The development of water powers to meet the needs of mining districts has not lagged far behind development at Northern mines. At Porcupine, there has been some misunderstanding as to the needs of the mining companies and the amount of power which the power companies could supply. Increased requirements and low water supply came together last winter, and the mining companies were forced to curtail production. This curtailment meant, for the mining companies, a very large reduction in profits. It was not surprising, therefore, that two of the mining companies made plans for development of their own water powers. The postponement of this work evidently does not mean that—it will not be undertaken, but it has been taken to indicate that the danger of shortage this winter is not great. The McIntyre statement shows that there is again likely to be a shortage of power which will necessitate the use of auxiliary power at higher cost, and will make rapid expansion of operations inadvisable. The mining companies will be in a better position to meet a water power shortage this winter than they were last year. The managers have given the problem much attention and are, doubtless, armed for trouble. The shareholders can, however, do no harm by praying for rain.

DEFLATION OF LABOR.

Mr. Daniel Guggenheim, questioned as to the copper situation, on his recent return from Europe, stated that there would be no attempt made to increase production until there were more orders in sight. He stated that increased building activity would result in a demand for copper, but that high labor costs were retarding building. He remarked that labor leaders should teach their followers that deflation must take place in wages as well as in prices, or the industrial situation is disarranged and dissatisfaction to all concerned is the result. "Labor is entitled to a higher rate of pay than it had in 1911, but for most occupations a lower rate is necessary to bring wages in line with prices of materials and products."

Mr. Guggenheim is connected with many enterprises and he is opposed to deflation of labor by closing factories and throwing men out of work. He is, however, convinced that production cannot be resumed on a

normal basis until the workers themselves make an effort to meet the situation. Evidently, he finds conditions in the United States and Europe quite similar to those which prevail in Canada.

If the workers in the building trades would accept more reasonable wages there would be much more building going on and the resulting demand for mine products would make more work for miners. The folly of the workers in one industry is unfortunately disastrous to the workers in another industry. Instead of supporting claims for high wages in other lines, leaders of labor must consider whether more reasonable wages would not be better for everyone. The high wage rate is not a benefit to the workman, if he cannot find an employer who can make use of his services.

STAMPS AND BALL MILLS.

That the stamp mill should be eliminated is the opinion expressed by Mr. H. S. Denny in the "South African Mining and Engineering Journal." Mr. Denny has long championed stage crushing and stage grinding. He believes the elimination of the stamp mill would bring within the bounds of commercial possibility many millions of tons of ore that could only be worked at a loss by existing Rand methods.

Mr. Denny would find many here who would agree with him. Ball mills have found favor in Northern Ontario and are found in nearly all new plants. There is difference of opinion as to whether the advantages gained warrant change being made, but the tendency is towards elimination of stamps. As to whether Mr. Denny's opinions regarding the results to be obtained in South Africa are sound or not we do not know; but we do know that ball mills are popular in Northern Ontario.

Questioned concerning the relative merits of the two methods of crushing and grinding, a well known metallurgist remarked that, while the ball mill has many advantages, the stamp mill has advantages that will enable it to retain a position for certain work, despite rude crowding by the hungry and efficient ball mills.

THE TEMISKAMING MINE.

According to the president of the Temiskaming Mining Co., the reopening of the company's silver mine at Cobalt will not be undertaken unless silver commands a considerably higher price than has been obtainable during recent months. This does not mean that the mine will not again be a producer, for there are indications that better prices for silver are already in view, but it means that Temiskaming shareholders must for the present regard their company's shares in the Blue Diamond mine as the chief value behind the Temiskaming shares.

The Temiskaming mine has had a full share of the ins and outs of metal mining. It is now definitely out until the market for silver improves. It is, however, quite likely to be a producer again, if the market continues its present course. It is of less importance to shareholders, however, than is the Blue Diamond coal mine.

THE OUTLOOK FOR SILVER.

The price of silver is always a matter of great importance to companies operating at Cobalt, but at present it is of very vital interest because it shows signs of rising to a point which will make the reopening of more mines possible. It is not easy to obtain facts which allow one to judge of the future behavior of the silver market, or to estimate the importance that should be attached to published opinions. It is worth noting, however, that there has been recently a more cheerful tone in the reports on silver markets and an apparent belief that better prices will prevail.

FILMING THE MINING INDUSTRY.

The U. S. Bureau of Mines has, by co-operating with companies interested in the industry, succeeded in having made a large number of films which picture work in mines and smelters. The Bureau had not the funds for undertaking the task of making the kind of films that were wanted, but succeeded in arranging with operating companies for over $100,000 worth of films during one year.

The Bureau detailed one man to supervise the work. He found a film maker who devised the special apparatus necessary, and named prices for the work proposed. The Bureau then approached mining companies and invited them to have films made. The response was generous and many films have been secured and are used for educational purposes.

In Ontario some good films have been made for mining companies and for the Department of Education. It has been found, however, that the public displays little interest in industrial pictures. The educational value of such pictures can be much increased by weaving a human interest story into the picture. As a background for a story a mine or smelter picture will attract much attention, while without the story it may be quite uninteresting to the average assembly.

EDITORIAL NOTES.

Under the Pittman Act the United States purchases silver from domestic producers at the fixed price of $1 per ounce. Some enterprising individuals have purchased silver in the open market and endeavored to sell it to the Government.

* * *

The plea of Mr. O'Connor for more geological workers in Northern Ontario will meet with approval. The small staff of the Department of Mines does good work, but cannot cover the ground as quickly and thoroughly as the industry demands.

The Outlook For Silver

Silver and its outlook is the subject of an article in a recent issue of the Boston News Bureau, which has this to say on the matter: Silver metal sold last week as high as 65⅜ cents an ounce, as compared with 52⅝ cents, the low point for the year made last March. At current prices, silver is only a few cents below the year's high point of 68⅝ cents reported last January. Opinion in circles, in close touch with the situation, is that silver will advance further. This opinion is based on increased demand from the Far East, to industrial consumption in the United States, to a general improvement in economic conditions, and to operation of the Pittman Act.

The situation in the United States is interesting. With market price for silver around 65 cents an ounce, producers in the United States are selling their output to the director of the mint under the Pittman Act at the fixed price of $1 per ounce. So long as the market price for silver is below the $1 mark, the output of United States mines will go to the government until the requirements of the Pittman Act are completed and consequently the arts and industries are purchasers of foreign silver and the absorption of stocks on hand together with increased shipments to China have forced up the price in recent weeks.

Prior to June, 1920, there was but one quotation on silver, as the price was above $1 per ounce. With trade unsettlement in the Far East and a poor monsoon in India, demand from that quarter fell off while some European countries continued to sell their silver currency in the bullion market. This forced the price below $1 an ounce, and in June, 1920, the government began purchasing silver at the fixed price of $1. Speculators not familiar with the provisions of the Pittman Act shipped silver here which they purchased below the $1 mark, expecting to sell it to the United States government and make an easy profit. Tenders of silver to the government have to be accompanied by affidavits, however, declaring silver to be product of United States mines and smelting plants and the foreign silver consequently was not available for sale to the Treasury.

Since the Pittman purchase clause became effective in June, 1920, the trade movement in silver in the United States has shown a net excess of imports over exports, up to the end of August, 1921, of $12,553,109. Of this total there was an excess of imports in the last seven months of 1920 of $2,632,406, and for the first eight months of 1921 of $9,920,703.

The excess of imports over exports, however, has been below the recent consumption of silver by the arts and manufacturers in the United States in recent years. For 1919, amount of new material consumed by the industries was 26,237,519 ounces, which at the average price prevailing that year had a total value of $29,386,021. Figures for 1920 are not yet available, but they will probably be around the figures for the preceding year.

In addition to the demand from the arts there has been an increase in shipments to China in recent months, as shown in following table:

	July	June	May	April
China. . . .	$1,971,317	$147,825	$291,622	$ 63,376
Hong Kong.	1,376,849	480,130	816,475	424,253

Exports to the Far East the first seven months of this year are considerably below the two preceding years as shown below:

	1921	1920	1919
China	$4,825,983	$49,915,419	$14,057,899
Hong Kong . .	6,511,677	18,698,886	3,400,707
British India . .	1,846,593	223,211	108,273,177

An improvement in industry in China and India will stimulate a demand for silver from that quarter, and this, with the demand for industrial purposes in the United States and other countries, coupled with the fact that the output of the mines in the United States is not a factor, with silver selling below $1 an ounce, is expected to bring about a further advance in the price of the white metal.

PORT ARTHUR NOTES.

By J. J. O'CONNOR.

There has recently been considerable activity displayed in the territory lying south of Ignace, on the Canadian Pacific Railway, by iron ore explorers and Mining Engineers. It is stated that one of these parties, headed by one of the most prominent mining engineers, of Duluth, Minn. was highly pleased with the showings in quality and tonnage, on a property he had under examination in that area. No definite particulars have been given out regarding this deposit, which is said to be of magnetite. A deposit of limonite has been examined by another prominent mining engineer, within the past few days in the same field. No particulars of this deposit are obtainable.

P. E. Hopkins, Geologist of the Department of Mines, Toronto, has paid visits within the past few days, to Silver Islet, Silver Mountain, and to the scene of drilling operation in Paipoonge township, where boring for gas is being carried on by the Nepigon Exploration Company.

Dr. W. L. Tanton, of the Geological Survey, Ottawa, is engaged in mapping the territory between Dog Lake, and Lake Nepigon. This area is practically within sight of Port Arthur, yet very little is known regarding its possibilities either in the way of mineral, or agricultural opportunities. It is fully expected that interesting geological features will be met with in this area.

Julian G. Cross, M.E. is at present engaged in the Schreiber field, examining and reporting on various properties. Continued activity is being shown at the different properties now under development in this area, that give great promise of successful issue.

Shipments of silver to the Far East have been much lower this year than last, but there has been a very notable increase recently.

Rock Strata Gases in Mines

By G. E. McELROY, Mining Engineer, U. S. Bureau of Mines.

The development of certain mines in the East Tintic mining district, Utah, has been hindered considerably by the presence in the rock strata of heavy irrespirable gases which at times flood the lowest working places, as well as by abnormally high rock temperatures in the lower horizons. A study of these features was completed in the spring of this year, and the information obtained is summarized here.

Only four mines have been affected to date by the presence of heavy gas, and only one of these is producing lead-silver ores in quantity. These four embrace a territory extending about three miles north and south and about two miles east and west, while both within and fringing on this territory are a number of prospects which have not been affected.

Thus far no fatalities have resulted from gas inflows, but a number of men have been temporarily overcome, and a few have had narrow escape from death by suffocation. That the record is not more serious is mainly due to the fact that the gas inflow, as a rule is relatively slow, mining operations have been quite carefully conducted, and the presence and extent of a gas inflow can be easily determined by its extinguishing action on the flame of miners' lights.

The affected mines are on or near the crest of a large anticline composed of sedimentaary rocks, almost entirely overlain by lava flows. The sedimentary rocks consist of a great thickness of quartzite separated from overlying limestones of considerable but varying thicknesses by a formation of pyritic shales, 300 to 500 feet thick, containing interbedded limestones.

The Showing on Analysis.

Samples of the heavy gases all showed, on analysis, some oxygen content, attributed to diffusion with mine air. Calculation of the analyses of samples having a low oxygen content to an air-free basis shows that the pure gas is primarily a mixture of carbon dioxide and nitrogen with the carbon dioxide in excess. The gas also contains some sulphur dioxide, sufficient to cause marked irritation of the eyes and nasal passages, and to give it a strong sulphur odor. Air-free calculations for the samples analyzed show that, for the pure gas, the carbon dioxide ranged from 60.7 to 76.7 per cent and the nitrogen from 39.3 to 23.3 per cent, the composition varying as to locality rather than time or other condition. The pure gas is saturated with water vapor, and the temperatures noted, 84 to 110 degrees, corresponded roughly to rock temperatures of the localities where observations were made.

Comparison of the calculated weights of saturated gases with weights of partly saturated air for the range of temperatures, relative humidities and barometric pressures existing in the mine openings, shows that the gas is 1.25 to 1.40 times as heavy as the adjacent air. The difference in weight causes the gas to drop to the floor of openings, where it drains like so much water to the lowest points, and forms accumulations or pools. Diffusion of the gas with the mine air is relatively slow in quiet atmospheres, but increases as the air motion is increased, so that at velocities of several hundred feet per minute and over, diffusion is practically instantaneous during an ordinary inflow.

Oxidation of Sulphides.

The evidence gathered from the mines affected indicates that the heavy gases have resulted from oxidation of sulphides, and confirms the explanation offered by Lindgren and Loughlin in their geological report on the East Tintic district, published as U.S. Geological Survey Professional Paper 107. Oxidation was, and is, extremely rapid, due probably to extreme fineness of the individual grains of sulphide, both in the shale and in the ore bodies. The steps in the formation of the heavy gas were probably as follows: The chemical reactions of oxidation, by removing the oxygen in the available air, produced a residual atmosphere composed of practically pure nitrogen, and generated heat, sulphur dioxide and sulphuric acid. When the acids came in contact with limestone or other carbonates, carbon dioxide was generated, which diffused with the nitrogen and sulphur dioxide. This resulted in the formation of a heavy gas which, on account of its weight, settled down through the porous and shattered quartzite, and now rests presumably on water at an unknown depth. The sulphur dioxide would be continually oxidising and reacting, so that it would ultimately disappear from the gas, leaving carbon dioxide and nitrogen.

The Explanation Deduced.

The following theory has been deduced to explain the mode of occurrence of gas inflows: A decrease in barometric pressure causes an increase in volume, according to the laws of gases, of a large body of gas contained in the quartzite and resting on water at an unknown depth. As the gas body is confined on the sides and bottom, the increase in volume tends to raise the level of the gas. However, since field observations show heavy inflows only from shattered and fissured zones, it is concluded that the rate of penetration of gas into the porous quartzite is so much slower than the rate of increase in volume that the excess is pushed up through the shattered, more or less open, zones that occur in the quartzite. Under certain conditions of rate and amount of decrease of barometric pressure, the gas rises to the levels of mine openings and an inflow of gas results. The upward travel of the gas is limited by the practically impervious shale overlying the quartzite, except where local fissures in the shale provide access to connected fissure zones in the overlying limestones. As the barometric pressure rises, the increase in pressure causes a contraction of the gas body and the level of the gas in the shattered zones recedes.

HOLLINGER INSTALLING ROLLS.

The "Northern Miner" says that Hollinger is installing rolls at the shaft to follow the primary crushing. This will reduce the size of material going to the stamps and enable them to crush a larger tonnage.

Marketing of Alberta Coal

Embodied in the report of the Mines Branch of Alberta, which has recently been issued, are very interesting reports from Mr. Stutchbury, Trade Commissioner, and Mr. L. M. Hyde, Engineer, on their efforts to find markets for Alberta coal.

Mr. Stutchbury says in part:

On my appointment to the position of Trade Commissioner for the Province of Alberta on May 15, 1920, I was instructed to make a study and survey of the possibilities for extending the market of Alberta coal, more particularly in the Province of Manitoba. I immediately proceeded to Winnipeg, and discussed the matter with the Fuel Dealers, Board of Trade, Citizens' League, City and Government officials, and others, for the purpose of ascertaining why so large a tonnage of American coal was purchased by the consumers of coal in Winnipeg and Manitoba.

I found in many quarters a very strong prejudice against western coal among both domestic and steam users. This prejudice was very largely caused through an entire lack of knowledge of the various qualities of coal obtainable in Alberta, and more particularly through lack of proper knowledge of combustion.

Quite a number of people whom I met were of the opinion that all Alberta coal was very low grade lignite, not capable of generating steam, and exceedingly dangerous for household use.

Many people who had used our coal during 1918 when under Federal Fuel Regulations (which made it compulsory to purchase one ton of western coal with each ton of American coal) and not having knowledge of the proper methods of combustion, found Alberta coal unsatisfactory, and reverted to American coal in 1919, when it was again made available.

It was, therefore, deemed advisable to enter into a carefully planned and vigorous campaign of advertising, drawing the attention of the people of Manitoba and Saskatchewan to the enormous coal resources of Alberta, and also to their high combustion qualities. In addition, the consumer was urged to purchase coal during the summer, so as to relieve congestion on the railways during the grain hauling season.

The Citizen's League, Fuel Dealers, and other public bodies in Winnipeg gave their very heartiest support to this campaign, which has resulted in not only breaking down prejudice which was heretofore existing, but also increasing the tonnage into that market very materially.

It is interesting just here to compare the figures of 1917, 1918, 1919 and 1920, of shipments into Manitoba from this field.

In 1917 the tonnage (railway coal not included)	249,872
In 1918 the tonnage (railway coal not included)	511,168

(During 1918 the Federal Government Fuel Controller ordered that the people of Manitoba must purchase one ton of western coal for every ton of American coal they desired).

1919 . . . . . 314,290 tons

(The compulsory order was off during this year and no educational campaign had been carried on).

1920 . . . . . 600,962 tons

(This was not on a forced market but is the result of educational campaign and shows a satisfactory increase).

It quite early developed while in Winnipeg that there was not a complete understanding between the fuel dealers and the coal operators of this Province, and a convention of the dealers of the three western provinces was called to meet with the operators for a full and frank discussion of the coal trade and its possibilities for development. The convention was held in the City of Calgary on August 19 and 20, and was most successful, a very representative gathering of both dealers and operators. The discussion was very free, frank, and entirely harmonious, and I believe the meeting resulted in the establishment of a much more complete understanding between the fuel-dealers and the operators.

Both dealers and operators expressed their appreciation of the Government for what it was trying to do, and this expression was moved by Mr. L. E. Drummond, of Edmonton, in the following resolution:

"This Convention of coal-dealers of the three western provinces, meeting with the Alberta operators, wish to place on record its appreciation of the Alberta Government and the Hon. J. L. Cote, Minister in charge of the Mines Branch, for the calling of this convention and for their efforts in extending the market for Alberta coal also for the research programme which is now being conducted on western coal."

Mr. Whiteside, President of the Western Coal Operators' Association, in seconding the resolution, stated that while the operations of the Government were comparatively recent, the results so far obtained had been beyond their expectations, and agreed with Mr. King of Winnipeg (a previous speaker) that actual demonstration, coupled with newspaper advertising, would do a great deal to overcome the prejudice in the minds of Manitoba consumers.

Mr. M. L. Hyde was appointed as Resident Combustion Engineer, in Winnipeg, during the month of August, and his services were placed by the Government at the disposal of both the Fuel-dealers' Association and the consuming public. Mr. Hyde, since that time, has been very active in attending to various calls that have been made on him, and has visited and worked with a very large number of the Plant Engineers, and established a personal contact between the Engineers and the Government such as would not have been possible in any other circumstance.

About October 1 a Fuel Demonstration Plant was opened at 277 Smith Street, right in the heart of the business district. Public demonstrations are held daily, demonstrating proper methods of firing Alberta coal. These demonstrations have been popular and largely attended, and very much good has resulted.

For the further direct education of the consumer, there have been published and distributed a bulletin on combustion and three illustrated cards for domestic coal-users and janitors, giving simple and explicit instructions as to the proper methods of burning Alberta coals. Enquiries for this literature have been received from all parts of Canada, and even from the Border States.

During the month of September, exhaustive tests were made in the Central Heating Plant of the Manitoba Government. These tests were in competition with

Youghigheny coal from Pennsylvania. The results were very highly satisfactory for Alberta coal.

After the tests were completed, a meeting of the Chief Operating Engineers of Winnipeg was called. This meeting was held in the Fort Garry Hotel, and 103 Engineers were present. Addresses were given by the visiting Engineers from Alberta, and a round table conference ensued. The interest was such that the meeting lasted until almost midnight, and gave the Government, through the Trade Commissioner, a very fine opportunity of personally discussing the various problems with the men who are directly responsible for the purchase of coal.

Many enquiries have been received this year from Ontario and Quebec relative to the shipping of Alberta coal to far east points, but so far the freight rates have been prohibitive for this field. It is interesting to note, however, that there have been shipped into Ontario almost 14,000 tons since June. There is no doubt that a very large market east of Great Lakes would be developed for our higher grade coals if a reasonable freight rate could be secured.

The policy of this Department has been to develop, as far as possible, geographic markets, and to that end a study was made of the possibilities for shipping coal into British Columbia.

In a recent trip to Prince Rupert it was found that a very large tonnage could be developed along the line between Edson and Prince Rupert and the coast plants, both mining and fishing, off the coast from Prince Rupert.

A conference was held with Mr. A. E. Warren, General Manager of the Canadian National Railways, with a view to having bunkering facilities placed at Prince Rupert, and a promise from him was received that such would be done.

The matter of special freight rates for coast points is now under advisement.

The development of the industry this year has more than proven the importance of an educational and publicity campaign as the following figures will show:

The production of coal for 1919 was 5,022,412 tons and for 1920, 6,908,923 tons; which is an increase over 1919 of 1,886,511 tons.

Mr. M. L. Hyde says in part:

Appreciating the opening offered Canadian coals due to the American fuel shortage and prevailing high prices, the Province of Alberta started a preliminary advertising campaign as early as 1917. Results were so gratifying that in the spring of 1920 educational as well as advertising work was undertaken. In August of that year, the writer was appointed to act as Combustion Engineer, with headquarters at Winnipeg. His instructions were to work through and in harmony with the Winnipeg Retail Coal Dealers' Association, and to educate both the domestic and steam coal-buyer in the use of Alberta coals.

Up to as recent a date as 1917, Manitoba had used practically no domestic fuel other than Anthracite, Coke, and a very inconsiderable amount of Souris coal.

In order that the difficulties encountered in winning this market for our domestic coals may be better appreciated, it will be of interest to know just what this competition represented.

American Anthracite, or hard coal, as sold in Winnipeg, averages 12 per cent. ash. It burns slowly, in a glowing mass of great heat and without flame or smoke. While hard to ignite, it holds fire over long periods, is dustless, and has practically no breakage in handling. It will hold fire for a given length of time in a similar fire-pot than can be used for any other type of fuel, and the majority of the earlier types of house-heaters were designed and rated for its use.

The coke sold in Winnipeg comes from gas retorts operated by the Winnipeg Electric Railway Company, and is made from American Youhikheny Gas Coal. It carries about 10 per cent. ash, and has very much the same burning characteristics as Anthracite, except that a larger fire pot is required, owing to its bulkiness. About 60,000 tons are imported each year for coking.

Souris is a low grade lignite, mined in southern Saskatchewan. It is sold on a price basis only, and offers no serious competition.

Hand-firing Alberta coal calls for an entirely different process from that used with anthracite or coke. In order to educate the public in the shortest possible period of time, a demonstration room was opened in October, in the heart of the shopping district. Five representative types of heaters were installed, with a practical demonstrator on the floor to fire them. Bins, with samples of all representatives domestic coals, and signs, giving their relative values, were also put in. A strong advertising campaign is used to keep up public interest, and excellent results were obtained. Each visitor is given a practical lesson in firing his particular type of furnace, also a card of instructions to be hung in his basement.

Winnipeg dealers are unanimous in their praise of the work accomplished by this demonstration. If maintained, there is small doubt but that our domestic coals will hold a good portion of the Winnipeg market permanently.

Western Domestic Coal Operators are to be congratulated on the hearty co-operation they have rendered the Province by their exercise of care in shipping only their best prepared products into this market.

Prior to the spring of 1920, Winnipeg had not used our steam coals to any extent. Most heating and power plants were designed for American smokeless coals, either anthracite or Pocahontas, though a great deal of Youghigheny, New River, and Miller's Creek was in demand.

It is even more essential that the difficulties encountered in the steam market be appreciated. Here we deal with experts familiar with coal values, who must be satisfied as to grading, heat units, and ash content of all coals they contract for—the same as the railroads. In giving Manitoba part of their output, the mines had to ship exactly the same grades the railroads were taking—they could not possibly change their equipment to make a special commercial coal—nor did they have the labor to do so, had the equipment been available.

In criticising Western coals, it must be remembered the operators, in most cases, gave Winnipeg the best they could; but their best, during these abnormal times, was in no way representative of what they could offer under normal conditions, and the consumer made his comparisons on pre-war American as against Western coals mined under severe difficulties.

The writer feels that there is a strong brief to be held for the Western operator; he did his level best, except in a few instances where some salesmen took gross advantage of Winnipeg dealers.

In Winnipeg are established branches for several

large American coal operations. These are owned by American capital, and Alberta can expect no co-operation from them. One company, the largest in Winnipeg, and owned by Americans, stocked heavily coals from the Yellowhead district and sold them as representative bituminous of the highest grade, under the trade name of Western Star. They showed on analysis, 19.71 per cent. ash and represent a poor sub-bituminous, entirely unsuited for the Winnipeg steam market. The public, when they complained, were advised this coal was a typical sample, and asked to bear with it until American coals returned. The writer, immediately he discovered the means this concern was taking to damage Western coals, took every step to enlighten the public direct, and most of the damage intended was averted.

Such practices have been used greatly to the detriment of our good name, and they must be stopped at all costs.

Competitive Coals.

Before going further, competitive coals and their preparation should be understood. The Manitoba market has always proven a good outlet for American coals when the home market was slack. By means of docks at the head of the Lakes a haven was offered to mines which would otherwise have had to shut down. The large operators therefore equipped their own docks at Duluth, Superior, Toledo, and such points with the most modern coal handling machinery known; stocked only their finest low ash coals, and sold them in Manitoba through their own organizations. They backed their coal with guarantees and the highest technical services.

Youghigheny.—The Pittsburg Coal Company offers Winnipeg two different grades of this coal. The straight gas from the thin veins near Pittsburg (this runs under 1 per cent sulphur and is used by the Winnipeg Electric Railway in its gas house retorts) and steam coal from its mines in the Panhandle district. The latter is too high in sulphur for gas making, and is sold only for steam purposes. All these coals are shipped from the mines over a ¾-inch screen. While very hard, and able to resist severe treatment, from 35 to 40 percent. breakage occurs by the time they are in storage at the dock. Here the coal is all resecreened over either ¾-inch or 1¼-inch screens, to suit purchaser.

Pocahontas.—This is a semi-bituminous coal, known to the trade as smokeless, and comes from West Virginia. Pocahontas is shipped from the mine as Run of Mine, but, owing to its friable nature, contains at least, 75 per cent. screenings by the time it reaches storage at the dock.

Large quantities of New River Coal from the White Oak Coal Company also reach the Manitoba market.

Other American coals are Miller's Creek, or No. 8, and Elkhorn.

As soon as navigation opens in the spring, all the above will be put on the docks in large tonnages—there is no question about this. We also know that the approximate cost F.O.B. Winnipeg will be as follows:

Youghigheny, F.O.B. mine, minimum	$ 3.00
Freight, mine to Lake Erie	1.91
Freight, across Lakes to Canadian docks	.60
	5.51
American exchange, 20 per cent	1.38
Cost in Canadian currency	6.89
Duty	.53
Handling at dock	.75
Freight, dock to Winnipeg	3.30
Cost to Winnipeg dealer	$11.47

Note.—Pocahontas may be estimated at $2.50 more than Youghigheny owing to additional freight charges, and increased price F.O.B. Mine.

These prices cover Run of Mine. The duty on slack is 14 cents in place of 53 as given above.

With this information, and the expectation of a system of grading, our course for next year's campaign is fairly clear. Out of the $11.47 total cost, $7.87 covers transportation, against $5.30 for Western Steam coal—a differential in their favor of $2.57. While American operators are insistent that legislation be enacted introducing the seasonal freight rate plan, as an incentive to summer storage, if this were done we should surely expect proportional rates here.

Our mine price will have to be on a B.T.U. basis of commercial coal graded to compete with Youghigheny. Run of Mine coal must carry all the clean lump that comes from the mine, must be free of cap rock, not over 15 per cent. ash, and of a coarseness that 40 per cent. will pass over a ½-inch screen.

By loading coal only from sections of the mine known to be of standard quality and hardness, and by careful picking on the surface, these requirements can be fully met.

Other points Western Operators should take into consideration:

(1) Overcoming prejudices now in existence, due to treatment of the public during past year.—This can be done only by proper guarantees as to quality, and grading F.O.B. Winnipeg. Removing ash from Winnipeg plants costs $2.50 per load of about two tons. This represents 12½ cents on every ton of coal purchased for each 10% variation in ash, not taking into account the additional labor in the boiler room, nor the $5.30 per ton freight, plus dealers' fixed charges. This is a serious factor, and the operators should appreciate it.

(2) Selling on consignment, or on a special summer price with the payments falling due in November and December.

(3) Selling on a scale of discounts according to tonnage.

At present the purchaser of one car gets exactly the same price as the man buying one hundred.

In his work towards winning next year's market the writer has received invitations to conduct tests at the steam plant of T. Eaton & Company, representative heating plants of the School Board, Oldfield Kirby and Gardner, and the General Hospital, and the Gas Plant of the Winnipeg Electric Railway Company. The combined tonnages of these purchasers is close to 100,000 and results obtained in their plants receive the broadest mention.

Special cards of instructions for burning steam coals under different types of boilers have been distributed to all plants, and weekly lectures given to different groups of firemen in the plants of the larger employers. Articles on Western coals are being furnished such magazines as reach buyers throughout the Prairie Provinces, and in every way at his command the writer is endeavoring to win as large a portion of the Manitoba market for Alberta coals as possible.

The work as planned for 1921 contemplates carrying

on the present educational campaign with steam coal purchasers and their employees; a close follow-up of all architects and building contractors, with the object of using every influence towards obtaining the installation of suitable furnaces for western coals in all new buildings and in all overhauling of present plants; a watch on all dealers during contract placing season, to the end that every influence may be exerted towards getting them to buy as heavily from Alberta as possible; a personal check on shipments of Western coals, including destination, analysis and quality of grading (this will enable the Province to protect the buyer in all cases where operators are not shipping suitable coals); competitive boiler trials against American coals.

In order that first-hand information might be available as to just what co-operation the Province could expect from the Steam Coal Operators, the writer made a personal visit to all the mines in the Crow's Nest Pass. Assurance was given by both the operating and sales department of all these mines, also Mountain Park and Cadomin, that they would use every means in their power towards carrying out the programme outlined.

The following figures are of interest in showing the tonnages used on the Manitoba market:

	1919	1920
Alberta Domestic	270,467	456,404
Alberta Steam	42,547	143,202
Alberta Anthracite	1,276	1,356
	314,290	600,962
American Anthracite	383,737	255,000x
American Steam	401,958	235,000x
American Smithing	11,406	10,000x
	797,101	500,000x
Totals	1,111,391	1,100,962

Note.—Figures marked "x" are rough estimates only. Figures on American shipment cover coals entering Canada via the docks at Fort William, Westfort, and Port Arthur; and do not include railroad coals.

SCIENTIFIC INDUSTRIAL RESEARCH.

The sixty-second meeting of the American Chemical Society was held in New York recently. In addition to the large number of members present, leading chemists from Great Britain, Canada and other countries took part in the international meeting at the College of the City of New York and the other meetings held in the gymnasium and lecture rooms of Columbia University.

Prof. R. F. Ruttan described the workings of the plan for the development of industrial research in Canada. In 1916 the government of Canada by order in council established an Honorary Advisory Council for Scientific and Industrial Research, corresponding very closely in organization to the National Research Council for the United States and modeled largely on the Advisory Council for Scientific and Industrial Research in Great Britain, which has now become the Department of Scientific Research of the British Government.

Recognizing after investigation that liaison between research and industry could not be effected except by organized effort, a Central Research Institute was established near Ottawa. It is to be housed in a four-story building, 200 x 60 ft., with power plant and laboratories, the first $100,000 being specially granted by the Cabinet to get the work under way during 1921.

The functions of the institute may be briefly described as follows:

(1) It will be the Bureau of Standards for Canada.

(2) It will carry on fundamental research in chemistry, physics, biology and related fields, investigations similar to those engaging the attention of university professors in scientific laboratories.

(3) Investigations in biochemistry and bacteriolgy, both general and as applied to such industries as the fisheries and packing industries.

(4) Investigations undertaken on recommendation of the Research Council from time to time to promote the utilization of the natural resources and valuable waste materials of the country.

The type of research work described under these four heads will be carried on by the permanent staff of the institute, associated with specialists engaged from time to time. This group of highly qualified investigators will form an advisory body for the industrial specialists who will be engaged by the Research Council or paid by the industries "to conduct investigation and standardization at the request of any group of industries in Canada concerning the materials used by them or of the products of such industries."

The difficult question of remuneration for valuable and patentable discoveries has been left largely to the discretion of the Research Council. The intention of the Council is to give a liberal share in the commercial rights of all such discoveries. Its function is to develop research, not to exploit it.

BETTER OUTLOOK AT COBALT.

Of conditions at Cobalt, the "Northern Miner" says:

It looks now as though this year's silver production of Cobalt, in ounces, will be little if any below last year's output. The first six months of the year were quite close, despite the drastic curtailment of operations of the late winter. Mining Corporation, O'Brien, LaRose and Coniagas are doing much better than a year ago in number of ounces. And the outlook for all the mines is immeasurably improved. Last autumn things were starting to look pretty blue. The price of silver was swooping downwards daily. The costs of producing it were swooping upwards. It was hard to get men, and hard to get them to work when they'd been hired. A year ago there was nothing to make an operator confident and easy in his mind. Today's price of silver isn't too bad, and there can be little doubt that the price will gradually work higher. Certainly no one can be found who will argue that there are potent reasons why the price shouldn't go up. And the costs of mining are steadily coming down, a little here and a little there, with old high-price stocks of supplies working out of the stores at the mines and new supplies coming in much cheaper. But without doubt the greatest improvement has been in the attitude of the miners toward their work, and the change in this attitude has been most pleasing to managers.

Institution of Mining Engineers in Britain

Three Important Papers on Coal Mining Read at the Annual General Meeting.

By Roland H. Briggs.

At the Annual Meeting of the Institution of Mining Engineers in Britain held on September 14th and 15th, three important papers were read, of which one of the most interesting was on "Coal-mining by steam shovel in Alberta" by Mr. George Sheppard.

The coal district described below occurs in the Brazeau Forest Reserve in the Foothills west of the Province of Alberta. The area is roughly 150 miles west of the city of Edmonton, and the Grand Trunk Pacific Railway connects up this city and the east to Vancouver.

In order to develop this comparatively new coalfield, the Alberta branch-line of the G.T.R. was constructed, which runs from Edson to Coalspur and terminates at the mining settlement of Lovett. The construction of this branch-line has been governed primarily by geological conditions, as it follows a north-westerly to south-easterly direction in conformity with the general strike of the coal-bearing formations. The Little Pembina River flows along the strike of the geological formations of this area, and, as a consequence, is found in close proximity to the railroad.

The major streams or rivers of this district, namely, the MacLeod, Brazeau, and Blackstone, are all probably following pre-glacial valleys and cut across the strike of the dominant beds, thereby exposing good geological sections.

Three Groups of Territories.

The chief features of topographical interest are directly connected with geological conditions, and for this reason the territory constituting this part of western Canada can be subdivided into three groups, namely, the Rockies, the Foothills, and the plains. The Rockies form the western background, and present an unbroken line of imposing peaks both to the north-west and south-east. Immediately abutting the mountains to the east are minor hills of considerable magnitude, which can be designated the Foothills proper. The Foothills present a series of parallel ridges, with intervening valleys, which give the country a roughly undulating aspect. Towards the east of the above belt, the hills decrease rapidly in altitude, until finally the topography flattens out to the monotonous and gently undulating character of the plains.

The greater part of the area under consideration has been covered with thick forests of spruce, pine, and poplar in the past, but a repetition of forest fires has destroyed the greater part of the older timber. New growth, however has quickly established itself, with the result that the whole terrain is now supporting a thick growth of new timber which will eventually develop into a considerable forest areas.

This western part of Canada, and indeed the whole of the same territory extending north and south along the same meridian, can be divided into three distinct geological and topographical areas, namely:—

(1) The Rockies . . . . . Palaeozoic.
(2) The Foothills . . . . . Cretaceous.
(3) The Plains or Prairies . . . . . Cretaceous.

For the most part the older Palaeozoic rocks of the earth's crust, the Carboniferous, Devonian, Silurian, and Cambrian, have been raised into a series of thrust-blocks which, in many cases, have actually overridden the newer Cretaceous formations of the plains to the east.

Over-Thrusting Compression.

The chief mountain, in Montana, at the Waterton Lakes Park, and at the Crow's Nest Pass of Southern Alberta, these older rocks of Palaeozoic age (usually consisting of hard metamorphosed argillites and limestones) are seen resting upon the newer Cretaceous sediments—a curious reversal of the law of superstition. It is by this process of over-thrusting and teutonic compression that the Cretaceous formations have been step-faulted and folded into a serious of structural ridges and alternating depressions. Incidentally, it may be noted that the topography of this area directly expresses the underlying geological structure. Towards the east of the foothills however, the undulations become less defined, until finally the formations gradually flatten out to approximate horizontally in the plains.

The general direction of the main range of the Rockies in this part of Alberta is to the north-west, and, as a consequence, the Foothill belt, with its associated features of structural interest, presents the same disposition.

Description of Geological Formations.

This comparatively small Foothill area which is now being developed for coal near Coalspur extends to the south-east roughly parallel to the Rocky Mountain range. A series of low longitudinal hills and corresponding valleys occur, which are interpreted structurally as anticlines and synclines. Since the original forces operated which caused these undulations in the Cretaceous formations, both glaciation and secondary processes of erosion have modified the topography to an appreciable extent, and, in this way, the crests of the principal anticlinal structures have been eroded and the synclinal valleys deepened.

The most easterly fold of any importance can be termed the Coalspur-Lovett Anticline. To the west of this a corresponding syncline, with minor anticlinal folds and faults, occurs in which the workable seams of coal are available. The most important coal deposits commercially occur on the crest of the structural uplifts.

In the majority of these cases the coal operations have little overburden to contend with, owing to the fact that a considerable amount of superficial erosion had taken place prior to the general glaciation. In short, the mining operations resolve themselves into a system of stripping and subsequent removal of the coal by means of the steam-shovel.

To the east of the main fold the geological formations flatten out appreciably, and thus the known coal-seams disappear to a considerable depth below the surface of the ground.

In the Coalspur coalfield the workable seams are found in the Belly River formations only, as this strip of territory happens to be folded suitably for the development of the coal-deposits on the surface.

Ten Coal Companies Working.

In conformity with the general rule of the Western Provinces of Canada, the first coal was discovered through the efforts of prospectors, who were attracted to the field some twelve years ago.

The original samples were analysed at the provincial laboratory, and proved to be of a high grade. Operating companies then became interested in the field, and large areas were staked for the purpose of subsequant exploitation. At the moment about ten coal companies are working in this district, and the majority are producing a good domestic or a fair grade of steam-coal. The deposits throughout are remarkably uniform in quality, and certain seams produce a good coking material yielding about 75 per cent of coke.

The greater part of the coal in this district is steam-shovelled—that is, it is actually obtained from the surface outcrops much in the same way as railway-ballast or gravel.

As a general rule the overburden is almost negligible, as it consists of soft glacial clays or gravels, or more rarely of a few feet of friable weathered sandstone. In certain cases the coal is in perfect condition for the application of the steam-shovel, as small fault dislocations have slickensided and fractured the coal to such an extent that it can be easily recovered. In few instances only is blasting resorted to, and this usually to remove a high face which is out of reach of the operating tool.

The Oliphant-Manson Mine is one of the most remarkable coal-mines in the world. The main excavations have been along the outcrop and, despite continued operations in this area for a considerable time, there are still many millions of tons of good-grade coal in sight.

The forces of nature have been particularly well disposed in this mine, as the coal occurs on the surface. Two complementary seams (originally forming the flanks of a small anticlinal fold) have been faulted together at the apex, thus producing a workable deposit 182 feet in thickness. Two steam-shovels are continually at work, and it is possible to load over 1,000 tons of coal in the trucks every 24 hours.

In order to remove the coal recovered by the shovel, two small trains, each drawing eight or ten trucks, are employed, and these quickly transport the coal to the electrically-driven screen. Here the material is separated by means of the inclined screen into its various sizes, and all the slack or small coal is loaded separately for use in smelting operations. A box-car loader is used for the purpose of expediting the despatch of the coal-train. This automatically loads and packs the coal into the box-cars used on the railways, and so obviates the employment of a gang of men for this purpose.

The workings extend fully a quarter of a mile into the coal, and on either side, cliffs of solid black coal occur up to 30 feet in height.

Character of Operations.

A close examination of the coal-face reveals the fact that the material is slickensided, faulted and folded to a minor extent, especially near the fault contact of the opposing seams of coal. This, however, is by no means detrimental to the quality of the coal. On the other hand, the slight discolations are an advantage to the operator, as the coal is in a more accessible condition for the steam shovel.

In local areas the coal contains a small amount of "bone," which consists for the most part of calcareous material interveined with iron Pyrites.

Lenses of coarse sandstone (containing plant-remains) are common in certain zones, as well as concretionary masses of argillaceous sand.

At the Blackstone No. 1 Mine the coal occurs at the crest of a comparatively flat anticline. There is no solid overburden, the only material on the surface of the outcrop being loose gravel and earth of glacial origin. After stripping in the usual way, the coal is immediately loaded into the trucks.

At the Blackstone No. 6 Mine, a sandstone layer about 10 feet in thickness forms the overburden. To the east of the exposure a deep tributary to the Little Pembina River has excavated a valley, thereby exposing the coal-seam. Operations were started from this point, and so the face was worked to its present dimensions. Towards the west of the exposure lenses of sandstone interfinger the coal, but apart from this the deposits form no difficulty for the steam-shovel.

The Foothills Colliery is operated by the usual methods. The coalseam dips to the west at a low angle, and the face is thereby exposed along the railway cutting. A shaft follows the seam, and the coal is removed by horse traction to the trucks in the railway-sliding.

Absorption of Gases in Coal.

Mr. J. Ivon Graham, M.A., M.Sc., presented an important scientific paper on the adsorption or solution of methane and other gases in coal, charcoal and similar materials.

Although coal is a solid it is capable, like charcoal, of taking up or "dissolving" quantities of gases, and in general the more easily liquefiable the gas the more readily will it be dissolved by the coal. In the case of those gases absorbed to a lesser extent, such as hydrogen, oxygen, and nitrogen, the curves expressing the relation between gas-pressure and amount "dissolved" are practically straight lines—the absorption in these cases thus obeying Henry's law for the aqueous solution of gases. In the case of the more soluble gases there is, however, considerable deviation from the linear equation.

This phenomenon of the absorption of gases by solids, or the withdrawal in a selective manner of dissolved substances from their solution, in the absence of, or apart from, any chemical action between the material and the gas, or dissolved substance as the case may be, is generally termed "adsorption" or "solid solution". Either of these are useful terms to cover a physical change which is not yet thoroughly understood, but which is now generally explained as one in which the molecules of the substance adsorbed are attracted to the surface, and particularly the internal surface, of the adsorbing material (charcoal, coal, or whatever this material may be) and there momentarily retained through the exercise of inter-molecular forces. The process is reversible and depends upon the concentration of the surrounding media of the gas or substance capable of being adsorbed.

Mr. Ivon Graham's Experiments.

Mr. Graham has carried out a large number of experiments under both normal pressure conditions on this property of adsorption, and from the results obtained has concluded that from solid coal, where the reduction of external surface area is 100 per cent, for practical purposes the adsorption of gas may be taken to be about 65 to 70 per cent of the adsorption which is found with fine dust.

A point to consider, which is of great practical interest, is what will happen when through earth-movements a portion of the seam is ground to the form of a fine dust. If a gas pressure of 30 atmosphere is assumed throughout the mass of coal in the seam, a reasonable assumption for a gassy seam newly opened, in the light of the late Sir Lindsay Wood's classical experiments, the accumulation of fine dust previously saturated in the solid and compact condition is now capable of picking up considerably more gas in order that it may be saturated at the same pressure. This will without doubt take place, gas flowing from the solid until an equilibrium pressure is obtained. With coal such as Barnsley Soft, containing its natural moisture, it may be shown that 1 ton of fine dust will contain as much as 470 cubic feet or 17 times its volume of methane. This is obviously not as much as would be contained in a cavity at this pressure. At pressures below 5 atmospheres, however, owing to the shape of the adsorption curve an amount may be taken up by the coal greater than would be possible to compress into a cavity at the same pressure.

There will thus be an enormous reservoir of gas available for discharge in the event of the pressure being suddenly released. This might take place, for example, by coal intermediate between the position of the dust accumulation and the working-face being taken off until what was left was insufficient to withstand the high pressure behind it, and was consequently blown out.

In connection with the adsorption of methane, a point of practical interest to mining engineers is the thermal charge accompanying this phenomenon. During the adsorption of this gas a certain amount of heat is evolved, and conversely when the adsorbed gas is liberated a similar amount of heat is evolved, and conversely when the adsorbed gas is liberated a similar amount of heat will be absorbed. This cooling effect is especially noticeable at a gassy longwall working-face where a considerable amount of firedamp is draining away through breaks and fissures from behind the coal-face.

From preliminary measurements of this heat of adsorption of methane by coal-dust, a figure of 0.1 calorie per cubic centimetre has been obtained, or 28 large calories per cubic foot of gas adsorbed. If there is in the coal-seam a pressure of 10 atmospheres, and during mining the pressure of gas drops to 1 atmosphere, the quantity of gas given off, according to the figures for Barnsley Soft coal moist, should be 138 cubic feet per ton of coal. The cooling effect of this would be such as to produce a lowering of temperature in this mass of coal of 3.0 deg. Fahr. It is thus readily intelligible how coal at a longwall-face may be lowered well below the natural rock-temperature when it is being worked at a rate sufficient to counter-balance the heat-flow from the higher temperature of the surrounding strata. Owing to the comparatively low conductivity of coal, shale, etc. it is not surprising to find a difference of 2 deg. to 3 deg. Fahr. between the temperature taken 12 to 15 feet in front of a longwall-face and the natural rock-temperature at the same depth at other points in close proximity to this working-face.

Major Roscoe's Paper.

Major H. Roscoe, O.B.E. presented a paper on the need for standardisation in geological sections of strata proved in the boreholes, shafts and similar mining operations. It is important that fossil records should be included. The ideal mining section should accurately and boldly record all information likely to be of the smallest use to geologists, mining engineers, borers or sinkers in the future.

In the heading of the section the title, latitude and longitude, surface level in relation to ordnance datum, and if a shaft or cross drift, the true bearing of the line of the section should be given. The conventional colours and signs should be simple, and the scale should be drawn in a prominent position.

In column (I) height above general datum in the section is given; in col. (II) the dates showing the progress of boring or sinking; in col. (III) the lithological description and sample numbers; in col. (IV) the true thickness of the stratum; in col. (V) the lithological section; in col. (VI) the subdivision of the geological formation; in col. (VII) the scale; in col. (VIII) the Palaeontological section; in col. (IX) the palaeontological detail; in col. (X) the boring or sinking remarks, the rate and direction of the dip of the measures, and the deviation of the boring from the vertical. Mr. Roscoe gave details with regard to the manner in which each of these columns in the proposed standard section chart should be filled in.

GOLD MINES A BRIGHT SPOT.

In the "Northern Miner", Mr. Homer L. Gibson says:

"About the brightest spot on the industrial map just now is gold mining. The world's real need of an increased supply of the yellow metal to bolster up the flood of paper money which was issued during and after the war, is the underlying cause for the demand which exists for the metal. This demand, coupled with the fact that gold is just about the most easily marketed commodity one can thing of today, makes the industry appeal very strongly indeed to some of the shrewdest of the world's financiers.

"Where, because of "buyers' strikes" etc., the manufacturer of many other articles are beset with difficulty in marketing their output, the manufacturers of gold—that is exactly what gold miners are—are faced with a condition exactly opposite. In other words, their energies can be devoted entirely to production, in the certain knowledge that buyers will literally come to their very door to carry their product away.

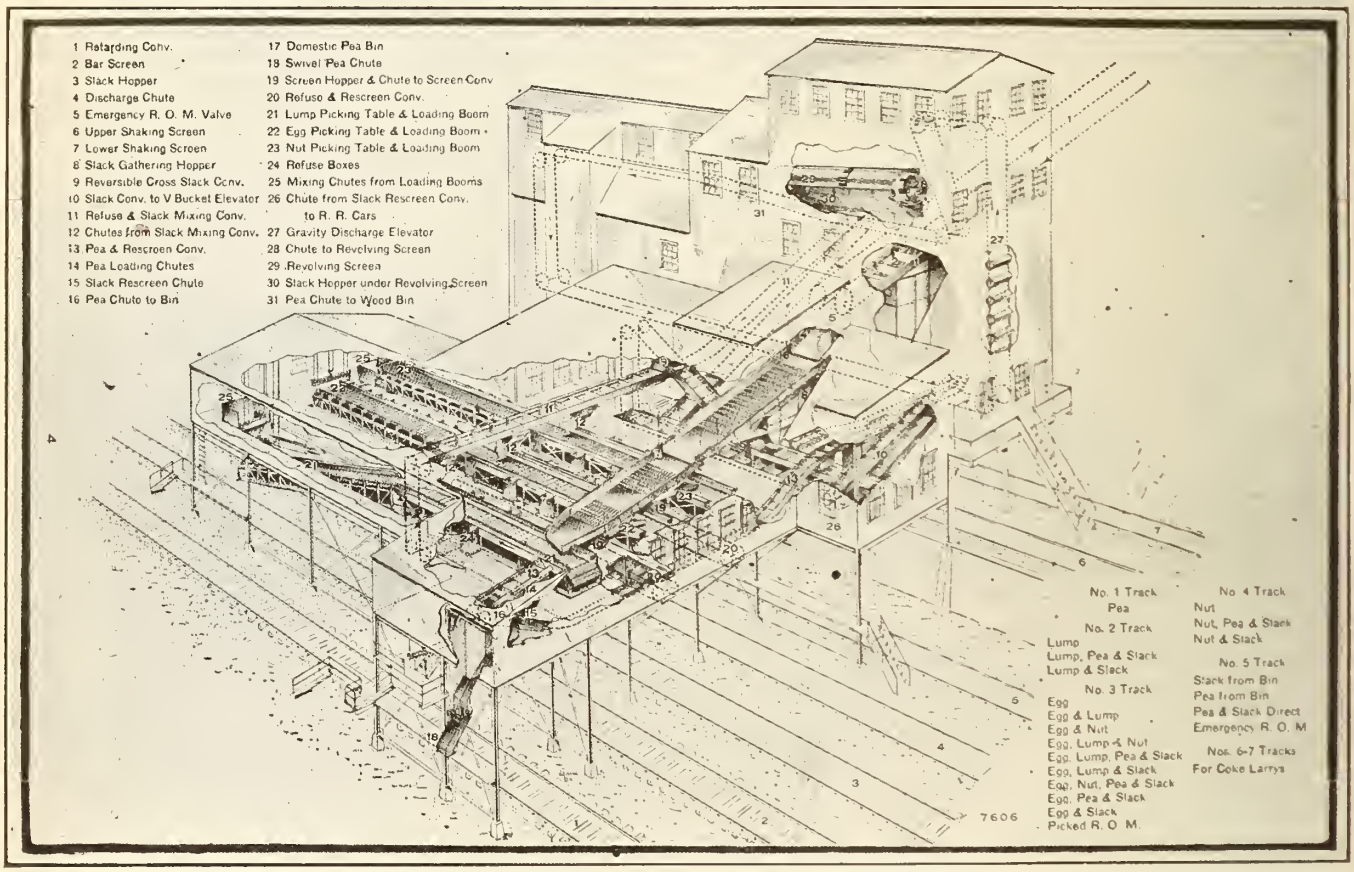
"What a change in one short year! A twelve-months ago, gold was just about the cheapest thing on the market. That is, its purchasing power, by reason of the high prices which prevailed for other commodities, was lower than at any previous time in history. In the face of rising commodity prices, the very stability of its prices was a severe handicap to its producers. Expressed in terms of materials, an ounce of gold would buy little indeed, and as for purchasing labor, it seemed that none was available at any price.

"Now however, the producers of gold can purchase, in terms of labor or commodities, a much greater supply for every ounce of output. Labor, a year ago, scarce, indifferent, and inefficient, is now clamoring for employment. The salesman for machinery, steel, chemicals and other materials used in mining, is anxious indeed for orders, and will grant the last concession possible to secure the business. In brief, the gold miner has come into his own again, and for a period of years at least will be able to compensate himself for the lean war period.

TIPPLE AND EQUIPMENT IN USE BY THE POWHATAN COAL COMPANY.

In an article in the Journal, last week, on Coal Mine Equipment in West Virginia and Kentucky, it was stated, with reference to mine car dumps, that the dump most in favor, and probably the fastest of all, is the power-operated, single compartment, rotary dump of the standard type, with some accessories, which dumps one, or, at the most, two or three, cars in tandem without the necessity of uncoupling the trip. Swivel couplings are used on the cars, and the centre of the dump is made coincident with the couplings of the car. Successful operation depends on securing the proper grade of the track entering and leaving the dump, and the proper control of the trip by means of a series of automatic car stops, which take the impact of the oncoming loaded trip and the pull of the empty cars, allowing the dumping car plenty of freedom in action, and, at the same time, imparting sufficient momentum to the empty car, to move it away quickly. These dumps have actually attained a speed of seven cars a minute in continuous operation.

A very good example of many of these new tipples is that of the Powhatan Coal and Coke Co., at Powhatan, W.Va. This company has been operating since 1889 on the No. 3 Pocahontas Seam in the heart of the famous Pocahontas coal region. The coal seam outcrops at an elevation of about 325 feet above the lines of the Norfolk and Western Railway. The mining is by the double entry panel system with two main drift openings and the mine is electrically equipped. The accompanying perspective drawing gives a very clear idea of the equipment for this tipple, which has a capacity of 450 tons per hour. As can be seen from the drawing, the tipple is divided into two parts; the low building over the tracks is for the screens and picking tables, while the high one to one side contains the pea, the slack and the refuse bins.



Tipple Of The Powhatan Coal and Coke Co.

WELSH COAL TROUBLES.

On Monday last a situation which may portend serious trouble arose in the South Wales coal field owing to a misinterpretation of the settlement of the last coal strike, the Mines Department requiring the owners to contribute a further ten shillings per ton, amounting to £750,000, towards wages. The owners expected this sum to be provided from the Government subsidy of £10,000,000, of which £3,000,000 remain. After a hurried meeting at Cardiff the coal exchange owners decided to close a large number of the collieries. If this decision is carried out the unemployment situation in South Wales will be seriously aggravated. It is devoutly to be hoped that, by the time these lines are in print, this dark cloud which, at the moment of writing, appears to threaten the coal industry in Wales—an industry which looms so large in the industrial life of that small county—may be dispersed.

Mr. Joseph Errington, of San Francisco, is in Toronto for the annual meeting of McIntyre-Porcupine and Blue Diamond mining companies.

Mr. H. P. De Pencier, general manager of Dome Mines Ltd., is in Toronto this week.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt Field.

This week's quotations for commercial bar silver give rise to high hopes of a great broadening out in the scope of work in and around the silver mines of Cobalt.

Local mines are now receiving approximately 75 cents per ounce for the metal they produce. Not only has this swelled the margin of net profit at the producing mines, but it offers every inducement for the second class mines to proceed with arrangements to resume work.

The sensational decline in the price of silver from a high point of $1.37 an ounce to a low point of 52 cents caused a number of the second grade mines to curtail work. The price then gradually strengthened until it appeared as though a general level would be established at around 60 cents per ounce. At such a price, the leading mines were in a position to make substantial profit and the silver mining industry once more became stabilized to a reasonable extent. Now, however, with the rise this week to upwards of 68 cents an ounce plus the premium on United States funds, bringing the total to around 75 cents, the second class mines are confronted with the likelihood of sharing the prosperity which has recently been confined to the leading properties.

In regard to the matter of a general move toward resuming work on all the mines, the question to be decided is as to whether it would be best to resume at present, or await a further possible decline in the cost of operations with a view toward going ahead at full blast in the early spring. Just now there are eight mines producing silver. In the order of their importance they are: Nipissing, Mining Corporation, Ceniagas, O'Brien, La Rose, Bailey, Aladdin-Cobalt and Hudson Bay.

A number of important discoveries in the operating mines has emphasized again the fact that there is still big scope for the development of important ore shoots in parts of the Cobalt field which have not yet been developed.

Cyril Knight, field geologist for the Ontario Department of Mines, made the statement to the Journal some months ago that as a result of the re-survey which he has been conducting during the past two summers, he has become convinced that there are certain sections in the Cobalt district where there are excellent possibilities and that in his opinion the field would still provide some favorable surprises. He pointed to these undeveloped sections as offering good chances of rewarding intelligent effort.

Among the important finds made recently are high grade ore shoots on the Nipissing as well as on the Violet property of the La Rose. In addition to these, is the fact that the O'Brien mine is producing some very rich ore. Indeed, from all three of these mines mentioned in this paragraph, there is ore being mined which compares favorably with the high grade shipments which first attracted world-wide attention to Cobalt.

Properties which are still idle in the Cobalt district, but with good ore reserves and desirous of re-opening at as early a date as may be considered advisable by the directors, are the Beaver Consolidated, Temiskaming, McKinley-Darragh, Peterson Lake and Crown Reserve. The Kerr Lake, which is operating at reduced capacity will also speed up operations just as soon as conditions are regarded as being entirely suitable.

At the first annual meeting of the stockholders of the Oxford-Cobalt Silver Mines, the by-law authorizing the purchase of the adjoining Waldman property was ratified. This deal involves the payment of 150,000 shares of the Oxford-Cobalt to Donald B. Russell who re-staked the Waldman last Fall. The old board of directors were re-elected.

The re-treatment of old tailings at the Coniagas continues on a big scale and the total tonnage now being handled at this property, inclusive of tailings, mine work, etc., exceeds 600 tons daily. With the arrival of winter, however, the handling of old tailings will be suspended until spring, although the handling of ore from the mine will continue uninterruptedly. The company will close its fiscal year at the end of next month and will show an output somewhat higher than for the past three years.

On October 20th, the Nipissing will disburse a dividend of 3 p.c., this being the regular quarterly payment. Total costs at the Nipissing are now understood to be under 35 cents an ounce, thus indicating a net profit of around 40 cents per ounce at the present price of silver. Production amounts to upwards of $160,000 monthly, thus indicating a net profit of around $80,000 per month. The current rate of dividends of 3 p.c. quarterly requires $60,000, and, it is obvious, therefore, that a considerable surplus is accumulating in addition to dividends.

Elk Lake and Gowganda.

An important conference is to be held in North Bay this week between Premier Drury, and the T. and N. O. Railway Commission. The question of building an extension of the Elk Lake branch of the T. and N. O. from Elk Lake to Gowganda will be considered. It is believed that in view of the many promising mineral discoveries in the district surrounding Gowganda, as well as the abundance of cheap labor, that the Government may now regard such an extension with favor. The territory to be served has big natural resources of proven merit.

Nothing definite appears to have been arranged in connection with re-opening silver properties in the Cane and Auld township district, but the higher quotations for silver is encouraging the belief that financial arrangements may now be made to work certain of the promising properties in that area.

THE GOLD MINES.

The Porcupine Field.

Numerous facts combine to place the Porcupine gold fields in a position where they should prove to be one of the greatest advertising factors within the Dominion. Rising production, proof of great depth and a general tendency to build big additions to the existing plants as well as the installation of new equipment on certain of the properties in the development stage are facts which stand out prominently in this field of big industrial progress.

The further favorable information that has come to hand with respect to each of the three leading gold mines of Canada, these being the Hollinger, Dome and McIntyre, each situated in the Porcupine district, is worth setting out in some detail.

In the first instance, the Hollinger Consolidated is treating an average of from 3,200 to 3,300 tons of ore daily, and there has been the general understanding that an increase of another 500 tons daily would be made in due course. However, it was not known on the street until to-day that an increase to about 5,000 tons of ore daily is not improbable in course of time. Officials evince their usual reticence owing to the fear of leading the shareholders to believe that such an enlargement may be expected right away. It is obvious that the additions required to so increase the tonnage would require considerable time to instal. It will be recalled

that the Journal's Northern Ontario Letter some months ago mentioned the Hollinger as being in line to soon realize an income of close to a million dollars a month and that certain writers expressed doubt about such an achievement. Yet such is now almost a reality, the monthly income being between $900,000 and $1,000,000. Officials at that time also drew the matter to the attention of the Journal correspondent, not out of the belief that such an achievement could not be accomplished, but on the strength of the fear that some unforseen obstacle might develop. For the same reason, it is probable that officials of the Hollinger will regard mention of 5,000 tons daily as being premature, but, nevertheless such is the record now being discussed and which has real prospects of ultimately becoming a reality. In connection with this, it has been learned by the Cobalt correspondent of the Journal, that the Hollinger has made arrangements to instal a Marcy rod mill for the purpose of finding out the grinding efficiency of such a machine. This mill will be run for a few months for the purpose of determining whether or not it is what its manufacturers claim. Should it do so, there are prospects of all subsequent additions to the grinding equipment being made up of these rod mills, and possibly ball mills, in preference to any further installation of stamps which have heretofore comprised the grinding equipment of the Hollinger.

In an interview with A. F. Brigham, General Manager of the Hollinger Consolidated Gold Mines, it was learned that the great plant has now attained an average capacity of 3,500 tons of ore daily. When it was mentioned to Mr. Brigham that the reports on the street have it that the plant is treating 3,800 tons daily, the manager made the reply that he is a believer in averages and that although the mill has actually attained a capacity of 3,800 tons per day over certain periods, yet it would not be advisable to take this maximum figure as a basis of analysis but that the achievement could be conservatively placed at an "average" of 3,500 tons per day. Mr. Brigham states that a total of between 1,700 and 1,800 men are employed at the mine and that the labor supply is abundant. From the foregong official details, and taking into account the fact that the ore on the mine contains approximately $10 per ton, the Hollinger income may reasonably be estimated at $35,000 every twenty-four hours. This is actually at the rate of $12,775,000 annually. The chief problem confronting the enterprise at this time is the question of hydro-electric power. With regard to this, it has been officially announced to your correspondent that the water supply in the storage areas is approximately the same as it was at this time a year ago, and that the power load now being carried is about twenty per cent. greater than at this time last year. This announcement is not altogether favorable, but with the rainy season just commencing, it will be another month or six weeks before the prospects for full power supply for the winter may be correctly measured. As matters stand, therefore, the Hollinger, with a monthly income of a million dollars a month is running almost neck-and-neck with the Crown Mines of Africa its chief rival as a gold producer for the position of world leadership.

Advice from the townships of Rankin and Doon where a promising gold discovery was reported last week is such as to hold out considerable promise for that area. The office of the Bureau of Mines at North Bay was visited by the Journal correspondent where maps are prepared for the guidance of prospectors showed between 40 and 50 mining claims recorded in the new district.

Information received from the Dome Mines goes to show that gold tellurides occur at the lower levels of the mine. Officials have known for some time that tellurides occur in the lower workings but have hesitated to make the fact generally known owing to being uncertain as to whether or not it occurs in any very great volume. This fact has not yet been determined and will not be until further extensive work is done. However, it is known that telluride does occur in spectacular quantities as so far opened up in the lower levels, and this is a factor which holds out hope of the Dome becoming as high-grade as its only Canadian rival, the Hollinger Consolidated. The telluride peculiar to the Dome is known as calaverite and is the richest form of telluride known, the gold content in the telurium amounting to upwards of 40 p.c. At the time of writing, it would be wrong for stockholders to conclude that calaverite is to enrich all the ore lying at the lower horizons of the mine. The extent of its occurrence may only be determined by further work, but the fact is regarded as important news.

The announcement that the Dome has encountered gold tellurides in its lower workings has served to attract more than ordinary attention, and the subject has become one of widespread discussion throughout the mining fields and in market circles. The belief is taking form that the Dome is about to fulfill the prediction made some years ago by the general manager of that time, Mr. Kaeding, that the mine was destined to take its place among the world's foremost gold mines. The high average of the gold content of the ore recently coming from the lower levels, coupled with the information that gold tellurides occur in encouraging quantities are factors which are giving birth to optimism on the part of stockholders in regard to the Dome.

After experiencing not a few reverses, those who are endeavoring to bring about a consolidation of the Dome Lake with the West Dome appear to be nearing their objective. It is said that a 5,000,000 share company may be incorporated, in which the Dome Lake will be given 1,500,000 shares with 1,500,000 to the West Dome Consolidated. The remainder would then be available with which to finance operations pending the time when production may be expected to become established.

Arrangements are being made to re-open the Hayden-Porcupine property, and toward this end a small force of men has been engaged. The property lies about four miles south-west of the Hollinger and is regarded as having considerable merit.

Headway is fairly slow in connection with the erection of a new milling plant on the Pearl Lake side of the McIntyre mine. It has been decided to go slow pending a decision in respect to the adoption of a method best suited to deal with the carbonaceous ores coming from the lower working of the mine. It is believed the foundations may be placed and the structure erected before winter sets in and that the installation of machinery may be carried on during the winter. In this way, the plant may be in operation by May. In the meantime, the present plant is operating at full capacity of about 550 tons of ore daily and the company is realizing an income of over $2,000,000 a year.

The Kirkland Lake Field.

Although no official statement has so far been given out, it has been learned on good authority that the bondholders of the Teck-Hughes Gold Mines have decided to deal leinently with the company. It is understood an arrangement has been made whereby the Teck-Hughes will commence paying off the bonds, the first payment to be $100,000 and that the indications appear to be that the entire indebtedness may be wiped out within less than four years. The ore in sight at the mine assures profit-

able operation for a number of years, while the possible ore as a consequence of going deeper may be estimated at a large amount. This means that the standing of the stockholders will not be interfered with and that they will probably stand in line to receive substantial dividends in due course.

Optimistic views are entertained with regard to the Teck-Hughes. It is believed that once the new additions now under way on the mill are completed the mine will be in a position to make between $15,000 and $20,000 net profit monthly. The company is capitalized at $2,000,000 made up of 2,000,000 shares of the par value of $1 each. Debts against the company amount to $500,000 plus several thousand dollars of accrued interest. Should net profits amount to the minimum estimate of $15,000 monthly, it would require but three years to retire the indebtedness. This rate of net profit would amount to about nine per cent. on the company's issued capital and would place the stockholders in a position to reap a very substantial reward for the money invested.

Reports from the Argonaut Gold are favorable. On the strength of good ore having been found in the lower levels of this property, together with the favorable outlook on the Elston-Duncan, the township of Gauthier has been staked out in a strip over two miles in width from north to south and across the entire breadth of the township from east to west.

It was reported this week that the Associated Goldfields had decided to curtail work on its properties at Larder Lake, but, at the time of writing, this report appears to have been based on the fact that work was stopped on one section with a view toward centralizing effort on the more promising part.

Good reports are coming from the property of the Crown Reserve in the Larder Lake district where values of $6 per ton are reported to occur in a wide ore body.

British Columbia Notes

Eureka Mine Re-opened.

One of the latest noteworthy mining events in British Columbia is the announcement of the re-opening of the Eureka mine, situated in the Cheam Mountains close to the town of Hope, and one of the oldest lode mines in the Province. It is being developed, according to authentic report, under auspicious circumstances. Attention, it is said, was directed to its possibilities by A. S. Williamson, who has been identified with the "Lucky Four" Mine in the same District. Messrs. Sperry & White, of Vancouver, have acquired control of the property. From work they have done, and from samples taken from bodies of ore recently opened, they have concluded that the proposition is worth a considerable expenditure. They are planning, therefore, to invest from $75,000 to $150,000 in development and plant. Confidence is expressed that the old property will become a large silver producer.

An early report of the British Columbia Minister of Mines, one of the first of which there is record, contains an interesting account of the first discovery of silver in the vicinity of Hope and, as the Eureka Mine is mentioned in this connection, possibly a few paragraphs of the same will stand publication at this date. They follow:

Silver ore was first discovered on the banks of the

Fraser, near Hope, and a lead was opened, by tunnel, at a considerable outlay, but nothing of any importance resulted.

The next discovery of silver ore was at Cherry Creek, in the Okanagan District, where ore of almost fabulous richness was found. At present, however, every effort to discover a well-defined workable lead has been fruitless, the very heavy character of the timber and superincumbent brushwood and soil forming an almost insuperable obstacle to successful prospecting.

True veins of silver ore were, however, finally discovered. This lead is of a far more valuable character Fort Hope, about 80 miles from the mouth of Fraser River, and six miles south of the town.

The first lead, called the Eureka mine, crops out about 5,000 feet above the river level, is well defined, four to seven feet in thickness and has been traced 3,000 feet. A tunnel has been driven in this lead for 190 feet. The ore is described as argentiferous gray copper, and has yielded under assay from $20 to $1,050 worth of silver to the ton.

During the time the above lead was being worked, another about three hundred feet distant was discovered. This lead is of a far more valuable character, and it is called the Van Bremer Mine.

The ore is described as chloride of silver, and has yielded under assay from $25 to $2,403 of silver per ton of rock. A quantity of the outcrop sold at San Francisco at $420 per ton. The lead is distinctly traceable for half a mile.

Tatlayoka Lake Area.

Wm. M. Brewer, resident mining engineer of No. 6 Mineral Survey District, B.C., returned recently from a three week trip into the section bordering on the Klinaklini river and Tatlayoko lake, where there is considerable activity in prospecting and development work. This section is north east of Bute Inlet, Tatlayoko Lake being west of Chilko Lake. While there has not been much mining done as yet the country is well mineralized and it is believed will become one of first importance. In 1920 twenty-nine locations of mineral claims were made on Chromium creek, a tributary of the Klinaklini river and arrangements were made to haul machinery for a small concentrating plant to be erected on the property of the Tatlayoko Gold Mines Company, Ltd.

The Provincial Mineralogist in 1920 described Tatlayoko Lake as lying at an elevation above the sea of 2,700 feet and the mineral claims at an altitude of approximately 5,900 feet. "The country rock" he continues "is a network of dykes, mostly basic, frequently cut by more recent acid dykes. These dykes are so numerous as to completely obliterate most signs of the original sedimentary formation."

"Cutting through this network of dykes there was seen out-cropping on the surface a quartz vein having a strike of about S 20' east and dipping to the east into the hill at an angle of 37'—very persistent in its course, but of variable width, varying from a few inches to several feet. I took a rough sample of this outcrop at one of the wide parts where it seemed to be most heavily mineralized and found it to assay: Gold, 3.50 oz.; silver, $26 to the ton, being ore worth about $85 to the ton.

"Associated with this quartz vein, apparently in lenses lying alongside the vein, were considerable quantities of stibnote—sulphide of antimony—mixed with quartz. These lenses assayed about the same in gold as did the main vein, and such experiments as I have been able to make did not indicate any increased gold values with an increasing percentage of antimony, from which I argue that the gold value is not associated with the stibnite, although it seems probable that the silver values are so carried."

After referring in detail to development work done on the particular properties in question the Provincial Mineralogist concerning the geology of the district says:

"The granite and other plutonic rocks forming the Coast Range mountains extend eastward as far as Tatlayoko lake; on the east side of this lake are the sedimentary rocks of the interior, and along this contact there is a strong probability that productive mineral deposits occur, particularly where the dykes from the main Coast upheaval have struck off into the sedimentaries. It is on this contact that the mineral locations of Portland Canal, the Telkwa, and of Lillooet are found."

OXFORD-COBALT SILVER MINES.

In the first annual report of the Oxford-Cobalt Silver Mines Ltd., announcement is made that the annual meeting will be held Sept. 19th. Features of the report are these: A by-law is being present which will authorize the company to purchase what was formerly the Waldman property. This ground became forfeited last fall through the drastic order placed into force by the Ontario government with respect to taxation, and was staked by Donald J. Russel, son of the president of the Oxford Cobalt. This Waldman property lies adjacent to the Oxford-Cobalt and shares the same vein system, and a deal has been entered into by which Donald B. Russell is to be given 150,000 shares of the Oxford-Cobalt stock for the sixty acres of ground staked last fall, this being made up of 20 acres in what was formerly the Waldman and 20 acres in each of two other adjoining claims.

In the directors' report on the Oxford-Cobalt the following information appears:—

The vein on which shaft No. 1 was started, crosses into the Waldman claim where the Keewatin formation is much shallower and it here shows at the outcrop a quite narrow shoot of cobalt ore with fair silver values; but the vein had not been opened up by the former owners due to its trend and proximity to the holdings of the Oxford-Cobalt Company. From the experience of the Beaver and Tamiskaming mines, both working in ground similarly geologically, it is expected to find the best values in the Keewatin near the contact with the underlying diabase rock. Hence, before continuing sinking shaft No. 2 to greater depth where the distance to the diabase has not yet been definitely determined, it appeared wise policy to test out extensions of our main vein on the Waldman claim.

"In early June, sinking by hand was started; almost with the first round high-grade cobalt ore was found. At about four feet down, this cobalt ore assayed over 600 ounces of silver. There is a wide fractured zone and the cobalt ore occurs in irregular shoots. Besides these stringers, there is a much better defined calcite vein that showed no silver at surface, but at six feet down with the calcite came in ruby silver and argentite. As sinking continued, this vein has steadily strengthened. At the present depth of 38 feet, it is very well defined and continues strong both ways from the shaft. At the bottom, it contains noticeable quantities of cobalt as well as ruby silver. Our policy is to continue sinking on this and establish a first level at about 75 feet deep near the contact. Power has been piped to this shaft, a collar, headframe and a hoist house completed.

"Further development can be conducted from the

Dr. A. G. Miller and Mr. A. G. Burrows, of the Department of Mines, are examining Pre-Cambrian areas in Northern Ontario.

Mr. P. E. Hopkins is at Port Arthur. He visited Silver Islet and other silver mines in the vicinity of Port Arthur.

Mr. R. J. Ennis was in Toronto last week for the annual meeting of shareholders of McIntyre-Porcupine Mine Ltd.

Mr. Charles A. Richardson has been appointed sales engineer with the International Nickel Company of Canada, Ltd., with headquarters in the Harbor Commission Building, Toronto.

MINING CONGRESS AT CHICAGO.

We make no apology for once more reminding our readers of the fact that the twenty-fourth annual convention of the American Mining Congress and National Exposition of Mines and Mining Equipment will be held at the Coliseum, Chicago, from the 17th to the 22nd of October, inclusive. For this convention will be one of the first importance—it will be the most notable exclusively mining show ever undertaken. It will probably excel in importance almost any previous convention of a great business organization, and this by reason not only of its magnitude and the exceptionally representative character of the attendance that is expected, but also because it will aim at the creation of a constructive policy for the mining industry.

The Canadian Mining Journal will be represented at this convention by a booth which will be in charge of Mr. H. W. Thomson, our Western Manager.

EDITORIAL

ANOTHER STEP TOWARDS THE BAY.

Premier Drury has announced that the Ontario Government Railway, the Temiskaming and Northern Ontario, is to be extended seventy miles beyond Cochrane to a point near New Post on the Abitibi River. The work is to begin at once and a number of men will be employed this winter in cutting the right of way.

While the district to be served by this extension of the railway is not of much interest to prospectors, there can be little doubt that the improved transportation facilities will hasten the exploration of the Hudson Bay basin. The railway will, doubtless, later be further extended to tidewater, and then will come rapid exploration, and probably the establishment of mining and metallurgical industries in the far north. Already it is known that there are important iron ore deposits in the Belcher Islands. Improved transportation will bring larger numbers of explorers, and will doubtless, result in many mineral deposits being uncovered.

The country to be served by the seventy mile extension is expected to yield a considerable quantity of pulp wood. It is partly agricultural land, and this will be settled more rapidly as a result of railway building. There are important water powers that will be reached by the railway. Development of these water powers will be hastened by railway construction, and it is not improbable that electrification of the railway will make a market for much of the power.

The building of a railroad into undeveloped country is a venturesome undertaking. Much can be said for and against the spending of public funds in such enterprises. There can be little doubt, however, that the people of Ontario will approve of the extension of the railway to Hudson Bay. Development of the hinterland is an enterprise which appeals to many, and the bringing of Hudson Bay into commercial range with Ontario settled districts is something worth striving for. The Bay is only one hundred and fifty miles from Cochrane, but, with only canoe routes and snowshoe trails as connecting links, the distance is an effectual barrier to trade and exploration of resources. The extension now authorized will cut the distance down to eighty miles.

Those who are interested in mining development will get no great immediate assistance from the extension of the railway into the area north of Cochrane, but they will be pleased to see that the Ontario Government is sufficiently interested in development of the north to go on with the project that resulted, in 1904, in the finding of silver at Cobalt, and, later, led to the establishment of gold mining at Porcupine and Kirkland Lake.

MINING LAW.

In this number of the Journal one of our mining engineers outlines some aims of mining legislation. He contends that security of title must be the foundation of any good mining law, and urges that any existing law which does not properly secure title should be revised. Non-enforcement of good laws may result in danger to titles, but, where good laws are enforced, there should be certainty that title will be indisputable. It is, therefore, necessary to provide that enforcement of the law does not impose unreasonable burdens on either government or mine operator. Lax enforcement for a period has, at times, been followed by unexpected action which has led to loss of faith in the security provided for.

Periods of too lax and and too strict enforcement of provisions of a mining act are disturbances to security of title and should be avoided. We have had some unpleasant experiences in Ontario, because of unexpected action in the enforcing of regulations which made titles insecure because of comparatively small sums of money being unpaid at certain dates. The government was quite within its rights in enforcing the regulations which made forfeiture of property the penalty for non-payment of certain taxes, but the unreasonable nature of the penalty and the non-enforcement of it had led to carelessness on the part of owners of property. Then,

snddenly the titles to valuable mining properties were found to be in danger or already lost.

The unfortunate result of enforcement after a period of non-enforcement was an impression created that the mining regulations were tricky, and that titles were not as secure as they had previously been thought to be. This undonbtedly did considerable harm to the mining industry in Ontario, as it led to many unfavorable comments on the existing mining laws. Not only was the penalty too severe for the offence; but the existence of the penalty had been lost sight of owing to non-enforcement. Some companies received no notice of taxes being due, and were not warned of penalties until they learned too late that their property was forfeited. It is not surprising that there was an outery when the law was enforced under such circumstances.

The plea for simplicity in mining laws should meet with general approval. Voluminous statutes are too often the result of lack of thorough study on the part of our legislators.

Our contributor does not deal at length with the relative merits of leasehold and freehold tenure. He suggests that the tax payments on freehold property, like the lease payments, will not be paid indefinitely, and that much land comes back to the Crown whether held as freehold or as leasehold.

Of much interest to the pioneers of the mining industry are the suggestions made for encouraging exploration and development of mineral areas. The imposing of charges at every turn where the Government and prospector come in contact is criticized, and the suggested elimination of minor fees is worth consideration. The discovery clause in the mining act is considered obsolete, and the enforcement of it impossible and not worth attempting. It is a law that, if taken seriously, would be morally degrading, but, even treated as a joke, it is not without bad effect. The prospector should not be asked to perjure himself in order to obtain rights to property which under any sensible law would be gladly given him in order that he might develop the mineral deposits on it if there should prove to be any worth the effort.

Non-enforcement of provisions of mining laws, as of other laws, comes naturally from recognition that such provisions are unfair, or are unsuited to the circumstances, or are, for other reasons, objectionable. Undue delay in amending regulations of such character can only result in annoyance and dissatisfaction. Undue haste in changing mining laws is not liked and is not urged, but in common decency we should bury the dead.

THE DIVINING ROD.

Of all methods of finding minerals the method of the forked stick is perhaps the most interesting. Every now and then there is a new story of the success of this method. Our correspondent at The Pas sends us, for publication in the Journal, an account of a recent exhibition of skill in locating minerals and metals in Manitoba. It will be found on another page. It is a good story and told in a very convincing manner.

Prospecting for minerals is an arduous task, and is becoming more and more difficult as the search proceeds. It would be a great gain to the industry if an instrument could be found to do the work that now requires much labor and considerable good luck. There would be lots of employment for the divining rod, if it were proven of use in the search for minerals. Its chief value in the past has been the basis it has given for mining romance. The prospector likes fairy tales as much as anyone, and he will doubtless be doubly interested in one which compares favorably with his dreams of how he made the "big strike."

3,000,000 *H. P. FOR ONTARIO.*

Sir Adam Beck promises that his engineers will soon have something new to show in the way of electrical equipment. Speaking of a scheme for development on the St. Lawrence River he says "we are going to be the pioneers of the greatest development of its kind." His scheme would make the St. Lawrence a navigable stream and regulate the level of Lake Ontario. Further information on this project will be awaited with interest. Water power development is of great importance in the mining and metallurgical industries. Sir Adam predicts that 3,000,000 h.p. will be developed in Ontario from the Niagara, St. Lawrence and other sources.

EDITORIAL NOTES.

The power situation in Northern Ontario has improved greatly during the past week. Heavy rains have fallen, and there is now little chance of a repetition of the power shortage of last year. If a normal amount of rain falls during the month, the water supply will meet requirements. Already it is claimed that the water supply for Cobalt and Kirkland Lake mines will do so. The three companies at Porcupine can make good use of all the power obtainable there this winter. Given adequate power, the gold mining companies will doubtless materially increase operations.

The Tin Can Portage is said to be the terminal of the authorized Ontario Government Railway extension. The pioneers who named the portage will receive no thanks from the Drury Government if the project proves unpopular.

Coal from Nova Scotia is coming to Toronto this week. A cargo of 3,000 tons is on the way. A trial shipment by the all water route was made some weeks ago and the bringing of this second cargo indicates that the business is feasible.

The productive season for hydraulic operations in the Yukon is nearly closed. It is estimated that the Dawson area has yielded about one million dollars this summer. This will be added to by dredging operations which continue for some time after the first frosts.

The report on coal statistics for the first six months of the year shows that production was 86 per cent. of that during the corresponding period last year. Importations were larger this year than in 1920. Exports declined one third. We imported more coal than we produced, the amounts being respectively 8,319,246 and 6,783,060 tons. Substracting the amount exported we have an indicated coal supply of 14,233,302 tons for the six months, or more than in the corresponding periods of 1919 and 1920.

Reports from Vancouver Island indicate that there is now a better market for coal than for some time. This is said to be not caused merely by the approach of winter, but by greater demands of the mercantile business of the North Pacific.

Ore carrying five per cent nickel is reported to have been found at the Gabbro mine, which is situate on the west coast of Vancouver Island. The nickel is contained in pyrrhotite. It is with this mineral that nickel minerals occur in the ore at Sudbury.

CHANGES IN TREATMENT CHARGES.

Nelson B.C.: Changes in the schedule of treatment charges imposed by the Canadian Consolidated Mining & Smelting Co., of Trail B.C., are foreshadowed as a result of a recent conference between representatives of the independent mine operators of the Kootenays and the management of the Company. The smelter proposes, it is stated, to pay for 95 per cent of the silver and 90 per cent of the lead irrespective of the zinc content of the silver lead ores of this section of the Province. Hitherto these figures have obtained for ore containing not more than 10 per cent. When, however, the zinc exceeded that percentage there was a deduction of ½ per cent of silver and 1 per cent for each unit of zinc in excess of the 10 per cent. The treatment of the zinc in such ore is to be reduced from over 60 cents per unit to 50 cents or possibly less. On the average Sloean ore going to the smelter it is estimated that this will mean a difference in favor of the operator of about $1.50 a ton. The Company also proposes to amend its present deduction for exchange of 5 per cent to 3 per cent. The silver is chiefly affected by this as practically all of it is marketed in the United States. For lead ores settlement will be at 90 days based on the price of the metal either on the day of arrival or the day of sampling. The advisability of taking the London or Canadian quotations instead of that of New York as a basis for settlement for lead also was considered. The London quotation is less than that of New York but more than those in Oriental countries where a large part of the Company's lead is marketed. The disposition thus shown by the Company to co-operate with and to show consideration for the difficulties of the independent mine operators of the Kootenays has given the latter heart, renewed confidence, and inspired a spirit of assurance that the present dull times are soon to be displaced by prosperity. There is no doubt that the Trail Smelter will get most of the ore that of late has been going across the boundary and it is equally certain that the operators, granted what they feel is fairer treatment, will be glad to give their business to the Canadian concern. Already a car of ore, taken from a small stringer of high grade ore in the Ruth Mine, Sandon, has been diverted to Trail.

The Rambler-Cariboo Mine has been leased by W. A. Cameron and associates and the lessees expect to open up new ground. With the predicted new Trail Smelter Schedule it is expected that it will be possible to operate the Mill at a profit.

The Mill on the California, Athabasca and Exchequer Groups, near Nelson, who is under bond to J. R. Cassin and associates, of Spokane Wn., was given a trial run recently with satisfactory results. Mr. Cassin says that it now is a really fine working mill. There are two batteries of stamps and the plant capacity is 50 tons a day. The chief new feature is that the Senn amalgamating table is not being used while two Deister tables have been introduced into the flow sheet. The Zeigler flotation machine is working efficiently. The flotation plant was added last year together with a Hardinge conical ball mill. There is said to be sufficient ore blocked out to keep the mill running steadily for years.

Trail B.C.: During the week 1st to 7th September there were shipped to the Trail Smelter, Consolidated Mining & Smelting Co., 6552 tons of ore and concentrates, the greater part of which came from the company's properties. The total receipts for the following week were 5,115 tons. Forty two independent mines have shipped to this smelter so far this year. In the last few weeks the shipping list has been growing to a marked extent.

DOME'S NEW OREBODY.

A body of rich ore has been encountered at the seventh level at the Dome mine. It is reported that the average value of the portion exposed is around $40. As yet the development has not advanced far enough to permit estimates of quantity. The "Northern Miner" says of the new find: This new body which is in the east end of the mine, and in the ground thought valueless, has the usual Dome characteristic of great irregularity in outline. Only one dimension has been got so far, and it is about 30 or 40 feet. The impression was received that it will take a lot of work to show up its boundaries, and that the present known dimension cannot be said to be its width, or its length. The material is peculiar. It is a slaty sort of ore, very hard. It often takes two shifts to drill off a round that in other parts of the mine takes five hours.

As the orebody occurs in slate quite a lot of that material is present in the ore. There is a high proportion of calcite, considerable quartz, and in places very massive sulphides.

It runs higher than usual in silver content, having as much silver, by weight, as gold.

The new orebody cannot be connected up with any other known body in the mine. The management is now endeavouring to get some idea of its extent.

Mr. George Mackenzie, secretary of the Institute of Mining and Metallurgy was in Toronto last week.

Mr. Robt. Bryce is in New York.

Mr. Ellis Thompson who has been engaged in geological survey work in the Goudreau district during the field season has returned to Toronto.

The Perfect Mining Law

By "KAY SEE (1950)."

The perfect mining law may be defined as a mining law which satisfies the prospector, protects the investor and the public, makes smooth the path of the operator, and brings a maximum revenue to the Crown. Such a law is an impossibility on account of the diverse interests involved.

In any mining legislation the following aims should be secured as far as possible:

1. Security of title.
2. Simplicity in administration and operation.
3. Protection of the public interests.
4. Encouragement of prospecting and mining.
5. Revenue to the Crown.

There may be a difference of opinion as to the relative order of importance of these aims. The lawyer would put No. 1 at the bottom of the list and the mining tax collector would transpose No. 5 to the top of the list, while many would say that No. 4 includes Nos. 1 and 2 and that Nos. 3 and 5 are not worthy of consideration.

1. Security of Title.

Security of Title must be the foundation of any good mining law, and any mining law which, through its enforcement or administration, induces doubts regarding security of title should be immediately revised. Doubt as to security of title is fatal to the continued prosperity of the mining industry in any country. In countries with a stable form of government, security of title is easy to provide for, and will exist if the laws are just and are strictly enforced. Lax enforcement of law encourages lax compliance with law, and in the mining industry this may endanger security of title. Where title to mining lands depends on compliance with regulations governing staking, assessment work, payment of taxes, etc., such laws should be automatic in action. Non-compliance with any regulation, the penalty of which is forfeiture of property, must be instant in action and without any appeal, otherwise the law will not be observed and is of no value. On the other hand, if the necessary regulations are observed title should be indisputable.

