr. Rose was observed by those who visited the headquarters at Montreal to be a capable and conscientious officer, modest as regards his work, but efficient in its carrying out, and the "Journal" desires to add its wishes to that of the Bulletin for his success in new employment.

PERSONALS.

Mr. Jas. J. Denny of Cobalt, who has distinguished himself as a metallurgist and made many contributions to improved practise in treating the silver ores of the Cobalt area is to be granted this week by Queens University the honorary degree of M.Sc. Mr. Denny is on the staff of the Nipissing Mines at Cobalt.

Among those who receive this week from Queens University the honorary degree of LL.D. are R. W. Brock, geologist and C. V. Corless, mining engineer. Mr. Brock is Dean of the University of British Columbia and was some years ago Director of the Geological Survey of Canada. Mr. Corless is manager of Mond Nickel Co. and is president of the Canadian Institute of Mining and Metallurgy.

Mr. A. H. Low, Mr. G. H. Thomas and Mr. Harry Dakes of the Mackenzie River Oil Company have left Toronto for Edmonton and the oil fields.

Mr. Robert E. Hogan representing the Palatine Mining and Development Co. is at Port Arthur. It is reported that his company has purchased and will operate the Atikokan blast furnace at Port Arthur.

Mr. O. S. Finnie, administrator of the Mackenzie River Oil territory has a party of geologists, surveyors, engineers and civil servants at Edmonton making preparations for a trip down the river.

Mr. C. A. Poirier of New York, a mining engineer who is well known in Ontario gold-mining districts is now at Porcupine making arrangements for the carrying on of development work on the Bewick-Moreing properties which have been acquired by the Goldale Mining Company.

Mr. E. P. Mathewson of New York, who was in Toronto for some time during the war in connection with the affairs of the British-America Nickel Corporation, of which he was at that time manager, it at present in London, England.

Mr. J. B. Tyrrell has been awarded a life membership in the National Geographic Society of America in recognition of his contributions to knowledge of geography of northwestern Canada.

GOLD MINING ON THE WITWATERSRAND.

Some interesting data concerning gold mining operations on the Rand during 1920 are contained in the recently issued report of the Anglo-French Exploration Co. There was crushed during the year 24,096,277 tons of ore, producing £42,273,637 gold. The working profit was £11,458,776, or an average of 9s. 7d. per ton. Dividends declared amounted to £8,275,708. The number of natives employed at the end of the year was 159,671. The average price obtained for gold was 112s. 5·6d. per ounce, equal to a premium of 23·3 per cent. The premium ranged from 21 to 50 per cent.

The Anglo-French Corporation has holdings in many South African companies. In Ontario its holdings are in Hollinger Consolidated and Lake Shore mining companies. The Corporation is represented in Canada by Mr. J. B. Tyrell.

The Toronto "Globe" refers to the presidential address at the recent meeting of the Mining Society of Nova Scotia as having been delivered before "a mining society at Halifax." This is a little curious, considering that this particular society has a record of honourable service in mining matters that should at least excuse the use of the definite article, even in Toronto.

Mining Possibilities in Alberta and Adjoining Territory.

A Paper Read at the Second Western General Meeting of the Canadian Institute of Mining & Metallurgy, by Dr. John Allan, Professor of Geology, University of Alberta, Edmonton, October, 1920.

IN discussing the general possibilities of Alberta, it may be permissible to consider not only the province of Alberta, which extends from the 49th to the 60th parallel of latitude, a distance of 750 miles, but also the great northland within the lower Mackenzie basin that is geographically and commercially tributary to Alberta. This hinterland lies between the 60th and 70th parallels of latitude, the latter of which passes through Herschell island.

It is not the writer's intention to discuss all the mineral possibilities in this area or even all the mineral deposits that are known to occur, but he will refer briefly to certain of the minor mineral deposits and discuss more fully the major deposits such as coal, oil, and bituminous sand.

Stretching from the Rocky mountains on the west to the Pre-Cambrian Canadian 'shield' on the east, and from the mouth of the Mackenzie on the north to the gulf of Mexico on the south, lies a belt with low relief. The northern part is drained by the great Mackenzie river system, the southern by the Mississippi system, while the area intervening between these two great drainage systems is drained by the Saskatchewan system. This belt has a width of over 800 miles of the international boundary line, but narrows rapidly towards the north. On the northern boundary of the province of Alberta, the width of the low upland is about 150 miles. A similar type of country widening towards the north, continues down the Mackenzie river. The substructure over this broad area can be roughly described as trough-like with the older formations outcropping along the westerly and easterly sides of the trough.

In discussing the mineral resources and the mineral possibilities in Alberta and the great northland, these general geographical details must be borne in mind, in order to obtain a proper conception of the extent of mineral-bearing formations and the possible occurrence of bodies of minerals.

The writer may here be permitted to emphasise the great need today for more accurate information on our mineral resources. These remarks possibly apply more directly to Alberta, which had an oil excitement in 1914 and is again on the verge of what may materialize into the wildest 'boom' that the province has yet experienced, unless influenced by those technically qualified. Too frequently, incorrect information regarding various mineral deposits has been given to the public or to companies or corporations considering investment.

It is the duty of geological surveys, whether federal or provincial, and of organizations and institutions such as ours, to see that accurate information is given to the public, whether grouped as a company or as readers of the daily press. It is a detriment to the industrial development of a country to have ridiculously overestimated and untrue statements made regarding any particular mineral deposit or occurrence. The time has come when this and similar organizations should impress upon the public that no one is better qualified to give advice on the opening up of a property than a competent mining engineer, no one better able to advise on possible mineral deposits than the trained geologist.

In several instances the development of the mineral resources of Alberta has been retarded by inaccurate statements and representations made to investors by individuals who pose as being technically qualified to give such information. During 1914 in Alberta there appeared several individuals who advertised themselves as geologists although no more qualified in that profession than the average speculator in mineral claims or leases. A similar individual has already made his appearance in Alberta this fall, and it is to be hoped that *bona fide* geologists and mining engineers will use their influence to guard the investor against such persons.

Minor Minerals.

Iron. — Much publicity has been given to statements that there are extensive deposits of iron ore in Alberta awaiting development. If this is the case, they have not yet been found by the geologist. Moreover he does not find the indications very promising. Iron occurs in Alberta in various forms, especially as the oxide, but no occurrences that contain any commercial quantity of this metal have yet been discovered.

In the Crowsnest Pass district there are magnetite shales containing up to 60 per cent metallic iron, but analyses show that they also contain from three to five and one-half per cent titanium dioxide, which is a disadvantage in the treatment of the ore. If a process for treating such an ore can be found, this deposit may prove to be workable.

An endeavour has been made to impress upon the public that there is, in the Sheep River district southwest of Calgary, a deposit that contains "upwards of 2,400,000,000 tons of iron ore" containing 29.9 per cent metallic iron. This information is contained in a report that includes analyses made at the Kingston School of Mines. The writer has investigated this district and finds that there is not a single ton of rock that would be classed as iron ore exposed in the district referred to in the report. The highest analysis from samples which he collected shows 4.5 per cent metallic iron. The writer was also given a sample of hematite by a person who claimed that the specimen came from this deposit. On one side of this sample, "No. 31" was painted in white and the writer proved that it was taken from the standard educational set of specimens sent out by the Geological Survey — this specimen came from the Helen mine in Ontario. This is the sort of information that strong endeavours are being made to suppress, as such erroneous reports hinder rather than encourage the development of our mineral resources.

During the past summer some very good deposits of ochre have been discovered and one of these may prove to be of sufficient size to be worked. Iron ore also occurs on the north shore of lake Athabasca and north of Peace River canyon, but detailed information of these occurrences has not yet been obtained.

Hematite and highly ferruginous red slates occur in the lower Mackenzie basin, below Fort Norman, and

about twenty miles east of the river. In the 1919 Summary Report of the Geological Survey, Dr. E. M. Kindle briefly mentions this occurrence and states that a composite sample contained 12 per cent metallic iron. A single specimen from this deposit that was given to the writer contains 18 per cent metallic iron. Although this is not sufficient to make the deposit workable, it is, however, an interesting occurrence.

Copper. — Several specimens of copper sulphides, chiefly chalcocite, have been brought from that part of the country between Great Slave and Great Bear lakes. The occurrence is worth noting although details are not yet available. A small deposit of chalcopyrite was recently operated for a time on the south side of the Bow valley between Banff and Lake Louise.

Talc. — There are several indications of a valuable though not extensive deposit of talc near Vermilion pass west of Banff. Arrangements are being made to develop this prospect at an early date.