Care should be taken that the regulations do not ask for impossibilities. This will be further referred to under heading 4. As an example of the evils resulting from a law which is not automatic in its penalties, may be cited the 1920 forfeiture of the Ontario Department of Mines for non-payment of taxes. The penalty provided for by the Mining Tax Act of Ontario for the non-payment of the acreage tax on mining claims is forfeiture to the Crown. The weakness of the Act lies in the fact that such taxes have to be two years in arrears before the penalty can be enforced, and then only after advertisement and notification to the owner when possible. On account of the expense involved for advertising, search of title for notification, etc., the forfeiture penalty is only enforced every few years. The fear of immediate forfeiture for non-payment of taxes being removed results in a false feeling of security and eventually entire forgetfulness of the tax. On the rare occasions that the law has been enforced a few innocent owners of mining lands have lost valuable property through the neglect of agents in not paying the small sum due in taxes, and the cry has been raised that title was not secure under the Ontario Mining laws. If the penalty for non-payment of taxes on mining property when due were forfeiture to the Crown, instant and without appeal, the taxes would be promptly paid. All government licenses to hold mining property should state concisely all regulations the penalty for the non-observance of which is forfeiture to the Crown.

2. Simplicity in Administration and Operation.

This will follow if the law itself is simple, but a simple law is not allowed to exist for any length of time. Were it possible to draw up a mining act before any of the mineral rights of a country were alienated probably a better law than any at present in existence could be thought out. Generally, however, a mining law is not only considered after the discovery of mineral, and the rights of those who have already acquired mineral holdings must be considered. This may include railway companies, lumbermen, farmers, and the original prospectors. The first mining law is generally drafted with a view to encouraging the prospectors and operators; mining rights are acquired easily and taxes are light. Before the long the need of increased revenue is felt and taxes are increased. Today the creed that the national resources of a country belong to all the people is in the ascendancy and legislation is governed by this theory. Every new group of administrators and legislators consider it necessary to add to the existing legislation. The result generally is a cumbersome and complicated mining act. Practically every mining act could be improved if pruned 50 per cent. An essential requirement for the successful administration of any mining act is that the administrator should keep in close contact with all branches of the mining industry.

3. Protection of the Public Interests.

This includes two questions: The protection of the interests of the state or the citizens as a body, and the protection of the individual

If a mining act is lenient regarding the acquirement and holding of mineral rights, large areas of mineral lands may be held by a few men and, further, the control of certain essential minerals might be in the hands of a very small group. Neither of these conditions are desirable, although the same result can be obtained by purchase. The question as to whether mineral rights should be granted in fee simple or only by lease is a moot one, although in practice there is really not much difference. If of value only for mineral, the land will eventually revert to the Crown after the mineral is exhausted. Under the leasing system sufficient time to mine all mineral must be given, so ultimately the result is the same. The Crown regains possession of the land after it is of no further value. The advantage of the leasing system is that the land is more apt to be worked. It might be said that any land tax is really a lease. The protection of the individual would be provided for by legislation covering hours of labor, working conditions, protection of wages, sanitation in mining villages, workmen's compensation, blue-sky legislation, etc.

4. Encouragement of Prospecting and Mining.

During periods of new discoveries, especially if of high-grade ore, boom conditions will exist whether the legislation governing prospecting and mining is good or bad, but when conditions are normal, and more particularly in periods of depression in mining, an act which is considered by the prospector and operator to be unfair may do a great deal of harm. Assistance to the mining industry may be provided by the State in

two ways: 1st, by removing any obstacles in the way of mining and 2nd, by direct assistance or encouragement.

Obstacles to be removed may include previous legislation which has become obsolete, working conditions which are found to be a hardship, and fees, taxes, etc., where such do not produce a revenue commensurate with the cost of collection and the irritation produced. A Prospector's License should include all fees for re-recording claims, taking of affidavits, search of titles, etc. The payment of a small fee for every contact with the government produces a feeling of resentment and often does not much more than cover the cost of collection. Care should be taken that the prospector is not asked to comply with an impossible condition. The discovery clause in most mining acts is an impossible law to comply with, and yet before a prospector can stake a certain piece of ground he is required to take an affidavit that he has found valuable mineral which will make a mine workable at a profit. A strict interpretation of this regulation shows that close to 100 per cent. of the claims held in Ontario have been acquired by perjury. A prospector may feel reasonably sure that a vein extends into a certain area and that he can sell the land for a good sum, but the cost of proving the value of discovery is far beyond his means. He is entitled to that land and should not be asked to perjure himself to obtain it.

Where working conditions are hard to comply with these should be modified.

Direct assistance can be given to the industry by the building of railroads, roads or trails, by Geological work and maps, and in some cases by bonuses and the erection of treatment plants.

Revenue to the Crown.

The revenue derived from the mining industry should be taken from the successful mines. Very little, if any, revenue should be expected from the prospector and the mine in the development stage. The tax should be in profits and should be graduated so that those best able to pay would contribute the most.

GOLD DISCOVERY IN B. C.

The report of a gold discovery never fails to cause excitement and such has been the effect, especially in certain sections of the interior of British Columbia, of the news that a discovery, apparently of some importance, has been made in the Lillooet District. There seems to be some confusion as to the exact location of the latest find. Statements have been made that it is on Gunn Creek in the Bridge River Section. That there is gold in the latter country is known, but it is not this that has created the recent interest. The center of attraction now is the Taseko (Whitewater) River region and the recoveries being made from claims staked on Iron Creek, a tributary of Taseko River. It is in this vicinity that the Limonite deposits recently investigated by the Provincial Government are located and report has it that members of the exploratory party, which spent the 1920 season on the Taseko, have their attention directed to the occurrence of gold on Iron Creek. H. Taylor, an old prospector, is credited with being the original staker. He and his associates have been making considerable recoveries of gold, coarse and rough in character. Indications are that the precious metal has been carried but a short distance and diligent search is being made for the Mother Lode. There is no doubt that next season will see much prospecting in this part of British Columbia.

MORE GEOLOGICAL WORK WANTED.

By J. J. O'CONNOR.

The active interest that is being taken by the Geological branch of the Ontario Department of Mines, in mapping the mining districts now under development and exploration, is appreciated in the highest degree by mining operators and prospectors. The work of the Departmental geologists is being carried out in the most thorough manner, and with all the rapidity possible under a limited staff, and limited seasons. Additional to the areas now under development and exploration, these geologists are extending their efforts to wholly undeveloped areas, mapping formations, and blazing the way for pioneer prospectors, in a way that is rapidly extending the field of operation, and making possible the finding of economic mineral deposits, that might otherwise remain hidden indefinitely.

This branch of the public service should be developed to the fullest possible extent, nothing should be left undone to enlarge and amplify its resources in men of the caliber and qualifications, of the geologists that are now pioneering the way in the unmapped portions of the mineral area.

The staff of field geologists should be so increased, that it would be possible to cover the mineral bearing area of the Province within a reasonable period of time. With what has been accomplished by scientific and reasoned methods of determining geological formations, together with their economic possibilities, seems to point to the lines that should be followed by the Department of Mines in an intensive manner, until the survey and mapping covers the entire mineral belt traversing the northern portions of the Province.

The vast unexplored areas of Northern Ontario, are of such immense extent, that it will take years of the most persistent geological effort to adequately map and outline the formations, and demonstrate the mineral possibilities of the various sections. Splendid work has been, and is being done by the field staff of the Department of Mines. So much yet remains to be done in this direction, that, in the light of what has been accomplished by geological research in the field, and mapping of mineral areas, it would seem that no branch of the public service offers greater attractions for the expenditure of public monies, than that of the Geological branch of the Department of Mines.

Northern Ontario presents the greenest of green fields for the further extension of geological effort. The vast white spaces that now cover ninety per cent of the map, from the Ottawa river to the Manitoba boundary, should be replaced by colours indicative of the geology and mineral possibilities of this territory.

Northern Ontario is served by thousands of miles of railways, splendid rivers, streams and lakes, offering reasonable passage to its most remote confines, and only awaits the pioneer geologist to make its possibilities known.

As this service grows, so will the mineral production of Ontario grow. One is dependent on the other. They must go hand-in-hand.

COPPER IN SHETLAND.

An important and rich discovery of copper has been made in Shetland. The lodes thus far proved give a high percentage and already half a million tons of copper ore are in sight. Experts and engineers are laying down mining plants and it is expected mining will commence next month.

Silver Mining Gaining Ground

Good Results Being Obtained at Nipissing and La Rose.

Silver mining in the Cobalt district is gaining ground, and the indications appear to be that the production of silver from this field will be higher during 1921 than during the preceding year. This fact has a tendency to encourage the belief that under the normal conditions which are gradually developing, the mines of this district will be able to maintain their output for quite a number of years.

The Coniagas is producing at a higher rate than for some years, while the same is true of the La Rose Consolidated. The Mining Corporation and the O'Brien are each maintaining high yields, while the Nipissing is gradually adding to its rate of production as compared with the opening of the current year.

Two of the more important discoveries to be made in many months took place in recent weeks, one on the Nipissing and the other on the Violet property of the La Rose. The vein on the Nipissing is from four to five inches in width of high grade ore and is accompanied with a large amount of mill rock. The vein itself carries ore which assays several thousand ounces of silver to the ton. Massive pieces a foot wide, two feet long and four or five inches in thickness of $2,000 ore may be seen at the mine as a result of the recent favorable developments. This high grade orebody, taken together with the fact that the average silver content of the mine's reserves is over 40 ounces of silver to the ton tends to indicate that the Nipissing will maintain an output of not far under $200,000 a month.

In addition to such big achievements on the company's Cobalt properties, the Nipissing is conducting careful investigations in certain of the other mining fields and may reasonably be expected to acquire more paying mines as a guarantee against the working out of the Cobalt deposits. The Nipissing has optioned two properties in the Porcupine district, these being the Edwards claim near the Dome mines and the Rochester property north of the Hollinger. It is the intention of the company to conduct an exploration campaign on both properties by using diamond drills. A dividend of 3 p.c. will be paid Oct. 20th to stockholders of record Sept. 30th.

The new vein on the Violet property of the La Rose has been drifted on for about 30 feet at the 570-ft level and has a width of from four to five inches. Some exceptionally rich ore is being bagged, while a substantial tonnage of medium grade ore is being opened up. It is now evident that the output of the La Rose for the current year will be the highest for some years. Some high grade ore is also being taken out of the Princess property of the La Rose as a result of taking out one of the floors in an old drift.

The annual meeting of the Kerr Lake Mining Company has been called for Sept. 26th. A meeting of the directors of the company was recently held at which a dividend of 12½ cents a share was declared. The annual statement has been delayed but is expected to be in the mail almost any day. It is awaited with more than usual interest owing to there being various reports relative to outstanding success on the company's New Zealand properties where dredging for gold has been under way. As regards speeding work up to full capacity on the company's Cobalt property it is not believed such a move will be made at present, although the strengthening which has recently taken place in the price of silver holds out promise of a general resumption of work being possible within a reasonable short time.

Attention is turning again to the South Lorrain district with renewed interest as a result of a discovery of high-grade ore at the 300-ft. level of the Haileybury Frontier property. It is stated that at a distance of about 30 feet from the bottom of the shaft, the drift has entered a rich shoot of ore which has the appearance of being important. High-grade ore is being bagged and the result of further work is of the utmost importance to the enterprise.

The mill on the Keeley Silver Mines is operating steadily and is producing a concentrate which contains about 1,800 ounces of silver per ton. A carload of these concentrates was shipped during the past week and places the Keeley on the list of substantial producers.

THE ALEXANDRIA MINE.

Excellent progress is being made in the development of No. 7 Colliery, the newest of the Scotia Company's chain of coal producers. The sod was broken for this colliery in September 1920 simultaneously with the closing down and dismantling of the Scotia colliery which became exhausted. No. 7 is in the vicinity of the old Scotia so that the men who formerly worked at the Scotia colliery were transferred to No.7 thus continuing them at work at convenient distance from their homes.

The first coal was hoisted from No. 7 in October last The average daily output is 400 tons, some days reaching 500 tons. These figures are eloquent of rapid work done in placing this colliery among the substantial producers of the Sydney Mines district.

The deeps are down 1,250 feet. No. 1 levels north and south are in 300 feet with ten rooms. No. 2 levels north and south are half the distance of the upper levels and will soon be producers.

Following a well thought out plan the mine is being rapidly opened up and each month adds to a steadily increasing output. The only factor in preventing No. 7 colliery reaching its maximum output at an early date is the depressed conditions of the coal trade. However, development work will go on and when the market expands N. 7 will do its part in filling the demand.

The mining is done by machinery, and not only is the mine very well laid out for economical capacity production and convenient working, but the mechanical equipment is excellent. The seam is about five feet thick and the coal of splendid quality.

The opening of the mine is one of the most important advances made in the Sydney Mines coal field during the regime of Alex S. McNeil as General Superintendent, and in deciding upon its location and laying out Mr. McNeil brought to bear his wide knowledge of practical and economical coal mining. The rapid progress made in opening and developing the mine was largely due to the active and personal interest taken by Mr. McNeil in pushing the work ahead. For these considerations No. 7 is generally referred to as Alexandria mine, and the present satisfactory state of the development work warrant the assurance that in a short time the Alexandria mine will become one of the most important producers in Cape Breton.—Glace Bay Gazette.

ACTIVITY IN BRITISH COLUMBIA COLLIERIES.

Vancouver Island collieries evidently are pushed to meet the market demands these days. Recently there has been a marked revival of activity. The Canadian Western Fuel Corporation, Nanaimo, has all its mines, No. 1, Herewood, Reserve, and Wakesiah, in full operation. In the course of the last few weeks this Company produced in one day a total of 2,800 tons which closely approaches, if not actually establishing, a record. The shaking up of this industry, the wheels of which have been moving slowly and uncertainly for the greater part of the summer, is not entirely due to the natural increased domestic requirements with the approach of winter. Nor is it due altogether to the unsatisfactory conditions as to production in the State of Washington where a recent strike, an investigation by a Commission on which the State was represented, the presentation of a report acceptable to the Operators and repudiated by the miners, have very seriously affected production. The improvement is said to be explained to a large extent by the greater demands of the mercantile business of the North Pacific.

The Canadian Collieries (D) Ltd., also, are working at normal at Cumberland and perhaps somewhat better than than the normal rate as to production at the Extension Camp. The former collieries, no doubt, have been slightly affected as to their showing by the closing down of No. 7 Mine, although its production never was great and Nos. 4 and 5 doubtless can be speeded up sufficiently to make up the difference.

The Granby Consolidated Mining Smelting & Power Co's collieries at Cassidy (V.I.), which slowed up for a short time, now are turning out about 1,000 tons a day. This is significant. The greater part of this coal goes to Anyox where, with a mixture of coal from the Interior, it goes through the by-product coking ovens in order that coke may be provided for the company's copper smelter at that mining camp. The maintenance of coal production to continue mining and smelting operations at Anyox notwithstanding the present unsatisfactory world condition as to metal markets. It certainly would seem to betoken confidence in an early return to more nearly normal conditions in respect of the copper mining industry.

There is one outstanding feature to the coal mining of the Nicola-Princeton section of the lower British Columbia interior, namely, the vigorous opening up of the Coalmont field by the Coalmont Coal Company. Development is proceeding there along such lines and on such a scale that before long the Company should be one of the considerable producers of the Province. An aerial tramway was installed recently which at first did not give satisfaction but now, a few alterations having been made, is working most successfully.

In the Crow's Nest Pass there is as yet no special evidence of improvement. The mines of the Crow's Nest Pass Coal Co. at Coal Creek and at Michel have been working five days a week. The coke ovens at Fernie are idle. Those at Michel are active, the output meeting the requirements of the Trail Smelter and the smaller demands of the several minor markets to the immediate south of the British Columbia border. The Corbin Coal and Coke Co. also is producing at about the usual rate and are engaged in the opening up of some new ground.

Pacific Coast Coal Co.

The property of the Pacific Coast Coal Co. Ltd., consisting of the Morden Mine and considerable undeveloped coal areas on Vancouver Island, would have been put up at tax sale by the Provincial Government on October 12th next if the ordinary procedure had been followed. But, had this been done, the claims of coal miners for back wages, aggregating $71,326, might have been adversely affected. The tax sale, therefore, was postponed to December 1st next. Meanwhile it is likely, should there be no settlement in the interim, that an order of the court will be asked for authorizing the sale of the property for the satisfaction of the wages in arrears. In such an event the purchaser, of course, would be called upon to assume such liabilities as the overdue provincial taxes.

Aveling Coal Co.

The Aveling Coal Co., Telkwa, B.C., is making preparations to take advantage of the growing demand for coal in northern British Columbia. That the coal is available, that it is of good quality, and that considerable market exists at Prince Rupert and other points along the line of the Grand Trunk Pacific Ry., are facts long apparent. The problem appears to have been that of transportation. This has been tackled seriously during the past Summer and, with the construction of a bridge now underway, in which the provincial government is lending financial assistance, it is likely that local coal will be available to the people of northern cities and settlements this winter.

LIQUID OXYGEN EXPLOSIVES.

The Bureau of Mines is conducting experiments at its Pittsburgh (Pa.) station with a view to making the use of liquid oxygen explosives practicable in certain mining and quarrying operations. The increasing cost of dynamite and permissible explosives at the time the United States entered the World War caused the Bureau of Mines to investigate all possible substitutes. It was found that the Germans used liquid oxygen explosives extensively in non-gaseous coal mines, in quarries and iron mines, as well as for destructive purposes in French steel plants. As eminent physicists are promising great improvements in liquefying apparatus that can be used for the production of cheap oxygen, it is possible that the explosive will become so cheap that it will displace dynamite and other explosives where conditions permit its use.

DALY MINES CO. LTD.

Stewart B.C.: Pat Daly is planning the further development of the "Big Missouri" Group of Mineral Claims in the Salmon River zone, Portland Canal. The diamond drilling and exploratory work carried out under Sir Donald Mann does not convince Mr. Daly that this property is without a future. On the contrary he is sure that the ore is there and that it is there in quantities that will make one of the big mines of the district. Mr. Daly explains that two Companies have been formed, one a holding company incorporated in the United States and known as the "Portland Canal Mines" and another incorporated in British Columbia and known as the "Daly Mines Co., Ltd." It is stated that the former's stock was well received in New York and that all that is necessary will be available for development.

The Divining Rod

Experiments in Northern Manitoba.

By REECE H. HAGUE.

The subject of the so-called "divining rod" is one which never fails to rouse a controversy in scientific circles and the writer fully realizes that technical men are very adverse to admitting its powers. At the outset he desires it understood that the material included in the following article is garnered from men who have been convinced of its efficacy through association with a man who claims power over it and not through any personal conviction that is is infallible. He has endeavoured to keep an open mind on the subject as the experiments which have been carried out in his presence have not been of a sufficiently important nature to justify him expressing a personal opinion on the matter.

Early in the prospecting season which is just drawing to a conclusion in Northern Manitoba, Professor R. C. Wallace received a communication from A. V. Arnott of Roblin, Man. requesting that he be allowed to accompany the Commissioner for Northern Manitoba on a trip through the mineral belt, in order that he might have an opportunity of trying out the power of the "divining rod" in locating minerals.

Professor Wallace complied with Mr. Arnott's request and the latter joined a party proceeding to Elbow Lake and other points in the mineral belt and during the trip succeeded in convincing those whom he accompanied that he had some power in locating mineral deposits.

Several Tests Applied.

One member of the party stated on his return to The Pas that severe tests had been given Mr. Arnott. On several occasions one member of the party would precede the others crossing a portage and would bury a coin somewhere along the route, which would be unfailingly located by Mr. Arnott, through the medium of a twig of poplar, willow or other wood which he held in his hands and which would turn sharply immediately he came over the hidden object.

Mr. Arnott also followed the leads of mineral bearing viens and was willing and anxious to undertake any tests which would serve to convince the sceptics by whom he was accompanied that he had the power he claimed.

By the time the party returned to The Pas there was not one of the men who had accompanied Mr. Arnott, but who would admit that the latter had some peculiar power and could really locate mineral by means of his wand.

While in The Pas Mr. Arnott gave private demonstrations in the writer's rooms. A silver coin or mineral sample would be placed on the floor and Mr. Arnott would walk towards it. Immediately his hands were over the planted object the twig which he held in his hands would bend, the efforts of men who held the opposite side to Mr. Arnott being impossible to restrain it.

His Excellent Credentials.

Mr. Arnott stated that he had spent some years in India locating water for the British government and produced excellent credentials as to his success. He intimated that he had considered he might have the same power to locate minerals and took the trip to Northern Manitoba to try out the process. He has made no experiments as far as oil is concerned but thinks he would be equally successful in locating oil pools. He contends that the only difference between an underground water well and a mineral deposit is that when the latter is disclosed their is a certain tingling in the fingers which is not noticeable when the presence of water is shown.

Iron bodies do not affect, the wand, he states, but it is susceptible to any mineral such as gold, silver or copper.

Mr. Arnott recently returned from a second trip to The Pas mineral belt, where he made extensive investigations and returned to The Pas more than ever convinced that he had the power he claimed.

While in the Elbow Lake region he discovered what he contends to be a mineralized area running beneath the heavy muskeg and he is so confident that he is not mistaken that he has staked claims and agreed to pay a sum of money to prospectors in the district to do work on his property during the coming winter, stripping the muskeg and diselosing what lies beneath. Other prospectors, convinced that Mr. Arnott is conscientious in his claims, have also staked in the locality.

Convinced of His Powers.

To meet Mr. Arnott is to be convinced that he is, at at anyrate, sincere in his contention that he has power to locate mineral. He has made no endeavour to commercialize the peculiar power which he claims but on the other hand has paid all his own expenses while in the north and has absolutely refused remuneration for investigation which he has carried out on any properties.

A man absolutely unversed in mineralogy, and knowing practically nothing of the bush, Mr. Arnott has met with severe tests at the hands of prospectors and mining men, but has never failed to make good.

If such a thing as discovering hidden mineral bodies through the medium of a "divining rod" really exists it will revolutionize prospecting. Mr. Arnott intends to continue with his experiments next Spring. He has convinced himself that he has the power he claims and has also convinced a number of hard headed northerners that he is not a faker.

A great rule of science is to deny nothing until actual proof is forthcoming that what is claimed is rendered impossible through scientific investigations ,and the result of the work done on the property recently staked by Mr. Arnott is eagerly awaited as it will prove definitely whether or not the "divining rod" in his hands is really an object with superhuman powers or whether he is only one of the many who has fooled himself by believing himself capable of powers denied the ordinary human.

Northern Manitoba waits with considerable interest the final results of Mr. Arnott's experiments. The sceptical are willing to be convinced by actual proof and there are many people who are already confident that proof will be forthcoming that Mr. Arnott is what he claims to be.

MINING CONVENTION IN CHICAGO.

In one line of industrial effort, the United States has always ranked first—namely, the production of labor saving equipment machinery.

This is particularly true of mine equipment and mine machinery for our great natural resources and the enormous industrial demand in this country have made it possible to develop the use of machinery in a larger and more intensive basis than in any other country in the world. This is well illustrated in the development of our copper resources. Out in Utah a whole mountain of low grade copper are has been utilized effectively through the introduction of large scale machine processes and practically the entire mountain has been dug away through the use of strip mining such as is seen in the great iron ore fields of northern Minnesota. These developments are typical of American mine equipment machinery.

Naturally, therefore, American mine equipment and mine machinery is found in every section of the world where mining is an important factor. From the Lean gold fields in Siberia, where American dredges formerly sucked up the gold bearing sand, to South Africa and Australia, American mine machinery is a standard.

As a result the bringing together of over two hundred exhibits representing the latest forms of American mine equipment and mine machinery at the National exposition of Mines and Mining equipment at the Coliseum in Chicago, October 17-22, has attracted the international interest of every foreign country which furnishes possibilities for the development of its mineral resources.

In response to an invitation to be represented at this great convention and exposition, a number of foreign countries will be officially represented by delegates of technical men appointed to study and investigate machinery exhibits and the machinery processes which are being utilized in American mining enterprises. Among the countries which have already accepted this invitation to be officially represented are Belgium, Italy, Spain, Mexico, Cuba, Costa Rica, Nicaragua, Columbia, Venezuela, Ecuador, Chile, Argentine, Brazil, China, Denmark, Norway, Sweden.

At the present time every American business man is interested in seeing the development of additional outlets for the scale of American products abroad in order that we may maintain the full productive capacity of our industrial plants during the years to come. Undoubtedly one of the important outlets for our plant capacity will be through the development of the utilization of American capital in mining enterprises overseas, especially in those countries which are as yet undeveloped and which have large mineral resources. A good illustration of this is the recent purchase on the part of the United States Steel Corporation of a four million dollar acreage in Brazil which will be utilized for the production of manganese ore in large quantities. The investment of American capital abroad in mining enterprises in such countries as South and Central America, in China and later in Russia will afford a great opportunity for increasing the sale of American mine machinery and mine equipment in these countries thereby increasing the utilization of American industrial products and the sale of American products overseas.

The presence of these international delegates, therefore, at the National Exposition of Mines and Mining Equipment and the 24th Annual Convention of The American Mining Congress will add a feature of special interest.

The Canadian Mining Journal will be represented at the convention by a booth of which Mr. H. W. Thompson, our Western Manager, will be in charge.

LIBERTY BRAND FERRO-CERIUM.

To make one small piece of metal do the work of thousands of matches at considerably less cost and with far greater safety, is an achievement that may well be considered wonderful. Such is Liberty Brand Ferro Cerium, the "wonder metal," more commonly known as Sparking Metal, Pyrophoric Alloy, Cerium Iron, Flintstone and Firestone, which has the property of giving off spark-showers upon friction with a harder metal.

Years of exhaustive research and costly experiments by noted chemists and constant striving for improvements in manufacture, have made LIBERTY BRAND FERRO-CERIUM what it is today—The Highest Grade Sparking Metal Known. It is made of the best and purest materials obtainable and will not powder. At the same time it is so much lighter in weight that it gives you more pieces to the pound or kilo.

The "hotter" sparks of Liberty Brand Ferro Cerium and the close adherence of the spark shower to the metal is another feature that places it in a class by itself and makes it the most desirable sparking metal to use under all conditions.

For use in Miners' and other safety lamps a special Liberty Brand Ferro Cerium which yields a concentrated flame that closely adheres to the metal and does not throw off a distributed shower of sparks is made. In dangerous surroundings the advantages of this feature cannot be over-estimated. This special metal is produced exclusively by New Process Metals Corp., 46-50 Center Street, Newark, N.J., and is claimed to be the only metal approved officially by the United States Bureau of Mines.

New Process Metals Corporation invite correspondence from readers of the CANADIAN MINING JOURNAL and will gladly sent complete information to any one inquiring.

ANNUAL MEETING OF TORONTO ENGINEERING ALUMNI.

Elaborate preparations are under way for the third annual gathering of the University of Toronto School of Science men, which will be held in Toronto on the 4th and 5th of November. Arrangements, this year, are being made on a much larger scale than in previous years and it is expected that among the long list of distinguished guests will be one or two of International reputation. The Graduates are coming from all parts of Canada and the United States and it is expected that upwards of one thousand will attend the Reunion. The programme embraces the official opening of the new Science Building at the University—Dinner Dance at the King Edward—Numerous Class Reunion Luncheons—Queens vs. Varsity Rugby Game and winds up with one of the long famous "School" Dinners on Saturday night. At the Annual Meeting on Saturday morning, broad questions relative to University Policy, Technical Education and professional matters will be discussed.

Preliminary Report on Coal Statistics

For the Half-Year Ending June 30, 1921.

The Mining Branch of the Dominion Bureau of Statistics has compiled a preliminary report on coal statistics for the half-year ending June 30th of the calendar year. Comparative data regarding the output from Canadian mines are given by months for each Province, and for each kind of coal produced. Similar statistics covering the importations into Canada and the exports therefrom, have also been compiled. Throughout the tables a series of index numbers show the relation of the output, imports, or exports, as the case may be, for the year 1919 and the year 1921 in comparison with the base year of 1920 for which the value of 100 was taken in every instance.

The output of coal from Canadian mines during the first six months of this year declined to 80 per cent of the amount produced during the corresponding period last year but was 5 per cent in excess of the output for the same period during 1919. With the exception of New Brunswick, none of the provinces showed an output equal to the 1920 record. New Brunswick produced 10 per cent of its 1920 output and the other provinces follow in the order named: Saskatchewan, 94 per cent; British Columbia, 91 per cent; Nova Scotia, 87 per cent; Alberta, 79 per cent.

In the table given below, the output, shipments, and value of shipments of Canadian coal produced during the period have been tabulated. A part of the data included in the table has been estimated and the figures are therefore subject to revision. The total value of coal shipped during the period amounted to $32,882,953 and the average selling price reported from the different coal-producing areas ranged from $2.43 a ton for lignite coal in Saskatchewan to $8.53 a ton for anthracite in Alberta. The average for the Dominion was $5.75. The table follows:

Coal by Provinces and Grades for the Six Months Ending June 30, 1921.

Provinces	Output (tons)	Shipments (tons)	Total Value	Average Value per ton
Nova Scotia				
Bituminous	2,750,319	2,257,261	$14,536,760	$6.44
New Brunswick				
Bituminous	69 230	65,768	377,508	5.74
Saskatchewan				
Lignite	145,394	136,670	332,108	2.43
Alberta				
Anthracite	46,402	10,357	88,419	8 53
Bituminous	1,261,080	1,172,804	5,711,555	4.87
Lignite	1,125 312	979,021	4,405,594	4.50
Total for Alberta	2,432,794	2,162,182	$10,205,568	4.72
British Columbia				
Bituminous	1,385,323	1,094,405	7 431,009	6.79
Total for Canada	6,783 060	5,716,285	$32,882,953	$5.75

Having regard to importations, the data show that Canada as a whole imported 104 per cent of the amount of anthracite coal brought in during the same period in 1920, and 132 per cent of the bituminous. Quebec was the only province which imported less anthracite during the six months than in the same period, 1920, but even then, imported 96 per cent of the anthracite coal received in the half-year of 1920, an increase of 12 per cent over the figures for 1919. Manitoba and the Head of Lakes imported 169 per cent of the 1920 quota of anthracite; Nova Scotia, 140 per cent; New Brunswick, 128 per cent; Prince Edward Island, 108 per cent, and Central Ontario, 107 per cent. In every case these figures show that more anthracite was imported during the past six months than in the corresponding six months in 1919.

Bituminous coal entered at Fort William and Port Arthur and the Customs port of Manitoba, amounted to 235 per cent of the 1920 figures. Nova Scotia imported 224 per cent, as much bituminous as during the same period of the previous year but the entire quantity was only some 1,500 tons. Quebec was more fortunate in the matter of bituminons than in the previons year and during the first six months received 179 per cent of the amount which was brought in during the first six months of 1920. Central Ontario obtained 115 per cent as compared with importations in the first half of 1920.

Central Ontario has received during the first six months of the past three years a continually increasing amount of bituminous coal, the index numbers for the periods being 92 per cent in 1919; 100 in 1920 and 115 in 1921.

Exports of Canadian coal have declined from the base figure of 100 for six months ending June 30th to 68 for the same period during the present year. In 1919 the corresponding index number was 74. Total exports for the Dominion amounted to 869,004 tons this year as compared with 1,278,957 tons in the same period last year and 948,495 tons in the six months of 1919. British Columbia was the principal exporter during the period, the amount of coal shipped out of the province amounting to 517,823 tons during the period, representing 87 per cent of the amount exported from this province during the same time in 1920. Nova Scotia shipped, for foreign trade, only 48 per cent of the amount of coal exported during the six months in 1920. The actual tonnage of exports for the six months just closed amounted to 284,601 short tons. The total output of coal from the mines of Canada during the first six months of the present year amounted to 6,783,060 tons. During the first six months of 1920 the output was 7,929,269 tons and in the same period in 1919, 6,355,532 tons. Total importations of anthracite and bituminous coal during the half-year just closed amounted to 8,319,246 tons, as compared with 6,768,709 tons in 1920 and 6,723,757 tons in the preceding year. Export figures have already been given and from these data the coal supply of the Dominion may be determined. The output from Canadian mines plus the amount imported and less the quantities exported, leaves an amount which may be called the "Coal Supply." This figure for the six months of 1921 was 14,233,302 tons, as compared with 13,419,021 tons in 1920, and 12,130,794 tons in 1919.

It thus appears that the Canadian coal supply for the half-year as shown by the index numbers, rose from 90 in 1919 to 100 in 1920 and 106 in the half-year just closed.

TO GRIND FELDSPAR IN FRONTENAC COUNTY.

In order not to have to order ground feldspar from New York State, the Frontenac Floor & Wall Tile Co. is commencing the erection of a large grinding plant here. For years feldspar has been shipped from Frontenac county to American points to be ground and the product shipped back into Canada. It is expected that more grinding plants will be established near the mines throughout the county.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt Field.

At the end of September, the quotations for silver continued to hold at above 70 cents an ounce, and the strong demand from the Far east appeared to indicate the likelihood of this price being maintained with good prospects of a still further advance. Silver-mining companies which operated last summer and made a profit with silver selling at below 60 cents per ounce are now realizing exeeedingly big profit. Other companies which have not made a start since closing last year, are now confronted with conditions under which they could again operate profitably. Labor is abundant and efficient, while heavy rains during the closing days of September asure ample hydro-electric power to operate the mines of Cobalt at full capacity. Added to this is a continued decline in the cost of supplies and a gradually broadening margin of net profit.

Nipissing.

Production from the Nipissing mine during September will be announced as usual about the 8th of the current month. It is understood the value produced during the period was the highest for any month during the current year. The new vein opened up in August stood up, well under the development work carried on during September, and this, together with the higher price of silver combined to increase the value of the output for the month.

La Rose Operating Four Mines.

Official advice from the La Rose Consolidated is exceptionally favorable. The company is now operating four mines, these being the original La Rose, Princess, University and Violet. Production has recently reached a rate of upwards of 500,000 ounces annually, and the total of the current year may approach that figure. In doing this, the four mines are sending out a total of about 130 tons of ore daily. Asked as to the outlook on the Violet property about which some very optimistic reports have been in circulation, Mr. G. C. Bateman, manager, told the Journal that a small amount of high grade is being bagged from the pay-streak, and that a large tonnage of good mill rock is being encountered. The silver values extend over a width of close to six feet and this is proving to be a source of big production. As a result of these favorable achievements on the La Rose, rumors are current which indicate the possibility of the company being able to resume dividend provided this record is maintained and the price of silver continues high.

May Reopen McKinley-Darragh.

The prospects of the McKinley-Darragh mine being reopened within a reasonably short time are considered to be bright. The matter, of course, rests with the directors to determine whether it would be best to start up now in the face of winter or await the arrival of spring when the resumption could be brought at considerably less expense. The disadvantage of waiting for spring is that considerable overhead expense is going on even during the idle period and this fact is encouraging the belief in Cobalt that the mine may actually be re-opened this fall. One favorable feature of the McKinley-Darragh is that upwards of 25,000 tons of ore is lying in the stopes, broken and ready to send to the mill. This could be turned into revenue quickly.

Temiskaming.

J. P. Bickell, president of the Temiskaming Mining Company states that the mine was forced to close last year only after the price of silver declined to below 70 cents an ounce. At that time, it is important to keep in mind, the cost of producing silver in Cobalt was about 20 p. c. higher than at the present time, so that it would appear as though the Temiskaming could now produce silver at a cost of under 60 cents per ounce. As against this, the metal is now commanding a price of over 70 cents an ounce, plus American exchange which brings the total up to between 77 and 80 cents per ounce in Canadian money. This offers good prospects of the Temiskaming being re-opened soon.

Kerr Lake.

During the fiscal year ended August 31st, the Kerr Lake Mining Company made a net profit of $478,979, an amount which is equal to 79 cents on each issued share. This compares with a net profit of $916,089 during the preceding year. The decline in earnings was due to curtailment of work on the company's property at Cobalt, as the greater part of the net profit came from newly acquired property in Utah. The higher price of silver during the past month encourages the belief that the current year may result in profitable operations being also resumed at Cobalt.

Premo Silver.

The installation of a small mining plant on the Premo Silver Cobalt property on the Montreal River near Latchford has commenced. Two boilers, a compressor and hoist comprise the new equipment. The property has seven veins showing, and former work consisted of surface trenching together with upwards of 100 feet of underground work divided between two shafts. The veins contain low silver values together with quite a large percentage of cobalt.

Searching for Cobalt Ores.

A feature of interest at this time in the Cobalt and surrounding district is the search for properties on which cobalt ore occurs. Cobalt, South Lorrain and Gowganda areas are being looked over with the object in view of carrying on work for cobalt, and to recover silver as a by-product. There are various properties on which the silver values proved to be too small to warrant operation, and it is now believed they could be worked profitably for cobalt.

Extending T. & N. O. Ry. to New Post.

An extension of the T. and N. O. Railway from Elk Lake to Gowganda is not expected for some time, according to unofficial information coming from North Bay following the conference there between E. C. Drury, premier of Ontario, and the Commissioners of the railway. The Commission will concentrate construction effort on the extension of the main line northward from Cochrane to a point near New Post on the Abitibi River. This is about 70 miles north of Cochrane and about 80 miles from tidewater on James Bay. Near New Post it will be possible to generate a minimum of 300,000 h.p., according to official information submitted to the Journal by Geo. W. Lee, Chairman of the T. and N. O. Railway Commission. This will comprise a number of developments, the main one of which will be a fall of 200 feet where over 200,000 h.p. may be developed. Press despatches have pointed out that the extension is to Smoky Falls, but such despatches are in error, Mr. Lee told the Journal, as the exact objectives is Tin Can Portage, at a point near New Post.

THE GOLD MINES.

Much Wanted Rain Falls In The Porcupine District.

Torrents of rain fell all along the height of land in this part of Northern Ontario during the closing week of September and rendered the outlook for hydro-electric power much more favorable. Upwards of four inches of rain fell during the week, two inches of which fell on the closing day of the month. This has raised the water in some of the streams from two to three feet and the storage basins are filling quite rapidly. As a result of this, the output of gold from the Porcupine field may be increased by several hundred thousand dollars and perhaps measured in millions as compared with what might have been the case had the weather continued dry.

The prospects of the Hollinger maintaining an income of around a million dollars a month unremittingly are greatly enhanced by this heavy rainfall. It may be pointed out that whereas the months of September and October of last year were the driest in sixty years, the exact opposite is proving to be the case this year, thereby offering every likelihood of each of the gold producing mines being able to go right through the winter at maximum capacity.

Last week, the McIntyre was bending much energy toward securing auxiliary equipment with which to generate power should the hydro-electric supply fail, and, now that wet weather has set in, coupled with the precautions taken to provide auxiliary equipment, no difficulty is anticipated in maintaining the current high rate of output. Moreover, it is believed the company may now proceed as rapidly as possible to carry out its big construction program in connection with doubling the capacity of its mill. It is believed this addition may be made and in operation by May of the coming year. A feature of the McIntyre is that accordingly as greater depth is attained, the ore becomes richer, the best ore so far found being at a depth of 1,750 feet, the deepest level so far reached on this property.

A force of upwards of 350 men comprises the crew at the Dome Mines, and the mill is treating an average of between 1,000 and 1,100 tons of ore daily. Mill heads are being maintained at around $7.50 per ton. This means that production averages around $7,500 daily at present, or at the rate of $2,737,500 annually. By adding the premium on United States funds, the gross income is indicated to be in the neighborhood of $3,000,000. Provided total costs do not exceed $4 per ton and thus leaving a net profit of $3.50 per ton, it follows that daily net profits of around $3,500 are being realized, or at the rate of $1,277,500 a year. This amounts to close to 27 p. c. on the company's issued capital. Further, given more time to increase tonnage to between 1,250 and 1,350 tons per day, it is believed the net profits may be brought up to over 30 p. c. annually. It is learned that developments at the 7th level are exceedingly favorable and that a large amount of ore has been opened up which contains an average of over $20 to the ton. The company will pay its usual quarterly dividend of 2½ p.c. Oct. 20th.

Thompsonite, the new explosive which is being manufactured in Deseronto is proving to be a success. A carload of the explosive was shipped to Porcupine two weeks ago, and, after being given a week's trial, the Dome Mine purchased the entire carload. A feature of the new powder is that in addition to having breaking power equal to the best on the market, the fumes after blasting do not contain gases, and it is possible for miners to return to the point of blasting within a few minutes after firing the charge.

This third diamond drill hole is under way on the Rochester property, lying north-west of the Hollinger. This work is being done by the Nipissing.

Kirkland Lake District.

A deal for the Townsite property in the Kirkland Lake district is pending. Certain interests in the United States are making a bid for the property.

The Kirkland Lake Proprietary (1919), Ltd., is meeting with encouraging results on its Tough-Oakes and Burnside properties. This is especially true of the Burnside where two important veins are being developed. It has just been learned that Mr. Latilla, of London, will sail from Liverpool on Oct. 10th for the purpose of visiting the property.

Some Miscellaneous Notes.

Enlargements to the mill on the Teck-Hughes are being carried forward at a good rate, and the plant is expected to be able to treat about 150 tons daily by the end of the current year.

The surface plan of exploration has been about completed on the King Kirkland Gold Mines and arrangements are now being made to carry on extensive underground operations. Toward this end, a large compressor has been placed on order.

Road work is progressing favorably on the extension of the Kirkland Lake highway through the township of Lebel. The greater part of this extension will be gravelled this fall and will be ready for rock during the coming summer.

A total of about 100 claims were staked in the rush to Luella Lake in the township of Rankin and Doon. About 50 have been recorded and further applications are expected at the recording office. The samples brought out are extremely rich, but the pay-streak is said to be very narrow. As yet, the average gold content of the dyke in which the pay-streak occurs has not been ascertained.

B.C. GOLD PRODUCTION.

Receipts of gold up to date at the Dominion Assay Office, Vancouver, indicate the gold production of British Columbia will be considerably greater for 1921 than that of 1920. The total receipts of bullion this year so far aggregate in value $1,275,000, as against $1,073,000 for the same period last year. The improvement, generally speaking, is ascribed first to the reopening of the local mines of the Consolidated Mining and Smelting Company of Canada Limited, and, second, to the fact that the placer mining areas are working under more satisfactory conditions, there being abundance of water, whereas last year there was a notable scarcity of that necessity.

BRITISH EMPIRE STEEL.

The time for exchanging 6 per cent. preference shares of the Dominion Steel Corporation, Ltd., 7 per cent. preferred stock of the Dominion Iron and Steel Co., Ltd., 7 per cent. preferred stock of Dominion Coal Co., Ltd., 8 per cent. preference shares of the Nova Scotia Steel and Coal Co., Ltd., 6 per cent. preference shares of the Eastern Car Co., Ltd., 7 per cent. preference stock of the Halifax Shipyards, Ltd., for cumulative 7 per cent. first preference Series B. stock of the British Empire Steel Corporation, Ltd., has been extended until Dec. 15, 1921.

British Columbia Letter

Stewart, B C.: The driving of two crosscuts on the property of the Bush Mines, Ltd., Salmon River, has served to open up a large body of ore. This work was done from Nos. 1 and 2 tunnels, and the results have proved the soundness of the reasoning of those in charge.—Development on the Idaho Group of Mineral Claims, Marmot River, has exposed a lead in respect of which the owners express every satisfaction.—The Luck Group, on Fish Creek, the property of Behnsen Brothers, of Victoria, B. C., is showing up most promisingly.

Alice Arm, B. C.: The Homestake Group, Kitsault River, under bond to the Consolidated Homestake Mining and Development Co., Ltd., of Vancouver, B. C., are being opened up with an energy indicative of a determination to make them productive with little delay. Three tunnels are being driven on these claims which, it is said with confidence, will prove up a considerable body of high grade silver-copper-gold ore. They already are in some distance and will be completed next summer. A site has been prepared for a compressor plant, which machinery, together with other equipment, will be shipped in as soon as the snow disappears. The intention is to instal it as soon as possible, using water power from a creek on the company's property for operation purposes. G. Hanson, of the Canadian Geological Survey, who has been working in the Kitsault section of Alice Arm District during the summer, is reported as saying that there are very large bodies of ore in the upper Kitsault Valley and that the camp has a great future.

Prince Rupert, B. C.: W. G. Fearnsides, a geologist of Sheffield, Eng., accompanied by John McLeish, of the Department of Mines, Ottawa, has been visiting Anyox and other mining centres of British Columbia. Mr. Fearnsides is engaged in research work throughout the United States and Canada. He has visited the asbestos mines of Thetford, Quebec, the nickel mines of Sudbury, and the iron mines at Missanabie. After inspecting the plant of the Granby Consolidated Mining & Smelting Co., that of the Consolidated Mining and Smelting Co. at Trail, and the collieries of the Crow's Nest Pass, he will tour California, Nevada and Arizona.

Trail, B. C.: Ore receipts in gross tons at the Trail Smelter of the Consolidated Mining & Smelting Co. aggregated 4,575 tons for the week ending September 21st. Of this 4471 tons came from the company's properties, 20 tons being received from the Champion, Salmo, and 84 from the Knob Hill, Republic, Wn.

The silver-lead mine operators of the Kootenay Districts of British Columbia have been addressed by the management of the Consolidated Mining & Smelting Co., Trail, B. C., explaining the conclusions reached at a recent conference between the company's representatives and those of the operators and asking for expressions of opinion, especially regarding the proposed formation of a lead pool in order to obtain the advantage of the higher prices that might be expected for deliveries against sales.

Appended are the important sections of the text of the company's circular:

Payments.

Gold.—95 per cent. at $20 per ounce. No pay for gold unless three one-hundredths of an ounce (.03 oz.) per dry ton or over.

Silver.—95 per cent. on the fire assay at the average Engineering and Mining Journal quotation for foreign silver for the calendar week, including the date of arrival, converted into Canadian funds at par. Minimum deduction from silver one-half (.5 oz.) ounce per dry ton.

Lead.—Contents to be determined by wet analysis, deducting one and one-half units to arrive at the dry lead assay.

Ninety per cent. of the lead will be accounted for on the said dry lead assay, provided, however, that in no case will the deduction from said dry lead assay be less than one unit or 20 pounds per dry ton of ore.

The price of lead to be used in settlement will be the London Metal Exchange spot quotation at the Bank of Montreal sale price for sterling exchange, less 1½c. per pound for refining and marketing. Both quotation and exchange rate used to be the average for the calendar week, including the date of arrival at Tadanac, B. C.

You will note that the schedule diminishing the quantity of silver and lead to be paid for with zinc over 10 per cent. is abolished.

Treatment rates as in Schedule "C" are unchanged except that the charge for zinc will be 50 cents instead of 60 cents.

Less for Exchange.

The allowanee for exchange based on the net value of gold and silver paid for will be the excess over 2 per cent. on the Bank of Montreal's purchase price for United States funds for the week including the date of arrival. This is in place of the excess over 5 per cent now allowed.

This proposal involves the fixing of the value of the ore at the time of its arrival at Tadanac, i.e., spot quotation.

Payment in full will be made in 90 days after the date of arrival. Drafts will be accepted for all or part of the value which doubtless could be negotiated without trouble at any bank. Interest during this period will be borne by the shipper.

The price for lead is low on account of the sale of large large quantities in keen competition in the Orient. The Canadian market is taking only a small quantity. The intention is to vary the lead payment from time to time to suit conditions. Stocks are very large at present which, added to poor markets, makes it necessary to defer payments. We hope to be able to reduce the time of payment as conditions become better.

A Possible Pool.

There was some discussion at the meeting as to the payment for lead, but we left the meeting with the understanding that the spot settlement was preferred. It has since been rather forcibly represented to us, from various quarters, that a scheme involving settlement for lead as delivered against sales was likely to result in higher prices for shippers and might be preferred; i.e., to pay shippers at the price we get f.o.b. Tadanac as we deliver against sales, our lead, including the present stock, being pooled with yours.

In view of an impression that we have that shippers were not satisfied with the operation of the previous lead pool, we do not feel justified in starting another in operation unless requested to do so.

We would figure on starting the pool (if requested) with stocks in our hands Oct. 1, 1921, which have not been delivered against sales; to add receipts from all sources and deduct deliveries against sales from month

to month until the stock at Oct. 1 was accounted for, then the receipts in the month of October, and so on. Each month's sales deliveries and each month's receipts would be treated as a unit. The net settlement price for each month's sales deliveries would be that obtained at point of delivery, less freight and other charges incurred in effecting such delivery and also less ¾ cent per pound for refining, i.e., the actual delivery charges and the refining charge would be substituted for the usual 1½ cent deduction.

In the vent of pooling the lead being preferred, no change would be made in any other part of the settlement, except that in valuing ore for drafts, 75 per cent. of the value of the lead at London price less 1½ per cent would be used instead of 100 per cent., as in the lead spot settlement.

Nelson, B. C.: One of the main features of Nelson's Annual Exhibition was a mineral display. An exhibit entered by J. W. Mulholland, well-known prospector, and now the operator of the Ivy Fern, Cultus Ck., included samples of ore from 163 distinct properties. There also was a contribution from the Consolidated Mining and Smelting Co., Trail, including a miniature lay-out of six lead tanks so equipped as to illustrate the electrolytical reducing process. There were specimens, too, of all the varied products of the Company's plant. In the competitive section the prospectors' discovery class brought out four exhibits, silver-lead ore from the W. J. Richards property in Anderson Ck.; gold ore from John Smallwood's Adora group on Bird Ck.; copper gold ore from the Vendla group at Greenwood; and high grade milling ore from the Ross property, Park Siding. The Anderson Ck. ore was awarded first place. Other awards follow: Gold ore—First, Robert Qua, for ore from Gold Plate, Apex; Silver ore—First, James Tiyo, for ore from Duck Creek claims; Copper Sulphide ore—J. W. Mulholland, for ore from the Iva Fern, Cultus Ck.; and Ore from a Shipping Mine—First, Vendla Mine, Greenwood.

Vancouver, B. C.: Litigation has commenced in the British Columbia Courts at Vancouver, B. C., the issue of which is ownership of the Engineer Mine, Atlin District, admittedly one of the richest lode gold properties of the Province, and for which over $1,000,000 has been offered on more than one occasion. The property consists of a group of six mineral claims situated on the east side of Taku Arm, Lake Tagish, near Atlin, on which considerable development has been done showing up a considerable body of ore. There also is a small stamp mill and other equipment. Action is being brought by the Engineer Mining Company and the Attorney General of the Province against J. A. Fraser, as administrator of the estate of the late Capt. James Alexander, who was lost on the S.S. Sophia, and also against the administrator of the Allan I. Smith estate, and against Charles C. Smith, Leda M. Smith, and Louisa Chapman Smith, heirs of the Smith estate. The latter are heirs and successors of the late Capt. Alexander, whose title is assailed. The history of the mine dates back to 1889, when the claims were located by two Swedes, Charles A. Anderson and Frank Nelson, representing the Aga Gold Mining Partnership. These afterwards were taken over by the Engineer Mining Company, an Alaska Company, with headquarters at Skagway. Crown grants subsequently were applied for, but were refused by the Gold Commissioner and Mining Recorder, doubtless on the ground that the provisions of the law had not been fully complied with. Meanwhile, it is alleged by the plaintiff, Alexander and his partners jumped the claims, re-staked, and eventually obtained Crown Grants. The Company asserts that it expended $40,000 on the development of the property. It admits that its free miners' license expired on the 31st May, 1917, but alleges it was not aware of this until 1918. It charges Alexander with making false affidavits when applying for title and alleges that he, in order to acquire the company's stamp mill and other machinery, arranged that judgment be obtained against the company in the County Court, Atlin. The company's mill, buildings and machinery were valued at $20,000, and were sold under process of execution to realize judgment of $452. The property was bought in by Alexander who, it is alleged, prevented competitive bidding at the sale by threat. The plaintiff company asks for a declaration that it is the owner of the mine, and that Alexander and his associates fraudulently, deceitfully, and unlawfully, obtained the Crown Grants.

Victoria, B. C.: Thomas Gibson, Deputy Minister of Mines for the Province of Ontario, while visiting British Columbia recently, observed that while the nickel and copper mining industries of Ontario were at present quiet, there was unusual activity in gold mining. Ontario, he said, was producing more gold than all the other provinces of Canada combined, and this year the value of the output would aggregate between thirteen and fourteen millions of dollars. The great Hollinger Mine in the Porcupine District is producing at the rate of about $8,000,000 for the year.

BEATTY VISITS TRAIL SMELTER.

E. W. Beatty, K. C., the first Canadian born president of the Canadian Pacific Railway, accompanied by Vice-President D. C. Coleman, F. W. Peters, general superintendent for British Columbia; C. A. Cotterill, assistant general superintendent; W. O. Miller, division superintendent; Senator F. L. Beique, of Quebec; Sir Augustus Nanton, head of the Canadian Advisory Board of the Hudson's Bay Company; General H. C. Nanton, and Sir Herbert Holt, president of the Royal Bank of Canada, visited the city yesterday and made a tour of inspection of the big plant on the hill. In the afternoon General Manager Blaylock, T. W. Bingay and B. A. Stimmel brought the party down to take in the sights of the big fair. President Beatty and his party were very much surprised at the high quality of the products of this section, voicing their astonishment in no uncertain manner.

JOBS FOR SENSIBLE WORKERS.

Laborers employed by the Oliver Iron Mining Co. accepted their third wage reduction Aug. 29. That brought the scale down to 30 cents an hour from the high point of 46 cents. Mine superintendents generally claim that the efficiency of labor has increased progressively during the last few months. Cost of production is being brought down substantially. J. H. McLean, general manager of the Oliver Iron Mining Co. states that every effort will be made by his company to afford employment to miners during the present difficult period.

Mr. Samuel W. Cohen has returned to Montreal after an examination of the Murray Claims, Elbow Lake, Northern Manitoba.

A MINE MODEL.

Showing Relation of Mine Workings to Keewatin Surface.

By JOHN W. SHAW.

At the Casey Cobalt Silver Mine near New Liskeard, Ont. the relative position of the various geological formations has an important bearing on the location of the ore bodies. The lowest formation is the Keewatin. The Huronian conglomerate overlays the Keewatin and these two formations are cut by a diabase intrusion which is of much later occurrence than the other formations.

It soon became evident that the pay ore in the veins extended from the Keewatin-conglomerate contact for a distance, seldom exceeding one hundred feet, into the conglomerate. It can, therefore, readily be seen that the location of this contact was of great importance as an aid in laying out exploration work at this mine. In order to get this information quickly over an extended area, numerous diamond drill holes were put down from the surface and from the underground workings to cut this contact. From the data thus obtained a contour map was made of the upper surface of the Keewatin formation. In order to show the relative position of this contact and the underground workings a model was made and it is the object of this article to describe the method of constructing this model in the hope that it may be of benefit to others working under similar conditions.

The model was made on a scale of 100' — 1" and represents an area of about 300 acres.

The contour map was placed on a large sheet of "Beaver board" and, by means of carbon paper, the lowest contour and the next twenty feet higher traced on the Beaver board. The board was then cut along the first contour and nailed to the table intended to hold the finished model. In the same way the second and third contours were traced on a second sheet of Beaver board, cut along the second contour and tacked on the first sheet over the second contour on that sheet. This procedure was continued until all the twenty feet contours had been placed in position. After each sheet was tacked in position it was given a coat of varnish to prevent shrinking. It is to be noted that Beaver board is 1/5" in thickness so that each sheet of board represents twenty feet on the scale used.

The spaces between the contours was then filled with "Plastizine" (a modeling clay). The mine workings on each level a height of ten feet and supported in their proper position on wires driven into the model. The shafts were made of wood and held in position by means of glue. Diamond drill holes were represented by wires stuck into the model in their proper position. The model mine workings, drill holes, etc. were painted to represent the various formations through which they pass.

President Chas. L. Denison states that a meeting of shareholders of Teck-Hughes Gold Mines, Ltd., will be called shortly to ratify a proposed reorganization of the company.

Mr. Thos. W. Gibson, Deputy Minister of Mines, Ontario, has been visiting mining districts in Western Canada.

NEW GOLD RUSH.

Claim-staking has become general among the prospectors who followed the back-trail of Benard Mic-Mac the Indian who recently came into Elk Lake and recorded a number of mining claims. The Indian endeavored to confuse those who followed him, but to no avail, and, anyhow, the records at the mining recorder's offiee showed the location of the find which lies at the north-east side of Luella Lake. In the meantime, the Indian had carelessly shown some samples to prospectors at Fort Matachewan and these men were staking claims adjaeent to the find even before Mic-Mac had reached the recording offiee.

A. E. Dumont who is said to be in the field for the M. J. O'Brien interests was the first to record claims following the recording of the Mic-Mac group. The Mic-Mac Indian recorded six claims. Dumont recorded eight, while Michell and Harry Baptiste recorded four. Up to Monday, a returning prospector declares 49 claims had been staked while others were being staked out as quickly as lines could be blazed and stakes made.

According to prospectors, the gold occurs in schist which shows very little quartz. The enrichment is said to occur in an outcrop of andesite and basalt formation which, starting at the north-easterly shore of Near Lake (sometimes known as Luella Lake) crosses the township line between Rankin and Doon townships and is about a mile wide from east to west and less than two miles in length from north to south. At least this much is shown on the geological map, and there is a possibility of the belt being much longer.

The mining recorder for the Elk Lake and Gowganda districts is absent on his holidays and the local office is in charge of Gladys Brooks, a girl deputy. Instead of business being slack, as has been the case for some months, the office has become one of the busiest places in the town and the new business is being well taken care of.

Up to the present, none of the Government geologists have had time to reach the scene of the new find, but a visit is expected during the next few days.

NIPISSING PRODUCTION.

During the month of August the Nipissing mine produced an average of $5,378.60 every twenty-four hours, thereby setting the highest record so far during the current year. In his regular monthly report to the president and directors, Hugh Park, Manager, states that during the month, the company mined ore of an estimated net value of $172,931 and shipped bullion from Nipissing and customs ores of an estimated net value of $236,558. The value of the silver production was estimated at 63 cents per ounce. Encouraging results were obtained at the second level of the 63 shaft at the end of the month. A vein was found which has a width of from two to three inches and assays several thousand ounces to the ton. This may prove to be a continuation of a small vein found some time ago about 250 feet distant, at which point developments were indifferent. General work at other shafts was usually encouraging. The low grade mill treated 7,325 tons of ore. The high grade plant treated 66 tons. Some changes for improved treatment were made in this plant which temporarily reduced tonnage treated. The refinery shipped 381,504 fine ounces of bullion. The following is an estimate of net production for the month of August: —

Silver	$147,551
Cobalt	25,380
Total	$172,931

The outstanding feature of the report as above presented is the announeement relative to the new high grade discovery which is the first to be made for some months.

TORONTO MINING QUOTATIONS.

Quotations on Active Stocks on Standard Stock Exchange on 4th October 1921.

GOLD PRODUCTION OF YUKON.

The gold yield of the Yukon valley, including Canadian and American territory, for the season 1921 aggregates approximately $4,000,000. It is estimated that the production of the interior of Alaska for the season will run to about $2,675,000. The output of the Canadian Yukon will amount to $1,250,000 for the season. A million of this was produced within a radius of fifty miles of Dawson and the bulk was shipped from that point. This makes a total for the two territories of $3,925,000, to which may be added an estimated $75,000 for the Atlin Camp, which is in Northern British Columbia on lakes which drain into the head waters of the Yukon River.

Following is the total season's yield, as estimated, by camps: Dawson, $1,250,000; Fairbanks, $800,000; Kuskokwill, $550,000; Iditarod, $500,000; Tolovana, $250,000; Ruby, $125,000; Bettles, $85,000; Ophir, $80,000; Marshall, $50,000; Circle, $50,000; Chandelar, $40,000; Hot Springs, $35,000; Rampart, $25,000; Eagle, $35,000; Forty Mile, $40,000; Atlin, $75,000.

Hydraulic operations around Dawson are shutting down, the first frosts forcing the cleanup. Several dredges around Dawson will run two or three months longer. These include two new dredges on Dominion Creek, one on Gold Run, and two on Klondyke Valley. A dredge on Highet Creek, tributary to Dawson, is also having an exceptionally successful season. The Old Glacier Creek District west of Dawson, which was struck before the Klondyke, is producing over $100,000 this year by the old steam thaw and hoisting processes alone.

Mr. John McLeish of the Mines Department, Ottawa, is visiting mining districts in British Columbia.

EDITORIAL

RESEARCH AND ITS APPLICATION TO INDUSTRY.

In addressing the Western meeting of the Canadian Institute of Mining and Metallurgy in Edmonton, Dr. H. M. Tory, President of the University of Alberta, made reference to the fact that many of the important discoveries in natural science have been made by workers who considered only in a minor way, if at all, the commercial value of the results of their research.

It is well known that the most thorough investigations are carried on by men who are chiefly interested in science because of their desire to know. It does not necessarily follow, however, that research that is undertaken regardless of commercial results is more praiseworthy than research carried on with a definite commercial object in view. Nor does it follow that men should be urged to ignore the commercial aspect of research. It is true that many men have failed to profit from the results of their research, and it is likely that many others will have to find their reward in the knowledge of the fact that they have helped in unraveling another secret of nature. Halos for research are cheap in this world, and there are some people who incline to the opinion that a liberal stock of halos is kept on hand by those who turn to their own profit the results obtained by researchers.

We incline to the view that the application of science is quite as important as the truths unearthed by study. In fairness to the researcher, it must be said that he makes gratuitous contributions to his fellows; but he who applies the discovery may make just as important a contribution, and he must also see to it that the commercial results are worth while. Our thanks are due to those who discover truths, but no less are they due to those who demonstrate how knowledge of those truths can be made to serve us profitably.

In claiming that the application of science to industry is quite as important to our welfare as the discovery of nature's truths, we do not wish to detract from the praise that is due research workers who regard the commercial value of their work as of little moment. We wish, rather, to point out that their researches will be of greater credit to them if they do not entirely lose sight of the real object of research—not the search for truth alone, but the search for truth for the benefit of man. It is true that all truths are useful; but it is also true that their usefulness has sometimes remained hidden for days and years, because the researcher had the fault for which there is a tendency in some quarters to praise him—lack of a developed commercial sense.

Dr. Tory states that the primary motive behind research is not commercial, but is "the spirit of man demanding knowledge and going out to find it." He claims that the "best intellects" have never endeavored to make money out of their discoveries. Now there can be little doubt that the researcher, when in the midst of his work, is most likely to get results if he concentrates his attention on his problem. We do not agree, however, that the intellect of the researcher is degraded if he, having made a discovery, endeavors to make useful application of that discovery. Moreover, the ability of the researcher to work is not lessened by his having an idea, when tackling a problem, of the possible commercial value of the solution of the problem. We do not wish to deprecate the value of the investigations that are carried on with the sole object of gaining information; but we are convinced that such researches are not more laudable than researches carried on with a view to gaining information for a definite purpose. There can be no doubt that many discoveries have been made by workers who did not appreciate the value of their discovery, and who worked simply with a desire to learn the facts. They deserve much praise for their contributions to knowledge; but it is as well to remember that if others had not turned their discoveries to the service of mankind there would seldom be occasion to remember the discoverer.

All research is valuable, and those who work solely with the view to gain knowledge will always be honored. All the praise that Dr. Tory gives such workers is due them. We, nevertheless, incline to the view that the application of science to industry is quite as important as the unveiling of nature's secrets. Further, we believe that the desired closer contact between colleges and industry will be brought about by mutual understanding of the work of both parties. Those who wish industry to be more sympathetic with the views of the researcher, will do well to rid themselves of the idea that science is degraded when it is turned to service.

In this connection we may refer to the proposed establishment of bureaus of industrial research. To us it seems that such bureaus must, sooner or later, be established in this country. In our opinion, the value of such bureaus will be determined very largely by the endeavor made to learn facts with definite objects in view. The researcher will inevitably follow many byways in seeking his goal and he may well be allowed to explore those byways; but he should not be allowed to spend too much time on these byways and should be reminded that there is a known value to the goal he started for. If the researcher has no other interest than to explore, he is not likely reach the goal. He may, in his explorations, make valuable discoveries, and the value of these will not be lessened by the fact that they are likely to help him in reaching his goal when he returns to the main object of his search. But aimless wandering with no advance towards a definite object is not the type of research that industry wants. Those who are in charge of bureaus of research must be familiar with the problems of industry and point the way, so that the work of the researcher will be along lines that are likely to lead to results that are commercially valuable. If the "best intellects" cannot work along these lines, industry will have to use ordinary mortals in its research bureaus as it does in its other departments.

THE THREATENED RAILWAY STRIKE.

The dispute over wages is developing rapidly towards a crisis in the United States. The railroad workers are naturally unwilling to accept reductions and they threaten to strike. In view of the industrial situation in the United States it is not likely that the railroad workers are anxious to join the ranks of the unemployed. It is also probable that, if they do, they will get little sympathy from the workers in industries which will be adversely affected by a strike.

It is certain that the railroad rates are too high for business and that the wages paid make it difficult to reduce the rates. To many it will appear that the announcement of a cut in railroad workers' wages is a belated recognition of the inevitable. There will not be a great deal of public sympathy for those who insist on having wages that make business impossible. It is to be hoped that a strike will be avoided, for it will help further to handicap many struggling industries. From the reports which reach us, however, it seems not unlikely that the railroad workers are determined to use a weapon which is most powerful, but often dangerous to the user and to spectators of the battle.

THE SEARCH FOR OIL.

There has not yet been announced any spectacular discovery of oil in the Mackenzie River area this summer. The difficulty of exploring areas where transportation is such a large part of the problem make progress slow, and there is now concensus of opinion that it will be some time yet before the value of the discovery made at Fort Norman last year will be known. There is noticeable a better appreciation of the distance of Fort Norman from the railways, and a tendency to turn from distant fields to others that are more easily reached.

The Fort Norman discovery attracted much attention because of its great significance. It served as a reminder that our unexplored areas may become the scenes of great industrial activity when their secrets are learned. Whether or not a productive oil field is found and developed in the Fort Norman area, the discovery made last summer will mark an important point in the history of the development of the Mackenzie River region.

During the past summer many have visited the scene of the discovery. Many others have gone into the district and explored small portions of the great territory tributary to the Mackenzie. Some have written accounts of their trips, and our daily and weekly newspapers have published, this year, many interesting descriptions of voyage to Fort Norman. The district has become of real interest to a great many people. Its development will, as a result, come much more quickly because of the oil discovery. Interest will lag because of the apparent scarcity of results obtained this summer, but realization of the difficulties will lead to postponement of judgment for some time yet. We may expect that areas more easily accessible will soon begin to show results of exploration of oil; but apparently the possibilities of the Fort Norman field cannot be safely guessed at this year.

Government officials, recently returned from the Mackenzie River area, are reported to be of the opinion that it will take at least another year to determine the importance of the Fort Norman field. Even then, the oil resources of the far north will be almost unknown, for it will take many years to prospect the area that is regarded as favorable for oil.

Henry Ford is introducing new ideas in paying workers at his Michigan iron mine. He pays surface workers at the same rate as miners.

EDITORIAL NOTES.

Commenting on the McFadden bill, a contributor to "Mining and Scientific Press" remarks that "special privilege legislation such as this is never desirable as a political policy." He contends that passage of the bill would temporarily stimulate, but not build build up the industry. One might suggest the possibility of getting a new prescription after the stimulant has done its work; but we are inclined to agree with the general view of the contributor, if not with his particular statement, that the present depression is largely the result of recovery from special privilege laws.

It is expected in Sydney that a large tonnage of steel rails will shortly be ordered for the Canadian National Railways. If such an order is obtained by the Nova Scotia steel manufacturers it will materially improve industrial prospects in Cape Breton. At present, there is a dearth of orders for steel and this makes the coal mining industry's outlook none too bright.

Commenting on the rise in the price of silver, "Engineering and Mining Journal" remarks that there has been no notable accumulation and that it has naturally been one of the first metals to respond to better feeling. Of the future course our New York contemporary predicts that there may be a slight reaction following the spurt upward, but not a permanent one.

Lead is reported to be in good market position, stocks being low and prices firm with a tendency upward.

According to opinions expressed by several mining engineers in the "Mining and Scientific Press" there has been no notable increase in gold mining in the United States recently, except at Cripple Creek. The improvement in conditions has evidently not been as great as in Ontario's gold mining districts.

NICKEL IN ORE FROM B. C. MINES.

Victoria, B.C.: George E. Winkler, president and manager of the Gabbro Copper Mines Ltd., west coast of Vancouver Island, reports the discovery of nickel in the ores of that property. In a zone recently uncovered, having a maximum width of over 30 feet, there was shown considerable copper and a great deal of pyrrhotite. Unlike occurrences in the Smloch Mine, situated in the near vicinity, where what is known as the Cave Zone is in the basalt, several hundred feet from the gabbro contact, the newly found one of the Gabbro Mine is entirely in the gazbbro. A pyrrhotite sample was selected for the purpose of assay for nickel. It was assayed at the Provincial Bureau of Mines and gave a return of 5 per cent nickel. Check assays gave similar results. Specimens have been sent to the Canadian Geological Survey Branch, Ottawa, where they have created much interest.

THE CONSUMPTION OF EXPLOSIVES.

The mining industry is by far the largest consumer of explosives according to the United States Bureau of Mines. The quantity thus used is generally about 75 per cent of the total production of all classes of explosives.

Coal mining normally consumes between 80 and 85 per cent of all black powder and permissible explosives used in the United States, and between 8 an 16 per cent of other high explosives. Other mining and quarrying operations consume from 40 to 50 per cent of all high high explosives other than permissibles, 6 to 17 per cent of permissible explosives, and 3 to 4 per cent of black powder.

In 1920 the sales of permissible explosives, which are those tested by the U. S. Bureau of Mines in an atmosphere containing inflammable gas and coal dust and found to be reasonably safe for use under such conditions, reached a record-breaking figure. The quantity reported was 53,962,841 pounds, an increase of more than 15 million pounds, or 39 per cent, as compared with 1919, and nearly double the sales reported for 1915. For every thousand tons of coal produced, the relative amount of permissibles used, as compared with other explosives, has more than doubled since 1912. In 1902 only 11,300 pounds of these short-flame or "safety" explosives were used in coal mining.

The quantity of permissible explosives used in the United States is larger than that of the corresponding explosives used in a number of foreign countries. In 1912 it represented about 5 per cent of the total quantity of explosives produced in that country, and in 1920 it was 10.03 per cent. The total amount of explosives used for the production of coal in 1920 was 302,258,010 pounds, of which 15 per cent was of the permissible class.

Accidents due to the use of explosives during the past nine years, have caused from 4 to 9 per cent. of all fatalities at coal mines, 9 to 14 per cent at metal mines, and 13 to 26 per cent at quarries. Considered in relation to the number of men employed, there has been a general decline in the number of such fatalities, although the rate has fluctuated from year to year. From 37 to 61 per cent of the fatalities in the United States occurred at the anthracite mines in Pennsylvania.

BRITISH MINE OWNERS WIN.

The labor troubles in the South Wales coal field, which arose over the interpretation of the terms of settlement of the recent coal strike, have been settled in favor of the mine owners, according to the award made by Sir William Plender, who had been selected to arbitrate the differences between the miners and the owners. The Mines Department of the Government had contended that the liability of the mine owners for September wages was 97.57 on the 1915 standard. The owners claimed that the liability should be 76.6. The Mines Department had maintained that the owners should contribute ten shillings per ton, amounting in all to £750,000, toward wages. The owners claimed that this sum should be provided through the Government subsidy of £10,000,000. At a meeting in Cardiff on September 26 the mine owners decided to close a large number of the collieries. On October 3 the mine owners agreed to refer the dispute to an Arbitration Board. The award of the arbitrator is expected to result in reopening of numerous collieries, thus easing the unemployment situation.

The Search for Oil in the Pasquai Hills

By Reece H. Hague.

Having recently returned from a visit to the Pasquai Hills, a district in which the search for oil has caused considerable discussion of recent months, the writer feels it may be of interest to outline the situation existing there.

For many years the presence in the Pasquai Hills of tremendous bodies of shale carrying an oil content has been known, and from time to time in the past prospectors have visited the district and staked claims, only to find when attempting to record them, that the land, being part of a Dominion Forest Reserve, was not open to be leased.

The Imperial Oil Company had representatives in the district in 1913 but suspended operation shortly after the outbreak of war.

When, in November last, the Pasquai Hills was thrown open for staking there was a rush of men, anxious to secure oil leases, to the locality and many thousands of acres were staked. Several syndicates were formed, some of them with the intention of boring for oil and others bent on extracting oil from the shales. S. C. Ells, a Dominion Government shale expert, spent several weeks going over the district carefully and securing samples for analysis. His report on the district has not yet been issued; but should throw considerable light on the subject when published.

Of the various organizations formed for the purposes of carrying on the search for oil in the Pasquai Hills, the one which has made most headway and is deserving of most credit is the North Battleford Oil and Gas syndicate, a group of Saskatchewan men who contributed a sum of money towards conducting investigations in the district and refrained from stock selling. A Star Drill was purchased in the United States and arrangements made for its transportation to the Pasquai Hills. The Syndicate had much to contend against. Many people sneered at the possibility of an oil field occurring in the Pasquai Hills district and the syndicate received little encouragement or help in the early stages of their work.

As is always the case of pioneers in any industry they found that the task they had undertaken was a difficult and expensive one and it has cost them in the vicinity of $40,000 to get their rig to the spot chosen for drilling, the parts assembled and a start made in the drilling.

It was necessary to transport all their plant 120 miles by water from The Pass to an unloading point on the Carrot River, a stream which is shallow in places and in low water offers difficulty in the matter of navigation on account of rapids. After unloading their material from the boat there was still an 18 mile journey through the bush to be undertaken before reaching the drilling site on the banks of the Man River. A lumber company tote road extended for 5 miles of the distance but the other 13 miles of road had to be cut through a dense bush. The going on the completed road was very heavy in places, the sticky black mud frequently reaching over the axles of the waggons, and the horses being able to pull only light loads on each crossing.

Eventually all the necessary equipment was taken to the Man River. Oil drillers were secured from the United States at a big expense and everything in readiness for the spudding in of the first well, which took place on October 3.

The writer accompanied G. B. MacMillan, field manager for the syndicate, on a journey to the Pasquai Hill to witness the spudding in. The well was officially christened the "Battle No. 1" and the hope that it would be a gusher expressed.

The drillers are favorably impressed with the formation of the country in the vicinity of the drill and consider the chances of striking a well good.

The drill is erected about 200 yards from the Man River on what Mr. MacMillan claims is the only true anticline he has seen in the district. Immediately across the river from the drill site is a towering exposure of shale. While sinking for water for the boiler, a few feet from the drill, heavy shale giving forth a strong smell of gasoline was encountered at a depth of six feet.

It is believed that this body of shale will extend for some 150 feet and that it will not be necessary to use casing in the whole for that distance. A large supply of casing has been secured to be used when necessary, the largest size being 12¼ inches and that with which it is intended to finish the hole 7¾ inches.

Only one tower is being worked at present, but it is the intention of the syndicate to get more drillers and start to operate a second tower almost immediately. When both towers are working the combined shifts should cover 40 feet a day unless some unforseen obstacles are encountered. A hole eight feet deep was dug before drilling was commenced in order to pass through a narrow boulder strip which would have impeded work in the initial stages. The syndicate have agreed to supply the Director of the Boring Division, Geological Department, Ottawa, with the log of the well and samples taken every few feet in the sinking.

Mr. MacMillan is confident that if oil is not encountered gas will be, as the presence of gas in the district has long been known and one prospector, after sinking a hole thirty feet with hand augers, had his tools blown into the air by an escape of gas, which rendered the atmosphere so bad that he was unable to return to the scene of his operations for some time.

The peculiar rumbling which is noticeable in the Pasquai Hill is attributed by some people to the presence of gas. The Indians who live in the foothills have a superstition that it is the growling of the spirits of the bears, which they maintain reside in the mountains and create an uproar when angry. The Indians have other superstitions regarding the Pasquai Hills and few of them will venture into the region, which they say is "Bad medicine."

Seepages have been encountered in the locality and it was noticeable on the trip to and from the Man River that the water in some of the streams left a thick scum of oil on the drinking utensils, when boiled.

Traces of Mr Ells' work were seen in the Hills. In one place he made a deep excavation into the side of an 80 foot exposure of shale occurring on the bank of the Man River. While working in the locality Mr. Ells uncovered the fossilized remains of what was at first thought to be a dinosaurus but which has later stated to be a conglomeration of bones of animals dat-

ing from the very ancient to the comparatively modern times.

The Man River at the spot where the Syndicate are drilling is 400 feet higher than The Pas and some 80 miles distant in a direct line, and in the event of oil being encountered it could be taken to the latter point by a pipe line.

Near the drill site is an ideal holding basin for oil, which could be used pending the construction of tanks. It is the intention of the drillers to cap the well temporarily in the event of indications pointing to oil or gas being near, in order that the necessary arrangements for controlling the flow can be made.

The cost of drilling is estimated at $6.50 a foot and with the other heavy expenses which the Syndicate will have to bear it will cost them a considerable sum of money to bore a well of any great depth. After the freeze up it will be necessary to transport supplies and any necessary equipment from The Pas into the Man River by horse teams, a distance of 120 miles.

Early Prospecting.

Probably the first prospector for oil in the Pasquai Hills was a German by the name of Brunne who lived in the district for many years, but never divulged what he had discovered. His secrecy gained for him the reputation of being an employee of the German Government, which it was stated he supplied with traeings of the district. However these rumours were probably unfounded as no proof of them is forthcoming.

Brunne died in 1911 and a tracing showing a staking in the Pasquai Hills was subsequently found in his old grub box. The location was rather vague, but a party of men who were taking up leasage in the Pasquai Hills recently found a stake bearing Brunne's name and showing that it was his Number One post on a staking made June 10, 1908.

The writer visited Brunne's old cabin situated not far from the Syndicate camp on the Man River. The cabin has fallen badly into repair and tools such as augers which were found in it have been eached near by.

Several American oil operators have visited the Pasquai Hills district recently and there is a probability that one or two more rigs will be installed in the Man River locality at an early date.

Some Leasers' Difficulties.

The Dominion Oil Regulations, as they stand at present, offer little inducement to development and there is a strong feeling locally that steps should be taken to have them amended. Then again it is a matter of months after an application has been put into Ottawa for acreage before the lease is granted and for some reason companies applying for shale rights have been unable to secure same.

Forest rangers keep a jealous guard of the timber in the district and a permit is required and charge made to cut even standing dead wood.

A charge of 50c an acre is made for land staked and it is necessary to stake for the Crown a tract of similar size to that applied for. Many applications for ground have been in Ottawa accompanied by the fee for months and no word of the leases has been received by the applicants.

Naturally in a district such as the Pasquai Hills there has been some confusion as regards applications, as the territory is unsurveyed and there is occasionally a paucity of detail as to exact location and a certain amount of overlapping of claims to be considered. The delay in receiving leases applies, however, to claims the titles to which are perfectly clear.

There is a general feeling existing among oil men who have visited the Pasquai Hills that in the event of indications being born out by drilling the Pasquai Hills will be the next big oil field on the continent. In any event there is general satisfaction expressed at the fact that one syndicate at least is going ahead and spending money in the district in a legitimate development enterprise and the results of their investigations are being eagerly watched in many quarters.

Providing work is carried on continuously, the next two months should tell the tale and in the event of the North Battleford Oil and Gas Syndicate's venture proving successful they will be well repaid for their expensive and arduous pioneering work. Residents of the district are viewing the matter sanely. While considerable staking has taken place in the district there has been no mad rush or undue excitement. People are sitting back waiting for results, but ready, as soon as any definite news leaks out, to hike with all haste in to the Pasquai Hills and get their share of land before outsiders can secure it all.

KERR LAKE MINES, LTD.

Mr. Adolph Levisohn, president of Kerr Lake Mines, Ltd., in his report to shareholders, says of operations for the year ending Aug. 31, 1921:

On account of the decline in the price of silver, operations were curtailed last December, though development work has been carried on continuously. The shipments for the year amounted to 282,075 gross ounces of silver. The smelter settlements aggregated 242,008 ounce, the difference being accounted for by the deductions made by the smelting works for losses and in the way of treatment charges.

During the early part of 1921 an opportunity presented itself to acquire the Hargrave property consisting of 80 acres (adjoining the Kerr Lake Mine) at a very favorable price. The ore taken from this property has already returned the purchase price and our engineers are hopeful that additional ore will be located so that the company may earn a substantial profit on this investment.

The Tahoe silver mine, in which this company has a majority interest, has been in continuous operation and has produced, since this company acquired its interest, a total of 983,007 ounces of silver and 1,868 ounces of gold. Certain unanticipated mining and metallurgical difficulties have been encountered which have prevented the making of as large a profit as hoped, but despite these the property has operated at a profit and the initial difficulties are, from present indications, gradually being overcome. Due to the fact that the oil engines have been superseded by electric power transmitted directly to the mine by a public power company, it is hoped that the mine will be able to operate more successfully during the coming winter. Development work at depth is being pushed.

During the year work has been continuously carried on in the construction of a 10 cu. ft. dredge on the property of the Rimu Gold Dredging Company in New Zealand, which is also controlled by this company. This dredge has recently been completed and a cable has just been received from the manager stating that the dredge began operations on September 12th, 1921.

Origin of the Explosion at Coal Creek

By J. J. ASHWORTH.

Second Report on the explosion which occurred in the Crows Nest Pass Coal Cos. No. 3 coal mine at Coal Creek, Fernie, B.C., on the 5th April 1917.

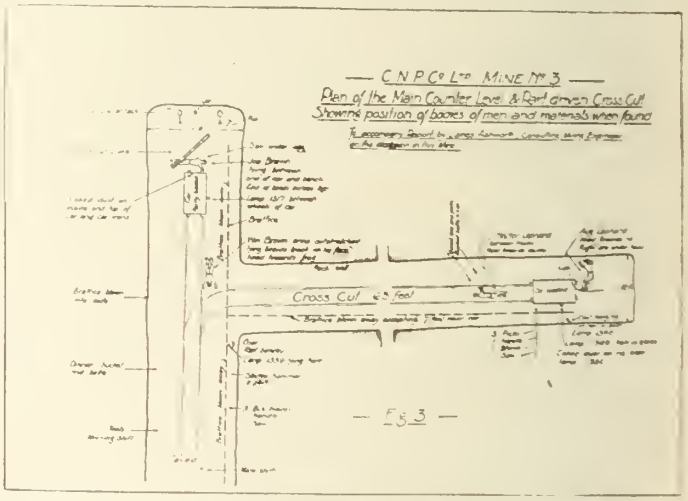
The first report on the Coal Creek explosion was made by the writer to the British Columbia Minister of Mines, the Hon. William Sloan, immediately after the inquest held by Mr. Murray on the bodies viewed by himself and the Jury, and as it was agreed by everybody who was interested in the exportation of the mine and the recovery of the remaining bodies, that as a consequence of the enormous damage done to the roadways and workings it was impossible to recover the remaining bodies for at least six months, the inquest was brought to a conclusion, without any evidence being produced as to the origin and cause of the explosion. It was, however, understood that if the Coroner thought it necessary after the recovery of the remainder of the bodies of the men killed, he would reopen the inquest.

Shortly afterwards one body was recovered, which proved to be that of a man who had been wrongly identified and the inquest was reopened, but, after the last of the bodies had been recovered, the further reopening of the inquest has not been permitted, and thus no verdict has been rendered by the jury as to the cause, the place of origin or whether or not any one was blamable for the deaths of 34 men.

The Minister of Mines' Report for 1918 does, however, give us a second Report from the Chief Inspector of Mines on that disaster, in which he explains why he concluded that the explosion was caused by a miner named August Leonard, whom, he thought, had punctured the glass of safety lamp No. 1349, and thus rendered it unsafe. If this had been correct, the miner would have broken one of the most important rules for safeguarding the colliery from such a disaster. Now what is the Inspector's argument? (page 347). First he assumes that August Leonard was *carrying* lamp No. 1349, but of this there is no proof whatever, nor that he was carrying a pick and other tools. Then he states: "Apparently, in passing through the narrow space between the car and the brattice, the glass of the lamp carried by August Leonard got punctured by coming in contact with some sharp instrument, presumably the point of a pick." The Chief Inspector goes on to say: "It is my opinion that this is the point or origin of the explosion, and what took place is about as follows: August Leonard was in the act of carrying back his tools. Having too many he probably stumbled, and one of the pick-points struck and penetrated the glass. It would seem probable Leonard heard the pick strike the glass, dropped his tools and raised his lamp to see what damage was done, raising it high enough to reach an accumulation of explosive gas along the roof of the place, so igniting the same, thereby causing the primary explosion."

Some extremely unlikely suppositions are grouped together in this theory. First, as to the tools; these were 2 pick POINTS,—one pick and handle, one shovel, and one saw,—hence it is clear that either the pick points or the pick MUST have been in an unexplained position to make it possible to be near the safety lamp glass, and it is also evident that nothing but a very sharp and hard blow could break a PUNCTURED hole through a safety lamp glass. Further than that, August Leonard was the whole length of the car away from the tools named, and, as showing that he was not near the tools when the explosion occurred, his cap was found close to his body behind the car. The Chief Inspector goes on to surmise that the blow from the pick point did *not* extinguish the flame in the lamp, and as a matter of fact, if those had been the conditions, then the explosion would have followed without giving him time to look at his lamp. To further back up this theory, we are asked to assume that the other lamp No. 1350 was not alight. We are also asked to assume (and are willing to do so), that there was a dusty atmosphere containing 4 per cent of explosive gas.

The Chief Inspector of Mines report does not favour us with the name or names of the originators of this theory of the puncturing of the lamp glass and no



Plan of main counter level showing position of bodies of men when found.

other theory is suggested than that August Leonard who was not found near the lamp was the culprit. Further there was absolutely nothing to provide a suggestion that the other lamp was already extinguished, seeing that it was provided with the ordinary Wolf relighter. It certainly does not seem reasonable to suppose that the miner would be trying to relight a damaged lamp when a safe lamp was already "in the dark".

The date and time of the recovery of August Leonard's safety lamp is not stated, but, as a matter of fact, the lamp was found covered with debris when the place was being cleaned up after the recovery of the bodies, and therefore there is a more than strong supposition that the lamp was punctured inadvertently by the pick of the man who found it. The puncture was a fortuitous happening, and was in itself a convenient circumstance on which to base a theory which was not borne out by any surrounding circumstance or evidence.

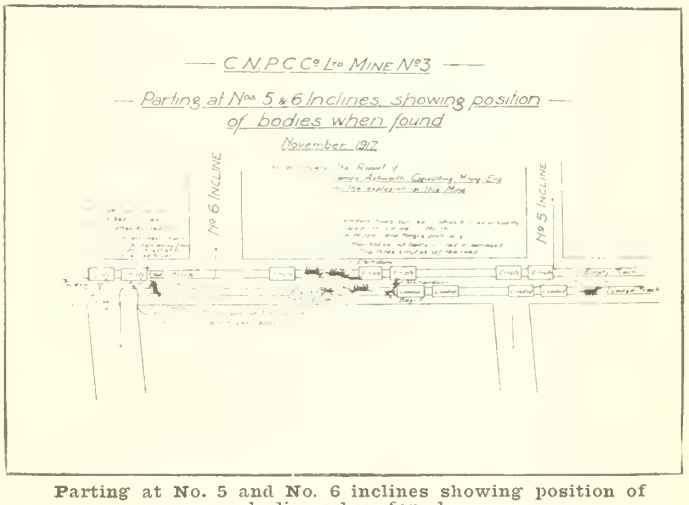
Was the miner to blame for working in dangerous

places under such conditions, or who was to blame? There was nothing in the then British Columbian Act of Parliament or in the Special Rules stating what percentage of gas constituted a dangerous condition of the ventilating current, but it does state that it must be "safe" for working and passing therein. This point was considered when the writer made his report on the explosion which occurred at the Reserve Mine at Nanaimo, and he then suggested that the rule used in British mines should be adopted, and so each fireboss would then understand that a quarter inch cap was the danger point. Small folding cards showing the appearance of the danger cap had been in the hands of officials long before the Reserve mine explosion, and were first issued in Sir Richard McBride's day.

Outside the question of the cause of the explosion, we have here a serious breach of British justice, viz., the condemnation of a miner for all this loss of life, without any semblance of a trial either by the coroner or by any special commission. There are other facts which, if considered in this connection, support the above arguments, and absolve August Leonard from the suggestion that his carelessness was the cause of this great disaster. Thus if we turn to the indications of force in the main level at bottom of Nos. 5 and 6 inclines and carefully examine these, we find that the Chief Inspector of Mines has had to adopt an impossible theory on which to build up his arguments as to the direction of forces, viz., that a heavy body of matter will be thrown further and more easily than a lighter body, that is to say, that where a horse is standing with its head pointing north and with a train of empty cars behind it, and a great blast of air rushes past in the direction south to north, the horse, although protected from the direct force by the cars, will be thrown out of the shafts, leaving its collar behind and the cars also. He then assumes that the horse driver is thrown into the place where the horse had been, — but whether by the same force or a secondary one he does not explain. Neither does he attempt to explain why the horse's collar, the safety lamp (in 2 parts), and the wood work of the tops of the cars, and probably the driver also, were thrown in the opposite direction to which he assumes the horse was thrown. The evident fallacy of this reasoning is so clear that it entirely absolves August Leonard as a culprit without other evidence which does so more completely.

The writer will now leave the Chief Inspector's theory for a time, and proceed to disclose his own theory based on all the indications disclosed during the cleaning up of the mine so far as it has gone.

Thus, at the time of the coroner's inquest it was evident to those who saw the inside of the mine, that the force of the explosion had come down Nos. 5 and 6 inclines, and possibly from the main level also. The evidence called attention to the various levels which were being driven to the south out of No. 6 incline, because out of No. 2, two miners left their work a considerable time before the proper quitting time. One of these men, Giacomazzi, had a brother working in No. 1 level, and as no one could suggest to the writer any reason why he and his partner should have come out before the end of the shift, he has always thought it was worth while to try and find out why they had quit. Unfortunately, these two men were killed when almost out of the mine, though one of them was still alive and lived three hours after being found by the first explorers. So far, information supplied to the writer has omitted the smallest mention of No. 1 level out of No. 6 incline, but it was established when the two bodies were recovered, under dangerous conditions, that both Nos. 1 and 2 levels were extra badly blocked by fallen roof, and that the indications of force were from No. 1 level direct into the incline, upwards also into No. 2, and thence into the incline, and so on upwards, and also across into No. 5 incline and again upwards to the top end and downwards into the main level. In the main level, the indications were most distinctly outbye from No. 5 incline, and thence also into the counter level. The roof falls inbye from No. 5 were so heavy that the direction of force could not be accurately diagnosed. However, since the cleaning up of the main level it has been ascertained that there were several horse drivers, with cars and horses, at this point, all of whom were evidently killed without any warning whatever, in fact so instantaneous was the death of one of them that he was found with his mouth wide open, as at the Reserve mine explosion, where there was a similar case, it may be safely assumed that the point of origin was pretty close at hand. On the inbye side of No. 6 incline there was a horse, its driver and some cars, and the main indications of force were inbye and across



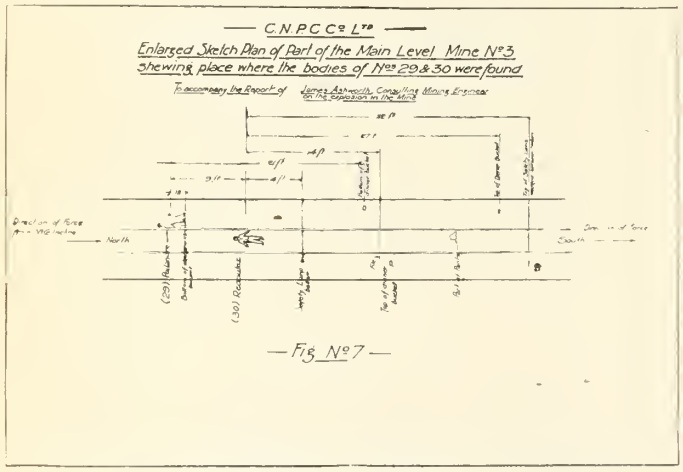
Parting at No. 5 and No. 6 inclines showing position of bodies when found.

the level, — the horses collar and gear having been torn off and found inbye of the horse, whilst the shafts remained attached to the cars and as these were empty they were wrecked and blown further inbye. The driver also with the driving lines still in his hands and his body burned and clothes ripped off was found between the shafts. The driver's safety lamp was smashed, the bottom part being on the roadway near the first car, and the rest part on the bottom of the remains of the second car. As usual, the wooden tops of these empty cars were smashed up, whilst the loaded ones remained intact.

With regard to the indications of force at this point the Chief Inspector could not make them fit his theory as to the point of origin without assuming that there were two forces, with an interval of time between to account for the position of the horse, viz., that an outward force, say from August Leonard's place, blew the horse out of the shafts outbye and that, later, the driver was forced into the place where the horse had been, seemingly forgetting that the lighter articles are always blown the furthest and that thus, the man, the cars, horse, collar and lamp top were carried furthest inbye. The position of the horse clearly showed that the force which threw it into the position where found

was a diagonal one which then passed through the cross cut on the lower side into the counter level and also inbye on the main level at the same time. It then became a race as to which force would first reach the end of the counter and main level, and possibly, as the air in the counter contained the most explosive mixture this force reached the men the first. Thus the heat effect would be more prolonged because there was not only flame heat, but also that due to compression which would operate until the force of the explosion had expended itself, and the condensation stage had set in. There was, however, further proof of the correctness of this argument in the main level, where two miners who had been driving it were found 500 feet outbye of the face, practically stripped of all their clothing, one safety lamp bottom being found on the high side of the level, a little inside of one of them, while the top part with the gauses near by, was found 28 feet further *inbye*, — the same with the men's dinner cans, the tops were further *inbye* than the bottoms or heavier parts. Nothing could be more conclusive evidence of the inbye direction of force than these positive facts.

Now, to return to the face of the counter, and the part driven cross cut, here there was phenomenal caking or coking of dust which could not have occurred if either



Plan of part of main level showing place where bodies were found.

of these places had been the point of origin, as, in that case, the heat would have been much less, and the force which was clearly in evidence would have been absent.

There is one more point in regard to the lamp No. 1349 of which the writer has only seen a photograph, which when the lamp is taken to pieces may prove whether or not it had passed a flame from the inside and thus ignited gas.

Again, on returning to the bottom of No. 6 incline and proceeding out by the damage done to the cars, men and horses is so slight in comparison with that done inbye that a reason has to be sought and that is quickly discovered on reaching the bottom of No. 5 incline. Here we find unmistakable evidence that the force and flame of the explosion also came down this incline, as in No. 6, and crossing the level into the counter than passed on oubbye on both the main level and the country.

Thus the siding, where most of the horse drivers were found was placed between two opposite forces, and in this way became a heated area under great compression and consequently the mechanical damage was very small. At least one horse was found in its shafts with the harness complete, and the body of the man which was found with mouth wide open where he was standing before the explosion, was not thrown about, but he was the worst burnt in this group and had most of his cloth ripped off. Thus the indications of force in this area become the most convincing evidence that it came down both Nos. 5 and 6 inclines, and that its point of origin must be looked for in that direction. We can, however, at once expunge No. 5 incline from further examination, because there were no working places out of it where the explosion could have originated. But in No. 6 incline there were several working places, of which any one may have been in a condition to originate an explosion. In fact in its normal condition the air coming down this incline seems to have carried at least two per cent of gas with much fine coal dust resulting from the passage of horses and cars. Broken lamps were found, thus No. 1375 was found with the glass broken, hanging up at the face of a crosscut. It had coked dust and small coal driven into the shield. Part of lamp No. 1388 was also found in No. 5 level. Why, then, should not either of these lamps or the miners using them be adjudged guilty of causing the explosion? Moreover, lamp No. 1375 was found in a condition much similar to that of August Leonard's, but the direction of force was from this cross cut downwards only as far as the next cross cut, where it turned north and not to the main level to the point from which the course of the explosion has already been definitely traced. It is not suggested, therefore, that this might have been the point of origin. The bodies of the two men found in this partly driven cross cut were, however, badly burned and a sample of coal dust taken from the next cross cut below showed the effect of great heat, as its analysis proved, viz., Moisture 1.3, Volatile matter 11.4, Fixed carbon 61.4, and Ash 25.9. Proceeding downwards in the direction of the ventilating air current, but in the opposite direction to the indications of the force of the explosion, we come to No. 3 South level, where in a cross cut between it and No. 2 South level a sample of coal dust was taken, which on analysis showed strong coking, viz., Moisture 1.2, Volatile matter 14.4, Fixed carbon 70.7 and Ash 13.7. Another sample of coal dust taken in No. 6 incline opposite No. 2 South level gave a similer analysis, viz., Moisture 0.8, Volatile matter 16.4, Fixed carbon 66.8, and Ash 16.0.

It has previously been shown that the indications of forces at the bottom of No. 6 incline demonstrated that it came DOWN the incline, and thence along the main level and counter in a southerly direction, and simultaneously with the force which came down No. 5 incline and which took a northerly direction to the old workings and the outside of the mine. Thus we have reached the point where the evidence demonstrates most distinctly that the point of origin of the force of the explosion must lie between Nos. 3, 2 and 1 levels. — In No. 3 two men were at the face; in No. 2 the men, Benezeth and J. Giacomazzi, had left their working place before quitting time, and their bodies were found in the main slope as previously described. In a cross cut out of No. 1 level B. Giacomazzi and Falip were at work, and though their bodies were recovered, their safety lamps were not recovered, and, so far as the writer has been informed, Nos. 1 and 2 levels have not been cleaned up nor carefully examined for information

which might disclose the cause of this disaster. After carefully considering the points already noted, the writer has come to the conclusion that the most probable point of origin is to be found in No. 1 level and cross cut, and he has assumed that B. Giacomazzi and his partner No. 2 level had some good and sufficient reason to cause them to hurry out of the mine.

The time when the disaster occurred, viz. at the end of the shift is very suggestive of blasting, the coal being hard in the crosscut, and although it has been definitely stated that no blasting was allowed, yet similar instances are on record. Thus, after an explosion in South Wales, Prof. Dr. William Galloway was left by the other experts solely by himself with the opinion that the cause of the explosion was a shot. However, he has lived to find out, years afterwards, that his conclusion was correct.

The writer would be loth to assert that a shot was the cause of the explosion at Coal Creek No. 3 mine, but, all the same, the indications of the direction of force point most distinctly to No. 1 level out of No. 6 incline as being the point of origin. Over four years have now elapsed since the disaster, but it may not yet be too late to discover the cause, which at the time of the explosion was attributed by the management to alien devilry.

Since the foregoing notes were written the B. C. Department of Mines in the spring of 1920, granted the writer's frequent request that the two missing safety lamps used by Giacomazzi and Falip, in No. 1 level out of No. 6 incline of No. 3 mine Coal Creek, should be recovered. These lamps had been left inside the mine at the time the bodies were recovered, at which time Giacomazzi's body was found lying on his back close to the high side rib, and his feet in the shearing,—Falip's body being also close by in the centre of the room, face downwards and with his face touching the coal. His clothes were badly torn. The lamps were found on about the first day of May 1920, in the proximity of where the bodies had lain, Falip's lamp being fifteen inches and Giacomazzi's thirteen inches from the coal face.

The latter's lamp had part of the shield and the glass broken, a portion of each being missing, the glass was smokey and the bottom gauze filled with coked coal dust. Fallip's lamp was practically intact, but had received a blow on the side of the shield causing it to press on the gauze. The glass was smoky and the lower gauze coated with coked coal dust.

These indications prove that the force came inwards and that it had not originated at the face of the level where the bodies of the men were found. With regard to this point, the ex-Chief Inspector of Mines (Mr. Wilkinson), in his first report, notes on page 507 (1917), that these two miners were not in their working place where the coal was hard, whereas at the face of the level the coal was soft. He says, that there were no signs of coking, but large deposits of soot and dust, also that the men were driving a cross cut to No. 2 room or level. Two other cross cuts had been previously driven from No. 1 to No. 2 level, and the indications showed that the line of force was inwards from the incline, and up the cross cut into No. 2 level or room.

These facts, when grouped together, and considered alongside with those disclosed at the foot of Nos. 6 and 5 inclines, and inbye also where the bodies of Philandre and Redoulez were found, show distinctly and in regular sequence that the origin of the explosion was in No. 6 incline district. In Nos. 5 and 6 inclines the force indicated a downward direction from, say, No. 2 level, and also an upward force from the same point, which again proves that the point of origin was in either No. 1 or No. 2 level, or in a cross cut between the two, and as Giacomazzi and Falip were the only miners at work in this area it would seem only necessary to find out which was their working place to completely unravel the mystery.

WORLD'S COAL PRODUCTION.

The world's production of coal during the first six months of 1921, according to reports collected by the United States Geological Survey, was approximately 525,300,000 metric tons. This was at an annual rate of 1,050,000,000 tons, a decrease of 250,000,000 tons when compared with the year 1920, and much below the output in any year of the preceding decade. The largest factors in this decrease were the British miners' strike, which lasted from April to June, and the world-wide industrial depression. The reaction has been in striking contrast to the feverish demand of 1920. Prices have collapsed, and seaborne coal trade has fallen off, affecting profoundly the volume of business offered to the world's shipping.

It is clear that the output during the second half of the year will be larger than in the first half because of the resumption of work at British collieries early in July. Even so there is little hope that the total for the year will much exceed 1,100,000,000 tons. Should that prove to be the case the world's production will have dropped back to the level of 1909. There is perhaps no more striking evidence of the state of prostration of world trade and industry than this fact. The relapse to 1909 levels is even more significant when it is remembered that the world's consumption of coal normally increases by leaps and bounds. The average rate of increase in the 20-year period preceding August, 1914, was 38,000,000 tons a year.

Of the principal coal-producing nations, Germany made perhaps the best showing in the first half of 1921. Production of bituminous coal in all districts, including Upper Silesia and the Saar Basin, was at the rate of 141,000,000 tons per year, far short of pre-war performance, but the output of lignite showed an increase over 1913 amounting to almost 30,000,000 tons a year. Whereas in 1913 the German Empire supplied only 22 per cent of the world's production of coal and lignite, its contribution in the first half of 1921 was 25 per cent of the whole and this in spite of the return of Alsace-Lorraine to France.

The proportion contributed by the United States was 42.2 per cent, a larger share than in pre-war days, but a smaller share than in any year since 1916.

LAWSON TO KIRKLAND LAKE.

According to the Toronto Mail and Empire, Thomas Lawson, famous instigator and follower of metal share booms, is stated to be coming to this camp to examine three groups of claims that have lately been negotiated, into a solid block. The block lies to the west of the producing area, and adjoins Kirkland Lake Gold and Elliott-Kirkland. It is composed of the properties of Chaput Hughes, Grozelle, and United-Kirkland. The block has good prospective merit. A million dollar deal was on for them once before last Spring, but failed for want of one vending signature.

METAL MINING ON VANCOUVER ISLAND.

On Vancouver Island there is very little of active metal mining in progress at present. The low copper quotations no doubt are largely, if not wholly, responsible. This does not mean, however, that there is a condition of complete stagnation. The foundations are being laid for large future developments. In this the Canadian Consolidated Mining & Smelting Co. Ltd., whose expansive and modern smelting plant situated at Trail gives them a commanding position in the Kootenays in respect of mining, will take a leading part. As is well-known this Corporation has an important property in the "Old Sport," near Quatsino Sound, on which thousands of dollars has been spent in exploration and other preliminary work with, according to report, very satisfactory results. It also has control of the "Sunloch," Jordan River, not far from Victoria. The "Sunloch" is an exceedingly promising prospect, in fact it is beyond the "prospect" stage now, with a large body of proven ore, and at a point where a steady output can be started and maintained as soon as the market is right. The same Corporation, being related through the Canadian Pacific Railway Co. with the Esquimalt & Nanaimo Ry. Co., is much interested in the minerals of the Esquimalt & Nanaimo R. Belt, Vancouver Island. At present, although work on the properties instanced and others has ceased, the Corporation's engineers are busily engaged in reconnaissance work in different sections of the Island. They are thoroughly combing the Quatsino District with a view to establishing what other mineral prospects are worthy of attention. They also are at work in the Cowichan River zone, the region of Nanaimo, and in the vicinity of Campbell River in the systematic assembly of such material as will facilitate the opening of good mineral bearing bodies. The desire, it is clear, is to definitely establish a source of supply, as permanent and dependable as possible, of good quality ore. This accomplished the next step—and this is reported on good authority—will be the installation of a smelter either somewhere on the Island or the Lower Mainland of British Columbia for the handling of the ore from Company Coast Properties and from such independent operators as may be shipping. There is no doubt that this is coming. How soon, is another question. But the Consolidated of Trail has its eye on the Costs and its expansion in this section is likely follow the same lines as has marked its progress in the Interior. There has been much criticism by the independent operators of the Kootenays at different times of the methods of the Corporation. It is not the purpose here to discuss the merits of these strictures. Doubtless similar aminadversions would have been directed any Monopoly, for that, without question, is what it has become. But it is equally certain that its place in the Kootenays has been won through the display of superlative enterprise and a spirit of progressiveness both technically and financially that has kept it well to the forefront of the smelter industries of the American continent. It is worth noting, too, in passing, that the present management has recently given evidence of a sincere desire to reach a better understanding with the Operators of the mining districts of the interior of the Province, which must have a very beneficial effect on the industry as a whole. All this is convincing evidence that the day the Canadian Consolidated Mining & Smelting Co. begins active operations in a big way on the Coast will be a Red Letter Day in the history of the mining industry of that part of British Columbia.

There is one mining property on Vancouver Island that has been showing up well of late, namely, the "You," the old McLeod group, a free milling gold proposition, situated on Ptarmigan Mountain, 2,700 feet above sea level, and fifteen miles from the mouth of Bedwell River, Clayoquot Sound. The owner, W. Woodworth, had driven an adit 78 feet on a quartz vein which Wm. M. Brewer, the resident mining engineer, describes as narrow but persistent. The walls are well defined. A ball mill is being installed, capable of handling one ton of ore a day. Mr. Woodworth states that it is his intention to sort the ore, treating only that yielding at the rate of $100 to the ton.

OBITUARY.

Stuart M. Thorne.

Major Stuart M. Thorne passed away on October 3rd after a lingering illness at the home of his uncle, Mr. A. E. Osler, in Toronto. Death was caused by a heart malady brought on by exposure while on active service as an officer in the Canadian Engineers.

He was forty-one years of age, a graduate of Toronto University in mining and engineering, and well known in Northern Ontario where he had been connected since 1908 with several mining enterprises and where he was highly esteemed for his sound judgment on mines and for the careful management he gave to the properties that were entrusted to him. Among the properties that were managed by him might be mentioned the Silver Leaf, Preston East Dome and the Trethewey.

In 1915 he resigned from the management of the Trethewey company and went overseas as lieutenant in the First Tunnelling Company. While in command of a section of this Company operating at St. Eloi in the Ypres salient, he had the distinction to have prepared the largest of the nineteen mines that were sprung at the Battle of Messines on the 7th of June, 1917, and won both the Military Cross and the Croix de Guerre. After his Tunnelling Company was merged with new battalions of Engineers, he served with distinction during the hard fighting of the summer and autumn of 1918 in command of "D" Company of the Fifth Battalion.

In 1919 he returned to Canada and resumed the practice of his profession, but his health had been permanently impaired, and last May he had to give up all professional work.

His loss is mourned by a large circle of friends and brother officers by whom he was affectionately regarded for his sterling character and bluff, hearty good-fellowship.

PERSONALS.

Mr. M. W. Summerhayes, who has been recently in California, is in Toronto. Mr. Summerhayes was for some time manager of the Porcupine Crown gold mine at Timmins.

C. J. F. Galloway, a mining engineer who has examined and reported upon coal areas of British Columbia, having left the Canadian West at the outbreak of the war, writes that he is on his way back from Sarawak, Borneo, where he has been engaged for the past four months in the examination of coal fields. He is en route to England.

GOLD WEALTH OF NORTHERN ONTARIO.

An Interesting Outside View of this District's Great Possibilities.

Barron's weekly publishes the following:

Northern Ontario possesses one of the greatest and most diversified mineral belts in the world. So far as yet proved—and it must be remembered that much of the ground to the extreme north is practically unknown land—the region of mineralization extends over several thousand square miles north of the Canadian Pacific Railroad and about 200 miles north of Toronto. The Temiskaming and Northern Ontario Railway runs through from North Bay to Cochrane, so that nowadays it is a comparatively simple matter to serve new mining camps as soon as developments justify. The territory contains the Sudbury nickel deposits from which 80 p.c. of the world's nickel requirements are obtained, and the Cobalt silver field which, in 16 years, has produced 10 p.c. of the world's silver output.

Unusual interest attaches to this region of Canada at the present time because of its gold producing possibilities. The world, outside of the United States, has greater need for gold at the present time than at any other period of history.

On the Eve of a Boom?

Gold mines, "prospects," fields and shares are attracting increasing attention. This movement may quite possibly in the near future assume the dimensions of a boom, proportionate in size to the severity of the preceding depression of gold. The world's output of gold since 1914 has fallen from about 21,000,000 ounces to 17,000,000 ounces and every gold producing country has contributed to that decline excepting Canada, which is now producing $16,000,000 per annum against $5,5000,000 in 1914. During practically the whole of that period conditions adverse for development ruled. Labor was in short supply and very expensive, while capital, the essential need of all new mining fields, found full occupation in other directions.

The Advent of British Capital.

To date it is safe to say that 75 per cent of the outside capital invested in Ontario mines has come from America, and only a very small proportion from Britain. This is partly attributable to the geographical situation and partly to the fact that British mining investors have been so exclusively responsible for the opening up of the great Rand gold field as well as the Indian, Australian and West African mines. These investments, however, appear to have passed the zenith of their revenue producing power and consequently, recognizing the immediately good future prospects of gold mines, British capital is now paying more attention to Canada, and the Porcupine field.

The Big Trio at Porcupine.

In that field there are at present only three large producing mines—the Dome, Hollinger and McIntyre—but they are all showing rich results in their lowest workings and appear to have brilliant prospects. The formation on which they work is known to extend for at least 12 miles on the strike and is believed to run a much greater distance. This formation, which is of peculiar character locally termed a "shear zone" measures 100 feet to 2,000 feet wide and contains numerous quartz veins of good body and proved persistency.

On the Hollinger there are over 200 veins which have been opened up by 35 miles of underground workings. The mine has ore reserves of over 3,000,000 tons blocked out above 850 feet, while levels down to 1,200 feet and boreholes down to 2,000 feet have proved continuance of highly satisfactory vein values and widths in depth. Costs on all the producing mines are low on account of wide ore bodies, hard yet friable ore, country rock of a character which needs practically no support, proximity to railway, and hydro-electric power supply available by contract at a price of about $60 per H.P. per annum. Shortage of power has been experienced at various times, however, and the Hollinger Co. is now scheming to utilize a big fall on the Abitibi River. The grade of ore mined by the three mines averages about $9.50 per ton and total costs range from $4 to $4.75 per ton. To date shareholders have received $20,000,000 in dividends.

New Capital Needed.

American investors control the Dome, Canadians own the Hollinger and McIntyre and British capitalists have recently undertaken to provide money for equipping a new property, the Davidson, which lies about four miles from the McIntyre and on same vein formation on which there are other considerable areas only awaiting capital for development.

The gold field next in importance to Porcupine is that known as Kirkland Lake about one mile from Swastika station. Here there are one main and two subsidiary gold-bearing ore-zones containing parallel veins. On the main zone there are eight companies working which own contiguous properties stretching for about three miles along the strike. American capital controls the Lake Shore and Wright Hargraves—the two most prosperous enterprises—and has a half interest in the Sylvanite. British capital is in Tough-Oakes and Sylvanite and also to some extent in the Lake Shore.

Gold Prospects.

The values found near the surface are poor, but enrichment takes place at about 400 feet where the width of the veins also improves. The Wright-Hargraves, for instance is stoping 15 feet wide at is 400-foot level and milling $16 ore in its efficient new plant producing at a cost of about $8. The prospects and properties in various stages of development in this region are numerous and influx of capital is awaited with confidence. The outlook for expansion appears to be good, for though the rock is much harder to grind than at Porcupine and the vein widths are considerably less, there is a compensating factor in usually higher value and smaller fluctuation, besides electric power available without shortage.

These are undoubtedly the two main gold fields of Ontario which will be developed in the next few years, but there are numerous promising enterprises to be had at Matachewan, Gauthier, Wolf Lake (Maisonville) West Shining Tree and other parts of the Larder Lake and Temiskaming Mining Divisions. It is necessary, of course, to have investigations made by competent engineers and geologists, but their employment now should give results far in excess of the expenditure involved. Moreover, the Provincial Government affords every assistance in the matter of providing information, and its engineers' reports, geological surveys and maps—complete in every detail—are obtainable on application at the Department of Mines, Toronto.

Mr. Norman Fisher, who was at Cobalt for some years as manager of the Temiskaming silver mine, and who is now an asbestos mine manager, was in Toronto last week.

REPORT OF MANAGER OF KERR LAKE MINE.

Mr. H. A. Kee, manager Kerr Lake mine in his report on operations for the year ending Aug. 31, says in part:

The production for the year ending August 31st, 1921, amounts to 194,351 ounces of silver and 17,096 pounds of cobalt. The above figures include 875 ounces of silver on hand August 31st, 1921, according to inventory. Of the total, 99,477 ounces of silver and 17,096 pounds of cobalt were produced from shipping ore and 94,874 ounces of silver from low grade ore milled by the Dominion Reduction Company at Cobalt.

Beginning in September, 1920, silver prices decreased rapidly from 91½ cents per ounce to 52⅝ cents per ounce in March, 1921, and under these altered market conditions our low grade mill ores could not be produced at a profit. It was therefore necessary to curtail operations in December, 1920, though our development work is being continued.

Exploration And Development.

During the year the total advance by drifting, crosscutting, raising and sinking amounted to 3,341. Lineal Feet as compared with 2,069 Lineal Feet during the previous year. The results from this work exposed some high grade values as well as a small additional tonnage of milling grade ore, though none of the exposures in Kerr Lake area proved of real importance. The greater portion of exploration and development work during the past year was done in the northerly and southerly extensions of the No. 3 Diabase Vein structure at different levels. While no important discoveries have been made, the results of development during the past year have been quite encouraging in the southeast Kerr Lake areas, all of which justified the expenditure.

During early operations a number of years ago very important high grade silver production from No. 3 Diabase Vein structure was procured in known horizons, the lower portions of which were about 125 ft. above the Lower Keewatin Diabase Contact, and as we have recently, in course of development, encountered pockets of high grade silver ore in close proximity to and both above and below this Contact, it is planned to continue development at favourable elevations along the Contact in Kerr Lake and Hargrave areas, as there are good possibilities for developing important ore shoots near the Contact.

Drifting northerly and southerly below the Contact at the 550 ft. Level, on the No. 3 Vein both in the Keewatin-Chert and Basalt, has exposed patches of high grade silver ore at points in the vein structure, where slightly schisted Lamprophyre formation is found associated with the persistent Cobalt-Calcite vein structure.

It is interesting to note that, while drifting north from the No. 3 Winze on the 550 ft. Level, gold values were exposed at one point of enrichment both in the Chert Wall Rocks and Cobalt-Calcite vein matter. The better gold values, however, were found in the Cobalt vein matter 2 in. in width, which essayed from $1.20 to $28.00 gold per ton, while the values in Calcite-Quartz vein matter indicated from $1.00 to $7.80 gold per ton, and the Chert Wall Rock lying close to the vein structure contained from 40 cents to $1.20 gold per ton. These gold values are not of commercial interest, but definitely indicate the possible existence of gold-bearing formation associated with the underlying Basalts.

Development included 1,975 ft. drifting, 889 ft. crosscutting, 397 ft. raising and 79.5 ft. sinking.

The silver production of individual veins for the year was as follows:

Vein System.	Development Ounces.	Stoping Ounces.
Crusher Vein	.....	1,560
No. 218 Side Vein	.....	2,598
Main East Vein	.....	6,244
No. 3 Lake North Vein	.....	11,706
Fleming Stope	.....	12,449
No. 3 Lake Vein	.....	4,535
Big Chamber	.....	5,406
Little No. 7 Vein	.....	897
No. 7 Vein Stope	.....	1,329
No. 7 Drift Intermediate	1,036	.....
No. 3 Lake Drift	812	.....
Main East Raise	812	.....
No. 3 Vein	.....	15,055
No. 3 Vein Hargrave	.....	20,223
No. 3 Vein Hargrave	15,750	.....
Totals	18,410	82,002

The mill ore production was 11,234. Dry Tons containing 94,874 ounces averaging 8.4 ounces silver per ton as compared with 12.5 ounces silver per ton last year, and the profits from this production were materially decreased as compared with previous years.

The withdrawals from our No. 7 Mill Ore Dump amounted to 5,313 tons, which were treated at the Dominion Reduction Plant and included in the Mill Ore figures. The additions to our No. 3 Mill Ore Dump amounted to 1,183 tons.

There was hoisted 7,342 tons ore, of which 49 tons was sacking grade and 7,293 tons milling ore.

The opportunity having presented itself, we procured a working option on the Hargrave property consisting of 80 acres. The results of development fully justified our anticipations and the property was purchased for $16,500, since which time a small ore shoot in the Hargrave area has produced in high grade ore about 36,000 ounces silver, and we anticipate that at least an equal production will be produced from this area in the future.

Silver values both in Hargrave and Kerr Lake areas will be extracted more advantageously when general production operations are again resumed. Preparations are made for the resumption of production operations, which will largely depend upon the future silver market conditions.

REPORTED GOLD STRIKE IN B. C.

The Vancouver Province recently stated that a very rich gold strike is reported on Cedar Creek, on Quesnel Lake, in the Caribou. Stakers of claims are reported to be taking out $35 a day in coarse gold, some very large nuggets being found. Great excitement prevails in the Horse Fly and Quesnel Forks districts.

R. Paterson, formerly an engineer at the Lenora Mine, Vancouver Island, and later professionally employed in the Slocan, passed through the Province recently, visiting Wm. Fleet Robertson, Provincial Mineralogist, Victoria. It was twenty years since he last saw British Columbia.

EXPERIMENTS IN COKE PRODUCTION.

Washington, D.C.—The obtaining of good grade coke from coals which seemed devoid of any cooking property has been accomplished by investigators at the University of Illinois, Urbana, Ill., working in co-operation with the United States Bureau of Mines, by the employment of a specially devised low temperature cooking process. As a result of the process, valuable by-products, in the way of ammonia, gas and tar, are derived.

The experiments were undertaken in connection with an investigation by the Bureau of Mines of the smoke problem at Salt Lake City, Utah. It was found that coke was regularly obtained from only a few coals tributary to the Salt Lake City district, and, if the use of coke, a smokeless fuel, was to be increased in that city, it would be necessary to demonstrate the possibilities of coking coals not regularly used for that purpose. Six coals from various Utah districts were tested.

Although, so far as present standards of coking indications are concerned, the coals tested seemed quite non-coking, treatment by the methods devised by Prof. S. W. Parr of the University of Illinois resulted in a yield of good coke amounting to approximately 60 per cent. of the coal employed. The coke is dense and of good texture, and seems adapted to use as a domestic fuel and for metallurgical purposes. In some respects the coke seems superior to anthracite for use in domestic furnaces. Slightly more than 20 pounds of ammonium sulphate, valuable as a fertilizer, were recovered per ton of coal coked. The gas recovered as a by-product is especially suitable for utilization in city mains. The tar oils obtained should lend themselves readily to cracking processes, thereby furnishing a product suitable for motor-fuel purposes, and may also prove a source of creosote oil and other wood preserving materials. These tar oils, on account of their marked drying properties, may also be available for paint and varnish manufacture. Other uses suggest themselves, such as direct combustion in engines of the Diesel type, as fuel for steam generation, as a source of heat for metallurgical purposes, the carburetting of water gas, and as the source of pitch as a binder for the briquetting of breeze, lignite fuels, etc.

The results of the investigation are of two-fold importance, indicating the possibility of coking many coals not generally considered to have coking qualities, and also constituting a factor in the solution of the smoke problem in communities not favorably situated for the obtaining of smokeless fuel.

POWER ON ABITIBI.

The Toronto Mail and Empire gives prominence to the following despatch from Timmins, Ont.:

A new feature has been injected into the Porcupine electric power supply, which is the most important factor in this gold camp's growth, by the intimation that the Ontario Government has reserved rights on the falls in the vicinity of the Big Bend, Abitibi River. This is the power that Hollinger endeavored to secure last Spring. Officials of the mine said then that granted the rights they would proceed at once to develop power and that they calculated that they would be delivering power to their mine early in 1922. A proposal has been made by responsible officials of the T. and N. O. Railway Commission that the commission develop this power in connection with their railway extension north of Cochrane, which touches it, and sell part of the energy to public consumers. This, according to The Northern Miner, which claims to be speaking with authority.

The falls is rated at from 15,000 to 30,000 horsepower. The commission gets the rights in view of its plans to electrify the northern section of the railway. Electrification would take from three to four years to prepare for, and when a line was ready there would still be a surplus. It is proposed that power be sold at cost to mines and other consumers. The falls is about sixty miles from Porcupine, the likeliest consumer.

Despite the new chance that Hollinger could get power to supply its extra needs from the commission, if the proposals are proceeded on, officials of that mine are known to be not very well pleased with the turn of events. They see that even if the commission goes ahead with the idea it would be two or three years before it would be ready to sell current. And Hollinger wants the power right away. They want to add to the mill, for they are not satisfied with 4,000 tons a day capacity. The mine manager is meeting the directors this week in Montreal on the power question.

The Porcupine mine managers feel that the water supply of the Mattagami, where the camp's current is now generated, is not sufficient as at present developed to permit the expansion that the gold resources of the mines calls for. McIntyre this year secured the rights on Sturgeon Falls, on that river, and Hollinger applied for and surveyed the falls on the Abitibi River, which it is understood have since been given to the Railway Commission.

Dome has made no outside move; it has directorial connection with the private power interests.

For the coming Winter the power outlook contains nothing that should cause serious apprehension. Additional water storage works have been completed, and if the extra area fills up before Winter the present supply should be assured. But the mines are all anxious to expand, and expansion with the present available amount of electric energy would be a most optimistic action, to put it mildly. That is why McIntyre has postponed the work of doubling its mill.

Mining men feel that as the mines are anxious to employ more men and produce more gold they should be given every assistance in the way of power rights or immediate power supply to do so.

TORONTO COAL PRICES.

Toronto, 18th Oct.—The threatened railway strike in the United States is causing a considerable "flutter in the dove-cots" among coal men and manufacturers in this country. Already it has had the effect, as regards bituminous coal, of sending up the price of lump twenty-five cents a ton, while slack remains at the same price as before, but firmer. One coal man of prominence told the writer to-day that if, at the end of the next three days, the strike still appears imminent, then coal might fetch almost any price at all. Unless consumers order coal within that time, and the strike really materializes, they are likely to go short for some while—in fact, until the United States Government is able to operate the roads efficiently—for it takes a week or ten days for coal to reach the border. Manufacturers here do not seem to think that the strike will materialize, but many of them are resolved to be on the safe side anyway, and to that end are sending in "hurry up delivery" requests for coal they have previously ordered.

Northern Ontario Letter

THE SILVER MINES.

Good Results at Keeley Mine.

One of the most interesting and important developments in recent years in connection with the silver mining industry of Northern Ontarion has occurred on the Keeley Silver Mines in South Lorrain. The representative of the Journal investigated the early reports of a big discovery at depth on the property and received official confirmation. The find was made at a depth of 435 feet at a point where a cross-vein lies at right angles to the woods vein on which milling values have been encounter. A feature of the discovery is that at this deep level, heavy oxidation occurs and which is pronounced by engineers to be pre-glacial. While the woods vein contains average values of about 28 ounces to the ton across a width of upwards of four feet, the new deposit has a width of about eight inches, and with values averaging about 4,000 ounces of silver to the ton across a width of about four inches for a distance of 32 feet in length as so far developed. Production from the Keeley during September amounted to approximately $90,000 and the indications are that October results may show a still further increase.

Profits are Higher.

Quotations for silver continue to hold at well over 70 cents an ounce, being 72¾ cents at the time of writing. As a result of this, the gross value being produced by such mines as the Nipissing, Mining Corporation, Coniagas and O'Brien is heavy while the margin of net profit on each ounce produced is the highest in many months.

The hydro-electric power supply in Cobalt is abundant and the supply of labor is in excess of current demand. As a consequence of this, the operating mines are working at maximum capacity and at greatly reduced costs For this reason, the balance sheets at the end of the current year may be expected to be exceptionally satisfactory.

Silver Cliff.

A scheme is under way to reopen the old Silver Cliff mine at Cobalt. An examination of the underground workings has been made, and the condition of the mine is said to be such as to encourage the belief that it could be operated profitably.

McKinley-Darragh.

The question of re-opening such mines as the McKinley-Darragh, Temiskaming and Beaver Consolidated appears to be uncertain and there is a growing belief that nothing may be done until the coming spring.

Lang-Caswell.

A deal which has been pending for the Lang-Caswell property in Lorraine is still hanging fire. A bid has been made for the property with a view to carrying on operations for the purpose of mining cobalt metal, but the outcome is still uncertain.

Elk Lake and Gowganda.

The Ontario Government has a force of 60 men engaged on road works on the highway from Elk Lake to Gowganda. This is approximately half as many men as were employed a few weeks ago. The road has been put in first class condition to a point 18 miles from Elk Lake and less than 10 miles from Gowganda. A motor bus is now employed in carrying passengers over the first 18 miles. The work will be suspended within the next week or so on account of the approach of winter.

It is stated that freight going into Gowganda district amounts to the equivalent of about one carload per week, this small tonnage being due to a tendency to await snow roads before hauling any very great amount of supplies, and, also, due to uncertainty on the part of property owners over the question of whether conditions have become sufficiently favorable to carry on general operations.

There are good prospects of the Cane Silver Mines in the township of Cane being re-opened this fall. Interests identified with the Hudson Bay Mining Company at Cobalt are interested in the enterprise and are considering a plan to work the property on a big scale.

THE GOLD MINES.

Power and Labor.

Features in connection with factors bearing upon the gold mining industry of Northern Ontario are the present big surplus of men and the general outlook for hydro-electric power.

The mines are all fully manned, and applications for jobs amount to an aggregate of over 100 daily. The companies are selecting those best fitted for the work and are operating at full capacity.

The dam which is intended to raise the water in Lake Kenogamisse about 10 feet and back it up for a total distance of about 30 miles has been completed and all surplus precipitation will be caught and stored for generating power throughout the winter. The power company officials are confident no shortage will be felt, although some of the mine officials are apprehensive. In any event, nothing like the serious shortage of the past winter is anticipated.

Weather conditions are mild throughout the north at the time of writing, and with the water gradually rising in the storage basins, it is obviously a race between this rising water and the approaching winter in determining whether or not the power supply will be sufficient to carry on operations at normal capacity until the spring break-up.

Hollinger Treating 3,500 tons Daily.

The Journal correspondent went through the mill of the Hollinger Consolidated this week where the full 200 stamps were in operations, together with 20 tube mills. The plant continues to treat an average of approximately 3,500 tons daily and the company is realizing an income of about $35,000 daily. This tonnage is the equivalent to 70 cars of ore daily, each weighing 50,000 pounds.

Drilling Rochester Property.

Diamond drilling operations are proceeding satisfactorily on the Rochester property. The Nipissing Mining Company of Cobalt has an option on the property, and the exploration work is being done on the strength of the location of the property adjacent to the Hollinger Consolidated on the north-west.

Carbon Problem Solved.

The occurrence of carbon in the ore in certain parts of the lower workings of the McIntyre-Porcupine has constituted a greater metallurgical problem than has generally been understood outside of those closely identified with the operation of that mine. However, Mr. Dorfman, the mill superintendent, has carried on certain experiments which offer promise of solving the difficulty.

Dome Treating 1100 tons Daily.

It has been learned officially that the mill on the Dome Mines is now operating at full capacity of upwards of 1,100 tons daily. The plant is rated at a maximum of 1,500 tons daily and at one time operated at an average

rate of 1,350 tons every twenty-four hours. However, the higher grade nature of the ore now being dealt with has necessitated a change in methods which, in turn, has made it imperative to deal without more than between 1,000 and 1,200 tons of ore daily. The current income on the Dome is at the rate of close to $2,500,000 annually. The company is fully supplied with men and hydro-electrie power, 2,800 h.p. being employed in the operation.

Ontario-Kirkland.

By early December, according to present indications, the new 100-ton mill on the Ontario-Kirkland mine will be ready for operation. The mine has been developed extensively and there is every prospect of the mill being quickly brought up to full capacity.

Teck-Hughes.

It has been learned officially that plans are being made to call a meeting at an early date for the purpose of discussing ways and means of reaching a satisfactory understanding as between the bondholders and the stockholders of the Teck-Hughes Mining Company. The property is now working on a substantial earning basis and the re-adjustment or re-organization is regarded as likely to be mutually satisfactory to the interests involved.

Kirkland Lake Proprietary.

Good progress is being made in the development of the Tough-Oakes and Burnside properties of the Kirkland Lake Proprietary. It is understood to be the intention of the management to continue development throughout the winter with a view towards placing the mill in operation in the early spring.

The recent decision of the promoters of a light railway project through the outlying mining districts of this part of Northern Ontario to clear 100 miles of right of way has aroused considerable interest, but there is obviously a tendency to await construction of the line before commencing mining operations on properties along the proposed route.

Crown Reserve in Larder Lake.

The entire aspect of the larder Lake district has undergone a change in the light of comparatively recent developments on property owned by the Crown Reserve Mining Company. Surface exploration has opened up a body which measures approximately 30 feet in width and in which the average gold values are stated to amount to $6 to the ton.

Associated Purchases Costello Property.

Another feature of the situation in the Larder Lake district is that the Associated Goldfields which was previously the chief operation in the Larder Lake field has suspended operations on its original holdings and has purchased the Costello property which lies adjacent to the Crown Reserve.

It is also learned that the Coniagas among other Cobalt companies has become interested in mining claims in this part of the Larder Lake district.

Fort Matachewan Area.

According to official information received by the Journal correspondent, there are good prospects of the Matachewan Gold Mines resuming operations during this fall or early in the coming winter. This opinion is based upon the belief that arrangements will be made to develop hydro-electric energy on a water fall which has heretofore been held under lease and with no effort at development.

At a depth of 100 feet on the Thesaurus property, north of Fort Matachewan, good results have been encountered. This property was originally known as the Nelson Clair. Gold tulleride occurs in spectacular quantities in a narrow pay-streak in the shaft, and the outlook for the property is believed to be exeellent.

In the townships of Rankin and Doon, interest in the reeent gold discovery has subsided somewhat, although assessment work is being done in some instances.

Lightning River.

On the property in the Lightning River district, owned in part by the Lightning River Gold Mines, some very spectacular ore has been opened up in a narrow vein in a pit which is down seven feet at the time of writing.

British Columbia Letter

Figures recently published by the Dominion Bureau of Statistics on the mineral output of Canada for the first half of the current year are particularly interesting to British Columbia in several particulars. With respect to lead it is shown that the total Canadian production for the first six months of 1921 was 32,875,616 lbs., valued at $1,883,773. Approximately 30,625,616 lbs. came from this Province. As the aggregate output of the Province for 1920 was 39,331,218 lbs., it will be seen that the 1921 half year is but 8,705,602 lbs. behind the results of the full 1920 period. The zinc record is not as good but, nevertheless, it is remarkable in that of the total Canadian output of 28,236,103 lbs., valued at $1,369,168, for the half year all must be credited to this Province. To equal the zinc production of 1920 it is necessary in the second half of the present year to produce 18,972,165 lbs. Although the zinc market appears to be more or less stagnant at present there is little doubt that this will be achieved. The Sullivan Mine and the Trail Smelter, Canadian Consolidated Mining & Smelting Co., are responsible for British Columbia's showing in connection with silver production, 6,545,481 fine ounces, this Province is credited with contributing 27.8 per cent. In Copper, too, the Canadian West appears to have done exceptionally well under the circumstances. The final year's totals, judging from the first official statistics available, will not be as unsatisfactory, speaking comparatively, as the general slackness in the metal market, and the consequent inactivity in connection with some phases of mining, would have led the statistical speculator to suppose.

Stewart, B.C.—H. Tanner, superintendent of the Fish Creek Mining Company, reports that a cross-cut on the lower workings designed to tap an ore body located recently has been driven forty feet and that No. 2 tunnel in the same locality also is in a strong and well defined vein. Work is to be resumed on No. 1 tunnel. Mr. Tanner says that development, which has been satisfactory, may be continued all winter and that accommodation is being provided for men with that end in view.—The difficulties of the Algunician Mining & Development Co., owners of the Spider and other mineral properties in the Portland Canal section, are said to be on the mend. Finances are expected to be available soon to meet outstanding endebtedness and to permit continuance of work on the Spider as well as on other promising prospects. — The Riverside Mineral Group, situated a short distance from the Salmon River Road, is being opened up, by the Lindeborg Brothers who report that a substantial body of ore has been shown giving average assay returns of $20 a ton in gold and silver. — The Independence Group, Bear River at Goose Creek, owners Fitzgerald Brothers, is said to

show in its development an exceedingly large body of milling ore. It is located within easy transportation range of the coast. — Former Senator John Ronan, of Alaska, is en route from Stewart with one thousand pounds of samples of ore from the mines and prospects of the Portland Canal District for display at the American Mining Congress, Chicago, Ill.

Anyox, B.C.—In addition to new development started on the Dolly Varden, Kitsault River, on which some fourteen men are employed, there is activity on the Homestake Group and the "Moose," both in the same section. On the latter 186 feet of tunnel work has been done on the lower level and 66 feet on the higher. Picked samples of ore have run as high as 240 ounces in silver to the ton. — High grade ore is reported to have been struck on the Lucky Strike, Cascade Falls, Silver Crown and Sunnyside mineral claims, which are in the vicinity of the Homestake.

Nelson, B.C.—The Bayonne Gold Mining Company has been re-organized and it is understood that its property, situated in the Bayonne District, not far from Ymir, will be re-opened and developed further, the work to start soon.

Trail, B.C.—Up to an including the 30th September the receipts of ore at the Trail Smelter of the Consolidated Mining & Smelting Co., aggregated 307,493 tons, which is about 50,000 tons better than last year at the same date. If the work of mining and treating continues at the same rate for the rest of the year the 1921 figures will establish records. For the closing nine days of September the receipts of ore at Trail were 7,983 tons, of which 7,629 tons came from the company's mines. Eight independent properties also were represented, constituting one of the heaviest shipping lists of the year to date. Of these the Bell shipped 27 tons, the Josie 125, the Knob Hill 95, the Paradise 45, the Ruth, of Ainsworth, 41; the Sally 18, the Freedy Lee 2, and the Skyline 1.

Vancouver, B.C.—Placer mining is likely to become active along the North Arm of the Fraser and Bridge River if the plans announced by a Vancouver Syndicate for the exploitation of the "Channel" Leases are carried through. The construction of a flume 700 feet long, 30 feet wide and 4 feet high is proposed as a preliminary step towards the commencement of hydraulicking. The road to the district is being repaired by the Government to permit the easy transport of machinery and supplies. Recent amendments to the Placer Mining Act resulted in the throwing open of the ground. — Judgment in favor of the heirs of the late Captain Alexander was given by the British Columbia Courts in connection with the action brought by stockholders in the original Engineer Mining Company whose claim is that Capt. Alexander and his associates "jumped" the claims and that, therefore, the title is unsound. The Court held that Section 85 of the B. C. Mineral Act constituted a complete bar to the plaintiff's success. This section deals with adverse claimants to mineral claims and stipulates that any contest concerning the rights of another to a claim must be marked by the commencement of action in the supreme court within 60 days of the first publication in the B. C. Gazette. This publication is one of formal procedure in securing title. The Act further states that failure to commence such an action shall be considered a complete waiver.

NEW ORE LEDGE IN B.C.

Alice Arm, B.C.—A new ore ledge is reported to have been located on the Silver Tip Group, which adjoins the Homestake Group. It is 12 feet wide and carries galena and copper values. The owners have commenced tunnelling and other development.

THE MAID OF ERIN.

"The Maid of Erin," as yet a prospect, situated near Rainy Hollow, a little known section of British Columbia lying to the west of the Atlin District with Alaskan territory to the south and Yukon territory to the north, is likely to be heard from if present indications are borne out by further exploration and development.

R. W. Wiley has been working in a small way on the property for the past two or three seasons. He has sunk a shaft a considerable distance, asserts that he is in ore all the way, that is cannot yet be said that all that is to be seen has been seen or all that is to be proven has been blocked out, and that the picked ore sacked and shipped last year and this has been running up to 25 per cent copper and 60 ounces of silver to the ton. In short Mr. Wiley, a Klondyke sourdough and an operator with experience in many American mining fields, is enthusiastic in speaking of the "Maid of Erin," although frank in declaring that it is but a "prospect" up to the present. Still he knows that it is a superlatively good "prospect" and is confident that it is going to make one of the new big mines of the north.

The Alaskan Road Commission has been spending considerable in the opening up of the district in question, having at present a first class road under construction from Haines, a small but prosperous community situated in American territory near the headwaters of Lynn Canal, north to the Canadian border. The work, apparently, has been costly as it is said that, roughly $60,000 was expended last year and that this year's operations will account for $20,000. However, when it is finished it will tap a new country, rich in minerals and with other possibilities. Its route is along the Chilkat river and up the north bank of the Klehini River. This road is being continued by Mr. Wiley and his associates to the mine.

Hitherto the work of opening up this property has meant the meeting and overcoming of serious difficulties, mainly in regard to transportation. Heavy tractors, however, have succeeded in bringing to Haines, down the valley of the Klehini and along the old road, the inconsiderable shipments that have thus far been made. The term, of course, is used in a comparative sense because, when the problems to be met and the number of men employed are considered, the ore shipped actually makes a creditable showing in quantity as well as in quality. Horses have been used to some extent in the transportation of supplies and Mr. Wiley tells of an experience in fording the Klehini, a turbulent glacial stream the character of which is constantly changing. A powerful horse slipped and tumbled in the river center and was carried, pitching and rolling, for fully half a mile before bringing up on a bar. He had instinctively kept his head up and when rescued was without serious injury. The rider had managed to safely reach the far bank. But such adventures, and in fact all difficulties that have been instrumental in holding back work, are expected to be passed very shortly now and the operators are looking forward to putting the Maid of Erin permanently among the shippers of the Province.

PORT ARTHUR MINING NOTES.

By J. J. O'CONNOR.

The expected has occurred at Silver Islet. After encountering a number of calcite stringers at various points in the new drift, the first of which was struck 250 feet from the old workings, a well defined vein ten feet in width, was met 723 feet in. This vein has all the characteristics of the old Silver Islet vein. At first glance it might very well be mistaken for the old material.

The drift is not now in the graphitic portion of the dyke. Mr. Peacock is of the opinion that when this portion of the dyke is reached by drifting on the vein, that it will be found to contain silver values, thus confirming the theories on which they are working. He is also of the opinion that this vein is a part of the Catholic Point vein, as it was met with at about the point where the latter should intersect the dyke, but is not nearly so wide as where it shows on the Point.

The first of stringers encountered had a westerly dip, each succeeding one had a lesser westerly dip, until they reached the perpendicular, after that each stringer had an increasing easterly dip toward a common point, bringing all the stringers together at a depth of 1,500 feet below the surface, or 1,500 feet below the present workings. The Islet Exploration Company have most sanguine expectations that their enterprise will meet substantial success, and result in placing Silver Islet in its old-time position as one of Canada's oustanding silver producers.

Good reports continue to come in from the Schreiber gold area. Satisfactory results are being obtained at the McKellar-Longworth property in the development of both No. 1 and No. 2 veins, both showing very high values, the latter carrying high values in tellurides.

EDITORIAL

"COAL OUT OF LINE."

"Iron Age" in the issue of October 13th states "The high cost of coal is undoubtedly a great impediment to industry. If cost has anything to do with consumption, and that is an accepted argument as to most commodities and as to freight rates, the high cost of bituminous coal is certainly a great drag upon industry. The price of coal f.o.b. mine is a serious concern to practically every one, for all are consumers of coal. There is no other article of commerce whose cost is so widely felt. ...At present the ambition of the union miners seems to be to charge the public, after April 1st 1922, with back pay for the time they have been idle of late, as well as for the time they may lose in a strike. This is a matter of the greatest concern to the public".

To no portion of the public is it of greater concern than to the remainder of unionised labour, as it is the high cost of coal that is the greatest obstacle to reduction of railway freights and general resumption of manufacture. Coal is the last great staple that is out of line with other commodities when compared with pre-war figures. The miners appear to have made up their minds that coal can be maintained on its giddy pinnacle, but they must inevitably discover that it cannot. The English miners had the same idea, but after testing it out they have freely and fully recanted their economic heresy. The revival of trade in Britain, the resumption of manufactures and exports, and the rise of sterling, are all results of a return to a more normal alignment of coal among other commodities in Britain. Coal is certainly "out of line", and so long as it remains out of line, business will stay out of joint.

Nor must it be forgotten that provision for employment for the steel workers—an industry just beginning to show appreciable signs of recovery—is dependent upon the coal trade, and that the keeping open of the mill can only be rendered possible by the reduction of wages in the mines. On this point Mr. Roy M. Wolvin, the president of the British Empire Steel Corporation, very properly laid special emphasis in the course of an interview in Montreal on Monday last, in which he indicated the possibility of the mines of Nova Scotia being closed down during the coming winter as the result of trade conditions and the determination of the miners to oppose any reduction in the rate of wages at present ruling. As he said, the most urgent questions for consideration, in the coming wage negotiations with the United Mine Workers, is not the rate of wages, but whether they can be paid at all, "and most earnest joint consultation and endeavor will be required, if severe and protracted unemployment at the collieries in Nova Scotia is to be averted."

Mr. Wolvin added that "the same wages as during the war, plus two heavy increases since the armistice, are being paid to the workers of the Dominion Coal Company and other coal companies in Nova Scotia. That fact must be faced in the wage negotiations. These high wages are being paid in a period of unparalleled trade depression. The price of coal has declined along with that of other commodities, but to a smaller extent, and no action of the employers of mine-workers can be taken that will enable coal to stand out singly against a world-wide decrease in commodity prices arising from world-wide causes. That course was attempted in Britain and most signally failed."

It may not be easy for the rank-and-file of the miners to realize that, while last year saw great, and almost unparalleled, prosperity in the coal trade, high selling prices and high wages occurring together, the inevitable time of depression is upon us now. The depression in the coal trade of the world, and in the allied steel trades, too, is the most acute known to modern times. But although the rank-and-file of the miners may not realize these facts, on their import, they must be well within the knowledge of their leaders. And the latter, if, in any sense, worthy of their position, must further be aware that, in the very nature of things, a period of smaller earnings must necessarily

also be one of lower wages. On these leaders, accordingly, there devolves a very heavy responsibility. We know that it is no easy task, and we are very sure that it cannot be other than an ungrateful one, for them to press on the miners the necessity of accepting wage reductions. But it is a task from which there is no escape if they are to be faithful to one of the prime and primary obligations of their position of leadership—the obligation to tell the workers the truth, even when that truth is hard.

It is not merely foolish, but it is absolutely futile to attempt, in this period of almost unexampled depression, to maintain wages at a standard which, in the circumstances of today, the coal industry simply cannot pay, except at a loss which it is impossible for it to contemplate. When coal profits were high, wages in the coal mines were high also—and rightly so. Now the lean times are upon us, the workers in the mines must accept reduced wages, if the industry is to be kept in being. Had labor leaders in other industries advised the adoption of such a course, unemployment, with all its concomitant evils, would be far less widespread in Canada than it is today. It is devoutly to be hoped that the leaders of the coal miners may show themselves inspired by wiser counsels, and, we may add, a higher patriotism.

OIL FIELDS OF THE EMPIRE.

The petroleum resources of the world have received much attention during recent years, the great demand for oil having stimulated search in all countries. It has been recognized that known resources must be greatly added to if the requirements are to be met. The recent explorations in the far northwest are but an indication of the effort that will be made by oil companies to find new sources of supply.

It is important that there should be available some concise account of the petroleum resources at present known, particularly of those within the Empire. This has been appreciated by the Imperial Institute, and, under the direction of its mineral resources committee, there has just been published by John Murray, London, a monograph on Petroleum. Special reference is made to resources of the British Empire, and the resources of foreign countries are also dealt with.

The sources and possible sources of supply within the Empire and dependencies are: Great Britain, Malta, British Borneo, Sarawak, Cyprus, India, Mesopotamia, Palestine, British Cameroon, Egypt, Sudan, Gold Coast, Nigeria, Somaliland, South Africa, Barbadoes, British Honduras, Canada, Newfoundland, Trinidad, British Guiana, Australia, Papua and New Zealand.

The United Kingdom produces very little oil, and that comes chiefly from oil shales deposits in Scotland. In Malta, test drilling is contemplated, as the geology is favorable. In British North Borneo, prospect wells are being drilled. In Sarawak oil is being produced, and a refinery has been erected at Lutong. In Cyprus, there are indications of oil, but rock structure is not favorable. Most of the oil produced in India comes from Burma, which district, in 1919, produced 1,174,995 tons. Assam and the Punjab are small producers.

The existence of petroleum and asphalt in Mesopotamia has been known for a very long time. The oilfield in this country is only part of a petroliferous area which extends through southern Persia to the north end of the Persian Gulf, passes through Mendeli on the Turko-Persian frontier and crosses the Tigris near El-Fatha. The belt is approximately 1,000 miles long, and covers an area of more than 26,000 miles. Three main oil zones are recognized. The largest production is at present obtained from an area of about 246 acres near Tel Kejara, the annual output being about 1,500 tons. Near Zakho there are numerous seepages over an area of about 120 acres, which yield from 250 to 300 tons per annum. Along the Euphrates River, the asphalt deposits of Hit and Ranadi have been known from ancient times, the yield of asphalt from the wells near Hit being estimated at about 2,500 tons per annum.

In Palestine, petroleum and asphalt occur. The asphalt deposits near Hasbeya are regularly mined, the output, about 380 tons per annum, being exported from Beyrout. Oil issues from cliffs facing the Dead Sea, and at several points along the shores there are hot springs bringing up traces of petroleum.

In the Egyptian oil field, which resembles those of Persia, the production in 1920 was 155,578 tons. Gemsah was the main producing area up to 1914, but since that date its output has greatly diminished, and commercial production is now practically confined to the Hurghada field. Storage tanks have been erected at Gemsah, Hurghada and Suez, with a capacity of about 100,000 tons. At Suez, there is a refinery capable of treating about 1,000 tons crude oil per day. Pipe lines have been laid to deep water at three shipping berths at Port Tewfik.

In the Gold Coast and in Nigeria, there are petroliferous lands, but no commercial quantity has been produced from the wells so far sunk. In South Africa, results of oil prospecting have, so far, not been successful.

In Canada, indications of oil have been found in many places, and exploration is now being carried on in the Western Provinces. Southern Ontario is the chief producing centre, and its output is declining. The discovery of oil at Fort Norman in 1920 has led to exploration of the Mackenzie river basin. In southern Alberta, prospecting is being carried on in several places.

In Trinidad, the principal producing area is the Forest Reserve, near Brighton. The famous pitch lake has an area of about 100 acres, and there is a constant

stream of pitch, towards the sea, averaging 15 to 18 ft. in depth. It is estimated that the lake contains 3,168,000 tons of pitch. The petroleum production of Trinidad in 1920 was 297,588 tons.

In British Guiana, negotiations are in progress for a concession granting exploration rights over 2,000 square miles, with the option of choosing therefrom an area of 100,000 acres for prospecting and development, if the results of geological investigation are favorable.

In Australia, efforts to locate deposits of petroleum have so far been unsuccessful. The Commonwealth Government has offered a reward of £10,000 for the discovery of natural oil in commercial quantities in Australia, and a bonus of £5,000 has been offered by the South Australian Government to the person who first obtains 100,000 gallons of crude petroleum from a well in South Australia.

In Papua, the Anglo-Persian Oil Co., is carrying on prospecting work for the British and Australian Governments.

In New Zealand, prospecting for oil has not given good results, oil being found only in small quantities.

NORTHERN INDUSTRIES AND THE RAILWAY.

The extension northward of the Ontario Government railway, the growth of the pulp and paper industry and the successful development of big gold mines at Porcupine are bringing the Hudson Bay district much closer to older Ontario. It should not be long now before a new settlement springs up in the wilderness seventy miles beyond Cochrane and little farther from James Bay. The building of the railway and the development of water powers on the Abitibi for the mining industry for the pulp and paper industry and for the railway will hasten development of this area.

The townspeople of Cochrane, through which the traffic of the north will pass, have good cause to feel that their town is to benefit largely from the mining and pulp and paper industries, which the construction of the railway made possible, and which have, in turn, been the chief source of revenue of the railway. The extension of the Government railway is, to a large extent, made possible by the mining activities at Cobalt, Porcupine and Kirkland lake. But for the mining industry and (more recently) the pulp and paper industry the railway would have been such a burden that no extension would have been thought of for many years. The building of the railway made possible the industries which now, by their growth, are leading to the development of an area much further north. The railway and the two industries owe so much to one another that it may confidently be expected that a way will always be found to satisfactorily solve problems arising from conflicts of interest, provided a serious endeavor is made by all concerned.

SILVER RESOURCES.

The monograph on silver ores written by Mr. H. B. Cronshaw, and published by John Murray, to which we made reference a couple of weeks ago, is one of the series prepared under the direction of the Mineral Resources Committee of the Imperial Institute. It summarizes the sources of supply of silver ores in the British Empire and in foreign countries, giving special attention to the resources of the Empire. An introductory chapter is devoted to the occurence, characters and uses of silver.

The Imperial Institute has a special staff engaged in the collection, critical revision and arrangement of all important information respecting supplies of minerals. This report on silver ores should, therefore, be found useful for its account of the silver resources of other countries.

EDITORIAL NOTES.

The Geological Survey, Ottawa, has published a summary report, part D, on investigations carried on by some members of the staff in 1920. The contributors are T. L. Tanton, T. T. Quirke, M. Y. Williams, Aleph Anrep, Joseph Keele, M. E. Wilson, J. F. Wright and Robert Harvie. The Ontario districts reported on are Thunder Bay, Nipigon-Schreiber, Geneva map area, Lower Albany and Lower Kenogami rivers, Manitoulin island, Madoc fluorspar area, and Brockville-Mallorytown map area. Asbestos deposits in Bonaventure, Quebec, were examined by Mr. Harvie. Mr. Keele reports on clays and sands of Northern Ontario and Mr. Anrep on peat bogs in Ontario and Quebec.

The fluorspar deposits of the Madoc area are described fully by Mr. E. Wilson in the survey report.

Geological features of the area immediately surrounding Thunder bay have been studied by T. L. Tanton for the Geological Survey and a contoured map of the area has been prepared. Mr. Tanton calls attention to the faulting of the area, which is particularly important because the known silver deposits occurred in faults.

The Nipigon-Schreiber area is briefly described in the Geological Survey summary report by Mr. Tanton. He describes two types of veins: 1. quartz veins which are locally pegmatitic and which carry disseminated pyrite; 2. carbonate replacement bodies.

Oil possibilities of Manitoulin Island are described by M. Y. Williams, who spent some weeks on the Island in 1920.

The Dome mines report for the first half of the company's fiscal year, shows that excellent results are being obtained. Development during the past year has been very favorable and, with the improving con

ditions the prospects for a good year are bright. The results such as are being obtained by Hollinger, Dome and McIntyre are making Porcupine one of the brighter spots in the industrial world this year.

On another page will be found an account of the rediscovery of British Columbia's first silver mine. We understand that arrangements have been made for the working of this property, which has been idle many years.

It has been reported from Cobalt that the rights to water power on the Abitibi river which had been applied for by Hollinger Consolidated Mines, have been turned over to the T. & N. O. Railway Commission. We are advised that this has not been done.

The coal briquetting plant at Bienfait, Saskatchewan, is said to be ready for operation. It is an experimental plant, which the Federal Government and the Saskatchewan and Manitoba Governments have erected with a view to utilizing lignite coal deposits.

That tar sand areas in northern Alberta are attracting capital is reported from Winnipeg. Utilization of these sands is a problem well worth attention as the deposits are very large.

The "Northern Miner" reports that very good results are being obtained in development of gold deposits at Lightning river and at the Bidgood mine in the Kirkland lake area.

The "Mining Journal," London, is running an article by R. C. Campbell-Johnston on the occurrence of petroleum in Western Canada.

There has been constructed in Queen's Park, Toronto, a cairn composed of the products of Ontario mines. Large blocks of ore have been assembled in this way with a view to interesting the passers-by in the mineral resources of the provinces.

The wire rope testing machine at 5 Queens Park is now in operation. Mines Inspector Sutherland broke the first rope last week. This machine has been installed for the purpose of testing wire rope used at mines. Previously the Government had no machine of its own and certain clauses of the regulations were not enforced pending this installation.

A COURSE IN INDUSTRIAL METALLOGRAPHY.

For several years there has been given in the department of metallurgy at McGill University, an extension course in Metallography which has been attended by Mechanics, Engineers, Chemists, and those desiring a "Hobby" or whose business brought them in contact with metals and who desire to have more knowledge of their composition.

No previous knowledge of the subject is assumed and the course is essentially practical from first to last. Ferrous and non-ferrous metals are dealt with equally and training given in preparing them for examination under the microscope and finally photographing the various structures developed.

Anyone desiring to enroll should apply to Dr. Alfred Stansfield Department of Metallurgy McGill University or to the lecturers Harold J. Roast F.C.S., F.C.I.C., or Charles F. Pascoe F.C.I.C.

The first class will be held on Monday evening November 7th at 8.30 P.M. in the Chemistry building McGill University.

Fee for the course of 15 periods is $20.00.

As only fifteen members can be accommodated application should be made at once.

The microscopic equipment has been added to considerably this year especially in regard to the photographic end. If any former members desire to continue their work, provision will be made for an advanced class if sufficient members are obtained.

WANTS ROADS FOR FISH CREEK DISTRICT.

Victoria, B.C.—Henry Benson, who has returned from the Fish Creek section of the Portland Canal District, says that the Fish Creek Mining Company has about twenty men at work and is prepared to continue operations through the winter. Mr. Tonkin, the manager of the property, is said to look for an output of $80,000 worth of ore in the next six months. Ten men are at work on the "Big Missouri," Mr. Benson states. Both the Hoveland and the Lucky Boy Group in the Fish Creek region are being energetically developed. The latter is about five miles from tidewater and is accessible by means of wagon road and train. Describing the work as far as it has progressed on the Lucky Boy, Mr. Benson says that there are three tunnels and a shaft 20 feet in depth. The main tunnel (100 feet in) was finished on September 20th and the main lead was struck and has been cut for three and one half feet. At 83 feet in a copper-silver lead was struck, which assayed $55.60 per ton in silver, copper and gold values. In the property is a water-fall which the Company is reported to have secured for power purposes on application to the United States Government.

After referring to the Premier Mining Company, explaining that the finishing touches now are being put on the aerial tramway, and after dealing generally with the mining possibilities of the whole section, Mr. Benson recommends that the Provincial Government expend an even greater sum than already has been invested in roads in that country and, in this connection, refers to the policy of the United States in the following terms:

"Every ton of ore has to come out of this district through the Fish Creek district on the American side. The American Government has done great work on the wagon road this season in the Fish Creek district. Many men with the most modern appliances for road making were at work the whole season and, besides the road gang, the Government had a trail building gang out from the beginning of July. This gang built a splendid trail to the Interior back of Fish Creek which will be of the utmost benefit to prospectors."

British Columbia's First Mine

By A. S. WILLIAMSON.

A great deal of history and romance has been written about the early days of placer mining in British Columbia, but little has been recorded of the early history of Lode mining in **British Columbia.** Although great wealth was derived from the Gold diggings, Lode mining has produced ten-fold more.

While operating a mining property on the Fraser River near the town of Hope (once a Hudson Bay outpost known as Fort Hope) some Indians told me a story of an old mine rich in silver on Issulick Mountain that shipped boat-loads of silver fifty or sixty years ago, and that their old people used to pack the ore on their backs from the mine to the river. According to their story the mine was discovered by an Indian called Peter Emery who ran across it while hunting goat. He showed the ore to a white man named Schooley in the then famous gold camp of Yale. Schooley bargained with the Indian to show him where the ore was, this the Indian did on Schooley trading him a rifle and a coffin to bury his wife in, which was all the Indian ever got out of his discovery, although it made Schooley rich.

I learned later that Schooley afterwards took up his residence in Victoria, (the only town of any importance west of Toronto in those days) married one of the leading Society girls there, and started out to have a good time, until one day whilst drunk, he got into an argument with his father-in-law and shot him, he was tried a few weeks later and hanged for his crime.

Information in Government Reports.

As the story seemed to me to be out of the ordinary run of stories usually told by Indians about lost mines, I decided to find out the truth of the story and prospect around for the mine. Before starting out, however, I determined to get any data I could that was reliable, so I wrote to the Compiler of Geological Information, Ottawa for information regarding the old "Eureka Victoria" mines, located 1868, and receiving an answer to the effect that the Reports of Progress were out of print for 1871-1872, but that he was pleased to quote a few paragraphs regarding the "Eureka" mine which were as follows:—

"In our report of progress for 1871-1872, page 57, Dr. Alfred R. C. Selwyn states:— "I was not able to examine the site of the silver mine near Hope, but was informed that the proprietor of the claim valued it at $300,000. Difficulty of transport, the high price of labour, and the lack of requisite capital have, however, prevented its development.

"The mine is situated 7 miles south of Hope on the Fraser River at an elevation of 5,000 feet above tidewater. Messrs. Geo. Dunbar and Thomas Schooley are the proprietors, they state that the vein is from 3 to 12 feet wide, that a tunnel has been driven on it for 190 feet, and that it can be seen for a thousand feet on a strike N.E. and S. W. dipping S. E. 80 deg. — 90 deg. The specimens for analysis (for which see Dr. Hunt's Report) were taken from a heap of several tons and were considered a fair average of the whole."

In the Report of Progress for 1871-1872, page 66, is a statement by Dr. T. Sterry Hunt as follows:— "Silver ore from the 'Eureka' mine near Fort Hope. These specimens show a vein-stone of spathic iron with some quartz, through which is disseminated a massive steel-grey ore giving a black powder, and yielding by analysis sulphur, antimony, copper and silver. From the comparatively large proportion of antimony which the ore contains it would seem to be a highly argentiferous Fahlerz of Friebergite. An average sample of the vein-stone, in a much decomposed condition gave 380 ozs. of silver, of which .11 per cent was present in the form of chloride, and was dissolved from the raw ore by a solution of Hyposulphite of Soda, other considerable masses of the ore would yield a much larger proportion of the previous metal."

In our Report of Progress for 1876-77, the Minister of Mines of British Columbia describes it as follows:— "The first lead called the 'Eureka' mine crops out about 5,000 feet above river level, is well-defined, four to seven feet in thickness and has been traced for 3,000 feet. A tunnel has been driven into this lead for 190 feet. The ore is described as an argentiferous grey copper and has yielded, under assay, $20 to $1,050 worth of silver to the ton."

"During the time the above lead was being worked, another about 300 feet distant was discovered, this is of a far more valuable character, and is called the "Van-Bremer" mine. The ore is described as chloride of silver, and has yielded, under assay, from $25 to $2,403 of silver per ton of rock. A quantity from the outcrop sold at San Francisco at $420 per ton. This lead is distinctly traceable for half a mile."

Assaying Outfit Discovered.

After receiving the Government reports, I decided that a little time would be well spent trying to discover the old mine, so getting an early start one morning, in company with an Indian, we spent several hours trying to pick up the old trail in a tangle of dead falls with a top dressing of devil clubs, and after following the old blazes for about two miles, the trail became well-defined, in places almost wide enough for a waggon. After this there was no difficulty in following it until, at an altitude of about 5,000 feet, just at timberline we came to an old cabin with the roof smashed in. Lying all around were old tools, 1½ inch steel with Bull Bits that made them look like baseball bats, old black powder kegs, and empty paper cartridges which were loaded with the black powder for blasting purposes.

There was also a 5½ foot cross-cut saw, without drag teeth, with the handles rivetted on, apparently the saw must have been considered a new-fangled idea, as I could find no place where it had been used, trees from 2 feet to 5 feet in diameter being cut through with axes.

At one end of the cabin was a huge fireplace, at the other a cast-iron cook-stove with an assortment of old-time cooking utensils even to the sheet zinc stove pipe just as good today as it was fifty years ago.

More interesting was the remains of an old assaying outfit, showing that the old-timers took no chances in shipping anything but the best when their nearest smelters were San Francisco and Swansea, Wales.

Close to the cabin around the roots of an old tree

were discovered quite a lot of ore samples, which from their appearance looked as if I had not come on a wild goose chase.

Satisfied to call it a day's work, we cooked supper, afterwards boiling our beans for next day in the same old three-legged iron pot that, without doubt, had rendered similar service fifty years before, then throwing our blankets down in a corner of the old cabin, went to sleep with sincere admiration for the nerve and enterprise of the old-timers who opened up British Columbia's First Mine, at that time 3,000 miles from a railroad.

First Indications of Ore.

Next morning there was little difficulty in picking up an old trail that led down along the face of an almost sheer cliff. Coming towards a very narrow ravine cutting at right angles to the trail, I noticed the ruins of an old blacksmith's shop, just on the other side of which was the ravine, the bottom of which was filled with snow. Crossing the snow, I discovered an opening underneath which showed indications of ore on the side of the ravine, evidently the hanging wall of a vein. Crawling down between the snow and the wall I located the Adit, about ten feet in. Under the snow the opening was filled up with sand and rocks to within two feet of the roof. Lighting a candle, I crawled in over the top to find three feet of water standing in the tunnel, feeling around with my feet, I found that I was standing on a old wooden track Continuing for about a hundred feet, I came to an old car on the track still in good working order. A short distance from the face were some tools, and on a ledge some old tallow dips, as if the miners had just gone off shift.

In driving the tunnel the ore was followed on the hanging wall. The orebody varied in width from a few inches to two feet with about two feet of high-grade ore in the face. No attempt had been made to crosscut, for this I couldn't blame them considering their tools and the black powder then in use.

After taking a few samples I did some more wading and came out just in time to prevent my Indian friend from starting down hill after a rescue party.

How It Had Been Worked.

Shortly after noon, I picked up a trail leading off in a south-westerly direction, following it for about a thousand feet it crossed a rock-slide at the mouth of a narrow ravine with walls about 300 feet high. The ravine was apparently caused by the erosion of a porphyry dyke cutting the vein nearly at right angles — this was evident from the large amount of ore and vein matter all over the slide. Finding no way of getting into the ravine, I continued on for a few hundred yards when the ruins of an old stone house blocked the trail in the face of a sheer cliff. The builders had used the overhang of the cliff for the roof, building the end walls of stone, and facing up the front with logs, making very comfortable quarters with "safety first" written all over it as there was no snow-slide that could ever harm it.

Among the ruins there were quite a lot of old tools, a 90-lb. anvil and a fifteen or twenty gallon milk can exactly the same as used these days for shipping milk, only that it had leather straps on it, evidently it had been used for packing water up from a small lake 500 feet lower down at the foot of the cliff which must have been some man-sized job, although from the number of empty whisky bottles lying around, it might not have been such hard work after all. This old camp, I afterwards learned went by the name of Victoria House, being on the Victoria claim.

Quite close to the camp the trail crossed a vein and a considerable quantity of ore, where apparently there had been sorting sheds.

Looking up the face of the cliff there could be seen what seemed to be a tunnel about 100 feet up, at intervals all the way up there were pieces of steel driven into the rock on which wooden ladders had been hung, pieces of which were lying at the foot of the cliff. By throwing a rope from one piece of steel to the other I got into the old workings which consisted of two tunnels and a large open cut very much like a glory hole. The ore was of the same character as the "Eureka" vein, only very much higher grade in places—this may be the Van-Brenmer lead mentioned in the Government Reports.

After doing the staking (relocating the claims) we made for camp just as the darkness set in.

Looking down the mountain from an altitude of nearly a mile could be seen the C. P. R., Transcontinental express flashing like a firefly along the canyon of the Fraser taking the place of the old stern-wheel steamers and pack trails of the early sixties when the first staking was done.

Among the original subscribers to the memorandum of Association of the two Mining Companies formed to operate the mines were the well-known pioneers and business men of the Province, S. P. Moody whose address is given as Burrard Inlet, and after whom Moodyville is named, Hugh Nelson, afterwards Lieut.-Governor Nelson the owner of the first saw-mill in Vancouver Harbour; George Dietz, of Cariboo Road fame; Francis Garesche, J. C. Hughes, R. P. Rithet, and others equally prominent in the early history of British Columbia.

CANADIAN ENGINEERING STANDARDS ASSOCIATION.

The Sixth Meeting of the Main Committee of the above Association was held on Monday, October 17th, at the Association's Office in Ottawa, Mr. H. H. Vaughan in the Chair. The Specification for Wire Rope, as approved by the Main Committee in August is now in the press and will shortly be issued. The Specification for Steel Railway Bridges (No. 1-1920) being now out of print, active steps are being taken in preparing a new edition, in which a number of important alterations and improvements are being incorporated, with a view of bringing it into agreement with the most recent practice of the large railway administrations. The first draft of the Highway Bridge Specification has been amended and is now being held, in order that it may be brought into general conformity with the provisions of the revised Railway Bridge Specification.

The work of the Sub-Committees on Incandescent Lamps, wood poles for Transmission Lines, and Watthour Meters is actively proceeding. The Committee approved the list of members for the Sub-Committee on Concrete and Reinforced Concrete and it is expected that this Committee will commence its work at an early date with a view of preparing general specifications for these materials, based on the existing specifications of the Engineering Institute of Canada. The Specification for Portland Cement is being finally revised by the Sectional Committee, and will be submitted to the Main Committee for approval and publication at an early date.

Nova Scotia Collieries

Recovery of B. E. Steel Corporation's Output from Low Work of Efficiency and the Necessity of Reducing Miners' Wages.

The coal output of the several companies of the British Empire Steel Corporation for the current year for the nine months ending September 30th was as follows:

	Dominion Coal Company		Acadia Coal Co.	N. S. S. & C. Co.
	Cape Breton	Springhill		Cape Breton
January ..	256,748	39,645	54,786	53,041
February ..	227,030	43,123	46,429	45,653
March	196,005	37,402	42,349	39,570
April	175,324	33,523	16,454	32,332
May	272,947	32,310	9,574	40,492
June	295,449	25,397	28,368	61,300
July	283,364	20,752	29,302	56,257
August	321,908	22,927	27,608	54,761
September .	272,819	27,169	21,088	54,140
	2,301,594	282,848	275,958	437,546

Total of combined companies for nine months 3,297,946

The average monthly output for the combined companies so far in 1921 has been 366,000 tons. The production during the remaining quarter of the year is not likely to exceed this average, and is likely to fall much below it, particularly if the Dominion Iron and Steel Company does not receive the orders for rails from the Canadian Government railways that are said to be in prospect. The production of the combined companies in 1920 was 4,839,402 tons, but in 1921 it does not appear likely that the coal outputs will aggregate more than 4,400,000 tons. The capacity of the Corporation's mines, as may be judged from the foregoing figures, is, with existing labour forces, probably about 475,000 tons monthly, or at the rate of 5,700,000 tons annually. If the maximum recorded coal production of the combined companies is taken, representing the performance of the year 1913, it will be found that this was 6,500,000 tons, so that there has been a decline in capacity of the mines for output of twelve percent. When disorganization of working forces during the war period was at its worst point, the capacity of the mines for output was decreased by from thirty to forty percent, so that recent figures of production indicate substantial recovery from the low mark of working efficiency. The proper proportion of faceworkers to other workers is not yet restored, but it is much bettered, and partial employment has increased the output of contract workers.

The Question of Wages.

The wage agreement between the Nova Scotia coal companies and the United Mine Workers of America in District 26 expires at the end of November next, and it is expected that the coal companies will ask for a substantial reduction in wages in any new wage agreement that may be negotiated.

The St. Lawrence season is approaching a close, and it is expected that some 1,200,000 tons will have been sent up the River from Nova Scotia coal-mines when navigation closes. This is the largest season's coal shipments since the season of 1914-1915, and while it represents real progress in the recovery of the Montreal market for the Nova Scotia mines, it is a long way from reaching usual pre-war shipments, which ran between 1,500,000 and 2,000,000 tons in the season of open navigation.

When the St. Lawrence outlet closes, the position of the collieries will become very difficult unless some revival of steel production takes place. The plant of the Nova Scotia Steel & Coal Company at Sydney Mines has not made a pound of steel since November 1920, and the Sydney Plant has few if any orders in prospect. The alloting of a rail order to the Dominion Steel Company is largely a question of a cost of production of steel which will justify the Government at Ottawa in making purchases at this time, and this in turn is altogether a question of the cost of mining coal. The wages of the steelworkers have been reduced by thirty percent, but the wages of the coal-miners, under the agreement of last November, remain at the highest point ever paid in Nova Scotia.

Miners' Wages Must Come Down.

The only possibility of commercial operation of the steel plants in Nova Scotia lies in the reduction of coal-miners' wages. If no outlet for coal is found through steel manufacture, the only possibility of finding employment for the colliery workers during the ensuing Winter months will be to bank out coal in expectation of sales in the St. Lawrence markets next Spring. In face of a declining market for bituminous coal and a tremendous over-development of bituminous coal mines in the United States it will not be advisable for the coal companies in Nova Scotia to attempt to finance the heavy expenditures that banking-out coal requires unless the coal can be mined at an expenditure in wages and materials which will be not less than the probable selling price of coal next Spring in the St. Lawrence markets. High railway freights, plus surtax on rail freight-charges and pit-mouth coal prices for exchange premium on New York funds, have been responsible for from $1.50 to $2.00 per ton on the price of coal in Montreal. A likelihood of reductions in rail freights, and a lessening of the surtax on exchange by improvement in the value of the Canadian dollar, will combine to bring about a lessening of the delivered price in Montreal next Summer, irrespective of the price at the pitmouth in the United States or the profit of the dealer in Canada. The state of business and the attitude of the banks will in any case discourage the undertaking of expensive banking-out programmes in Nova Scotia during the coming Winter. If a reduction in wages can be arranged that will permit of mining coal at a cost to meet American competition next Spring a limited amount of employment will be possible at the collieries.

Wages and Cost of Living.

Coal miners wages in Nova Scotia rose with the increased cost of living to a point from 120 to 150 percent above the figures of 1914. The cost of living, as estimated by the Department of Labour at Ottawa, reached a peak in July 1920 that was 100 percent above 1914 figures, and has since dropped to a point about 60 percent above 1914. It is therefore evident that coal-miners wages in Nova Scotia could undergo a very

substantial reduction and yet leave the net earnings of the miners much higher, relatively, than they were in 1914.

It is anticipated that a wage reduction will be arranged at the expiry of the current agreement with the U.M.W. of A., probably under protest from the union, but the complete inability of the coal companies to continue to pay war-time wages in a period of wide-spread trade depression and acute unemployment leaves no choice to either side.

THE CHUCHUA COAL FIELD.

Authoritative information indicates that the report of Capt. James McEvoy, included in "Coal Fields of British Columbia," necessarily based on surface observations, does not do full justice to the possibilities of Chuchua field. Although it covers a limited area it now promises to become a factor in the solution of the fuel problems of the Kamloops District, B.C.

The seam operated at present pitches between 14 and 15 degrees and the following is an approximate section of it as exposed at the working face:

Roof, Sandstone; Coal, 14 inches; Slate, 6 inches; Coal, 12 inches; Slate, 3 inches; Coal, 6 inches; Bone Coal: Mixed with rock. A band of very good blacksmith coal has been discovered among it.

On the south bank of the Newhykulston Creek a four foot outcrop of apparently good coal has been found. The same seam, with a thickness of about six feet, has been reached by a Calyx drill hole on the north side of the creek at a depth of 35 feet. A haulage slope now is being driven towards it and work also has begun on a second opening.

The output has reached 25 tons a day. The mine run, hauled in small cars up a small slope by a minuscule hoist, after being passed over an improvised screen, is stored in small bunkers whence it is hauled to the railway siding, a good mile distant, by motor trucks. Nut and slack, mixed, are supplied to the Tranquille Sanitorium and the Lump Coal is shipped to Kamloops, Vancouver and Everett.

The power plant at the mine consists of a 44 h.p. boiler, a diminutive air compressor and a small generator, supplying a current of 12 amperes by 110 volts to run the fan and charge the Edison lamp batteries.

PERSONALS.

Mr. Hugh B. Gillis has been appointed Superintendent of Ore Mines & Quarries for the British Empire Steel Corporation. Mr. Gillis has for a number of years been in charge of the iron-ore and limestone mining of the Dominion Steel Corporation, and his duties will now be enlarged to include the supervision of the ore mines and quarries of the Nova Scotia Steel & Coal Company at Wabana, Newfoundland and in Cape Breton. Mr. Gillis is a graduate of St. Francis Xavier College at Antigonish in Arts and of McGill University in Mining Engineering. He is a member and counsellor of the Mining Society of Nova Scotia and the Canadian Institute of Mining & Metallurgy.

Mr. Samuel W. Cohen, Consulting Mining Engineer of Montreal, was the official representative of the University of Minnesota at the McGill University Centenary.

B.C. COAL PRODUCTION.

The coal production of the Province of British Columbia shows little variation when figures for the month of September are compared with those of the previous month. There has been a very slight falling off, a matter of 3,757 tons, spread over the whole of the Province.

In the Crow's Nest Pass there were smaller tonnages produced at Coal Creek Collieries and at Corbin while at Michel there was an increase. On Vancouver Island the output was kept at practically the same mark while in the Nicola-Princeton Field there was some decline.

The total production for the month of August for British Columbia was 252,677 tons while for the month of September it was 248,920 tons.

Following are the detailed figures:

Output of Coal for Month of September 1921.

Vancouver Island District.		
Canadian Western Fuel Co., Nanaimo	68,470	
Canadian Collieries (D) Ltd.,		
Comox	37,952	
South Wellington	7,802	
Extension	19,016	
Nanoose Wellington Collrs., Nanoose	5,733	
Granby Consolidated M.S. & P. Co.,		
Cassidy	22,374	
Old Wellington (King & Foster)	604	
Total	161,951	161,951
Nicola-Princeton Collieries.		
Middlesboro Collieries, Middlesboro	5,311	
Fleming Coal Co., Merritt	3,444	
Coalmont Collieries, Coalmont	7,604	
Princeton Coal & Coke Co., Princeton	1,666	
Total	18,025	18,025
Crow's Nest Pass District.		
Crow's Nest Pass Coal Co.,		
Corbin Coal & Coke Co., Corbin	6,226	
Coal Creek	37,459	
Michel	25,259	
Total	68,944	68,944
		248,920

U.S. COAL PRODUCTION.

Production of soft coal increased sharply during the week ended October 15. The total output, including lignite and coal coked at the mine, is estimated at 9,696,000 tons, and increase of 573,000 tons over the week preceding. Despite this improvement production is still much below the level reached in the corresponding week of the past four years, the period over which records of weekly output extend. A year ago, for example, more than 12,100,000 tons were mined. The production in 1921 has not only been lower than in the years of active demand during and since the war, but it has also been lower than in the pre-war years. In the diagram above the heavy black line represents the average production per working day during each month of 1921. Only once has the 1921 line risen above the average for the years 1913 to 1916, and at that time American coal was in demand to meet the deficit in Europe caused by the British miners' strike. What the record for the month of October, 1921, will finally show remains to be seen, but the average for the first 15 days is only 1,568,000 tons, still below the pre-war level

American Electrochemical Society

Features of Fall Meeting at Lake Placid were Symposiums on Non-Ferrous Metallurgy and Electrodeposition.