Mica. — There is no mica of importance known in Alberta but a promising occurrence has been found near the head of Peace river, in the vicinity of one of the tributaries. Analyses show that it is muscovite, while optical examination proves it to be of high quality. It is expected that the development of this deposit will be commenced next summer.

Sodium Sulphate. — Alberta encloses upwards of one and a half million acres of water. Many of the smaller lakes contain dissolved salts and an investigation is under way to determine their quality. Just east of the interprovincial boundary, there are several lakes in which deposits of remarkably pure sodium sulphate are found. One of these lakes lies nine miles north of Fusilier and contains about one million tons of pure sodium sulphate (Glauber salt). This deposit is now being operated. Other similar deposits are known both north and south and one deposit of this mineral has already been found in the eastern part of Alberta. There is a large demand for this mineral in the pulp industry as well as a small demand for the salts for medicinal purposes. There are large possibilities for the development of an important industry from these deposits.

Sodium Chloride (Common Salt). — At the extreme northern boundary of the province, salt is being deposited by springs of saturated brine. This material, although pure in quality, is of little value on account of its inaccessibility except to the trading posts at points farther north.

The indications of rock salt to the north of Edmonton were sufficiently promising to warrant a well being drilled by the provincial government at Fort McMurray, at the junction of the Clearwater and the Athabaska rivers. This well is now approaching the salt horizon and indications are becoming more favourable for the discovery of a bed of rock salt.[3]

Major Minerals.

Coal. — Coal is the most important of the mineral resources to date, in that mining operations have been carried on continuously since 1881. The earliest record of the occurrence of coal in Alberta was that made by Sir Alexander Mackenzie in 1789. He refers to a seam of coal that was discovered on the Red Deer river near the mouth of Rosebud creek. This occurrence is at the margin of the present-day Drumheller coal basin.

In making an estimate of the coal resources in any area, it is necessary to determine the areal distribution of the coal-bearing formations, and to estimate the approximate thickness of the coal seams throughout that area. Owing to the importance of coal in Alberta, much detailed work has been carried on by the Geological Survey of Canada. Stratigraphical information has been obtained throughout Alberta, and the distribution of the coal-bearing formations mapped as accurately as the geological knowledge to date would warrant. The information on the coal resources of Alberta has been published from time to time by Mr. D. B. Dowling. In many districts the information that he has published is all that is yet known of the coal resources.

It is not the writer's intention to discuss at this time the origin of coal, but he would emphasize in passing that coal deposits are formed on the lowlands along the shores of seas, inland swamps, or lakes, and, in some cases, in coves and basins on the sea-shore where driftwood has accumulated for geological periods and has been transformed into coal. This last type can be seen today along the shores of Vancouver insland and on the mainland coast of British Columbia. There is reason to believe that the coal seams in Alberta belong to several of the above mentioned types.

In Alberta there are three important coal horizons in the Cretaceous. These horizons are in most localities separated by shale formations of marine origin. There are no Carboniferous coal formations in Alberta and there are no Cretaceous coal seams in eastern Canada. All grades of coal are found in Alberta from lignite of medium grade to high-grade semi-anthracite coals bordering on anthracite. This is a fact that is too frequently overlooked by those discussing the quality of the coal of Alberta. The two most important factors to be considered in discussing coal deposits are age and pressure; both of these factors must be remembered when discussion arises on the coals of Alberta. Furthermore, the quality of the coal in this region is dependent upon these factors. The three distinct coal-bearing horizons in Alberta are:

1. The Edmonton formation, upper Cretaceous.
2. Belly River, middle of the upper Cretaceous.
3. Kootenay formation, lower Cretaceous.

These horizons are separated from each other by formations of from 700 to 3,000 ft. in thickness. The The coal seams in the lower formations are of higher quality than those that occur in the younger formations. This is attributable to the age and to the fact that they have been subjected to pressure from the overlying load for a greater period. On the other hand it is important to remember that the Rocky mountains form the western side of the province, and the mountain-building movements, which have been the cause of the up-building of the mountains have exerted a greater pressure on the coal seams to the west. The quality of a coal, therefore, improves as a seam is traced towards the west and into the foothills or within the front range of the Rocky mountains. The highest grades of coal are, therefore, found near the foothills, or within the front ranges. At the same time, the seams of coal belonging to the Belly River and Kootenay formations are exposed close to the mountains or within the mountains, owing to the fact that the beds have been tilted upwards in the process of mountain building. There are several coal basins in Alberta, widely distributed, and yet all

[3] Early in November a bed of transparent rock salt, at least 14 feet thick, was penetrated by the drill at a depth of 648 feet. Plans are being made for more extensive development in the spring of 1921.

are producing coal. The grade and quality of the coal in these individual basins vary, but in general it may be said that the higher grades are found towards the west. There are other coal basins containing high-grade semi-bituminous or anthracite coals that have not yet been opened up, but they are known to possess large reserves for future use. These undeveloped areas include those at the head of the Highwood and Sheep rivers and towards the head of the Smoky river between the Athabaska and Peace rivers.

Alberta does not contain any large quantity of anthracite coal but small irregular pockets occur within the mountains where portions of the coal seams have been affected by the most intense diastrophic movements.

There is still a large field for investigation of the coal resources of Alberta, both regarding the continuation of coal seams of uniform quality and also on the best methods of preparing the coal for market and of storing coal so that a wider market may be maintained.

Realizing the importance of the coal resources to the province, the provincial government, under the direction of the Hon. J. L. Côté, has instituted a research department at the University of Alberta in Edmonton, in which these and other problems dealing with the coal resources are being investigated.

The importance of the coal resources of Alberta is evident when the amount of this mineral in reserve is considered. It is estimated that Alberta contains 15 per cent of the coal reserves of the world and 87 per cent of the coal reserves of Canada, and that upwards of 96 per cent of the coal reserves of Canada lie west of the Great Lakes. Mining operations began in Alberta in 1881 when 1,500 tons was produced. For the current year, it is estimated that the output will be in the vicinity of 7,000,000 tons. Since the beginning of mining operations in this province, the output has been only a little over 60,000,000 tons. In the 1919 Annual Report of the Alberta Mines Branch, Mr. J. T. Stirling, Chief Inspector of Mines, states that during the last fifteen years, "100,484,038 tons of coal have been affected by mining operations", of which 47,227,498 tons have been extracted and 26,628,770 tons have been "lost without any chance of recovery". This is a deplorable fact and one that calls for immediate consideration and investigation.

Petroleum. — The possible petroleum resources of Alberta are today receiving very widespread attention. On account of the trough-like structure extending throughout Alberta and the Mackenzie basin, to which reference was made in the first part of this paper, there are upwards of 300,000 square miles in Alberta, the lower Mackenzie basin, and western Saskatchewan underlain by formations suitable for the accumulation of petroleum. When one visualises this vast area that contains possible oil reservoirs, one must assume an optimistic attitude regarding the future development in so far as petroleum is concerned. The problem of working out the structure in this area is extremely difficult on account of the scarcity of outcrops, the thick veneer of glacial debris, and the extensive muskegs. Development must of necessity proceed more slowly than if the geological structure could be more readily determined.

The early work of the Geological Survey has assisted greatly in directing the attention of field geologists to certain areas in Alberta and the Mackenzie basin where indications are, at least to a certain extent, favourable.

The stratigraphy of the belt in Alberta and the northland is not unlike that south of the international boundary line where there are today many oil producing areas in Montana, Wyoming and Colorado. However, the structure is more readily determined towards the south on account of the exposures being more numerous, and it is true that the formations have been deformed to a greater extent by tangential pressure exerted by the mountain-building forces. The continuation of these beds into Alberta is just as suitable for the accumulation of petroleum, and the natural occurrence of minerals of any kind is not confined by political boundaries.

The discovery of new petroleum fields is essential if the world's supply of petroleum is to be maintained. The shortage of petroleum is already felt with great acuteness, and while the demand for fuel oil is rapidly increasing, the supply is not keeping pace. We have been recently informed that in this country alone, the Canadian Pacific Railway Company is replacing its oil-burning locomotives by those of the coal-burning type and that a similar change is being planned for its steamships. Today, the United States has about 62 per cent of the world's supply of petroleum, and yet those who have carefully investigated the problem state that the reserve at present mapped out will only last for a comparatively few years. This means that new fields must be discovered outside that country if the petroleum supply is to be maintained. Mexico and Russia include about 20 per cent of the world's supply. With the restoration of peace in Mexico, the production of petroleum will be more assured and will, undoubtedly, increase.

Petroleum was first discovered in Alberta in 1898, in a well drilled southwest of Pincher Creek. Little attention was given to the oil possibilities in Alberta until 1914 when, in May of that year, a strike of light oil of gasoline grade was made in the Turner valley, 16 miles west of Okotoks and 35 miles southwest of Calgary.