It was generally conceded by all in attendance at Lake Placid that a most unique meeting place had been selected for a Fall Meeting. Through the courtesy of the Lake Placid Club their recreation facilities were placed at the disposal of members and afforded excellent opportunities for taking part in golf, tennis, motoring and mountain hiking. A great deal of the success of the Meeting is due to Mr. W. M. Corse, who spared no effort as acting chairman of the arrangements committee

On Thursday, September 29, at 9 A.M., the fortieth General Meeting of the Society was called to order by President Acheson Smith who then introduced Mr. Melvil Dewey, founder and president of the Lake Placid Club. Dr. Dewey cordially welcomed our members and mentioned several points of interest that everyone should see while at Lake Placid. The reading and active discussion of papers followed this talk and were continued in the mornings of the next two days, the features of which were respectively the Symposiums on Non-ferrous Metallurgy and Electrodeposition.

Each of the three technical sessions was attended by a number of members and guests who took active part in disenssing the papers presented. The result was that the proceedings, carried out according to schedule, were lively as well as interesting.

The Thursday morning session was filled by reading and discussion of papers:

Experiences with Alkaline and Alkaline Earth Metals in Connection with Non-ferous Alloys. Charles Vickers. Sodinm appears to have a negative value for copper, bnt seems to be superior to phosphorus in deoxidizing bronze. Calcinm, of the alkaline earth metals, appears valueless in producing sound copper castings. As a deoxidizer, calcium is best adaptable when combined with an acid element, as silicon, and is further improved when combined with a third element.

The Electrolytically Produced Calcium-Barium-Lead Alloys Comprising Frary Metal. W. A. Cowan, L. D. Simpkins and G. C. Hiers. This paper presented by Mr. Hiers described the development of Frary Metal and its production by electrodeposition from a mixture of calcium and barium chlorides over a bath of molten lead as cathode. The properties of Frary metal are compared with those of other bearing metals. As a bearing metal it has desirable hardness and strength at elevated temperatnres.

The Electrolytic Corrosion of Lead-Thallium Alloys. Colin G. Fink and C. H. Eldridge. Presented by Dr. Fink. Anodic corrosion losses in an acid copper sulfate electrolyte containing nitric and hydrochloric acids are reduced by using lead-thallinm alloys. A minimum loss of 1.2 lb. per 100 lb. of copper deposited resulted with a lead anode containing 10 percent Tl and 20 per cent Sn.

A New Theory of the Corrosion of Iron. J. Newton Friend. An auto-colloidal catalytic theory, which postulates the corrosion as starting by the formation of colloidal ferrous hydroxide. This by contact with the air forms hydrated ferric hydroxide which in turn is alternately reduced by contact with iron and oxidized by contact with air, thus continuing the corrosion.

Rust Prevention by Slushing. Haakon Styri. An extended research which shows that for protection against rust by greases a thorough cleaning of the steel parts by an aqueous solution is essential; an oil emulsion which leaves an oil film for short time protection is preferable. Such emulsions protect against rust.

Transformer Oil Sludge. C. J. Rodman. Of the three types of transformer oil sludge (asphaltic, soap and carbon), the asphaltic is the most general form and is the oxidation product of an attackable oil. It collects upon the active parts of transformer. The soap sludge forms slowly and is difficult to remove by filtration. The carbon sludge is caused by electrical breakdown.

The Electrolytic Dissociation of Cyanamide and Some of Its Salts in Aqueous Solutions. N. Kameyama. The degree of dissociation and of hydrolysis of sodium and calcium cyanamide was determined; from this the dissociation constant was calculated and the mobility of the cyanamide anion estimated.

The Electrolytic Oxidation of Hydrochloric Acid to Perchloric Acid. H. M. Goodwin and E. C. Walker. The investigation and data present the effect of acid concentration, current density, duration of electrolysis and temperature on the yield of perchloric acid. A cell yielding 800 grams of 60 percent acid per 24 hours is described.

Graphic Control of Electrolytic Processes. B. C. Worth. A graphic method of maintaining fixed conditions in potassinm chlorate production is presented. Of the three factors which influence the yield, two represent concentrations of 2 compounds one of which which is controllable by addition agents, and the third is temperature.

Friday morning was devoted to a Symposinm on Non-ferons Metallurgy. The papers included were:

The Influence of the Electric Furnace on the Metallurgy of Non-ferrous Metals. H. M. St. John. The nse of the Electric furnace in brass foundries and refining plants for melting purposes has revolutionized metal handling methods; a more uniform quality of product is obtained with less labor and less metal wastage. The attainments are better than have been previously possible and the secretiveness which has been characteristic of the non-ferrons industry is gradually being done away with.

Modern Developments in the British Brass Industry. E. A. Smith. The actual condition of the British brass industry are presented with a discussion of electric brass furnaces, hot pressing and forging of brass, rolling mill practice, annealing, etc.

Resistance Type of Electric Furnace in the Melting of Brass and Other Non-Ferrous Metals. T. F. Baily. The various features to be considered in making an electric furnace installation for melting non-ferrous metals are discussed.

Comparison of Electric Furnace Practice with Fuel Fired Furnace Practice. N. K. B. Patch. The author's experiences are that the cost of metal melted, the melting losses, and the solution of gases in metal, are substantially the same in the electric and the fuel fired furnace, provided intelligent operation is pursued.

Electric Silver Melting. H. A. DeFries. Describes advantages of electric furnace melting of silver and relates how a more ductile and tougher silver results upon introducing an iron block into the bath.

Electric Furnace Melting of Nickel-Silver. F. C. Thompson. Advantages of melting nickel-silver in the externally heated electric furnace are discussed.

Aluminum-Copper Alloys. R. J. Anderson. A discussion of the manufacture, properties and uses of the commercial aluminum-copper alloys employed in the United States.

Recent Developments in Electric Furnaces of the Muffled Arc Type. H A. Winne. Several types of muffled are melting furnaces are described with their features and adaptabilities.

Electric Furnace Purification of Zirkite. J. G. Thompson. The arc type furnace used in this investigation made it possible to remove 90-95 percent Si as an impurity from the Zirkite ore; the amount of carbon introduced being only sufficient to transform the silicon to the carbide.

Physical Characteristics of Specialized Refractories. Cross Breaking Strength at 20° and 1350°C. M. L. Hartman and W. A. Koehler. The tests were carried out on each of ten refractory materials at the temperatures indicated.

An Electrodeposition Symposium was the feature of the morning of the closing day of the Meeting, Saturday, October 1. The papers discussed were:

An Electric Steam-Generator for Low Voltage. F. A. Lidbury and F. A. Stamps. An inexpensive form of apparatus for the generation of steam by means of an alternating current of voltages from 100 to 500.

The Effect of Pressure on Overvoltage. H. M. Goodwin and L. A. Wilson. The values of overvoltage of hydrogen against copper, nickel and mercury electrodes were determined at pressures varying from one atmosphere to a few centimeters of mercury.

Researches on the Electrodeposition of Iron. W. E. Hughes. The result of several experimenters and those obtained by the author are related in the electrodeposition of iron from (1) sulphate solution, (2) chloride solutions and (3) sulphate-chloride solutions.

Electrolytic Solution and Deposition of Copper. T. R. Briggs.

Electrometallurgy of Zinc. W. R. Ingalls. The developments in the electrolytic zinc extraction process and the progress, in Scandinavia, of electrothermic smelting are set forth.

Deposition of Zinc from the Zinc Cyanide Solution. C. J. Wernlund. This research was carried out with the intention of obtaining a zinc cyanide plating solution which would operate successfully under the most trying commercial conditions.

The Electrodeposition of Lead-Tin Alloys. Wm. Blum and H. E. Haring. That a finer grained deposit of alloys of lead and tin can be obtained from fluoborate solutions than is possible when depositing either of the metals under similar conditions is established.

The Structure and Properties of Alternately Electrodeposited Metals. Wm. Blum. If during the deposition of copper thin layers of nickel are interposed, a deposit of greater tensile strength than pure copper results due to the restraining influence nickel has on the growth of copper crystals.

In all, the meeting proved to be most profitable, social and instructive.

DANGEROUS GASES LIBERATED IN MINES.

In Technical Paper 249, "The Determination of Oxides of Nitrogen," by A. C. Allison, W. L. Parker, and G. W. Jones, just issued by the United States Bureau of Mines, a new method for the determination of this noxious gas, sometimes formed after blasting in metal mines, is described.

The U. S. Bureau of Mines, in the course of its work looking toward the minimizing of accidents in mining operations, has occasion to make analyses of gases in determining the ventilation conditions and the hazards that may develop from exposure of the workers to gases liberated in mines. Not only is it important to identify such gases as form explosive mixtures and are at times liberated in large quantities, but in addition it is necessary to determine what gases have harmful effects upon miners who are exposed to them while at work. In metal mines where much blasting is done, the shots are often prepared improperly, and some oxides of nitrogen may be formed after firing. Moreover, other industries than mining produce oxides of nitrogen which have a deleterious effect on individuals breathing them for any length of time.

Two gases that result from the firing of explosives are, because of their physiological effects, important in mine ventilation. They are carbon monoxide and oxides of nitrogen. Other gases produced at the same time, including carbon dioxide, hydrogen, methane, and nitrogen, are unimportant unless in proportions sufficient to diminish appreciably the oxygen content of the mine air. Carbon monoxide and oxides of nitrogen usually occur together and are very harmful even when inhaled in small quantities. About 0.01 or 0.02 per cent is the maximum quantity of carbon monoxide allowable continuously in mine air without affecting the workmen harmfully, although as much as 0.04 per cent is harmless for periods of time not exceeding one hour. Very little data are available on the maximum quantity of oxides of nitrogen that may be tolerated in mine air without danger to the men working therein. The general conclusions are that 0.01 and 0.02 per cent of oxides of nitrogen is dangerous and under no conditions should 0.05 per cent be reached. Carbon monoxide can be determined to an accuracy of about 0.02 per cent by the usual Haldane analysis, but an accurate method of determining oxides of nitrogen at low concentrations has heretofore been impossible without using a large quantity of gas for a sample.

A method was desired by which very small quantities of oxides of nitrogen could be determined from a minimum quantity of gas, for samples of mine gases are taken most conveniently in vacuum bottles of about 250 c.c. capacity. The nitron method used by Gutbier and Busch is difficult to perform and can not be used at such low concentrations as are present in the usual mine-air samples. To be of value in mine-gas analysis, a method should be accurate to at least 10 parts per million, or 0.001 per cent. After explosives have been fired, especially in ventilated working faces, the products of the explosion are, of course, diluted with large quantities of air, and the amounts of oxides of nitrogen present will usually be lower than 100 parts per million (0.01 per cent). To determine these small quantities, a method was adapted from the usual procedure for the determination of the oxides of nitrogen in water analysis, applying the de-phenyl sulphonic acid method to give the total oxides of nitrogen as nitrogen peroxide

or as nitrates. By the use of the method evolved, ten parts of oxides of nitrogen as nitrate could be detected in one million parts of the air oxides of nitrogen mixture with an accurary of five or six parts per million.

Copies of Technical Paper 249 may be obtained by applying to the Director, U. S. Bureau of Mines, Washington, D.C.

PORT ARTHUR MINING NOTES.

By J. J. O'CONNOR.

Another rich vein has been discovered in the Schreiber gold area, south-east of Cook Lake, and about two miles north-east of the village of Schreiber. This discovery was made on September 26th. last, in the course of development work in that field. No definite particulars are to hand regarding the values contained in the vein gangue, it is announced, however, that it is one of the richest local discoveries yet made. The vein is said to be twenty feet wide, and can be traced for three quarters of a mile.

A new company to be known as the St. Anthony Gold Mines Ltd. has been formed to operate the old St. Anthony Mine, at Sturgeon Lake. It has been announced that financial arrangements are being completed in New York, whereby this property will be placed under active operation in the very near future. This property has recently been in the hands of a syndicate, headed by C. Lorne Campbell, formerly of Campbell & Deyell, operators of the ore sampling plant at Cobalt. Their attention has been devoted to putting the mining and milling facilities in shape to operate at capacity after the new start is made. The mill will have a capacity of approximately 150 tons of ore daily. The writer has seen plans of the underground development, together with the results of samplings of the entire body of ore blocked out, which has an estimated value of $1,250,000, and is suffieient to keep the mill running at capacity for over two years. Further development will be pushed with a full force of miners on the various veins on the property, in order to keep well ahead of milling reqnirements. The mine is well equipped with mining and milling plant, together with comfortable housing and office accommodation for a large force of men. Mr. Campbell will take personal charge of operations under the new regime. It is confidently expected that under his management, the St. Anthony will give a good account of itself, and confirm the opinions of mining engineers, that have been tenaciously held to since this property was first opened up. The successful operation of the St. Anthony, will do much to bring Northwestern Ontario back to its old position as one of the chief gold producing areas of the Province, and be an incentive to the opening up of the many promising gold claims in this district, that only await the coming of capital, and intelligent management, to prove their worth.

WORK AT SULLIVAN MINE.

Development work at the big leading zinc mine of the Consolidated Mining and Smelting Company of Canada, at Kimberley, in East Kootenay, is being most energetically pushed under the superintendency of E. G. Montgomery, the recent daily output of ore averaging 950 tons. The two new bunk houses recently erected on the townsite, were available when the recent fire destroyed the old bunk houses, which was most fortunate for the owners, for the buildings being available, made it possible to house the workmen. The burned cook and bunk houses were adjacent to the new tunnel, and were not very conveniently situated. It is planned to erect even a larger and more modern cook house near the new bunk house.

In order to make some necessary repairs at the mine, the Sullivan was closed down recently for about two weeks, but work was resumed the first of the present week with the usual force.

THE SILVER MARKET.

Samuel Montagu and Co. of London, Eng., in their letter of Oct. 6th, say in part:

"Recently the silver market has been made up of many confused elements. China has again posed as buyer and seller, even on the same day. The Indian Bazaars also have operated both ways, though selling has had the preponderance; the effect is shown in the easier tendency of prices. America and the Continent have partieipated in this double-minded method of doing business. Obviously, in these circumstances, issues are obscured. Besides the purchases by China in this market, substantial amounts for that quarter have been sent from India direct.

"Correspondents in Bombay inform us that the heavy buying for India which took place a month ago was in anticipation of a good up country demand later on, and in the expectation that if sterling exchange went up, the Indian price would fall and thus stimulate demand for the metal. It will be observed that in this way the silver market here can very easily become a medium for speculation in the exchange with India, as well as in the exchange with China. No wonder therefore that another Indian correspondent writes about the market that it is "worked up by so many currents that it is rather crazy to speak anything positive at present." Meanwhile it is of interest to note that the sterling value of the silver shipped to India and China combined, is about the same as during the same period last year—though the proportions to the respective destinations differ."

In connection with the silver situation the Financial Times, of London, Eng., recently had this to say: To what extent speculation has been responsible for the recent advance in silver, which has just touched 43⅜ per ounce, the highest price since last December, it is difficult to say, but there have been certain changes in the world conditions during the last few months which have undoubtedly tended to favour a rise in the price of the metal, and it is only natural that these should have been taken advantage of. The recent buying is reported to have come mainly from China, but it is difficult to find any economic reason for an increase in the demand from that source, except that stocks have been allowed to run rather low and an effort is being made to re-establish them. There is no mystery with regard to the previous fall in silver. The two principal causes were admittedly the sudden setback in the trade prosperity of India, and indeed of the Far East generally, coupled with the amount of the metal released by the dilution—to use a polite term—of our own subsidiary coinage, together with that of most of the other principal European countries. These two causes have begun to lose their effect. Since July the trade balance has again turned in favour of India, while the quantity of silver released through the substitution of nickel in our own coinage has mainly been absorbed.

IMPORTANT MEETING IN TORONTO.

Engineering Section of the American Association for the Advancement of Science Will Be Held December 27th to 31st.

The engineering section of the American Association is arranging an important program for the Toronto meeting which will occur from December 27 to 31, 1921. The arrangements for the engineering sessions are in charge of Mr. J. B. Tyrrell, mining engineer, of Toronto. The programs aim to present the application of science to the solution of engineering problems. Many of the addresses will deal especially with the recent accomplishment of scientific engineering in Canada. It will be shown how scientifically trained men have developed some of the natural resources of the Dominion and the means by which this has been accomplished. Addresses already arranged are on the work accomplished by the Hydro-Electric Power Commission of Ontario; on the mines and mining plants of Canada including a account of prospecting in the northern wildernesses; on the explorations for oil carried out in the valley of the McKenzie River by the Imperial Oil Company, and on the work of the Toronto Harbor for the accommodation of ships of ocean draft. All of them, and especially those dealing with exploration in the far north, will be of interest not only to engineers but also to geographers and to every one interested in the out-of-doors. These addresses will generally be accompanied by illustrations and in many cases by motion pictures. Other topics will be announced later.

IMMIGRATION, CAPITAL AND DEVELOPMENT.

A couple of weeks ago, we commented editorially on Sir Joseph Flavelle's pronouncement that a solution of the Railway problem in this country lies in the increasing of agricultural production in the Western Provinces. In his statement of the railway problem, Sir Joseph Flavelle presented a striking argument in favor of speeding up development, and we pointed out that, in our view, endeavor should be made to expedite the development of all natural resources. "Immigration," using that term in its widest sense, must necessarily be a very important factor in the development of all natural resources, and, in this connection, the monthly review for October, of progress in Canada, published by the department of Colonization and Development of the Canadian Pacific Railway, has something very pertinent to say:

The most frequently recurring word in Canadian economic converse is "immigration." It is continually on the lips of the country's statesmen and legislators; it is to be found every day in the editorial columns of Dominion's journals; business men find in it the mirror which reflects the general trend of commercial affairs. The term suggests the history of Canada's wonderful growth in all respects since Confederation; in all that it signifies lies the Dominion's hope and expectation of a development surpassing even this unprecedented record in the next half century.

Canada's interpretation of the word in her national economic life, however, admits of a wider significance than the entry into the country of foreign peoples, and includes the introduction of foreign capital. In agriculture and the successful settlement of the Dominion's vast, uncultivated tracts of fertile land lies Canada's fundamental of progress and future greatness. There must, however, be a corresponding industrial growth with the development of mineral, forest and other natural resources and expansion in the field of manufacturing. To this end capital is needed and the attraction of this necessary factor in the Dominion's endeavors only to that of increasing the population by inducing an intelligent and assimilable type of settler to the country.

In the general depression to which Canada was subjected in common with other nations implicated in the Great War and which affected most phases of her national life, it was gratifying to note the resumption of the influx of foreign money which had practically ceased with the outbreak of the war and continued whilst hostilities were in progress. The only difference was that British capital which had previously led in the assault on Canada became subservient in its volume to that of the United States, for the very conditions which militated against the transfer of any substantial amounts across the seas made it decidedly advantageous to send money across the border. It was estimated a short while ago that United States capital invested in Canada amounted to about 1,600 millions, or about one half the total British investment in the Dominion.

The value of United States investments in Canada during 1920 is estimated at $32,000,000 made up as follows: new bond issues placed in the United States $235,000,000; other bonds purchased $15,000,000; industrial investments, $50,000,000; Western land investments, $5,000,000; increase in assets of insurance companies, $15,000,000. This constituted a record for United States investment, the figures of 1919 being $200,000,000 and the highest previous figures the $207,000,000 of 1916. It is estimated that these probably yield an annual return of $90,000,000, including as they do some of the Dominion's best paying businesses.

The total number of company incorporations with Dominion charters in 1920 was 991 with a total capitalization of $603,210,850, the greater part of which, without doubt, represents foreign capital. Just how investment in Canada is increasing can be realized from a comparison with the previous year's figures, when there was a total of 512 companies which received Federal charters capitalized at $214,326,000. In addition to the figures above recorded 88 companies, by supplementary letters patent, increased their capital stock by $85,187,750. In considering these figures, too, it should be borne in mind that no account is taken of the host of companies incorporated under the charters of the various provinces, all of which have power to grant charters.

The fact that last year, in a period generally considered depressive and one justifying conservatism of action, Canada practically trebled the incorporated capital stock of the previous year and United States total investments nearly doubled, together with the tendency apparent for English incoming capital to assume greater substantiality of volume despite its many handicaps, is just cause for boundless optimism in the immediate future of Canadian commerce and industry. Indications become more apparent every day of the widespread attraction Canada's resources are exerting and the greater attention devoted to the Dominion as a country for investment. To an ever greater extent the great undeveloped wealth of Canada will draw capital for its exploitation.

ALBERTA TAR SAND AREAS.

A despatch from Winnipeg to the Financial Times, Montreal, reports that oil men from the south are said to be returning to the Athabasca area of northern Alberta and buying an interest in the tar sands of that country.

Some years ago United States people became deeply interested in the tar sands districts of Alberta and spent considerable money in the purchase of desirable locations.

At a later time these investors who were practical oil men, became discouraged, and a syndicate was formed in Winnipeg to take over some of these properties.

At that time a German prospector made a number of trips to Winnipeg and spent a couple of years in and out of the city. His name was Von Hammerstein, and his home is still in the far north of Alberta, his residence being in the village of Lac La Biche on the line of Fort McMurray.

Among those who became interested in the tar sand areas at that time were E. F. Hutchings and W. R. Mulock, K.C. The former is the president of the American Oil and Asphalt Company which is a holding corporation only, and not an operating company, and which holds title to 12,000 acres of the most promising land in the district.

Interest in this proposition was to some extent revived this year owing to the pressing search which has been made for petroleum in the north. Prospectors traversed the country, and sent back interesting accounts of the great potential wealth of the region.

It was recently reported from Edmonton that a syndicate in that city had disposed of their holdings of tar sands to oil men from Texas for the sum of $120,000. The names of the buyers were given as R. W. Campbell and C. B. Hammond. The acreage involved in the sale was given as 1,900. This land is within 2½ miles of Fort McMurray. Before the sale was completed samples of the tar sands were sent to Texas and tested in refineries in which the Texas investors are interested.

Northern Ontario Letter

THE SILVER MINES.

Although the price of commercial bar silver rose to upwards of 73 cents an ounce at the beginning of the third week of October, it eased off during the close of the week to around 70 cents an ounce.

Silver miners, as well as certain metal authorities, are again discussing the possibility of an early upward move to around $1 an ounce. Outstanding among the more optimistic is Senator Key Pittman, author of the Pittman Bill under the terms of which the United States Treasury is purchasing all home-produced silver at 99½ cents per ounce.

Working Forces at Cobalt Increased.

In the Cobalt district, the stronger position of the silver market has resulted in working forces being increased to upwards of 1,000 men, as compared with less than 700 toward the end of the past winter when the price of the metal fell off to a low point of 52 cents an ounce. Business men in the Cobalt district are pointing to the increased pay-roll as an indicator of better business, while there are additional prospects of other mines resuming work not later than next spring. Among these would be the McKinley-Darragh, Beaver Consolidated and Temiskaming, the operation of which would tend to increase the total pay-roll by another 25 percent.

La Rose.

A cave of rock in an open cut on the original property of the La Rose Consolidated has let considerable water flow into the workings. This has caused a suspension of operations on this part of the company's holdings. In the meantime, however, work is being continued as usual on the Violet, University and Princess.

Hudson Bay Mining Co.

There are strong indications that the Hudson Bay Mining Company may interest itself in the Cane Silver Mines, situated in the township of Cane on the Elk Lake branch of the T. and N. O. Railway. Already certain of the directors of the Hudson Bay are involved in the Cane Silver Mines Company and are understood to be very well pleased with the outlook. It is pointed out that the Hudson Bay Mine has about exhausted its resources, and that the plant now on the property could be moved to the Cane property with a minimum of difficulty, if so desired.

Exploring Larder Lake Properties.

The Crown Reserve Mining Company is meeting with a good deal of encouragement in the exploration of property in the Larder Lake district. Early reports in circulation indicated values of about $6 per ton across a width of about 30 feet. Later reports modify these figures, particularly in the case of the average values which are now understood to amount to approximately $5 per ton.

Other companies which have shown interest in the Larder Lake district include the Coniagas Mines, but it is difficult to estimate as yet whether work is to become widespread or not.

Nipissing's Option on Rochester.

It has just been learned that the option held by the Nipissing Mining Company on the Rochester property in the Porcupine district is for $250,000. The company is continuing exploration of the property with a diamond drill. A wide zone of schisted formation occurs, and encouraging mineralization has been encountered. The Rochester lies immediately adjacent to the Hollinger Consolidated on the north-west.

Looking for Cobalt Ore.

The Cobalt district is being investigated carefully by mining men who are looking for commercial deposits of ores of the metal cobalt. As yet, no deals appear to have been closed although a definite proposition has been made to the owners of the Lang-Caswell property in Lorrain. It is believed arrangements may be made to operate this property during the coming winter.

Silver Production Increased.

Silver production from this district amounts to about 800,000 ounces per month. This compares with a low point of around 600,000 ounces per month near the close of last winter when the price of the metal fell off to around 52 cents per ounce.

Right of Way.

The winding up of the affairs of the Right of Way Mines is proceeding, and it has been intimated in official circles that the 2,000,000 shares have practically no value.

Elk Lake.

Apart from the reports that the Hudson Bay Mining Company of Cobalt may interest itself in the Cane Sil-

ver Mines, the mining situation in the Elk district does not present any very favorable aspects, with a few exceptions as in the case of the Downey property at Silver Lake, where considerable work is planned.

The Gowganda Road.

In the construction of the road from Elk Lake to Gowganda, the Ontario Government is paying workmen $3.50 per nine-hour day. Although this is low when compared with around $4.75 at the gold mines and $4 at the silver mines, yet it is high when compared with $25 and $30 per month which is the average rate of pay this fall in the lumber camps.

May Instal Mill this Winter.

It has been learned on good authority that the prospects are favorable for the installation of a small mill during the coming winter on the Castle property of the Trethewey Company. The Castle appears to be second in importance to the Miller Lake-O'Brien in the Gowganda district, and those interested in the field are keenly interested in its development for the reason that success on this property would encourage more widespread activity and would enable other property owners to raise finances with which to carry out warranted exploration and development work.

Bailey Ships Ore.

A shipment of 24,534 pounds of ore has just been made from the Bailey Silver Mines to the Pennsylvania Smelting Company, Carnegie, Pa. This is the second shipment within one month from the Bailey.

Coniagas.

The activities of the Coniagas Mines in the Larder Lake field consists of having a man in the district looking over property in the vicinity of that owned by the Crown Reserve. Capt. John Reddington is in charge of this field work for the Coniagas, and it has just been learned that arrangements are being made to take over a promising mining prospect in that district.

The Coniagas Mine itself continues to produce silver at normal capacity, the plants treating an aggregate of upwards of 600 tons of ore every twenty-four hours. The company will close its fiscal year on Oct. 31st, and will show a production for the year well in advance of the past two or three years.

Working Reliance under Lease.

The Reliance property at Cobalt is being worked under lease, and shipments of ore are being made to the Bailey Customs Mill. The property is known to have an encouraging amount of medium grade ore.

THE GOLD MINES.

Heavy rains continued intermittently during the third week of October throughout the Cobalt, Porcupine and Kirkland Lake districts. As a result of this the swamps are filled to overflowing and the lakes and rivers are gradually rising. This condition means that the seepage into the main waterways will probably continue long after the surface becomes frozen, all of which tends to indicate that the winter may be far advanced before the water level commences to lower.

May Substitute Ball Mills for Stamps.

In spite of the desire of the Hollinger Consolidated to prevent optimistic statements to get abroad with respect to contemplated enlargements to the size of its milling plant and the scope of underground operations, it is being mentioned in well informed circles that another big central shaft is under consideration and will be so designed as to have for its objective the 2000 and possibly the 4000-ft. level. Also, that the present stamp equipment may be entirely replaced by ball mills. At present, there are 200 stamps operating in conjunction with 20 tube mills. The displacement of these 200 stamps by 10 ball mills each of 600 tons daily capacity would increase the total capacity of the mill to approximately 6000 tons of ore daily. Were the company to do this, and continue to realize an income of $10 per ton, the annual income would exceed $21,000,000. It is considered probable, however, that in bidding for such a vast tonnage, the average grade of the whole might be reduced somewhat by the inclusion of a large amount of medium grade ore. Also, that although the maximum capacity might be brought up to 6000 tons daily, yet, after making due allowance for a reasonable amount of lost time, such a plant might be expected to handle about 2,000,000 tons of ore annually. Also, allowing for reduced values to $8 per ton, the annual yield would amount to $16,000,000. Just now the mine is producing at the rate of between $12,000,000 and $13,000,000 a year.

Work Started at Davidson Mine.

Work is being started on the Davidson Consolidated, the company being in strong position as a result of successful financial arrangements having been made in England. From the available reports on the property, the Davidson has a substantial amount of ore and is expected to figure conspicuously in developments in the Porcupine district during the next year or so. It is stated that sufficient money is available with which to finance the construction of a big mill at such time as the management may consider such a plant advisable.

Teck-Hughes.

There is further talk about a possible consolidation of the Teck-Hughes with the Orr Gold Mines. Incidentally, it has been learned officially that a meeting of the bondholders and the stockholders of the Teck-Hughes may be held at an early date for the purpose of arriving at a mutually satisfactory arrangement in respect to the $610,000 owing by the Teck-Hughes Company, this being in the form of $500,000 in bonds and the balance being accrued interest.

Crown Reserve.

In view of the encouragement which the Crown Reserve is meeting with on its property in the Larder Lake field, this belief is now taking form that the entire stretch of 25 miles of territory lying between Kirkland and Larder Lake may be found to contain commercial deposits of ore at intervals. It is learned, however, that the earlier reports about the results on the Crown Reserve were slightly exaggerated, in that the ore assays approximately $5 per ton across about 30 feet instead of around $6 per ton.

The trend of results from one end to the other of this auriferous zone is leading to the belief that the present easterly extension of the road through the Kirkland Lake district will likely be continued right through Lebel and Gauthier townships to the vicinity of the Argonaut Gold property and there link up with the Larder Lake road.

Lake Shore.

During the month of September the Lake Shore mine produced $40,928.74, thereby maintaining its record at the rate of approximately half a million dollars a year in spite of the mill having operated only 90 per cent of the possible running time.

A feature of the monthly achievement was that the ore yielded an average of $25.24 per ton, this being

slightly above normal. Another favorable feature was that of the 10 per cent of the possible running time lost, only 1.4 per cent was due to "power off," the remainder of lost time being due to installing reduction gear and re-lining the ball mill.

The report does not deal as usual with the amount of work done underground and gives no indication of what point exploration or development work is being centered.

Dome Using 2,800 h.p.

It now requires approximately 2,800 hydro-electric horse power to operate the Dome Mines equipment at full capacity, according to official advice. This consumption of power enables the mill to handle between 1,100 and 1,200 tons of ore, on which the monthly income is at present at the fluctuating rate of between $200,000 and $250,000 per month.

Montreal Kirkland.

A meeting of the shareholders of the Montreal Kirkland has been called for November 1st at which the question of raising more money with which to explore the property will be discussed.

In notice of the meeting sent out to the shareholders, as large an attendance as possible is urged.

Teck-Hughes.

A mining man who is in close touch with the Teck-Hughes Mining Company declares that although no date has actually been set upon which to hold a special meeting of the bondholders and stockholders such a meeting will probably be arranged within a reasonably short time. This statement was in reply to questions based upon the recent reports that such a meeeting is under contemplation.

British Columbia Notes

Nelson, B.C.—The production of the Sullivan Mine, Kimberley, B.C., is being reduced temporarily by the Consolidated Mining & Smelting Co. because of the slackness of the zinc market. —The option held on the Van Roi Mine, Silverton, by Clarence Cunningham, has been relinquished. Ore to the value of approximately $350,000 has been shipped by Mr. Cunningham. His option, secured in 1916, was for $225,000. After making some payments on this amount, the owners, owing to metal market conditions, agreed to permit the continuance of operations on a royalty basis.

Gold Find in the Old Cariboo.

Quesnel, B.C.—There is great excitement in the old Cariboo, British Columbia. Gold again has been struck. How important the discovery is cannot be said until more reliable information is received but first reports are favorable and have started a stampede from the Horsefly and Quesnel-Forks Districts. The find is at Cedar Creek on Quesnel Lake, about eight miles up the lake from Quesnel Dam. A few men have been prospecting there for some time and taking out small amounts of gold.

Prospectors Find Lost Channel.

Some weeks ago they started prospecting the upper benches of the creek and apparently struck the old channel that was lost in the early days, at least that is the current belief and no doubt the fervent hope of residents of the district. The original stakers are reported to be taking out $35 a day in coarse gold, some large nuggets being found. Several claims staked up and down the channel from the discovery have proved up similarly. A gas boat service has been started from the mouth of Horsefly River to the claims. Notwithstanding shortage of water it is said that $1,200 in nuggets and coarse gold dust has been taken out in a very short time and the first recorders aver that they have another Klondyke.

Says Mayo the New Eldorado.

Vancouver, B.C.—Frank Lowe, a prominent businessman of Dawson Y. T., who is out for the winter, describes the Mayo District as the new silver Eldorado of the Yukon. There have been handled from the Camp this year 2,500 tons of silver bearing ore and reports from the Tacoma Smelter reaching the north have been that it is the richest ore ever treated there. "At one mine which I visited" Mr. Lowe says, "the silver vein was four feet wide at a depth of 150 feet and I was told by the engineers in charge that the ore got richer as the depth increased. Winter work is in progress here and by Spring it is expected there will be a large quantity of ore bagged and ready for shipment." From lookout Mountain to Mount Cameron, a distance of some thirty miles, the whole of the Mayo country has been staked. The Yukon Gold Company and the Bradley interests both have done considerable work and there are hundreds of small claims being developed. Mr. Lowe thinks it likely that the latter will be absorbed by the bigger financial interests as "the day of the small miner in the north has pretty well passed." Mayo, he says is not like the Klondyke of the early days but is an orderly camp, the inhabitants of which are law abiding and industrious. Of the future of the Yukon Mr. Lowe speaks optimistically but it is his belief that it is to become predominantly a lode gold producing country. He states that gold bearing quartz has been found in several sections and that some of the properties are promising.

High Freight Rates Retarding Development.

Gordon F. Dickson, General Manager of the Blue Diamond Coal Company, Brule, Alberta, considers that high freight rates alone are responsible for retarding the development of the coal resources of the Province of Alberta. With a reduced transportation cost coal could be laid down in Vancouver City cheaper than it is produced on Vancouver Island and sold in the Vancouver market. Alberta coal fields he describes are practically inexhaustible. The Blue Diamond Mine is producing 1,000 tons a day but this could be doubled if freight rates were so graded as to give the coal producer a wider market. Mr. Dickson further says: "American mines are today running almost full blast. This great production allows a cheaper output than in Alberta. Mines in Alberta consequently have strong competition across the border and as a result the great coal fields of Canada lie undeveloped while American mines capture the market. This takes money out of Canada and has a notable effect on the rate of American exchange. Low freight rates would change the whole situation. It would permit Alberta coal to be sent as far east as Ontario where it would undersell American coal."

Ore Receipts at Trail.

Trail, B.C.—Ore receipts in gross tons at the Trail Smelter of the Consolidated Mining & Smelting Co. for the week from October 1 to 7 totalled 7,596. Of this 7,339 tons came from Company properties. Among the independent shippers were the Black Prince, Sloean City; the Castor Fraction, Beaverdell; the Highland Chief, Beaverdell; and the Surprise, Rossbery.

2,000,00 Foot Flow at Pouce Coupé.

The Imperial Oil Company officially announces the

striking of a 2,000,000 foot flow of gas in the Pouce Coupé Field, Province of Alberta, now being prospected. The gas was reached at a depth of 1,650 feet. Drilling commenced last June. At 150 feet the drill encountered oil and gas and since it has passed through a dark marine shale with considerable showing of oil.

A. McQueen, vice-president of the Company, is quoted as saying that drilling will be prosecuted all winter in all of the Alberta Fields now being tested. He asserts that drilling during the next twelve months should reach such a stage as to elicit definite information regarding the oil producing possibilities of all the sections of western Canada now receiving attention.

The Fort Norman Field.

Reports have been received from officials of the Mines Department, Ottawa, who have been in the Fort Norman section of northwestern Canada. They take a middle position in regard to the commercial possibilities of this field—neither overly optimistic nor unduly pessimistic. They say that undoubtedly there is oil in that section, that much of the likely area has not yet been explored, but that production in large quantities is not yet in evidence. While one gusher was struck and poured forth in volume for a time, the run now has fallen to a few barrels a day. Another boring has struck oil at 1,500 feet but only in small quantities. The officials do not condemn the Field nor do they deny its possibilities but on the basis of what has been discovered, they are not enthusiastic, especially in view of the isolation of the territory and transportation and other difficulties.

TORONTO COAL PRICES.

Toronto, 25th Oct. As it is now assumed that the threatened railway strike in the United States is unlikely to materialize, it is not possible to quote prices obtaining at the moment. Last week, when the situation looked more serious, coal men in Toronto ordered quite a bit of coal in order to take care of their customers. But the said customers have not shown much alacrity in desiring to avail themselves of this forethought. For example, one firm within the writer's knowledge had some forty or fifty cars ordered, and now, with the strike looking unlikely to occur, it has had about a quarter of this cancelled. As many coal men are apt to have a fair amount of coal left on their hands in this way, it is quite possible that the market will sag a bit. In that case, such prices as obtain will be fixed, more or less, as the result of individual deals.

NIPISSING INCREASING PRODUCTION.

During the month of September, the Nipissing mine produced silver at a greater rate than during any preceding month since away back in 1920. The daily production for September averaged $6,584, and amounted to a total of $197,536 for the period.

In his regular monthly report to the president and directors, Hugh Park, manager, says that—"During the month of September, the company mined ore of an estimated net value of $197,536 and shipped bullion from Nipissing and custom ore of an estimated net value of $164,405. The value of the silver was estimated at 70 cents an ounce, an increase of 7 cents over August."

With respect to development work, it is noted that exceedingly favorable results were achieved, the official statement showing that "Development work on the new vein found at the second level of 63 shaft at the end of August was favorable during September. The vein has been drifted on for 80 feet, of which 60 feet has an average assay of 2,500 ounces over a width of 3 inches. General underground work at all shafts was favorable throughout the month; a few small veins of minor importance were found at 73 shaft.

"The low grade mill treated 6,835 tons. The high grade plant treated only 36 tons, being shut down to await the completion of an acid treatment annex. This is now ready to start.

PREPARATION AND STORAGE OF MINE TIMBERS.

Perhaps no phase of mining is given less attention than preparation and storage of mine timbers, yet timber in many mines constitutes one of the principal items of cost, particularly in metal mines. By better preparation and storage of mine timbers the durability and strength may be considerably increased and the consumption decreased, thus reducing mining costs.

Preparation may be considered under two heads—peeling and seasoning. The principal advantage from peeling timbers are (1) lessens weight, (2) increases durability, (3) offers greater resistance to insect and fungus attack, and (4) promotes seasoning.

Peeled timber weighs 6 to 10 per cent less than unpeeled green timber. Therefore, peeling at point of shipment effects a considerable saving in cost of freight. In comparatively dry workings peeling will increase the life of timber appreciably, but in wet places this is not so apparent. In dead timber the space beneath the bark is an ideal breeding place for wood destroying insects, which cause both weakness and rapid decay. Bark also causes the retention of moisture and thus promotes fungus growth.

Seasoning mine timber has the following advantages, (1) increases the strength and in some cases the durability, (2) decreases the weight and thereby reduces cost of freight and handling, (3) protects from insects and decay before the timber is placed in service, and (4) makes the timber more easily susceptible to preservative treatment.

Records of actual tests show that thoroughly seasoned timber may be from 25 to 50 per cent stronger than green timber of similar varieties. Under some conditions seasoning increases the durability, but in general seasoning without preservative treatment does not add greatly to the life. Like peeling, seasoning decreases the weight of timber and thus saves freight and cost of handling. Experiments by the Forest Products Laboratory, Madison, Wisconsin, have shown that round mine timbers up to 11 inches in diameter air-seasoned 3 months, lost 15 to 25 per cent of their original green weight, depending upon the size and variety of the timber. In general, mine timbers may be sufficiently air seasoned for most purposes in 3 to 6 months, depending upon the weather, locality, and variety of timber. Timber that is to be treated must be seasoned, as the preservative fluid cannot be injected until at least a part of the water which green timber contains is expelled.

Usually timber storage does not receive the attention that it deserves. Proper storage is essential for proper seasoning, also for preventing checking and initial decay before placing the timbers in service. Timber yards should be well drained and free from vegetation and decaying wood. Timber should be placed on supports at least 12 inches from the ground, and should be so piled that air can circulate freely.—U.S. Bureau of Mines.

WILL MEET IN TORONTO.

The seventy-fourth meeting of the American Association for the Advancement of Science and of the Associated Societies will be held in Toronto, Dec. 27-31. The engineering and geological sections will have addresses and discussions of interest to mining engineers. Mr. J. B. Tyrrell and Dr. W. G. Miller of Toronto will preside at the sectional meetings devoted to engineering and geology.

Through its meetings and through its publications, the American Association promotes intercourse and cooperation and the feeling of fellowship among scientists and those interested in the advance of science and education. North America and South America are its its special geographic fields, but members may be citizens of any country. The Association has become a great affiliation of American scientific societies, and its meetings have become increasingly characterized as conventions of many special organizations. A large number of the associated societies regularly meet with it and the facilities of the Association are always at the disposal of these societies, for the arrangement of meetings, the preparation of programs, etc. Many associated societies are also officially affiliated and are represented in the Council of the Association, thus taking part in its direction.

Work has been resumed at the Coalmont Coal Company's Mine, Nicola Princeton District. The plant has been idle for a fortnight.

EDITORIAL

GOVERNMENT INACTION DELAYING PROGRESS.

The delay in granting rights to Hollinger Consolidated Mines Ltd., which will permit the company to go ahead with its plans for increasing development and production, is arousing considerable comment.

That an effort to carry out plans which mean so much to Ontario should be defeated by the failure of the Government to rise to the occasion is deplorable. It is surprising that so little has been done to facilitate the carrying out of this projected industrial expansion, especially when it comes at a time when few concerns are able to finance projects that will help to reduce unemployment and increase production. At this very time conferences are being held everywhere to consider plans for doing the very thing which Hollinger is prepared to do, and yet finds it so difficult to do, because of the apparent inability of the Ontario Government to act in a reasonable time.

There may be some conflict of interest that makes careful consideration of such plans necessary, but there is no known satisfactory explanation of the Government's inability to act. Difficulties may sometimes be given as causes for delay in reaching a decision when a serious effort is being made to get somewhere, but they cannot be accepted as excuses for lack of effort to get there. Lack of effort may be the result of lack of appreciation of what Hollinger's proposal means for Northern Ontario, but it is hardly reasonable to assume that any Government does not appreciate the desirability of developing natural resources, nor can any Government of Ontario long remain ignorant of the fact that the gold mining industry is one of the most desirable industries in Ontario and that the busiest communities in the Province to-day are the centres of gold production.

If the Government is, with full appreciation of the situation, delaying action for reasons unknown to the public, it may be acting wisely, but, in fairness to the mining industry, and to the people of Ontario, there should be some explanation of the Government's behaviour in this matter. It is difficult to believe that the Government is desirous of preventing the growth of the mining industry, and we are rather inclined to believe that it really wishes to hasten, rather than retard, progress, but we are quite unable to understand why the Government should fail to act on the proposal of the Hollinger company which calls for utilization of water power for the development of this great gold mine.

SOME PERTINENT QUESTIONS.

The Ontario Government has, during the past year, shown some endeavor to meet the needs of the mining industry in minor matters, but it has not yet shown signs of understanding big affairs of the industry. It has for several months practically ignored a proposition which is the biggest which has been made in the history of gold mining in Ontario. By failure to act in a manner which might reasonably be expected of it, the Government has obstructed a great plan for water power development which would make possible a very large increase of gold production, which would give employment to a large number of men and hasten development of a district into which the Government has already announced that it will build a railway.

If the expected action had been taken by the Government, the work of developing 15,000 h.p. on the Abitibi river would now be well under way. Instead, we enter the winter season with very little done to relieve the power situation. The mining companies will be lucky if they do not have to curtail operations this winter, and their plans for expansion are again held up.

Under the circumstances we are not surprised to see in the "Porcupine Advance", which is published in Ontario's greatest gold mining centre, the following pertinent questions:

"Does the Ontario Government wish to see the North Land develop and progress? Does the Government desire the expansion of North Land industries, with the consequent prosperity and progress that will ensue, benefitting and enriching the south as well as the North? Does the Government desire a very material assistance, without the expenditure of a cent of public money, in the solving at least of part of the pressing unemployment problem now facing the Province? If the Government desires these things, is the Government ready to take the necessary action to assist in securing these desired advantages, especially when the Province may do all this without loss or cost?

"Is it not a fact that the Hollinger Consolidated Gold Mines applied for the right to develop power on the Abitibi River, and that without the power thus planned to be developed, is it not a fact that the Big Mine is handicapped in expanding its great industry?

"Is it not a fact that the Hollinger is ready to make noteworthy additions to its equipment and output, and add many more men to its staffs, just as soon as it has the right assurance of that very necessary ample power for the enlarged needs? Is it not a fact that the Hollinger stood ready to develop its own power at its own cost to meet its own needs? Is it not a fact that the Hollinger was ready to do that same right away, and be ready to deliver power to its own mine early in 1922?

"Was not the Hollinger ready in this connection to push the work with the greatest despatch and energy, giving employment to over 2000 men at once? Was the Hollinger not ready to expend no less than $3,000,000.00 in less than a year to provide this boon to the progress of the North Land? Is not the employment of 2,000 men and the expenditure of $3,000,000.00 of private capital very desirable at the present time? And did not the Government neglect or delay to give the Hollinger Consolidated the necessary rights in this matter of power development?

"Is it answered that it is desired to reserve this power for the T. & N. O. Commission? Then, is it not a fact that there is sufficient water power available north of here for both the T. & N. O. and the Hollinger? And is it not a fact that even if the purpose is to sell surplus power, after the electrification of the T. & N. O. is provided for, the T. & N. O. will not be ready to supply power for three or four years at least, while the Hollinger would be ready to help the progress of the country in this way in a few months? Are the industries of the North Land to wait on the convenience of the T. & N. O. without necessity or due and sufficient reason?

"Will the Government stand thus in the way of the expansion and development of this part of the North Land? Or will Premier Drury and his Cabinet find a way and a means to help this country and its industries, not to hinder?

"In view of the striking benefit in the way of employment, in view of the large outlay of private money ready for this important development, can not the Government do something, and do it quickly, to show that it is ready to encourage and support a plan that promises great assistance in the development and expansion of this part of the North Land?"

RAILWAY COMMISSION AND POWER DEVELOPMENT.

It has been rumored that the water power which the Hollinger company applied for has been reserved by the Government for the T. & N. O. Railway Commission. Enquiry at the Department of Lands gives no confirmation of this rumor.

It seems scarcely possible that the Ontario Government will turn down the proposal of the Hollinger company in order to hold the rights to power until such time as the Railway Commission may develop it. Apart from the fact that the Commission has no present need for the power, and no funds for developing water power, if it did undertake such a proposition, there is the Governmental reply to those who asked that the Commission build railway extensions to serve mining districts. If the Government is unable to find money for the extension of its lines to serve the mining districts tributary to it, it is not likely to find money to permit the Commission to embark in power development schemes.

To hold for the Railway Commission rights to develop the water power applied for by the Hollinger company, would greatly delay the development of Northern Ontario, and it is hardly likely that the Government would take active steps to prevent development. The Government has failed to act to aid progress; but it is hardly believable that it would endeavor to make progress impossible. The present situation seems to be the result of lack of effort on the part of the Government, rather than the result of deliberate planning to retard development.

BRITANNIA BEACH.

Reports of the disaster at Britannia Beach indicate that thirty-six persons lost their lives when the little mining town was flooded. Heavy rains made a large body of water above a railway fill, which gave way under the pressure, and resulted in such a rapid flood that escape from the waters was very difficult. The people of the community have had a terrible experience and the survivors have the sympathy of the whole country.

Britannia Beach is one of the two townsites established by the Britannia Mining and Smelting Co. near the Britannia mine. The Mine Townsite is at the mine entrance, while Britanna Beach is on the shore of Howe Sound. There is a large company store and several smaller buildings on the Beach townsite.

The Britannia mine is one of Canada's biggest copper mines. It has been a large producer, and has, in recent years, been extensively developed. It is equipped

with a mill of 2,500 tons daily capacity. The company has developed 8,000 h. p. on Britannia creek, and has also at the Beach a steam turbine plant of over 3,000 horse power.

The Britannia Mining and Smelting Company, Ltd., is controlled by the Howe Sound Co., of New York, which owns all the stock. The development of the property to its present position has been largely the work of Mr. G. B. Schley and his associates.

POWER REQUIREMENTS AT PORCUPINE.

On another page, our Cobalt correspondent, Mr. J. A. McRae, makes an appeal for co-operation to prevent restricted operation of gold mines in the Porcupine field. Mr. McRae is apparently of the opinion that the threatened power shortage arises from lack of knowledge of the requirements of the gold mines operating in the Porcupine district. It may be true that the exact amount of power required cannot be predicted; but it has been well known for many months that much more power than is now available could be advantageously used this winter, and that much additional power will be required to carry out the announced plans of the mining companies.

Hollinger Consolidated Mines, Ltd., has made no secret of the fact that it will require much more power than it can now obtain. The company's announced intention was to proceed this year with the development of water power on the Abitibi river. The failure to get ahead with the project has resulted from the surprising delay of the Ontario Government in making development possible. All power now available is being used, and plans for increasing production are held up owing to this fact. There is even some doubt as to whether the present supply of power can be maintained during the winter.

It should not be difficult for anyone to obtain some idea of the probable requirements of the operating gold mines. Close figures of the amount used now, and of what is wanted for next year, could be easily obtained. Less exact, but still reasonably approximate, figures for the next few years could be estimated. The Hollinger has proposed to develop for its own use 15,000 h. p. The McIntyre has announced its intention to increase capacity when power is available. The present requirements of the Dome are known. The amounts wanted by other companies can only be guessed at; but are relatively small.

EDITORIAL NOTES.

According to reports from Sudbury there is a growing interest in the possibility of making gold mines in the Shiningtree area. Investigation and development of two properties is reported to have been arranged for.

The report of M. E. Wilson on the Madoc fluorspar industry is a contribution which we have abstracted for readers of the Journal. The district is likely to receive more attention when the iron industry picks up again. Fluorspar was in good demand during the period of munitions making and resulted in drawing attention to the fact that sources of supply are not numerous.

Hollinger is bending every effort to increase production; but cannot get far beyond 4,000 tons per day without more power.

The railroads of the United States in three months carried 220 million tons freight. Of this mineral products constituted 124 million tons. As the "Engineering and Mining Journal" remarks, these mineral products go into a multitude of industries, supplying raw materials for manufacture and supplying energy to do the work.

Mining men are scarce in Parliament. We are pleased to learn, therefore, that Col. T. J. Cantley is a candidate for election in Pictou County, Nova Scotia.

Many Canadians will learn with regret of the death of Dr. Joseph William Richards. He took a prominent part in the teaching of metallurgy in the United States.

ACCIDENTS IN COAL MINES.

According to reports received by the United States Bureau of Mines from the various state mine inspectors, 152 men were killed during September in and about the coal mines of the country, as compared with 197 killed in the corresponding month in 1920. The 1921 figures show a decrease of 45 fatalities, or about 23 per cent, from the record of the same month of last year. Based upon an estimated output of 42,229,000 short tons in September, 1921, the fatality rate is 3.60 per million tons produced. The corresponding rate for September last year was 3.66 and the production of coal was 53,810,000. The production of coal during September, 1921, represents a decrease of 22 per cent.

The average number of lives lost during September of each year from 1913 to 1920 has been 189. The production of coal has averaged 51,886,000 tons, showing a fatality rate of 3.64 per million tons as representative of the month of September for the past eight years.

During the first nine months of the present year, 1,455 men have been killed by accidents at coal mines, against 1,686 killed during the corresponding months of 1920, a decrease of 231 fatalities, or 14 per cent. The output of coal for the same months was 362,800,000 short tons in 1921 and 473,100,000 tons in 1920, a decrease during the present year of 110,300,000 tons, or 23 per cent. These figures represent a fatality rate of 4.01 per million tons mined in 1920.

Of the total of 152 fatalities during September, 30 occurred at the bituminous coal mines in Pennsylvania, a decrease of 15 from September a year ago; 25 in West Virginia, a decrease of 6; 14 in Illinois, a reduction of 3; 6 in Kentucky, a reduction of 8; 5 in Ohio, a reduction of 13; 5 in Alabama, a reduction of 4; 3 in Indiana, a reduction of 12. At the anthracite mines in Pennsylvania, 41 men were killed, as against 20 during September of last year.

The Disaster to Britannia Beach.

A Large Part of This Mining Town was Destroyed Last Friday By Flood.

The whole country has been thrilled with horror at the disaster which overtook the mining town of Britannia Beach on Howe Sound, B.C., last Friday, when a large part of the town was practically obliterated by a flood. It appears that the flood came after seven or ten days' heavy rain, accompanied by snow in the higher altitudes. The warm weather accompanying the precipitation caused the rapid melting of the snow on the mountain-top and a consequent aggravation of the swollen creeks and streams.

The great disaster was not known until the next day. The Britannia settlement has communication with the outside world over its own telephone wires, and these are rarely used at night. Their destruction passed unnoticed, and the disaster which caused the deaths of at least three dozen people was unknown until straggling boats brought the news Saturday morning. The town, which is devoted to the milling of copper ore, will not recover from the disaster perhaps for several months. The damage in the Fraser Valley just east of Vancouver, which was simultaneously flooded is less serious, and on Monday people were returning to their flooded homes in the village of Port Coquitlam, and railways were quickly repaired with a view to the resumption of traffic.

At the moment of writing, it appears that the dead number thirty-six, including several children. Further, many were seriously injured, while a still larger number received injuries more or less slight. Despite the serious injuries of some, it is thought that all will recover. Ten of the dead and all of the injured were brought to Vancouver last Saturday evening on the steamer Capitano. Ambulances were waiting, and the injured were rushed to hospitals, while the bodies were taken to the Morgue to await decision as to an inquest. The search for the missing was continued, but the work is necessarily slow because of the difficulty in clearing away the wreckage in the sea of mud and water. It is doubtful if some of the bodies of the missing will ever be recovered from the muddy waters of Howe Sound.

Manager J. Donahue, of the Britannia Mines, described the efforts made by those on duty at the mines proper, three miles back from the beach, to warn the village. When the railway fill, which caused the accumulation of water in the hills, gave way and released a roaring torrent into the creek, urgent warning was sent out over the mines' telephone.

Before the warning could be understood and passed on to all the residents the waters crashed down the mountainside, swept away transmission lines and plunged the village into darkness. The creek bed, which once carried a veritable river, cut through the centre of the settlement. The arrival of the torrent at sea level meant that everything in its path was carried toward the sea. The water had fallen 2,000 feet in its three-mile journey and gained a momentum which the little houses of Britannia could not resist. On Sunday a broad stream divided the untouched fringes of the town, strewn with timbers, poles, twisted telephone wires and scraps of heavier furniture. Britannia Creek now runs through the village itself. The waters will have to be diverted to their former course by dynamiting. Surveyors say that the worst part of the disaster was the crying of the injured or bewildered villagers.

The flood came up on a community confused by the sudden darkness, caused when the transmission lines failed and a torrential rain fell. The houses for the most part were without foundation, and yielded readily to the surge of the flood. One man hurried with his wife to the attic when he found the water about his doorstep. By the time he could climb on to the roof his house was already out to sea, bobbing about in the rain-swept waters of Howe Sound. Two occupants were rescued finally in a launch.

Other houses were crushed to pulpwood when they were caught between some obstacles and the rushing water. Many were injured by falling timbers. Some of these owe their lives to the efforts of rescuers who toiled throughout the night in and out of the maze of floating houses, guided to those in distress by cries and warnings. Candles and pit lamps were of little use in this work. Two children were found asleep in their beds, unhurt, hours after their mother and two brothers had been swept away with a damaged portion of their home.

Fourteen bodies, out of the known list of thirty-six dead, had been recovered by noon of last Monday, and, at the moment of writing, it is stated that, although heavy rain has caused a considerable rise in the water, the workers are making good progress in uncovering wreckage. The flood seems to have descended upon the inhabitants so suddenly that many found their homes actually floating and tossing upon the turbulent torrent ere they realized that anything was amiss.

Three miles back in tthe hills, near the mines proper, a railroad "fill" was being watched night and day for the possibility of a flood. Incessant rains, melting snows from the high levels, and swollen streams which ordinarily trickled harmlessly seawards had deposited a veritable lake of water on the shoulder of the mountain. When darkness fell watchmen reported that there appeared to be no immediate danger of an overflow. Suddenly at 9.30 o'clock the rough dam of timbers, holding back the swollen pocket of water, went out, and the huge mass was released to tumble 2,000 feet down the mountainside upon the settlement below.

One sentry, Jim Emmett, was caught in the swirl as he ran to give warning. The first man to hear his shouts and join in his mission was W. London, who also was washed away. A third managed to reach the mine and telephone a frantic warning to the village exchange. From this telephone the operator, a girl, managed to send out a warning to many residents, and she continued to call her message of terror through the transmitter until the exchange was cut off and she heard the lap of the water against her office door. Then she escaped to the security of the upper floors of the compressor plant. Meantime a wall of water was rushing to the sea. Before the citizens could properly grasp the danger the water was upon them, having found its natural outlet through a long dried-up creek bed which cuts straight through the residental part of the town

CO-OPERATION NECESSARY TO PREVENT RESTRICTED OPERATION OF GOLD MINES IN THE PORCUPINE FIELD.

(By J. A. McRAE).

In the Porcupine district there is an unfortunate situation existing as between the mining companies and the concern which is supplying hydro-electric energy with which to do the operating.

In the past, there has been considerable loss sustained due to an insufficient amount of power, particularly during last winter, as well as in 1915. The shortage during last winter was due to an abnormally dry summer and fall in 1920, and was a condition against which it would have been impossible to make full provision.

This year, the Northern Canada Power Company took the additional precaution of erecting a new dam which is intended to raise the water about ten feet in Kenogamissee Lake, and thereby create a big water-storage basin upon which to draw during coming winter when the lakes and rivers become tightly ice-bound. But, there is general fear among the mining companies that even this precaution may prove to be insufficient, all of which tends to cause uncertainty in the minds of owners of newer properties as to whether it would be advisable to attempt operations and run the risk of being hampered by power shortage.

Officials of the power company previously authorized the Northern Ontario representative of the Canadian Mining Journal to state that the company is not apprehensive about the power supply, but, at the same time, should the mining companies feel otherwise, the power company would welcome suggestions from the mining concerns in respect to their probable requirements and the extent toward which they are willing to co-operate with the power company in connection with taking desired additional measures to provide energy in such volume as to satisfy all concerned. That is to say, that if the mining companies will offer some idea of the amount of power they will require and will agree to take their full requrements from the Northern Canada Power Company, that concern stands prepared to proceed with additional development.

Certain factors which have had a tendency to cause intensified uncertainty are statements from the Hollinger Consolidated and the McIntyre Porcupine that they have each secured rights to develop hydro-electric energy on their own account. In the face of these statements, and in the absence of reasonable assurance from the mining companies that they will use the power coming from further development on the part of the Northern Canada Power Company, the latter concern is obviously afraid to launch out into heavy additional expenditure, when, in doing so, they might find themselves confronted with a lessened demand due to development of energy by one or another of the big mining companies.

It appears as though a considerable amount of new power will be required, indeed such is a certainty at such times as the Porcupine V. N. T. Mines, the Schumacher and West Dome decide to resume operations. This being so, it is obvious that either the mining companies must be prepared to place their requirements squarely before the power company with an offer of reasonable co-operation—either that or to at once undertake power development on their own account.

The general improvement in the economic situation, and the rising tide of interest in gold mining has encouraged the belief that in addition to the present operating mines, there will be a general broadening out and a big increase in the demand for hydro-electric energy. This being so, it behooves all those concerned to bend their energies toward co-operation and thereby relieve the menace of restricted development which at present hangs like a wet blanket over a rising wave of enthusiasm which will make those gold fields of leading world importance provided the requisite encouragement is offered.

DOME FINANCIAL STATEMENT.

A six months' financial statement issued by the Dome Mines Company, Ltd., show earnings before the deduction of depreciation and depletion charges of $432,137, to which is added other income of $81,725, making total earnings of $513,863. This compares with net operating earnings for the full year ending March 31 of $706,894, but shortage of power and other difficulties had to be dealt with during the year. The balance sheet shows a much improved position and that the period under review was a satisfactory one is apparent.

Total assets of the company are now given as $7,485,- amounting to $300,000. Inventories are placed at $275,- 352, as compared with $7,229,977 at the end of the fiscal year. Cash on hand amounts $190,737, as against $356,- 695. The company owns government and other bonds to the value of over $1,000,000 and has loans on call 542. The profit and loss statement shows the sum of 369,712 reserved for depreciation of plant and exhaustion of mine, as well as Dominion of Canada taxes, which leaves profits of $144,151 transferred to the balance sheet.

In the liabilities, there is capital stock outstanding of $4,766,670, reserves for plant depreciation and mine exhaustion are given at $2,396,041, while the reserves for operating equalization are $25,910. A surplus of $3,041 is shown after regular dividends were paid.

SYNDICATE BUYS KINGSTON MINE.

According to a despatch from Sudbury, Ont., appearing in the Toronto Globe, an English syndicate, who have purchased outright the Kingston property, owned by J. J. and W. R. Knox, Orillia, and Sam Cochrane, Sudbury. A half cash payment was made.

There are three lots in the group of claims, situated a half mile east of the White Rock. The sale to the English syndicate is said to be the biggest yet made in connection with a West Shining Tree property, an amount exceeding $150,000 being involved.

The sale of the claims is confirmed by Mining Recorder Campbell, Sudbury, but the transfer of the leases was made to private individuals acting on behalf have had engineers on the ground for several weeks, of the purchasers. Heads of the English syndicate are now in Toronto and plan coming north this week for a visit to the property, according to their representative here.

There has been considerable work done at Shining Tree this summer and showings in some cases are even more sensational than those of Porcupine's early days, particularly in regard to extent of ore bodies. The Mond Nickel Co. has also invaded the field.

Hardinge Company Publishes a New Catalogue on Pulverized Fuels

A Bulletin entitled "Pulverized Fuels" has just been published by the Hardinge Company. This Bulletin is known as their No. 9 Catalogue. The adoption of the Hardinge Mill for pulverized fuels is comparatively recent according to their own statement, as follows:—"The Hardinge Conical Mill, although only recently applied to this field, has been fully demonstrated as a most satisfactory unit for pulverizing solid fuels. The results obtained are a continuation of the remarkable record of the Hardinge Mill in the mining and industrial grinding fields, as evidenced by the fact that over 70,000,000 tons of friable materials are being ground per year in Hardinge Mills alone."

This Bulletin is divided into three main sections, viz., the application of pulverized fuel to various burning problems, the principle of operation of the Hardinge Mill, and a discussion of the application of the Hardinge System for pulverizing fuels. Under the heading of "Pulverized Fuel", three principal causes are mentioned why the advance of this class of fuel has been so rapid in the last few years. These reasons are:

a—The increased efficiency of combustion.

b—The utilization of fuels which would otherwise be wasted or be very inefficiently burned.

c—Flexibility of operation and ease in handling, making it possible to control the burning within a wide range on short notice.

In the general discussion of pulverized fuel where the Hardinge System is used, emphasis is laid upon the point of "sparking" during the burning process. They emphasize the point that when coarse oversize of from 65 to 150 mesh, depending upon the character of fuel, is eliminated, "sparking" ceases, and when this oversize is eliminated by a satisfactory means, it is not necessary to grind to a degree of fineness which was at one time thought necessary.

Under the subject "The Hardinge Mill," the general principle of grinding is discussed, with special reference to stage reduction, elimination of the fine particles as soon as produced, and the proportioning of energy to the work required. The different types of Hardinge Mills and the details of their construction are also discussed in this section, and special reference is made to the advantages of the conical mill when used for pulverized fuels of widely different character.

Under "Pulverized Fuel Installations," a complete pulverized fuel plant is outlined, which includes the feeding of the coal from the track hopper to the crusher, dryer, mill, separator, and distribution system. There is also taken up different arrangements of the mill and separator which would be used according to the special requirements. In addition, there is given a table showing the general dimensions of the different sizes of Hardinge Mills, so that it is possible to make a rough estimate of the floor space required for each unit.

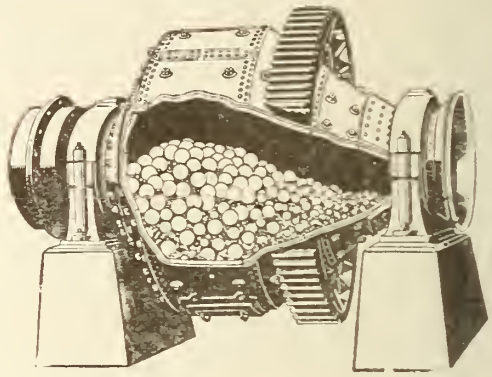

Illustration of the manner in which balls segregate during the operation of the Hardinge Conical Mill.

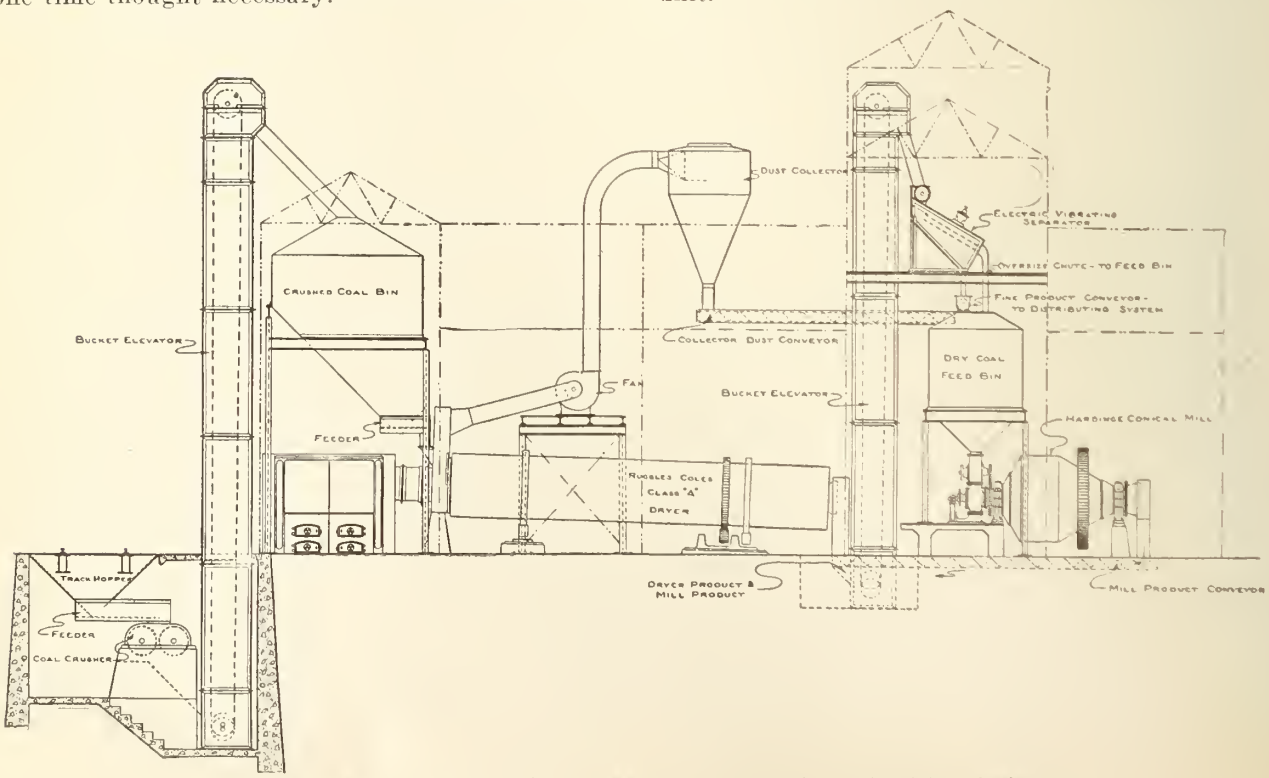

Typical plant layout, embodying Hardinge System for pulverizing fuels.

The Position of the Kent (Eng.) Coalfield

By ROLAND H. BRIGGS.

No problems in the coalfields of the Old World are of greater interest than those surrounding the finding of Kent coal. Even the international and political questions which are shaking the very foundations of European nations, the coal strike, the effect of the reparations coal paid from Germany under the treaty, and other vital problems, cannot reduce the interest which is being taken in both England and France in the subject of Kent coal.

This famous area of apple blossom and trailing hops, the "Garden of England," where one seems further removed than perhaps anywhere else in the world from the bustle, smoke and crowded populations of great industrial districts, may again soon be awakened to commercial life, as one of the great coal, iron and steel producing areas of Europe.

The iron industry of England was once centred in the south of England in the most rural districts of Sussex and Kent, when iron smelting was done by charcoal, and it will be strange if this industry is re-opened so many generations later in its ancient home.

The value of the Kent coal to England, and especially to London, may be almost limitless. It is only half the distance from London of the other nearest coalfields, and only one-third of the distance from the larger ones. It is claimed that the existing borings have proved its area to exceed two hundred square miles, and that the borings, some of which approach 4,000 feet in depth, have shown that in this proved area there is estimated to be from six to ten thousand million tons of coal.

The seams range in thickness from about 2 to over 13 feet in thickness, and the working of the coal does not exceed in difficulty that of other places where it is satisfactorily exploited. Coals of various classes are found, but the bulk of the coal proved is a soft steam-coal with excellent coking qualities.

Deduced From Geological Reasoning.

The finding of Kent coal was a remarkable scientific achievement. Its presence was deduced from pure geological reasoning, and some years afterwards its existence was proved by the bore-hole put down by Sir Edward Watkin near Dover. Many borings have been sunk since that day and various collieries started. The importance of the coalfield, if of sufficient size, was so obvious to the public that a great deal of speculation has taken place in the coal concerns themselves, and iron, steel and railway companies likely to be favourably affected. The various companies passed through many vicissitudes, and at least once the Kent coalfield was announced in the Press to be dead and finished.

There have, however, always been men with sufficient faith in this coalfield to back their opinions with hard cash, and as a result during and since the war, the coalfield has become a regular producer, and while it may not have fulfilled the anticipations of its earliest promoters, it is nevertheless adding a steady 10,000 tons or so per week to the British coal supply. In the Government Report on Mines and Quarries issued in 1920 the number of coal mines working in Kent is given as seven, and the number of work people employed in these mines above and below ground as 1,954, an increase of fifty per cent on the numbers employed in 1919 as compared with 1918, but the output for 1919 was only 277,829 tons.

Tilmanstone, Chislet and Snowdon.

The most productive colliery up to date has been the Tilmanstone Colliery, about six miles due north of Dover, over half a million tons having been raised from this colliery during the six years including the War, namely 1913 to 1918. The output of Tilmanstone for some considerable time now has been near 4,000 tons per week, and in one week last December the output reached 4,609 tons.

The great expectations with regard to the coal output of the Shakespeare Cliff near Dover have not been fulfilled, but the finding of iron ore there may provide sufficient compensation. The two most important collieries next to Tilmanstone are the Snowdon Colliery and the Chislet Colliery. The output of these three collieries reached about 10,000 ton in July 1920, and since that time it has tended to slightly increase. A steady trade in bunker coal has been built up at Dover, which has sometimes accounted for as much as 3,000 tons of the Kent output.

In November 1920 additional light-railway schemes were authorized, to increase the facilities which had already been arranged for delivering the coal, and in March 1921 a development company has purchased from the Government the war port of Richborough, at Sandwich Haven, and has given an undertaking to maintain it for at least five years. It is stated that the company have made the purchase under the belief that the port will have a great future as one of the principal outlets of the Kent coal-trade and kindred industries which may be expected to spring up in its neighbourhood.

Good Plant and Equipment.

It is therefore clear that the Kent coalfield may at last be regarded as having passed through its experimental stages and having reached the period of regular production. Great difficulties have been faced and overcome, especially those connected with the large amount of water which has been met with. The plant and equipment of the collieries is of the most up-to-date and economical type, as for example that at the Chislet, which has fine horizontal cross-compound non condensing winding engines with drop steam-valves and Corliss exhaust-valves using super-heated steam. The cylinders are 2 ft. 8 in. and 4 ft. 5 in. in diameter, and the stroke in both cases is 5 ft. 6 in. The steam passes from the high-pressure cylinder through a reheater, heated with live steam to the low-pressure cylinder, and the steam retained in this receiver enables the engine to be started from any position, without live steam being admitted to the low-pressure cylinder. Each of these engines is designed to raise four tons of coal from a vertical shaft 1,500 feet in depth in 40 seconds. The electrical and compressed-air equipment is also of the most modern and efficient character.

With the certainty that coal is present in large quantities, that the difficulties of mining it are not insurmountable, that there is a ready market for the output, and that the collieries are being handled efficiently and equipped in an up to date manner, the Kent coal industry may now be regarded as an accomplished fact and its future as definitely assured.

CRUSHING GOLD ORE ON THE RAND.

Messrs. G. A. Denny and H. S. Denny discuss in the Oct. 15 number of the "Mining Journal," London, methods of crushing gold ore on the Rand. They argue that the stamp mill should no longer be used for crushing ore. After giving an account of the results obtained in different types of crushing plants, they say: "the extraordinary thing is that in the face of such facts and records, the policy of stamp milling has even been considered of late years."

"Before the introduction of the tube mill in 1905, the battery screens varied in mesh from 400 to 1,000 holes to the square inch. After the advent of the tube mill the battery screens were gradually coarsened, until finally a coarseness of four holes to the square inch was reached. At the same time a tendency to crush the rock finer in the preliminary stages developed until nothing much above 2-in. cubes was fed to the mill bins. The effect of these alterations in reducing the size of the rock fed to the mill and increasing the size of the product taken from the mill was naturally to increase the quantity of ore passed through the mill, and where 5/6 tons per stamp per day with 1,200-lb. stamps was a normal output, it was increased steadily up to 10/15 tons. Further alterations were made by increasing the weight of the stamps, and at the East Rand Proprietary Mines it is stated that with 1,600/1,800-lb. stamps the output per stamp reached 26 tons per day. The development of independent crushing machines and grinding machines naturally led to comparisons in efficiency between them and the stamp mill, as the result of which a number of plants in different parts of the world were laid down which did not include gravity stamps in the scheme at all. The crusher, on the one side, overlapped the province of the stamp mill in reducing rock down to about ¾-in. mesh, and the tube mill and independently operated grinders made inroads into the field of the stamp mill on the other side by gradually taking a feed up to ¾-in. mesh or more, so that the position of the stamp mill became untenable. There are two fundamental reasons for the crusher development, these being: (1) That the frictional losses in the crusher are only a small percentage of the power which it can usefully employ; and (2) it has a positive discharge for its finished product.

"For the tube mill or other equally efficient fine grinding machine, the favourable features are continuous action, partly percussive and partly triturative, with positive discharge without screens for the final product. The stamp mill, therefore, has been ousted from the field by the perfection of these other machines, each of which has its own scope, and the stamp mill must be regarded as an hybrid instrument that fails to fulfill the functions of either the crusher or the grinder."

"Little has been said of the crusher, of which there are many forms, and amongst which may be mentioned the "Blake" type of jaw crusher and the "Gates" type of gyrator crusher. There are many modifications of the principles on which these two machines are designed, and for breaking rock they have the advantage over the stamp mill, that they have a positive clearance for the finished product, and the power absorbed is proportionate to the actual work done. They can be operated to reduce the ore in two stages, from 12 ins. to ¾ in., so that through their medium the ore can be produced in a fit condition for the tube mill feed."

The Denny brothers, have for years, been advocating the substitution of other machines for stamps. There are still many stamps in use and they have their champions. The tendency in Ontario is to substitute ball mills for stamps, and in most of the recently installed gold milling plants there are no stamps. There is a probability that the stamp will long be used for certain ores, though experience with Porcupine gold ores will probably convince operators that ball mills are more suitable for Northern Ontario gold ores.

MARITIME OIL SHALES.

Exploitation and development in the Canadian Maritime provinces, says the monthly review published by the Department of Colonization and Development of the C. P. R. goes oftimes unheralded by any great amount of publicity, but because the people of that area have their own modest ideas of unostentatious progression it is erroneous to conclude that little is being done. Steps which have recently been taken to develop the oil shales of two of the provinces have considerable significance for the industrial future of the Canadian Maritimes.

New Brunswick has long been known to geologists, engineers, and interested capitalists as possessing extensive bituminous or oil shales, which exist in the counties of Westmorland and Albert, near Moncton. Though no real attempt has been made to make use of them commercially, it has long been known from experimentation that they possess a richer value in oil and by-products than the famous Scottish shales which have been operated very profitably for years. The quantity of the rich shale is practically unlimited and has been estimated by several mining engineers at as much as 270,000,000 tons.

In Pictou county, Nova Scotia, there is an area of about ten square miles estimated to contain 500,000,000 tons of oil shales which will yield a minimum of thirty gallons of oil to the ton, of which fifty per cent is available for motor fuel, the remainder making fuel oil, lubricating oils and greases.

A real system of exploitation and utilization of the New Brunswick field is being undertaken by the Imperial Government through the Anglo-Persian Oil Company, in which it owns a controlling interest. This organization has entered on operations in an aggressive manner, making a practical test of the shales, their campaign being an elaborate one designed to cover several years. Upwards of $6,000,000 has been allocated by the company for the purpose of New Brunswick development.

At the outset progress is being made in a slow and sure manner. A retorting plant has been erected at Baltimore which has a daily capacity of eight tons. The material as taken from the surface workings is crushed to egg size and great satisfaction has been expressed with the results to date, the average yield being 32.7 Imperial gallons of crude oil per ton of shale. Some idea of the extent of the projected operations of the company and the volume of the shale deposits may be gathered from a statement that later the erection of a 5,000 ton plant is projected which at the average yield noted above should produce about 60,000,000 gallons per annum from the deposits. An authority declares that there is enough shales in the series to supply five plants of 1,500 ton capacity each for fifty years.

During the present year experiments have been carried on with the Nova Scotia shale deposits in Pennsylvania. The shale was shipped in carload lots and

worked under the supervision of the owner of the properties and heads of the Dominion Government Fuel Testing division and Mines Branch. The type of retort used had a capacity of from fifty to one hundred tons per day and can be brought up to three hundred or more tons per day for single retorts. With access to the Atlantic and Gulf of St. Lawrence direct from the works, transportation for oil extract and by-products is ideal.

The Anglo-Persian Oil Company has declared its intention in the building of plants, erection of machinery, etc., to utilize as far as possible the products of the Maritime provinces. The development in Nova Scotia must also have a local benefit industrially. This taken with allied activities and the export of products should make the entry of these companies in the field a reason for yet greater faith in the future of the Canadian Maritimes.

HOLLINGER EXPLORING SHININGTREE PROPERTY.

The Toronto Star publishes the following from Sudbury under date 26th Oct.:

Hollinger interests have invaded the Shining Tree area for the second time. The announcement that they taken an option this week on 13 claims in the area has caused a sensation in local mining circles. Two diamond drills are being taken in, and material for the establishment of a camp is already on order. The optioned claims are situated in the townships of Fawcett and Asquith. An amount well over six figures is said to be involved in the deal, which was concluded in a Sudbury legal office yesterday, and the options are reported to be for six months.

Prospectors, although surprised by the news, have not been flurried. It is only a matter of two or three years until Shining Tree develops into a camp of importance, they claim, the trouble so far being that it has been held too cheaply by capital, considering the showings made.

The properties referred to are the Burke-Landagne-Cochrane-Bulloch claims. Mr. P. E. Hopkins, of the Ontario Bureau of Mines, mentions these in his Shining-Tree report. He says: "Messrs. Burke, Landagne, Coehrane and Bulloch have staked a group of claims on the west shore of Granite lake, Fawcett township. On one of these claims a large quartz deposit can be seen running north and south under the water near the mouth of Papoose creek. A portion of the vein was picked up by trenching in a swamp four chains to the south of the showing at the water's edge. A 20-ft. shaft was sunk on the creek bank, from which point a cross-cut was driven towards the creek for a distance of 78 feet. Mr. Burke stated that the cross-cut passed through 14 feet of quartz and schist which yielded considerable gold on assay. The dump shows much mineralized schist and quartz, a rough sample from wich yielded $2.00 in gold per ton. Owing to the low land it is difficult to prospect the surface. The vein occurs in a fracture which cross-cuts the altered pillow lava and rusty carbonate schist at about right angles. Hence it is in many ways similar to the Ribble vein which outcrops about two and one-half miles to the north. The vein occurs in a fracture parallel to the Ribble vein, or it may possibly be a continuation of the Ribble, although the writer did not learn of any discovery in the intervening area."

The Ribble vein is the deposit which has been developed at the Wasapika property. The Burke is on the line of strike; but owing to low-ground separating the properties, the relation between the deposits cannot be definitely determined yet. Mr. Hopkins reported that the vein could be traced for one mile and that it is probably much longer.

MINING TAXATION IN BRITISH COLUMBIA.

This Subject Will Be Discussed During Present Session Of The Legislature.

Mine operators of British Columbia are making strong representations to the Government in regard to what are termed the present excessive taxation levies. A delegation of representative Coast mining men waited upon the Provincial Executive recently in this connection, and there is to be another discussion of the matter at an early date between the Government and those identified with mining in the interior of the Province.

One of the chief concessions sought is that a greater allowance be made for depreciation of property when the annual assessments are prepared. Mr. Valentine Quinn, of the Granby Consolidated Mining & Smelting Company, voices the views of mining men when he says: "There is no reason why the same procedure with regard to other tax reductions cannot be ruled with regard to development, depreciation and depletion in the mining industry. If we are going to be taxed it is better to tax us on our real income. If the assessment is made up on the true income of any Company there is no objection. What we do object to is the withholding of our right of appeal if our determination does not agree with that of the Finance Minister. We feel that we have a right of appeal and should be able to establish our protest in the Court if necessary."

Honourable John Hart, Minister of Finance said that he had no objection to appeals being made. This intimation was received with marked appreciation.

Dealing with the matter of taxation, W. R. Esling, Member for Rossland in the Provincial Legislature, maintains that the municipality of Rossland should be given the monies it would receive were it permitted to tax the lands and improvements of mining companies. These Companies pay a 2% tax to the Province on ore mines, and are exempted from municipal levy. He said that the producing mines had yielded in the past few years in excess of $18,000,000.00 and had paid into the Provincial Treasury $700,00.00. In return for the loss Rossland sustained the Provincial Government handed back in special grants $140,000 or much less than could have been collected by the city from the lands and improvements of the mines.

There is no doubt that more will be heard of this question of the taxation of mines during the present session of the Provincial Legislature. The problem of taxation in all its phases is to be before the Legislators, it being the intention of the Government to take some action towards relieving the financial embarrassment of the municipalities by granting them a greater share of the sources of provincial revenue. As to mining, the Government is being assailed on the one hand by the mine operators who are endeavouring, quite naturally, to obtain improved reductions and on the other by the municipalities who are insisting that their coffers shall be more adequately filled by the diversion of pro

vincial funds. The situation is one not easily solved to the satisfaction of all parties, but there is no doubt that the Government is seized with the need of encouraging the mining industry and it is equally certain that the representations of those identified with it will have every consideration.

SOME DRILLING TROUBLES, THEIR CAUSE AND REMEDY.

Prepared for Canadian Mining Journal By F. A. McLEAN, C. I. M. & M.

A frequent source of drilling troubles is stuck steel, and a common cause of this is improper alignment of the drill steel with the hole. When this occurs, the drill steel will bear on at least two points in the drill hole, thereby having a tendency to bend and cause a severe grinding action on the reaming surfaces of the bit which increases with the divergence from true alignment. (See Fig. 1.)

This causes difficult rotation or, in some cases, stops rotation altogther, and is generally due to ignorance or carelessness on the part of the drill runner. The steel should be brought nearly into line to have it enter the hole. An experienced drill-runner can line up the drill laterally "by sight". He does this after entering the steel and cranking it nearly to the cutting face, then tightens his "tee bolt nut". He then opens the throttle a little and lets the drill find its own vertical line; helping it meanwhile, by raising up on the crank end and finally tightening the clamp bold nut. When holes are very much out of line it is often best to abandon them entirely and start new ones.

Proper Type of Bit.

The choice of the proper type of bit is an important consideration in securing the best results from rock drills as a whole, for no matter how efficient the compressing plant, the mining methods and drilling machines, or how careful the operator, if the bit is dull or of incorrect shape, the rock is not cut, expensive energy is wasted, and money and time are lost.

In the design of a good bit, the cutting and staying qualities should be considered as well as the ease and rapidity with which it can be made in the blacksmith shop. The most important of these, of course, is the rapid cutting quality because the object in view is to cut the maximum rock in the minimum time. The importance of the staying quality is determined by the labor of sharpening and the cost of transportation and handling.

Allowable loss of gauge is an important factor, for the greater the loss the larger must be the diameter of the starting steel to insure a certain diameter of hole at a fixed depth. This means a loss of power, so this point should not be lost sight of in determining the bit to be used. Operators who believe the gauge should be retained irrespective of the amount of power used, run the edges of the wings of the bit back about one inch in a line parallel to the axis, making the bit a reaming tool.

If this is done, as soon as the cutting edges wear a little the shoulders begin to bind and stick against the sides of the hole and it must be reamed out to a size which will allow the bit to move forward. When such bits are removed from the holes they will show greater wear on the edges of the wings than on the cutting edges.

As the bits are about as hard one-half inch back of the cutting edge as they are on the face of the latter, it seems only reasonable to suppose that there has been as much work done in wearing the wings as in wearing an equal amount at the cutting edge. Therefore, if the reaming edges show more wear than the cutting edges, it is evident that they have done at least as much work as the latter and as much, if not more power has been expended in reaming the hole than in cutting it.

Furthermore, the Rock Drill being designed to cut rock by means of a blow, as soon as a bit starts reaming the side of the hole it is retarding the cutting action of the drill and putting severe strain on the rotating mechanism. It is thus apparent that because of the rapid loss of power and the wear and tear on the drill, little of the efficiency of the bit should be sacrificed to the reaming qualities.

Essentials of a Drill.

Experience has shown that to be successful under average conditions, a drill should embody the following essentials:

(1) It must take full advantage of the chipping and fracturing of the rock. In a bore hole there is a certain depth to which rock will fracture when struck by a sharp tool. If the tool is driven deeper than this it does not fracture the rock, but crushes it. If the cutting edge of the bit is blunt it does not get full advantage of the fracture and a considerable portion of the force of the blow will be expended in crushing or pulverising.

(2) The wings of the bit should be as thin as is consistent with its standup quality to allow for the ejection of the cuttings. If the wings are left heavy there is little space for the escape of cuttings and consequently they are held in front of the bit and continually churned and ground. Under these conditions the bit does not reach solid and the blow loses a large proportion of its cutting power before it reaches the rock.

(3) The bit should be perfectly free in the hole at all times and on account of the tendency of the rock to fracture—the drill hole will be a trifle larger than the cutting edge. If the bit is so designed that the cutting edge has the same diameter as the distance across the diametrically opposite corners and will remain so until dull, it will always be free in the hole.

(4) The bit must allow equal wear on all corners. If the bit is not symmetrical, viz.: if the ends of all cutting edges are not the same distance from the center of the bit—the longest end will cut a groove on the side of the bore hole and a rifled hole will result. Furthermore, the wear is unequal and the extra strains set up in the steel often cause breakage. The rotation of the drill is also impeded and the parts of the machine subjected to excessive wear.

(5) The bit must be dressed in a manner consistent with the treatment of good steel. It must not be overheated or worked while too hot. Light, rapid blows should be used in forging and the proper temper determined by experiment and rigidly adhered to. The bit should be allowed to cool thoroughly after forging and should then be re-heated for tempering. **It should never be sharpened and tempered on the same heat.**

Bits Should Fracture the Rock.

An angle of about 90° for the cutting edge is generally accepted as the correct angle. If the angle is greater the bit has a tendency to crush rather than fracture the rock, and as a rule cuts slowly. An angle less than 90° gives a bit which will cut as fast but is one which is likely to break off and wear rapidly. There is also a tendency for it to enter the rock—especially soft rock—past the point of fracture and expend energy in crushing or wedging out the rock.

The thickness of the wings should range from ¾ in. on a lage steel to ⅜ in. or even less on a stoper and hammer drill bit. The wing must not be so thin that it breaks off but, the less stock the better the clearance for the cuttings.

The 14′ and 5′ Double-Taper Bit.

The bit that has been found most successful for rapid cutting, long-wearing gauge, and ease of making and re-sharpening, is the 14′ and 5′ double-taper cross or four point bit as made in machine sharpeners of the Leyner type (Fig. 2). This bit has a guiding surface of the same diameter as the cutting edge that backs up the latter with a good stock of metal, increasing the life of the gauge. This guiding surface prevents the steel from running off into the seams or fissures and results in faster drilling and less hardship on the operator.

From the foregoing, the necessity for having correct drill bits is obvious. In the hand-sharpening—and even with some power sharpeners—it is common to find one of the ends of the cutting edges protruding 1/32 to 1/16 in. beyond the others. In sharpeners of the Leyner type this difficulty has been effectively overcome by entirely enclosing the bit under a heavy pressure while it is being forged. When this is done, there can be no question as to the corners falling within a circle whose center is the axis of the steel.

Manufacturers of steel drill sharpeners are continually making machines more nearly fool-proof. One of the latest improvements for assuring better bits, is the use of double-bored gaging blocks with an adjustable latch guide (See Fig. 3). The wide range of these blocks permits the operator to gage accurately an entire normal run of steel on the one set of blocks, and these adjustments for the various gages require only the pressure of a finger on the adjustable latch guide.

Various Causes of Trouble.

An interesting but rather rare cause of drilling trouble, is the feeding of too much or too little water through the hollow drill steel. When too little water is fed, a mud collar often forms behind the drill steel which makes it difficult to extract the latter. When drilling into rock-bearing metallic ore and too much water is fed, a mineral separation sometimes takes place. The gangue is sludged off and the drill hammers away on the metallic residue and finally becomes stuck. Sometimes dry drills are run in abrasive ground which soon heats up the steel and burns the temper out of the bit. The remedy for this condition is obviously the use of a water feed or a wet drill.

At times, the shank portion of hexagon steel becomes so badly worn that it either damages the piston or anvil block or permits the steel to slip in the rotative sleeve, or again, the lug on round steel may wear or break off with similar results. When this happens, the drill steel is hammered into the ground without rotating and soon gets stuck. The only preventative measure, is to keep the shanks in proper condition (See Fig. 4). Similar troubles result from the use of worn or broken drill parts, such as pawls, chuck bushings, pawl springs and rifle bars. The only sure remedy is to replace the worn or broken parts.

The rotation of some drills may be too weak for the conditions under which the drill is used, but this trouble is exceptional, as rock drill manufacturers have strengthened the rotative power of their drills up to the practical limit. Quite frequently, though, trouble is attributed to weak rotation when that is far from being the true cause.

Unequal cutting may easily take place when drilling into a seam or in fitchery ground, and this throws the steel out of line and sticks it. Drilling into brecciated ground sometimes causes pebbles or small bits of rock to fall behind the bit, and these wedge against the steel and the drill hole stopping rotation. In some limestones and other calcareous formations the water mixing with the cuttings will form a mud collar back of the bit.

In all of these instances, it becomes a question of loosening and removing the stuck steel. The one universally popular method of performing this operation, that is, "hitting the steel a few good cracks with a 16 lb. sledge" while sometimes effective—and perhaps conducive to the operator's peace of mind—cannot be condemned too strongly, as usually it results only in bent steel, broken drill parts and an explosive vocabulary (Figs. 5 and 6).

Lubrication and Drills.

The one best motto or axiom when this or other forms of trouble occurs is, "When in trouble lubricate." Then open the throttle and 99 per cent of the time, the steel will back out of the hole without any further trouble. The blow slightly loosens the drill steel and the properly lubricated rotative parts take care of the rest.

Rock drill lubrication is not given sufficient thought, yet it is one of the most important items in drill operation. Representatives of the large oil companies and rock drill manufacturers are carrying on a continual campaign of education along these lines. Their greatest foes are ignorance, thoughtlessness and negligence. However, the increased ease of operation and the greater drilling speed of properly lubricated drills should convert the operator to a proper consideration of this matter, while increased footage and decreased cost for drill repair parts should convince the mine manager.

There are proper and improper lubricants for rock drills, just as there are for any other high-speed machinery. With every drill shipped, manufacturers include an "oil-tag" which designates the best lubricants for that drill. These tags embody information that has meant exhaustive and costly testing on the part of the drill manufacturers. The information is valuable and should be recognized as such. However, in spite of all this, some operators still think that "axle grease is good enough," others think cylinder oil will do, and others don't think about it at all. Sales engineers or service men of either the oil companies or the rock drill manufacturers, are always pleased to consult with mine executives and to give them the benefit of expert knowledge and long and varied experience gathered from all quarters of the globe.

The writer desires to express his thanks to Mr. D. E. Dunn, of New York and the Ingersoll Rand Company, for permission to use the drawings and some of the information contained in this article.

ASBESTOS IN QUEBEC.

A brief statement by Dr. Robert Harvie on asbestos deposits in Ranges 1 and 2, Weir township Bonaventure country, Quebec, appears in the summary report of the Geological Survey, Ottawa, for 1920, Part D. The asbestos occurs sparingly in serpentine which forms two or three narrow belts having a maximum thickness of less than 300 feet. The fibre observed was very short, the proportion of fibre is extremely small, and the means of access to the deposit is poor. Dr. Harvie, therefore, concludes that the occurrence has at present no commercial possibilities.

STORAGE OF COAL.

That there are unsolvable technical difficulties in the way of the plan recently suggested by President Harding to the American Mining Congress whereby the production of coal might be made more uniform, and conditions of unemployment ameliorated and seasonal periods of depression largely obviated in the mining industry by the provision of storage reservoirs in which coal could be stored in quantity by large consumers and producers, is declared by Dr. H. Foster Bain, Director of the U.S. Bureau of Mines. Careful analysis may show an extremely slight loss in the heating value of most bituminous coal after storage for a considerable period, says Dr. Bain. This loss, however, is very much smaller than is commonly supposed by the public, and in burning the coal little or no difference can be distinguished. Certain coals have an extra market value when carefuly sized; handling these coals in and out of storage causes some breakage and may lower slightly the market value of particular coals, but this loss in value relates largely to the availability of the coal for certain classes of equipment and for certain uses, rather than to its actual heating value.

Spontaneous combustion in coal, the most troublesome factor in handling large storage piles, can be prevented, if proper methods of storage and supervision are adopted.

"The adoption of a general policy which would provide reservoirs of bituminous coal to be drawn upon in times of great demand or of low production is entirely a commercial question," continues Dr. Bain. "If the producer, or the dealer, or the large consumer, could produce or buy coal in the spring or summer for a price low enough to justify the cost of putting coal in storage and its rehandling, minus a fair insurance rate that he would be guaranteed a continuous supply in time of need, storage would become common."

"This lower seasonal price of coal could be brought about by concessions on the part of the miner, the mine operator, and the railroads. For the sake of obtaining more regular employment, the miner might accept a lower wage or rate in certain seasons of the year, although this is doubtful; but the mine operator might accept less profit during the same periods in order to keep up his production. Steady and regular mine operation at capacity production always means lower production costs, as compared with intermittent operation and lessened production. Overhead expenses—taxes, interest, management, together with the expense of keeping the mine in proper working condition—all go on, whether production is light, heavy, or has entirely stopped. The railroads could assist by accepting a lower freight rate on coal moved in the spring and summer.

"The small individual consumer, especially in the cities, often has inadequate storage space. Storage at the mine may allow a steady working-day in time of stortage of cars but will not ensure steady seasonal operation. Again, large scale storage at the mines does not do away with the difficulty of transportation often experienced to the points of consumption. Moreover, a great many mines are in a hilly or mountainous country, where but little, if any, space is available for large storage capacities. The proper place, therefore, for storage on a large scale is at or near points of consumption.

"This latter kind of storage involves the use of a large plot of ground, as coal stored 10 feet high allows slightly less than 10,000 tons storage per acre. The purchase and installation of mechanical coal handling devices and systems would also be necessary.

"When, at such a projected storage plant or yard, coal can be purchased at a delivered price sufficiently low to secure a fair return on the investment, after adding the operating costs of storage and rehandling, then coal storage yards will become established near all of the points of heavy consumption and the present seasonal variations will be largely avoided.

"There are no mysterious or unsolvable technical or mechanical questions that block the way to the adoption of a general policy of storing bituminous coal, in either large or small quantities."

U.S. COAL PRODUCTION.

Apprehension of consumers over the effects of a possible railroad strike was no doubt the chief cause of a sharp increase of coal production in the week ended October 22. The total output of bituminous coal, including lignite and coal coked at the mine, is estimated at 10,993,000 net tons, an increase of 1,302,000 tons in a single week. The rate of production attained under the stimulus of emergency demand was not far below normal for this season of the year. In the corresponding week of 1917, for example, 10,844,000 tons were produced; in 1918 about 11,170,000 tons, and in 1920 over daily loadings increased steadily up to Wednesday, but declined but little thereafter.

Monday, October 17	33,826
Tuesday, October 18	35,556
Wednesday, October 19	35,964
Thursday, October 20	35,459
Friday, October 21	35,496
Saturday, October 22	28,916

A further sharp increase is indicated by telegraphic reports of loadings on Monday and Tuesday of the present week (October 24-29), which were approximately 38,200 and 36,600 cars, respectively. The total for the two days shows an increase of 5,424 care over the corresponding days of the week preceding.

Whether the increased rate of production will be maintained now that the strike has been averted remains to be seen.

TORONTO COAL PRICES.

Toronto, 1st Nov.—It was pointed out last week that, when the railroad situation looked serious in the United States, coal men in Toronto ordered in quite a bit of coal to take care of their customers. Now the strike has been averted and there is a surplusage on hand. The consequence is that the market is quite a bit softer just now. Prices of both lump and slack are from ten to twenty-five cents a ton less than those obtaining a couple of weeks ago. However, the surplusage will probably be absorbed in a couple of weeks, and then prices will stiffen up. Information from reliable sources points to the fact that concerns which have long neglected the advice to get their coal in are likely, before many moons, to wish that they had taken it, and had been more liberal in their orders. For a car shortage is said to be likely to interfere with rapid deliveries of coal. As regard anthracite, today's cold weather has caused quite a lot of citizens to bestir themselves with the object of replenishing their bins.

Northern Ontario Letter

THE SILVER MINES.

The price of silver appears to have become steady at around 70 cents an ounce. But, in spite of this, the mines which have not already been re-opened, will probably remain closed until spring. This is the belief gathered as a result of discussing the situation with certain of the officials of these mines.

Coniagas Treating 600 Tons Daily.

On October 31st, the Coniagas closed another favorable fiscal year. The last half of the year was marked by establishing a high record in point of tonnage, the mill having handled an average of upwards of 600 tons of ore daily during the closing months of the period. The ore yielded an average of less than 10 ounces of silver per ton, in spite of which the year's operations showed a substantial profit. It will be several weeks before the annual statement may be prepared.

Crown Reserve.

The future of the Crown Reserve Mining Company appears to be wrapped up in the Porcupine Crown, which company in turn controls the Northern Mines. The Crown Reserve is also endeavoring to secure and develop new properties the more promising of which is a group of claims in the Larder Lake district. These claims were referred to in last week's Journal, and although they are not yet regarded as a probable source of revenue, yet the mineralization is encouraging.

Mining Corporation Producing about 6,000 oz. Daily.

An average of approximately 300 tons of ore is being handled daily by the Mining Corporation of Canada and the average daily output is understood to be close to 6,000 ounces of silver. This is the highest tonnage record ever established by the corporation, and will result in an aggregate output of around 1,600,000 ounces for the year. But for the curtailment of work for some time during the past winter, while alterations were being made in the mill, the production for the current year would have reached about 2,000,000 ounces.

Nipissing.

The cable which operates the aerial tramway of the Nipissing from the Meyers shaft to the mill broke on Thursday last, and caused a temporary delay in the transportation of ore from the north side of Cobalt Lake. The aggregate monthly output will not be greatly hampered, however, as at the time of writing the cable is being quickly repaired. The company is continuing exploration work on the Rochester property in the Porcupine district.

Hudson Bay Mines.

Milling operations are being continued on the Hudson Bay Mines, but the end of the resources appear to be in sight. Within a few weeks, the broken ore will have passed through the mill, and with no further exploration or development work under way, the mine will likely close down. As regards the reports that the company may become involved in the control of the Cane Silver Mines, nothing has been announced officially, although it has been definitely learned that certain of the officials are already deeply interested.

New Interest in South Lorrain.

By reason of the outstanding success recently met with on the Keeley Silver Mines, the entire South Lorrain district is arousing quite widespread interest. The fact that the Keeley encountered an exceedingly rich ore shoot at depth and along a fractured zone which extends through a considerable area, lends greatly increased merit to a number of neighboring properties. Various property owners are showing renewed enthusiasm, and the coming winter promises to witness the commencement of a substantial amount of exploration work. In the meantime, the Keeley mill is being enlarged so as to handle about 60 tons of mill rock daily, with the intention of keeping the plant in operation throughout the winter.

Not a few mining men have come to regard the South Lorrain area as one of the more promising districts in Northern Ontario in which to explore for silver, and the recent success on the Keeley is believed to signalize considerable interest turning from Cobalt in that direction.

Elk Lake and Gowganda.

Reports that the Trethewey Company might instal a small mill this winter on its Gowganda property is one of the leading topics of discussion in this district. It is believed that the operation of this property on a profitable basis would provide incentive for other property owners to renew their efforts. In the meantime, however, the Gowganada field is comparatively quiet.

In the Elk Lake district itself, interest in silver mining is at quite a low ebb, and attention is turned more to the Fort Matachewan district where it is believed that some definite move will be made during the coming winter to get operations under way on the leading property, the Matachewan Gold Mines.

THE GOLD MINES.

Dome.

A feature in connection with gold mining in the Porcupine district is that mill heads at the Dome Mines recently approached a point close to the Hollinger. It has been learned by the Journal that the ore going through the Dome mill has recently resulted in an income of over $7 per ton, and that for the month of September, the income was not far under one quarter of a million dollars. The mill treated a total of upwards of 31,000 tons during the month. The mill has a capacity of 45,000 tons monthly when treating low grade ore, but, on the higher grade now being handled, is able to treat a maximum of 1,100 tons daily.

Thompson-Krist.

At the annual meeting of the Thompson Krist, the old board of directors was re-elected. The threatened action of the Porcupine Crown to foreclose a mortgage on the Northcrown Mines, which is the operating company for the merged properties of the Thompson-Krist and Porcupine Crown, was considered, and it was decided to carry on further negotiations with the Porcupine Crown with a view toward determining what kind of a settlement may be arranged. It will be recalled that in the consolidation of the Thompson-Krist with the Porcupine Crown, a new company known as the Northcrown Mines was formed as the operating company, while two-thirds of the stock in the Northcrown was allotted to the Porcupine Crown and one-third to the Thompson-Krist. The Northcrown subsequently found its treasury depleted, thus necessitating the holding companies to advance funds. The Porcupine Crown advanced money, but the Thompson Krist appears to have been unable to do its share. Accordingly, the Porcupine Crown took a mortgage on the Northcrown, and is now threatening to foreclose.

Porcupine V. N. T.

It is reported at Porcupine that the new central shaft which the Hollinger may ultimately drive to a depth of 4,000 feet will likely be near the north side of the property and comparatively close to the bound

ary of the Porcupine V. N. T. It is also learned that the greenstone schist in which the greatest of the orebodies on the Hollinger occur is dipping sharply to the south under the overlying basalt toward the Porcupine V. N. T., and this appears to hold out exceedingly favorable prospects for the latter property. It is a matter of record, that the orebody which placed the Porcupine Crown on a dividend-paying basis, dips onto the Porcupine V. N. T. at a depth of between 1,100 and 1,200 from the west, all of which is considered to be important for the Porcupine V. N. T. which holds 120 acres, made up of a block of ground half a mile in length immediately adjacent to the Hollinger on the south.

Will Drill Beaumont Property.

A diamond drilling outfit has been purchased by the Beaumont Company, owners of the former North Davidson property. This equipment, which will be used to explore the property to a depth of about 500 feet, is already in course of transportation to the Beaumont.

March Gold Co.

A force of about 16 men is engaged on the March Gold, a property situated in the township of Deloro, in the neighborhood of the Ankerite property. The erection of camps is about completed, and the company is said to have about $20,000 in the treasury with which to carry on further exploration work.

Kirkland Lake District.

Last week's reports mentioned in the Journal, in which it was stated that the question of consolidating the Teck-Hughes Mining Company with the Orr Gold Mines, are understood to be premature. The Journal has learned on good authority that the prospects of the merger are very remote.

Another deal is pending on the Hunter-Kirkland. Negotiations have reached an interesting stage and, if successful, will assure the aggressive operation of this promising property. The Hunton takes on added merit owing to the success being met with on the adjoining Ontario-Kirkland, where a new mill is being completed and with prospects of turning out gold bars before the end of the current year.

Lake Shore.

On November 10th, the Lake Shore will disburse a dividend of 2 p. c., amounting to $40,000. This will make a total of 6 p. c., amounting to $120,000 paid so far this year. Since commencing milling operations on March 8th, 1918, the Lake Shore has produced approximately $1,500,000 and has paid a total of $400,000 in dividends. In addition to this, the mine has been extensively developed underground, and has a large tonnage of high grade ore blocked out. In fact, in one stope alone there is upwards of $500,000 in "broken" ore made up of ore containing $28.57 per ton. Officials of the Lake Shore declare they are unable as yet to tell the size of the mine as they are still "toddling along in their infancy." Close observers who have witnessed achievements to date, as summarized above, are speculating upon the future when "full maturity is reached."

Granby Kirkland.

Good results are reported on the Granby Kirkland property. The surface of the property has been extensively prospected and a total of 14 veins have been opened up. One of these has a width of approximately six feet and contains encouraging gold values. It is planned to sink a shaft on this vein.

Larder Lake.

The Coniagas Mines of Cobalt has secured a property in the Larder Lake district, in close proximity to that being explored and developed by the Crown Reserve. It is still too soon to estimate whether this new interest in the Larder Lake district will result in success, but is generally agreed that the present outlook is better for that field than ever before since gold was first discovered there a decade and a half ago.

Bousquest Gold Mines

Work has been suspended for the time being on the Bousquest Gold Mines in the Sudbury district. It is understood an arrangement may be made under which the company will resume operations at a fairly early date on a newly acquired property. The original effort is stated to have been disappointing, while the outlook on the newly acquired property is more promising.

White Rock.

Among the new mining concerns which appear to be making sound and substantial progress in Northern Ontario is that company known as the White Rock, which is being promoted by business men of Sudbury.

The company has an authorized capitalization of 1,000,000 shares of the par value of $1 each, there being 450,000 shares in the treasury. The Sudbury interest raised $40,000, with which an exceptionally favorable showing has been made on the property. This includes a shaft to the depth of 65 feet and 175 feet of drifting, in addition to a large amount of surface exploration. The vein has been traced for approximately 2,600 feet, with 600 feet having been stripped. It is stated that whereas the vein has a width of about two feet at surface, it has widened out to about six feet in the underground workings and with high gold values in evidence.

The White Rock is equipped with a small mining plant as well as a 2-stamp mill and a saw-mill.

British Columbia Letter

Stewart, B.C.: The sudden flooding of the Salmon River, as well as of other rivers and creeks in the Portland Canal District, has done much damage to roads and trails serving mining properties. Repairs will be necessary in a number of sections to permit ready access to some of the well-known mines and prospects of the country.—There are 22 men employed on the Silverado Group, some being engaged on a tram road and the others in development work.

Alice Arm, B.C. The David Copperfield Group, which joins the Dolly Varden on the south, has been bonded for the sum of $75,000, payments running over four years. Work this winter will consist of the driving of a tunnel and the development next summer will be carried out on a considerable scale.—The Waverley Group of three claims has been bonded by A. McGuire for $30,000. It is situated on the northeast fork of the Kitsault river. Some rich ore has been uncovered on the Moose Group, Kitsault Valley.—In driving a crosscut at a distance of 140 feet from the portal and at a depth of approximately 140 feet the vein is some 18 feet in width. The last five feet of this cut is in ore said to average 34.2 oz. silver per ton while samples have given 240 oz. silver to the ton. Good indications also have been encountered in the upper tunnel, where a fifty foot vein is reported to average 21 oz. of silver to the ton.

Hazelton, B.C.: It is reported from Terrace, B. C. that a Ross Mill has been installed on a free milling gold property situated on Maroon Mountain, east of Kitsumkalum Lake. High returns have been secured and J. M. Hoar, the manager, anticipates success. The site is at an elevation of 5,000 feet and about five miles from the lake. Operations can only be carried on until snow interferes so that the winter, for the most part, will be spent in further developing the property. The Mill consists of a crusher which breaks the rock to quarter inch in which shape it enters the mill. Revolving balls pulverize this material. Water carries off the gangue. It is claims for the Mill, which has a capacity of between 15 and 20 tons of ore per 24 hours, that it will make a recovery of between 80 to 90 per cent. The Kitselas Copper Co. Ltd. still is busy on a 400 foot cross-cut tunnel designed to obtain drainage and stoping levels.

Merritt, B.C.: The Calcium Carbonate Co. has resumed operations. Its equipment includes an automatic pulveriser driven by a small motor. One ton of finished material can be turned out per hour and sample shipments are being prepared for immediate delivery. There is said to be a good market for the product both in east and western Canada and the Company expects soon to be able to operate steadily. There is sufficient material in the deposit to supply all needs.

Trail, B.C.: Ore receipts in gross tons at the smelter of the Consolidated Mining & Smelting Co. for the week ending October 14th totalled 3,185. Of this 3018 tons came from the Company Mines, 98 tons from the Josie, Rossland; 36 tons from the Republic, Republic, Wn.; and 33 tons from the White Water, Retallack.

Quesnel, B.C.: Recent reports of a placer gold strike on the south side of Cedar Creek, about four miles from Quesnel Lake, are said to be substantially correct. The find was made in July by old prospectors, A. E. Platt and J. Lyons, who kept it quiet until three or four weeks ago. The ground now is staked for seven miles each way from the first location. Platt maintains that he will have no difficulty in taking out $100 a day and says that, if it were not for the timber, he would be able to make it $500. There is said to be plenty of water for the rocker.

Britannia Beach: Two men are entombed in the mine of the Britannia Mining & Smelting Co. at the time of writing (October 26th) and every effort is being made towards their rescue by their fellow miners. The Chief Inspector of Mines and one of his staff are on the ground. The men are L. C. Craig and Francis Patenaude. They are believed to have water within reach and a supply of food. It is possible, therefore, that they will be found alive although it is some days since the accident occurred.

Vancouver, B.C.: Glenville A. Collins, Engineers Ltd., of Vancouver, have taken a lease and bond on the Sally Mine, owned by the Wallace Mountain Mines, Ltd. The property has produced more than $100,000 in ore values. The new holders propose extensive development, the drinking of a 1,000 foot tunnel being planned.

Victoria, B.C.: Recent gold discoveries on Iron Creek, Taseko Lake District, have been attracting attention. Much of the ground open has been staked and something of a rush to the district is looked for in the Spring. Holders of claims are agitating for a road. They assert that the section can be reached without crossing either Warner or Taylor Passes, the route suggested being by way of Williams Lake on the Pacific Great Eastern Ry. and Hansville. By adopting this means of ingress they say that only some ten or twelve miles of construction through open country will be necessary. The matter is being investigated.

Valentine Quinn, of the Granby Consolidated Mining & Smelting Co., is quoted as saying that there now are some 890 men on the payrolls of the Hidden Creek Mine and the Anyox Smelter. The plant now is shipping as much blister copper as at any time in its history. Two steamer loads a month are coming south en route to eastern refineries. Technical improvements in smelting have reduced the demands on the coke plant. Formerly the whole battery of thirty coke ovens was insufficient to supply all the coke needs. Now sixteen ovens supply all the coke that the smelter needs for night and day work at full capacity. The per man unit of production for Granby is said now to be greater than that of any other smelter on the continent. Since the destruction of the great German chemical works all of the ammonium sulphate from the coke plant has found a ready market. Seventeen thousand gallons of benzol produced each month is shipped to Vancouver. The remaining 7,000 gallons is used at Anyox.

JAMES W. DAVIS JOINS ENGINEERING EQUIPMENT CO., LTD.

James W. Davis, for the last seven years District Sales Manager for Canadian Ingersoll-Rand Company, Limited, with headquarters in Montreal, has severed his connection with that Company, after twenty years of service, and has become associated with Engineering Equipment Company Limited, New Birks Building, Montreal, in the capacity of General Sales Manager. Mr. Davis has, for many years, been a familiar figure about the Mining Camps of Central and Eastern Canada, having been stationed in Cobalt and Porcupine for some time, before being moved to Montreal.

Engineering Equipment Company, Limited, has just completed arrangements with Stimpson Equipment Company, Salt Lake City, for the exclusive manufacture and sale of Mitchell Electric Vibrating Screens in Canada and Newfoundland, and Mr. Davis will devote a large part of his time to the promotion end of the Company's business. The Mitchell Gyro-Ballistic Crusher will also be introduced into Canada by the same Company and will no doubt create a great deal of interest in the engineering profession.

Mr. Davis is probably best known in the Thetford Mining District, having been among first to recognize the importance of the Asbestos industry and it is safe to assume that he will in future be closely associated with the progress of mining and milling in that field. Mr. Davis is a member of the Engineer's Club, Montreal; St. George's Club, Sherbrooke; Thetford Golf Club, Montreal; Temple Club, Three Rivers, Fish & Game Club, Canadian Railway Club, and an associate member of the Canadian Mining Institute.

METAL QUOTATIONS.

Following are the fair average price for ingot metals (in less than car-loads):

Toronto.	Cents per lb. 1st Nov. (Unchanged since last week).
Copper, Electric	17
Copper, Casting	16¾
Tin	35
Lead	6¾
Zinc	7½
Aluminum	27
Antimony	9

That the average prices for ingot metals has been unchanged for some time is due to the fact that the market is just holding its own and has been in that condition for several weeks now.

OIL POSSIBILITIES OF LOWER ALBANY BASIN.

In his report to the Geological Survey on investigations along the Lower Albany River, Mr. M. Y. Williams says:

In reporting upon the oil possibilities of virgin territory such as the James Bay basin, three main points must be considered. These are, indications of oil such as seepages or springs; the presence of sedimentary formations similar in character and age to those which bear oil elsewhere and the presence of impervious cover and rock structure favourable for oil accumulation.

In the region traversed, no oil seepages have been reported. However, as the outcrops are mostly in the river beds at or below water level, the seepages may easily have been overlooked or they may be obscured by gravel and sand. Of the formations observed, the lower Salina and upper Niagara or Guelph, and the Onondaga limestone contain oil elsewhere. The Onondaga limestone is, however, unpromising on the Albany, since it is everywhere exposed and eroded, the shale which elsewhere retains accumulations of oil in rock of this age having been long since removed. The Trenton limestone—oil-bearing in Ohio and elsewhere—underlies the younger rocks to the northwest, but its presence in the Albany region, though probable, is not certain.

Thus the dolomites of Guelph and Salina age are the most likely containers of petroleum pools. A sufficient cover is probably present to retain oil from the upper outcrops of red Salina shale on Kenogami, Albany, and the tributary rivers down to the bay, but conditions would appear more favourable both for cover and thickness of formations from the Forks down. It is probable also that the Trenton limestone underlies this region.

The general structure observed is too flat to favour the accumulations of large oil fields. There are, however, indications of fairly marked structure along Albany river, between Snake and Flat islands, where a syncline, with sides dipping at from 3 to 4 degrees, is followed by the river. Accompanying anticlines may be looked for to the north and south. Outcrops are so scattered that it is not possible to draw definite conclusions as to structures, but where the shale beds are well exposed, little indication of other than slight undulations is present.

Drilling machinery and supplies may be taken down river from the Canadian National railway at the crossing of the Pagwachuan near Pagwa station, by means of scows, provided that advantage be taken of high water in the spring. Should locations be made below the Forks, the scows could be used during the summer, except in very low water, for transporting the outfit to successively lower points as wells were completed. Arrangements could probably be made with Revillon Freres for bringing out machinery and other equipment the following spring, provided work were abandoned.

The first wells should be drilled to the Precambrian crystalline rocks, and samples of cuttings should be kept every 5 feet, and sent to the Geological Survey for examination. It is not probable that the total thickness of the sedimentary formations is more than 600 or 700 feet.

ASBESTOS SITUATION IMPROVED.

The situation at the Mines in the asbestos district, according to reports received therefrom has bettered itself. During the month of August the schedule was four days a week; during September this schedule was increased to six days a week. During the height of the demand the Mines were running night and day whereas the six day time is only a six hour day. Increased operations at the Mines would not have been put into effect had the demand not returned. The demand will eventually reflect upon prices.

EDITORIAL

MINING AND THE TARIFF.

In the present election campaign, the question of the tariff far out-distances all other competitors as a fertile subject of prolific discussion, both from the public platform and in the public press. A good many wise things are, doubtless, being said and written about it — and certainly a good many things that are *otherwise*. Neither those who uphold, nor those who denounce, Protection have been very notably successful, in their advocacy of their respective views, in avoiding "the falsehood of extremes." Protection, as we have known it hitherto, and know it today, in Canada is neither so black as it is painted in some quarters, nor so spotlessly white as it is represented as being, in others.

The tariff question is, in the very nature of things, a question with which all those interested in whatsoever capacity, in the mining industry, have an intimate concernment. Whatever the party complexion of the Government returned to power, as a result of the present appeal to the people, may be, it must be animated by a resolute determination to increase production. To that end, the development of our natural resources is essential. Of such natural resources, our mineral resources form a unit of great and increasing importance, by reason not only of the position to which they have already attained as contributing, by their development and yield, to the aggregate wealth of the country, to the building of communities and to the employment of labor, but also (and in still greater degree) of their vast future potentialities in the same beneficent directions.

In their efforts to develop the mineral resources of Canada, great risks are inseparable from the part that the producers are called upon to play. For, in the case of every mining venture, the uncertainty attaching to the development stages, is an invariable and a formidable factor to which regard must be had. Hence, it is necessary that no unnecessary impediments should obstruct the path of those who are blazing the trail of an industry that is calculated to enure so greatly to the benefit of the country at large.

Such a consideration brings us naturally to the question of the tariff in its relation to the mining industry. Producers feel — and rightly feel — that, in the framing of a tariff, regard should be had to their interests. At the same time, we believe we are correctly interpreting their viewpoint in saying that they recognize that "there are others" — that they do not want to "hog it all" (to use a colloquialism). They recognize that the manufacturer also has interests — and legitimate interests — which it would be unjust to menace and unwise to jeopardize.

Now, it is a matter of common knowledge that a good many lines of gold mining machinery and machine parts have to be imported from the United States because they are not manufactured in this country. Where that is the case, it seems to us to be essential, in the interests of the mining industry of Canada, that such machinery and machine parts should be imported free of duty. For it is obvious that such duty-free importation would tend to increase mineral production — an end as to the desirability of attaining which there can be no dispute.

Some provision, it is true, already obtains, under the existing tariff, in connection with the metallurgy of gold ores, for the free importation of certain of such machinery and machine parts. But, when producers have attempted to avail themselves of this provision, unexpected difficulties, arising from either the regulations or their interpretation, have frequently been encountered. In other words, while the tariff has acknowledged the principle that production should be encouraged, by the admission of such machinery and machine parts duty-free, its application has, in practice, been seriously impeded.

It is only right to acknowledge that satisfactory and substantial progress is being made with the manufacture of mining machinery in Canada. Indeed, the progressive spirit evinced by many Canadian concerns, turning

out products of this kind, has been very notable, especially of late. And we are persuaded that producers, as a body, desire nothing less than to interfere with the legitimate protection such as renders their enterprise remunerative and their industry possible.

As things look to us, in this connection, what is required by those who are called on to frame a tariff is an intelligent understanding, and an adequate appreciation, of the situation. Advice should be sought from, and consultation should be had with, both the mining operators, on the one hand, and the manufacturers of mining machinery in Canada on the other. This would result in an intelligent understanding, and a sane application, of the principle that the mining operating industry should be encouraged, but not at the expense of manufacturing industries already established and endeavoring, often under substantial handicaps, to serve the country well.

THE GEOLOGICAL SURVEY.

It is interesting to note that in Great Britain the Geological Survey Board is providing for increased activity. Four field units are being constituted, in addition to the five which have formed the basis of the staff organization since 1900.

In Canada, where there is so much work for the Geological Survey to do, there has not, in recent years, been any great increase in activity. The pioneer work, done by the field parties in all parts of the country, has been of great value. The progress made is, however, limited by the fact that the staff is small and the territory very large. It would seem that the revival of activity of the Geological Survey in Great Britain means that the work has value. If it is of value there, it must surely be of great value here.

THE POWER SITUATION AT PORCUPINE.

There is, as yet, no announced solution of the power situation at Porcupine. The Ontario Government has not yet given the Hollinger company the permission necessary to enable it to go ahead and develop power on the Abitibi river. The Northern Canada Power company has not made public its plan for providing power, and is evidently waiting for information as to what the mining companies and the Government intend doing.

The best news in this connection is that the fall rains have so improved the situation that the power company is satisfied that the present supply can be maintained during the winter.

CARBONIZATION OF PEAT.

The Fuel Research Board has issued a report on investigations into utilization of machine-won peat. Air-dried peat was subjected to a series of experiments on the carbonization of peat in vertical gas retorts with steaming. Further experiments are necessary, but the Board considers that the results already obtained are encouraging. In view of the attempts made to use Ontario peat, the results of these investigations of the Fuel Research Board will be interesting here.

THE BRITANNIA DISASTER.

We have, as yet, only meagre accounts of the damage wrought by flood at Britannia Beach. It would appear, however, that the early accounts were not much exaggerated, and that nearly forty lives were lost when the waters of the big reservoir were let loose. The Britannia company has had more than its share of trouble, having, in recent years, suffered from rockslide, fire and flood.

EDITORIAL NOTES.

The United States Bureau of Mines recognizes the good work done on Miners' Field Day. Commenting on the Butte contests the Bureau says: "The Bureau representatives feel that the Butte annual miners' field day is an unqualified success, not only as regards the forwarding of first aid and mine rescue work and of general mine safety and accident prevention, but also as to the opportunity it presents for the dissemination of information on efficient modern mining practices and the growth of general good feeling. The Butte mining companies are to be congratulated for their progressiveness in establishing such an excellent institution, and it is to be hoped that there will be no interruption in the holding of the field day annually for a number of years to come."

According to reports from Dawson, a steamer and six barges are wintering at West Dawson shipyards to be in readiness for shipments of ore from the Mayo mine early in the spring. This far north producer of silver ore is evidently making good headway with development.

It is reported that an Ontario mining company will explore under option a gold property at Elbow Lake, Manitoba.

Visitors to the Kirkland Lake district who have been said to represent Mr. Thomas Lawson of Boston are not pleased with the notoriety. We are not surprised.

ELECTROTHERMIC SMELTING OF ZINC.

An investigation of the electrothermic smelting of zinc and the condensation of zinc vapor is being undertaken at the Mississippi Valley Experiment Station of the Bureau of Mines at Rolla, Mo., in cooperation with the Missouri School of Mines and Metallurgy. A critical study of the physics and chemistry of the condensation of zinc vapor will be made for the purpose of obtaining sufficient data to design a condenser for an electric furnace which will result in the elimination or diminution of the formation of blue powder.

The Fluorspar Deposits of Madoc District, Northern Ontario

By M. E. WILSON.

The following description of the fluorspar deposits of Madoc district, Ontario, is based on examinations of these deposits made by the writer during the summer of 1920 while engaged in the geological investigation of the Madoc and Marmora map-areas.

That fluorspar-bearing veins were present in Madoc district was known to some of the local inhabitants more than thirty years ago, but these were not then regarded as commercially important. The first attempt to mine the mineral was made by the late Stephen Wellington who in 1905 put down a prospect pit 14 feet deep on the Bailey property. During the years following this operation a small amount of prospect work on the fluorspar deposits of the district was performed, but little interest was taken in the mineral until the year 1916 when owing to the world war the price paid for fluorspar rose to as much as $30 per ton. As a consequence of this increased demand the production of fluorspar from the Madoc district rose from no production in 1915 to 7,286 tons valued at $153,190 in 1918. Since 1918 the production has gradually declined. When the writer examined the fluorspar properties in 1920 there were six deposits on which mining operations were being performed, but the greater part of the production of the mineral was being derived from the two principal mines of the district, the Noyes and the Perry. Now, however, both of these properties are idle and active mining of fluorspar in the Madoc district has ceased.

The production of fluorspar from Madoc district since the year 1905 has been as follows:

Year	Tons	Value
1905	30	$ 150
1907	15	75
1910	2	15
1916	1,283	10,146
1917	4,327	66,474
1918	7,286	153,190
1919	3,425	60,389
1920	3,704	67,381

The village of Madoc, near which the deposits occur, is situated in the central part of Southeastern Ontario about 25 miles north of the north shore of lake Ontario, and at the northen end of the Belleville-Madoc branch of the Grand Trunk railway. It lies 7 miles north of Ivanhoe station on the main line of the Canadian Pacific railway between Toronto and Montreal via Peterborough.

The deposits outcrop mainly in two localities: (1) the northern part of Huntingdon township; and (2) the southern part of concession I, Madoc township. Since nearly all the deposits in the first locality occur either in the vicinity of Moira lake or along the continuation of the Noyes-Perry fault which crosses Moira lake, they will be referred to collectively as the Moira Lake group. The deposits occurring in the southern part of concession I, Madoc township, on the other hand, will be designated the Lee-Miller group.

*Extracts from Summary report published by Geological Survey, Ottawa.

General Character of Deposits.

The fluorspar deposits of the Madoc district are all veins occupying fault fissures of post-Ordovician age. They consist chiefly of fluorspar and barite, or fluorspar, barite, and calcite intermingled in varying proportions. The less common minerals present are celestite, quartz, pyrite, marcasite, chalcopyrite, tetrahedrite, malachite, and elaterite, but all of these with the exception of the celestite are quantitatively unimportant.

The most characteristic features exhibited by these veins are the presence of two ore-zones separated by a zone of fractured or brecciated wall-rock and of lenticular masses of ore usually situated where two such parallel ore zones unite. Where two ore zones are present, one is generally wide and the other relatively narrow. The width of the zone of fractured country rock intervening between the ore zones ranges from a few inches to 10 feet or more in proportion to the average width of the main vein. The lenses of ore that occur on the veins range from a few feet to 200 feet in length and from 2 feet to 17 feet in maximum width. The longer direction of the principal lenses that have so far been opened up on the Noyes-Perry vein all appear to extend diagonally down the vein towards the southeast. The structural explanation of this feature was not determined by the writer.

The material composing the fluorspar deposits occurs chiefly in two ways: (1) as alternating bands; or (2) as an irregular network forming the partitions between caverns. In vein material of the first variety cavities are relatively uncommon, whereas in vein material of the second class cavities form a large part of the total volume. On this account the two varieties of the ore may be appropriately designated for the purpose of description the "banded" and "cavernous" types respectively.

It has been previously noted that the mineral composing the fluorspar-bearing veins consists chiefly of varying proportions of fluorspar, barite, and calcite. Furthermore, the relative abundance of these minerals varies so greatly, even in adjacent parts of the same vein, that the grade of fluorspar produced from different properties or from the same property at different times varies considerably.

The colour of the Madoc fluorspar is most commonly white, grey, or green, but honey-yellow, blue, purple, rose, and red varieties are also common. Some of the large, brilliant, clear crystals embedded in celestite in the Kane vein and the transparent, pale green crystals obtained from the deposit on the Perry property are exceptionally beautiful.

Structural Features.

That the fissures occupied by the fluorspar-bearing veins are related to faulting is indicated (1) by the abundance of fractured and brecciated wall-rock associated with the fissures, (2) by the slickensided and strated character of the wall-rock on either side of the vein, and (3) by the displacement of contacts observed in underground workings. The first and second of these features can be observed almost anywhere in

the workings along the veins, but the third feature was seen only in the underground workings on the Noyes and Perry properties.

The displacement that has occurred along the Noyes-Perry vein is shown at the extreme southeast end of the underground workings on the Noyes property by the manner in which the contact between the Precambrian granite and the overlying Palaeozoic limestone has been dislocated. Here the contact was encountered on the southwest side of the vein at a point approximately 40 feet lower than on the northeast side indicating apparently that the southwest side had been downthrown 40 feet with respect to the northeast side. The striae on the walls of the vein, however, are not vertical but nearly horizontal and indicate, therefore, that the faulting in reality was in a horizontal direction and consisted either of a movement of the rock on the southwest side of the vein towards the northwest or of the rock on the northeast side towards the southeast. Since neither the slope of the Palaeozoic-Precambrian contact at the point of dislocation nor the direction of movement along the fault place is definitely known, the exact amount of displacement resulting from the fault movement cannot be determined, but it probably was not less than 100 feet and may have been considerably greater than this amount.

The evidence of displacement on the Perry property is the dislocation of the contact of the grey banded Precambrian limestone and an intruded mass of granite. The contact of this granite mass, which outcrops south of the vein and forms the wall-rock in the workings adjacent to No. 3 shaft should under normal conditions cross the vein in a north-south direction so that in drifting along the vein to the southeast the limestone would be met first on the northwest side of the vein. In reality, however, the relationships were reversed at the end of the drift driven to the southeast from No. 3 shaft at the 140-foot level, for the wall-rock on the southwest was limestone, and on the northeast granite. Furthermore, since the striae on the walls of the vein in this locality also are approximately horizontal it is evident that at this point, as on the Noyes property, either the rock on the southwest side of the vein has moved towards the northwest or that on the northeast side of vein has moved towards the southeast. When the writer last visited the Perry property in September, 1920, the limestone-granite contact was situated about 20 feet from the end of the drift on the southwest wall of vein, but had not yet been intersected on the northeast wall so that the amount of displacement along the vein was not determined, but it was at least greater than 20 feet.

The fluorspar veins almost without exception trend in a northwesterly direction. The veins belonging to the Moira Lake group likewise are distributed in a northwesterly trending zone; the veins belonging to the Lee-Miller group, on the other hand, although individually trending in a northwesterly direction, lie in a zone trending only 15 degrees west of north.

The most striking structural feature exhibited by the fluorspar veins is the presence of horizontal or nearly horizontal striae on the wall-rock of the veins belonging to the Moira Lake group. The well-developed character of these striae, their presence on the wall-rock of every vein belonging to the group, and the absence of striae in any other direction seem to indicate that all the displacement along these fissures was in a horizontal direction.

Palmateer.

The fluorspar deposits situated farthest to the south in the district are those outcropping at the north end of lot 18, concession VIII, Huntingdon township, the property of Mr. George Palmateer. In this locality the Palaeozoic limestone, which underlies nearly the whole of the southern part of Madoc district, is cut by several small fluorspar-bearing veins.

The material composing these veins consists mainly of fluorspar, barite, and calcite. The fluorspar is chiefly a colourless, massive, white or green variety, but on the ore pile near the No. 2 pit some crystallized red-looking fluorspar was observed which consists of colourless fluorspar in which red particles (probably hematite) were distributed in zones parallel to the crystal faces.

Although these veins are relatively small their presence on this property is important because they all trend in a northwesterly direction and lie directly on the continuation of the Noyes-Perry vein, thus indicating that the Moira Lake fracture system continues as far south at least as this locality.

Wright.

Wellington and Munro of Madoc have excavated a series of ten prospect pits in the gravel which overlies the Palaeozoic bedrock on this property which adjoins this lot on the west. In one of these pits situated near the middle of the series—an excavation about 50 feet long, from 20 to 55 feet wide, and 10 feet deep—a vein of fluorspar was discovered. When the writer examined the pit the walls had caved-in and the only evidence of the presence of fluorspar that could be observed was the fragments of vein material that had been piled nearby.

Howard.

Several carloads of fluorspar have been shipped from a deposit situated near the north end of lot 14, concession XI, Huntingdon township. The discovery of fluorspar in this locality was made by Stephen Wellington who, with Mr. Munro, worked the deposit during January and February 1918, and then sold the property along with the Noyes mine, which adjoins the Howard on the northwest, to Canadian Industrial Minerals, Limited. The operations commenced by Wellington and Munro were not continued by the new owners, however, and the property lay idle until August, 1920, when Wellington and Munro obtained an option on the lot from Canadian Industrial Minerals, Limited, and resumed operations.

A number of scattered prospect pits have been excavated on this property, but the only openings in which a vein has been found are two northwesterly-trending pits situated about 300 feet east of the Howard farmhouse. The northern of these pits is about 70 feet long, 10 to 15 feet wide, and 2 to 15 feet deep. The other pit which is situated about 50 feet to the south is about 60 feet long, 10 to 20 feet wide, and 10 feet deep. A shaft now filled with water but said to be 25 feet deep has been sunk from the bottom of the north pit close to its southeast end. In September, 1920, a new shaft was being sunk from the bottom of the south pit near its northwest end, and at that time was 25 feet deep. The walls of the pits consist of grey, flat-bedded Palaeozoic limestone overlain by gravel and boulder clay. The latter material has slumped down from the pit faces covering the bottoms of the pits so that the vein was not seen by the writer except in the southeast face of the north pit and in

the faces of the new shaft. At the first of these points the vein was 2 feet wide, but was said to be 5 feet wide in the old shaft only a few feet away. In a new shaft it was from 5 to 7 feet wide but included a considerable proportion of limestone fragments in places. The vein material is mainly white to grey, massive fluorspar, but includes some barite and calcite.

A diamond-drill hole was put down on this property at an angle of 61 degrees towards the northeast from a point about 60 feet to the south of the old shaft.

A mass of red granite penetrated at a vertical depth of 131.2 feet was presumably a boulder and indicates that the drilling was discontinued close to the Precambrian-Palaeozoic contact. The Palaeozoic in this locality, is, therefore, about 150 feet thick. The vein of fluorspar was cut in the drill hole about 10 feet to the southwest of the outcrop of the vein at the surface and has, therefore, an average dip of 80 degrees.

The Noyes Mine.

The Noyes mine, the property of Canadian Industrial Minerals, Limited, is situated on the top of the high area of granite that outcrops to the south of the eastern and lower part of Moira lake. It lies about one-half mile east of Moira Lake station on the Madoc branch of the Grand Trunk railway, where a siding has been constructed by the company.

The discovery of fluorspar on this property was made by Donald Henderson of Madoc in 1916. In that year Henderson, in company with Chesley Pitt, purchased an option on the mining rights of 20 acres in the southeast corner of lot 13, concession XII, Huntingdon township, and after sinking prospect pits along the outcrop of the vein they sold their option in the early part of 1917 to Wellington and Munro who had previously acquired an option on the remainder of the property. Wellington and Munro then commenced mining operations and continued to work the property until March, 1918, when they sold their options on lot 13 with the mining rights to some adjacents lots, to Canadian Industrial Minerals, Limited. This company continued mining operations until the autumn of 1920 when the mine was closed down. Over 15,000 tons of fluorspar was produced from the mine during the period of its operation.

The belt of Palaeozoic limestone that underlies the southern part of central Ontario is delimited on the north in places by steep northward-facing escarpments that rise abruptly to a height of 150 feet above the Precambrian complex exposed at their bases. An escarpment of this type lying along the south shore of Moira lake is interrupted directly east of the narrows where the Grand Trunk railway crosses the lake by an embayment three-quarters of a mile in width, on either side of which the escarpment turns southward and gradually disappears on the slope of a knob of Precambrian granite. The principal workings on the Noyes property are situated close to the eastern edge of this granite mass, but the vein from which the ore has been mined has been traced almost continuously in a northwesterly direction to the shore of Moira lake and in a southeasterly direction into the Palaeozoic limestone.

The fluorspar produced from the Noyes mine has been obtained chiefly from lenticular enlargements on a vertical or nearly vertical vein which extends in a northwesterly direction diagonally across the property. These lenses range from a few feet to over 200 feet in length and from a few inches to 17 feet in width. They consist mainly of fluorspar and barite in varying proportions, fluorspar being predominant in some lenses and barite in others. In practice only that part of the vein in which fluorspar predominates is taken as ore.

Blakeley.

The Blakeley property is situated west of the Madoc-Belleville road where it ascends the Palaeozoic escarpment that adjoins the south shore of Moira lake. The discovery of the fluorspar on this lot was made by James O'Reilly in 1916, but most of the development work was performed by the late Stephen Wellington and his associates. Several carloads of fluorspar were shipped from pit No. 1 and shaft No. 1 by Wellington during the summer of 1920.

There are at least three fluorspar deposits present in this lot which for the purpose of description may be referred to as the north vein, the south vein, and vein in pit No. 1.

The north vein trends approximately north 40 degrees west (magnetic) and has been traced at intervals for over 500 feet.

The south vein on the Blakeley property trends north 4 degrees west (magnetic). It can be observed in pit No. 4, in shaft No. 2, and in a trench situated about 80 feet north of pit No. 4. Pit No. 3 is an excavation 40 feet long, 10 feet wide, and 6 feet deep, from the bottom of which, at a point about 10 feet from its south end, shaft No. 2 has been sunk to a depth of 25 feet. The vein material exposed in these openings consists mainly of alternating bands or zones of white barite and colourless to honey-yellow fluorspar. The proportion of barite and fluorspar varies greatly from point to point, but on the whole the barite predominates. The width of vein material exposed in shaft No. 2 ranges from 2 to 6 feet. The vein material observed in the trench that has been excavated along the outcrop of the vein further to the north ranges from 6 inches to 1 foot in width and is similar in character to that seen in pit No. 4.

Pit No. 1 is an excavation 50 feet long, 6 feet wide, and 30 feet deep that was opened up by Stephen Wellington during the summer of 1920. The vein material exposed in the pit consists mainly of fluorspar and occurs in two zones separated by a much fractured mass of the limestone wall-rock. The total width of the vein material ranges from 1 to 3 feet. Since this vein trends north 35 degrees west (magnetic) and is situated 30 feet to the southwest of the continuation of the north vein, it might be assumed that it is a separate parallel vein having no connexion with the north vein, but the results from diamond-drill hole No. 1 have shown that the north vein dips to the southwest, so that at depth it lies almost directly on the continuation of the vein in pit No. 1. It is possible, therefore, that this vein is a branch from the north vein. The walls of the pit are polished and striated, indicating that the fracture in which the vein occurs is also the locus of a fault. Since the striae trend almost horizontally the direction of movement along the fault was presumably nearly horizontal.

Two diamond-drill holes were put down on the Blakeley property in 1918 by Canadian Industrial Minerals, Limited. In hole No. 2 no fluorspar was found, but in hole No. 1, 7 feet of vein material was cut at a depth of 142 feet. From these data it can be calculated that the vein was crossed by the diamond drill at a vertical depth of 111 feet and at a point situated about 25 feet to the southwest of shaft No. 1.

The Perry Mine.

The Perry mine is situated about 2 miles south of the village of Madoc and close to the north shore of the narrows that divides Moira lake into upper and lower divisions. The principal workings on the property lie only a few hundred feet to the west of the Belleville-Madoc branch of the Grand Trunk railway with which the mine is connected by a siding.

The outcrop of the vein on the Perry property is said to have been laid bare at the time the Belleville-Madoc branch of the Grand Trunk railway was being built, but no attention was paid to the discovery until the year 1912, when Messrs. Cross and Wellington purchased an option to prospect the property. Actual mining operations were first undertaken in the autumn of 1915 and except for an interval of about 11 months between December 1, 1917, and November 1, 1918, were carried on continuously from that time to the autumn of 1920.

The rocks occurring adjacent to the Perry mine, so far as observed, are all of Precambrian age and fall into two principal groups: (1) a number of sedimentary types belonging to the Grenville series; and (2) masses of quartz syenite and granite similar in character to the Moira granite that outcrops in extensive areas south and east of Moira lake.

The fluorspar found on the Perry property occurs in a northwesterly-trending vein that outcrops in two rock-areas that protrude through the swamp adjoining the north shore of Moira lake. Since this vein trends in the same direction as, and lies directly on the continuation of, the vein on the Noyes property to the south of Moira lake, it is evident that the veins on the two properties belong to the same fracture system and are probably parts of the same vein. One of the two rock areas in which the vein is exposed adjoins the north shore of Moira lake, whereas the other area is situated across the swamp about 700 feet to the northwest.

With the exception of a small stope said to be 20 feet long to the southeast of shaft No. 1, all the underground mining on the Perry property has been carried on from No. 3 shaft. This shaft, which is 140 feet deep, has been sunk close to the west end of a lenticular mass of granite 50 feet long and 10 feet wide that lies between northeast and southeast branches of the vein. Between the surface and the 90-foot level, to the southeast of the shaft the northeast branch of the vein is only a few inches wide, where as the south branch widens at a depth of 50 feet to a lens having a maximum width of 4 feet; to the northwest of the shaft both branches of the vein unite forming a single lens 100 feet long and 6 feet wide. Between the 90-foot and the 140-foot levels, to the southeast of the shaft the southwest branch is only a few inches wide, whereas the north branch widens into a lens 80 feet long and 5 feet wide at its maximum point; to the northwest the lens terminates at about 50 feet from the shaft. In reality, therefore, most of the fluorspar found in the vicinity of No. 3 shaft occurs in a lens having a horizontal length of 100 to 130 feet and extending diagonally down the vein to the southeast at an angle of about 65 degrees. From this lens a branch lens extends southeast for about 50 feet at the 50-foot level. Since the main lens has a width of 5 feet at the 140-foot level and no vein material has been removed below that depth the total length of this lens is not known, but its length from its northwest termination down to the 140-foot level is 150 feet. The height of the lens measured parallel to the shaft is about 200 feet, but measured at right angles to its longer direction only 100 feet. Its maximum width is 6 feet. All the ore present in this lens has been removed down to the 140-foot level. During the latter part of the summer of 1920 a drift was driven along the continuation of the vein for 75 feet from the southeast end of the 140-foot level, that is, to a point 160 feet from shaft No. 3 and hence almost directly beneath shaft No. 1. In this distance the vein had an average width of 2 feet.

The vein material on the Perry property is mainly the banded type and consists chiefly of fluorspar, barite, and calcite. The fluorspar greatly predominates, however, and practically all the vein material is sufficiently high grade to be mined. The fluorspar is a honey-yellow, colourless to pale green variety and for the most part occurs in well developed crystals. The less common constituents are fibrous celestite and pyrite.

Coe.

Two parallel northwesterly-trending veins are exposed in some shallow pits that have been excavated close to the north shore of Moira lake on lot 10 XIII, Huntingdon township, the property of Mrs. Arthur Coe, of Madoc.

South Reynolds.

A fluorspar-bearing vein trending north 45 degrees west (magnetic) occurs on the South Reynolds property, lot 7, concession XIII, Huntingdon township, directly north of the outlet of Moira river into Moira lake. The vein can be seen at present along the bottom and faces of an open-cut, 200 feet long, 2 to 6 feet wide, and 20 feet deep, that has been excavated at right angles to the slope of the ledge of Palaeozoic limestone that parallels the west shore of Moira lake in this locality. Throughout a considerable part of the length of the open-cut the deposit consists of two parallel veins ranging from a few inches to 18 inches in width and separated by lenses of limestone up to a foot or more in width. In places along the northeast face of the pit subsidiary veins branch from the main vein, and fade out towards the north, a feature that was also observed along the north side of the Noyes-Perry vein on the Noyes property. The material composing the vein on the South Reynolds property, as in the case of most other deposits, consists chiefly of fluorspar with barite and calcite as less abundant constituents. The walls of the open-cut are slickensided and striated in places and as in the case of the other deposits of the Moira Lake group, the striae are almost horizontal. Two carloads of fluorspar were shipped from this property in 1917.

Rogers.

The occurrence of a northwesterly-trending fluorspar-bearing vein at the south end of lot 10, concession XIV, Huntingdon township, is of considerable interest because the vein at this point lies directly on the continuation of the Noyes-Perry vein and hence affords evidence of the continuity of the Noyes-Perry vein from the Perry mine on the east across the Roger's property to the Kane mine on the west. The discovery of the vein at this point was made by Donald Henderson and Chesley Pitt of Madoc about the year 1909, but actual mining was first undertaken by Messrs. Gillespie, Cross, and Wellington, in 1910. In the following year Gillespie, Cross, and Wellington sold the property to Mr. L. L. Battle from whom it was afterwards purchased by the present owner, Mr. C. M Bowman. Mining opera-

tions have been attempted on the Rogers property at frequent intervals during the twelve years that have elapsed since the vein was discovered, but the greater part of the work on the deposit was performed during 1910, 1911, and 1914.

The principal excavation on the property, an open-cut about 100 feet long and from 5 to 10 feet wide, was partly filled with water at the time the writer examined the property in the summer of 1920, so that neither the depth of the pit nor the character or extent of the vein present in the bottom of the pit could be determined. The form of the opening indicated, however, that the vein material originally present occurred as a lens about 80 feet long and 8 feet wide at its middle. The only vein material seen on the property was a mass that stood above the surface of the water at the northwest end of the pit. This had a width of about 5 feet, and consisted mainly of green to honey-yellow fluorspar. The striae on the walls of the pit are almost horizontal. At a point about 40 feet northwest of the pit a vertical shaft said to be 65 feet deep has been sunk, from the bottom of which a cross-cut has been driven to intersect the vein. It was reported to the writer, however, that no fluorspar was mined by way of this cross-cut. The country rock exposed near the vein and the rock composing the dump from the shaft are mainly the buff-coloured Precambrian dolomite that outcrops extensively elsewhere in the vicinity of the north shore of Moira lake.

Kane.

The fluorspar deposits occurring on the Kane property, lot 9, concession XIV, Huntingdon township, are especially interesting because the principal vein contains a considerable proportion of brilliant transparent crystals of fluorspar up to 4 or 5 inches in diameter. The discovery of the main vein on the property was made by Mr. Kane, owner of the lot, in the latter part of the summer of 1917, when deepening the outlet of a spring. In the autumn of 1917 Mr. Rinaldo McConnell purchased a lease of the lot from Kane, and the following spring after sinking a pit 10 feet deep on the vein, sold his lease to a company known as Canadian Fluorite, Limited, that had been organized in Toronto for the purpose of purchasing and developing the property. The new company continued operations until April, 1919, when the mine was closed down, and all equipment with the exception of the shaft house and ore shed was removed.

Two occurrences of fluorspar are known to be present in the territory included in the Kane property: (1) the main vein which is situated near the north end of the lot, and lies directly on the continuation of the Noyes-Perry-Rogers vein; and (2) a group of veinlets exposed in a small prospect pit situated near the southwest corner of the lot.

North Reynolds.

Near the southeast corner of the north half of lot 8, concession XIV, Huntingdon township, and hence almost directly south of the shaft house on the adjacent lot to the east (Kane property) an area of impure, grey, banded Precambian limestone is exposed, in which two small deposits of fluorspar have been found. The larger of the two deposits is exposed in an east-west trending pit 12 feet long, 2 to 6 feet wide, and 2 to 12 feet deep, and is a mass of the cavernous type about 10 feet long and ranging in width from 6 inches at its extremities to 5 feet at its middle.

Bailey.

The discovery of fluorspar on the Bailey property is said to have been made about thirty-five years ago by Nicholas Fleming, owner of the lot, while excavating the cellar for a house, but no attention was paid to the discovery at that time, and it was not until 1905, when Stephen Wellington purchased an option on the property, that mining operations were undertaken. In that year Wellington sunk the shaft to a depth of 14 feet, and took out a carload of fluorspar in the course of this operation, but the following year allowed the option to expire. In 1907 Wellington renewed the option from William Bailey, who meanwhile had purchased the lot from Fleming, but after taking out a half carload of ore again dropped the option. During the years following the operations of Stephen Wellington, numerous options were taken on the property but actual mining was not resumed until late in 1916, when Mr. H. Hungerford took an option on behalf of the Hungerford Syndicate. This syndicate, after taking out one carload of ore during the early part of 1917, in 1918 purchased the mining rights to the lot outright. When the writer examined the property in the summer of 1920 there was a shaft on the deposit 45 feet deep from the bottom of which a drift had been driven 35 feet towards the southwest. A stope had also been excavated for about 20 feet to the northeast of the shaft.

A number of pits and trenches have been excavated along the outcrops of two small veins or vein-zones of fluorspar exposed on the north slope of a ridge of Precambrian limestone situated a few hundred feet south of the Grand Trunk Railway station at Madoc village. The fluorspar occurs in the excavations on the south deposit as a zone of two or more parallel veinlets, which range from ½ inch to 2 inches in width, and lie from 1 to 2 feet apart. The trend of the veinlets is approximately north 35 degrees west (magnetic); the length of the zone exposed is about 75 feet.

The other fluorspar deposit is exposed in a series of openings lying about 75 feet to the northeast of the south group of pits and consists of one principal vein having a maximum width of 2 feet and an average width of approximately 9 inches.

McIlroy.

The McIlroy property comprises part of the west half of lot 2, concession IV, Madoc township. Mining operations were commenced in this locality in 1916 by Mr. C. R. Ross and were continued at intervals during 1917 and the early part of 118 by Mr. Ross as manager for a company known as Mineral Products, Limited, which, in the meantime, had been organized to take over the property. Since 1918 the mine has been idle. Several hundred tons of fluorspar are said to have been shipped from the property during the period of its operation.

Lee Senior.

A number of fluorspar-bearing veins have been discovered on the east half of lot 1, concession I, Madoc township, by Mr. George Lee, sen., to whom the property belongs. The most important of these occurrences is the No. 5 vein that outcrops close to the west boundary of the property and extends diagonally across the half lot line into the territory belonging to the Wallbridge estate. About 800 tons of fluorspar are said to have been mined from this deposit in 1918 by H. L. Osborne who worked the vein under lease during the greater part of that year. The deposit consisted of a lenticular mass of fragmental or "gravel" fluorspar,

90 feet in length and 8 feet wide at its middle. The fluorspar was mined from the lens chiefly by way of a vertical shaft 60 feet deep from the bottom of which drifts were driven along the vein for 30 feet toward the north and 60 feet toward the south. These workings were inaccessible when the writer examined the property in 1920, but the vein is said to have a width of 2 feet in the bottom of the shaft.

Wallbridge.

There are two fluorspar-bearing veins known to be present on the Wallbridge property which for the purpose of description may be designated the north and south veins, respectively. Of these, the south vein is the continuation of the No. 5 vein on Lee property and the north vein the continuation of the vein on the adjacent Herrington) lot to the north. These deposits were discovered by Mr. C. M. Wallbridge during the summers of 1918 and 1919 while prospecting for the continuation of the Lee vein. Three hundred and eighty tons of fluorspar were shipped from the property in 1918.

PORT ARTHUR MINING NOTES.

By J. J. O'CONNOR.

Developments now being carried on in the Schreiber gold area, confirm the general opinion of men informed as to conditions that are being met with, that this field will soon be the scene of aggressive mining activity. Astonishingly good results are being carried on, in three different areas, all within two miles of the village of Schreiber, while the Duck Lake district 14 miles north, are showing up well under recent development.

A peculiar feature of the Duck Lake area, is what are locally known as "Mud Veins." These veins are composed of a fine gossan, and are from eight inches to fifteen feet in width. Samples of this material have been sent to various points in Canada and the United States for assay. Out of 32 samples $1.40 to $180 per ton in gold.

Mr. William Longworth has just completed this season's assessment work on four claims in this area, he is also the owner of eight other claims.

Wm. McKirdy has been sampling his claims in this district recently, and carrying on some quite extensive development. It is reported that he has granted an option to Eastern parties.

The Gold Range Mine, formerly known as the Jackson, have driven a prospecting tunnel into the hill on TB3326, and intersected the vein at 30 feet. At this point the vein is 2 feet wide, heavily mineralized, showing free gold, pyrites, zinc blende and galena, assaying high values. Another prospect tunnel is being driven 200 yards to the westward in order to cut the vein at that point. Camps are being constructed, and active mining operations will be continued aggressively during the coming Winter. Wm. Jackson is in charge of the work.

Channel samples, covering ten veins on this property, taken from the surface gave assays from $20 to $600 per ton in gold. These veins will average from 4 to 18 inches in width. They cut altered pillow lava and syenite porphyry.

A strong sulphide lead 200 feet wide, on TB3412, formerly the old Otisse mine, has been uncovered, but no work done. It has been thoroughly sampled on the surface, and gives an average of $4.90 per ton in gold.

The most extensive and important work being carried on in this field is at the McKellar-Longworth Mine, BJ122. The formation here is syenite porphyry and felsite porphyry, with some ankerite. There are seven known veins on this property. All have been cross trenched at every 300 feet. The tunnel being driven on the main vein is now in 65 feet. At 30 feet in, a cross cut was driven north 59 feet, and south 30 feet, both of which are being continued. Three veins were met in the north cross cut, and two in the south. The main vein shows visible gold, assays running from $8 to $45 per ton. A shaft is being put down on No. 2 vein half a mile west of the tunnel. This vein is 2½ feet wide, and traceable for 250 feet, and shows free gold wherever uncovered. This vein carries high values in tellurides. There is about 8 tons of ore on the dump, all showing visible gold. A set of samples have been taken from the shaft, and forwarded to D. Johns, Haileybury, for assay.

Another shaft is being put down on No. 3 vein, about midway between the tunnel and No. 2. This work is now down 12 ft. There is no visible gold showing, but tellurides are in evidence. This vein shows considerable shearing.

The new discovery made by Mr. Longworth on X776, near Cook Lake is developing satisfactorily. A shaft is being sunk, and a tunnel is being driven into the hillside in order to cut the vein. This vein is heavily mineralized, no assays have been made as yet. Samples have been taken every few feet in the shaft, and in the tunnel, and forwarded to D. Johns, Haileybury.

REPORTED STRIKE IN ELBOW LAKE DISTRICT.

Hosts of old friends in the Porcupine this week says, The Porcupine Advance of the 26th of last month, gave glad welcome here to Mr. Gordon Murray, one of the old-timers of the Porcupine, who has recently been working hard in the Pas district of Manitoba, in company with his brother, Kenneth, at their chosen calling as prospectors and miners. Mr. Murray spent a number of years in Porcupine and did very valuable work here as a prospector and mining man. He was one of the old-timers who in the early days helped to set this Camp on the way to success and progress. Early in the war he enlisted with the Royal Flying Corps and soon graduated as a fearless and efficient air pilot, giving active service in that line that won him special commendation from the Headquarters of the R.A.F. After the war, Gordon and his brother, Kenneth, went out to the Pas district where they have been very busy ever since. In the Elbow Lake district north of the Pas they have made a remarkable strike, one that does not seem to be often equalled even in rich gold areas. Gordon is in the east at present to interest mining men in the claims referred to. It is understood that he has been successful, though he will not talk for publication on this point.

COAL RESOURCES OF THE WORLD.

A complete and authoritative work on the coal resources of the world was published in connection with the meeting of the International Geological Congress held in Canada in 1913. It may be of interest to our readers to know that this three-volume work with accompanying atlas which originally sold for $25.00 can now be had at a cost of $10.00 per set by applying to the King's Printer, Ottawa.

Production of Ontario Gold Mines

J. A. McRAE.

Gold ore is being put through reduction plants at the gold mines of Porcupine and Kirkland Lake at an aggregate rate of approximately 2,066,400 tons every thirty days, according to figures secured as a result of a preliminary enquiry made in October by the representative of the Canadian Mining Journal.

These preliminary figures are supplemented with an estimate of $1,584,000 in gold bullion produced each month, the estimate being based upon achievements during the past two months.

This means that ore is being drawn from the gold mines of this part of Northern Ontario at the rate of approximately 25,996,800 tons annually, and resulting in a production at the rate of about $19,008,000 a year.

Following is the preliminary estimate at the individual mines:—

Name of Company	Monthly Tonnage	Value per Month	Value per Year
Hollinger Consolidated	110,000	$1,000,000	$12,000,000
Dome Mines Company	32,000	240,000	2,880,000
McIntyre-Porcupine	16,500	175 000	2,100,000
Wright-Hargreaves	4,500	60,000	720,000
Lake Shore Mines	1,800	45,000	540,000
Teck-Hughes Gold Mines	3,200	32,000	384,000
Kirkland Lake Company	4,500	32,000	384,000
Totals	172 200	$1,584,000	$19.008,000

In order to produce gold at the above rate, there are approximately 2,600 men employed at the mines of the Porcupine district, while there are approximately 500 men at the mines in the Kirland Lake district, making a total of 3,100.

These figures do not include the properties in the development stage, but merely deal with the seven mines which are at present producing gold. It is conservative to estimate a total of 300 to 400 additional men on the various properties in the development stage.

Further Kirkland Increase.

As regards the future, it is certain that the Ontario-Kirkland, at Kirkland Lake will be among the producers early in the coming year. This property has a 100-ton mill in the final stages of installation. It is probable that the Tough-Oakes at Kirkland Lake will also re-open its 140-ton mill early in the coming summer. These two mines may reasonably add an aggregate of another $1,000,000 a year to the production from the Kirkland Lake field. There are also the added prospects of mill enlargements on the present producers, and with the likelihood of a new mill being installed on the Argonaut Gold, some twelve miles east of the present producing part of the Kirkland Lake district. Also, there are a half dozen other properties in the development stage the Kirkland Lake field which may reasonably be sufficiently developed to commenced mill construction before the end of the coming year.

Probable Porcupine Increase.

In the Porcupine field, the Porcupine V.N.T. Mines has a mill which may treat 100 tons of ore daily, while the Schumacher is equipped to handle over 200 tons per day and with 140 tons daily at the Porcupine Crown, together with a 100-ton mill on the Dome Lake. These plants are at present idle, but the prospects are that practically every one of them may be in operation during the coming year.

In a word, the mill which may join the producers in the coming year, are the following:—

Name of Company	Daily Mill Capacity in Tons
Schumacher	200
Porcupine Crown	140
Porcupine V.N.T.	100
Dome Lake	100
Tough-Oakes	140
Ontario-Kirkland	100
Total	780

Allowing for an income of $10 per ton, and not making allowance for enlargement of plants such as to possibly 150 tons on the Porcupine V. N. T., the daily production of these mines should reach approximately $7,800 or at the rate of $2,847,000 per year. This production, added to the current output, tends to indicate a yield at the rate of $21,855,000 annually.

Additional probabilities are increases of possibly $2,000,000 a year on the Hollinger and $1,000,000 a year on the McIntyre, thereby bringing a total of close to $25,000,000 within the range of possibility within the next year or so.

GRADING COAL IN ALBERTA.

At the Third Annual Western Convention of the Canadian Institute of Mining & Metallurgy held at Edmonton, Alberta, an address was delivered by the new Premier, Mr. Greenfield; his subject was the Research Work of the Government in the matter of the mineral industry. "The Government is endeavouring" he said, "to develop more markets for Alberta coal, but we have met with one difficulty and that is the grading of the coal." He deplored the lack of uniformity in the grading of coal, for that had proved an hindrance in the market of the product. He concluded, "We advertise, make demonstrations and continue the research work, and I should like to suggest cooperation with the Government as well as to advise you that the uniform system of grading coal is a necessity."

WAGES TO VARY WITH COST OF LIVING.

At a mass meeting of the Canadian Collieries (Dunsmuir) Ltd. recently held at Cumberland, the wage agreement which has existed between the miners and the Company for the past two years was renewed for a similar period. There were a few minor changes, for the most part in the men's favour. The scale of wages has been regulated by the cost of living commission which includes a representative of the men, a representative of the Company and the fair wage officer. The commission investigates the cost of living in the district for three months and regulates wages accordingly. This provision applies to the new agreement. There are over one thousand men affected, and the fact that an understanding was reached without any friction is is a striking commentary upon the good relations existing between the management and the men. Recently the Company erected a large hall for the men at a cost of $30,000. They also laid out a new athletic ground which is said to be one of the best in the Province.

Ontario Wind Engine and Pump Co., Ltd.

This Long-Established Concern Manufactures Wind-mills, Pumps, Stable and Mining Equipment and a Large Variety of Similar Lines.

By A. R. R. JONES.

There are few better-known manufacturing concerns in Canada than the Ontario Wind Engine and Pump Company, Ltd. It was originally incorporated forty years ago under the name of the Ontario Pump Company, Ltd. Of the original incorporators, the only survivor today is Mr. James Brandon, who has been vice-president of the Company, and is now in the real estate business in Toronto Street. The concern carried on business in its early days at the corner of Cecil Street and Spadina Avenue, Toronto, when windmills constituted the sole line of manufacture and the employees numbered only some nine or ten. As an instance of the small beginnings from which this large concern has grown, it may be mentioned that the sales in the first year of its existence amounted to $16,000 only. Mr. S. W. Chapman, who died last Thursday, became secretary of the company in the year 1889, and was with it until three years ago, when he resigned as president, having held that office for a number of years.

The Company was incorporated under its present title of the Ontario Wind Engine and Pump Company, Ltd., in 1900. Some two years before that date, it had moved into its present quarters at the corner of Atlantic Avenue and Liberty Street, Toronto, where both its large factory and its head offices are located. This plant is a three-storeyed building for the most part. The floor space of the factory is 195,000 square feet. In addition, the Company has warehouses in Winnipeg, Regina and Calgary—the floor space of the warehouse in Winnipeg is 31,000 square feet—and branch sale of fices at the three places named and also in Montreal. The whole country is the Company's selling territory.

Company's Products and Officers.

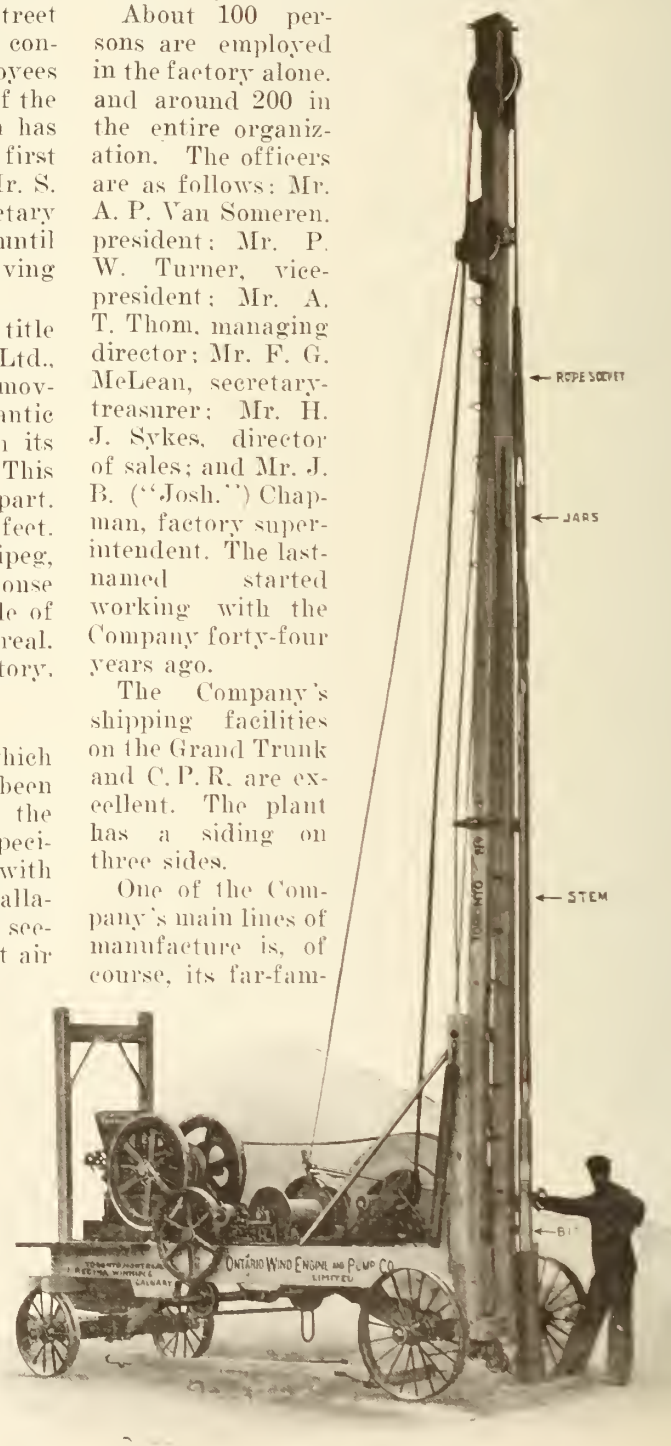
One of the Company's main aims and objects which it has kept before itself consistently, has always been to manufacture machinery which would lighten the burden of the farmer. The first mill in which it specialized was known as the Star mill, a wooden mill with a solid wheel. Then it made a specialty of the Halladay mill, which also was a wooden mill, but with a sectional wheel. It is of interest to note that the first air motor produced by the Company was built in 1894, and shipped to Muskoka where it is still working. By degrees, the Company dropped the manufacture of wooden mills and drifted into other lines.

The Company's products, at the present time, comprise windmills; pumps, iron and wooden; silos, spruce with a double tongue and grooved; ensilage cutters; grinders, galvanized iron tanks; wooden tanks; sprinkler tanks and towers of the trade in which in Toronto the Company does, possibly, some ninety per cent; steel flag-poles; well drills; portable wood saws; scales; stanchions; rams; and watering basins. The Company has its own foundry, and does a jobbing business in gray iron castings. It has galvanized equipment for both hot and electric processes. It undertakes the installation and supply of water systems, for rural, household and municipal requirements; these water systems, when installed are operated by four different methods, namely the windmill, gasoline engine, electric motor and waterfall methods. The company further does a jobbing business in gasoline engines, cream separators and pressure systems. The pressure systems are operated either by hand or by automatic motor.

About 100 persons are employed in the factory alone, and around 200 in the entire organization. The officers are as follows: Mr. A. P. Van Someren, president; Mr. P. W. Turner, vice-president; Mr. A. T. Thom, managing director; Mr. F. G. McLean, secretary-treasurer; Mr. H. J. Sykes, director of sales; and Mr. J. B. ("Josh.") Chapman, factory superintendent. The last-named started working with the Company forty-four years ago.

The Company's shipping facilities on the Grand Trunk and C. P. R. are excellent. The plant has a siding on three sides.

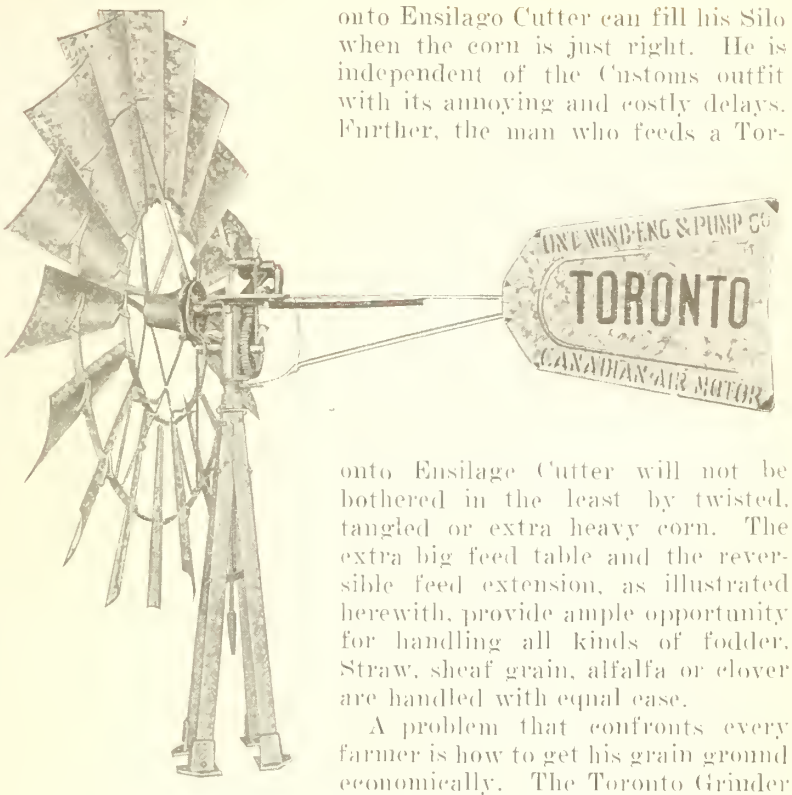
One of the Company's main lines of manufacture is, of course, its far-fam-



A Company Well Drill.

ed Toronto windmills. First, there is its single geared pumping windmills, the bearings of which are constructed of high-grade babbitt fed by large oil cups. It is most important to have smooth surfaces with a minimum of friction, and this method of construction is, by test of time, the best for a windmill. The gears are designed so that three and one-third turns of the wind wheel produce one stroke of the pump. This design enables the mill to work efficiently in a light breeze, and insures against wasting energy in a heavy one. The shafting is made of specially manufactured drawn steel. Its toughness and elasticity are such that it will stand the wear and tear of day and night work during the life of the mill, without replacement. It is absolutely necessary to stop the wheel of a mill when not in use. The brake consists of an expanding cone, which acts by friction on the interior surface of the spider and stops the wheel automatically, when the vane is pulled out of the wind. The Pitman is the rod that converts the rotary motion of the wheel to the reciprocating motion of a pump. It is a piece of malleable iron working on babbitt bearings and supplied with two capacious oil cups.

Then there is the double geared pumping windmill, manufactured for those who desire a heavy duty pumping wind motor. The feature of this is the two distinct sets of gears, pinions and pitmans, which transfer their power to one crosshead to which the pump rod is attached.



A Company Windmill.

Specially Constructed Mining Tanks.

Another special line of manufacture is the Toronto Mining Tanks, which are specially constructed for the Cyaniding process. They have to retain heavy and precious liquids as high as 80 lbs. pressure to the cubic feet. They are made of B. C. Fir, Redwood, Gulf Red Cypress also in White Pine. All Toronto Tank Stocks are air dried. This means perfectly seasoned material. It takes longer than kiln drying but it means longer life and superior material in every way. The White Pine is known as Tank Grade Stock, free from sap, shake, large or unsound knots or other defects. The B. C. Fir is what is known as Superior Clear Tank Grade Stock, free from sap and large pitch pockets and with one clear face. The Gulf Red Cypress and Redwood is Clear Tank Grade Stock, free from sap and other defects. The staves are made of 2 in. or 3 in. stock, surfaced two sides, sawn radially to insure tight joints. Bottoms are also 2 in. or 3 in. stock, surfaced two sides, jointed and dowelled for maximum strength. The hooping is especially strong, of round wrought iron construction up to ⅞ in. size and over that of steel. These are joined by lugs of extra heavy design. Toronto Mining Tanks are in use to-day, giving first-class service to: Dominion Reduction Co., Cobalt, Ont.; Shumacher Mines, South Porcupine, Ont.; McIntyre Mines, Ltd., Porcupine, Ont.; Kerr Lake Mines, Ltd., Cobalt, and many others.

Specialists in Farm Machinery.

As has been noted, the Company specializes in all kinds of Farm Machinery. To mention one important line the Toronto Ensilage Cutter is a thoroughly dependable, efficient machine, which fills a Silo quickly with very little power. The Farmer who owns a Toronto Ensilago Cutter can fill his Silo when the corn is just right. He is independent of the Customs outfit with its annoying and costly delays. Further, the man who feeds a Toronto Ensilage Cutter will not be bothered in the least by twisted, tangled or extra heavy corn. The extra big feed table and the reversible feed extension, as illustrated herewith, provide ample opportunity for handling all kinds of fodder. Straw, sheaf grain, alfalfa or clover are handled with equal ease.

A problem that confronts every farmer is how to get his grain ground economically. The Toronto Grinder here "fills the bill." It can grind anything from ten to forty bushels an hour, right into the feed trim at the cost of a few cents for fuel. As one satisfied purchaser said, the other day: "When I figure the amount of time and money spent yearly on chop done at the mill, and the wear and tear on bags and compare it with the expenses of grinding my own grain, it would pay me to borrow as much as $500.00 to get my own Grinder and Engine. Figuring the interest at $30.00 I would be money in pocket besides the many other things I could do with the engine, such as sawing, filling my silo, etc."

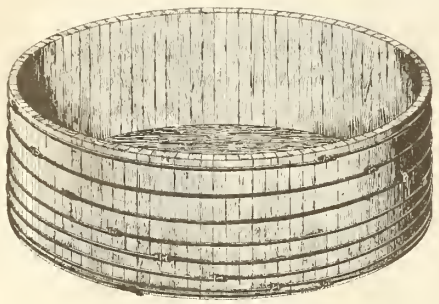
The Company manufactures an extensive and varied selection of Toronto Pumps to suit every requirement. It makes Lift Pumps and Force Pumps, some of which may be operated by hand, some by windmill, engine or electric energy, and some in combination of two or more of these methods. Some of those are suitable for shallow wells only, and others for deep wells only, and then others again combine both requirements. Inasmuch as pumping means continuous service on which depends the health and welfare of man and beast only first-class materials and workmanship are put into Toronto Pumps, Cylinders and accessories.

As regards well drills, the Company has long led in the introduction of the newest and most feasible methods of securing water, whether it was with the use of a hydraulic ram, in the creek, or drilling the earth's surface to extreme depths, and today its Chapman Well-Drill not only releases the imprisoned water, but with the water supply line so complete, it is delivered wherever it is required, whether it be to the watering trough on the prairie, or the locomotive on the Overland Limited, the kitchen of the suburban city home, or the thresherman's water-tank.

The Best in Silos.

Another specialty, of which mention should not be omitted, is the well-known "Toronto" silo, which con

verts the corn, the ears, the stalks, the leaves, into a most delicious mixture that the cattle enjoy. Nothing is wasted. It is made of wood. Cement is not only more costly, but draws moisture, which causes the ensilage to freeze. The ensilage will not stick to the walls of a "Toronto" Silo. It is air-tight. The staves are of double-tongued and grooved construction, carefully matched. This makes an air-tight container, so that the process of turning the corn into good ensilage can be carried out properly. A "Toronto" Silo is waterproof. Water rots ensilage. Each stave is treated with creosote, which resists water, rot and rats. Silage cannot get mouldy in a "Toronto" Silo. It has smooth inside walls. In Silos with corners or rough walls, the



One of the Company's Mining Tanks.

ensilage cannot settle properly. This causes air-pockets, resulting in spoilage. A "Toronto" Silo is built of 2" x 6" Double Tongued and Grooved Spruce—held together by 5/8" to 3/4" Wrought Iron Hoops with Malleable Lugs. A "Toronto" Silo will, therefore, stand the strain of wind and storm from the outside, as well as the immense pressure on the inside, for many years.

Steel Tower Flagstaff.

The Company is noted for its flagstaffs. The Toronto Steel Tower Flagstaffs follow the same type of construction as the towers used in connection with the Toronto Windmills. They are galvanized throughout, and will stand up against the strongest winds when properly erected and anchored. The Corners are made from 2½" x 2½" x ⅛" angle steel. The Braces are round, 5-16" diameter, and are adjustable. The Girts are 1¼" x 1¼" x ⅛" angle steel. The Pipe Staff extends 30 feet above top of tower, which allows plenty of space for flag.