This discovery precipitated a boom during which about five hundred companies were formed. Less than two dozen of these companies began drilling operations before the boom 'broke' on the outbreak of war, early in August. Most of the oil companies ceased to exist soon after this disaster and in 1919 less than a dozen were active. About twenty-four drills were at work this season, distributed from the 49th parallel to Fort Norman in the lower Mackenzie basin.

During the summer of 1919, a systematic field search was begun, chiefly by the Imperial Oil Company, and by the Whitehall Oil Company of England.

The result of geological work to date has been that several fields have been outlined in which the chances are greater for finding petroleum. These possible fields are as follows:

1. Southwestern Alberta.
2. Southeastern Alberta (Sweet Grass hills).
3. Okotoks field, Sheep river and Highwood river. This is the only producing field to date. In 1919 the Calgary Petroleum Product Company and the Southern Alberta Company produced 13,000 barrels of crude oil.
4. Central eastern field—Czar, Monitor, Viking, etc.
5. Central western field—between North Saskatchewan and Athabaska rivers within the foothills.
6. Peace river—vicinity of town of Peace River, small quantities of oil have been found with gravity from 12.5 to 17 degrees Beaumé. Between 900 and 1,150 ft.
7. Upper Peace river field in Peace River block.
8. Great Slave lake—western end—oil seepage at Windy point, has a gravity of 16 degrees Beaumé.
9. Lower Mackenzie basin—Fort Norman district.

"Oil struck at Fort Norman, a barrel-a-minute flow", was the first intimation the public had through the press

of the discovery made late in the summer. As is frequently the case, when this report was investigated, it was found to have come from an unreliable source and was not official. The facts are somewhat different from the first report.

During the summer of 1919, the Imperial Oil Company began drilling on the east bank of the Mackenzie river at a point about 50 miles below Fort Norman. Drilling operations were continued during 1920 and at the close of the season a flow of oil was struck at a depth of about 800 ft. The pressure was sufficient to throw the oil some distance above the top of the derrick. The flow, however, was officially reported to be intermittent. Between the gushes, a two-inch pipe was attached to the top of the casing and the well was capped. No accurate measurements were made of the quantity. Indications of oil were obtained at higher horizons in the well.

The oil taken from the well has an olive green colour and a gravity of between 36 and 38 degrees Beaumé. Analysis shows that it contains less than 24 per cent gasoline and about 38 per cent kerosene, the balance being light and medium lubricants. There appears to be no asphalt base present.

The location of this well is about 900 miles northwest of Edmonton and about 1,200 miles by the travelled route. This discovery indicates the occurrence of an undefined oilfield, but there are difficulties that will hinder the development of this area into an oil-producing centre. The prime difficulties are the inaccessibility to transportation, the short summer-season, and the rather severe winter-season. In spite of these difficulties a rush is already under way, and lease-taking parties are now making preparations to go down to the Fort Norman district this winter. The wildest kind of stampede seems to be gathering for the opening up of the rivers in the spring, and it is evident that much 'wildcat' staking will take place during the next year. An aerial service from Edmonton or Peace River is being considered, but it is doubtful if this service will be open to the public.

This discovery is a good indication, but there is yet no need for extreme optimism. The world's petroleum supply is not yet assured. It will require the conservatism of all those who know the facts and the difficulties entailed to tone down the wild enthusiasm that is gathering rapidly.

A second well was begun late this summer by the Imperial Oil Company at Windy point on the north shore of the Great Slave lake, but drilling operations had to cease for the season before any favourable indications of oil were obtained. Close to this point there are several oil springs and pools of oil. A sample of oil collected from one of these pools in 1916, by A. E. Cameron for the Geological Survey had a gravity of 16 degrees Beaumé.

Statements are being made through the press that the Imperial Oil Company is holding back the actual facts. The writer has reason to believe that this is not the case and that this pioneer company is withholding from the public no information that can be expected from any private corporation. Prospecting and development of the possible producing-areas in central Canada has been greatly stimulated by this discovery and progress is assured for the ensuing year.

Bituminous Sands. — To discuss this very important mineral deposit would require more time and space than are at the writer's disposal. It is sufficient to say that in the bituminous-sand formation there is enclosed an enormous supply of oil. The bituminous sands, more frequently called the 'tar sands', belong to the McMurray formation, which F. H. McLearn of the Geological Survey has placed near the base of the upper Cretaceous. This formation consists chiefly of sandstone, saturated with bitumen. The formation covers upwards of 15,000 square miles and reaches the maximum thickness of about 225 ft. The texture of the sand varies greatly from about 20 to 200 mesh. The bitumen content ranges from 12 to 22 per cent with an average of about 15 per cent. Simple calculation will show that there is about 189 cubic miles of bituminous sands in this formation, but only an extremely small portion could ever be utilized. Many tests have been made in which from 15 to 40 gallons of crude oil per ton has been extracted. If even a fair proportion of the bitumen could be extracted, there is sufficient oil to supply the world's demand for over a thousand years at the present rate of consumption.

The real problem in connection with these sands is to find some process which will extract the bitumen from the saturated sands on a commercial scale. Various laboratory processes are known and some of these are patented, but to date none has proved suitable to extract the oil commercially. When such a process is found, a very large reserve of crude oil will be available. Samples of these sands are now being tested at many points in North America, as well as in Europe and in the Hawaiian islands. The chances are favourable for the discovery of some commercial process at an early date. It is anticipated that extensive development work will be carried on in these deposits next season. The problem here is not one of transportation as in the case of the oilfields in the far north, but one of treatment.

UNIVERSITY OF IDAHO OFFERS RESEARCH FELLOWSHIPS.

In co-operation with the United States Bureau of Mines and the Idaho Bureau of Mines and Geology, the University of Idaho offers in the School of Mines a number of fellowships. These fellowships are open to college graduates who have had good training in mining, metallurgy, or chemistry, and who are qualified to undertake research work. The income of each fellowship is $750 a year for the twelve months beginning July 1st, 1921.

Fellows will register as students in the University of Idaho and become candidates for the degree of Master of Science in Mining or Metallurgy (unless this or an equivalent degree has been earned.) Their class work will be directed by the heads of the departments of instruction, but the greater portion of their time will be spent in research work under the direction of the Bureau of Mines staff resident at the University. The purpose of this work is to undertake the solution of definite problems confronting the mining and metallurgical industries of the state of Idaho. For 1921-22 the following subjects are being considered.

(1) Flotation—with especial reference to differential separation of various minerals.

(2) Treatment of the complex zinc-lead ores of the state.

(3) Ore Dressing problems.

(4) Mining problems.

Applications, with certified copy of collegiate record, statement of professional experience, and names and address of three references will be received up to June 1, 1921. The applications should be addressed to Francis A. Thomson, Dean, School of Mines, Moscow, Idaho.

LONDON COMMENT ON CANADA'S RECORD COAL OUTPUT IN 1920.

The following comment from the "Financier" of London, indicates that Canada's coal output in 1920 has excited interest over the seas, and, although the reference to the "provinces of Athabaska, Saskatchewan and Assiniboia' is a little startling at this date, the London writer seems to have sized up the export possibilities of western coal fairly well.

The editorial referred to is as follows:

Statistics now published with regard to the output of coal in Canada in 1920 show a very large increase and a record total, amounting to over 16½ million tons, which is a growth of 21½ per cent. as compared with 1919 and a much larger one in contrast with the pre-war period. Of course, the Dominion is not yet one of the principal world producers, but the industry seems likely to develop rapidly in the future.

Canada has long been known to possess large deposits of this mineral. The richest areas are in Nova Scotia, British Columbia and Alberta. The first named has hitherto had the largest output, owing to its proximity to the sea, but the coal of British Columbia is specially good in quality and has long been popular in California, in spite of the high United States duty. The largest area is in Alberta, which, it is computed, contains about five-sixths of the whole of Canada's coal deposits.

Lack of population has hitherto retarded development in this province, but as it is now attracting numerous immigrants, and as, moreover, there is increasing difficulties in obtaining supplies from the United States, coal mining has recently gone ahead considerably. The increased production of Alberta in 1920 was 38 per cent. as compared with 1919, and last year its output was for the first time larger than that of Nova Scotia.

As Alberta is contiguous to the American mining State of Montana, and as, moreover, the neighboring provinces of Athabasca, Saskatchewan and Assiniboia are steadily developing, there seems great scope for increased coal production, which will, in its turn, tend to promote the flow of immigration and to facilitate greater railway communication. It is thus a fact of great economic importance to the Dominion as a whole.

DOMINION COAL COMPANY'S OUTPUT IN APRIL.