THE YIELD OF OIL SHALES.

Chemists who have had occasion to report the results of assays of oil shale will probably be interested in the Alignment Chart which has just been published by the U. S. Bureau of Mines. This Chart, prepared by M. J. Gavin, L. C. Karrick and J. J. Jakowsky, gives in simple form the relations between the weight and volume of shale and shale oil. By the use of the Chart, it is easily possible to determine the yield of oil in gallons per ton of shale when the actual laboratory results are in terms of grams, ounces, or cubic centimeters. The whole operation consists of connecting two points on the Chart by means of a straight line and reading the desired result without further calculation.

Copies of the Alignment Chart for Determining Oil Yields in Assaying Oil Shale may be obtained free by applying to the Director, Bureau of Mines, Washington, D.C.

BRITISH GEOLOGICAL SURVEY CHANGES IN PERSONNEL.

The Summary of Progress of the Geological Survey of Great Britain and the Museum of Practical Geology for 1920 has just been issued.

In his introduction, Dr. J. S. Flett, M.A., D.Sc., LL.D., F.R.S., the Director, states that during the year 1920 changes on the staff of the Geological Survey were exceptionally numerous and important. In July Sir Aubrey Strahan, Director, and Mr. G. W. Lamplugh, Assistant Director (for England and Wales) retired after completing their service; Dr. Flett (Assistant Director for Scotland) was appointed Director, and Mr. J. Allen Howe (Curator of the Museum) became Assistant Director in Mr. Lamplugh's place. Dr. Walcot Gibson was promoted Assistant Director for Scotland, in succession to Dr. Flett. Dr. McLintock, of the Royal Scottish Museum, was appointed to succeed Mr. Allen Howe as Curator, but did not take up his duties before the close of the year. The staff was expanded by the appointment of six geologists, and Mr. Henry Dewey and Mr. Bernard Smith were appointed district geologists.

BOOK REVIEWS.

Oil Field Practice, by Dorsey Hager.

This little book, published in New York by McGraw Hill Book Co., contains information concerning American methods of developing oil properties. It deals with development of properties, production, transportation, wastes and losses, refining and valuation of properties. It is well written and amply illustrated and should prove serviceable. Mr. Hager is the author of the companion book "Practical Oil Geology," which has had a good reception.

A. S. T. M. Testing Standards.

We have received a copy of the 1921 edition of the Book of A. S. T. M. Tentative Standards, issued annually. This volume has just come off the press, comprises 518 pages, and contains 127 Tentative Standards as follows:

12 relating to Steel, Wrought and Cast Iron; 10 relating to Non-Ferrous Metals; 25 relating to Cement, Lime Gypsum and Clay Products; 12 relating to Preservative Coatings; 12 relating to Petroleum Products and Lubricants; 28 relating to Road Materials; 2 relating to Coal and Coke; 4 relating to Waterproofing; 4 relating to Insulating Materials; 4 relating to Shipping Containers; 10 relating to Rubber Products, 3 relating to Textile Materials; 3 relating to Miscellaneous.

By way of explanation, it should be said that the term "Tentative Standard" as distinguished from "Standard" is applied to a proposed standard which is printed for one or more years with a view of eliciting criticism, of which the committee concerned will take due cognizance before recommending final action toward the adoption of such tentative standards by formal action of the Society.

Those readers of the Mining Journal who are interested in engineering materials will find this publication of very considerable value.

Northern Ontario Letter

THE SILVER MINES.

In spite of the high quotations for silver, the production of metal from the Cobalt mines is not likely to increase before next spring. The Coniagas will be obliged to slow down to some extent during the winter, owing to the fact that it will be impossible to continue the re-treatment of sands during the cold weather. Mining and milling operations on ore from the mine, however, will continue unremittingly throughout the winter. A number of the closed down mines could operate profitably under present conditions, but would be under heavy expense were they to re-open at this season. Accordingly, it would appear as though general activity may be deferred until next spring.

Geological Studies at Cobalt.

Mr. Cyril Knight is completing a re-survey of the geology of the Cobalt field, this being the second year of work. It is understood the Ontario Department of Mines is desirous of completing the work this year, and Mr. Knight is working with this end in view. In the meantime, property owners are awaiting completion of the work, having in mind that a study of the report and map may be of value. It is generally admitted that a thorough study of geological structure is vital to successful mining, and with this in mind and knowing that the report will be the most complete ever compiled in connection with Cobalt, those owning property in close proximity to the producing mines are anxiously awaiting the time when the details may be made public.

Oxford Cobalt.

The shaft on the Oxford-Cobalt has reached a depth of 70 feet at which point the contact between the Keewatin formation with the underlying diabase has been penetrated. The vein is strong at this horizon and contains heavy cobalt mineralization. A feature of the composition of the vein is the presence of a small amount of quartz in which native gold is visible in small quantities.

Aladdin-Cobalt.

Work has been suspended on the Chambers-Ferland mine of the Aladdin-Cobalt Company. The reason for curtailment has not been officially announced, but it is understood to be the intention of the management to leave the mine closed for some time. All the employees were laid off this week with the exception of three.

The Aladdin has operated only on a limited scale during recent years, and is one of the companies which entered into the merger with the Tough-Oakes and Burnside Mine in what is now known as the Kirkland Lake Proprietary (1919) Ltd.

Nipissing.

The favorable developments on the new vein which was found in August on the Nipissing, and which has since developed into one of the more promising ore carriers on the mine, is being pointed to by the more optimistic as further evidence of what they claim to be a fact that some of the better known areas in the Cobalt field are as yet undeveloped and lie as an assurance of important mining activity for many years to come. The orebody lies in territory which is comparatively virgin and is in close proximity to other veins of promise which have not yet been extensively developed.

South Lorrain.

Unofficial reports from South Lorrain carry the information that a second high-grade ore shoot has been opened up at the 435-ft. level. Details of the find are lacking at the time of writing, but the vein is said to be several inches in width and containing wire silver and argentite. The mine is now a steady producer of high-grade ore as well as concentrates from the steady operation of its mill, while the physical condition of the property is stated to be the best in the country's history. The Keeley is controlled by the Associated Gold Mines of Western Australia, together with the firm of Ehrlich and Hamilton, London, England.

September Ore Shipments.

According to the regular monthly statement issued by Arthur A. Cole, mining engineer for the T. and N. O. Railway, there were 230.36 tons of silver ore shipped over the line from the silver mines of Cobalt and South Lorrain during the month of September.

The O'Brien was the heaviest shipper, with 71 tons, as shown in the following summary:—

Company	Tons.
Bailey Silver Mines	42.00
Coniagas Mines	43.55
Hudson Bay Mines	31.82
O'Brien Mines	71.00
Keeley Silver Mines	41.89
Total	230.26

A feature of the month's shipments was that half the ore went to the United States, the division being 112.89 tons to Canadian and 117.37 tons to United States Smelters.

During the period, the price of silver was at its lowest on Sept. 1st, being quoted at 62.500 cents an ounce on that date. It reached its highest mark on Sept. 27th, being quoted at 71.625, the average for the month being 66.150 cents.

Will Prospect in Quebec.

With a view toward looking into the possibilities of that area lying in the province of Quebec, lying to the east of Lake Temiskaming directly opposite the South Lorrain district, a syndicate is being formed in North Bay for the purpose of staking out claims in such parts of the district as are known to have favorable geology. The construction of an extension of the C.P.R. from Kipawa to Des Quinze has provided incentive to prospect this area in which it is known that diabase, conglomerate and keewatin formation occurs in certain areas. These comprising the syndicate are pointing to the similarity of the geological structure to that in Cobalt as well as South Lorrain.

Hudson Bay Mines.

According to the annual statement of the Hudson Bay Mines, Ltd., the company spent $37,765.50 during the fiscal year ended August 31st and realized an income of $17,418.10, thereby showing a loss of $20,347.10 on the year's operations.

During the period, bonds were issued for $35,000 which, with other liabilities and accrued interest amounts to $43,000 current liabilities. The loss and gain account shows a balance at credit of $96,591.31 after deducting the loss of the year under review.

The assets include $19,000 in bills receivable, $4,877.21 in accounts receivable, with $2,660.30 in ore at smelter and bagged at the mine. Outside such assets as

mine, mill and so on, as well as property at Gowganda and Kirkland Lake, the following investments are held:—Bonds in the Dome Lake Mining and Milling Company with accrued interest, $34,112.50; stock in the Dome Lake, $318,909.57, and stock in the Kirkland-Hudson amounting to $44,000.

The report shows that broken and blocked out ore in the old Hudson Bay mine amounts to 4,896 tons, estimated to contain about 48,960 ounces of silver. No estimate is made of a limited amount of low grade ore in the dumps or tailings.

Optimistic reference is made in regard to the company's property in the Kirkland Lake district and the directors express the belief that this may in due course be made to perpetuate the profitable existence of the Hudson Bay Company.

Peterson Lake.

A scheme has been decided upon by the Peterson Lake whereby silver certificates totalling $100,000 are to be issued in note form, in denominations ranging from $100 upwards. The company is stated to owe approximately $40,000 and is desirous of paying off this indebtedness as well as financing the re-opening of the mill. Low grade ore and sand tailings are estimated to contain over one million ounces of silver, and the management believes this material could now be handled profitably.

THE GOLD MINES.

Hollinger.

The big feature in connection with gold mining in Northern Ontario is that the Hollinger Consolidated has eclipsed all past records and handled over 4,100 tons of ore in a single day. The average, of course, is somewhat below this figure.

Premier-Paymaster.

The installation of a mining plant has been completed on the Premier-Paymaster and general mining operations are under way with a force of 30 men. This number will be increased in the near future. The Paymaster is made up of the old Standard Mine as well as some adjoining claims, comprising a total of about 175 acres and lying in the township of Delora just a short way south-west of the Dome Mines. Former work on the property consisted of sinking to a depth of 200 feet and with upwards of one thousand feet of lateral work. A good deal of encouragement is reported to have been met with.

Porcupine Crown.

It has been reported on good authority that the Porcupine Crown mine mill likely be re-opened just as soon as the complications with the Thompson-Krist interests can be adjusted. The Porcupine Crown is threatening to take action against the Thompson-Krist for alleged default in its obligations as outlined in the terms of consolidation. In the meantime, a meeting of the Thompson-Krist shareholders was held and an endeavor is to be made to have the matter adjusted.

Triplex.

Operators of the Triplex property, situated in the township of Shaw, are considering the question of making a small shipment of selected ore to the Ontario Government sampling plant at Cobalt.

Rochester.

Nothing of outstanding importance has so far been encountered by the Nipissing during the course of exploring the Rochester property by diamond drill. The property adjoins the Hollinger Consolidated on the north-west and has been under option to the Nipissing for $250,000 on the strength of its favorable location.

Power for Matachewan.

The question for development of hydro-electric power is a pivot around which interest in the Fort Matachewan district is swinging. Those in control of the chief water fall in the district, with which is identified Sutcliffe and Neelands of New Liskeard, are said to be prepared to proceed with development of energy provided they are assured of the cooperation of the mining interests. On the other hand, the Matachewan Gold Mines Company, which promises to be the leading mining operator in the district has adopted the attitude of desiring to develop hydro-electric energy on its own account.

Reports were recently in circulation that those who held the right to develop power were about to relinquish their hold, but these reports proved to be in error. Now, however, comes a report that the Matachewan Gold Mines Company has applied for the right to develop a small water power in the district. This power has been surveyed and is said to be sufficiently large to supply energy for the mine during its early stages of development, and the project may be commenced at an early date.

Porcupine V. N. T.

Some of the largest base metal mine operators in the world have representatives in the gold mining districts of Northern Ontario, with their attention directed particularly to the Porcupine and the Kirkland Lake districts.

These interests are especially desirous to secure gold mining property upon which the pioneer work has been done and which are in need of finances only to place them among the profit earners. Among these properties which one representative referred to with favor was the Porcupine V. N. T. where operations have been carried to a depth of 600 feet and with ore reserves variously estimated at around $1,000,000, and over half of which is of a grade which could be handled profitably even under the present high cost of operations. The property is equipped with a highly modern mining plant which is sufficiently powerful to carry work to a depth of 1,000 feet, as well as having a 100-ton mill. It is controlled in England, from where finances to resume work will perhaps not be forthcoming until next spring.

Kirkland Lake Output.

An output of upwards of $5,000 daily has been established by the producing mines of the Kirkland Lake district, and this rate is expected to be increased to about $8,000 every twenty-four hours before the end of the coming year.

The mines with mills are:—The Wright-Hargreaves, Lake Shore, Teck-Hughes, Kirkland Lake Mining Co., Tough-Oakes and Ontario-Kirkland. The first four are producing, while the Ontario-Kirkland is expected to join the list before the end of this year with the Tough-Oakes likely to fall into line next spring.

Among the newer properties in the development stage and which present good prospects of figuring among the producers of the future are these:—Orr Gold Mines

Sylvanite, Bidgood, King-Kirkland, Hunton-Kirkland, Wood-Kirkland, Lebel Oro, Kitchener Kirkland, and so on.

Other properties of outstanding promise include such companies as the Granby-Kirkland, Lebel Lode, Moffatt-Hall, Fidelity, Goodfish Lake, Canadian Kirkland, etc.

Montreal-Kirkland.

At a meeting of the shareholders of the Montreal-Kirkland held recently in Montreal a by-law was passed which authorizes the sale of 75,000 treasury shares at 25 cent per share. It is the intention of the company to instal a mining plant and resume operations as quickly as possible. The property lies immediately adjacent to the Ontario-Kirkland on the south.

Argonaut Gold.

Reports are current that the Argonaut Gold has succeeded in selling a large block of treasury stock, in which case the company may be financed to complete its development program. The Argonaut has considerable ore blocked out, but the management is determined to have the property thoroughly developed before launching out upon a considerable campaign. Provided the report of successful financial arrangements is correct, the enterprise offers promise of being numbered among the producing mines during the coming year.

Will Drill Pinelle Property.

Arrangements have been made to diamond drill the Pinelle property, situated along the boundary of Lebel and Gauthier. Tenders for from 5,000 to 10,000 feet of diamond drilling are being called.

Associated Goldfields.

It is learned authoritatively by the Journal representative that Dr. Mackay, president of the Canadian Associated Goldfields, has taken over the Costello-Thighe as well as the Costello-Lucy claim in the Larder Lake district, on which properties some genuine encouragement has been met with on surface. Assays taken at outcrop show gold in commercial quantities over a good stoping width, according to authentic advice. The result of underground work will determine whether or not these values are uniform.

British Columbia Letter

Zinc Production Increased.

Victoria, B.C.: The announcement that the zinc production of the Trail Smelter, Canadian Consolidated Mining & Smelting Co. this year will be the largest in the history of the plant has been received with much interest in British Columbia mining circles. The output is said to be nearly 50 per cent above that of last year. A market has been found in the Orient, important shipments having been made to the East recently thus relieving surplus stock situation.

Improvement in Copper.

Improvement in copper market conditions has made the mining situation in British Columbia much brighter. There are a number of important projects in view, which are likely to assume definite shape as soon as it is assured that better times have come to stay. A large concentrating plant is proposed for Anyox, the smelting centre of the Granby Consolidated Mining & Smelting Co. There is the new mill of the Britannia Mining & Smelting Co., Britannia Beach, as well as the proposed new mills at the Sunloch and Old Sport Mines, Vancouver Island, to be constructed by the Consolidated Mining & Smelting Co. Ltd. Besides, there is no doubt that operations will be renewed on a substantial scale at the Copper Mountain Mine, Princeton, while the Iron Mask at Kamloops and many similar properties now idle will become active.

Changes Probable in Taxation.

Coincident with the present revival of all phases of mining in the Province is the effort being made by Operators to induce the Government to reduce its present system of taxing the industry. Reference already has been made to this movement, but it may be added that, within the past few days, a further delegation headed by Mr. J. J. Warren, President of the Canadian Consolidated Mining & Smelting Co. Ltd., has waited upon the Provincial Government and advanced strong arguments in support of their position in regard to taxation. While it is impossible to say at the moment what the outcome will be, there is no doubt that the authorities are disposed to be friendly and to look with favor upon at least some of the recommendations made. There is a possibility, therefore, that changes of importance may be provided for during the present Session of the Provincial Legislature.

That the mining industry must bear its fair share of the financial burden of the country is the principle upon which both Government and the mining operators agree. In the past differences have arisen as to the just and equitable interpretation of the words "fair share". The Premier and the Minister of Mines and their Colleagues may be said, however, to be unanimous in the belief that it is of first importance that capital should be encouraged to invest in the mining industry of the Province, and that the surest way to obtain this result is the enactment of a taxation policy, not too heavy, capable of being easily understood, and easily administered and assured of permanency over a period of some years.

Moose and Last Chance.

Alice Arm, B.C.: A small crew of men is to be kept at work on the Moose Mine during the winter. Development will consist of cross-cutting the ledge in the lower tunnel. As ore bunkers have been built, other equipment installed, the property will be in good shape for the operations of next summer. The Last Chance Group is said to be showing up well. Ore has been traced on the surface for about 1000 ft., 300 ft. of stripping has been done on one point on the lead which shows the ore body to be about 70 ft. in width. The Last Chance joins the Moose Group.

Granby Bay Polytechnic.

Anyox, B.C.: There has recently been established at Anyox with the support and approval of the management of the Granby Consolidated Mining & Smelting Co. an Institution known as the Granby Bay Polytechnic. This will give an opportunity to the young people of that mining community to obtain a knowledge of mineralogy, metallurgy, etc. At the inaugural meeting Mr. H. S. Munro, General Manager of the Company gave the educational enterprise his unqualified endorsation.

Reno Gold Mines.

Nelson, B.C.: The Reno Gold Mines, Ltd. of Sheep Creek has been incorporated with a capital of one million dollars. The officers are: W. B. Pool, President

& General Manager; Thomas Kilpatrick, vice-president; Clarence Pool, traveller; James O'Shea, Secretary & Solicitor; Michael O'Donnell, Director and Superintendent of development work.

Rescue of Miners at Britannia Mine.

Britannia Beach, B.C.: L. C. Craig and Francis Patenaude miners entombed in the Britannia Mine for eight days, have been rescued. They were reached after gangs of men had worked continuously in six hour shifts, under conditions that were very trying and at times extremely perilous. The men had been without food, and their water was obtained from a trickle that was directed from the roof down a stick of timber. Notwithstanding the physical and nervous strain to which they had been subject, both men were found in fairly good condition. They were also able to walk from the mine with only slight assistance, and since have completely recovered their strength.

The Disaster at Britannia Beach.

Not many hours after these miners were brought to their homes a cloudburst occurred, and the little town of Britannia Beach suffered a disaster, the full extent of which in life and property has not yet been measured. The number of deaths has not yet been officially announced, but it will total at least 38, and some newspaper reports computed it around 50. The mining community of Britannia Beach is situated on Howe Sound at the base of the mountain in which is the mine of the Britannia Co. Near the summit of this mountain there is a dam with a capacity of five million cubic feet of water. When the contents of this reservoir were let loose, therefore, it meant that 150,000 tons of water fell a distance of 4000 feet directly upon the clustered homes of the Company's employees. No further explanation of the disastrous consequences need be made because the results of such a combination of circumstances must be clear to any intelligent person. The Britannia Company appears to have been pursued by an imp of ill fortune. In 1914 a huge rock slide wrought destruction, and more recently there was the fire that almost completely demolished the mill and other plant. Plans now are under way for the reconstruction of the latter, and the actual building was to have commenced very shortly. It will now be necessary to erect a new, not only plant and housing for the same, but homes for officials and workers.

Yukon Gold Production.

Vancouver, B.C.: The Dominion Assay Office receipts for the month of October were the largest for any month of the current year, amounting to nearly $400,000. The greater amount came from the Yukon, although that from British Columbia Camps was above double for the corresponding period of last year. The Yukon production is nearly 10 per cent over the corresponding month of last year. The total receipts are about $500,000 greater than was the case for the first eight months of 1920.

NEW DISCOVERY ON KENO HILL.

It is reported from Dawson that a rich new vein of silver ore has been discovered on Keno Hill by Mr. Bussey, who is in charge of work on claims now under bond to the Slate Creek Co.

MR. FORD MYSTIFIES.

During the recent visit of Mr. Ford to his iron ore property he was attracted by the old hoisting drums that were on the property and he ordered them shipped to Detroit, as he also did a gasoline engine that was purchased from the White Pine plant of Calumet & Hecla Copper Company. Another old relic that he wanted and purchased was the old air compressor at the Beaufort mine, located not far from the Imperial. It was installed at the Beaufort in 1882 and was second-hand when secured at that time. It was of five-drill capacity and when in operation could be heard as far as a flock of Ford tractors with mufflers lacking. Just what Mr. Ford wants with these old machines he did not state, but they were all being loaded on a car for shipment to him when we were at the mine this week. Evidently he has some idea as to what use he is going to make of them.

ACCIDENTS IN U.S. MINES.

Accidents in the year 1920 at all mines, quarries, coke-ovens and metallurgical plants (except iron-blast furnaces) in the United States caused the death of 2,973 employees and the injury of 206,000 others, according to the United States Bureau of Mines. In these industries 1,088,000 men were employed last year, who worked a total of 279,400,000 shifts, an average of 257 working days per man. Accident rates based upon a standard of 300 working days to the year show that for every thousand men employed 3.19 were killed and 221.25 were injured. For 1919 the corresponding rates were 3.63 killed and 219.33 injured. These figures do not take into account the large number of slight injuries causing a loss of time of less than one day.

BLAZED NEW TRAIL.

Dawson: Dr. W. E. Cockfield, Dominion geologist, who has been in the field in the Mayo district since early in the summer, arrived here on the Casca. He and his party spent the summer in geological work on Stand-To Mountain, Rambler Hill and Mount Cameron, and, starting the first of September, crossed the country blazing a trail from Mayo to the Pelly river. The doctor reports that the work on Stand-To, Rambler and Cameron included the mapping of each place and geological examinations, which will be reported in detail in the official geological publications. He will return from Dawson to Ottawa direct, and will put in the winter there working up his field notes and preparing his reports.

TORONTO COAL PRICES.

Toronto, 8th Nov.—There is little question about the fact that the situation in Toronto looks pretty bad for the coal men at the present, so far as bituminous coal is concerned. The price of slack is between $5.75 and $5.95, and that of lump from $7.00 to $7.25 a ton. In both cases the prices named are in Toronto in Canadian funds. But there is little demand. For the moment, the market is glutted, and, though the surplusage, due to circumstances indicated last week, is not relatively large, it is not being absorbed. In fact, one coal man in a very large way of business put the situation thus to the writer: "You can't give coal away in Toronto today." The market in the United States, it may be mentioned, is also very slow and soft. The present is a good time to buy, for with the cold weather coming along, prices will probably stiffen up a bit. But, at present, things are about as quiet in the bituminous coal line, as they could well be.

PERSONALS.

Mr. A. L. Parsons has been elected chairman and Mr. Ellis Thompson secretary of the Toronto Branch of the Canadian Institute of Mining and Metallurgy. The branch held two meetings during October and will hold a series of meetings during the winter months.

Mr. A. Young is in charge of explorations of the Burke property at Shiningtree.

President Schley of the Howe Sound Co. is at Britannia Beach making arrangements for the rebuilding of the town destroyed by flood. A new site will be chosen close to the old one.

Mr. Robert Mackay, a Toronto lawyer who died suddenly last week, was well known among the mining fraternity. He took an unusual interest in engineering projects, particularly in power development and distribution. He was an authority on mining law and several mining companies had his advice on legal matters.

Mr. Geo. Gray, manager of Canadian Associated Goldfields, was in Toronto last Saturday.

Mr. Arthur W. Jenks is examining mining properties in Northern Ontario.

Mr. C. B. Smith of Rossland has been visiting his old home in Michigan.

Mr. J. L. Agnew of Copper Cliff is in New York for a few days.

EDITORIAL

PROSPECTORS AND PROPERTIES.

Last week, in connection with the question of the tariff in its relation to the mining industry, we took occasion to emphasize the absolute necessity, in the national interest, of an enhanced development of our natural resources. We pointed out that, of such natural resources, Canada's mineral resources form a unit of great and increasing importance, by reason alike of their present position and of their future potentialities. And we gave it as our own view, in connection with the framing of a tariff in relation to mining machinery and machine parts, that every encouragement possible should be afforded the mining operators, but not at the expense of manufacturing industries already established and endeavoring to serve the country well.

In short, it is our opinion that it is possible, and would be found practicable in a tariff wisely and understandingly framed, to provide for duty-free importation of such mining machinery and machine parts as are not manufactured in this country, without working any hardship to manufacturers of mining machinery already in existence or diminishing their profits in the lines they are handling. Such duty-free importation as this would unquestionably tend to increase mineral production. And anything that tends to that end, without adversely affecting other legitimate interests, is, in the highest degree, desirable.

In this connection, we may mention another matter which is, possibly, not without a substantial bearing on this important question of increased mineral production. In Canada, and certainly not least in Northern Ontario, the mineral-bearing lands present singularly rich, if not almost illimitable, possibilities. But there is urgent need of their development on an ample and adequate scale. Anything that tends to retard such development necessarily hinders that increase in mineral production which, it is agreed on all hands, is so eminently desirable. Now, the question arises. Are prospectors doing what they should do to advance the progress of our mineral-bearing areas? Or are they, on the contrary, assuming an attitude calculated to hinder, rather than to hasten, the development of our mineral resources on a fit and proper scale?

The other day, a New Yorker, said to be well known in mining circles on both sides of the line, visited the gold-bearing areas of Northern Ontario, and subsequently, stopping off at Toronto, on his way home, gave expression to his impressions of what he had seen in the North. He was, naturally, very enthusiastic as to the future of Ontario's gold-bearing lands, and particularly of those in Porcupine and Kirkland Lake districts. But he was certainly the very reverse of enthusiastic with regard to the figures that prospectors are asking for their claims. "To my mind," he said, "the chief obstacle to a gold boom in the Dominion, the like of which has rarely been seen in the world before, lies in the ridiculous figures that are being placed upon properties in the north country by the prospectors. One of them offered me a parcel of land comprising four claims for the small sum of $675,000, and told me that if I would not buy it at that figure he knew where he could find another, and an anxious, purchaser. Now, a man like that has lost all his ideas of value. But he was not by any means alone in his extravagant notions. Most of the prospectors around Kirkland Lake are fit candidates for Matawan, and until their proposals are infused with more elements of sanity the progress of your north country will be permanently retarded."

Now, to this question, and to others, there is more than one side. No doubt, some prospectors do ask exorbitant figures for claims—although, by a sort of "custom of the country", the initial figure asked is not always—is, in fact, perhaps, rarely—the figure at which a deal is actually closed. The prospector knows full well that, whatever figure he asks for his claim, the attempt will invariably be made to beat him down. Consequently, in naming a figure, he makes allowance, be the same more or less, for the beating-down process. On the other hand

there are promoters who want to acquire prospectors' holdings at almost a nominal figure. Their idea of the equity of things is that they should get all the fat and the prospectors a very diminutive slice of the lean.

Nobody can be more alive than we are ourselves to the patent and obvious fact that capital is greatly needed both for the development of properties upon which no work has been done hitherto, and also for the more complete development of properties upon which work is now under way. Nor are we ever inclined to be unmindful of the risk and uncertainty which, in practically every mining venture, necessarily attach to the development stages. But it must be remembered that all the risk and uncertainty does not fall to the promoter. The prospector has his share. It may be that, in a figure which, at first sight, may seem high, and even unreasonably high, in comparison with the work which he has done on the property in question. But, very possibly, the prospector has spent years of effort on other claims which have turned out devoid of promise. Those fruitless labors have to be taken into account when he is fixing his price for a property which affords a good prospect of turning out to be a really good thing.

In a word, these must be present the spirit of "give-and-take" in the relations between prospector and promoter. An irrational, "dog-in-the-manger" attitude on the part of either is certainly inimical to that speedy development of our mining areas and that rapid progress of our mining industry to which it is to the best interests of both to contribute.

A MILL FOR SMALL MINES.

In an article on methods of treating gold ore on the Rand, Mr. G. A. Denny and Mr. T. S. Denny, suggest in the "Mining Journal", that a combined ball and pebble mill may prove feasible for treating ore at small mines.

Their investigations satisfy them that tube mills can be advantageously used for both coarse and fine grinding, and that one tube mill, divided by a partition and loaded, in one part with large grinding balls, and in the other with pebbles or their equivalent, would do the work of crusher, stamp mill and fine grinder. By circulating cyanide solution through the mill it becomes also a cyanide plant. Such a mill could be fed with ore up to 5 inch cubes.

The writers claim that while all this sounds fantastic it is quite feasible. Means for separating and washing the pulp free from gold-containing cyanide solution would have to be provided.

In the interests of gold mining it is to be hoped that machinery will be devised that will permit the operation of small properties, without the necessity of the heavy outlay for plant that is now required. More attention is needed to be given to the problem of making gold properties productive on a small scale, while the possibilities of operating on a very large scale are being determined. We frequently have enquiries concerning some such machine as is suggested by Denny Brothers, and there can be little doubt that the perfecting of such a device would help the growth of the gold mining industry in Canada.

STAMPS IN FAVOR OF THE RAND.

While there are metallurgists who consider that the stamp mill is to be forced out of a place in the treatment of gold ore, it is worth noting that stamps are still being used at all the gold mines on the Rand, and that they are in recently built mills as well as in the older ones. Stamps have done such good service on the Rand that advocates of other methods of crushing gold ore have not been easily able to convince the operators that they could save money by installing other machinery in place of the stamps. In Ontario it has been not so difficult for the ball mill manufacturers to bring their machines into favor.

THE POWER SITUATION.

Our Cobalt correspondent, on another page, deals with some features of the power situation at Porcupine. He attributes the long delay on the part of the Ontario Government to the fact that there are conflicting interests. He intimates also that a possible cause for lack of progress in providing power is the doubt on the part of the power company as to what the mining companies are going to do.

That there are conflicting interests is no excuse for inaction. Careful consideration is necessary because of the conflicts of interest, but there is, as yet, little evidence that the attention necessary is being given to the problem. If the importance of providing more power for the mines were appreciated by the Government, there would have been some progress made in the matter by this time. An active leadership is required to get the different interested parties working together on a northern development plan.

In connection with this subject, the Northern Miner, of the 12th instant, after stating that there would be no power shortage this winter at Porcupine, goes on to ask: "But how about the future? Suppose that before next winter rolls around the three main mines have added to their power usage by 50 per cent. Suppose that instead of three customers, as at present, the company has six or seven big takers of energy, something not at all improbable. What is the Power Company going to do?

"The Power Company to that question will say: If Hollinger goes off by itself and develops its own energy, leaving us with 50 per cent. of our power on our hands, why should we or the lesser mines worry about the future. We will have all the power they want; and it would be foolish for us to spend money on new dams and powerhouses when our biggest customer threatens to leave us.

"McIntyre, which secured the power rights on the set of falls on Mattagami River, naturally hesitates to plunge into the expense of power development when there is a chance that it will be able to get all its needs

supplied from the private company's source. President Bickell is not going to throw his company into heavy power supply capital expenditures if these can be avoided.

"Therefore the whole situation at Porcupine appears to revolve around Hollinger.

"It is pretty hard to find the answer. Porcupine mining men should be spared censure if they venture to surmise that the suit, involving several hundred thousand dollars, that Hollinger brought against the power company alleging that damages were sustained through the power shortage last winter, is not a factor in to-day's situation at Porcupine and that neither side is asleep as to the possibilities."

SCIENTISTS WILL MEET IN TORONTO.

At the invitation of the University of Toronto and the Royal Canadian Institute, the annual meeting of the American Association for the Advancement of Science is to be held this year in Toronto. This will bring to Canada, during Christmas week, a large number of scientists, and the exchange of ideas will, no doubt, be fruitful. The Association has become affiliated with many scientific societies and its interests are many; but in them all the object is the promotion of science.

The members of the Association have made many contributions to industry, and it may confidently be anticipated that the coming meeting will result in the dissemination of useful knowledge. Those engaged in mining will be particularly interested in the doings of the engineering and geology sections of the Association. All who attend such meetings find something instructive and interesting there, and it is an opportunity that should not be overlooked by any who can arrange to be present. The application of science to industry is not the special object of such meetings; but there are many members of the Association who are making contributions to industry by their scientific work. Some of the sessions will be found of much interest to those who are more concerned with the application of science than with the study of it.

The meetings of the Association are generally held in the larger American cities, and Canadians have seldom had the opportunity of attending a meeting in this country. It is to be hoped that the enterprise of those who are in charge of the Toronto meeting will bring together many Canadians scientists to meet the American scientists.

EDITORIAL NOTES.

Wright-Hargreaves Mines Ltd. has declared a dividend of five per cent payable January 1, 1922. The directors are to be congratulated on the success of their enterprise. We hope that the company will long continue to operate profitably. It has a good property, well equipped, it should do well.

That there will be some activity in the Goudreau gold area this winter is indicated by reports of arrangements being made for development of the Murphy property. Mr. C. E. Foster, who has taken up the property under option has been a pioneer in many Ontario mining districts.

The receipt of an order for rails for the Canadian National Railway has improved the situation of the steel mills in Nova Scotia and Ontario. The coal mining industry will also benefit in the case of the Nova Scotia companies.

The wage question in Nova Scotia has to be gone into carefully by employers and employed. It is to be expected that negotiations will find both sides ready to make some concessions in order to make business possible. As has been stated in England, "wages must be cut or there will be none to cut."

The October statement of Nipissing mining company should be pleasing to shareholders. The development work on the new vein had not such good results as during the previous month but, as the manager remarks, "it was satisfactory." The October output was valued at $258,768.

The Canadian Light Railway Company has announced that it will push the building of the railway to serve mining districts tributary to the Ontario Government Railway. This should soon help development of the area east of Swastika.

MOVEMENTS IN SILVER.

Messrs. Samuel Montagu and Co., of London, Eng., write, with reference to recent sharp movements in silver, in part as follows:—

Many would be glad to know the reason for these changes, which are not heralded by any warning. To gain it, we must look below the surface, and reach the speculative forces which sway silver and many other commodities, as well as the foreign exchanges. For some time past no stable ground has been under our feet in the world condition of affairs. On the whole some slight amelioration is taking place, but currency inflation, exaggerated prices for goods, and the legacy of under left by the war, afford great room for snatching profits—and also incurring losses—by gambling in any counters that are ready to hand. Among other commodities, silver has been selected for the purpose, and the fact that it governs, or is governed by the Far Eastern exchanges, renders it specially suitable; for it can be dealt in as a counterpoise to operations in the China exchange. Hence, given large unexpected sales or purchases upon a rather indifferent silver market, quick falls and rises in the price are only to be expected. Forecasts as to prices in the near future are therefore futile in the circumstances to which we have alluded. India seems for the time being to have ceased acquiring the metal, and competition between her and China is therefore absent, but there appear to be two classes connected with China holding diverse views, and not infrequently they operate here either on the same day or some day not far apart. To them is principally owing the irresolution of the market. At the same time silver is being actually shipped to China.

The Porcupine Power Controversy

(By J. A. McRAE).

Quite a controversy has developed with respect to the question of the development of hydro-electric energy for use in connection with mining operations in the Porcupine district.

It has been intimated by writers of mining news that the Ontario Government has not given the Hollinger Consolidated due encouragement to develop energy, and it has been stated that the Temiskaming and Northern Ontario Railway is unreasonable in making reservations of rights to develop energy in a certain section of the country "when the Government through the T. and N. O. Railway has neither the demand for such development nor the finances with which to carry it into execution."

The point is generally admitted that although there is at present sufficient power for industrial needs, yet so close is consumption to maximum generating capacity that new mining enterprise or proposed enlargements on the present operating mines must be held in abeyance pending the development of more energy. This is a serious situation, particularly at a time when it behooves all to encourage industrial progress where ever possible.

In regard to the T. and N. O. Railway's position, the writer interviewed Chairman George W. Lee. The chairman declared that the Commission is wishful to co-operate with the mining industry and is vitally interested in seeing maximum progress. He stated that the electrification of the entire Government-owned T. and N. O. Railway would eventually take place and that the reservations made for this purpose would not interfere in any way with the development of energy for industrial use. "You may be assured of this," said the Chairman, "that the T and N. O. Railway will encourage industry throughout the whole field which it serves, but, at the same time, will so conduct its affairs that when electrification takes place it will be through development of its own energy on its own account and not by paying enormous tolls to private power concerns."

This leaves the T. and N. O. Railway out of the controversy, in that the reservations made by the Government for electrification purposes are at a point from where the mines would probably not develop or draw energy at present even though permission were available.

The question, therefore, seems to simmer down to one in which the mining companies and the Northern Canada Power Company are concerned. There is the added possibility of a conflict of interests between the Hollinger Consolidated Gold Mines with the Abitibi Power and Paper Company in connection with the development of power on the Long Sault Rapids on the Abitibi River. If this conflict exists, it will probably require some little time to adjust, and, as is well known, the present Ontario Government has already tasted too much of the bitter sweet of arbitrary measures and may this time be pardoned for acting with due caution.

Relief is possible in the immediate vicinity of Porcupine, either through increased development on the part of the Northern Canada Power Company or through the development of Sturgeon Falls on the Mattagami River, the rights to harness which are held by the McIntyre-Porcupine.

Last week it was stated that the Northern Canada Power Company stands prepared to develop energy for the full demand of the producing mines of the Porcupine districts, but is unwilling to launch out into too expensive a program until being assured of securing the business of supplying the full requirements of the mines. This statement was misinterpreted in some circles as inferring that the power company was not certain that more power was needed. As to this, the correct interpretation is that the power company is afraid to spend a lot of money on power development until being assured that before such time as such development might be completed, one or another of the leading mining companies might decide to go ahead with power development on its own account, thereby leaving the private concern with a white elephant on its hands.

With these facts in minds, co-operation between mines and power company was urged. That is to say: The mining companies could secure a show down by placing all their cards on the table—secure from the power company a statement of how much energy they can develop and when. In the event of this being inadequate, the development of power through some other source would become a necessity.

NEW STRIKE AT KEELEY.

The other day, miners at the Keeley, in South Lorrain, while drifting on the Woods vein at the 400 foot level, broke into material of extraordinary richness, according to the Northern Miner. The ore is a foot in width and runs about fifty-fifty calcite and silver in spots. Reports are that the material is continuing. Four weeks ago they struck rich showings of wire silver, with argentite, at the junction of the Woods vein with another vein. This is directly below the new find on the 400, and in a winze at the 435 foot level. This has been worked on steadily, and is standing up. Both these finds are in the Keewatin, an undetermined distance from the contact.

ALPINE AMPLY FINANCED.

At the Alpine property in Gowganda $3,500 a month is being expended, says the Northern Miner, and the operation is at the present time the second largest in the camp. It is learned officially that the company has been financed lately with sufficient money to demonstrate the merits of the property. Chicago capital, from strong sources, has become interested.

The Alpine is equipped with a complete set of camps and other buildings. The plant is adequate for the scope of operations planned.

During the past summer most of the effort has been centred on opening up surface ore showings, and this work resulted in increasing the good chances of the company. The main vein has been traced for 900 feet and open cut for 400 feet. Other veins have been disclosed and worked. Values are reported as very satisfactory.

Previous work included a tunnel 600 feet in length. The company will prolong this tunnel now that surface work is over for the year, carrying it forward for the purpose of picking up and connecting the veins found on surface. This tunnel is now about 200 feet below surface.

Light in the Mine

Its Bearing on Accidents and Reduced Costs.

The mine casualty list is said to be on the up-grade during the present year. Moreover the economy in the use of stores is more pronounced than ever before on the mines of the Witwatersrand. Is it not just possible that there may be some connection between these two occurrences, that a two severe economy in the use of mine stores may conceivably lead to a heavier accident roll and as a consequence to an increase and not a decrease in the actual cost of mining? This is not by any means a plea for relaxation of control in the allotment of mine stores, nor for the issue of such stores, without full and careful inquiry as to the necessity for such issue. It is more particularly the purpose of this article to consider whether, in the desire to cut down mining costs it may not be possible to proceed too far in such a direction and thus to defeat the end in view. We have all heard of the man who tried a restrictive diet on his horse and what became of it. It may be equally useful to consider whether in the matter of illumination the desire for economy has not resulted in an addition to, and not a subtraction from, the costs of mining.

Given that the other things are equal, the better the light is the better is also the work performed. We all know that in fiery coal mines the need of safety lamps with their feeble lighting effects has resulted in the creation of a new industrial disease known as astygmatisis, affection of the eyes which prevents miners from following their occupations. It was proved in Great Britain that where mines changed over from open lights to locked lamps the accident rate was also raised and that the cost of mining was increased: this was conclusively proved by statistics published by the Home Office; and it also affected the rates of pay given for coal cutting, a higher price per ton being paid to the collier when using safety lamps than when using open lamps or candles, because it was found that the earning power of the miner was directly affected by the absence of light in his working face.

There has never been a thorough investigation into the minimum amount of light essential to safe and economical working of the Witwatersrand gold mines. It is scarcely too much to assert that the adequate lighting of the mine has not figured in any inquiry relative to working costs. In most cases the prominent factor has been how to reduce the consumption of candles and carbide so as to make an apparent reduction in cost of stores, and this without any reference to the vital bearing on costs of the absence of a sufficient amount of light throughout the mine.

We hear much about organisation as applied to the working of the Rand mines, but where is the organising power which takes no account of the lighting factor in mine costs? As an actual fact it does not exist. Each mine is a law unto itself so far as it arrangements for lighting are concerned. We know that a co-ordinated plan exists for the watering of the working faces, etc., in each mine, and as this is enforced by statute it may be assumed that it is fairly efficient. Lighting is in even a worse plight at present. Owing to the causes referred to above, i.e., the absence of statistical records on lighting efficiencies, the apparent conflict of good lighting with cost of working—it is only reflected at present in lower costs of candle and carbide—we have no evidence on record of the evils of our neglect of this matter. Indirectly, however, there is abundant evidence on the subject, and this of such a nature as to make the need of investigation a matter of urgency.

It would be very interesting to know, for instance, which mines are most and least economical in the consumption of candles and carbide. Coupled with this should be appended tables showing their relative accident records. Of course, one would necessarily allow for circumstances which would operate in favor of or against any such mine—such as age of mine, its general layout, the amount of electric light installed, and such like.

One fact, however, stands out unchallenged, and that is the supreme importance of adequate lighting as a necessity for efficiency.

How many daily cases of minor injuries are treated in the mine hospitals, entailing a smalll expenditure in materials and possibly in time lost by the native labourer or possibly the white man. This time lost is a real addition to working costs, since the person injured does no more work for the shift in most cases, and there is always the disruption of the routine work, if only for a few minutes, but which in the aggregate is a factor in the actual working cost of the mine. The native with his candle, or sometimes a half candle, is apt to overlook the element of danger due to his being unable to see clearly his surroundings. In the hammer gang he may have shattered and loosened rock above his head hidden from him in the darkness, his time is occupied with his task, the rock falls and he is injured more or less severely. The lashing boy cannot see clearly many yards around him, he himself is only a dim shadow to others. Without being in the least blameworthy, he may quite easily cause injury to himself or others through his being unable to see clearly the surrounding objects.

The tramming boy is very often the cause of injury to himself or others for the same reason. Coming along in the dark or with his candle throwing out a feeble beam, he is unable to see clearly what lies ahead of him. Usually he is lucky and pulls through, sometimes he is not; and then the resulting accident may incapacitate himself or others for a time. All these are routine cases which are considered inseparable from and incidental to mine work, and call for no comment from anyone, but are taken as a matter of course.

Inadequate light is further responsible for the fact of much time and labour being wasted in many directions owing to the need of concentrating several lamps or candles on an important piece of work, or perhaps because it is dangerous and light is essential to show a quick means of escape if needed. It is surely high time that special efforts were made to supply a better illuminant than the ordinary candle or carbide lamp. For one thing the extension of the arrangements already in force for lighting shaft bottoms, engine chambers, pump houses, and such like, should be extended very considerably. In some of the newer mines long stretches of main haulages are lighted, with manifest advantages to efficient working and comfort in travelling. What is wanted is the extension of the system to the working faces generally.

The cost need not be excessive in the first instance, and that is at any rate partly balanced by the saving in candles and carbide possible.

Cables could be run along the drives with coupling arrangements at convenient points from whence small cables coiled on drums to be worked by hand and with attachments on the cables at suitable intervals for lamps would radiate. These cables would be unwound at the commencement of the shift and be carried up through the stone face and connected where necessary. The lamps, suitably protected, would be attached, and in this way a flood of light could be obtained which would undoubtedly make for safety, comfort and efficiency of those workers concerned. If such a method were in operation there would certainly be a far better chance of detecting bad ground in the stopes and of minimising the risk of accidents due to the condition of semi-darkness of the workers. The working face could be examined more closely, likewise the hanging wall and the general state of the stope. If the miner were further furnished with an electric torch of suitable pattern, he would then be able to supplement the general examination of the working face by a particular examination of the hanging wall and thus, so far as is humanly possible, ensure the safety of himself and his gang. The drives would have sufficient lighting power to enable tramming to be carried on under the best possible conditions and with the least fear of accidents. Similarly with regard to the lashing, timbering and waste packing gangs. One must not omit the fact of better supervising results, since the officials and supervisors would each be so much better able to see exactly what the workers were doing.

Altogether we may assert that the advantages accruing from a proper and sufficient supply of light would not only offset the actual first increased cost of installing the system, but would enormously increase the comfort of the workers, improve their efficiency, better the supervision, and reduce the accident rate very materially. The result of such a combination of improvements would necessarily be a reduction of working costs in the mine, and this would be reflected in additions to the profits of mining and in an extension of the lives of the mines of the Rand with mutual benefits to the workers, the shareholders, and the community.

(W. H. Jones in the South African Mining and Engineering Journal).

HARDINGE COMPANY NOTES.

Mr. H. A. Kimber, formerly of the Quigley Furnace Specialties Co., is now in charge of the sales of the Quigley Pulverised Fuel Department of the Hardinge Company, 120 Broadway, New York, N.Y. This change was made owing to the acquirement by the Hardinge Company of the Pulverized Fuel Department of the Quigley Furnace Specialties Co.

Mr. L. W. Marso, who is in charge of the Branch office of the Quigley Furnace Specialties Co., located at 427 Oliver Building, Pittsburgh, Pa., has now become associated with the Hardinge Company, and will continue in the Pittsburgh office under the name of the Hardinge Company, but will specialize in the handling of the Quigley Pulverized Fuel Systems, which department has been acquired by the Hardinge Company from the Quigley Furnace Specialties Co.

Mr. O. M. Rau, formerly Consulting Engineer to the Philadelphia Rapid Transit Co., has now become associated with the Hardinge Company, and will specialize in the handling of Quigley Pulverized Fuel Systems as applied to boilers. This change took place with the acquirement by the Hardinge Company of the Quigley Pulverized Fuel Department of the Quigley Furnace Specialties Co.

Mr. W. O. Renkin has become associated with the Hardinge Company, in the capacity of Managing Engineer of the Quigley Pulverized Fuel Department, since this Department of the Quigley Furnace Specialties Co. has been acquired by the Hardinge Company.

PROPOSED CHANGES IN B.C. MINING LAW.

Present indications are that there will not be any legislation of great importance in its relation to the mining industry before the Session of the Provincial Legislature now in progress. There is a possibility that in the general adjustment of taxation, a problem with which the legislators are to be faced very shortly, some action will be taken with regard to mining. Even this, however, is but speculation and will come only if the Mine Operators are able to impress the Government with the necessity of relieving them of some of the burden which, they claim, threatens to seriously hamper development.

Both the Mineral Act and the Placer Act are to be opened, but only for amendments of minor interest The purpose in connection with these Statutes apparently is to make provision for the re-alignment of the boundaries of some of the Mining Divisions of the Province. Section 112 of the Mineral Act is to be made so as to read as to give the Lieut-Governor-in-Council power "to constitute any part of the Province a mining division and declare by what local name it shall be known, and may establish therein a Mining Recorder's Office, and may from time to time extend, reduce, sub-divide, or annul any existing mining division or merge it in whole or in part in the consolidation of two or more mining divisions." No doubt has existed of the power to create new divisions, but this will give authority specifically to annul present divisions and to merge annulled divisions with others. Section 114 sets out the procedure that shall be followed with reference to records and documents in the charge of officials of a division when it annulled or merged. The Placer Act is to be altered in the same manner, the idea clearly being to make the law apply similarly both in respect of placer and lode mining, where it was deemed expedient to alter existing mining divisions.

The Toronto branch of the Association of Women of the Mining Industry of Canada will meet at Mrs. J. B. Tyrrell's residence on Wednesday Nov. 16. Mrs. E. V. Neelands will give an address on "South America."

A list of metal mines in Canada has been published by the Mines Branch, Department of Mines, Ottawa.

The Salmon River Area, B.C. and an area east of Lake Nipigon, Ont., have been geologically mapped by the Department of Mines, Ottawa. These maps are now ready for distribution.

The International Nickel Co. of Canada Ltd.

An Outstanding Concern Which, With its Mining Smelting and Refining Division, Supplies, Among Other Products Nickel, a Metal of Which Canada Possesses Almost a Monopoly.

By A. R. R. JONES.

The International Nickel Company of Canada, Ltd., supplies, among other products a refined metal—nickel—of which Canada possesses almost a monopoly. It has three main divisions. There is its mining and smelting division; its refining division, and its sales department. The last-named is situated in Toronto, in the Harbor Commission Building, where the head offices of the Company are also located. In fact, the Company occupies the whole of the fourth floor of that large building, and exceptionally handsome and spacious its offices are. The present method of distribution by the Company is, at present, entirely through this sales department. It handles nickel and nickel products, including Monel Metal, in the forms of sheets and rods and shot and nickel salts.

The officers of the International Nickel Company of Canada, Ltd., are as follows: Mr. Arthur D. Miles, president; Mr. John Agnew, vice-president and general manager; Mr. George E. Silvester, assistant to the president; Mr. Britton Osler, secretary; Mr. F. P. Bernhard, auditor; Mr. C. A. Richardson, sales manager; Mr. J. C. Nicholls, general superintendent at Copper Cliff; and Mr. John More, general manager at Port Colborne. When the Company is operating at its full strength, the employees in the mining and smelting division at Copper Cliff number around 3,500 and those in the refinery at Port Colborne about 750.

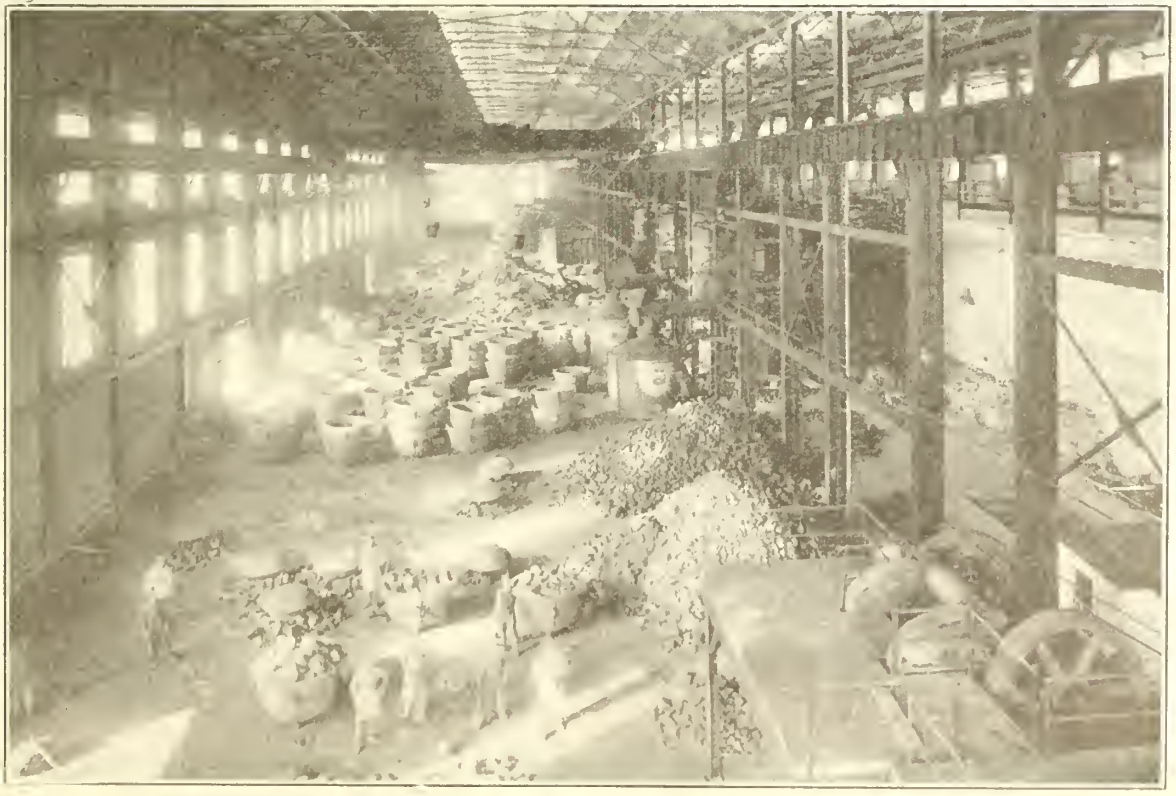
Monel Metal and Its Uses.

The outlook for the nickel business at present depends, perforce, very largely on the resumption of activity in the steel industry. It is, of course, common knowledge that, for nearly a year now, the steel industry in this country has been in a very listless condition. Largely this depression is attributable to the fact that transportation charges are nearly double, fuel costs more than double, and building trades labor costs double the charges under those respective heads before the war. Happily, there are some indications that the steel industry is about to brisk up.

Nickel steel is much used in automobile construction and also in marine machinery on account of the large reduction of weight in which its use results, as compared with the use of steel.

But one feature in connection with the Company's business, which makes for brighter prospects at the moment, is the business that it does in Monel Metal. For this is not used in conjunction with steel but by itself. It constitutes, in fact, one of the most important uses of nickel. There are very many ways in which it can be used to great advantage. For one thing, it can, in many cases, replace steel and bronzes. Indeed, it compares favorably in price with the higher grades of bronzes, and, though its cost may be higher than that of some grades, yet it possesses certain properties, such as that of non-corrodibility, that they lack.

Among the many uses to which Monel Metal is put may be mentioned the following; for parts of power plants; of gas and oil engines; of mining equipment; of dairy equipment; for storage battery casings; for meat slicing machines; for golf club heads; for parts of submarine torpedo and ordnance; for valve stems for high-pressure fire service; for general equipment, such



Cupola Furnace Building at the Refinery at Port Colborne, Ont.

as that of packing houses, which comes in contact with salt and brine; for refrigerating machinery and refrigerators; for laundry machine parts; and so forth. In fact its various uses are almost endless, and these the Company is steadily developing.

Early Days of Smelting Nickel.

The Company's mining and smelting division is, as has been stated above, at Copper Cliff in the Sudbury district of Ontario. In fact, until the advent of the Monel Company, which, in 1901, began to produce nickel in 1901, the Canadian Copper Company, which is the predecessor in title (so to speak) of the International Nickel Company of Canada, Ltd., and which is now amalgamated with the latter concern, was (with the exception of a few sporadic operations) the sole smelter of ores in the Sudbury district.

Thus the history of the nickel industry in Canada dates from the incorporation, in January 1886, of the Canadian Copper Company, now The International Nickel Company of Canada, Limited, by S. J. Ritchie of Akron, Ohio, and some business associates from Cleveland, Ohio. The original holdings were acquired by Mr. Ritchie in 1885 from prospectors who had been prompted in their search by exposure of ore in a rock cut at Murray Mine near Sudbury during the construction of the Canadian Pacific Railway then recently completed through that district. The early discoveries were taken up for copper only, the presence of nickel not being suspected, hence the inappropriate name—

The Company's Smelter at Copper Cliff, Ont.

"The Canadian Copper Company." In 1888, after a good deal of preliminary investigation, a smelting plant with one small blast furnace was designed and built at Copper Cliff by Dr. E. D. Peters who had been engaged as Manager. Dr. Peters had stated that a furnace to smelt 100 tons per day would be "enormous and unprecedented," and when asked later if he thought the smelter could be enlarged to treat 300 to 500 tons per day, said it might be done, but such large figures were very bewildering, as no plant in America was treating so much. It required comparatively little nickel at that time to swamp the entire world's markets, consumption being only about 1000 tons annually, and it was only with the development of nickel-steel and its adoption for armour plate by the United States Navy that The Canadian Copper Company began to get on its feet.

The Canadian Copper Company's operations continued to grow in spite of difficulties and disappointments, financial, metallurgical, mechanical and economic. The original (East) Smelter was enlarged from time to time until there were six furnaces, and further expansion on the original site was practically impossible. Then in 1899 the West Smelter was built. This was an up-to-date plant with eight furnaces, but still using the same type of small Herreshoff water-jackets, hand-fed and with hand-pushed matte buggies. Most of the slag had been granulated since 1891.

The Period of Rapid Development.

In the fall of 1891 a Bessemer Converter plant was built, and in 1900; the Ontario Smelting Works at Copper Cliff was put up by the Oxford Copper Company. Various mines were, from time to time, operated, and, in 1901, the construction of what is now known as the Algoma Eastern Railway, from Sudbury to Gertrude Mine, provided an opportunity to develop Creighton Mine, which soon proved to be a very extensive orebody. Then, in 1902, the International Nickel Company of Canada was formed. This combined, with certain other interests, the Canadian Copper Company, operating mines and smelter, and the just mentioned Oxford Company, operating the refinery, but the former Company, as indicated above, retained its name and identity until its amalgamation with the International Nickel Company of Canada, Ltd., in 1918. At this point, a period of rapid development, made possible by an ample supply of capital began.

The first step was the construction of a modern smelting plant on a new site, employing large units with everything possible operated mechanically. The Ontario Smelting Works was superseded by a Bessemer Converter plant adjoining the blast furnaces, using the latest type of acid copper throughout, for example, the use of alternating current for the operation of cranes and converters. This plant was blown in on July 20th, 1904. The first installation consisted of two blast furnaces 50" x 204", and three acid converter stands.

Creighton Mine.

Steam power was used at the smelter until the construction of the High Falls Hydro-Electric Plant, which was put into service in February, 1905, a thirty-mile transmission line having been completed to Copper Cliff, with branches to Creighton Mine and the newly opened Crean Hill Mine. Since that time everything at mines and smelter has been operated electrically, except railway transportation.

The present smelter since it began operations in 1904, has experienced a practically continuous programme of expansion and evolution to provide for increased production requirements and changes and improvements in smelting practice. The two blast furnaces have increased to eight, five of these being of the original length, one a quarter longer, and two a half longer.

The three acid converter stands became ten and then were shortly afterwards replaced by large basic converters of modified Peirce-Smith type, 37 ft. x 10 ft. The first of these was blown in in March, 1911. There are now six in service.

To take care of flue dust and excess ore fines a Reverberatory Plant was built in 1911 with two furnaces, 19 ft. x 112 ft., using pulverized coal for fuel. This was the first reverberatory installation of this kind, and has since been widely copied in copper practice.

The reverberatory plant includes four Wedge me-

chanical roasting furnaces with ball-mills for fine grinding.

The Roast Yards, which at one time formed three angles of a triangle surrounding Copper Cliff, much to the discomfort of the inhabitants, but which later were confined to one location about a mile from the town, and finally moved, in 1916, to a new site about nine miles west of Copper Cliff.

The Refinery at Port Colborne.

The refinery, as has been stated, is at Port Colborne, Ont., on the shore of Lake Erie, about twenty miles west of Buffalo. The site consists of 330 acres and has a frontage of about half a mile on Lake Erie. In all, there are thirty-one buildings of steel and brick construction. The design of the works provided for a complete power plant, a water-supply system, a separate sewerage scheme for storm water and sundry drainage, an electric-conduit distribution system for power and lighting and piping system for steam, oil and compressed air. The various units of the plant are served by both standard gauge and narrow-gauge railroad tracks. Railroad facilities are provided by the Grand Trunk Railway. Special attention has been paid to light, heating and ventilation, and the mechanical handling of material has been brought to a pitch of perfection. The plant was built at a cost of over $5,000,000.

The Company's Refinery at Port Colborne, Ont.

There is a hospital in a detached building. A staff house is provided for the employees, and a club-house for the accommodation of the unmarried men and executive heads. The club-house is admirably equipped for both residence and recreation, and the houses built by the Company are exceedingly attractive.

The Largest Process Building.

The largest process building is 76 feet long and 125 feet wide, and contains most of the heavy machinery and metallurgical equipment, among which are three cupolas, three reverbatory furnaces, two slag furnaces and three converters. Here the matte, received from the smelter at Copper Cliff, undergoes preliminary treatment. This matte, which consists of 55 per cent. nickel and 24 per cent. copper, is smelted with salt, cake, the nickel separated and the copper bessemerized in 84 by 126 inch Allis-Chalmers converters. One fifty-ton, one thirty-five ton, two twenty-ton and two five ton cranes are installed in this building, all of them having been built by the Dominion Bridge Company, Ltd., of Lachine, Que.

Among the other process buildings, are those used for the purposes of leaching and roasting. The leaching is carried out in a building 420 feet long by 90 feet wide. To facilitate the handling of the product between the leaching and roasting departments, these are connected by three overhead bridges. The building in which the roasting furnaces are installed is 380 feet long and 110 feet wide, and it has one clear span of 90 feet in which the ten mechanical and hand-calcining furnaces are installed.

The nickel-refining department is particularly admirable in arrangement and equipment. One part of this building is used for the storage of chemicals, etc., and contains a very perfect system of bins and measuring and weighing devices, for the preparation of furnace charges to go to the nickel-refining furnaces. These are located in the main portion of this building, and are of special design rendered necessary by the high temperature which exists under the operating conditions desirable.

The power plant is of the most approved power-house design. The main power-house boiler room contains for Babcock and Wilcox standard water-tube boilers, each of 4,319 square feet heating surface, set in two batteries. Two Babcock and Wilcox boilers of special design are installed for utilizing the waste heat from the reverbatory furnaces in the nickel refinery. They are built for an output of about 400 boiler-house power each, and are of the very latest design in this phase of engineering.

Turbines, generators and feed-water equipment are all the best word of perfection in their respective categories. The machine shop, so necessary an adjunct to a plant of this kind, is 200 feet long and 175 feet wide, and it also accommodates the forging equipment and a complete electrical repair shop. There are also a very complete carpenter shop and a cooperage.

At full capacity, the yearly production of the Port Colborne refinery consists of about 15,000,000 lbs. of nickel and 8,000,000 lbs. of copper.

U.S. SOFT COAL REDUCTION.

Production of soft coal in the United States, dropped back to 9,344,000 tons during the week ended November 5. In comparison with the week preceding, this was a decrease of 1,624,000 tons, or 15 per cent. Three factors entered into the decrease—the observance of All Saints Day, a reaction in demand following the settlement of the railroad controversy, and mine strikes in Indiana and elsewhere over the proposed discontinuance of the check-off. The relative importance of the three factors can hardly be determined until reports of operating time at the mines are received.

The impress of the three factors may be read in the following record of cars of coal loaded daily. Loadings on Tuesday, All Saints Day, were the lowest on any day of the week. Loadings on Monday were but 34,003 cars, compared with 38,832 on the preceding Monday, and the decrease of 4,829 cars measured the drop in orders which followed the news that the railroad strike had been averted. Yet hardly had consumers been relieved of apprehension over a stoppage of transportation when the news of strikes at the mines influenced them to place fresh orders with the producers. As a result, instead of decreasing as the week progressed, as usually happens, loadings increased steadily from Wednesday to Friday, the date on which the temporary check-off injunction was set aside.

Dr. W. F. Ferrier, who has been for some months in British Columbia, is at present in Toronto. He will return to the west shortly.

Schreiber Gold Deposits

Mr. T. L. Tanton, of the Geological Survey, says in a recent report on the Schreiber area:

The mineralized deposits in the Big Duck Lake district, Ontario, are of two distinct types which are probably genetically related. Those of type one are quartz veins, locally feldspar-bearing, and hence pegmatitic, carrying disseminated pyrite and small quantities of chalcopyrite and yielding upon assay low gold values. Native copper occurs near the surface in veins carrying chalcopyrite. Commonly there is a thin gossan, less than a foot deep at the surface of these deposits, but on one of the Longworth claims a highly pyritiferous vein has been weathered to a depth of 12 feet, and fine gold can be panned from the gossan. This is locally known as the Mud vein though it does not occur in a fault plane. These veins range from less than a foot to about 15 feet in width and their walls are fairly distinct, though a narrowed marginal zone of country rock is frequently found impregnated with quartz and pyrite. These deposits have the appearance of fissure fillings which have a minor amount or marginal replacements of country rock associated with them. Faults are very difficult to recognize in the regionally deformed schist complex and insufficient information is at hand to permit of any generalizations regarding the cause of the vein distribution, though evidence of faulting can be seen locally in connexion with certain viens. A vein on the Estelle property has been traced for 60 chains and other veins of this type apparently show a considerable degree of continuity, though much stripping would be necessary to expose this feature. The veins trend in various directions.

The second type of gold deposit is in carbonate replacement bodies. Part of the carbonate is pale grey, fine-grained calcite; this locally carries finely disseminated galena, zinc blende, chalcopyrite, pyrite, molybdenite, and gold. Enclosed in this material, lenticular masses of rusty weathering dolomite, from 6 inches to 2 yards in maximum diameter, occur, within which there are plicated streaks rich in bright green chlorite, mica, and serpentine. Barren quartz veinlets cut the assemblage. The shape and size of the carbonate bodies are irregular and variable in different localities. Lenticular masses having approximate diameters of 10 feet and 100 feet occur; and on the McCuaig property, where ore has been found, the carbonate body has been traced for 4 chains with widths varying from 3 feet to a few inches. The known carbonate bodies occur in a zone trending north 60 degrees east from the northern part of Little Duck lake to near the northwest part of Big Duck lake. In general these bodies have their longer dimensions parallel to the foliation of the sheared rocks and occur in sheared quartz porphyry, andesite, and along the contact between these rocks.

Near the top of a hill on Estelle claim, T.B. 1911, a mineralized quartz vein and a marginal calcite replacement body are exposed. The intimate relationship of the two typical deposits here indicates a close genetic relationship.

The origin of the gold-bearing solutions is not known. The igneous rock which appears to be most closely related to the gold deposits in time and place is the massive, pale pink, quartz porhyry. This rock is thought to be younger than the sheared, grey, quartz porphyry in which some of the replacement bodies lie.

Assays of gold to the value of over $1,000 to the ton are reported to have been obtained by Mr. W. S. Jackson from his claim, R 425, about 2 miles east of Schreiber. The mineralized veins in common with others developed farther east occur in the schist complex very close to the contact of the intrusive granitic batholith. The mineralized veins carry very little visible gold and average about one foot in width; they are well defined and occur as a nearly parallel series with certain additional cross veins. The extent of the high-grade ore in the deposits has not been determined.

No copper deposits of economic value are known in the district though copper minerals occur in deposits of at least three types: (1) chalcopyrite disseminated through quartz veins cutting the schist complex, the best known examples being on claims T.B. 2091 and T.B. 1911 and eastern extensions, in the Big Duck Lake district; (2) native copper in amygdules and veinlets in the Keweenawan lavas on the outer islands; and (3) chalcopyrite associated with lead and zinc minerals in quartz calcite veins cementing fissures and fault planes which formed in Keweenawan or post-Keweenawan time.

A great series of veins carrying copper, lead, zinc, and silver minerals, is now known to occur in a zone bordering the shore of lake Superior as far west as Pigeon river. In the opinion of the writer systematic prospecting should be carried on in the exposed veins of this type and an effort should be made, where feasible, to expose veins in fault zones of late Keweenawan age. In the writer's summary report of 1919 special mention was made of veins of this type and it was pointed out that new discoveries of silver ores may possibly be found analogous to those at Silver islet and along the north shore of Thunder bay. The mineral assemblage in veins of this type is remarkably similar over a large area, though the proportions of the constituents vary considerably even within short distances; the principal minerals are: galena, zinc blende, chalcopyrite, pyrite, and occasionally silver and argentite, together with quartz, amethyst, calcite, fluorite, and barite.

A number of mining claims have been staked with the apparent purpose of taking up for development veins of this type, but no work was in progress at the time of the writer's visit and no deposits of commercial value were seen. It is reported that a small amount of native silver was found near the surface in a vein on claim R 570, 1½ miles north of Pays Plat village; the occurrence of silver has been reported from two other localities to residents of the district, but from the available data on the location of these deposits the reports could not be verified. A trace of silver was found in the analysis of a sample from a narrow galena-bearing vein on lot 9, con. IV, Nipigon tp. Samples from several of the veins elsewhere in the district show no silver content upon assay. The greater part of the silver found in neighbouring areas has occured as recognizable silver ore; not carried by the galena or other minerals in the veins.

Mr. R. R. Rose is at Galetta, Ontario.

Mr. J. B. Tyrrell has been visiting gold properties in the Cariboo district, British Columbia.

Mr. C. J. F. Galloway is returning to England from Sarawak, Borneo.

HUDSON BAY REPORT.

The annual report of The Hudson Bay Mines, Limited, for the year ending August 31st, 1921, is now being sent to shareholders. The drop in silver's price hit the company hard and wiped out of its calculations the possibility of treatment of much low grade ore and old tailings. The investment in Dome Lake, the weak sister, and the loss on last year's operations, have made a big hole in Hudson Bay's liquid assets. During the year it was necessary to issue $35,000 in bonds.

The directors report in part as follows:

"Underground work at your Cobalt mine was carried on continuously from September 1st to April 11th, 1921, when it was deemed wise to stop further mining operations as no new discoveries of high grade had been made and the ore in sight was of too low grade to pay unless a marked increase took place in the price of silver. Mill operations were stopped on October 14th, 1920, in accordance with the recommendations of your Manager in last year's report. Costs in the winter months are considerably higher and it was necessary to allow time for underground development to place a supply of broken ore ahead for milling. The development and exploration work carried on throughout the winter did not develop anything of importance, but produced 6,000 tons of mill ore broken or blocked ready to break. It was decided to start the mill in August, 1921, in order to treat this ore before cold weather should render it more difficult and costly and the mill was started again on August 22nd, last. Reserves of broken and blocked out ore are estimated at 4,896 tons, containing 48,960 ounces. No estimate is made of ore in the dumps, tailings or probable ore left in the mine.

"The financial statement shows a total revenue of $17,418.40, and a total expenditure of $37,765.50. Against the balance of $20,347.10 carried to Loss and Gain account must be placed the value of 4,896 tons of ore developed.

"The amount necessarily expended in exploration of your property last winter was raised by a bond issue of $35,000, approved by the shareholders at a special general meeting called for that purpose on the 18th day of December, 1920.

"The Dome Lake Mining & Milling Company was idle throughout the year. Negotiations are at present being carried on by that Company with the adjoining West Dome company with a view to a possible amalgamation of the two properties and in the event of this consolidation being completed the properties would again be actively developed. Such an arrangement would facilitate the economic working of important ore bodies.

"The Kirkland-Hudson Bay Gold Mines was also inactive in the past year, but other neighboring developments in the camp have served to enhance the value of its properties in the opinion of your directors.

"No work was done on the company's properties at Gowganda or its other claims in the Kirkland Lake area.

"The directors hope that the coming year will be a successful one. It would appear that the ore in sight in your Cobalt property is of such low grade that without higher silver prices or lower costs with improved methods of treatment the working of this lower grade material will not be profitable. The directors consider the company's holdings in other fields to be very valuable and trust that future developments will lead to renewed prosperity for the company."

The Loss and Gain account shows a balance at credit of $96,591.31 after deducting the loss on last year's operations.

Current liabilities, including the bond issue of $35,000 and accrued interest, total $43,000.

Included in the assets of the company are bills receivable of $19,000, accounts receivable of $4,877.21 and ore at smelters and bagged at mine $2,660.30.

Outside such assets as mine and mill plant and buildings, and mining claims in Gowganda and Kirkland Lake are the following investments in other companies: Dome Lake bonds and accrued interest, $34,112.50; Dome Lake stock, $318,909.57; Kirkland-Hudson Bay Mines stock, $44,000.

The manager states in his report that the results of exploration and sampling carried on in the past year on the Cobalt property do not warrant further large expenditures in development unless a marked advance in the price of silver occurs. The present broken and developed ore, he says, can be milled at a profit, but under present conditions he would not recommend further work after it is used up.

BRITISH COLUMBIA NOTES.

Stewart, B.C.: All the towers in connection with aerial tramways of the Premier Mining Company have been completed and most of the work at the upper end has been done. At present operations are being pressed forward on the bunkers at the dock. Additional and better storage and shipping facilities are to be provided at tidewater. The construction of a train up the north fork of the Marmot River has been of much assistance to prospectors and claim holders in that district. The owners of the Idaho Group expect to ship some 20 tons before the Spring. They say that they have been driving along a shoot of high grade galena, carrying high values in silver. This has increased from a few inches to 18 inches in width and they expect to realize a good profit notwithstanding high transportation costs.

Trail, B. C.—Receipts of ore at the Trail Smelter of the Consolidated Mining & Smelting Co. from the 15th to the 21st of October totalled 7,964 tons, all of which came from the Company's mines. For the last ten days of October there were received 10,963 tons, or over 1,000 a day. Four well-known mines appear on the shipping list for the first time this year. The Rambler-Cariboo, which W. A. Cameron and associates are working under lease, is credited with 30 tons; the Utica, now operating after a long period of idleness, with 47 tons; the Silver Bell, Kaslo Creek, with 46 tons; and the Silver Standard, of New Hazelton, with 30 tons. Other contributing properties were the Josie, Rossland, 92 tons; Rosebery-Surprise, New Denver, 182 tons; and the Knob Hill, Republic, 217 tons. Company properties shipped 10,319 tons. The aggregate total of ore treated at the smelter up to the end of October approximates 337,201 tons.

Greenwood, B.C.—The stamp and mining machinery of the Lemon Mine, near Camp McKinney, have been shipped to the Emancipation Mine, near Hope.—It is reported that the Federal Group of Mineral Claims, situated a short distance north of the old Stemwinder Mine, is to be explored by diamond drill. An outfit in charge of Mr. Dan Lynch is on the ground prepared to start operations.

Vocational Training of Industrial Cripples

(The following paper, presented at the Annual Meeting of the Mining Society of Nova Scotia at Halifax, by Principal F. H. Sexton, of the Nova Scotia Technical College, and published in the Bulletin of the Canadian Institute of Mining and Metallurgy, should be of interest to the readers of the Canadian Mining Journal.—Ed. C. M. J.)

When our young men went overseas in the recent war to fight for their country, their parents, relatives, and friends were fearful that they would be killed or come back helpless and totally disabled. The last few hours before embarkation of the fighting units were always periods of terrific mental stress for mothers, wives, and sweethearts of the soldiers. There were strained faces, anxious hearts, and loving eyes, but no tears until the boys were well away out of sight. Were not these strong lusty youths going to pit the mere strength of their young bodies against the most terrible engines of destruction the fertile brains of man had been able to produce? With guns that could accurately place, within a radius of 15 miles, shells weighing a ton each and making a crater 150 feet across and 40 feet deep; with machine guns that spit a stream of bullets at the rate of 300 a minute; with poison gas so deadly that it needed only a few breaths to burn out a human life; wih darts and bullets and bombs from giant aeroplanes above, and high explosive placed by the ton beneath; with rifles, rifle grenades, hand bombs, trench mortars, flame throwers, high explosive and shrapnel shells, barbed wire entanglements, saw-tooth bayonets; with death lurking at the elbow in a thousand hideous forms every minute of the day and night—how could those at home expect aught but that their loved ones would be obliterated, or would return mangled, hopeless wrecks.

But what were the facts? Man's ingenuity developed cunning devices for his own protection against every form of danger. These artifices are now well known and are so effective that, on the basis of the number of men engaged, this war was practically no more deadly than those which had been fought previously under more primitive conditions. The percentage who were disabled by dread disease was even less than in some other notable struggles of nations. The number of those who were maimed by wounds was also kept down to the proportion prevailing in other wars, through the recent discoveries and advancements in medical and surgical science and practice.

The ordinary mother or wife does not usually hang trembling on the neck of the husband or son when he goes forth to his daily work unless she be inordinately fearful and he engaged in some extremely hazardous occupation, such as an oilwell shooter or a caisson worker. In the ordinary duties of life, however, an unrecognized amount of danger always lurks. During the four years of warfare, our army recorded about 55,000 deaths and 250,000 casualties. Among the people in peaceful pursuits here at home, where it seems as though everything possible has been done to protect human life, in that same period there were about 20,000 people killed and 250,000 injured by accidents. The numbers are truly appalling. It is only thirty times as dangerous to march against a foe under the terrific conditions of modern warfare as it is to pursue the peaceful art of ordinary living. One out of 1,200 of the people in this Province is killed by accident each year, and one out of every 110 is injured. And these are the figures of terrible waste which do not take into account such terrible catastrophes as the Halifax Explosion, which was probably a preventable accident due to criminal carelessness.

Preventable Fatalities.

The ordinary person has a vague notion that most of the deaths and injuries are caused by the swift machines controlled by men in organized industry, but this is not the case. Only a little over one-third of the accidents are associated with industry according to the records of the Workmen's Compensation Board. One-fifth of the accidental deaths occur among children under the age of fourteen.

These are figures that cause the most callous and selfish among us to pause and ponder. When we realize that three-quarters of the deaths and serious injuries in industry, and probably a greater proportion of the others are preventable, we do not wonder at the increasing activities of Safety Societies, Accident Prevention Associations, and other organizations of like nature. We will not blame the mother, either, if she clings longingly and affectionately to her husband when he starts out in the dim light of morning with his dinner pail, or if she seems to unduly prolong the caresses on her curly-headed boy before he trudges away from home with his school books. The definite organizations for the prevention of death and injury by accident began only twenty-five years ago, but they have already done an enormous amount of good in industry. The great need now is to extend them to include every human being who is old enough to talk.

The special stress of this paper will be laid upon one aspect of accidental injuries. If a man is killed, there is nothing to be done but to pay respect to his worth through a decent funeral and to provide some means of pensioning his dependents so that the family may be held together until the children are prepared to take their places as wage-earners. For every death by accident there are approximately thirteen injuries from like causes. One-half of these result in such disability that the worker is maimed for life or loses over a month of time from work. It may be said conservatively, that in Nova Scotia there are 750 people accidentally injured every year and are left crippled in such a way that they cannot return to their occupations and discharge their duties efficiently. Many of these lose heart and are permanently submerged in the daily struggle for existence by depending on intermittent charity or on a non-productive job as a watchman, gate tender, elevator-runner, etc.

What should be done with these men and women who are so maimed by accidents that they cannot go back to the occupation in which they were earning their living before their misfortune? Happily the answer is not far to seek. It comes out of the experience of this country in the civil re-establishment of its crippled soldiers.

The Analogy of War.

When our broken soldiers began to drift back from the second battle of Ypres through the English hospitals to convalescent homes in Canada, our whole country

feverishly tried to show her gratitude to these boy-heroes, who had so ably held our lines against the pick of the German army, attacking with the aid of a deadly new contrivance—poison gas. Of course, pensions were provided, because such reparation had been established in previous wars. This, however, did not seem wholly adequate. The facts that Crimean veterans had died in the English workhouses and that Canadians demobilized from the Boer war had sold their land-grant scrip for a few dollars hung tenaciously in all minds. In the present conflict, any reward that the country could afford and that would be a real benefit to the disabled soldier was considered as due him.

This attitude on the part of the public led to two great efforts to restore the crippled man as far as possible to his normal state of mind and physical efficiency. The first work attempted to bring back the man's confidence in himself and to re-establish habits of industry. No one who has gone through an experience which includes a serious surgical operation or long hospital treatment and a definite loss of physical power can at all appreciate the depths of despair to which the patient sinks in the long hours and days of convalescence. No one else can sympathize with the sloth of the mind and the timidity in facing actual life again which are acquired wth long 'hospitalization.' The ordinary and even the exceptional hospitals are institutions where physical ailments are treated only until the patient is fit to be transported to his own household. Nothing is done in connection with the person except to make the body repairs and to carry him along until he can complete the convalescence with his own family. Imagine, if you can, the perpetual horror of the ordinary, strong, independent mechanic when he recovers from a serious accident and is sent back among his dependents to look into the future with the idea that he will be unable to carry them along further, and may even be a drag on their efforts to support themselves.

With the disabled soldier, provisions were made from the start to restore him physically and mentally. Medical skill of the highest order used its every resource to bring him as far back to normal as was possible. Just as soon, however, as he was capable of receiving it, other agents began to build up his confidence in his power to still win success in the world in spite of his handicap. He was prevented from becoming morbid through long days and nights of gloomy introspection and dismal foreboding. He was given light, interesting work in various kinds of handicrafts while he still lay in bed. Through this activity, his mind was kept from brooding on himself, he renewed his interest in life, his self-confidence began to return, his creative instinct was satisfied, his mind maintained an objective altitude through work, and convalesced more rapidly than he would have otherwise. As soon as he could hobble about, various classes were provided for him in an annex to the hospital, where sympathetic, competent teachers helped him repair defects in his general education or started him in some kind of vocational instruction, leading to some occupation where his disability would be little or no handicap. The hospital retained him under its direction and care until no further treatment would benefit him. When he emerged from the hospital, he was an upstanding man, hopeful of the future and confident that he could fill some useful occupation and still maintain his position as an independent, self-respecting citizen.

He usually was not ready at once to enter commercial or industrial work as a man who could command a living wage and here functioned the second division of the work intended to make him capable of re-establishing himself. This was a new branch of humanitarian activity which came to be known as 'Industrial Re-training'.

If the soldier had been discharged finally from hospital treatment with a disability incurred through wounds or disease in military service, or an old disability aggravated by service, so that he could not return to his old occupation and perform his duties efficiently, he was entitled to be trained for a new occupation which he could follow with success. The method was to give him a short period of intensive vocational education so that he could take his place in industry where his handicap would not interfere with his ability to make a living. This education might be given in a special school, or partly in a school and partly in an industry, or wholly in an industry. Each case was treated in a different way and the individual needs satisfied as fully as possible by special consideration. Of course, the man and his dependents had to be maintained while this training was going on. They received enough money while he was learning so that they could live respectably. The amounts were graded according to the number of the man's dependants, and were varied from time to time according to the cost of living. During training the mind of the man and his family were relieved of anxiety so that he could put forth his full effort to learn the new trade.

The results of this method of preparing the disabled man to re-establish himself as a normal worker were surprising and gratifying. The efforts put forth by the disabled man were heroic in many cases. He struggled to adapt his remaining powers to the task before him. Nature seemed to help those who had suffered a physical loss by stimulating the remaining powers to a new degree of acuteness. It had been feared that the task of educating mature men would be more difficult than would have been the case with plastic youths, but this was not true. Under the pressure of necessity to make good for his own sake, and often for the sake of two to even six or eight dependents, the discharged soldier progressed amazingly. He had had some years of industrial experience before he enlisted and thus had a foundation on which to build. He was kept as close as possible to his former occupation so that the re-adjustment would be less difficult. If the man had the mental and personal capacity, he was trained for a job requiring more use of his intelligence and consequently less physical effort. Industry as organized at present offers a great many positions low in the scale on the staff of administration, direction, or control, and is continuously looking for suitable men to promote. Many of the disabled soldiers were lacking in general education for one reason or another, so that with these defects corrected and some technical training added they were able to be promoted to a higher rating than they had before they lost part of their physical power.

Comparatively Easy Task.

Modern industry has become so highly specialized and sub divided into occupations that it is a much easier task to select and prepare a disabled man for a new vocation than it would have been twenty years ago. Where formerly a boy learned a whole trade by apprenticeship for four to seven years with a master

workman, now a youth becomes proficient as an operator in one of the sub-divisions of the trade in a few months to a year, and earns a much higher wage than used to be paid to the thorough mechanic. Physical toil has been eliminated to a large extent by labor-saving machines so that there are infinitely better opportunities for a man with a physical disability to fit himself to work successfully at a gainful occupation.

All are more or less familiar with the splendid work that has been carried out in the industrial re-training of our crippled soldiers. Each man was carefully interviewed and all the facts ascertained about his education, his industrial history, his aptitudes, and his own wishes regarding a new trade. Our men were sensible and shrewd enough, so that generally they had formulated a sensible plan for their re-establishment. In many cases, however, they had formed wrong conceptions about certain occupations with which they were only casually acquainted. To them, as to most people, the "distant fields were ever green." As might be expected, a goodly number were looking for some "soft snap with easy money." They were patiently and wisely counselled by men who had a wide practical knowledge of various trades and who were thoroughly familiar with the physical and mental requirements of workers, and the prevailing rates of compensation in these various trades. As far as possible the injured men were kept in their old industry, and trained for occupations parallel with their former work, or for higher positions, if they seemed to possess the proper personal qualifications and were able to fulfill the demands.

The process of training was simple and practical. Where special educational institutions were carrying on the proper kind of intensive, efficient courses, as was the case with business colleges, the soldiers were placed in them. Some institutions like agricultural colleges, technical colleges, and art schools, patriotically organized special courses for disabled soldiers and trained them adequately in a variety of branches. Unfortunately, schools where trades were taught had not been developed to any great extent in Canada. Therefore, trade classes were specially organized on an extensive scale by the Dominion Department of Soldiers' Civil Re-Establishment. Those trades were covered which normally enrolled large numbers of workers in our industrial life, and which could absorb many new recruits without throwing the labor market out of adjustment. Among the classes conducted were those that trained men to become garage mechanics, gasoline marine engine repairers, architectural and mechanical draftsmen, electric wiremen, carpenters and cabinet makers, boot and shoe repairers, machine tool operators, oxy-acetylene cutters and welders, barbers, stationary engineers, masters and mates in the merchant marine, wireless and commercial telegraphers, various certificated workers in the collieries, etc. Temporary quarters were secured and fitted up with adequate equipment. Instructors were secured who had demonstrated in practical life that they were thoroughly competent in their respective vocations. New intensive courses were planned and the work done in the classes was as far as possible conducted on a commercial basis. The reason for all operations was carefully explained and each man was given individual attention. The men were not thrown from the school into actual industry to sink or swim without a period of adjustment to actual working conditions. The students were thoroughly instructed for a period of four to six months and then apprenticed in industry itself for another two to four months. All this time the man was receiving from seventy-five to a hundred and fifty dollars per month (according to the number of his dependents) besides free tuition, books, etc.

The results were astonishing. These injured men bent themselves heroically to the task, and the instructors plied them with information. They marched forth from the classes for short apprenticeships into industries large and small throughout the Province, and were usually absorbed on the pay rolls when their courses were completed. Employers gave them every chance and their brother workmen in trade unions waived their regular rules and assisted them to their utmost. In cases where there were small groups entering widely diversified occupations, and where the trade could be learned better in the industry itself, the men were apprenticed directly in workshops for the whole eight months of training.

Over 30,000 disabled soldiers successfully completed their industrial re-training courses, and of these about four-fifths were, up to the recent industrial depression, holding their places satisfactorily. This covers men occupying positions in nearly three hundred different occupations.

Same Problems Here.

I have dwelt on the methods employed and the results obtained in the re-training of disabled soldiers, because the problems of re-establishing workers who have been seriously injured in industry is precisely the same. The handicap of losing an eye, or a hand, or a leg, is practically the same to a wage-earner whether he loses it in war or in his daily work. The procedure of preparing him for further usefulness in remunerative work should be the same in both cases. The experience that has been gained in dealing with those maimed in war should be applied immediately to the great army of industrial cripples who are being recruited through grievous accidents every day. The expert organization that has been dealing with discharged soldiers is fast disintegrating because its work is nearly finished. But it should not be allowed to vanish. An adequate provision should be made to retain enough of the organization to enable it to assist in the re-establishment of the cripples.