The production from the Cape Breton mines of the Dominion Coal Company in April was 174,969 tons, the smallest output since the strike in 1908, and the smallest monthly production, under normal conditions, since 1905. No. 15 Colliery did not work during April. For the first four months of the year the production was 864,747 tons, which is smaller than for the corresponding period of 1920 by 212,000 tons. The falling off in coal output in Nova Scotia since the first of the year, as compared with 1920, approaches 250,000 tons, and, unless trade conditions improve quickly and materially, it will hardly be possible for Nova Scotia to produce as much coal as was raised in 1920. The production so far for May is probably not greater than two-thirds of full time capacity, and the reduction is much more marked in the case of the larger companies than it is at the smaller mines, largely owing to reduced consumption at steel plants. It is necessary to go back at least sixteen years to find records of coal production as small as at this time.

The effect of the British coal strike has not as yet resulted in any marked improvement in demand, and, in view of the attitude of the transport workers in Britain, it is unlikely that any large direct shipments will be made to Britain, although an indirect increase in demand will certainly result throughout the remainder of the year as a result of the stoppage of the British collieries, and their inability to supply European and other markets. There is, however, a very considerable ability among United States coal producers to supply British markets at this time, and Nova Scotia coal will find it difficult to compete with U.S. coal in the export trade. The price of bunker coal at Sydney has recently been reduced from $10.50 to $8.50 per ton.

PORTABLE MINE-CAR AIR COMPRESSORS.

The Sullivan Machinery Company in its Bulletin 77-A illustrates applications to coal-mining of a portable, motor-driven, air-compressor, mounted on a mine-car truck. The persistence of hand-drilling methods for putting in shot-holes for the removal of coal and rock is one of the reasons why Canadian coal-mines are unable to get the lowest possible production costs, and, in mines where dust and gas render the use of electricity inadvisable at the coal face, there are many instances where it would be safe to use portable air-compressors driven by electric motors, thereby effecting the transference from electricity, with its sparking dangers, to compressed-air near the point of the air, thus getting away from the chief drawback to the use of compressed-air underground, namely, the loss of power in transmission. The operation of hammer-drills is, of course, only possible by use of compressed air, and it is for machines of the percussive type, large and small, that the portable air compressor is designed. The idea might go a good deal farther, however, and include the provision of air-compressors of large capacity, enclosed in a flame-proof chamber, from which coal-cutting and heading machines suited to longwall faces and of rotatory type could be supplied. The combination of the ideal transmission capacity of electricity with the ideal safety advantages of compressed-air should be developed to a much more perfected stage than that of today, and will find its chiefest application where working faces are situated at long distances from the pit bottom, or the point of entrance of the motive power.

U.S. METAL MINE FATALITIES IN 1920 LOWEST ON RECORD.

That fewer men lost their lives in metal-mine accidents in the United States during 1919 than in any previous year for which statistics of accidents have been compiled is shown in a report just issued by the United States Bureau of Mines. The number of men killed was 168 as compared with 646 killed in 1918. The number of men injured was 31,506 as against 42,915 in 1918.

The fatality rate was the lowest on record for the metal mining industry in the United States, and the injury rate was lower than any year since 1914. For every 1,000 men employed during a full time year of 300 working days 3.43 men were killed and 231.18 were injured.

WORKMEN'S COMPENSATION IN NOVA SCOTIA DURING 1920.

The report of the Workmen's Compensation Board of Nova Scotia for 1920 shows that the improvement in the number of fatal accidents disclosed by the 1919 figures has not been maintained. A comparison with previous years, after deduction of fatalities in two coal-mine explosions and a lumber-camp fire, is as under:

	1917	1918	1919	1920
Fatal accidents	146	185	59	81
Deduct disasters	65	105	..	..
	81	80	59	81
Number of Coal-mine fatalities, included in above	97	126	21	28

The total number of compensable accidents in 1920 was, so far as reported, 5649, a notable increase over previous years, particularly in cases of temporary disability, as is shown by the following table:

	1917	1918	1919	1920
Fatal Accidents	146	185	59	81
Temporary disability	4,504	4,504	4,640	5,374
Permanent disability	187	242	250	194
	4,837	4,931	4,949	5,649

The cumulative tendency of compensable accidents is illustrated by this comparison.

Assessment rates were generally adjusted downwards, the Nova Scotia Board having taken no chances in making assessments in the earlier stages of the operation of the Act. Some of the principal adjnstments made were as follows:

	Assessment Rates.		
	1918	1919	1920
Coal mining	$4.00	$3.00	$2.20
Steel & Iron Manufacturing	1.90	1.50	1.00
Building	2.00	1.50	1.00
Stevedoring	4.00	3.00	1.00
Steam Railways	4.50	2.00	1.00
Lumbering, etc.	4.20	4.20	3.80

The cost of administration grows steadily, the ratio of expenses to the total assessments levied being in 1920 8.6 per cent, comparing with 5.76 per cent in 1919, 3.66 per cent in 1918 and 2.58 per cent in 1917. While some growth in this ratio was to be expected the figures of 1920 seem to be excessive.

The investments in the hands of the Board at the end of 1920 total $3,119,026, comparing with $2,233,026 at the end of 1919, all, with the exception of $245,000 of Province of Nova Scotia bonds, being government war-loan securities.

The particnlars of nationalities of injured workmen shows that 4,425 of these out of a total of 4,949, or 90 per cent, were British. This confirms the general belief in Nova Scotia that not more than 10 per cent of the industrial population is non-British. The average age of injured workmen is given as 34 years, with an average weekly wage of $18.57. The nmmber of cases of injury developing sepsis was, in 1919, 122 or 2.6 per cent, which compares with 2.3 per cent in 1918 and only 1.6 per cent in 1917. The increase is in the wrong direction and is rather surprising.

A number of enlargements of the scope of the Act were made in 1920 that will increase the expenditure. Injured persons, from the 1st. of January, 1920, became entitled to free medical aid for a period of thirty days from the date of disability.

The cost of medical aid for the first year was $50,789, but this amount does not represent anything like the full cost of medical aid nnder the Act, as the workmen of the Dominion Coal Company, and of practically all the other coal companies, of the large steel companies, and many other industrial concerns are furnished aid under schemes allowed under the Act. It is stated the medical aid conditions at the coal-mines are not in the opinion of the Board satisfactory, and that conferences are to be held between the operators, the workmen and the Board to formulate new arrangements.

From October 1st, 1920, the allowances to widows and children are increased as follows:

a. Widows from $20 to $30 per month.

b. Children (where there is also a widow) from $5.00 to $7.50 per month.

c. Children (where they are the only dependents) from $10 to $15 per month.

These increases are retroactive, applying to accidents happening in the previous three years and nine months, which necessitated adding a capital snm of $335,748 to the pension reserves, and increased assessment rates in some industries, and prevented their being lowered in others.

The industry where least has been done in the way of accident prevention is the lumbering trade, and the Board signifies its opinion in this respect by the very assessment rate. The Accident Prevention Association is stated to be doing good work, and a snm of $8,320 was expended ont of the Accident Fund in 1920 in forwarding the educational campaign of this Association.

Wages paid in industries coming under the Board totalled $73,000,000 in 1920, some of the chief items being as follows:

Coal Mining	$21,170,000
Steel and Iron Manufacture	9,350,000
Steam Railways	2,090,000
Lumbering and Sawmills	5,800,000
Building (general construct.)	3,570,000

The Board states that it has not incurred or paid one cent for legal fees since the Act came into force.

DOMINION COAL WORKERS' RELIEF ASSOCIATION.

This organization has completed the second year of its existence. It has 6,128 members, an increase of 766 over that of a year ago, and includes 75 per cent of the workmen of the Dominion Coal Company. Receipts for the year were made up as follows:

Members contributions	$83,753
Dominion Coal Company	20,596
Government Nova Scotia	13,546
Interest	4,824
	$122,718

The figures for the year show an excess of income over expenditure and liabilities incurred of about $50,000, and the second year of the Association's life ends with an estimated snrplus, after allowing for incurred liabilities for families of deceased members, of $84,230. Dnring the year, the weekly relief payment was increased from six dollars per week to nine dollars per week for the first six months, from $3.00 per week to

$4.50 for the following six months and from $2.00 to $2.25 per week for the following two years. The revenue of the Association comes from a weekly fee of 25 cents from each member, and a contribution from the Dominion Coal Company of 25 cents per month per member. The Local Government's contribution is based on the quantity of coal raised.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt District.

According to the latest estimates, the mines in the Cobalt district are producing silver at the rate of approximately 6,000,000 ounces a year. In addition to this is about $50,000 a month in cobalt metallics and cobalt oxide. There seems to be fair prospects of this figure being increased, as it is believed the Mining Corporation may make arrangements to resume production. Until official information is forthcoming it will be impossible to include the Mining Corporation in the estimates, and the above figures for the time being remain approximately correct. Should the Mining Corporation get under way, an additional output of silver at the rate of upwards of 1,500,000 ounces of silver annually seems reasonable to expect.

There are approximately four thousand men now employed in the silver and gold-mining industry as found in the district of Temiskaming. An arbitrary division finds about one thousand are employed in the silver mines of which Cobalt employs about seven hundred, while the remaining three thousand are employed in the gold mines. The mines in the Porcupine district are employing about twenty three hundred, while about five hundred are engaged at Kirkland Lake. The Beaverhouse Lake and Larder Lake district account for the balance, and in addition to which are a few men in Skead township and near Matheson.

In all the districts referred to a further increase in the scope of work appears to be assured, while some of the outlying districts promise to become increasingly active. Before the end of the Summer it seems reasonable to expect the total number of men employed in the silver and gold mining industry along the T. & N. O. Ry in the district of Temiskaming will aggregate at least five thousand.

The annual statement of the Trethewey Cobalt will be withheld for a time and will likely be placed in the mail early in June. Unofficial reports tend to indicate favorable results on the Company's Castle property in the Gowganda district. The annual statement is being awaited, however, as it is expected to provide a reasonable means of estimating the measure of success achieved on the enterprise during the past year.

According to telegraphic advice just received from Toronto by the Journal correspondent, the Ontario Government is understood to have passed legislation allowing relief from forfeiture under the Mining Tax Act. It will be recalled that wholesale forfeitures occurred last fall as a consequence of the new Ontario Government enforcing a certain regulation in which all patented mining claims on which a certain tax of five cents an acre had not been paid were forfeited to the Crown. In many cases the claimholders did not know such a tax existed. The Ontario Government came in for very considerable censure and a good deal of injury was done to the mining industry in so much as the impression went abroad that title to land in this province was unstable. In this case, as well as others, the legislation which an amateur government made up of farmer and labor groups enacted has been restrained from providing more than a serious shock and some monetary loss to those engaged in the industry, and the Government has now returned to a more reasonable attitude in allowing themselves to be guided to some extent by those familiar with the mining industry and the manner in which the Mining Act was intended to be administered.

Official announcement is made that the Silver Bullion property in the Gowganda district will be re-opened immediately, and aggressive operations will be carried on. The property has excellent surface showings, and has considerable silver showing underground.

Arrangements have been made to open the Victory Silver Mines, formerly known as the Hylands property, lying in south-eastern Coleman, in the vicinity of the Adanac and Temiskaming. St. Catherine interests are involved. A. Patterson being president and P. E. Hetherington being Sec.-Treas. Work is to be started this week in laying air-pipes, and in pumping out the 200-ft. shaft. J. A. Maevichie, who was connected with the Temiskaming in the early days and more recently with the Cobalt Townsite and the Chambers-Ferland Mines, will be in charge of operations on the Victory. The geology is known to be very similar to the Temiskaming Mine, and encouraging showings of smaltite as well as silver occur on surface.

It is understood that tentative arrangements are being made with a view to re-opening the old Silver Cliff mine by the present owners, one of which is Mr. A. R. Peacock, formerly a partner of the late Andrew Carnegie. The Silver Cliff is known to contain a fair amount of medium-grade ore, and with good prospects of high-grade shoots being found.

At the fifth level of the Bailey Silver Mines, a raise has been put up into the slate formation and a promising vein encountered in which silver values run as high as 1,200 ounces to the ton. In the meantime, the vein found at the beginning of the year at the fifth level is being drifted on with very favorable results. Also, at the fourth level the Big Pete vein has been encountered and is being drifted on. In the present face of this drift the ore is of good trade. The mine is making regular daily shipments to the Bailey Customs mill.

The recent collapse in the market quotations for shares in the "Atlas" property in the West Shiningtree district is understood to be attributed to one of the "insiders" acting contrary to the procedure the manipulators had planned.

It seems as though arrangements were made to stage a stock play on this property of only prospective merit. It is understood that arrangements were made to give an option on treasury shares at something like 10 cents each to certain New York brokers. The option is understood to have also carried several hundred thousand shares at 5 cents each as well as a bonus of 100,000 shares, making the average cost of Atlas shares about 10 cents each to the brokers. All seems to have gone merrily for a time, and the stock soared. Of a sudden however things began to happen and the bottom went out of the market. It appears that as soon as the brokers had completed their plans to make a market one of the "insiders" whose name is well known in promotion circles endeavored to sell a large amount of his stock, thereby causing a collapse.

Conferences have been held, and the "bolter" is expected to be eliminated from the scheme.

Assessment Work Regulations.

In the Act to amend the Mining Act of Ontario

which passed its second reading some time ago, two very important changes are noted. One of these has to do with enlarging the authority of the Mining Commissioner so as to permit this official to deal with all mining disputes whether involving patented or unpatented mining claims. Heretofore, the Commissioner was permitted to only deal with unpatented claims.

The other amendment of importance has to do with the amount of assessment work and allows a longer period in which the work is required to be done. The intent of this amendment has been endorsed by those vitally interested, but the manner in which the amendments appear on the statutes is so ambiguous and in fact so erroneous as to came alarm over the great likelihood of serious diffieulties arising unless the Minister of Mines immediately passes an Order-in-Counеil to remedy the matter.

Heretofore, the Mining Act required a total of 260 days' assessment work to be performed within three years and three months after the date of recording a mining claim. The new amendment to the Act aimed to modify this, and reads as follows:—

Section Two, sub-section One.

"The recorded holder of a mining claim heretofore or hereafter recorded shall, *within five years* immediately following the recording thereof, perform or cause to be performed thereon, work which shall consist of stripping or opening-up mines, sinking shafts or other actual mining operations to the extent of 200 days' work of not less than eight hours per day, which work shall be performed as follows: At least 30 days' work within THREE MONTHS immediately following the recording of the claim, and not less than 40 days in each of the remaining FOUR YEARS, provided that in any one of the said five years 10 days additional work shall be done to make up the total of 200 days."

Just how the first three months, and the following four years are to make up the total of five years is difficult to figure out.

The amendment under section 13 contains the following:

"The application for a patent or lease shall be made to the Recorder within one year from the date before which all work on a mining claim is required to be performed."

It is obvious that a full five years within which to perform the total of 200 days' work is intended, but under the wording of the amendment, all but 10 days work would of necessity have to be performed within four years and three months.

Temiskaming Prospectors.

At a well-attended regular monthly meeting of the Temiskaming Prospectors' Assoeiation, considerable important business was dealt with. Among other things, it was decided to open an office this week in Haileybury in which to provide facilities for attending to the business of the assoeiation.

It was decided to defer action for a time on the objectionable features which certain of the members believe are contained in the bill in Parliament to lend exceedingly wide powers to professional mining engineers.

In connection with other vital matters to the prospectors, the following resolution was passed:—

"1.—That this Association request the Minister of Mines to amend the Mining Act to the effeet, that work performed by prospectors between the dates of staking and recording be accepted as regular assessment work.

"2.—That no timber be sold off mining claims between the date of staking and time of granting of patent, and that all timber then becomes the property of the patentee.

"3.—That the discovery clause in the Mining Act be struck out and that prospectors be granted claim upon making application for mining land.

"4.—That the Minister of Mines be requested to use his influence with the T. & N. O. Commission, to procure for bonafide prospectors, who are members of this Association, special reduced passenger-rates over the lines of the T. & N. O. Railway.

"5.—That the Minister of Mines be requested to use his influence with the T. & N. O. Commission to procure, for prospectors, a reasonable freight-rate for small quantities of explosives between different points on lines of the T. & N. O. Railway, at regular intervals."

THE GOLD MINES.

The Porcupine District.

One of the outstanding developments in connection with the mining industry in the Porcupine gold area has to do with an application made by the Hollinger Consolidated Gold Mines for the right to harness Kettle Falls on the Abitibi river, about 25 miles north from Cochrane. The application has been before Premier Drury, and it is believed will be considered favorably. The Government, it is understood, will reserve 10,000 h. p. for its own use should such be required at any future date. This would leave about 25,000 h. p. available for industrial use. It is not known whether or not the Hollinger intends to proceed at once with the development of this power, but the application is believed to be significant. Heretofore the company in common with the other mines in the Porcupine field has secured its hydro-electric energy from the Northern Canada Power Company, which concern is understood to have contracts with all the mines. This concern is also understood to be increasing its water storage so as to minimize the danger of another shortage during the coming winter. Everything considered, therefore, it would appear as though adequate arrangements will be made to assure a full supply of power for the mining industry in that district.