It was a simple matter to secure sufficient funds from war appropriations to re-train disabled soldiers. You may rightly ask where money is to be secured to carry out the same education in the case of men handicapped from accidents in industry. This is partly a national concern, and some generous appropriation should be forthcoming from the Federal Treasury to assist the Provinces to meet the needs. The United States has recognized the rightfulness of such a measure, and now furnishes $1,000,000 a year to be distributed among the different States on the basis of population, in order to assist them in re-training industrial cripples. Each State must spend an equal amount from its own funds in order that it may obtain the Federal money.

A portion of the money paid by the Workmen's Compensation Board as reparation to an injured man could be made available for his re-training. The common method of award is to grant the disabled man a little more than half his pay, up to a maximum amount, for a number of weeks depending on the nature of the injury. This is supposed to provide for him until he has completely recovered and then for a further period while he is re-adjusting himself until he is ready to go back to some kind of work. In the cases of serious injuries where probably there exists usually the clearest need for re-training, the period is extensive, much longer than is necessary for recovery and re-adjustment. Very

often the man makes no attempt to take up work again until the last bit of award for compensation has been spent. During this time he has generally acquired an exaggerated estimate of his inability to successfully compete in industry with a normal worker, and he may also have formed new habits of sloth and idleness. If the Workmen's Compensation Board had the power to use its judgment in applying a portion of the award for injuries to industrial re-training, many of its wards could be entirely rehabilitated by intensive vocational education to suit each man's case so that he could be fitted for a new occupation, where he could successfully compete again in a gainful trade. It would also materially reduce his period of withdrawal from productive work. In most cases where a worker has sustained an injury through accident, his employer feels some moral obligation to find a place for him again on the pay roll. The employer would usually be only too glad to co-operate with any agency in an effort to see that the disabled man was fitted for the highest position he could fill competently, instead of having to make a place for him as an attendant, janitor, gateman, etc.

From the figures I have quoted you have seen that the number of people crippled and maimed by accidents every year is a very serious matter. During the last five years, disabled soldiers with every kind of ability, experience, and handicap have been successfully trained for 300 different occupations. The methods of industrial re-training have been completely developed and the results to the man and the nation have been highly gratifying. Are we to let the army of those who are daily crippled and maimed in the peaceful walks of life drift into the hopelessness of performing the minor tasks when they have potential productive power that can, with a little training, be saved and developed? This is a rather simple problem which calls for the co-operation of the employer with the Provincial and Dominion Governments. Our duty is evident, and the trail is clearly worn. It is a service which is absolutely justified on both economic and humanitarian grounds.

Northern Ontario Letter

THE SILVER MINES.

Increasing Silver Output.

Revised estimates of the production of silver from the mines of the Cobalt district, including South Lorrain and Gowganda, show a substantial increase in production as compared with preceding months of the current year. The increase is due to favorable results on the Nipissing as well as another big month for the Keeley. From the figures now available officially, it would appear as though the silver production reached close to 900,000 ounces as compared with about 800,000 ounces during the preceding month.

From present indications, the output throughout the winter will probably range between 800,000 and 900,000 monthly, followed by another substantial increase in the spring provided the Beaver Consolidated, Temiskaming and McKinley-Darragh are able to resume production at that time.

The price of commercial bar silver is steady at around 70 cents an ounce, added to which is a premium of about 8 p.c. on account of the exchange on New York funds where the silver is marketed. At this rate, the income to the mines amounted to about 75 cents for each ounce of silver produced, the value of a production of 900,000 ounces being approximately $675,000 for October.

The number of men employed in the silver mines has reached approximately 1,100, and this may reasonably mark about the average force until such time as some of the closed down mines decide to re-open. Wages continue to be comparatively high, the average being between $4.25 and $4.25 per eight-hour day.

Keeley Silver Mines.

The Report of the Keeley Silver Mines, Limited for October shows a production for the month of 102,819 ozs. of silver, of which 36,819 ozs. are mill concentrates and 66,000 ozs. high-grade. This makes a total production since operations of the mill commenced in June of 263,000 ozs.

The No. 16 vein, which runs at right angles to the Wood's and No. 6 vein, has been drifted on for 32 feet at the 6th level (418'). For this distance the ore is high grade, averaging 4,000 oz. per ton in silver over a width of 12 inches. The drift will be extended as soon as the No. 3 shaft, at present being deepened, reaches the 6th level. During October the No. 16 vein was opened up at the 5th level to a length of 44 feet from the Wood's vein, disclosing excellent mill rock and considerable patches of extremely high grade ore. The drift on the Wood's vein north at the 6th level is now 160 feet long, entirely in good ore, with the last 30 feet in high-grade.

Nipissing.

Production from the Nipissing mine for October underwent a big increase, the regular monthly statement of Hugh Park, manager, showing an output of well over a quarter of a million dollars.

"During the month of October", says the statement, "the company mined ore of an estimated net value of $258,768. No bullion was shipped during the month. The value of the silver production was estimated at 69½c per ounce.

Underground development work was satisfactory. Results at vein 251, the new vein in 63 shaft, were not so good during October as they were for September. An ore shoot, 60 feet long, assaying 2,500 ounces over a width of three inches was developed in September. Work during October did not greatly increase this length. Vertical development is now under way and it is expected that the ore shoot will prove to be of greater extent than at the second level. Favorable results were obtained at 64 vein. Development at an intermediate level disclosed ore having a width of as high as 26 inches and assaying 2,500 ounces to the ton. Steady production is being obtained from this vein.

The low grade mill treated 6,736 tons. The high grade plant treated 176 tons. The following is an estimate of production for the month of October:

Silver production	$243,333
Cobalt production	15,435
Total	$258,768

Coniagas.

It has been learned on good authority that the annual statement of the Coniagas Mines for the fiscal year ended October 31st, will be favorable and will show an increase of close to 20 p.c. in production. The number of ounces recovered from each ton of ore treated was the lowest on record, but a big increase in tonnage was established. The company attained a maximum of close to 700 tons daily near the close of the period. Full details are not available until such time as the report may prepared, but in view of the company having conserved its finances during the year, the balance sheet is expected to show the surplus well maintained at over $2,000,000. During the period under review, a total of 5 p.c. amounting to $200,000 was paid in dividends. This compares with 12½ per cent amounting to $500,000 dur-

be prepared, but in view of the company having conserved

dividend record of $10,240,000 to its credit and is led only by the Nipissing and the Hollinger among the precious metal mines of Canada in point of dividends paid.

The Gowganda District.

Good progress is reported on the Alpine Silver Mines in Gowganda where work is being carried on aggressively. Considerable ore has been taken out by open cuts at surface, and arrangements are now being made to extend a tunnel at a point where it will encounter the veins at a point about 200 feet below surface. The company is spending about $3,500 monthly on exploration and development work and is said to be financed to carry out its scheme of work.

Mining Disputes.

Five mining disputes will be heard by Mining Commissioner T. E. Godson, K.C., at his regular monthly sittings which will be held in Haileybury, beginning Nov. 16th.

Following is a summary:

J. D. Lavillie vs. Max Kaplan, this being a dispute in respect of mining claims L.-9001 and L.-9002 situated in the township of Gauthier, in the Larder Lake mining division.

C. Edmonds vs. Peter McLaren, a dispute in respect of mining claim L.-4661, situated in the township of Lebel in the Larder Lake mining division.

T. W. Wilson vs. John Bruce, this being a dispute in respect of mining claims L.-9469 and L.-9470, situated in the township of Gauthier in the Larder Lake mining division.

Kinch and Porcupine Porphyry Hill Gold Mines vs. Jules J. St. Paul, being an application under section 86 of the Mining Act, in respect of mining claim P.-8288 situated in the township of Deloro, in the Porcupine mining division.

Ole Olson, Albert Wickstead and O. Wickstead vs. B. G. Killoran, this being a dispute in respect of mining claims L.-6698, 6699, 6769, 8207, all situated in the township of Maisonville in the Larder Lake mining division.

THE GOLD MINES.

The question of development of additional hydro-electric energy holds a leading place in the minds of those identified with the gold mining industry of Porcupine. This subject is dealt with at more or less length in another column of this issue of the Journal.

Dome Mines.

Achievements at the Dome Mines continue favorable, and an income of approximately $8,000 has recently been established. The mine appears to have definitely found a place among the higher grade producers instead of being known as a low grade mine as in former years. Net profits are accumulating at a substantial rate above current dividend requirements of 2½ p.c. quarterly, and the disbursement of an additional 10 p.c. in the form of a capital reduction is considered a certainty before the end of the company's fiscal year, March 31st.

Paymaster.

Good progress is being made on the Premier Paymaster, formerly known as the Standard property. Good values are reported, and the promoters of the project believe they will be able to proceed with plans and specifications for a mill some time during the coming year.

Hollinger.

The Hollinger Consolidated has recently established an "average" tonnage of around 3,800 tons daily, which appears to mark the peak with present equipment. Indicated income, inclusive of premium on New York funds is approximately $40,000 daily.

Porcupine V. N. T.

Negotiations of importance are pending in connection with the Porcupine V. N. T., and the outlook for this property has brightened perceptibly. Its location immediately adjacent to the Hollinger, and the occurrence of numerous veins under somewhat similar conditions as on its big neighbor is attracting genuine interest.

Growing Interest in Gold Mines.

As the tidings of extremely favorable achievements at the producing gold mines of the Porcupine and Kirkland Lake fields gradually find their way to all parts of the world, the interest in this important Ontario industry grows steadily.

Thirty-five hundred men are now directly employed in the gold mine of these two districts, while many more are engaged in prospecting.

Seven mines are turning out bullion at an aggregate rate of over $1,500,000 every thirty days. A number of new producers are assured for the coming year and with an indicated output of $2,000,000 a month before the next year draws to a close.

The traffic to and from the mines in the form of freight and passengers goes a long way to maintain the railways which, in turn, comprise a necessary part of the entire north. Given due consideration in regard to taxation and the industry promises to experience additional important growth and thereby pave the way toward the permanent development of the whole of Northern Ontario.

McIntyre.

Arrangements in connection with driving the main shaft of the McIntyre-Porcupine to new deep levels are being carried out, and the mine will soon be operating at a lower horizon than any other precious metal mine in Canada. This work is preliminary to placing the mine in shape to feed the proposed bi-addition to the mill.

For the time being, however, the plans to double the capacity of the milling plant are held in abeyance, and no actual construction is expected to take place until spring. In the meantime, a total of about 550 tons of ore are being handled daily in the present mill and a production of approximately $175,000 monthly is being maintained.

Ontario-Kirkland.

The installation of a 100-ton mill on the Ontario-Kirkland has been almost completed and the tuning up of the equipment will commence within the next week. The mine has been extensively developed and production is expected to reach upwards of $1,000 per day before the current year draws to a close.

The addition of the Ontario-Kirkland to the producing list will increase the aggregate output of the Kirkland Lake district to approximately $6,500 every twenty-four hours.

Wright-Hargreaves.

Announcement is made by the Wright-Hargreaves Mines, Ltd., that a dividend of five per cent will be paid January 1st to stockholders of record December 17th. It is stated that this dividend is "From the accumulated surplus earnings since the 1st day of January 1921, the time of the commencement of operations of the mines."

This dividend will call for the distribution of $125,000 and is the initial bow of the Wright-Hargreaves among the dividend paying gold mines.

A feature of the dividend is that during the war and for some years thereafter, development work was conducted on a quite limited scale, up until the beginning of the current year. The construction of a mill was accomplished during 1920, and the plant was brought into operation early in May of this year. The dividend announcement, coming within six months after commencing production is an achievement difficult to equal in the gold mining industry.

The plant has a rated capacity of 175 tons of ore daily, and almost from the beginning was able to treat about 150 tons daily with a production of approximately $2,000 every twenty-four hours. The enterprise was financed by business men of Buffalo, being practically a closed corporation.

Kirkland Lake Proprietary.

Operations are well under way on the Sylvanite property. The plant has been overhauled and placed in first class condition preparatory to carrying out a comprehensive scheme of exploration and development work, including the sinking of a shaft at a central point to a depth of 200 or 300 feet.

The Sylvanite lies directly between the rich Wright-Hargreaves mine and the Tough-Oakes and is believed to be almost certain to share in about one-quarter of a mile in length of the main zone of mineralization along which the producing mines of the Kirkland Lake district are situated.

The Kirkland Lake Proprietary, (1919), Ltd., holds not far under fifty per cent. of the Sylvanite stock, while interests in Buffalo are also heavy holders. The mine is being operated under joint arrangement between these two factions and is being managed by Albert Wende, who is general manager of the adjoining Wright-Hargreaves.

PERSONALS.

Mr. J. A. Dawson, of Vancouver, is returning to the west after a trip to Ottawa and Toronto.

Mr. E. L. Bruce, professor of mineralogy at Queens University, has been offered the position of Mining Commissioner of Northern Manitoba.

Nelson, B.C.—Owners of the Rampolla Group of Mineral Claims, Lightning Peak Camp, Arrow Lakes, are proceeding with the development of that property with intelligence and system. Having completed a 400-foot crosscut intersecting the lead another tunnel is to be driven to given increased depth. This will have to be driven some 1,000 feet before it strikes the main vein. There are three known veins on the Rampolla and the proposed work will crosscut them all, as well as traversing 600 feet of new ground.

Rossland.—Eight lessees now are operating the Velvet Mine, near Rossland. The mine is said to be in good condition, six working levels having been run from a 500 foot shaft.

EDITORIAL

NICKEL — AND NAVIES.

That the Conference on the Limitation of Armaments is going to play the dickens and all with the nickel industry seems to be the view of some of the sage and sapient newspaper correspondents who are reporting the proceedings — or such of them as they are permitted to attend — of the Conference. Here is a recent gibe of one of them: "The activities of the International and Mond Nickel Companies will inevitably be curtailed, and the Sudbury district can begin to pray for the discovery of some other veins of mineral wealth within its bounds, as the demand for nickel for use in armor plate and munitions will at once fall to zero." Such fanciful and fantastic deductions must be due, it seems to us, either to ignorance of nickel and its uses, or to something of the amiable spirit which animated the Fat Boy in the Pickwick Papers when he announced to Mr. Wardle's mother "I wants to make yer flesh creep."

There is no likelihood of panic among those who, as being engaged in the industry, may be supposed to be best cognizant of its position and its possibilities. Nor is there any reason for panic. Incidentally, it may be mentioned that, while everyone wishes well to the Conference, it is a conference looking to the *limitation* of armaments and not to their immediate *abolition*. In such armaments as continue to be maintained, after the Conference has separated, nickel will doubtless play its proportionate part. But it is a serious error to imagine that the leaders in the nickel industry have not laid well-considered plans for the creation of profitable markets for nickel in other directions than those devoted to armaments. Indeed, although during the war period the demand for nickel for purposes of war was of such magnitude and persistence that it, for the time being, completely overshadowed the demand for it from all other sources, in the years immediately anterior to the war about fifty per cent. of the nickel marketed was used for industrial and cognate purposes.

Confronted with the necessity that has now arisen, owing to the likely curtailment of the use of the metal for armament, to find new markets for nickel, there is no room for doubt that the nickel industry, as a whole, will prove equal to the task. For the high economic value of the metal and its alloys is a proven and well-ascertained fact and one which is being increasingly recognized by the whole industrial world. More brilliant than platinum, and with a weight approximately equal to that of copper, it is about as hard as soft steel. It is remarkable for its extreme malleability and ductility, which enable it to be rolled into extremely thin sheets, or drawn into very fine wire, of great tenacity. It is well suited to plating on other metals. It is strongly resistant to oxidation in the air, and is passive to caustic alkalies, while weak acids affect it only slightly. For the great variety of uses to which it has been adapted, and is adaptable, it stands first among the common metals.

Moreover, the important alloys, from a commercial and industrial viewpoint, which contain nickel are more numerous than those of any other metal, with the exception of copper. It is useful in such a large number of alloys by reason of the fact that it promotes strength, tenacity, soundness, resistance to corrosion and homogeneity in the product. A very important factor, in connection with its use in alloys, is that it has a coloring power greater than any other base metal in common use, and provides a means of producing many bright, silver-like alloys from metals of inferior color and lustre.

Nickel steel is used not only for armament purposes, in the form of armor plate and ordnance, but also very widely as automobile steel; in locomotive tires, axles, piston rods, etc.; in bridges; in rails; in railroad frogs and switches; and in resistance wire. Nickel silver, which, in other days, used to be known as German silver, is used in jewellery, novelties and table wear. Cupronickel is used in coinage, pyrometer wire and resistance wire. Anodes are used in nickel plating, and catalyser is used for hardening fats and oils. Malleable nickel is widely used in chemical apparatus, in coinage, in cook-

ing utensils, in electrical instruments, in spark plug wire, in valve trim and so forth.

Of course, those mentioned are just a few of the hundreds of uses to which nickel and its alloys are put. But some mention should be made of the possibilities of Monel Metal of which the International Nickel Company has done so much to stimulate a wider use. The use, in this form, of nickel is, in fact, one of the most important of the uses to which the metal is put. Monel Metal, by reason of its non-corrodibility, its durability, its acid resisting qualities, its resistance to super-heat, its tensile strength, and its resistance to high heat, and its electrical properties, finds already, and, in enormously increasing measure, is destined, to find in the future, high favor in industrial pursuits ranging all the way from automobile manufacture to ship-building, and from the manufacture of coal-mining equipment to that of restaurant apparatus. Alike in plant equipment and in products, it is used by an enormous number of manufacturing establishments. But, perhaps, its most important present use is in power plants, where, on account of its property of withstanding corrosion and the erosive action of super-heated steam, it is used extensively as valve seats, valve rods and discs, pump rods and liners, turbine blading, and so on. In the chemical industry, because of its resistance to chemical fumes, alkalies and most acids, its uses are almost endless. In particular, it is of high value and utility in the manufacturing parts of bleaching and scouring machinery, and in dye-house and similar industrial chemical equipment.

The whole subject is a fascinating one, and it has, perhaps, momentarily led us into some little divergence from our main point, though one which is not altogether impertinent to it. What we are concerned to emphasize is that the uses of nickel and its alloys in the arts of peace in the future are certain as can be to prove more important and vastly more remunerative to those engaged in the nickel industry, as well as vastly more beneficial to humanity at large, in the future than their uses in the arts of war have proved in the past. The present times are abnormal, but when once conditions approximating to the normal supervene, it will speedily be seen that, whether in production or in marketing, the nickel industry and those engaged therein have little to fear.

THE POWER QUESTION.

The power situation at Porcupine is not as bad as anticipated, thanks to heavy rainfalls. The precipitation has given rise to hopes that the present supply of power can be continued through the winter months. There are as yet however, no arrangements made for providing the additional power which the mining companies require.

The shortage of power last winter resulted in considerable loss to the gold mine operators, and the power question has been consequently attracting much attention. Two of the companies, which suffered large financial loss last winter from power shortage, announced their intention of providing against a repetition of winter shortage and also of providing additional power for larger operations, by developing power themselves. This has not been done, and the company which at present supplies power to the mines has not yet undertaken to supply such additional power as the plans of the companies call for. The present situation must be considered unsatisfactory to all concerned.

It is reasonable to assume that the various parties interested have conferred on the problem and found no solution. No progress having been made, it seems desirable to enquire into the reason for the lack of progress, with a view to having obstacles removed, and an amicable agreement arrived at that will result in rapid progress to the desired end.

The manager of the power company has been quoted as being ready to undertake to propound a satisfactory solution of the problem, if the mining companies will make known their requirements. The plans of the Hollinger are, apparently, not well known to the power company, and the relations between the two companies were not improved by the dispute arising over last winter's shortage. The plans of the Hollinger, on the other hand, are indefinite, owing to the way in which the Ontario Government has treated the Hollinger company's application for rights to develop power. The Government, by taking a very long time to do nothing, has naturally been criticized for failure to act in a matter which is of great importance to Northern Ontario.

In the power question at Porcupine, the Ontario Government will find something worthy of its attention, if it makes due investigation. It will find that development is being retarded by lack of power, and it will find several interests concerned in the plans made for providing the required power. If Mr. Drury endeavors to find a solution of the problem, he will have to listen to arguments from several quarters. There are, without doubt, reasons why it would take some time to arrive at a decision; but the matter is of sufficient importance to justify the claim that the Government should take a more active interest in obtaining the facts and endeavoring to clear the way for increased activity in the development of the North's resources.

In this issue of the Journal, our Cobalt correspondent suggests that the mining companies and the power company might be able to make satisfactory arrangements for the development of the power at Sturgeon Falls on the Mattagami River the rights to which McIntyre-Porcupine Mines Ltd. applied for some time ago. Possibly, Mr. Black, manager of the power company, had this and other schemes in mind when he stated that his of company could find, for the mining companies, all the power which he thinks they want. Mr. Black admits, however, that he has not been able to find out just what the Hollinger company is desirous of obtaining. To make headway with such a plan, it is evidently necessary that the Government must indicate what it intends

to do with the Hollinger application. The Government cannot come to any decision until it knows the facts, and it cannot learn the facts without giving the matter more attention than has been devoted to it during the past year.

To develop a sound policy with respect to Northern Ontario is an aim worthy of Mr. Drury and his cabinet. Investigation of this power question will not only help the mining industry; but will enable the Government to gain useful information concerning a part of the Province in which progress can be hastened or retarded greatly by the Government. Investigation may reasonably be expected to result in action that will meet with some measure of approval. The present policy of avoiding the difficulties by delaying action does not meet with approval in any quarter. If the delay were due to effort being made to get the facts, there should, by this time, have been a very full investigation, indeed.

Commenting on the power situation at Porcupine the "Northern Miner" says: "If Hollinger Consolidated Gold Mines directors felt sure that they could get a continuous and sufficient supply of hydro-electric energy they would immediately take steps to increase the output by mill additions. They feel that the mine is in shape to warrant increased production and they have in mind the treating of 6,500 tons daily as against a present record of 4,000 tons. They plan increasing the output to 6,500 tons next spring, but do not feel like taking the step until they can see their way clear in regard to power supply. The situation, as here outlined, is officially given The Northern Miner.

"Hollinger and the Northern Canada Power Co. are in a legal dispute from which might arise a clear understanding in regard to future power supply. If the Power Company arranges for the development of the Sturgeon Falls power, owned by McIntyre, at least the immediate needs of Hollinger, McIntyre and Dome would be satisfied. It is understood, in mine operating circles, that the diversion of other streams into the Mattagami above Wawiatin Falls would hardly add sufficient energy to allow the three big Porcupine mines to expand as they hope to do, and that ultimately more power plants will have to be installed."

The situation is one which calls for action. It seems to us that it is of sufficient importance to merit Government attention, for a solution of the problem is in the interests of the Province.

EDITORIAL NOTES.

Both at Cobalt and Gowganda some interest is being shown in the possibility of finding gold deposits in the silver areas. Manager Kee's reference, in his annual report, to the occurrence of small quantities of gold found at the Kerr Lake mine and the discoveries of gold at several places in the Gowganda area should lead to further discoveries.

The Gowganda road has been much improved this summer, but work was stopped too soon. It is now possible to make the trip in by automobile in two hours. This is something which operators in the area have cause to be thankful for. A little more work is still much needed and it is to be hoped that this will be attended to at the earliest possible opportunity next year.

An engineer, who recently visited one of the mining areas in Ontario in which some prospecting is going on, was surprised to see that very little use was being made of the gold pan. The pan in experienced hands is a very useful article, and prospectors who do not use it are handicapping themselves. Some of our prospectors have found the mortar and pan very valuable assistants.

Coal mine operators in Nova Scotia and British Columbia are naturally opposed to tariff changes that would add to their present problems of meeting competition with American coal. In the west there is also to be met the competition with fuel oil which is at present being sold at a low price.

There are signs of improvement in the steel industry. This unfortunately does not mean that there will be any large production of iron ore in Canada in the near future. It is, nevertheless, of great importance to our coal mining industry.

PORT ARTHUR MINING NOTES.

By J. J. O'CONNOR.

Work has commenced on the opening up of the old Shuniah Mine, situated three and a half miles north of Port Arthur. This is one of the pioneer silver discoveries in the Thunder Bay silver area, being the second silver find of importance made in this district. The first being the Thunder Bay Mine, made by Mr. Peter McKellar on September 20th, 1866. The Shuniah find was made by the late George A. McVicar, in May, 1867. The vein strikes nearly east and west, and had a width of from 20 to 24 feet on the surface, carrying high silver in native and argentite.

The surface showings were so rich that large quantities of silver were taken out by means of the pick. At the time this work was in process, an excursion from Houghton, Mich., arrived at what is now Port Arthur. The excursionists went in a body to see the wonderful silver find. One of them, an American gentleman of some mining experience, offered the late John McKellar, then in charge of the work, $3,000, to be allowed to work from 7 a.m. until 6 p.m. with a pick, and keep what silver he was able to take out during that time. This offer was refused by Mr. McKellar.

The property was sold to Boston, Mass. interests, and the Duncan Mining Company was formed for the purpose of developing and operating the deposit. This company continued, with varying success, until 1870, when the mine was again sold to the Shuniah Mining Company. Mining operations were carried on by this company until July 1881, under the management of John S. Sargent, who prosecuted sinking to a depth of about 450 feet, and did some diamond drilling below the workings. On a report by John C. F.

Randolph, E.M. of New York, the mine was closed down on the above date.

The present operations are being carried on outside the former workings, on a part of the vein hitherto untouched, and which is claimed to be of a stronger character, and that is expected to carry higher values than formerly found below the surface.

The late N. N. Stewart, a mill wright, in charge of the construction of the stamp mill at the Shuniah, claimed to have found an enormously rich surface showing on another vein on this property, which he offered to point out to the management for a consideration, which they declined to give, and Mr. Stewart passed away without disclosing its location. In conversations with the writer, Mr. Stewart frequently made most positive assertions regarding his find, and the general opinion among those who knew him, had no doubt as to his veracity in the matter of the find, although he might be mistaken as to its value.

ADVANCEMENT OF SCIENCE.

The American Association for the Advancement of Science has met in Canada three times before, twice in Montreal — in 1857 and in 1882 — and once in Toronto, so that the meeting for the fiscal year 1922 will be the second Toronto meeting. This meeting will be held the 27th to 31st December, 1921.

General Scope.

Through its meetings and through its publications, the American Association promotes intercourse and co-operation and the feeling of fellowship among scientists and those interested in the advance of science and education. North America and South America are its special geographic fields, but members may be citizens of any country.

The Association has become a great affiliation of American scientific societies, and its meetings have become increasingly characterized as conventions of many special organizations. A large number of the associated societies regularly meet with it and the facilities of the Association are always at the disposal of these societies, for the arrangement of meetings, the preparation of programs, etc. Many associated societies are also officially affiliated and are represented in the Council of the Association, thus taking part in its direction.

Importance of Meetings.

The regular annual meetings and the other meetings that are occasionally held constitute a powerful means of disseminating knowledge, of cultivating the scientific attitude of mind, and of promoting a general appreciation of the great importance of science and scientific study. It has frequently been stated that the progress of democracy depends mainly upon these things, and the truth of this statement becomes increasingly emphasized as science and the work of scientists becomes better understood by the public.

The meetings also furnish the only means by which a large number of active workers in all branches of science are brought together from distant regions, with consequent opportunities for the formation and renewal of numerous personal acquaintanceships and friendships. These meetings do much toward preventing the development of the undesirable aspects of personal rivalry and toward the encouragement of friendly co-operation among those interested in science and education.

Endowment and Grants for Research.

The American Association is entrusted with a considerable permanent endowment, which has been derived from gifts and bequests of public spirited persons and from payments made by Sustaining Members and Life Members. The income derived from these funds is employed to advance scientific research. It is annually appropriated for grants, which are made to individuals or scientific organizations, to aid research projects. Applications for financial assistance in scientific investigations are referred to a special Committee on Grants, which considers the applications and apportions the available funds. For the year 1921 this committee thus apportioned the sum of $5,000, in 24 different grants. Recipients of these aids to research make reports to the Association, showing how the funds have been expended and the nature of the results obtained.

It is desirable that the endowment of the Association be increased whenever possible, and it is hoped that this opportunity for continuously aiding the increase of useful knowledge may be widely appreciated. The fundamentally democratic nature of the American Association and its broad, general scope constitute an unusual guarantee that funds entrusted to it will be reasonably and efficiently employed in ways calculated to advance science and improve education.

The Association offers the most efficient means by which individuals, scientific societies, and scientific institutions may unite to hasten the growth of scientific knowledge and to increase public appreciation of what the nations owe to science and what may be expected of science in the future. The insistent urge of many individuals and organizations, united in a comprehensive association for the advance of learning, is capable of exerting a most powerful influence for good in national and international development.

The Membership List of the Association forms one of the most valuable instruments of its kind, as an address list of American Scientific workers and friends of science. The 1921 list contains about 12,000 names and addresses and furnishes an invaluable reference volume at a very low cost. Fellows of the Association are specially designated. The publication of the membership list is a valuable and important service performed by the Association in the interest of intercourse and co-operation among men of science in America.

Dr. J. C. Fields, F.R.S., Professor of Mathematics University of Toronto and President of the Royal Canadian Institute is Chairman of the Local Committee for the Toronto meeting 1921 of the American Association for the Advancement of Science.

Mr. H. L. Seymour, C.E., is the Secretary, with address, the Royal Canadian Institute, 198 College Street, Toronto, Ontario.

The Blue Diamond Coal Co. is reported to be producing 1200 tons per day and making large profits. As this mine is jointly owned by McIntyre and Temiskaming companies, its successful operation is of interest to a very large number of shareholders.

The "Northern Miner" reports the resumption of work at Wisconsin-Skead and Crawford properties and arrangements being made for the reopening the St. Anthony and Bourkes mines. These are all gold properties.

McIntyre-Porcupine May Hold Key to Solution of Power Requirements of Porcupine

It has been learned on good authority that there are no insurmountable obstacles in the way of the development of an abundant supply of hydro-electric energy for use at the mines of the Porcupine district provided the concerns involved are prepared to co-operate with each other.

This statement is made advisedly, having nothing whatever to do with the viewpoint of one or another of the companies involved, but deals along broad lines in an effort to point out the way to a solution of the difficulties which are at present delaying a start on power development which is essential to further growth of the gold mining industry of the Porcupine gold area.

The present supply of power, due to the fall having brought more rain than the general average, is believed to be sufficient to carry the producing mines through the winter at full capacity. However, all the producing mines are planning big enlargements to their plants, and, instead of using close to 13,000 h.p. as at present, will probably require an additional 5,000 h.p. by the end of another year. In addition to this, there are a number of mines that are at present idle which will possibly be re-opened during the coming year.

Thus, if the present system of water storage, water diversion and power development is taxed to the full limit to meet current demands, it is obviously imperative that additional developments are unnecessary if the natural growth of the industry is to be made possible.

A lot has been written in regard to the Ontario Government, through the T. and N. O. Railway, placing obstacles in the way of a leading mining company securing the right to develop energy on the Abitibi River. it is true that certain reservations have been made along the Abitibi for protection of the T. and N. O. Railway at such time as the plan to electrify the system is carried into execution. At the same time, an opportunity to develop abundant hydro-electric power for use at the gold mines of Porcupine dies right in the vicinity of the mines without engaging in power development on the far distant Abitibi where the initial cost of building a long transmission line and its constant upkeep renders the plan undesirable, if at all possible to avoid.

I have learned through careful enquiry that the Sturgeon Falls on the Mattagami River which flows right through the Porcupine field, has been surveyed and has been found to have sufficient flow and fall to generate approximately 7,000 h.p. I have also learned that according to careful estimates recently made, this development would not cost more than approximately $1,100,000. Moreover, although the right to develop Sturgeon Falls is held by the McIntyre-Porcupine Mines, I have been led to believe that this company will not stand in the way of any company which may desire to proceed with the development. All that the McIntyre would ask would be first call on its own power requirements which would be from 2,000 to 3,000 h.p. or possibly an ultimate maximum of 4,000 h.p.

The development of Sturgeon Falls, added to represent developments would remove all anxiety of power shortage and would permit all the mines to proceed with the plans to increase production. The McIntyre hesitates to go into the business of power development on its own account. The Northern Canada Power Company is now involved in heavy litigation launched against it by the Hollinger Consolidated, and which leaves the power company in a position where it may be considered unwise to avail itself of the opportunity to develop Sturgeon Falls.

It is my opinion that if the difference between the Hollinger and the power company were settled, and were the Hollinger and the McIntyre to draft an outline of their probable power requirements and to agree to take all their requirements from the power company, there would probably be steps taken almost immediately by the Northern Canada Power Company to provide the necessary additional energy. Failing in this, provided the Hollinger may be determined to set at rest any danger of a recurrence of a power shortage, the Hollinger and the McIntyre might reasonably enter into some joint arrangement for the development of Sturgeon Falls on a fifty-fifty basis, each taking half the power generated and then securing the balance of their requirements from the Northern Canada Power Company's plants.

Thus, two solutions are apparent. First is a settlement of differences between the Hollinger and the power company and the immediate development of Sturgeon Falls by the Northern Canada Power Co. Second, would be the development of Sturgeon Falls jointly by the Hollinger and the McIntyre.

FORMER TRAIL MAN SUCCEEDS TO TITLE.

The news of the death of Lord Ebury as cabled from London this week came with considerable interest to the older residents of Trail, for his successor, Hon. Francis Grosvenor, was a former resident of this city. Coming to Trail in 1903 as a lad of 20, he was employed at the smelter as a metallurgical chemist. In 1907 he left to become chief chemist at the Hall mines in Nelson.

As a land expert, he made reports for a London firm on the Columbia & Western land grant at Nelson, as well as the Fort Sheppard land grant and the grants in the Peace river country. In 1911 he became assistant managing director of the Norton Griffiths Contracting company in western Canada, and was employed by the late Duke of Sutherland to organize an imperial immigration scheme to Canada in 1912. He was also active in Vancouver real estate circles.

He was a licensed assayer and a justice of the peace in the province of British Columbia until the outbreak of the war, when he joined the forces. He was a lieutenant in the 72nd Seaforth Highlanders, Vancouver regiment, before going overseas. He later became a brigade major in the Sixth Canadian Infantry brigade on active service. He was wounded in November, 1915. He was appointed aide de camp to Brig. Gen. H. D. B. Ketchen in 1916. He was thrice mentioned in dispatches, and won the Military Cross and bar, the Distinguished Service Order and the Croix de Guerre with palms.

He has Canadian homes at Atlanta beach, near Nelson, and Riondel, B.C. He was a member of the Union club in Victoria.—Trail News.

Coal Carbonization at Low Temperatures

By JOSEPH D. DAVIES
(Fuels Chemist, U.S. Bureau of Mines, Pittsburg, Pa.)

For the past twenty years an enormous amount of experimental work has been done in this country and in Europe on the carbonization of coal at low temperatures. Most of this work has been carried out on a laboratory scale, or at least on a semi-commercial scale, and only recently have results been obtained that can be used directly by the carbonization engineer. One object in view in the experimental work has been to learn from a purely scientific standpoint more of the composition of coal and its thermal decomposition. Another object has been the discovery and commercial development of more economical methods for processing fuels than the well-known high temperature methods. This paper deals more particularly with the latter phase of the work.

Parr and his co-workers in this country, Stansfield in Canada, Wheeler, Jones, Burgess, Bone and Lewes in England, and Fischer and Gluud in Germany, have been particularly active in research on the scientific aspects of the problem and on the technical application of their results as well. The problem of coal constitution and thermal decomposition is a long way from solution, although considerable progress has been made. Of the chemical constitution of coal, little is known as yet, but the yield of distillation products obtained under fixed temperature conditions, as well as their general nature has been empirically worked out; the actual chemical reactions involved, however, have not been fully explained.

The technical application of low-temperature carbonization is still in its infancy and development has been slow, mainly for three reasons—(1) adequate fundamental knowledge of coal constitution and thermal decomposition is lacking; (2) evolution of suitable retorting apparatus is slow, owing to the low heat conductivity of coal and the consequent diffieulty of designing retorts which have appreciable capacity and also the requisite low temperature gredients; (3) a market for the rather special distillation products, however valuable they may prove to be in the future, does not exist and must be created.

Tar Oils.

The tar oils for what is perhaps destined to be the most important product of low-temperature carbonization technically, since on account of their similarity to petroleum products they can be used largely as substitutes for petroleum oils in the industry.

It is now pretty well established that these primary tar oils from bituminous coals consist chiefly of phenols and hydrocarbons of the paraffin, napthene and olefin series, together with substituted aromatic compounds which are for the most part methylated. According to Gluud, 10 to 15 per cent of the hydrocarbon portion of the tar consists of pure paraffins, the lighter part of the higher percentages of napthenes, unsaturated bodies and hydro-aromatic compounds. The amount of phenols in the raw tar varies from 15 to 50 per cent, according to the volatile content of the coal, the remainder being hydrocarbons. The hydrocarbon portion of the tar is very similar chemically to Russian petroleum; it is likewise very complete and only a very few pure chemical compounds have been separated from it and identified. Bituminous coals yield around 10 per cent primary tar. On refining this tar by distillation with superheated steam, a method which he recommends, Gluud obtains the following products:

Refined products obtained from low-temperature tar from gas coal.

Boiling range (deg. C.)	Yield per cent of tar	Product
20 to 100	3	Paraffins from the gas.
100 to 200	10	Light oil.
200 to 300	12.5	Low viscosity oil (solar oil, motor oil, polishing oil) containing 1 per cent fluid paraffin oil.
300 to dry point	(15.0	Lubricating oil (viscosity, V_{50} = 20 to 30 deg. E.)
	(	containing 1.5 p. c. solid
	(	paraffin.
	(9.0	Red resin.

In addition to the above products, 50 per cent of the tar was obtained as phenolic compounds boiling between 200° C. and the dry point.

The above results agree fairly well with those obtained by Parr, and may be taken as representative of low-temperature tar oils obtained under conditions which are within the meaning of our definition. Their technical application will be discussed later.

Coked Residue.

The coked residue in general amounts to from 70 to 75 per cent of the coking or semi-coking coal charged; it is not so hard as metallurgical coke and contains from 10 to 18 per cent volatile matter. This coke is easy to burn without smoke, ignites readily, and should make an ideal domestic fuel.

It is claimed that coke suitable for this purpose can be made from coking coals unsuited for the making of metallurgical coke. Parr claims to be able to make a good domestic coke from Illinois coals of high oxygen content, and samples shown the writer would seem to bear out this claim. The main feature in Parr's process is a preliminary heating to 300 deg. to 400 deg. C., after which the coking takes place for the most part autogenously, due to heat of reaction of the coal undergoing carbonization.

Gas.

Writers differ considerably as to the amount of gas produced, but it is probably safe to assume that the yield for fair gas coals is between 5,000 and 6,000 cubic feet of 650-750 B.t.u. gas, per ton of coal carbonized. Bone conservatively puts the gas yield at from 3000 to 4000 cubic feet per ton. The composition of this gas, according to Lewes is approximately as follows:

		Per cent.
Hydrogen		27.5
Saturated hydrocarbons		
Methane	48.0	
Higher members	10.1	58.1
Unsaturated hydrocarbons		3.0
Carbon monoxide		7.3
Carbon dioxide		2.5
Nitrogen		1.6
Total		100.0

Uses of Low-Temperature Products.

One must discount to some extent the claims of exponents of the various low-temperature processes as to the special uses to which their products are suited, and as to what extent they are destined to displace other materials for which the demand is well established. As a matter of fact, there is now no well established demand either in this country or abroad for low-temperature products as such or as substitutes for other materials. The writer believes that development, though it has been slow and beset with technical difficulties, has been in advance of the demand for materials produced. Any process, in order to be a success financially, must now bear the burden of creating a demand for its products, and this has been the chief reason for slow development of low-temperature methods up to the present time. As for the future, perhaps in the near future, there is every reason to believe in the success of a low-temperature carbonization industry. The main factor which will bring this about is the rapidly increasing demand for liquid fuels of all kinds. Every resource will be drawn upon, and coal, particularly of low rank, will probably be for a long time among the cheapest of raw materials. It may therefore pay in time to "process" coal for oils as the main product. So long as there is no definite demand for the special products which "processing" will supply, one might as well think of going to the trouble of refining cast iron; making a fine grade of tungsten steel, for example, to use for window weights, as to think of "processing" coal. This of course does not apply to well established methods for processing coal where gas or metallurgical coke are the special products sought.

It must not be expected that the profits to be derived from low-temperature processing of coal will be large. To quote Sir George Beilby, Director of the British Fuel Research Board, "Low-temperature carbonization can only be established on a sound commercial basis with low operating costs and a very moderate margin of profit."

The refined light oils from the tar may be sold as motor spirit, for which there are good prospects of ever increasing demand. The amount of oil available for this purpose may be taken at around 3 gallons per ton of coal carbonized, the exact amount depending upon the volatile content of the coal. There is a question in this connection, as to how far the refining of oils of this character must be carried to fit them for use in motors. It is possible and even probable that refining methods other than those now used for petroleum, and high-temperature light oils, may be developed which will release a larger proportion of the low-temperature light oils as refined motor spirit stock than can be now counted on. The Bureau of Mines is just at present working on the problem of motor spirit refining in connection with oils similar to low-temperature light oils. The heavy low-temperature oils, as previously indicated, consist chiefly of acids (phenols) and neutral hydrocarbon oils. The phenol content is high, it amounts as much as 50 per cent of the total tar yield of 24 gallons per ton of coal, according to Glund. He also finds that the higher the total tar yield, the higher its content of phenols.

One large use for low-temperature tar acids will doubtless be in connection with timber preservation. According to Coffin, between 90 and 100 million gallons of such oil was used in 1913 in this country for that purpose, and two-thirds of this amount was imported. Evidently there is a present demand for low-temperature tar acids, and the only question remaining to be decided relates to their suitability for the purpose. Coffin states that they are even better than high-temperature tar creosote. Other uses mentioned for these tar acids are, insecticides (including dipping oils for live stock), disinfectants, and flotation oils. It is not clear that there is an appreciable shortage in the present supply of these chemicals, although a growing demand may probably be assumed.

According to Glund, the heavy hydrocarbon oils, and in fact crude tars from which the acid is not removed, have found extensive use in Germany as lubricants during the war. He adds that even now most of the low-temperature tar produced is used directly for that purpose, although really high-grade lubricating oil can be made from the crude tar on distilling with steam and removing the phenols.

The total tar oils, with very little refining, may be used as fuel oils, although demand for them for other purposes should preclude such use. Armstrong, of the Low Temperature Carbonization, Limited, states that at the Barnesley plant, fuel oil complying with the Admirality specification, is made by steam-distilling the crude oil till sufficient light oil is removed to bring the remainder within the Admirality flash point specification and then decanting the water.

It is claimed both in this country and in England that low-temperature coke is an ideal fuel for domestic heating. This seems reasonable, particularly in view of the quality of coke obtained by Parr from coals rather inferior from the coking standpoint. It should be feasible and profitable to coke low-rank semi-coking coals primarily for solid domestic fuel and light oils. However, the American public is slow to take up the use of coke, and the same seems to be true in England. The public aversion to coke may be due partly to prejudice and partly to lack of knowledge of the best ways to burn it; the writer is inclined to believe both factors are responsible. In any event, the public must be educated to its use before there will be a good demand for low-temperature coke for domestic heating.

The small amount of surplus gas available for distribution (at most 3,000 cubic feet per ton of coal carbonized), makes the gas product of lesser importance. It is, however, of good quality and suitable for distribution for domestic heating.

Coals Suitable for Low-Temperature Carbonization.

What has been said so far applies to semi-coking coals such as will not produce satisfactory metallurgical coke; and it would seem that low-temperature carbonization methods would apply best to coals of this rank. It is claimed that they produce a good domestic coke and at the same time a high yield of oil. A further consideration is that their use would not interfere with the supply of high grade coking and gas coals. Considerable experimental work has been done on the low-temperature processing of sub bituminous coals and lignites, although the information gathered so far regarding these coals is not so complete as that for coals of higher rank.

Higher Grade Fuel from Lignite.

In our western States where there is a scarcity of high-grade solid fuels and where our lignite is plentiful, there is a real need of a process for making a higher grade fuel out of lignite. Possibly low-temperature processing may solve the problem. Babcock

for the Bureau of Mines, has given "Especial attention to the study of utilizing lignite in the form of residue briquets and in the manufacture of by-product gas." More recently Stansfield, for the Canadian government, has done some excellent loboratory work on low temperature carbonization of lignite and as a result of the work, a 200-ton carbonizing plant at Bienfait, Saskatchewan, has been erected. Information on large-scale results from this plant is not yet available.

Apparatus.

It is hardly necessary here to deseribe all the apparatus which has been proposed for low-temperature carbonization or even a major part of it. In all low-temperature installations in so far as the writer knows the retorting apparatus is in the process of evolution and it is perhaps too much to say of any low-temperature process that it has attained entire technical success. Processes referred to in what follows will therefore be deseribed briefly and for the purpose mainly of illustrating a principle in design. Any attempt at this time to decide on the relative merits of different commercial processes proposed would not, in the writer's opinion, be justified.

The Carbocoal Process.

A plant with a capacity of 500 tons per day, based on the carbocoal process has been in operation at Clinchfield, Virginia, for the past year and represents perhaps the farthest advance in commercial low-temperature development in this country.

The Carbocoal process includes three distinct stages: (1) Primary carbonization; (2) Briquetting; (3) Secondary carbonization.

The coal to be processed is first crushed to ½-inch size or smaller, and then fed into a horizontal retort through which it is forced continuously by heavy cast-iron paddles mounted on two parallel shafts. These shafts are driven by a motor suitably connected by gearing at the intake end of the retort. The vertical section of the retort is approximately cardioid. It is heated by gas at the bottom and sides to a temperature of 850 deg. to 900 deg. F. (450 deg.-480 deg. C.) The capacity of each retort is one ton per hour. Uniform and rapid heating is in this case secured by agitation of the charge and the fact that the solid residue obtained is thereby broken up, is in no way objectionable since it is subsequently briquetted.

The product of the low-temperature retorts is immediately mixed with 10 per cent of pitch (obtained in refining the tar recovered in the process) and briquetted. The briquets are then carbonized at 1800 deg. F. (980 deg. C.) in inclined retorts.

The yields of products reported for this process agree fairly well with low-temperature yields previously given, and it remains only to be said that the highly refined briquets obtained as the end product appear to be in good demand for domestic fuel. The writer has been told that they are competing successfully with the best anthracite coal.

The Summers Retort.

A continuous low-temperature retort designed especially for producing a dense coke by compressing the charge during coking has been proposed by Summers, and the writer is informed that a plant designed by him is being erected at Hamsburg, Ill.

Briefly, the Summers' retort consists of a horizontal coking chamber built of masonry about 40 feet long and of rectangular vertical section, 17 inches wide by 27 inches high. On the floor of the retort is a reciprocating iron conveyor extending throughout the retort length. A heavy cast-iron fin attached to this conveyor serves to take the raw coal from a hopper at one end of the retort and force it forward toward the other end where it is discharged through a water seal as coke. The conveyor is actuated by a powerful hydraulic ram. Heating is effected in large flues running horizontally through the retort side walls, and built-in regenerators are provided at the top. Extending along the roof of the carbonizing chamber is a channel which serves to assemble the distillation vapors and convey them to a standpipe and hydraulic main located at the feed end of the chamber. Provision is made for shifting the zone of highest temperature to any desired section of the oven walls so that the heating of he charge can be well controlled.

Mr. Summers states that "domestic coke of unusual density or a metallurgical coke can be made if desired." This is particularly interesting, since it lays open the possibility that in the future, low-temperature coke of such quality may be made that it will compete with that from high-temperature processes.

The yield of oil (20 gallons per ton) is much greater than that obtained in high-temperature processing, and at the same time a large yield of good gas is realized, one ton of coal yielding 8,000 to 10,000 cubic feet of 590 to 630 B.t.u. gas. It would seem, however, that in view of this high gas yield, distillation temperatures above the low temperature range were maintained and that the tars must have been decomposed to some extent.

The Green-Laucks Retort System.

An experimental plant of the Green-Laucks system is operated at Denver, Colorado, by the Denver Coal By-Products Company.

The retorts are vertical, 1 inches in diameter and 18 feet high, four retorts being mounted in each setting. A hollow worm mounted axially in each retort serves to force the charge through it and at the same time to conduct the distillation vapors to the outside. A vacuum of as high as 24 inches of mercury has been maintained in the retorts. This system involves, therefore, some agitation of the charge, and in addition, distillation under reduced pressure.

The Wallace Retort.

The most interesting feature of the Wallace retort system is a perforated off-take located at the center of the retort, the idea being to insure passage of the vapors from the point of evolution in a direction opposite to that of the heat flow.

The Wallace retort consists of a cast-iron cylinder mounted vertically in a brick setting and is heated by combustion gases in an annular combustion chamber passing entirely around the retort. To the top and bottom of the retort are bolted cast-iron plates, the joints being made gas tight with asbestos gaskets The perforated off-take pipe is closed at the top and passes downward through the center of the retort and to the outside through the bottom plate. Provision is made for collecting the tar-oils that condense in that portion of the offtake which is inside the retort, so there is little chance for the oils to become superheated.

The writer is informed that a Wallace plant at Petersburg, Virginia, has very recently been put into operation. All the analyses of products for the preliminary runs are not yet available, but it appears that the coke obtained is of good quality, the gas yield abnormally high (4.62 feet of 600 B.t.u. gas) and

the oil yield perhaps somewhat low (20½ gallons per ton.)

The Stansfield Carbonizer.

In a continuous apparatus for carbonizing lignite evolved by Stansfield, the material is fed onto the floor of a rectangular retort inclined at an angle of 45 degrees, or slightly greater that the angle of repose of crushed lignite. The retort floor is gas heated from below and the charge flows over it by gravity, the thickness of the layer being fixed by numerous baffles placed at right angles to the floor. The baffles also effect stirring of the charge and uniform heating. The rate of flow of material through the retort is regulated by the rate of withdrawal of carbonized lignite at the lower end of the retort.

The Traer Retort.

Traer carbonizes coal continuously in a retort 60 feet long, and of rectangular section 20 inches wide by 48 inches high. The charge is carried through the retort in cast-iron boxes mounted on iron cars with which the retort is kept filled, freshly charged cars being fed in at one end and cars of coke being removed at the other. Each end of the retort is fitted with a double door system. Passage of heat to the charge is here aided by the high conductivity of the iron containers.

The same device is used by the British Fuel Research Board to obtain efficient heating in their experimental low-temperature retort. Here the coal is charged in shallow iron trays sub-divided by numerous partitions, and the coked residue is obtained in uniform size.

Gas Generators with Built-in Low Temperature Carbonizing Retorts.

A method of combining low-temperature carbonization with complete gasification of coal has been developed in Germany and is now, according to Gluud, of considerable industrial importance. The apparatus is being built by the A. G. fur Brenstoffvergasung, Berlin, N.W., 40 Roonstr 4, and also by the Dutch Mondgas a, Nebenprodukten, Ges., m.b.H. Berlin. The machine of the Bernstoffvergasung Company is an ordinary gas producer with a rotating top. Attached to this is an annular iron retort extending downward into the body of the generator with means provided for retaining the charge and feeding it uniformly over the surface of the fuel bed in the generator as carbonization is completed.

A hopper similar in design to the charging bell of a blast furnace, serves to admit fresh coal as required to the retort. The retort is heated partly from the outer surface by conduction from the hot generator gases and partly by direct contact with a portion of the generator gas which is drawn through it. About one-third of the generator gas is by-passed through the retort for this purpose, and after the usual scrubbing for low-temperature oils it is re-united with the main supply which comes directly from the generator. It is claimed that the loss of gas due to re-carbonizing the coal can be replaced with an additional 10 per cent of raw coal or even less.

The improved Mondgas machine has a bell-shaped low-temperature retort built into the stationary generator cover and extending vertically downward into the generator body. The heating is done in the same manner as in the machine of the Brenstoffvergasung Company just described. Stirring of the charge and a uniform feed of coked residue are maintained by means of a gear-driven stirrer and distributor mounted axially in the retort. With this arrangement, coking of the coal is completed in 2½ hours and the generator gas contains "hardly traces" of tar; whereas without stirring of the charge the coking time is 3½ hours and even then the generator gas is dirty.

The gasses were compared for two parallel runs with brown-coal briquets, the low-temperature retort being operated in one test and not in the other. In the latter test nine per cent more gas was obtained, but it contained more tar and water, 80 grams of water and 5 grams of tar per cubic meter; whereas in the other test the total gas obtained from generator and low-temperature retort contained only 30 grams of water and 3 grams of tar per cubic meter. The heating value of this gas was about 1.5 per cent higher than that of the gas obtained by direct gasification. It would seem that this process might with profit be investigated further for the manufacture of industrial gas in this country. A clean, dry gas is always to be desired, and it does not appear that the scrubbing of the gas in this process presents much difficulty. Furthermore, it is only necessary to scrub one-third of the gas produced. The process might even prove applicable to our western lignites.

Conclusions.

Although increased interest has been manifested in low-temperature carbonization during the past year, progress toward commercial development has been slow. This is probably due in part to market conditions and in part to difficulties experienced by builders in perfecting their apparatus mechanically.

In order that a low-temperature industry may be firmly established, it is necessary that the popular prejudice against soft coke be overcome, and it will take time to accomplish this.

It does not appear that low-temperature methods are destined soon to occupy an important place in the gas industry in so far as gas for city supply is concerned. They may, however, be used to advantage in the production of industrial gas.

The writer is indebted to Professor S. W. Parr and Messrs. C. V. McIntire, R. S. McBride, G. W. Wallace and Walter Runge for their assistance in assembling material for this report. Reports of Investigations, U. S. Bureau of Mines.

TREATING DRY SILVER ORE.

L. H. Biggar, manager of the Ottawa mine, Springer creek, five miles east of Slocan City, was at the Trail smelter recently looking after a consignment of concentrates shipped from his mine. This shipment was of particular interest because it was the first product of a new adaptation of the flotation process to dry silver ores, and its success means low grade ores throughout the district, thus opening up a new vista in the treatment of dry silver ore. Seven hundred tons of mill feed of ore averaging twelve ounces to the ton were reduced to 20 tons of concentrates, containing 75 per cent of the total silver content. Mr. Biggar reports mining throughout the Slocan mining division is now more active than at any time in the past year. A number of other mines will soon begin shipping to the smelter and leaders throughout that section have taken fresh heart. Trail News.

At a meeting of the Association of Women of the Mining Industry held at Mrs. J. B. Tyrrell's residence, an address on Columbia, S. America, was given by Mrs. E. V. Neelands. The Association will hold several meetings during the winter months.

B.C. COAL MARKET DULL.

At the end of the month of October the coal production of the Province of British Columbia for 1921 aggregated about 80 per cent of the output for the same period last year. That the last two months of the year would see such an increase of activity at the collieries as to almost overcome the deficiency was the opinion of computators at that time. The situation now has changed, it being clear that the 1921 record can scarcely hope to equal that of the previous year.

On Vancouver Island two of the mines of one of the largest producers, the Canadian Western Fuel Corporation Ltd., Nanaimo, B.C., have been closed temporarily. These are the Wakesiah and Herewood Mines. At Extension, Nos. 1, 2 and 3 Mines, Canadian Collieries (D) Ltd. were compelled to close for about a fortnight owing to floods but are again in operation. Extension is responsible for a production of between 16,000 and 18,000 tons of coal per month. The Comox Mines of the same Company are working not much more than half time. The Cassidy Collieries, Granby Consolidated Mining & Smelting Co. Ltd., are maintaining a steady production of about 1,000 tons a day.

In the Nicola-Princeton Field the situation shows little change. The Coalmont Collieries Ltd. are making a better showing, ranking now next to the Middlesboro Collieries.

The Coal Creek, and Michel coal mines, Crow's Nest Pass Coal Co. Ltd., are working about five days a week on an average. A slight falling off is shown but, generally speaking, production is being maintained rather better in this section than on the coast.

Coal Mine Operators hesitate to ascribe a reason for the present dullness of the market. In some quarters the competition of fuel oil is blamed. There is significance in the fact that oil has dropped in some four months from $5.50 to $2.30 a barrel in Vancouver. Four barrels of oil are equal approximately to a ton of coal in B. T. U's or heat producing values. It follows that oil, equal in heating qualities to a ton of coal, can be purchased in Vancouver for $9.20. Coal cannot be produced at that figure. The cheapest it can be placed on a steamship in Vancouver is $10.50 a ton, this being Vancouver Island steaming coal. In view of these facts it seems reasonable to suppose that the present competition of oil is having a material effect on the demand for the locally produced fuel.

PACIFIC COAST COAL MINES.

The affairs of the Pacific Coast Coal Mines, Ltd. appear to be in almost an inextricable tangle, both in point of litigation and finances. The Morden and Suquash Mines of the Company were offered separately by the Sheriff at Nanaimo City on November 1st. The former was bought in by that Official with a reserve bid of $250,000 and the Suquash Property was taken up also with the reserve bid, the figure being $200,000. No sale to outside parties having been effected the situation remains unchanged.

Meanwhile litigation in the local courts continues. Applications are under consideration for the reduction of these upset prices on behalf of a legal firm having a claim of $40,000 and the representatative of 550 coal miners, former employees of the company, who wish, by virtue of mechanics' liens secured against the holdings of the Company, to obtain arrears of wages. This is being opposed by judgment creditors among whom are the Canadian Bank of Commerce, the Prudential Trust Company et al, the amount involved being considerable over $2,000,000.

Notwithstanding the present apparent confusion there is a prospect that the matter will be settled at an early date.

PORTER GOLD MINES.

An outlay of $200,000 will be made on the development of the Porter Gold Mines this Winter, says a cable from Sault Ste. Marie to the Toronto Mail & Empire, following the excellent showing made in the sinking of the first shaft in the mine. Word received from Gondreau Township was to the effect that other properties were showing rich free gold ore similar to that of the Murphy-Porter claims. The Gutcher properties, with three veins, have, it is reported, shown up well. A Detriot syndicate has taken an option on the sixteen claims of Thomas Powell and others, at a considerable distance east of the Porter mines. The first shaft in the latter has been sunk six feet in four days, and continues to make an excellent showing. There is feverish activity throughout the whole township.

PERSONALS.

Mr. Kirby Thomas of New York is in Toronto on his way back from Gowganda where he visited the Northcliffe property at which development work is being carried on.

Mr. A. G. Burrows is putting the finishing touches on his revised report on the Gowganda silver area. This has been for some time in the hands of the printers and should soon be ready for distribution.

A meeting of the Toronto Branch of the Canadian Institute of Mining and Metallurgy will be held on Saturday, November 26th.

Mr. F. J. Bell has resigned as president and general manager of Canada Wire and Cable Co.

PLACER MINING IN B.C.

Most of British Columbia's placer gold production comes from the Atlin, Omineca, and Cariboo Districts and it is expected, although no official figures have been compiled as yet, that the output for 1921 will be about the same as that of last year. Thus it may be anticipated that the value of the gold so recovered throughout the Province in the twelvemonth drawing to a close will amount to approximately $221,600 in value.

There has been clear evidence of a renewal of interest in the placer fields of the Province. This is not confined to one particular section. It is true of the Cariboo, where the Provincial Government last Summer did some keystone drilling; of the Omineca, where a number of enterprises give promise of becoming established mining industries; of the Peace River, where an important dredging proposition has been launched; and of the Atlin District.

It is significant that within the past few weeks Mr. J. B. Tyrrell, a well-known mining engineer of Toronto Ont., has been visiting the Province. In well informed quarters it is said that Mr. Tyrrell's visit to the West was made on behalf of a considerable and substantial body of capitalists of the Old Country. They are reported to be interested in the development on a large scale of some of the placer grounds of the Cariboo, Keithley Creek being mentioned as being the part with which his principals are particularly concerned. If Mr. Tyrrell's report is favorable it is possible that an investment aggregating $2,000,000 will be made in the Province. As Mr. Tyrrell is an engineer of high repute and unquestioned ability, one who has been identified with mining in the Yukon in the days of the Klondyke rush and who since has been connected with mining in this Province and elsewhere in Canada, a member of the Canadian Institute of Mining & Metallurgy and known from end to end of the country to the other professionally, there can be no doubt that his work in the West was of importance and that the outcome will be awaited with interest.

While in the Atlin District proper there has been little placer mining development of a new character, work of consequence is in progress some distance further north on Thebert Creek in the vicinity if Dease Lake. Here George Adams, a well-known northerner, is busily working out the problem of hydraulicking a large area of ground that, without a doubt, carries good pay. In 1919 he recovered $14,000 as a result of two months actual work in a very small area. During 1920 and 1921 his efforts have been seriously handicapped because of slides which washed out his flumes in some instances and in others completely covered his pit, necessitating commencing all over again. Last reports are that the water system has been re-established in a satisfactory manner and that the ground has been so cleared as to permit of mining on such a scale as to permit of regular returns being secured. Mr. Adams is an old placer miner. He thoroughly understands hydraulicking, having been in the business in Atlin for a number of years, and the word that comes to the outside indicates that his perseverance is about to be liberally rewarded.

These instances of improvement in the placer mining situation, however, are not and will not be reflected in the statistical returns for 1921 but they are happy auguries for the future of the industry.

THOMAS CANTLEY'S CAREER.

The Maritime Mining Record, of Stellarton, N.S., has the following to say of Mr. Thomas Cantley, Government Candidate for Pictou:

Thos. Cantley is a striking example of what push, brains,—natural ability—can accomplish. In his early years he was a typical Nova Scotia boy, in that he could turn his hand to about anything, and not ashamed to tackle anything that came his way. The first work he did was as telegraph messenger boy in New Glasgow. Then he secured a position in the Drummond colliery office, Westville. The explosion put him out of a job. Nothing in his particular line turning up, he accepted a position with Fraser and McKay, who carried on a small business, chiefly in railway spikes, carriage springs and axles and later forging railway axles. Afterwards he held a position, for a few years, with McCurdy & Co. In the later seventies, he went into business on his own 'hook' the firm name being Thomas Cantley and Co. The firm dealt largely in building material, Mr. Cantley, by strict attention, and ability was building up a lucrative business, when he was approached by Mr. Graham Fraser and asked to become *traveller* for the Steel Company. A salesmen was necessary for the extended, extending business. Two salesmen had been employed prior to Mr. Cantley being called upon, but neither turned out a first class man, and that was the kind of a man wanted. They say that opportunity knocks but once at the door of a man. Thos. Cantley nearly lost his opportunity, for he, for a time, declined the position, having married two or three years previously, and being father of a little boy of the age when boys are most interesting, he naturally preferred home to being away on the road. Mr. Fraser would not have a refusal and Mr. Cantley finally consented to enter the service of the Steel Co., and from that time till the present his career is a record of promotion step by step, as Thomas Cantley's wonderful executive ability became more and more apparent. From the 'road' he went to the office, from the office to the Board Room, from the general directorate into the inner circle, until two or three years ago he became Chairman of "Scotia's" Board.

At the beginning of the great war when it was imagined that Nova Scotia could not produce munitions steel, he asserted she could, he was taken at his word and we all know the triumphant success attending munition manufacture in Canada, due in main part to the man who Pictou intends to send to Ottawa—Thomas Cantley.

COAL AND THE TARIFF.

A convincing argument in favor of protection, and even protection in this particular case higher than exists, is built up by the Nanaimo Herald in an article dealing with the coal industry. This industry on Vancouver Island has suffered during recent years from the competition of fuel oil. Had this competition been allowed to go on unchecked it would have very seriously interfered with a great local industry, and probably half the mines on the Island would have been forced to shut down. The Government, however, imposed a duty on imported fuel oil, and this had a steadying effect, but not altogether the most desirable effect, for a higher

tariff still would lead to immediate development of the coal industry and the opening up of new mines.

The Herald points out that British Columbia now imports from the United States fuel oil valued at $12,000,000 yearly. Owing to the adverse rate of exchange the people of this Province pay a premium of ten per cent or more on their money for the privilege of buying this fuel oil. A heavier tariff would lead to a wider use of coal, would mean a substantial increase to the wage roll on this Island and the consequent circulation of more money at home. Vancouver Island, because of its dependence on the coal industry, is practically interested in this tariff question, for there can hardly be a doubt that a reduction in the tariff, such as is advocated by both the Liberals and Farmers, would spell ruin to the development work which is being carried on in the coal areas. A stated case always carries conviction and there are sound and legitimate arguments why British Columbia should use products of its own mines for the benefits of its own people. The importation of fuel oil is on the increase and the coal industry suffers, which shows that the existing tariff is not high enough. It shows also that any reduction in that tariff would assuredly increase unemployment on Vancouver Island.—Victoria Colonist.

Northern Ontario Letter

THE SILVER MINES.

Temiskaming.

The possibility of the Temiskaming mine being worked under a leasing system is mooted this week in Cobalt mining circles. It is stated that this method of working the mine was discussed in official circles some time prior to closing down the mine, but was dropped on account of certain favorable developments having taken place about that time. It is now understood that a proposition is being prepared for presentation to the directors under which the mine might be worked on a royalty basis. As to this, there seems to be a strong element of doubt about the shareholders ratifying any such drastic steps in view of the fact that the resources of the mine, though limited, are such as will permit general operations to be conducted on at least a moderately profitable basis by the company itself. As long as this situation exists it is not believed the stockholders will be prepared to sanction the granting of leases to individuals.

Alladin-Cobalt.

Although the Alladin-Cobalt has suspended operations on the Chambers-Ferland mine, yet a small reduction of silver is being maintained through an arrangement whereby the adjoining Nipissing is working across the boundary of the Chambers-Ferland. This silver is being taken out on a basis of cost of mining and milling and has given general satisfaction on former occasions. Incidentally, the fact that such is being done has led to the belief that the Nipissing might reasonably be found making a bid for the purchase of the Chambers-Ferland.

Coniagas.

The re-treatment of tailings on the Coniagas has been suspended for the Winter due to cold weather interfering with outside operations of this nature.

Rich Ore at Nipissing Mine.

Official advice that vein No. 64 on the Nipissing mine has been opened up at an intermediate level and has been found to carry silver values of about $2,000 to the ton over a width of as high as 26 inches, mark the discovery as one of the best ever made in the Cobalt district.

Another feature of the discovery is that a large tonnage of good milling rock lies along the walls of the vein, and will yield about 100 ounces of silver to the ton.

This is the third important discovery to be made so far this year on the Nipissing, a fact which is giving rise to the belief that the new ore developed may actually exceed current production and thereby show an increase in reserves as of the end of the current year.

The latest ore shoot, running up to a width of 26 inches of $2,000 ore, is in a class with the surface bonanza's which in the early days of Cobalt earned the name of being silver sidewalks.

To Explore Bucke Properties.

Local mining men are endeavouring to organize a company which would have for its object the exploration of prospective silver mines in the township of Bucke. The re-survey of the geological structure of the Cobalt field is said to encourage the belief that commercial deposits of silver may be found in Bucke. The metal was found in a number of instances in this area, but was usually quite patchy and never resulted in more than intermittent operations on any of the various promising properties. In this latest effort under contemplation, a study of geology is to play a more important part than was the case in the past.

Keeley and Frontier.

Concurrent with the announcement that besides producing silver at the rate of over 100,000 ounces monthly the Keeley mine is adding in a big way to its ore reserves and is now stated to have approximately 850,000 ounces in sight, comes the information that the Haileybury Frontier is also meeting with substantial success. High grade has been found in a number of shoots on the Frontier, and although the occurrences are less spectacular than on the Keeley and not so large, yet they hold out good indications of further work resulting in the discovery of more extensive deposits.

La Rose.

The cave-in of rock on the original property of the La Rose Consolidated which caused the workings to flood has proved to be costly, and it is now understood that very little hope is entertained for being able to dewater the workings profitably. For this reason a considerable tonnage of low grade ore as well as a limited amount of high grade has probably been lost. The company is now confining its efforts to the development of its three other properties, namely the Violet, Princess and University.

THE GOLD MINES.

McIntyre Will Increase Mill Capacity.

The directors of the McIntyre-Porcupine Mines have decided to proceed immediately with the installation of equipment which will increase the capacity of the mill to fifty per cent. above its present rate. This information is official and promises to increase production to $3,000,000 annually as compared with around $2,000,000 a year heretofore.

This announcement comes at a time when the general

public had come to believe that mill enlargements on the McIntyre would be left in abeyance until next summer, and is a favorable surprise.

The present mill is treating approximately 550 tons of ore daily, while the new equipment will be a separate unit of an additional capacity of 250 tons daily in which the carbon bearing ores will be treated by special process, patents for which have been secured by the McIntyre in Canada and the United States. This means that the total capacity will be brought up to 800 tons daily, with a probable big increase in the amount of net profit. A feature of the announcement regarding the enlargement is that work commences immediately and that the new unit will be ready for full operation in March.

Another feature is that late yesterday the weather turned quite mild along the height of land and considerable rain fell. This caused a large amount of snow to melt and has caused a great volume of water to flow down into the lakes and rivers thereby adding to the water supply in storage for power development and completely setting at rest any fear in regard to power shortage for another full year.

The main shaft on the McIntyre has reached a depth of 1,875 feet at which point a station is being cut preparatory to opening up development levels at a depth of 1,625, 1,750 and 1,875 feet. In this way, the mine will be put in shape to feed still further enlarged mill at such time as additional power development becomes assured.

Union Mining Company.

Lateral work is being conducted at two levels on the property of the Union Mining Corporation, situated in the township of Whitesides and about thirty miles south-west of the producing section of the Porcupine field.

The shaft is down 300 feet, with lateral work having been carried on at a depth of 150 feet as well as at the 300-ft. level. It is now stated officially that arrangements will be made to conduct extensive diamond drilling operations for the purpose of exploring the veins at a still lower horizon.

R. W. Winton of Chicago, is president of the corporation, recently paid a visit to the property. C. Denker is engineer and manager in direct charge of operations.

Night Hawk Lake.

The Night Hawk Lake section of the Porcupine mining division is attracting more or less attention. A force of about 25 men is employed on the Peninsular Gold Mines, where A. R. Globe, former assistant manager of the Hollinger is in charge of operations.

Other properties in the Night Hawk Lake district are the Triplex to the south-west, the Muir property to the south-east and the Carveth to the east. It is stated by interested mining men that the coming summer may witness widespread activity in this field.

May Re-Open Ankerite.

The Ankerite property in the township of Deloro may be re-opened some time during the coming month provided the plans of Clifford E. Smith materialize. The property was aggressively operated some years ago by the Coniagas Mines of Cobalt, but values were officially stated to be too low to make the veins of commercial value. A large amount was paid and a further substantial amount spent on the property, but the Coniagas relinquished its option in preference to meeting the final payments.

At the same time, the Coniagas purchased the adjoining Maidens-McDonald property for something like $18,000 which property it still holds. The veins are said to traverse both properties.

Hollinger Treats 3,880 Tons Daily.

During the four weeks ended Nov. 4th the Hollinger Consolidated mill treated an average of 3,880 tons of ore daily This compares with an average of 3,858 tons daily during the preceding four weeks.

This latest achievement is the greatest ever accomplished at the Hollinger and marks almost the maximum that may be expected with the present milling equipment. Further increases will probably take place in due course through the installation of ball mills.

Ontario Gold Mines Output.

The Cobalt correspondent of the Journal corrects an error which recently crept into one of his articles about the present standing of the gold mines of Northern Ontario in which it was stated that an aggregate of upwards of two million tons of ore were being treated "daily". This should have read "annually."

Exploring North of Cochrane.

Right at the heels of the official statement just issued by George W. Lee, chairman of the T. and N. O. Railway Commission, that preliminary work in connection with the extension of the line from Cochrane to Oil Can Portage is now under way comes the information that a large number of boring permits are being applied for in that area lying approximately 40 miles beyond the end of the railway extension.

Geologists, among them being M. Y. Williams of the Geological Survey, Ottawa, have previously visited the district and report the occurrence of oil shales under conditions which hold out promise of petroleum being ultimately found in commercial quantities. These shales occur on the Mattagami river, and the applications for boring permits include territory on both sides of the Mattagami.

In a number of applications brought in to the Mining Recorder's office at Haileybury, were a number for land lying to the west of the Mattagami River. Prospectors are reminded that the river at this point constitutes the dividing line between the Temiskaming and the Sudbury Mining Divisions and that all applications for boring permits along the west side of Mattagami must be submitted to the Mining Recorder at Sudbury.

The announcement that the construction of the T. and N. O. extension is to proceed at once has signalized a general movement among prospectors to push far out into the unexplored lands ahead of the railway so as to "stand on the ground floor" at such time as the line is completed. There are thousands of square miles of territory through which no railways, not even a survey line passes and the area lies as a huge prize package into which the hunters of natural wealth are now finding their way.

King Kirkland.

A special general meeting of the King Kirkland Gold Mines, Ltd., will be held in Toronto, Nov. 28, for the purpose of considering and, if approved, confirming certain by-laws passed by the directors.

These by-laws are three in number, being summarized as follows:

(1) A by-law authorizing an application to the Lieutenant Governor for the right to increase the company's capitalization from 2,500,000 shares to 5,000,000 shares.

(2) A by-law authorizing the sale of the new stock at a discount.

(3) A by-law authorizing the purchase by the company from C. F. Jordan, E. L. Wettlaufer, G. A. M. Davison, Geo. Wettlaufer, A. B. Crosby, Gea. I. Hambly and Herbert Spoffard of the "Ferguson" claims Nos. 12440 and 12441 in the Larder Lake mining division. The price to be paid is 450,000 shares.

The Ferguson claims comprise approximately 80 acres and lie immediately adjacent to the present holdings of the King-Kirkland. In addition to having big prospective merit from a mineral standpoint, they are believed to comprise an excellent townsite.

The present authorized capital of the King-Kirkland is 2,500,000 shares, of which there are 970,000 shares in the treasury. By increasing the capitalization to 5,000,000 shares, issuing share for share of that already issued and paying 450,000 shares for the Ferguson claims, the King Kirkland property will be greatly increased in size and the treasury will contain 3,020,000 shares. With such a treasury and having a property of excellent merit, the King-Kirkland appears to be working into a position where no difficulty should be encountered in financing development work on a big scale and providing money for mill construction at such time as such equipment may be required.

Lake Shore.

During the month of October the Lake Shore mine produced $51,302.88. The mill operated 97.98 per cent of the possible running time and handled 2,015 tons of ore. This is the highest tonnage record in the history of the mine.

The Lawson Rumor.

All the flurry which developed in connection with reports that Thomas W. Lawson would visit the Kirkland district with a view toward interesting himself in a number of properties, appears to have died with the dismissal of a court case against "Col." Macklem who was represented as an advance agent of Lawson's.

Macklem entered into negotiations with B. C. Killoran of Haileybury for the purchase of three claims in Teck Township, the price to be $6,500. It was represented by him that he was a member of a syndicate in New York which had a capitalization of $50,000, his subscription to which was to be $2,500. Macklem stated that he had $2,000 but required $500 more to make good his membership in the syndicate, and if able to secure this $500 would then be in a position to go ahead with the $6,500 deal. It was suggested that a note should be drawn up for $500, backed by B. G. and H. Killoran. At the same time, Macklem presented the Killorans with a cheque for $7,000, this being payment for the claims as well as covering the note. Accordingly, when the time arrived for cashing the cheque as agreed, no funds were there. A charge of fraud was then entered against Macklem.

During the course of taking evidence, it developed that Macklem had already paid the Killorans $90 on the note, and the case was dismissed on the grounds that there was no evidence of fraud. In the meantime, nothing has been learned of "Lawson's second coming."

The bi-Metallic Standard.

Senator Tasker L. Oddie of Nevada has gone on record as declaring that the world must adopt a bi-metallic standard if the monetary status of the nations is to be preserved. It is stated that one of the leading economists who attended the recent meeting of the American Mining Congress in Chicago was asked the question of how could the countries of the world expect to meet their debts? To which he replied that the payment would be impossible unless the production of gold was stimulated far beyond its present rate. This stimulation does not appear to be possible, and in order to protect the present monetary system it would be imperative for the nations of the world to adopt the bi-metallic standard.

Whether or not Senator Oddie, or whether the economist referred to have judged the situation correctly is problematical. Silver producers have the fact fresh in mind that when the price of silver went to $1.37 cents an ounce a couple of years ago, there were a number of alleged metal authorities who predicted $2.00 silver. This has a tendency to make producers of the present day extremely cautious in accepting expressions of opinion.

One thing is sure, of course, and that is should bi-metallism be adopted on a basis of 16 to 1, that is 16 ounces of silver for 1 of gold, the silver mines in the Cobalt district would experience another boom. In thus fixing the price of the metal at $1.29 cents an ounce as compared with under 70 cents an ounce at the time of writing, an enormous tonnage of what is at present waste rock would be changed into a big profitable resource.

There would probably be at least a dozen new silver producers added to those that are already producing, while the incentive to explore and develop silver prospects would become great.—J. M.

B.C. MINING NOTES.

Stewart, B.C.—The boom days in the Portland Canal District, northern British Columbia, have passed and in their place has come a spirit of confidence coupled with solid development. Much has been said of the Premier Mine, but miners claim that the possibilities of the property are not yet appreciated on the outside, it not being confidently asserted that with the completion of the aerial tramway under construction, and the finishing of other work at the mine and at tidewater, the Company will be in a position to proceed with the opening up of one of the biggest mining propositions on the continent. George Clothier, the resident mining engineer for the District, is expected to have considerable to say in his Annual Report, not only regarding the Premier but with respect to other promising properties and to mining conditions generally in that section. Some of the prospects in the Fish Creek zone are said to be looking particularly well and development work is to continue throughout the winter on the property of the Fish Creek Mining Co. The Silverado Group of Mineral Claims also are being systematically explored.

Trail, B. C.—Ore receipts at the smelter of the Canadian Consolidated Mining & Smelting Company, Trail, for the week ending 31st October totalled 11,307 tons. Among the contributories were the Horn Silver, Silkameen, 43 tons; the Jessie Bluebird, Woodberry, 21; the Josie, Rossland, 96; the Molly Hughes, New Denver, 27.

the Ottawa, Slocan City, 26; the Queen Bess, Alamo, 33; and the Rambler, 32. The remainder 11,023 tons came from the company mines. The aggregate for the year runs to 348,156 tons.

Nelson, B.C.—The North Star Mine, Kimberley, has been re-opened after a period of idleness extending from last January. O. C. Thompson, one of the owners, states that it is the intention to operate throughout the winter. The North Star has only shipped a few cars this year, these consisting of a clean-up of old ore. In 1919 and 1920 this Mine was one of the chief private shippers in the Kootenay in point of tonnage. Mr. Thompson is interested with W. B. Horton in the Utica Mine, held by them under lease, and in the deepest workings two ore shoots have been uncovered recently, one 18 inches and the other about 24 inches in width, the showings being of clean ore of shipping quality. They now are driving a 2,000 foot crosscut which will give an additional depth of 250 feet on the vein.—L. H. Biggar, manager of the Ottawa Mining & Smelting Co., whose property is situated on Springer Creek, five miles east of Slocan City, has made a shipment of concentrates from the Ottawa Mill to the Trail Smelter. The shipment is of special interest because it is the first product of a new adaptation of the flotation process to the dry silver ores of the district. Mr. Biggar states that 700 tons of mill feed of ore averaging 12 ounces to the ton was reduced to 20 tons of concentrates, containing 75 per cent of the total silver contents and that the total cost of milling and handling was only $2 a ton from the dump to the smelter. As the values are concentrated to one-thirty-fifth of the original bulk the saving in freight alone is material and the Ottawa Mill Process may well be considered to mark a notable advance in the economic treatment of the dry silver ores of the section. Mr. Biggar and his associates have a four year lease of the Ottawa Mine and enough ore is in sight, it is said, to keep the Mill in operation for that period. It is the intention, however, to extend the plant in order to permit of the treatment of ore from neighboring properties. — The Mine Operators Association of Eastern British Columbia has been organized at Nelson, officers being elected as follows: President, R. Randolph Bruce, Invermere; vice president, Clarence Cunningham, Alamo; secretary-treasurer, W. H. Burgess, Kaslo; executive, S. S. Fowler, Riondel; T. W. Bingay, Trail; Major A. W. Davies, Nelson; J. P. McFadden, New Denver; W. T. McDowell, Ymir; Douglas Lay, Rossland; and S. G. Blaylock, Trail. Mining taxation is the principal subject with which the new organization is concerned at present, it being maintained that owing to the low prices obtainable for metals, as well as to general conditions, there should be no further taxation of the industry.

Vancouver, B.C.—J. B. Tyrrell, mining engineer and geologist of Toronto, Ont., addressed a recent meeting of the Vancouver Branch of the Canadian Institute of Mining and Metallurgy. He referred to the magnificent natural resources of British Columbia in agriculture, minerals and timber and continuing said: "There are people in Vancouver who would put their money into development projects if they believed the money would be properly expended. When it comes to mining the people do not know where to go for good advice. You as mining engineers can give them such advice and it is your duty to tell the people where they can be advised. You talk among yourselves and write articles to the technical magazines which are not read by the general public. If the public can be assured of fair and competent service it will be prepared to furnish funds for the service rendered. The province must look to you mining engineers to develop the resources of the province. You must get information about the mineral industry into the daily newspapers which are read by the public. You must get the ear of the public and assert yourselves in your profession in the duty of developing the resources of the country."

The Annual General Meeting of the British Columbia Division of the Canadian Institute of Mining and Metallurgy will be held in the City of Vancouver sometime during the month of February. In a circular announcing this decision the secretary emphasizes the opportunity that is afforded by such a gathering for the mining men of the Province to get together, at least once in the year, "to renew old acquaintances and make new ones." It also is stated that an excellent programme is being prepared and the hope is expressed that all members will make a point of planning to be present.

Dawson, Y. T. — Development work is to continue all winter on a number of the Mayo Camp properties. Electric drills are to be used throughout the closed season on the properties of the Yukon Gold Company and the Bradley Interests, associated with the Alaska Treadwell Company, will continue prospecting at their new camp, Keno Hill. Two shafts, three hundred feet deep, are to be sunk and connected on four levels. The Yukon Gold Company is opening up a vein of galena. It is a high grade ore, said to average well above 200 ounces of silver to the ton. Sixty additional claims have been staked within a month on Galena Hill, where recent promising strikes are reported. The winter work of hauling ore from Keno Hill to Mayo Landing for summer shipment down the river is now under way.

TECK-HUGHES.

Mr. Charles L. Denison, of New York City, the president of the Teck-Hughes Gold Mines, Limited, has written to the Financial Editor of the Toronto Mail and Empire to say that the long-awaited meeting of that organization has been set for November 30, when, it is expected a definite proposition will be placed before the shareholders. In some quarters there has been a disposition to blame the management for the delay in calling the shareholders together, but Mr. Denison says that, after the Provincial Government had submitted a draft of the title to the property that was satisfactory to the company's attorneys, the death of the late Lieut.-Governor Clarke before his signature had been attached necessitated the matter being gone over again. "I am sorry that the affair could not have been closed up before," says Mr. Denison. The forthcoming meeting is to be held in Toronto, although Mr. Denison and a majority of the bondholders wanted it held in New York. In deference to the stockholders this city was selected. Mr. Denison will probably not be able to be present, as his health has not been very good of late. While the plan that is to be submitted to the shareholders has not been as yet officially disclosed, it is understood that it will involve a new issue of stock and the retirement of at least a portion of the existing bond issue. Meanwhile the company is understood to be producing gold at a rate second only to the Lake Shore and the Wright Hargraves in the Kirkland Lake region.

U.S. COAL PRODUCTION.

Observance of Armistice Day was the principal cause of a sharp drop in total production of coal during the week ended November 12. The output of bituminous, including lignite and coal coked, is estimated at 8,466,000 net tons, as against 9,315,000 the week before and 10,956,000 in the last week of October.

THE VALUE OF GOLD.

To the Editor of *The Canadian Mining Journal*:

Sir,—I have read with interest some of the articles by Alexander Gray on "Gold" appearing in the "Canadian Mining Journal" and "Wall Street Magazine" and take the liberty of addressing you in reference thereto. I am of the opinion that "Gold" is the one factor that will decide either the prosperity or destitution of the present world, and am pleased to learn of some one else in Canada being interested in this question. I have written some letters to a Vancouver paper on this subject and enclose a copy of one, but the people of this country, generally, are blind on the money question, although it means bread and butter to many.

You, no doubt, have noticed the claims made by financial writers, "that the price of commodities determines the value and purchasing power of gold." You quote a Mr. Evans who seems to reason along similar lines. I cannot agree with that view, as it would be setting up commodities as a standard by which the value and purchasing power of gold might be determined, while the reverse is the case. I will adduce some proofs in support of my contention—if you are interested, consider them, if not throw the letter in the waste.

The standard price of gold in dollars is $20.67 per oz. The different monetary units contain sufficient gold to conform to this price. The unit of value is determined by decree insofar as the standard weight and fineness is concerned, but the value thereof is a different matter, and is subject to a higher law, that of "production and use" and value cannot be legislated into a thing that does not proceed by direct methods. Consequently, the value of gold would not be directly affected if the price were placed at $40 per oz., unless its use was increased or lessened thereby.

As an illustration, in respect to the value and purchasing power of gold, we can use the standard silver dollar, as when measured by gold we can observe the rise and fall of value therein, as with the purchasing power. Some time ago the price of silver rose to $1.30 per oz. (gold), the silver dollar then being at par with gold. Later it dropped to 60 cts. per oz., the value of the dollar going below 50 cts. (gold). Yet no change took place in the appearance, weight, etc. of that dollar, value being the only feature affected, which shows that "value" is the main requisite of a standard irrespective of the amount of metal it contains. It is easy to see that the actual worth of that dollar depended upon the value of the metal of which it is composed, and that the purchasing power increases or decreases according as the value thereof does—without reference whatever to the price of commodities, which must be changed to conform to the value of the standard, and may or may not be a true index to the purchasing power thereof. The gold dollar being subject to the same law in respect to value and purchasing power. As an instance—if gold should become as plentiful as silver, costing no more to produce, other things being equal, its value would be no greater. If it still remained the standard, its price, weight, fineness, etc., would be as today, but its value would be much different.

We can see today the price of all dairy products, eggs, etc., advancing, while that of cereals is decreasing, which according to this theory would mean both an increase and decrease in the purchasing power of mon-

ey, at the same time. The price of many products is controlled absolutely through understandings amongst producers, due to protection from world competition by an artificial barrier known as a high tariff, regulated on a currency basis. While the basic commodities, such as many of farm, forest and mineral products, must compete on world markets, the price of which is measured by highly appreciated gold dollars wherein the producer has no control over the price, which is as a consequence being forced down.

We hear of the decreased value and purchasing power of gold chiefly through editors of papers. It would be interesting to know what brought it about? Special payments were suspended for the purpose of protecting gold reserves. Gold is in greater need today than at any time before for the purpose of reserves in support of the paper issues of the various countries (without which, notes payable in gold, and in gold standard countries if not payable in such are worthless, as it requires no effort to produce millions of dollars worth, and have no value if the promise cannot be redeemed) the visible supply not being able to meet the demand. The greatly increased cost of production applied to gold as well as all commodities, and if these features cause gold to depreciate in value, it is in direct contravention of all economic laws. The gold standard was nowhere abandoned, and if it had been all currency based on payments in gold would become worthless. All countries, United States excepted, are functioning on a currency basis, but gold measures the value of those currencies, the result is the same the world over, the standard of measurement being the same. The concentration of gold in the United States does not cause inflation of prices there, and cannot anywhere unless it should decrease in value. If it did, then it should apply to commodities such as copper, wheat, paper and other products that are not controlled in price by artificial methods as there is evidently more gold there now than before.

If there was a shortage of wheat in the world, and the bulk was accumulated in one country, this fact would not cheapen the price even where it was piled up, as the world's demand for such would force it up everywhere, and to a greater extent than if it was equally distributed, and the position of gold is identical. The United States has the dearest money in the world today, and as a consequence the cost of production is higher,

D. J. Sullivan, Anyox, B.C.

COAL PRODUCTION IN U.S.