In response to an offer to purchase the 475,000 treasury shares of the Porcupine V. N. T. Mines at a price well in advance of the present quotation on the open market, an official of that company expressed the opinion that a price of less than 40 cents a share would not be acceptable, and that in his opinion the treasury stock should not be sold at less than par value of one dollar per share. In view of the competition which appears to be developing in connection with a bid to secure a large block of this stock, it is believed quite probable the Porcupine V. N. T. Mines will experience no diffieulty in getting under way within a reasonably short time. The property lies right against the Hollinger and has a series of streng veins which are well mineralized. Official figures show values to be increasing with depth, and on one vein opened to a depth of 600 feet the gold content is $11.50 a ton across a width of twelve feet.

Work on the Allied Porcupine Mines will be on a quite extensive scale. This is a consolidation of the La Palm and the Three Nations properties as well as some other adjoining claims. It is reported unofficially in South Porcupine that Capt. Anchor, formerly identified with the Dome Extension will have charge of the work.

A claim, situated adjacent to the Tommy Burns property in Shaw township has been optioned from Fred

Croteau and J. J. St. Paul to Major B. Harrison on behalf of New York interests.

It is reported in Matheson that a quite comprehensive scheme of exploration and development work will be carried out this year on the Cartwright Gold Mines, some twelve miles east of Matheson.

Kirkland Lake District.

Vein No. 2 has been cut at the 600-ft. level of the Lake Shore Mine. Last week the Journal carried an account of value No. 1 being opened up at this depth, and the opening of No. 2 having just commenced at that time. It is now learned that No. 2 vein is exceptionally rich where opened up and this gives the Lake Shore two large and very high-grade ore bodies to develop at the 600-ft level. By reason of these favorable results the company will now immediately enlarge its 60-ton mill to 100 tons daily. Furthermore, just as soon as the requisite amount of development work is done, the question of installing a much larger plant will be taken up.

It is learned on good authority that the bond holders of the Teck-Hughes Gold Mines intend to be reasonable, and an adjustment of the financial affairs of this company is probable at a very early date. The physical condition of the mine has greatly improved and the work is highly efficient. The enterprise is now on a profitable basis of operation and a good future seems to be assured.

A deal for the Kirkland Townsite property is being negotiated and the indications appear to be that this property will be under operation within the next few weeks. The claims lie adjacent to the Wright-Hargraves Mines.

The Kirkland Lake Proprietary has established its main office at the Tough-Oakes Mine, having formerly been located at the Chambers-Ferland mine at Cobalt. This concern is gradually shaping its course and the mine will be under operation on a quite large scale before the end of this month. It is hoped to have sufficient ore developed to re-open and operate the mill at full capacity by late summer.

At the 100-ft. level of the King-Kirkland Gold Mines, drifting operations have opened up additional ore. The pay streak is about fifteen inches in width and the values range from $10 to $25 a ton. This is regarded as excellent encouragement at this early stage of exploration.

The directors of the Miller Independence Mines have decided to make a bond issue of $50,000, maturing in three years and carrying 8 p.c. interest. The company has placed 150,000 shares aside in its treasury and gives the purchasers of bonds the right to exchange bonds for this stock, at any times before maturity, on the basis of three shares for each dollar held in bonds. By this method it is planned to finance the carrying on of extensive diamond drilling operations and complete the general scheme of exploration underground.

MONTREAL METAL QUOTATIONS

Following are fair average prices for ingot metals (in less than car loads) at Montreal:

	May 5	May 12
Copper, Electro	17½	17½
Copper, Casting	17	17¼
Tin	38	39
Lead	6¾	7
Zinc	7¾	8
Aluminium	31	33

TORONTO COAL PRICES

Toronto, May 11. Demand for coal is picking up a little but generally speaking, the soft coal situation is about the same. The number of idle cars is being considerably lessened and railway earnings are increasing, all of which would appear to indicate that business is improving somewhat. The anthracite situation is described as "tight." It is difficult to obtain stove coal and large tonnages of anthracite have been started to the Lakes which cuts this market off to some extent. Consumers of anthracite are taking hold in better shape in the cities and coal for next Winter's consumption is now being put in freely. The prices in the bituminous market depend largely on the grade of coal. Slack can be bought for from $5.75 to $6.75, lump $5.75 to $6.75, lump $7.50 to $8.00, Toronto, Canadian funds. Standard mine run is $7.50 to $7.75.

British Columbia Notes

THE METAL MINES.

A considerable section of the Clinton Mining Division of British Columbia, known to contain iron ore deposits of importance, was placed under reserve by the Provincial Government about a year ago, it being thought that investigation might prove that deposits could be made to play a vital part in the development of an iron and steel industry.

This reservation was removed recently on the recommendation of Hon. Wm. Sloan, Minister of Mines, the report of Wm. M. Brewer, government mining engineer made in 1919, after a brief and superficial examination—one more thorough being impossible because of the lateness of the season and lack of facilities,—having failed to receive the substantiation of F. J. Crossland, a mining engineer of Vancouver B. C., who went into the district last Summer. He was properly outfitted, made an early start, and so was able to prospect all the limonite occurrences and to furnish what may be accepted as a good approximation of the tonnage available.

Mr. Crossland's report deals with an area of fifteen square miles of the upper part of Taseko Valley. He finds the ore is a secondary limonite and that it occurs as surface deposits following the present contour of the ground. The deposits are patchy and vary from one foot to five feet in thickness. Eight widely separate deposits are described. The McClure Mountain deposit is referred to as one of the chief among those of appreciable size. It contains nearly half a million tons of "positive ore." Whale Mountain contains half a million tons of "probable ore". The total of "positive ore" in eight deposits is placed at 672,741 tons and "probable ore" at 911,250 tons. The ore is homogeneous and is a good grade of iron ore, averaging 50 per cent iron with no impurities that would affect its value as a supply for blast furnaces. The deposits consist of a number of widely separated aggregates.

While Mr. Crossland was proceeding with his work a party headed by Mr. Mackenzie, of the Canadian Geological Survey Branch, Ottawa, was engaged in making an investigation on behalf of the Ottawa Department of Mines. This party took up both geological and topographical work and Mr. Mackenzie's report is being anticipated with considerable interest.

It would appear from Mr. Crossland's report that the ore tonnage of the area placed under reserve is not sufficient to warrant the installation of the equipment necessary to mine out the ore beds. The scattered nature of the deposits, and the difficulties of transportation, are factors that make their economic exploitation impracticable at present.

The "bona fide mineral prospector" is to be assisted by the provincial government to obtain cheap powder for the development of mineral properties. At the last session of the legislature $10,000 was voted for this purpose and Hon. Wm. Sloan, the Minister, has approved of regulations to govern the distribution of this fund. Twenty-five per cent of the legitimate cost of the powder at the point of purchase is to be granted in the form of a rebate. Applicants must prove to the satisfaction of a Mining Recorder or a Mining Engineer employed by the government that they are "bona fide mineral prospectors". Rebates will be allowed on a basis of not more than ten cases of powder to each applicant in one year, except where "exceptional circumstances" are proven and on the "written recommendation of the Resident Engineer of the Department of Mines." Applicants are required to sign declarations, upon forms supplied by the Department of Mines, setting out the legal definition of the ground on which powder has been used and the number of cases of explosives actually used in prospecting such ground and an invoice of the powder purchased must be furnished. To make the conditions clear: if powder is bought in centres where it is comparatively cheap, the rebate or subsidy will be based on such cost; if it be bought at outlying points at a higher price the percentage will be figured on the higher cost. This is considered to be more of an advantage to the prospector than would be a straight rebate per case of powder.

Without a profitable market for their products the mines of the eastern districts of British Columbia are going through a period of gloom. There are properties in the Slocan and other sections of the Province that have not shipped for a year and on the dumps of which is stacked ore which, under normal conditions, would be bringing satisfactory returns. Every cloud is said to have its silver lining and the warm glow in this case is the change of attitude of the metal miner and the working man.

Not long ago the operators of the Slocan were in the throes of a strike called by the organization known as the One Big Union, an organization of the same stripe as the Industrial Workers of the World. The mine owners, although the market permitted operation if there were no unreasonable increase in costs, vigorously combatted those responsible for the demands made upon their resources. Thus they lost a season of fair weather in world conditions. When they had succeeded in overcoming the menace of the One Big Union it was found that the general slump in metal quotations, which has ever since been in effect, had developed.

In May, 1920, an agreement was entered into between the Mine Operators of the Slocan and the International Union of Mine, Mill and Smelters Workers of America and Slocan Lake Union, No. 98. This provided for a generous scale of wages, miners receiving $5.75 per day, muckers, $5.25, timber-men, $6.25, timber-men's helpers, $5.75, blacksmiths, $6.25; blacksmith's helpers, $5.75; carpenters, $6.75 and so forth. A uniform rate of $1.50 per day was fixed as the company charge for board and lodging.

A clause of this agreement of exceptional interest reads as follows:

"In-so-far as practicable workers seeking employment shall be hired through the nearest local branch of the International Union of Mine, Mill & Smelter Workers, the Mining Companies through their representatives and foremen, however, reserving the right to hire any person holding membership in the I. U. of M. M. & S. W., or desirable persons who are not members of the I. W. W. or O. B. U. In every instance workmen holding membership in the I.W.W.—O.B.U., or any other labor organization not eligible to membership in the American Federation of Labor, shall renounce their allegiance thereto and, as evidence of such renunciation, hand over their membership card therein and agree not to be come members of any of the said labor organizations while in the employ of the

Company. The mining companies agree to afford every facility to organizers or agents of the I. U. of M. M. & S. W. for the enrollment of men in their employ.

Last month (April) the companies of the Slocan came to the conclusion that it would be impossible to pay the scale of wages quoted and continue the working of the mines. As a matter of fact most already had closed down because of the lack of market but it was thought that, if the men would express willingness to take a smaller wage, it might be possible to obtain capital to proceed with development, pending the improvement of outside conditions. Accordingly a conference was called and was held on the 25th and 26th of the month at New Denver, B. C.. Representatives of most of the well-known mines of the Slocan, which include the Bosun, the Rosebury-Surprise, and the Rambler-Cariboo, were present. There also were in attendance delegates representing the International and the Local Unions as well as Mr. J. D. McNiven, Deputy Minister of Labor for the Province.

The decision reached was that there should be a general cut in wages of $1.25 per day, this to be contingent on the men accepting the proposal by vote. At the time of writing, the result of the voting had not been heard but there is authoratively said to be no doubt that the miners and workmen will endorse the arrangement. Thus the future scale of the Slocan will be that quoted as having been arrived at under the contract of May, 1920, less $1.25 per day. On their part the Employers have undertaken to reduce the cost per day of board of lodging from $1.50 to $1.25, so that the total reduction in wages really amounts to $1.00. With the approval of the new scale the rate of wages paid metal miners, muckers, artizans and their helpers in the mining districts of British Columbia will be uniform. What the Slocan metal miners and their co-workers apparently are willing to take is what their fellows in the Consolidated Mining & Smelting Co.'s employ are getting and is what is recognized in other parts of the Kootenays.

A tribute is paid to the Provincial Department of Labor in the agreement being discussed in that it is provided that if, in the quarterly conferences arranged to take place between employer and employees, there should develop differences that threaten to be serious the department's representative, Mr McNiven, shall be called upon to act as mediator in the settlement of such misunderstanding.

Dawson, Y. T.—Reports of the richness of the Mayo Silver Camp continue to be received, the latest being that a nine-foot vein has been struck on the Rico Claim, Keno Hill. This deposit is said to be made up of two feet of high grade galena, giving assay returns of approximately $200 a ton, while the remainder is carbonates quite as rich

---

Stewart, B.C.—Work of clearing the right of way for the aerial tramway that will connect the Premier Mine, Salmon River, with tidewater is making good headway. Separate contracts have been let for practically every mile of the 11½ miles, with the idea of speeding its completion. The sites of the towers have not yet been chosen but will be soon when the work of construction will start. The winter trail has softened, which has slowed down shipment of ore.

Some high-grade silver-bearing ore is being rawhided from the Silverado Property located last year and situated on the mountain side about the mouth of Bear River.

Parties of prospectors already are preparing to scatter through the hills back of Portland Canal. Some are setting their steps for the promising country lying further north and known as the Unuk River section.

Alice Arm, B.C.—The situation in this mining community, like that in most of those of a similar character all through America, is at present not too bright. There is some doubt expressed as to the plans of the Dolly Varden Mines Ltd. this Summer. With the silver market at a low ebb and mining costs comparatively little reduced it seems problematical whether the operation of the mine could be made profitable. However nothing certain will be known until the return of A. J. T. Taylor, the president of the Company, from England. Even if no shipping is done it is possible that development will be proceeded with on a considerable scale which would relieve what unemployment there is. In any event, with the opening of the season, there will be many prospectors in the district, development will be undertaken on some of the claims located on the Kitsault and Illiance Rivers, and assessment work must be done on all, so that in a few weeks there will be renewed activity even if there is no marked improvement in the market conditions. Meanwhile some relief has been afforded by the initiation of government road work.

Prince Rupert, B.C.: Shuttle Island, a small member of the Queen Charlotte Group, is witnessing some gold mine development that may become important. Gold was discovered on the beach here in 1918 by workmen engaged in getting out spruce for aeroplane construction. Claims were staked in considerable numbers wherever quartz-veins outcropped. The Ellen Group Gold Mining Company has been opening up one of these properties. They are on one small vein, five inches wide, assaying from $1,100 to over $1,400 in free-milling gold. Another vein, eight inches wide has been located in a quartz ledge, the returns, from which are fully as high. Some very fine nuggets have been found on the beach, doubtless, having been dislodged from the vein outcrops by the wash of the sea.

Nelson, B.C.—The Florence Silver Mining Co., Ainsworth Mining Division, is proceeding with development and piling up some clean ore and concentrate for shipment at some more propitious time. There now are on hand some 500 tons worth, at last year's prices, about $90 per ton. The work of late has had most satisfactory results and it is stated that the property looks as well now as at any time in its history. The vein being prospected is six feet wide between well defined walls and carries as much as three feet of clean galena ore

---

Anyox, B.C.—The Granby Consolidated Mining & Smelting Co. treated 200,000 tons more ore in 1920 than in 1919, when operations were hampered by fire and labor troubles. Silver production was increased by 100,000 oz. and copper by 5,500,000 lbs.

Quesnel, B.C.—Placer mining, dredging, hydraulicking, as well as individual, is to take on a new lease of life in the Cariboo judging from reports from that section. Operations are to start on most of the old workings, and on many new ones, as soon as the weather permits. The California-Cariboo Gold Dredging Co., who hold dredging leases on the Cottonwood river, propose shipping in a drill for prospecting purposes.

Cranbrook, B. C.—British Columbia is rich in undeveloped talc properties. For some time there has been a property under development, from which shipments have been made, in the Leach River section, Vancouver Island. There are claims containing the mineral in large quantities and of good quality on the line of the Pacific Great Eastern Ry., near Anderson Lake. Others are to be found in the northern interior. None however, has been worked on a large scale not because of any problem as to mining but no doubt by reason of the joint difficulties of transportation and market. Now comes the announcement that the Fox Talc Property, situated in the Upper Columbia River Valley, has been optioned and that it is the intention to open it up and that plans have been formulated for the marketing of the product. If this is so it is possible that the foundations will be laid for an industry of importance.

Trail, B.C.—The Trail Smelter of the Canadian Consolidated Mining & Smelting Co. received 9,977 tons of ore for treatment during the week ending April 14th. Of this 9,840 tons were from the company's properties. The Blue Bell Mine at Riondel contributed 137 tons. Shipments to Trail thus far this year total 128,038 tons.

Ashcroft, B.C.—The recent discovery of gold near Spences Bridge in the Thompson River Valley has directed attention to the possibilities of mining development. The difficulty of obtaining water in quantity is likely to preclude operations unless backed by considerable capital. Meanwhile the entire alluvial deposit of the section, and a large part of the hillside, has been staked, the latter locations having been made with the idea that some of the quartz outcroppings contain the motherlode. Some development of single claims by individuals is underway and it is reported that good returns are being obtained. Some fine nuggets have been found and single pans are returning as much as 50 cents. The first evidence of larger scale work is the formation of the Hellsgate Mining Company to open up a number of the claims.

Vancouver, B.C.—Interesting figures have been issued recently regarding the business of the Dominion of Canada Assay Office at Vancouver. These show that in 1918 it handled gold bullion to the value of $4,099,595 while last year the total only reached $2,499,174. For the three months ending March, 1921, $394,244 was received as compared with $254,234 for the same period in 1920. While the prospects are that the aggregate for 1921 will be well over that of the previous year it is held that, if all the gold produced by the ores of this Province went through Vancouver, the amount would be much greater. At present large quantities of gold-bearing ore or concentrates leaves the province to be smelted or refined. Some British Columbia properties which produce gold in appreciable quantities, and send it to the United States in ore or in concentrates to be added to the gold reserve of that country, are the Premier, the Hidden Creek Mines of the Granby Consolidated, the Belmont Surf Inlet Mines Ltd. and the Britannia Mines. It it were possible to keep this precious metal in Canada there is no doubt that the receipts of the Vancouver Office would be largely increased, as is illustrated by the effect of the recent renewal on a more extended scale of bullion shipments from the Trail Smelter. Dominion officials, however, declare that the decline in gold production is serious in the United States as compared with the situation in Canada. They state that, while British Columbia's output has declined, the net Canadian production has increased and, from indications, will make rapid strides this year.

Dr. M. Y. Williams, has been appointed to lead a party of fifteen into the Mackenzie River District this summer, on behalf of the Canadian Geological Survey. He and his associates will be engaged in a geological survey of the region. They will leave Edmonton on the 15th of May. There are to be three other parties from the Canadian Geological Branch in this country during the open season, one of which will be headed by Fred V. Seibert who is to make a topographical survey of the Mackenzie River oil district. J. A. McElhanney, assistant controller of surveys, is in Edmonton arranging for the season's work.

Victoria, B.C.—D. C. Coleman, vice president of the Canadian Pacific Ry. Co., when on the Coast recently informed Wm. Sloan, Minister of Mines, that a substantial sum had been appropriated for the prosecution of a thorough mineral survey of the Esquimalt & Nanaimo Ry. Belt, Vancouver Island. Messrs. Archibald and Kilburn of the staff of the Canadian Consolidated Mining and Smelting Co. Ltd., are understood to be already making their plans for the season's work. This survey is the outcome of the provincial government's efforts to bring all the minerals in this section under the control of the Province. Under present conditions it is under the joint administration of the railway and the government by virtue of the terms of a subsidy grant made to the E. & N. Ry. Co. some seventy five years ago. The old saw that no one can serve two masters applies here, for the prospectors and mine operators have found it so difficult to obtain title and to work properties within the limits of this belt that development has been seriously hampered. The Company has agreed to the survey with a view to obtaining some idea of the mineral wealth of its Island holdings, in order that negotiations directed towards sole provincial control may be continued intelligently and to a satisfactory conclusion.

THE COAL MINES.

The Coal Inquiry, ordered by the Provincial Government of British Columbia to ascertain why coal costs the consumer in the Province so much more now than it did a few years ago, is at an end. Witnesses representing the coal companies, the coal distributors, the general public, as well as some outside engineers, were examined. The books of the Canadian Collieries (D) Ltd. and the Canadian Western Fuel Company were thrown open to the chartered accountants appointed by the Commissioner and the costs of those in control of the dealers' end of the business in Vancouver and Victoria were closely scrutinized.

This investigation was granted after sustained agitation centering chiefly in the City of Vancouver. It

was backed up by the City Council of that City. It will, there is no doubt, cost the ratepayers of the province a considerable sum. What results will be achieved remains to be seen. The reports of the Commisioner, the coal mining engineer chosen to conduct the technical side of the inquiry, and the chartered accountant, have not yet been released by the Minister of Mines. But from all reports, it is not likely that much new light will be thrown on the British Columbian's problem of obtaining cheaper coal. F. T. Congdon, counsel for the public, voiced public sentiment when he observed that it seemed absurd that, with coal in quantities short distances from the centres of population, it should cost $15 a ton. The cost sheets of the operators and the dealers, sworn to by responsible businessmen and apparently unshaken by competent rebuttal evidence, justify the prevailing conditions. Mr. Congdon further gave expression to an acknowledged fact when he said that, with the millions of tons of coal waiting development in old and new fields, British Columbia's industrial future was assured if it could be got to tidewater in quantity and made available for sale at reasonable rates. There is no reason why the coal of the Province should not be so developed sometime but the cost of mining, it would seem, must be reduced and transportation facilities improved before that time arrives.

Mr. Congdon, as a result of his activities before the Coal Commission, has been able to make a number of interesting recommendations relative to the coal business of the Province, which are appended:

1. Abolish the use of the long ton.

2. Require coal operators to furnish monthly returns of operating costs and sales realizations of their several mines.

3. Dealers should be licensed, not for revenue, but to comply with conditions contained in the license safeguarding the public.

4. Consideration of feasibility of collection of stores of coal during the Summer.

5. Tests should be made and published showing the analyses and characteristics of coal from all provincial mines.

6. Dealers should be required to issue regular lists setting forth the different grades of coal, tests relating to them and the uses to which different grades of coal may be best applied, with prices.

7. Consideration of appointment of a fair weights-and-measures officer for the Province and his supervision over similar civic officers and jurisdiction as to grades.

8. Supervision of construction of buildings might include regard to convenience for accepting coal and wood in bulk.

9. Combines which keep up the price of coal should be dissolved and the offenders punished.

10. An enactment to compel operators to furnish coal to any person demanding a quantity not less than one carload of forty tons.

11. Study should be given to the question of introducing uses of coal that would obviate the waste of by-products and the public nuisances now suffered.

12. Consideration of the use of pulverized coal and establishment of central plants for its production, and automatic stokers.

13. Encouragement of interior (British Columbia) mines, which can produce coal at low operating costs and can place it on the market at low cost if railway rates are made reasonable, and endeavor to secure reduction of railway rates.

The coal output of the Nicola-Princeton Fields of British Columbia is to be materially increased. There is no doubt that the production of the Coalmont Collieries will be much greater in the early future than is now the case. The Princeton Coal and Land Co. is proceeding with development and work is either underway or planned in other parts of the district. Regarding the last-mentioned Company most of the damage caused by the recent fire has been repaired, the new tipple again being in shape for work. The old workings of the property have been abandoned temporarily and workings opened up elsewhere. The latter are being driven in a south and slightly westerly direction from the main slope, following the dip of the coal, which varies from 12 to 15 degrees.

The White Lake Collieries have been incorporated with a capitalization of $400,000 to develop some 3,000 acres of coal lands in the vicinity of West Summerland. Slopes are being driven and three seams, described as a first-class blacksmith and steam coal, are being opened up. The output is very limited as yet but will be augmented when the plant has been completely installed. It is the intention to haul the product to Penticton for use on the C. P. R. lake steamers.

Alexander Sharp, a prominent mining engineer of British Columbia, member of the Canadian Mining Institute, and particularly well-known because of his knowledge of coal-mining conditions in western Canada, has died at Vancouver after a long illness. In the course of a long residence he has been identified with most phases of mining development in this Province and was highly respected.

LATE AMBROSE MONELL.

Word reached Toronto last week of the death in New York of Mr. Ambrose Monell, who for some years has occupied a conspicuous position in financial affairs in Canada and the United States, and whose death has caused general regret among his business associates. The late Mr. Monell was the first president of the International Nickel Company and it is the testimony of Toronto officials of the company that under his regime as chief executive the company achieved a dominant place in the nickel industry of the world. The International Nickel Company was formed in 1901 and it took over as a subsidiary the old Canada Copper Company which had been operating since 1887. Development and expansion rapidly took place until by 1905 the Ontario production of the company, together with that of the Mond Nickel Company outstripped that of New Caledonia. Mr. Monell was 29 years of age when he was called to the presidency of the International Nickel Company, following a thorough grounding in the steel industry in the United States. He brought a wealth of native ability to the task of developing and furthering the company's interests and his subsequent career of a successful administration proved him to be a great organizer and executive. It required much faith and money to break into the then new Porcupine field because Hollinger at that time was not looked upon as a world beater, but it was the late Mr. Monell who took the first option on the Dome Mines property and played no small part in its development and prosperity.

The late Mr. Monell resigned his position as president of the International Nickel Company in 1917, to enter the United States Aviation Corps, he having charge of the aviation program of that country after it entered the war. He went to France with the rank of Colonel. He returned from France suffering from a nervous breakdown and for the past eight months had been in a sanitarium, his condition gradually becoming worse until death came to him at the early age of 48 years.

At the time of his death he was Vice-President of the International Nickel Company, a director of the International Corporation, of Midvale Steel, of the Liberty National Bank, of the Bankers' Trust Company, International Motors, and some other concerns.

Among his achievements is to be mentioned the fact that some years ago while with the United States Steel Corporation he invented the formula for alloying steel known as the Monel process.

He was a graduate of Columbia University, from where he went to the United States Steel Corporation as metallurgical engineer. He was shortly afterwards made assistant to the President, which position he resigned to accept the Presidency of the International Nickel Company when it was formed in 1901.

The late Mr. Monell spent several months in Northern Ontario and British Columbia in search of health and also spent some little time in Toronto. He was a man of great energy and enthusiasm and had the faculty of inspiring his associates with the same qualities that made his own career so successful.

ONTARIO MINING TAX ACT PROVIDES FOR RE-GRADING OF FORFEITED TITLES.