Production of soft coal in the United States showed a decided improvement during the week ended September 17, and for the first time since early in June, passed the eight-million ton mark. The total output, including lignite, coal coked at the mine, and mine fuel, is estimated at 8,139,000 net tons. In comparison with the week ended September 3, the most recent week of full time production, this was an increase of 533,000 tons, or slightly over 7 per cent. So far as it has gone, the year 1921 is in round numbers 47,000,000 tons behind 1919, 97,000,000 tons behind 1920, and about 126,000,000 tons behind the average of the war years. Compared with the average of all four years, it is 99,000,000 tons behind. In considering the possible effect of this subnormal production it must be remembered that the consumption of bituminous coal varies greatly with the general condition of business. For example, in 1914, a year of industrial depression, domestic consumption was only 409,000,000 tons; in the war year, 1918, when industry was running at a maximum, it was 530,000,000 tons. In 1914 a production of 423,000,000 tons was sufficient to fill the needs of the country. At present, however, 1921 is behind 1914, and if production during the remainder of the year is maintained at the rate since January 1, the total output for 1921 will be only 393,000,000 tons. The most recent year in which less than 400,000,000 tons would have been sufficient was 1909.

UNEMPLOYED COAL MINERS.

Unemployment among coal miners will constitute one of the major subjects of discussion at the forthcoming conference which will meet in Washington in response to a call by Herbert Hoover, Secretary of Commerce. Unemployment at coal mines during the first eight months of 1921 set a new low record. It was even greater than during the period following the panic of 1893, which previously held the low record. Twenty-six per cent less work was performed in coal mines during the first eight months of 1921 than during the corresponding period of 1920. Enough information already has been gathered, in anticipation of the conference, to indicate that approximately 150,000 men who are coal miners by trade are not now engaged in that activity.

SINTERING FLUE DUST.

Working from preliminary designs of the Cambria Steel Co., Arthur G. McKee & Co., Cleveland, have designed and erected a complete sintering plant at Johnstown, Pa., for the sintering of flue dust, both the large stock on hand and that as produced. The plant embodies two of the large size Dwight & Lloyd sintering machines. Only 12 workmen are needed to handle over 1000 tons of material daily. The plant covers an area, 80 x 300 ft. Advantage is taken of a hillside location to eliminate the installation of an expensive trestle. An area of otherwise useless space is also occupied to advantage.

NITRATE POOL.

Those interested in the nitrate industry, says The Capitalist of London, (Eng.), will read with interest the telegram which has been received from the Valparaiso branch of the Anglo-South American Bank, in the course of which it is stated that there is no movement to report as regards nitrate, but the arrival of the Hon. Herbert Gibbs, chairman of the Nitrate Pool, is awaited with interest, in view of the possibility of an arrangement between the Association and the Pool. Mr. Gibbs, who is due in Valparaiso on the 29th inst., is visiting this country by invitation of the Chilean Government, and it is hoped that as a result of the personal conferences between the leading representatives of the nitrate interests which will then be possible, some arrangement will be evolved which will be satisfactory to all sections of the industry, and to Chile, to whose interests the present deadlock is obviously inimical.

EDITORIAL

THE GENERAL ELECTION.

With polling to take place on Tuesday next, the long-drawn-out election campaign is getting very near its end. It is more than usually difficult to make any forecast of the probable result of this election by reason of two circumstances. First, in the present contest, three distinct and separate parties are, for the first time in Canadian political history, contending, throughout the length and breadth of the Dominion, for place and power. Secondly, this contest is the first in which the women of the whole country have been entitled to the exercise of the franchise. These two circumstances combine to introduce an element of doubt—just as they present unusual possibilities—into the present election which is remarkable even in this country where the political opinion of the constituencies is notoriously difficult to collect, save at the polls themselves.

Apart from the question of the Government record which, in various directions, has been bitterly assailed by both the Liberals and the Progressives, the question of the tariff has formed the dominant issue in the campaign which is now so near its end. Three weeks ago, we dealt editorially, at some little length, with this important question, as we believe it to be viewed by the mining industry as a whole. In our judgment, mine operators generally would welcome the duty-free importation of such mining machinery and parts as are not manufactured in this country, but, at the same time, they are very far from being inclined to be unduly and selfishly insistent on the encouragement of the mining operating industry at the expense of manufacturing industries already established and endeavoring, often under substantial handicaps, to serve the community well.

Considered purely as an intellectual problem, the framing of an adequate and equitable tariff for the Dominion—such a tariff as will mete out substantial justice to all the parties affected by its incidence, producer, manufacturer and consumer alike—is a feat the achievement of which surely presents no insuperable difficulty. It is a task which we should contemplate with equanimity seeing entrusted to the hands of either a Conservative or a Liberal Government. The one party stands for tariff for protection of industries, and the other for tariff mainly for purposes of revenue. But (as our past political history has shown) a tariff framed along lines substantially similar has hitherto satisfied alike the Conservative, Protectionist and Liberal who adheres to the tariff mainly for purposes of revenue. In other words, the difference between the two schools has been rather academical and theoretical than one involving any enormous divergence in practice. As it has been in the past, so we believe it is likely to be in the future, so far as Conservatives and Liberals are concerned.

But Conservatives and Liberals are no longer the sole contestants for the position of shaping the policy of the country, fiscal and otherwise. A new party—the Progressive party—has arisen whose goal, in the words of its accredited leader, the Hon. T. A. Crerar, is "the ultimate elimination of the principle of protection in our fiscal policy." The platform of this party demands that the tariff laws should be amended in the following respects:

(a) By an immediate and substantial all-round reduction of the customs tariff.

(b) By reducing the customs duty on goods imported from Great Britain to one-half the rates charged under the general tariff, and that further gradual, uniform reductions be made in the remaining tariff on British imports that will ensure complete Free Trade between Great Britain and Canada in five years.

(c) By endeavoring to secure unrestricted reciprocal trade in natural products with the United States along the lines of the reciprocity agreement of 1911.

(d) By placing all foodstuffs on the free list.

(e) That agricultural implements, farm and household machinery, vehicles, fertilizers, coal, lumber, cement, gasoline, illuminating fuel, and lubricating oils be placed on the free list, and that all raw materials and machinery used in their manufacture also be placed on the free list

(f) That all tariff concessions granted to other countries be immediately extended to Great Britain.

(g) That all corporations engaged in the manufacture of products protected by the customs tariff be obliged to publish annually comprehensive and accurate statements of their earnings.

(h) That every claim for tariff protection by any industry should be heard publicly before a special committee of parliament.

Now if this party should secure the opportunity, either alone or by reason of an undue predominance in a coalition it might effect with another party, to translate its platform into legislation, we confess we should regard the outlook with considerable apprehension. It may, no doubt, be said, and with a certain modicum of truth, that, in certain directions, some of the provisions quoted would directly benefit the mining operating industry. It may also, perhaps, be argued that, inasmuch as their conjoint tendency would undoubtedly be to direct workers from the factories of the country into its fields, its forests and its mines, the mining operating operating industry would indirectly benefit from them in the way of securing a more plentiful, and a much cheaper, supply of labor for the mines. But those engaged in the mining operating industry do not, we are persuaded; form their judgment solely by reference to any such narrow or sectional standards. Industrially, we "are members one of another," in a very real sense. From even the most casual and cursory examination of the platform from which we have quoted, and its almost certain effects in application, it is apparent that it seriously threatens many existing Canadian industries. As a matter of fact, it is not possible truthfully to say that, while such and such industries would be prejudicially affected by it, others would be unharmed thereby, and hence have no cause to be disquieted thereat. For if a blow is dealt at some industries, it is out of the question, in the complex and complicated condition of our present commercial and industrial life, that the effects of the blow should be confined solely to those particular industries. Impairment of a number of the country's industrial units must inevitably make for the impairment of our whole industrial fabric.

A reduction of the customs duty on goods imported from Great Britain to one-half the rates charged under the general tariff—apart even from the effects to be apprehended from "an immediate and substantial all-round reduction of the customs tariff"—would gravely menace the existence of hundreds of Canadian industries, "while complete Free Trade between Great Britain and Canada in five years" would completely and irretrievably ruin them. Even as things are today, a large number of our national industries are subjected to the pressure of acute and increasing competition from the importation of goods imported from Great Britain which not only enjoy the lower rates accorded by the existing British Preference, but are also, at the moment, substantially aided by the exchange situation.

Considerations of space prevent us from analysing the whole of the rest of the Progressive platform, but attention should be drawn to the plank which advocates "endeavoring to secure unrestricted reciprocal trade in natural products with the United States along the lines of the reciprocity agreement in 1911." Now, whatever may be said for, or against, the reciprocity agreement of 1911, the situation has certainly changed since then, and it scarcely seems opportune that, at a time when the United States has raised its tariff barriers to an almost prohibitive level, that we should indulge in extensive talk as to the feasibility of lowering our own. The Emergency Tariff Act of the United States had for its primary object the protection of the agriculture of that country from Canadian competition. If, in the future, it should be so modified as to allow of importation from Canada of agricultural products, the *quid pro quo* which would be insisted on would undoubtedly be heavy reductions in the Canadian tariff on manufactured goods from the United States. Thus, however it may be sought to disguise it, the demand for "unrestricted reciprocal trade in natural products with the United States" must mean the obtaining of special concessions by a special class—namely, the agricultural (and mainly the grain growing) class—in Canada at the expense of the manufacturing community of the country.

We are not contending that mine operators think that the present tariff is not susceptible of equitable modifications. But we certainly hold that the extremely radical and, in a fiscal sense, almost revolutionary proposals on which we have commented, are of such a nature as to impair the fabric of Canadian industry, viewed as a whole. In our view, the requisite modifications of the tariff, so far as the mining industry is concerned, could easily be agreed on in consultation between the mining operators, on the one hand, and the manufacturers of mining machinery, on the other. The mining operating industry can be, and should be encouraged in many ways by the Government. Fiscally, it should be stimulated in every way that is possible without the infliction of injustice on manufacturing industries already established, and which have been encouraged to reckon on a degree of such legitimate protection as renders their industry possible and their enterprise remunerative.

SOME INTERESTING FIGURES.

In an address to the Associated Northern Boards of Trade, Mr. G. C. Bateman spoke of the importance of the mining industry to Ontario, and, in doing so, made use of statistics which show what has been done. He estimates the expenditure of metal mining companies operating in Ontario up to the end of 1920, at $760,000,000. "This vast sum has been paid out by the mining industry for labor, supplies and equipment, and a large part of it has gone directly to the farmers and business men of the older part of Ontario. The shareholders in these companies received $125,000,000 in dividends on investments of $160,000,000, while the business interests received the profits on disbursements of $760,000,000. It does not seem unreasonable to assume that the business interests have profited to a greater extent than the shareholders."

Such figures as quoted by Mr. Bateman help to explain why those who are engaged in the mining industry claim that the industry is of national importance and is one which should have the intelligent consideration of Governments. Such indirect benefits as come to the Province from mining operations cannot properly be ignored by the public and would not be if the public and the Government were as well informed on the subject as they are concerning industries that thrive in the more settled districts.

The lack of interest in mining is not peculiar to any political party. All profess great interest in the development of our great natural resources, and nearly every politician finds occasion to refer to the vast undiscovered or undeveloped wealth of our country. But few of these gentlemen take sufficient interest in the development to learn the facts, and to formulate and fight for policies that will be really helpful. We must of course, all realize that Ontario's mining industry is young, and that its place in the life of our people is not yet well understood. The strange behaviour of Governments, in matters that affect the mining industry, is the natural result of the educational system, which is designed to lead young men into safe and proven fields, rather than to venture out into new fields and run the risks and share the trials and triumphs, of the pioneer. In our cities, and in towns and villages of the agricultural districts, mining, as an industry, is scarcely known. Small wonder, then, that the men who risk lives and futures to make mines in the wilderness are not highly regarded by the men who are elected to govern. The successful miners are seldom given credit for building up industries that are a benefit to the community. They are recognized for their money rather than for their works. Some of our people are even desirous of taking back from successful companies the lands which they have, by their industry, made valuable. Others, who cannot appreciate the difference between mineral deposits and profitable producing mines, like to regard the mines as public property, which should be worked for the public benefit alone rather than for those who have made the deposits commercially valuable by expenditure of money and labor.

Under such conditions, it is but natural that men in the mining industry have frequent occasion to ask for better understanding of their enterprise by the public. Such figures as Mr. Bateman has collected help to indicate, in terms that are easily understood, the importance of the industry. In addressing such men as compose the Boards of Trade, Mr. Bateman is helping the industry, and we can well thank him for his contribution towards a better understanding of the industry by the public.

THE FUTURE OF GOLD MINING.

That the mining industry is attracting some attention in Toronto is indicated by the fact that the "Globe" comments on Premier Smuts' recent remarks on the gold mining industry of the Rand and says of Ontario gold mining industry: "Last year Canada's whole gold production was valued at about $16,000,000. Today the gold mines of Northern Ontario alone are producing at the rate of nearly $20,000,000 a year, or nearly 40 per cent. of the output of the United States. Ontario's mines are not dependent upon the premium which General Smuts says is keeping a score of South African mines alive. Revenue from exchange is surplus profit—pure 'velvet' for the mine owners. In the Northern Ontario gold mines this Province and this country have an asset which is peculiarly valuable at the present time. It is only in the early stages of its development, and it is destined to be an economic factor in the life of Canada beyond anything imagined a few years ago."

The development of our mineral resources is evidently attracting some notice, and the possibility of gold mining becoming a great industry here is not altogether ignored by our leading newspapers. Some day the newspapers will begin to help the public to think of mining as an industry that can be honorably engaged in. The risks that men take to develop mines will then not be so easily spoken of as dangerous speculation, and the efforts of the builders of new industries in the wilderness will be praised quite as loudly as the works of those who travel the safe and easy paths of the older settled communities.

To encourage the development of mineral resources means to encourage the taking of risks both physical and financial. Mining is a hazardous business and many have not the courage to take the necessary chances. It is natural that men who hold responsible positions should not appear to encourage speculation, even if they believe it necessary in order that there may be progress. Even among mining men we frequently find persons who like to delude themselves and others with the idea that mining is not a venturesome

business. We are inclined to view such expressions not as the results of experience, but rather as an effort to make mining appear respectable. If to be respectable we must engage only in business that does not entail great risks, then the future of gold mining must depend on the efforts of those who are yet called speculators.

The results being obtained by our successful mining companies can safely be commented on by our most highly respectable newspapers without giving them the appearance of encouraging the taking of risks. It is not possible to make mines without taking great chances, but the evidence that there is some chance of winning is not without effect on public opinion. The future of gold mining in this country continues to depend on the prospectors who run chances on making discoveries and on men who risk money to develop the prospectors' discoveries.

EDITORIAL NOTES.

In South Africa the future of the gold mining industry is attracting the serious attention of the Government. There the interest rises because of threatening decrease in production. In Ontario we need Government attention to help increase production.

Another addition to gold producers of Ontario is to be made shortly. The Ontario Kirkland mill is nearly ready for operation.

Larder Lake gold area is receiving a great deal of attention now. Coniagas and Crown Reserve mining companies are interested. Canadian Associated Goldfields has been for some time almost alone in the area, but seems now likely to have the advantage of activity on neighboring properties.

The Toronto branch of the Canadian Institute of Mining and Metallurgy is holding a series of winter meetings. Some of the members are displaying an interest in Institute affairs that should have good results.

In our opinion the best thing the Mining Institute has done for some time was the sending of the Secretary on a tour of the mining districts.

REVIVAL OF NOTED ASBESTOS MINE.

During the past few months, says the Financial Times Asbestos Corporation of Canada has been increasing its production, and is now operating 50 per cent greater than during the dull period of last summer.

Its mines are being operated six days per week, as compared with four days per week last August.

Generally speaking, operations in the asbestos industry are carried on under adverse conditions at the mines in the winter time, and in consequence a very considerable number of mines are closed down in whole or in part, until the weather moderates, and the approach of spring relieves the situation.

Following its customary policy, however, Asbestos Corporation will maintain operations throughout the coming winter to the greatest extent consistent with the situation, and with its general plan to keep its staff employed as fully as possible.

Industrial conditions during the current year have been particularly bad everywhere, and the asbestos industry was no exception to the rule. The opinion was expressed to The Financial Times by an authoritative source, that, in line with other industries, the asbestos industry probably encountered the worst period in its history during the year 1921, it being added that the trade hoped, and also believed that it would prove the worst period the absestos industry would ever have to pass through.

European Market Affected.

The weakness of European exchange has probably been a more prominent factor in the case of asbestos than in most other lines. This is accounted for by the fact that the producers of asbestos depend upon their exports to Europe for an unusually large per centage of their business. Germany, in particular, has been a large buyer, and the asbestos industry of Europe may also be said to have centered in that country. The fact that the German mark has fallen to about one-fiftieth of its par value has been a most adverse factor.

The near future of the asbestos industry will depend to a very considerable extent on the movement of the mark and European exchange.

Asbestos Corporation of Canada probably goes in vicinity of 60 per cent of the asbestos business of Canada. It has been fortunate in overcoming to some extent the obstacle of depreciated exchange, and the hope is indulged that International relationships and exchanges will adjust themselves gradually hereafter, in such a manner that the export trade will not only be maintained at its recent volume, but will permit of the industry getting back to normal.

The Corporation, by reason of its conservative policy will, it is believed, be able to show a satisfactory financial statement for the current fiscal year at its annual meeting. Shareholders have been in receipt of their regular dividends and there is every reason to think that the surplus has been well maintained.

LA ROSE TO GO DEEPER ON VIOLET.

La Rose, says a despatch dated the 26th November, from Cobalt to the Toronto Mail & Empire, has decided to go deeper on the Violet vein, where results have been so good at the 530-foot level. This week sinking of the winze to 600 feet was started and if results are as expected at the deeper level the main shaft will be continued from the 470-foot level. On the 530-foot level a shoot of ore 225 feet long has been developed. Both ends of the drift are in ore, so no idea is had yet of the full length of the shoot. While not a very high-grade vein, values are found over a width of about five feet. The value of the whole 225 feet is about 30 ounces to the ton. It will be seen that this shoot is of considerable size and importance. Stopes started at the 530-foot level have been satisfactory. All work on the level will be stopped while the winze is being deepened. To handle the higher grade ore being sent by La Rose to the Bailey mill the milling company is now installing a ball mill. This will allow of finer grinding, giving a higher recovery.

The McMurray Tar Sands

By Dr. K. A. CLARK, Road Engineer.

The Industrial Research Department of the University of Alberta has undertaken the study of a separation process for reclaiming the bitumen from the "tar sands."

Bitumen from the "tar sands" may prove to be the remedy for Alberta muddy roads.

Probably no other natural resource of the Province holds quite the lure and fascination for the public mind as the "tar sand" deposit of Northern Alberta. While the scramble for oil goes on, and while we wait in expectancy till some of the drill-holes going down all about us shall tap some hidden petroleum pool, the "tar sand" deposit stands plainly in view, the biggest thing of its sort in the world, for anyone who passes to see. The deposit contains more mineral oil than the whole world could use for some time to come. But, because no one has yet discovered the secret of how to take the oil away, it remains there, year after year, unmolested. Many have looked for the secret. Samples of the "tar sand" have found their way far afield, and many technologists have given the material more or less their thoughts and attention. But still the deposit remains unexploited.

The Province of Alberta has recognized the futility of waiting for the development of this resource as the result of the efforts of outsiders, and has decided to shoulder the burden of her own problem. The answer to the "tar sand" riddle is now being systematically sought at the University of Alberta. The Industrial Research Department has undertaken the work and hopes to find the way to make available the content of the "tar sand" which is of value. It hopes to go further and fit uses for it to economic conditions in the Province. The attempt will be made, for instance, to demonstrate that the "tar sand" bitumen can be used in improving the highway conditions in Alberta.

Appearance of "Tar Sand."

One travelling into the Northland by way of McMurray and the Athabasca River can see the "tar sands" exposed on the banks of that great waterway for a distance of more than one hundred miles. The material can also be seen in the banks of the tributary streams. Such evidence has caused geologists to conclude that the deposit must extend over an area of at least 10,000 square miles. By the action of water during some past geological age, a huge bed of sand, approximately two hundred feet in thickness, was deposited on a floor of limestone over this great area. Succeeding ages buried the sand beneath several hundred feet more of other material. But, in the meantime, petroleum from some source that the geologist has not yet determined leaked into the sand and coated all the particles with a heavy mineral oil. The bituminized sand bed would be unknown to us to-day and safely hidden away if it were not that the Athabasca River and its tributaries had cut down their deep valley trenches through the covering to the sand and brought it to view. Most of the deposit, as a matter of fact, is hidden away under its heavy overburden and might about as well not exist. For it is only the material that is uncovered along the river valleys that is ever likely to be of any practical use.

A close examination of the "tar sand" shows it to be a dark brown to black looking material, soft enough, when fresh and not too cold to be deformed by the pressure of the fingers, and sticky enough to soil them with the tar. It has a decided petroleum smell. A magnifying glass enables one to see that each of the small sand grains is surrounded by a coating of the sticky oil. This oil, in a good sample, makes up about one-third the volume of the "tar sand." It represents, however, only one-fifth of the total weight.

If the "tar sand" deposit were located in the populated part of the Province, a certain amount of it could be directly utilized. Similar material occurring in certain parts of California has long been used for making pavements. There is a pavement in Edmonton built for demonstration purposes by the Dominion Department of Mines from the McMurray deposit. The small amount of useful material in the crude product, however, is an insurmountable obstacle in the way of its transportation to any distance. Since four-fifths of the weight of the material is worthless sand, it is not hard to understand that it will not take much shipping charges to bring the cost far in excess of any value it may possess.

How To Use It.

There is only one way to utilize the "tar sands" economically. Some scheme must be devised whereby the sand and bitumen may be separated from each other at the deposit, the sand discarded, and freight paid only on the bitumen to the point where it is wanted. Many schemes to accomplish this end have been proposed, and not a few have been tried. Most of the schemes fall into one of two classes. They either aim to take the bitumen away from the sand by driving it out with heat, or else by dissolving it out by some liquid in which the bitumen is soluble. Both schemes work, but not economically. The heating, or retorting, method is faced with the necessity of heating for nothing four times the weight of sand that there is of bitumen. Further, all the bitumen cannot be driven out by heat. Quite an appreciable portion of it remains and is destroyed. The solvent method is also inconvenienced by the necessity of handling large quantities of sand, which make it difficult to prevent loss of solvent which is a more valuable commodity than the bitumen being reclaimed from the sand.

It appears that some new lines of procedure must be thought out if the "tar sand" problem is to be solved. It is to this task that the Industrial Research Department has been set. Investigational work has been proceeding for some time now, and with considerable progress.

The Research Department does not, however, propose to leave the question when a separation process

---

* The term "tar sand" is a misnomer which is only justified by its wide popular acceptance. Tar is a term reserved for the oily distillate obtained in the destructive distillation of such substances as coal. "Bituminous sand" would be a better name. Bitumen is a very general term. The bitumen present in the McMurray deposit is a heavy asphaltic oil such as might be obtained by the partial evaporation of an asphaltic petroleum.

has been found. This would be to only half solve the problem. It is useless to extract the bitumen if there is no use for it after it is extracted. It is a common belief that the mineral oil that is present in the "tar sand" is on a par with petroleum such as is obtained from an oil well. There is a very real difference. When petroleum is distilled, light oils such as gasoline, kerosene, etc., pass over, while the part left in the still becomes thick and heavy. The material in the "tar sand" is more like what is left of a petroleum after the distillation process. Unfortunately much of the valuable parts of the original petroleum that leaked into the sand has disappeared. The "tar sand" will be a very unimportant source of gasoline. The most of the bitumen will have to be made use of in some other way.

For Rural Roads.

The Province of Alberta has one great need, and it is an idea of the Research Department that the "tar sands" can be made to fill it. Alberta needs serviceable rural roads, and is at a loss to know just how they are to be obtained. It is not at all improbable that the "tar sand" deposit is Nature's compensation to this Province for withholding the common stone road-building materials. Alberta is a Province where the earth road in some form must be the prevalent type. Soil materials must form the bulk of any road structure if the prohibitive expense of imported materials is to be avoided. Alberta earth roads, on the whole, are fairly satisfactory when they are dry, but when the wet weather comes their stability vanishes. Is there any way in which the earth road can be kept as satisfactory under wet as under dry conditions? Some preliminary experiments performed in the Research Laboratory seem to indicate that a reasonably small percentage of the bitumen extracted from the "tar sands" when incorporated into clayey soils prevents them from turning soft and sticky when exposed to moisture. The bitumen mixes with little difficulty into the wet clay soil. When the soil again becomes dry it is found that its behaviour toward water is decidedly modified. Work is under way to thoroughly investigate this effect, and to ascertain how much it can be counted upon to solve the earth road difficulties.

The Industrial Research Department believes that the "tar sands" and the earth road present phases of one big problem, and that the solution of the one involves the solution of the other. The bitumen, to be made available for economic use, must be separated from the sand with which it has been associated. At the present moment, however, it is not evident that there is any important economic use which would take care of large production of tar-sand bitumen. The development of a method for utilizing this bitumen in the construction of an economic type of improved rural earth road seems to offer one of the best foundations for the development of a "tar sand" industry.

ONTARIO KIRKLAND TO START HOISTING.

According to a despatch from Kirkland Lake to the Toronto Mail and Empire the power company was to turn full power into the Ontario-Kirkland motors and the management will begin hoisting ore into the mill. On Tuesday the mill will be turned over, and another gold producer will be added to the Ontario list of bullion makers.

The Ontario-Kirkland, financed almost entirely by Pennsylvania men, will make Kirkland Lake's fifth bullion maker against Porcupine's (at present) three producing gold mines.

Developed a half-mile south from the "main" break of Kirkland Gold Camp, the Ontario's efforts have demonstrated the existence of a second pay ore zone when for years it was thought that only one zone ran through the camp. The Ontario's success had something to do with widening the exploration of the field, with the result that three zones have been located definitely, and evidence of others has been secured.

The Ontario's mill, construction on which started only last summer, is of 100 tons daily capacity. The ore in the mine, as developed to date, will average around $15 a ton. A monthly output of between $40,000 and $50,000 is indicated. There should be a very fair percentage of profit. The deepest workings are at the 450-foot level, with most of the ore encountered to date on the 300 and 450-foot levels.

The first serious work on the Ontario-Kirkland commenced in 1916, under an option which was dropped because payments could not be arranged satisfactorily. The present operations were begun about a year later, under the management of Mr. Ralph Hurd, one of the pioneers of the district.

The company adopted the plan of having its mill erected by contract. Hill, Clark and Francis had the contract and they fabricated and set up the mill building, and installed all the tanks and machinery connected with the tanks. Ontario-Kirkland officials found this a good way, and were saved considerable money over what the cost would have been had they performed this work themselves, owing to the fact that the contractors already possessed the constructing equipment and organization.

ALBERTA COAL FOR PACIFIC MARKET.

The coal operators of the Province of Alberta are looking for a market on the Pacific Coast. Negotiations are under way between the Government of the Province of Alberta and the Vancouver Harbour Commissioners, having in view the construction of the floating dock in Vancouver Harbour. The object of this would be to permit the bunkering of steamers with Alberta coal on the Coast. No definite action has yet been taken, but it is thought likely that the project will be carried through, as the Alberta coal men are confident of their ability to meet the competition of British Columbia coal, provided the facilities indicated are arranged for.

WHITE LAKE COLLIERIES.

The White Lake Collieries, controlling a considerable area of coal bearing lands in the Nicola-Princeton District, have obtained the advice of mining engineers as to the possibilities of these lands, and have received very favourable reports. The result is likely to be the inauguration of drilling on an extensive scale in order that the opinions of these engineers as to the coal content of the region may be confirmed. If the results are satisfactory, there is no doubt that considerable capital will be invested and a new industry of importance launched. The coal in question is said to be of an exceptionally high quality in comparison with other Pacific Coast coals.

Rossland and Its Future

Well-known British Columbia Mining Authority Sees A Good Future For This Important Mining Camp.

Mr. E. A. Hoggen, a well-known authority on mining matters in British Columbia speaks highly of Rossland future prospects in the Vancouver Daily Province. He says: Rossland has been the most productive mining camp in British Columbia, and it has brighter days ahead than ever. With this year's production, Rossland will have produced 5,600,000 tons of ore, from which have been smelted about 2,800,000 ounces gold, 3,400,000 oz. silver, and 110,000,000 lbs. copper valued at $76,673,000. This represents 25 per cent. of the total lode mineral production of British Columbia, and more than 50 per cent. of the lode gold production. The experimental metallurgical work carried out by the Trail Smelter shows that millions of tons of mineralized rock, hitherto considered valueless, can be milled and smelted at a profit, and it is to utilize this huge reserve of low grade ore that the Consolidated Mining and Smelting Company has planned a mill to be erected in units, each capable of treating 1,500 tons a day, with a total capacity eventually of 5,000 tons a day. The mining of this low grade ore will employ a much larger amount of labor than has been required in mining the higher grade ores hitherto mined, and will probably double the production of Rossland.

New Mines May Be Added.

While there are only two operating companies in Rossland — the Consolidated Mining and Smelting Company operating the Le Roi Centre Star, White Bear and War Eagle Groups of mineral claims; the Le Roi No. 2. Ltd., operating the Josie mine—there are many claims on which mineral has been proved, and some of which may yet be added to the list of producers. Le Roi No. 2 Limited is the only gold mining company operating in the province backed by English capital, and it has arranged to increase its production by the addition of an oil flotation addition to the concentrating mill. This company has profitably concentrated ore as low as 46 cents per ton in gold, 0.5 oz. silver, and 20 lbs. copper. Its production has varied from the annual returns showing from 10,000 to 28,000 oz. gold; 12,000 to 30,000 oz. silver; and 500,000 to 1,000,000 lbs. copper.

Dividends.

Rossland mines have paid $4,550,000 in dividends, since the Consolidated Mining and Smelting Company, Limited, acquired the Le Roi and War Eagle-Centre Star groups, part of its dividend distributions should be credited to the Rossland mines which have thus re-paid their investors probably around $5,500,000 in dividends, while another $5,000,000 was earned as profit on the sales of mines to investors.

"The following companies paid dividends:

Le Roi No. 2, Limited	$1,620,000
Le Roi	1,475,000
War Eagle	1,245,000
Centre Star	210,000

Holdings of Consolidated Mining and Smelting Company.

The Consolidated Mining and Smelting Company Limited, has been steadily increasing its holdings at Rossland. It started by acquiring the War Eagle and Centre Star. In 1907 the Iron Mask, Idaho and Enterprise were added. In 1912 the Le Roi group was bought from the English company originally organized by Whittaker Wright; also the Virginia, Abe Lincoln and Iron Horse. In 1914 the Mabel, Paul Boy, Edie J. and Annie E. claims were added, and also the holdings of the Canadian Goldfields Syndicate. The White Bear group was subsequently bonded.

Nature of Mineralization.

There are two main mineralized belts in Rossland, known respectively as the North and South belts. The Consolidated has acquired the pick of the North belt. The ores of the North belt are copper-gold; those of the South belt carry galena, zinc blends and stibnite with a little gold. It is possible that the South belt may yet develop important mineral deposits, though it is at present neglected. It includes the Lily May, the first claim located at Rossland. The Consolidated properties give about two miles of mineral zones on the strike of the main veins. There are three of these veins, known as the Centre Star, War Eagle and Le Roi respectively, besides numerous small veins. These veins occupy shear zones in which ore shoots from 3 ft. to 50 ft. in width and from 50 ft. to 600 ft. in length. Gold values run up to 5 oz. ore ton, and copper values to 2 per cent. When first opened these mines carried high copper values. Now the copper is low and the values are mainly gold.

This Year's Tonnage.

The Consolidated Mining and Smelting Co. Limited has mined the largest amount of ore this year since 1916. The year's production will amount to about 130,000 tons, from which will be derived about 72,000 oz. gold,70,000 oz. silver and about 2,000,000 lbs. copper, of a total value of about $1,750,000. The production is likely to be increased from now on provided labor troubles do not upset the company's plans as in the past.

The new mill will doubtless be gone on with at an early date since the metal markets are improving. This mill will require a production of 450,000 tons a year to keep the first unit running, and will represent an annual value of about $1,500,000 a year. The mill when completed to the full capacity proposed, will handle 1,500,000 tons a year, of an annual value of about $5,000,000. In its best days the largest tonnage of the Rossland camp was 360,783, valued at $4,255,958. The highest value produced in any year was $4,893,395. The lower the grade of ore that can be profitably mined, the better it is for the miner, and for the camp, as the number of men employed is proportionate to the greater tonnage that has to be raised, and the larger the payroll on which the town depends. This is the justification for the forecast that Rossland has in sight the best days the camp has ever known.

Development.

Some idea of the amount of mining that has been done at Rossland may be gathered from the fact that the underground workings aggregate over 60 miles and the ore deposits have been worked to a depth of about 2,000 feet.

Other Mines.

Other mineral Claims in the North belt of the Rossland camp which have been shippers and may again become producers, are Nickel Plate, which shipped about 500 tons of $40 ore; Columbia-Kootenay, which shipped about 6,000 tons with values from $11 to $50 per ton; Cliff-Consolidated St. Elmo, shipped 1,517 tons, valued at $9.46 per ton; Spitzee, operated by the late Alex. Sharp, M.E., and which produced 5,000 tons of $12 ore; Giant, shipped 4,344 tons of $12 ore; Evening Star, shipped 899 tons running from $24 to $32.80 per ton; Jumbo, 30,000 tons, carrying $7.00 to $20.00 per ton; O. K. shipments, valued at $20,000. In addition to these there are several claims of which development has shown promising prospects, which await further development to ascertain their value.

The Velvet, 6½ miles southwest of Rossland, shipped about 100 tons valued at about $12 per ton.

South Belt.

Shippers in this belt are: Bluebird, 432 tons of ore averaging $28 to $35 per ton; Crown Point, 267 tons, averaging $35 per ton; Curlew, 7 tons; Homestake, 14 tons, varying in value from $4.40 to $150 per ton; Mayflower, 36 tons, valued at $56 per ton; Maid of Erin, 12 tons, valued at $38 per ton; Richmond-Lily May, 12 tons, valued at $32 per ton; Sunset 19 tons.

Largest Gold Producer.

Rossland is the largest gold producer in British Columbia to-day, and has the resources to enable it to maintain the position of the leading gold mining camp of the province for many years to come. Geological conditions are similar to those of Butte, Mont., and Namaqualand, South Africa, in operation since 1902. The mineralized area is proved over 9 square miles representing the site on ancient volcano. Discovered in 1887 it had the difficulties to contend with of want of transportation and smelting facilities. The first shipment of ore was packed by mules to the Columbia River, and shipped to a Montana smelter, giving a return of about $100 a ton. This fact at once attracted the attention of mining men to the new camp. By 1895 the camp had made such progress that it had two-dividend paying mines in the Le Roi and War Eagle. Then followed the erection of the first smelter at Trail to treat Rossland ores, and railway transportation followed. Electric power was provided from Bonnington Falls. Then came the boom from which the camp suffered for some years. The next set-back was the miners' strike which closed the camp for about a year. The exhaustion of the richer ore-bodies and the difficulty of working out a successful method of treating the low grade ores caused the shut-down of several mines. Yet, with all these difficulties, the camp has maintained an average output of about $3,000,000 a year for 22 years.

The Low Grade Ores.

In 1903 the necessity of working out the problem of concentrating the low grade ores was recognized and much money expended on it by interested companies. For 16 years, the best scientific talent that could be obtained was employed on the problem. Eighteen months ago it was successfully solved by the metallurgical staff of the Consolidated Mining and Smelting Co. of Canada, Ltd., and plans put in hand for the erection of the necessary mill. Construction was started at a site between Rossland and Trail, but in the closing months of 1920 the aftermath of the war disorganized finance, the metal market, and closed most of the mines. The work was suspended in consequence. Now that mining conditions are improving it will be again put in hand and carried to competition, turning to economic account millions of tons of minerals hitherto considered valueless; and adding probably $100,000,000 to the realized wealth of Rossland.

Not only will that camp benefit, but the work done by the Consolidated Mining and Smelting Co. Limited, on this problem has opened the way for the economic utilization of vast resources of mineralized ore bodies hitherto considered of no account, and the value added to the wealth of Rossland will be multiplied many times by its application to other similar low grade mineral deposits in the province.

With Rossland leading the way in the increase of gold production we may expect renewed activities in other sections of the province.

RAND MINING POSITION.

A despatch from Johannesburg shows that the mining position in South Africa is such as to necessitate the severest economy, owing to the dependence on what is known as the "gold premium." It is so serious, in fact, that General Smuts, the Premier, recently met a deputation of the South African Workers' Union thereon. According to the despatch in question, the momentous position which has arisen with regard to the whole gold-mining industry as the result of the conference between the Government and the white miners is the great topic in Johannesburg.

The new proposals would mean a slight diminution in the number of white miners, as compared with that of native labourers, and also result in considerable economy. The white miners so far oppose the proposals, and the Rand is now faced with the possibility of a far-reaching settlement, or, on the other hand, with the probability of a refusal on the part of the men to accept the position.

General Smuts says he joined the conference because he felt the gravest concern for the position of the gold industry. That industry had been drifting into a more dangerous position for many years. It seemed to him that the time had come for the Government and the people to review the situation very carefully, and, unless they were prepared to court disaster in the not distant future, they ought to begin to put their house in order.

The gold industry to-day continued to exist on a mere fortunate accident, namely, by the grace of what was called the "gold premium." If that premium were to disappear half the Witwatersrand would close and that premium must come down.

If, for instance the Prime Minister added, America cancelled the war debt owing by Great Britain to the United States the exchange between Great Britain and America would be restored and the gold premium would disappear in one swoop. Hence the industry should be run independent of the premium. There were 39 gold mines working to-day. Of these 24 would close down immediately if the premium disappeared.

The Prime Minister emphasized the fact that if the East Rand Proprietary Mines closed down and pumping ceased it would practically mean a wash-out of the Witwatersrand from the Geldenhuis Mine to

Benoni, and a similar situation was possible on the West Rand. After most serious consideration the Government had come to the conclusion that the only means of improvement was to make native labour underground more efficient, and it asked the conference to give this scheme a trial. He was informed that the new regulation would not affect white labour detrimentally, although it would doubtless prevent the appointment of the large white force which would be necessary if the present regulations remained in force.

The Prime Minister then gave an assurance that there was not the least idea of touching the position of white labour on the mines, otherwise he would not look at it, but he was convinced that it would lead to a slight increase in the employment of whites.

In the course of his statement the Prime Minister gave a detailed description of the position in the industry, contrasting the year 1914 with to-day. Working costs, he said, had risen by 8s. 5d. per ton, while wages had increased 54 p.c. and were now about £11,000,000 yearly. Nevertheless, efficiency, if anything, had decreased, and native labour efficiency had gone down by 13 p.c., despite a slight increase in wages.

Summing up the position, the Premier asserted that, in seeking a solution of the danger threatening the existence of the Rand, in future he would not look to white labour nor to the removal of the colour bar, nor to the importation of more natives, but to the one vital matter of the real working efficiency of the natives. He appealed to the deputation to give it a trial.

The miners' delegates, in rejecting the proposal, maintained that it meant the removal of the colour bar.

Mr. Hendricks, the miners' acting secretary, said if the proposal were gazetted there would be a general strike on the reef and the coalfields within 48 hours.

It is understood that there is every likelihood that the matter will be re-discussed at a conference between the Chamber of Mines, the Mineworkers' Union and the Government representatives next week.

The Financial Times, of London, (Eng.), has the following comment to make in the matter:

"Theoretically, a decline in the paper-price of gold should be compensated for by a rise in its purchasing value against commodities and wages. Already this has happened in a degree, but the danger is that the mines—as well as other industries—may be crippled by the remedy coming too slowly after the disease. As has been found the world over, and is virtually inevitable, it is much easier to put wages up in a period of prosperity than to bring them down again in the lean years such as we are now experiencing. With a view to tempering the wind to the lamb's natural disinclination to be shorn, General Smuts and the leaders of the Rand industry have put forward a bold programme for improving the efficiency of the mines.

"By allowing the natives to take over certain tasks which they are quite capable of doing, and which do not justify the employment of highly-paid white labour upon them, the mines would be able to obtain a much higher output for the same—or a smaller—aggregate of cost than at present. They would thus be able to go some way towards reducing expenses per ton of ore from their grossly inflated post-war level. The miners' delegates' futile reply to General Smuts is that the suggested reforms would mean the removal of the "colour bar," and that the gazetting of them would be followed by a general strike on the Rand and the coalfields within forty-eight hours. This reply is, as we have characterised it, futile, because there are only two alternatives before the white miners. Either they must consent to a much more drastic reduction of their own wages than has already been agreed upon or they must co-operate with the native workers in giving a much-increased ratio of efficiency. Failing the carrying through of either of these alternatives half the mines of the Rand will find themselves compelled to suspend operations when the paper price of gold settles down at a low level. Then for a majority of the white miners there would be no "colour bar," or anything else, left to strike about. They would simply join the ranks of South Africa's already numerous unemployed. Happily further conferences are to be held, during which it is to be hoped that the men's representatives will see reason."

PROSPECTORS AS MILLIONAIRES.

Northern Ontario, says the Northern Miner has made millionaires of very few prospectors. Probably Harry Oakes and Bill Wright are the only ones who can count up to seven figures, but scores of them became wealthy, like Barney McEnaney, with his half million and Aleck Gillies and Ben Hollinger with their $150,000 odd. If one were to scout around he could dig up 50 prospectors who have made $50,000 and more, enough to keep them for life, from their lucky strikes. Harry Oakes is the only man in the North who staked a gold claim and carried it through to the producing stage without control.

The Ontario gold and silver mines have been most kind to the men who got into the mining game in its infancy, or into recent camps in their first days, on the financing and operating end. Twenty millionaires have been made by Cobalt, Porcupine and Kirkland Lake, and in nearly every case they were poor men to start with.

And then the dividends that have gone out to shareholders; they have enriched many a bank account, built many a fine home and made many a family comfortable. Perhaps we do not hear so much of the dividends, the rewards of fortunate investment, as we do about those who took a flyer on the mining market and landed wrong side down, but figure for yourself—115 million dollars in dividends, from the Ontario gold and silver mines, in little more than ten years, well,—real mining pays. Now to, the list of prospectors who have made a big killing in Northern Ontario add the name of W. H. Wright. He was a quietly pleased man when a few days ago Wright-Hargreaves Mines, Limited declared its initial dividend, one of five per cent. That dividend meant a cheque for $26,896.35 to him, a rather handsome windfall especially as the mine is showing that there are many more to follow, but the worth of the dividend exists mostly in the establishing of value to his shares. Mr. Wright holds 537,927 shares of the 2,750,000 in the company. That stock appears to have a price of at least $1.50 a share, perhaps much more because a block of this size fetches a higher price than a small lot.

On top of his Wright-Hargreaves holdings, Bill Wright is a large shareholder in Lake Shore of which company he is second vice-president and he had big holdings in Sylvanite, which he sold out a few months ago. He has made pleasant cleanups on other parts

of his original 17 claims in the Kirkland Lake camp. At the present time he has a deal on foot for some of these claims at a good figure. There is reason to credit Mr. Wright with being a millionaire.

Ten years ago he had nothing, except at odd times a few hundred dollars. When he left England it is said that his chief asset was the rights on a veteran lot in Porcupine, given him in exchange for a bill that a man in London owed him. He sold the veteran lot when Porcupine was enjoying its first boom, but he says that the thousand odd dollars he made selling this was eaten up in travelling to England, and in legal expenses trying to establish title.

His next important move was into Kirkland Lake. He was one of the first small batch of prospectors in that now thriving camp. Harry Oakes, another of the prospector millionaires, came in at the same time. Bill Wright may have had a little more than Oakes when they pushed through the bush to the lake that a government clerk honored with her name, but he didn't have much. Oakes staked the Lake Shore Mine, and was also connected with the staking of the Tough-Oakes and other properties in the district. Wright, in company with his partner Hargreaves, staked the claims that now make the Wright-Hargreaves Mine. Hargreaves sold out a fortnight after staking, getting a respectable sum for his interest, but an amount comparatively small compared with what he might have had if he had stuck like his partner. Altogether Wright staked and acquired 17 claims to the east of the lake. And he made the first discovery of visible gold in Kirkland Lake camp. That was in the fall of 1911.

Big developments have followed since that day. The Wright-Hargreaves Mine, moneyed by New York State people, has stepped into place as one of the most promising gold mines on the continent and considering its size it is probably the best equipped of any in the North. Its mining and milling machinery are perfect samples of the latest Northern Ontario practise. Its ore is rich as Northern Ontaria gold ores goes, averaging $15 to the ton, and there looks to be lots of it.

Bill Wright puts on no airs. He is unassuming to the point of modesty. And to look at him you'd never know he had a million. Most decidly he refutes the claim that wealth brings worries. He is unmarried, and lives at Haileybury when he isn't off prospecting.

To show you the kind of man he is, when the war broke out he enlisted. He served with the Canadians in France, the front line troops. He was pretty well fixed then but as he says, "I would have had to go if I had had 100 times the money." He served all the time as a full buck private. "I wouldn't even let them make me a lance jack."

U. S. PRODUCTION OF PETROLEUM.

Production of petroleum in the United States, according to the U. S. Geological Survey, continued to decrease during October. The daily average for the month, 1,149,613 barrels, was 70,887 barrels a day less than the production for September, and was the smallest for the month since February, 1920. California, as a result of the strike in the oil fields, dropped to third rank, and decreased daily average production is also reported for all the other States, with the exception of Wyoming, Illinois, and Montana, where small gains are recorded. Only 752 producing oil wells are reported to have been completed during October, as compared with 2,086 wells in October a year ago.

BRITISH INDUSTRIES FAIR.

The eighth annual British Industries Fair, which embraces a large number of the most important lines of British trade, will be held in London and Birmingham from 27th February to 10th March. This is purely a trade fair where buyer and seller meet, not an exhibition. This fair, whether regarded from the point of view of size, diversity of products shown, or resultant business, now surpasses in importance and value to the world's markets any other trade fair or similar purpose. A visit to the fair will convince overseas buyers that enormous strides have been made in Britain's post war production. A considerable number of Canadian buyers are making arrangements to attend. Admittance is restricted to trade buyers on invitation of the British Government, and business is not impeded by crowds of sightseers.

The British Industries Fair covers the following industries at London:—

Cutlery; silver and electro-plate; jewellery, watches and clocks; hard haberdashery; glassware of all descriptions; china, earthenware and stoneware; paper; stationery and stationers' sundries and office appliances; printing, books; fancy goods, including travelling requisites and tobacconists' sundries; boots and shoes and shoe mercery; leather for boot and shoe, fancy goods, bookbinding and upholstery trades; brushes and brooms; toys and games; sports goods (including sports clothing); scientific and optical instruments; medical and surgical instruments and appliances; spectacle ware and opticians' supplies; photographic and cinematographic apparatus and requisites; musical instruments; furniture of wood, cane, wicker; bedsteads and bedding; carpets, linoleum, etc.; basketware chemicals light and heavy; domestic chemical products; drugs and druggists' sundries; perfumery; dyes; foodstuffs (prepared and preserved) and beverages; confectionery (sugar and chocolate); tobacco, cigarettes and cigars.

At Birmingham:—Lighting plant for electricity, gas, oil, etc.; cooking stoves and utensils, including aluminum, enamelware, etc.; foundry appliances; general hardware, including builders, marine and household ironmongery of all descriptions; general machinery of all descriptions and small tools mill furnishings; india rubber goods for industrial and household purposes; motor cycles and cycles; accessories for motor cars, cycles and aeroplanes; weighing and measuring appliances and instruments; sanitary appliances; paints, colours and varnishes and painters' requisites; railway equipment; metals of all descriptions (excluding precious metals); agricultural and horticultural machinery and implements; mining, colliery and quarrying plant; brewing and distillery plant; metal furniture for house, shop, office, garden and camp use, including bedsteads; building construction; perambulators, mailcarts and push-chairs; saddlery and harness; firearms; fishing tackle and rods; tubes in copper, lead, brass and steel and steam and pipe fittings; architectural and ornamental metal work, including gates and fencing; ropes of steel and hemp, cordage and string.

PERSONALS.

Mr. Geo. C. Mackenzie, secretary of the Canadian Institute of Mining and Metallurgy, was in Toronto on Saturday and addressed a meeting of the local branch.

Mr. Cyril A. Robothan is in Toronto.

BITUMINOUS SANDS.

Elsewhere in this issue, we publish some account of the McMurray "tar sands." The Annual Report on the Mineral Resources of Alberta by Dr. John A. Allan, Professor of Geology in the University of Alberta, contains a good deal of interesting matter on this important subject from which we make the following extracts:

Distribution.

In the vicinity of Fort McMurray, 300 miles north of Edmonton there is an extensive deposit of bituminous sands, more popularly known as the "tar sands." The bituminous sand formation outcrops along aside the sides of the Athabasca valley for a distance of nearly one hundred miles north of Fort McMurray down stream, and for a distance of forty miles in a straight line up the valley of the Athabasca from Fort McMurray. There are numerous exposures of this formation along the rivers and streams which enter the Athabasca. These exposures prove the lateral distribution of the bituminous sands. As the formations rise gently towards the north the exposures of bituminous sands disappear above the sides of the Athabasca valley or have been eroded away or covered with glacial drift, between the 25th and 26th base lines, about 100 miles by river and 65 miles in a direct line north of McMurray. The areal distribution of the bituminons sands is much more extensive than the outcrops would indicate.

Wells that have been drilled for oil and gas up the Athabasca, south of McMurray, for 150 miles, and also in the Peace River valley over 200 miles west of McMurray, have proven the extent of the bituminous sand formation.

At McMurray the base of this formation is exposed about fifteen feet above the low water level in the river. At the junction of House river and the Athabasca, about sixty miles southwest from McMurray, a well was drilled by the Great Northern Asphalt and Oil Company to a depth of 295 feet, but the bituminous sand horizon was not reached, and the well was still in the Clearwater shales that overlie the bituminous sands. Above Pelican Rapids and the mouth of Pelican river, thirty miles south of House river, a well was drilled by the Geological Survey in 1897-98, in township 78, range 18, west of the 4th meridian. The bituminons sands were reached at a depth of 750 feet below the surface. Drilling ceased at a depth of 837 feet, when a strong flow of gas under terrific pressure was encountered. Natural gas has been flowing out of the well into the air since that date, and it is reported that the pressure has not been greatly decreased although the flow has continued for twenty-four years.

The well record, indicates a thickness of eight-seven feet of bituminous sand, but the bottom of the formation was not reached.

Another well was drilled by the Pelican Oil and Gas Company, four miles south of the Geological Survey well, in township 78, range 17, west of the 4th meridian. This well was drilled to a depth of 2,069 feet, and the log indicates that the upper Devonian limestones were reached at 903 feet. Dowling has classified this well record and shows the bituminous sand formation, now called the McMurray sandstone, to include the strata between 843½ and 898 feet a thickness of 54½ feet.

In Peace River valley, 200 miles west of Fort McMurray the records of some of the wells drilled for oil seem to indicate that the McMurray formation (bituminous sand) is reached between 900 and 1,000 feet below the surface. Dowling shows that in the log of well No. 1 drilled by the Peace River Oil Company, in township 85, range 21, west of the meridian, the McMurray formation extends from 980 to 1,107 feet, which is the bottom of the well.

The Peace River and Athabasca sections have been studied and correlated by McLearn on paleontological evidences. He states that the thick sandstone near the bottom of this well may be correlated with the "tar sands of the Athabasca at the same horizon."

Oil seepages in Wabiskaw Lake district, about midway between the Athabasca south of McMurray and the Peace, are believed to be derived from the underlying bituminous sands. All of this evidence indicates the wide distribution of the sands which are so well exposed on the Athabasca.

The exact areal distribution of the bituminous sand formation can only be estimated, but from the extent of the outcrops and other indications it is reasonable to estimate that between ten and fifteen thousand square miles are underlain by this formation.

The bituminous sand formation is an ordinary light grey to white sandstone, more or less completely saturated with bitumen. The beds vary in color in the outcrops from black to light grey. The color depends upon the percentage of saturation in the sand and distance from the surface.

The thickness of the bituminous formation varies in different localities to a maximum of 225 feet. Toward the north and east from McMurray the formation has been completely denuded by glacial action.

In some beds the percentage of bitumen is so small that the sand grains are only coated with bitumen. In other beds in the same exposure the sandstone is supersaturated with bitumen, so that when heated by the sun the bitumen with the loose sand oozes down the surface of the exposed bed.

The texture of the sandstone in various strata throughout a single expose varies considerably from a coarse grit in which thirty per cent of the sand will pass a 10-inch mesh screen to an extremely fine silt, of which over eighty per cent will pass through a 200-mesh screen.

This marked variation in the size of sand grains is characteristic of almost every exposed section of the bituminous sand. This variation in texture must be considered in any process used for the extraction of bitumen from the sand grains.

The bitumen content in the sand also varies considerably in the different beds. In general the beds in the lower part of the formation are richer in bitumen than the higher beds, but this is not always the case. In several exposures examined on Horse creek and Hangingstone creek the richest beds exposed occur between twenty-five and fifty feet above the base of the formation.

Tests made on individual samples from various beds show that the sand contains from twelve to twenty per cent bitumen. Carefully selected specimens have tested twenty-two per cent bitumen. The average bitumen content of the sand is between fifteen and eighteen per cent. The specific gravity of the saturated sand is 1.75 to 1.80. There are, however, bands of hard nodular and ferruginous sandstone in many of the exposures, which contain little or no bitumen. Specimens collected from these bands have a specific gravity of 2.5 and 3.7. These bands are of no commercial value.

About five tons of sands were collected from an ex-

posure on Hangingstone creek and brought to the University for experimental purposes. One cubic foot of this sand weighs 120 pounds and the bitumen content is about 17.5 per cent.

Extraction of Bitumen.

The real problem in connection with the bituminous sands is one of treatment. Some process is necessary which will extract the bitumen from the sand on a commercial scale. Various laboratory processes are known which will successfully recover the bitumen, but up to the present time no process has been proven to have commercial possibilities which will extract the bitumen.

When a block of bituminous sand rock is subjected to heat the mass will soon become plastic and with further heating will flow readily, but the sand will flow with the oil, as there is no coherent material in the rock other than the bitumen.

By heating a fragment of the saturated sand in an open container, gas is liberated until all of the bitumen has been driven off and only loose white sand remains.

By heating a quantity in a closed container gas is liberated which may be condensed to a crude oil. The residue is a coke-like mass consisting of sand grains held together by a filament of bitumen residue, which remains firmly attached to the sides of the container.

Considering the extent of the saturated sands, and the quantity of oil in a ton of sand, which weighs about 120 pounds per cubic foot, this deposit is worthy of extensive investigation as the possibilities are unlimited. A simple calculation based on the distribution of the exposures shows that there are at least 189 cubic miles of bituminous sands, but only an extremely small percentage of this mass could ever be utilized. The workable portion of the formation is defined by the thickness of the overburden, so that the actual area of bituminous sand which can be utilized is extremely small in comparison to the quantity in the deposit. Even if only a small acreage can ever be utilized, and a fair percentage of the bitumen content extracted, the quantity of oil in the deposit would be an important factor in maintaining the petroleum supply of the world.

Samples of this sand are being tested in several laboratories throughout Canada, the United States, and the British Isles. The chances are favorable for the discovery at an early date of a commercial process for the extraction of the oil. It is, however, the case that a successful laboratory process might not be a practicable field process. The oil can be extracted in a laboratory by heat treatment producing destructive distillation, as described on a preceding page, and also by the use of steam hot water or various other solvents, but none are yet known to be adaptable to the bituminous sand on a practical scale in the field.

Experiments were conducted in the field in 1920 by Mr. D. Diver of Calgary with an electric heater which he designed. This heater was inserted into the bituminous sand in situ and a quantity of gas was liberated and condensed.

The analysis indicated commercially:

Illuminating oils	86.8 per cent.
Light lubricants	8.5 per cent.
Gasoline	0.0 per cent.

The analysis shows that only a fraction of the lighter oil in the bitumen was driven off by this process. No attempt was made at determining the cost of producing the heat by the process. It was an interesting experiment and it is the intention of those interested to try out another type of heater during the current year.

The economic problem on this deposit is one of treatment and extraction of the bitumen, and not one of transportation. During 1921 it is contemplated to extend the Alberta Great Waterways railway into McMurray. This will make the deposits quite accessible.

In July, 1920, the Federal Government by Order in Council No. 1495, "withdrew from sale, settlement or disposal for any purpose both in respect of the surface and the mining rights," all lands not already leased which contain workable deposits of bituminous sand. According to the records in the Dominion Land office in Edmonton, since this regulation was made, the Dominion Government has leased considerable acreage in small parcels to one General Wm. Lindsay and his associates, who claim to have discovered a commercial process for the extraction of the bitumen. These small parcels include many of the workable outcrops along the Athabasca and its tributaries.

PRODUCTION OF PIG IRON AND FERRO-ALLOYS.

The upward trend noticeable in so many lines towards the latter part of October was reflected in the output of pig iron for the month, the total being almost 6,000 tons higher than the amount reported from the Mining Branch of the Dominion Bureau of Statistics as the output for the preceding month. Basic pig iron made in blast furnaces and produced for the use of the makers amounted to 41,846 tons in October as compared with 38,590 tons in September. Basic iron made for sale rose one hundred tons to 510 tons making a total output for the month of 42,356 long tons. A total of 87 tons of foundry iron was made for further use while 7,130 tons was produced for sale. This latter figure is 50 per cent higher than the corresponding figure for the previous month. No malleable iron or direct iron castings were made in October so that the pig iron produced by makers for their own use amounted to 41,933 long tons; that for sale was 7,640 long tons, which makes a total output for the month of 49,573 tons. The average monthly output of pig iron this year to date remains unchanged at 51,000 long tons.

Ferro-alloys showed a similar healthy increase, the output for the month being 1,266 long tons as compared with 914 long tons in September. This product was, as usual, all ferro-silicon in grades of 15 per cent, 50 per cent and 75 per cent. The output of ferro-silicon in October was higher than for any month since February last when a total of 1,662 tons was made. This comparison does not hold for the total output of ferro-alloys since it is the custom to include under this heading any spiegeleisen that is produced as well as the ferro-silicon. No spiegeleisen has been made since August.

There was no change during the month in the number of furnaces operated. The five in blast at the beginning of the month continuing active throughout and being still in operation at the close of the month. These five included two at Sault Ste Marie, one at Hamilton and two at Sydney.

The gradual improvement in the steel situation noted in the September report is reflected in the October output, which, it may be expected will be well maintained

PRODUCTION OF STEEL INGOTS AND CASTINGS.

The output of steel ingots and castings for the month of October established a new high record for the year at 72,204 long tons, an increase of nearly 16,000 long tons, over the production during the preceding month, and some 200 tons more than the output for August, when the previous high record for the year was made. During the latter part of the month, particularly, there was a favorable turn in the steel making industry closely following the increased production in the United States at the same time. As noted in the preceding record the output of pig-iron recovered to the August level and in the production of steel ingots and castings the output also rose to the August mark and passed slightly beyond.

Basic open hearth steel ingots made by the several firms for their own use rose to 69,809 tons from a total of 54,320 tons in September. No acid open hearth steel was made and very little bessemer.

Electric steel ingots increased to 542 long tons or nearly three times as much as in the preceding month. From these data it will be seen that the total production by makers for their own use during October was 70,352 long tons as compared with 54,478 tons in the preceding month.

There was a small production of steel ingots made for sale. Basic open hearth steel castings made for further use amounted to 228 tons or an increase of about 50 per cent and basic open hearth steel castings made for sale rose 100 tons to 792 tons making a total for this class of 1020 long tons. Fourteen tons of bessemer castings was made for further use and a total of 113 ton was produced for sale making a total output of 127 long tons.

Electric steel castings declined slightly to 702 long tons, consisting of 6 tons made for further use and 696 tons produced for sale.

Direct steel castings for October thus amounted to 1849 long tons, of which 1601 tons was made for sale, the balance being used by the producers in further processes. The average monthly output of steel ingots and castings for the year is now 55,000 long tons in comparison with which figure the output of 72,000 tons for the current month stands out in good relief.

Table 3(a) shows the production of steel ingots and castings during the current and preceding month, and Table 3(b) shows the total output for the ten months ending September. Table 4(a) and 4(b) show the monthly outputs of steel ingots and castings for the past fifteen years.

INCREASE CAPITAL OF TECK-HUGHES.

The long awaited re-organization plan of the Teck-Hughes Gold Mines, Limited, has been announced, and details are given in a circular now being mailed to shareholders, which calls for a special meeting for December 7 to consider and confirm same. The intention is to increase the capital of the company from $2,500,000 to $4,000,000, and also provides for the sale of the unissued stock at a price of 15 cents a share. The stock is to be first offered to the shareholders on the basis of four shares of the new for five of the old, while the unsubscribed balance will be available to the bondholders. The directors feel confident that the bondholders will freely exercise their rights in this respect if the shareholders do not do so.

Plan Averts Foreclosure.

The outstanding bonds of the company, amounting to $500,000, fell due on October 1, 1920, and default was made in payment of the interest thereon. There is now past due and owing in respect of the bonds the sum of $500,000 for principal and, approximately, $135,000 for arrears of interest and interest on arrears. The directors are of the opinion that the suggested reorganization should have the approval of the shareholders, as it averts foreclosure by the bondholders and further permits them to subscribe for shares at 15 cents a share.

It is the intention to create an issue of five-year 7 per cent. first mortgage bonds to the amount of $500,000, the new bonds to be in such form as the Protective Committee may see fit, and to be redeemable by the company in whole or part at any time at par, the whole of the said $600,000 of the bonds to be delivered to the committee in exchange for the present outstanding bonds, the company to pay to the committee a sum squal to the amount by which the unpaid interest and principal of the bonds exceeds $600,000, and the committee to distribute the bonds and cash pro rata among the holders of the present bonds. The bondholders or the persons entitled to the new bonds are to have the right to subscribe pro rata for 1,720,000 shares, at 15 cents per share, subject, however, to the offer to the shareholders.

Provide Ample Capital.

The directors believe that under the new plan the company will have ample capial for its present needs, and for a contemplated increase in its mill capacity, and for development work. They also expect to be able to make early and frequent payments to the holders of the new bonds, which will be redeemable in whole or in part at any time at par and accrued interest.

Shareholders at the special meeting will also be asked to vote on a by-law to change the head office of the company from Toronto to Kirkland.

GRANBY WINS IMPORTANT CASE.

The Privy Council has allowed the appeal of Charles Wilson versus the Esquimalt and Nanaimo Railway Company, which appeal asked that a Provisional Crown Grant of Vancouver Island Coal land be set aside. A similar appeal in the case of the Esquimalt and Nanaimo Railway Company versus Elizabeth Dunlop has been treated in the same way.

This is a double victory for the Granby Consolidated Mining, Smelting and Power Company, which operated a coal mine at Cassidy, B.C., on the property in litigation.

The importance of the action to the appellants may be ganged when it is stated that the Provincial Leases in question, issued by the Province under the Settlers' Rights Act of 1917, were acquired by the Granby Company, and in their development, the establishment of collieries and auxiliary plant, the Company expended considerably over two million dollars. The collieries at Cassidy are considered to be, in point of the accommodation provided for officers and men, and also in point of the mine equipment, in every respect up-to-date.

The cases may be said to date back to 1871, when British Columbia entered Confederation, it being not many years after that a man named Joseph Ganner

occupied lands within an area afterwards designated as the Railway Belt of the Esquimalt and Nanaimo Railway Company. He died in 1889, and his executors are Charles Wilson and Angus D. McKenzie, of Nanaimo. Later, an Act was passed giving settlers only surface rights, and ever since there has been continuous agitation on the part of the settlers for a declaration that they are entitled to the under surface rights on the lands occupied either by themselves or by those whom they have succeeded.

Northern Ontario Letter

THE SILVER MINES.

Bi-Metallism.

Discussion of the question of bi-metallism by international agreement is again on the lips of operators of silver mines. There are those who believe mention of the subject at the recent Convention in Chicago of the American Mining Congress may have been significant. There are others who believe the question may be brought up at Washington should the Disarmament Conference actually result in assuring world peace. It is contended that a mutual understanding between the nations in respect to armies and navies might reasonably lead to another conference in connection with finding a solution of the financial difficulties which confront practically every European nation. Bi-metallism on a basis of 16 ounces of silver to .1 of gold would automatically fix the price of silver at $1.29 cents an ounce, and would create greater metallic backing to the large amount of paper currency now in circulation.

Haileybury Frontier.

The Mining Corporation of Canada is stated to be considering entering the South Lorrain silver area, and is reported to have secured an option on the Haileybury Frontier property. The result of work on the Haileybury Frontier during the past few months has been highly encouraging, and some pockets of high grade ore have been found. It is believed that the property has considerable merit, and that the chances of finding ore shoots of major importance are good. Were the Mining Corporation to actually commence operations in the district it might reasonably signalize a general move among mining interests to secure property in that field.

It has been learned that recent unofficial reports which intimated that a substantial tonnage of low grade ore had been placed in sight on the Reliance has so far been blocked out.

Temiskaming.

In regard to the reported possibility of the Temiskaming Mining Company receiving tenders for leases on this closed down mine, the Journal has learned that the matter was discussed some time ago in official circles, but was abandoned for the time being. It is believed that with the arrival of next spring the Temiskaming will be able to operate the mine profitably on its own account, and that a leasing system may not be expected until such time as the resources now in sight become exhausted. The mine closed down last year on account of the high cost of operation and a rapid slump in the price of silver. Since that time the price of the metal has not only strengthened but the cost of operating mines has declined to a considerable extent. In due time, however, it is probable that the Temiskaming may be surveyed out into blocks of about 100 feet square, and perhaps operated under leases.

Deeper Deposits at Cobalt.

A local paper prints an article this week, which states that not a few mining men believe there is a possibility of another zone of mineralization in the Cobalt district being found to lie at a lower horizon than that heretofore worked for silver. The article states:—"While the theory is generally accepted in Cobalt that the deposition of silver is within clearly defined limits in relation to the diabase sill, and that the fractures extending for a limited distance from the contact zones constitute the only points of mineralization, yet it is surprising to find among not a few mining men the belief that the limits of mineralization in the Cobalt field are not so restricted.

"For instance, one mining man stated recently to the representative of this paper that it would not surprise him were new mines to lie below the old, and that they might contain metal other than silver. He pointed to other mining camps where such developments had taken place, and he pointed to the occurrence of gold values of a "commercial" grade in a vein in the Kerr Lake Mine at Cobalt. The vein itself is measured in inches, and for that reason sould not be worked at a profit, but it does demonstrate the presence of gold."

Hudson Bay.

During the week ended November 18th the Hudson Bay Mine shipped a car containing approximately 64,000 pounds of concentrates. This was the only Cobalt shipper during the period.

Coniagas.

The Coniagas has suspended operations for the winter in connection with the re-treatment of old tailings. In the meantime, general operations are continued in the Coniagas Mine and Mill, and the tailings operations will be resumed in the spring.

Bailey Cobalt.

The final act that draws to a close the seven years of litigation in Bailey Cobalt Mines, Limited, was performed this past week at Osgoode Hall in Toronto, when Master-in-Ordinary Alcorn delivered into the hands of W. R. Sweeny, of New York City, representing the Bailey Cobalt Mines, Limited, Certificate for 425,000 shares of Bailey Silver Mines Limited; at the same time the Court made orders discharging the Liquidators, passing all of the accounts and ending the liquidation proceedings.

The Bailey Cobalt Company is now the owner of 425,000 shares of Bailey Silver Mines, Ltd., and it is to be assumed that the directors of the Bailey Cobalt Company will presently hold a meeting for the purpose of making proper distribution of their assets.

This litigation was bitterly fought, and the law costs exceeded $50,000.

The Professional Engineers Act.

An act respecting professional engineers, known as The Professional Engineers Act, is being pressed, and is now before the Ontario branches of the Canadian Institute of Mining and Metallurgy. The idea has been advocated for many years among mining engineers, as well as financiers engaged in the business of mining. It has been felt that mining engineers should be given exclusive right to certain letters which would constitute a distinguishing badge in a like manner as doctors, lawyers, etc.

In regard to those who qualify, the bill states:—

(1) "Only such persons who are members of the association hereby incorporated, and registered as such under the provision of this act, or who have received a license from the Council of the Association as heretofore provided, shall be entitled within the Province of Ontario to take and use the title "Registered Professional Engineer," or any abbreviation thereof, or to practise as a "Professional Engineer."

(2) "Each member of the association shall have a seal, the impression of which shall contain the name of the engineer and the words "Registered Professional Engineer," and "Province of Ontario," with which seal he shall stamp all official documents and plans, and the design of such seal shall be approved by the Council."

In so far as the preceding clauses are concerned, the idea promises to meet with quite general approval among mining men. However, the bill is marred somewhat in the opinion of many by the inclusion of other clauses which have the appearance of being objectionable.

For instance, the following, Clause 44, would prevent practical mining men from carrying on operations on any other but small prospects, and is looked upon by practical miners as going to the extreme:—

44. "Nothing in this act contained shall be construed as preventing the carrying on or construction of works by any person on his own property for the sole use of himself and his domestic establishment; nor to the prospecting or developing of any patented or unpatented mining claim by any person or syndicate; nor the designing, construction or installing by any person of works, plants or appliances of a value not exceeding $5,000, provided, however, that such works, plants and appliances shall not involve the safety or health of the general public, and nothing in this act shall be construed to apply to the construction of township roads, or roads under the supervision of a county road superintendent."

THE GOLD MINES.

McIntyre-Porcupine.

The main shaft on the McIntyre-Porcupine having reached a depth of 1,875 feet, and the sinking of an additional 100 feet to be carried out immediately, places this mine in the position of being the deepest precious metal mine in Canada. A feature of the work is that in an official statement to the Journal, General Manager R. J. Ennis declared that the geological structure continues to be exceedingly favourable, and that there is every indication that the ore deposition will continue to great depth, and that the life of the mine will be long. A production at the rate of $3,000,000 annually from this mine is assured, beginning with next spring, and the enterprise is running neck-and-neck with the Dome Mines for the position of being the second largest producer in the Dominion. The increase to $3,000,000 a year as compared with a little over $2,000,000 yearly heretofore will be the result of the installation of a new unit for the purpose of treating the carbonaceous ores found in certain parts of the mine. This new unit will be completed by March.

By reason of the achievements on the Hollinger and the McIntyre, it is learned that these companies are now turning their eyes toward two adjoining properties, these being the Schumacher on the south of the McIntyre, and the Porcupine V.N.T., on the south side of the Hollinger Consolidated. It is learned that the Hollinger has encountered good results on vein 92 at a point not far from the Porcupine V.N.T. boundary. It is also understood that the McIntyre has its attention in the direction of the Plenaurum and the Newray to the east.

Nipissing Drilling at Porcupine.

No detailed information is available with regard to the results achieved by the Nipissing Mining Company, of Cobalt, during the course of drilling five diamond drill holes on the Rochester property on the north-west side of the Hollinger. However, it is understood the core shows the presence of an intrusion of porphyry formation, and that gold-bearing deposits of an encouraging nature have been penetrated. The working option holds good for another six months, provided the Nipissing continues exploration work.

Davidson Consolidated.

Good progress is reported in connection with the development of the Davidson Consolidated. It is stated that the mine will be operated on a big scale, and officials are optimistic in regard to the result.

Gold Discovery in Bristol.

Another discovery of gold is reported to have been made to the south-west of the producing part of the Porcupine district. The new find lies in the township of Bristol, about ten miles from Timmins. Samples of the ore brought out are spectacular, and the quartz greatly resembles that found on the Dome Mines. The vein is said to measure only about 18 inches in width, but only a limited amount of prospecting has been done, and the owners are hopeful of developing larger bodies. The find is directly in line with the south-westerly strike of the ore-bearing zone of Porcupine.

Hollinger Reserve.

The Hollinger Reserve property, situated in the township of Deloro, is stated to be in strong hands, and a scheme to re-open the property is under consideration. Considerable work was done on this property by the late Barney McEnaney, and a good deal of encouragement was met with.

Wright-Hargreaves.

Output from the Wright-Hargreaves is stated to have reached $2,300 daily, and production at the rate of upwards of $800,000 annually is now indicated. A favorable factor in connection with the Wright-Hargreaves is that, in addition to having the largest mill in the Kirkland Lake district, the property also embraces a greater length of the ore-bearing zone than any other mine in that field.

Tough-Oakes.

The geological problems of the Tough Oakes and Burnside Mines are stated to have been worked out, and the enterprise is now in the line to place a substantial amount of ore in sight preparatory to re-opening the mill in the spring. Reports are current which suggest a possibility of the joint operation of the Tough-Oakes and Burnside with the adjoining Sylvanite.

Queen Lebel.

Good results are obtaining on surface at the Queen Lebel property, and an inspection of the veins by mining men of experience in the Kirkland Lake district has been followed by general favorable comment. The surface work has been efficiently done, and the property has excellent prospects of being developed successfully.

Bidgood.

Lateral operations are proceeding at the 400-ft. level of the Bidgood Gold Mines, and the work of the next month or so will probably have a vital bearing on the future of the enterprise. At the proceeding level a substantial amount of ore was opened up, and if found to continue in similar volume at the present point of operation will offer good promise of another mine being added to those already proven in the Kirkland Lake area. Reports some weeks ago that the McKinley-Darragh interests were prominently identified in the Bidgood are understood to have been in error in that it has been learned that only two officials of the McKinley-Darragh are comparatively small stockholders in the Bidgood.

Larder Lake.

With the Coniagas working property on one side, and the Canadian Associated Goldfields working on the opposite side, the Crown Reserve Mining Company is biding its time in connection with its property in the Larder Lake district.

Miller Independence.

Although diamond drilling is still under way on the Miller Independence Mines at Boston Creek, yet nothing in the way of ore has so far been encountered.

B. C. MINING NOTES.

Rich Ore at Fish Creek Mine.

Stewart, B.C.—It is reported that a strike of some importance has been made on the property of the Fish Creek Mining Company. A raise was started 160 feet from the portal of No. 1 tunnel to connect with No. 2 tunnel, 180 feet above, and a shoot of high grade ore was opened up. This is becoming richer as the raise is continued and the ore taken therefrom is being sacked for shipment. A considerable amount of ore running from $300 to $400 per ton, already has been packed down the hill, preparatory to being transported. Latest Reports from the Premier Mine are to the effect that good progress is being made in the work both at the mine and on the aerial tramway. With regard to the latter all the towers are completed with the exception of the four at the lower end and these will be up in a few days.

Trail Ore Receipts.

Trail, B.C.—Ore receipts in gross tons for the week from November 8th to 14th at the smelter of the Canadian Consolidated Mining and Smelting Power Company, totalled $8,642. Of this 8,205 tons came from the Company Mines, while the remainder was made up chiefly as follows:—Gen. Sandon, 10 tons; Horn, Silver, Similkameen 51 tons; Queen Bess, Allamo 36 tons; Standard, Silverton, 109 tons; Surprise, Roseberry, 97 tons; and Van Roi, Silverton, 92 tons.

Wallace Mines, Ltd.

Penticton, B.C.—One of the few silver mines in the Provinces which has continued to operate successfully through the period of silver depression, is the Sally Mine at Beaverdell, operated by the Wallace Mines, Limited. This mine is running steadily with a force of 15 men. Since having been taken over by the present Company, considerable development has been done and a substantial quantity of ore blocked out. In 1920 about $80,000 worth of ore was shipped. The ore mined at present runs between 300 and 400 ozs. of silver to the ton, with some lead and a trace of gold.

Taylor's Discovery at Lillooet.

Vancouver, B.C.—Further particulars of the gold strike in the Whitewater section of the Lillooet District have been obtained from E. J. Taylor, the original discoverer, who recently came to the coast. He brought with him 60 ozs. of gold, which he and another man took out in two weeks' work by means of an arrastra. Mr. Taylor's claims, situated near Iron Creek, run up the mountain side, and so far his operations have been confined to the natural dump brought down from the ore shoot through corosion. He describes the ore as being telluride in the serpentine formation, and his observations lead him to believe that the mineralized zone stretches a distance of 25 to 30 miles. It is expected that there will be much interest manifested in this district by prospectors next summer. Word has been received that the Kitchener Mines, Limited, Keithley Creek, will open next season's operations under very favourable circumstances. During the open months of this year much work was done in the installation plant, particularly with reference to providing an adequate supply of water. The Company now is prepared, as soon as conditions are right, to open up an area of virgin ground. This is an unusual condition in the Cariboo, the Placer fields of which have been well worked over since the original discovery in 1860 and the present time. Moreover, the Company, in the short time that it was able to engage in productive work this year, made some recoveries that seem to assure very good results when operations begin in real earnest. The Granby Consolidated Mining, Smelting and Power Company has entered suit in the Supreme Court against the Attorney General of British Columbia. The Company seeks a declaration with regard to its rights and liabilities under the British Columbia Taxation Act. The Company further seeks a declaration to the effect that taxes for which it is liable are not due until January 2nd next and will not be in arrears until December 31, 1922.

Yukon's Silver Camp.

Captain George Black, who is the Government Candidate for the Yukon Territory, recently visited Mayo City, the centre of the Yukon's new silver camp. He spent eight days in the Silver District, visiting Keno Hill, which will produce about 5,000 tons of silver lead ore this winter, he says. All the rich veins opened there are reported to be holding out with winter development, and Captain Black observes that he never saw so many prospective millionaires. Three Companies are working crews, including the Slate Creek Company, which has opened a new vein at Keno City at the foot of the Hill, and sunk it to a depth of 30 feet, the Treadwell Company and the Yukon Gold Company. He speaks also of the rush to Galena Hill, upon which a large number of new claims have been staked within the past few months. There are about 600 people in the entire city.

MILL AT BRITTANIA BEACH.

It is reported in the Rockland Miner that the Brittania Mining and Smelting Company has authorized the erection of a mill on its copper-gold property at Brittania Beach, B.C. The mill will have a capacity of 2,500 tons daily, which will be the greatest in British Columbia, and greater than that of the mill destroyed by fire last spring. The machinery has been ordered from the Traylor Engineering and Manufacturing Company through W. H. Agens, Spokane. The purchase

includes grinding and crushing machinery, except for that part of the crushing plant situated in the mine which was not reached by the late fire. In the equipment to be delivered are 18 tube mills of 7 by 10 foot size, a set of 72 by 20 inch rolls and four sets of 54 by 20 inch rolls. The equipment will weigh 700 tons, will be taken through the Panama canal from the plant at Allentown, Pa., and will be delivered within less than six months. The construction of the plant will be supervised by Bradley, Bruff & La Barth of San Francisco, Cal., who designed and erected the smelter of the Bunker Hill & Sullivan Mining and Concentrating Company at Bradley, Idaho. The motive power will be electricity, which will be delivered through several motors having a total capacity of 2,000 horse-power. The contract was let by E. J. Donohue, general manager of the Brittania Company, who had bids from other builders of heavy milling machinery. The large stockholders of the Brittania Company are residents of New York, and the president is H. J. Quigley of that city. Mr. Agens left Brittania Beach before the flood that recently damaged the village and took the lives of 35 persons. Mr. Jules La Barth is well-known in Rossland, having been prominently identified with the mining and smelting business in this section a number of years ago.

TORONTO COAL PRICES.

Toronto, 29th Nov.—The truest thing to say about the market for bituminous coal in Toronto at the present moment is that no such thing exists. The same thing is probably true of other places as well, but in Toronto things are certainly terribly bad from the viewpoint of the man with coal to sell. He is finding that he can't give it away. As an instsance, the writer may cite the case of a coal man who was asked by a customer today to quote him on a carload of slack. He quoted him $1.25 a ton for coal for which he had paid $1.35. The customer demurred at the price as too high and bought a car-load elsewhere for $1.00 a ton. Since then he has been offered other car-loads at 75 cents a ton. And so it goes. Nor is any improvement in this condition now to be looked for until the New Year, unless really cold weather sets in.

TRETHEWEY SILVER MINES.

The Financial Times says that the Trethewey Silver Mines will probably be reorganized within a few months. The directors are figuring out a plan that will raise, at once, sufficient money to pay off the present indebtedness of the company and give the necessary working capital to further develop the mine.

It is believed that it will be found necessary to either increase the capital of the present company or form a new one. Trethewey has in its treasury about 400,000 shares of its capital ($1 a share) and if the shares in the treasury are sold at the present market price of around 10 and 11 cents, little more than enough to make the company free of debt will be realized. The loans of the directors and the bank overdraft total approximately $30,000.

EDITORIAL

MINING—AND GOVERNMENTS.

These lines are being written before the results of the Dominion general election have been made known, and therefore before it is possible to make any reasonable or reasoned conjecture as to the complexion of the next Administration at Ottawa. But while this is yet in doubt, there is one matter as to which all engaged in, or otherwise connected with, the mining industry in this country may be absolutely certain. And that is the desirability of the new Government, however it may be composed, displaying a more active, a more sympathetic, a more sustained and (if we may say so without offence) a more intelligent, interest in the mining development of the country, as a whole, than has been evidenced in the past.

Nor need this aspiration be limited to the Dominion Government. In nearly all the Provinces it is true that those engaged in the development of what is, after all, next to agricultural land, the greatest of our natural and national resources, have not received from Provincial authorities encouragement and support of a kind commensurate with its importance as an actual and potential source of wealth. There is need for a change in the mental attitude of those in the seats of the mighty, whether in Ottawa, or in Provincial Legislatures, who have too long treated our mines as the Cinderella of our natural resources.

Canada's known and ascertained mineral wealth is huge. Her potential wealth of this character is possibly, judged by the standards to which we are accustomed, almost illimitable. It is well within the bounds of possibility that, ere long, this country will take undisputed pride of place as the world's greatest gold-producer, a position which Canada already holds in the case of nickel, asbestos and other minerals. The magnitude of Canada's mineral resources is only rivalled by their extent and variety.

But yet both Dominion and Provincial Governments have shown themselves insufficiently alive to the importance, in the national interests, of the adequate development of this source of wealth and to the difficulties of various kinds which beset those who are seeking, often under substantial handicaps, and with the certainty of heavy financial expenditures at present while future rewards are, more or less, problematical, to develop it. For, in practically every mining venture, the uncertainty attaching to the development stages is a factor as formidable as it is familiar.

We have referred, before now, to the notorious fact that it is necessary to import many lines of gold mining machinery and machine parts from the United States, for the reason that they are not manufactured in this country. Right here is where, in connection with the vexed question of the tariff, the Dominion Government can aid the mining operating industry without working hardship on those Canadian manufacturers of mining machinery, who, in their own lines of manufacture, are serving the industry well. Let them have adequate protection for their lines of manufacture, but let such lines of machinery and machine parts as they do not manufacture be admitted duty-free from the United States.

Further (also in connection with the tariff) there are two modes of dealing with many of our mineral resources—such as asbestos, for example. They can either be exported in their raw state to other countries, made into finished products and sold back to Canadians, in that form at hugely increased prices; or they can be made into finished products in this country and exported to other countries in that form. It is obvious that the latter mode is the one which is in the interests of the country at large. For (to take the case of asbestos) it would mean that the whole of the various processes of manufacture would be carried on in Canada, providing employment and creating business—and it is a significant fact that the value of the asbestos

which we export to the United States is merely in its crude form about a tenth of its value when it has been worked up there into asbestos products. It is in cases of this kind that the tariff can be so shaped as to foster national development.

Again, we have been compelled, more than once, to call attention to the Ontario Government's neglect to facilitate the expansion of the industries of the Northland of Ontario by its delay in granting rights to the Hollinger Consolidated Mines, Ltd., such as would allow the company to go ahead with its plans for increasing production. The Hollinger was ready to push on with its plans for power development—a work which would have resulted in the disbursement of a large amount of private capital and the employment of perhaps thousands of men, at a time when work and wages are urgently needed—but the Government delayed to grant the rights necessary to this projected industrial expansion.

What is wanted, in Dominion and Provincial Governments alike, is a more comprehensive understanding of the needs of the mining industry, both in large things and in small. With a new Government at Ottawa, is it too much to be hoped that it will seek to foster such an understanding and to coordinate its own activities and those of the Provincial Governments in aiding the mining industry of the country.

THE POWER SITUATION.

The gold mining industry at Porcupine, at the moment of writing, is still held in check by the inaction of the Ontario Government. Men who might be expected to help solve the problem are busily engaged in electioneering, and the serious responsibilities of office are apparently, with some of them, taking second place to the effort to put more farmers into legislative offices. Until after election day at least, the application for rights to develop power for Porcupine mines is to be ignored.

It might be supposed that the utilization of our water powers, would be considered in the best interests of the Province. It might be supposed that expansion of the gold mining industry with increased production and larger pay rolls, would seem to be so desirable that Ontario Cabinet Ministers would exert themselves to help in finding the desired power. Yet the attitude of Government appears to be that the water should continue to run to waste and that operators should be forced to develop their power from imported fuel.

This lack of attention to the needs of the mining industry, and disregard of the consequences of inaction, is difficult to understand. There may be different interests to satisfy in taking action, but that cannot be accepted as a satisfactory explanation of the Government's attitude.

Until there is a solution of the power problem the planned expansion of operations must be postponed. The mining companies, if not allowed to use available water power, will have to consider other sources of power. The most reasonable substitute will probably be oil, which can be advantageously used in special engines. The use of oil will help the companies to increase production in case the use of water power is not permitted. There is as yet no satisfactory explanation of the Government's attitude towards the mining industry and it may prove necessary to wait a few years for action. Meanwhile the companies will do well to consider other possible sources of fuel.

THE FORT NORMAN DISCOVERY.

It has previously been pointed out in these columns that the discovery of petroleum at Fort Norman is significant as a reminder that the unexplored areas of this country are liable to become the scenes of great industrial activity when their secrets are learned. Already the district, by reason of the oil discovery, has become a centre of interest, and its development will undoubtedly proceed much more rapidly than would have been the case, had the discovery not been made. Indeed, in the opening of the new route of travel to the North, the district is already reaping the first fruits of the operations of the Company which is responsible for the exploration of the western provinces and the north-west territories.

At the same time, in this matter, as in others, the course of not counting one's chickens before they are hatched may be heartily commended to sundry commentators on the discovery in question. As a recent issue of the Imperial Oil Review very pertinently points out, following on, and in consequence of, the discovery at Fort Norman, a good deal of loose talk was indulged in regarding the exploitation of the country's oil resources by large private enterprises at the expense of the public interest. "Some newspapers at once ear-marked the proceeds from the sale of Fort Norman petroleum which would accrue to the public treasury for the liquidation of the national debt."

"Now it is true that "Hope springs eternal in the human breast"—and often it takes little or no account of the delays that are inevitable before it can be realized. In this case, we are in hearty accord with the view expressed by the Imperial Oil Review to the effect that the discovery of the Fort Norman well meant only the begining of a long and costly experiment, upon the result of which, at best, success or failure was evenly balanced. What has now to be determined is the value of the Fort Norman field as a potential source of supply.

This work will take a long time. It involves great difficulties and necessitates heavy expenditures, before favorable results can certainly be shown. But it is work which is necessary in the national interests. And it would be well if those who have, before today, talked light-heartedly of vast benefits to accrue to the

public treasury from this discovery, were to reach some more accurate understanding of the magnitude of the task that yet lies ahead, of its difficulties and of its heavy cost.

GOLD AND THE EXCHANGE PROBLEM.

In the November 12th number of the "Mining Journal," London, Mr. H. Abbati advocates a free market in gold as a solution of the exchange problem. This would reduce the national debt in terms of gold, and increase revenue in terms of paper. Conditions for export would be much increased. Mr. Abbati argues that the reason why the value of gold has been subject to such wide fluctuation since the war is solely because it has been diluted with paper and credit as a substitute. Owing to the exigencies of the situation brought about by the war, huge gold debts have been contracted, to an extent far exceeding the amount of gold in the world. In fact, were there such a quantity of gold in the world, gold would then be so diminished in value as to be unsuitable as a standard. As it is, to cover up the insolvency of the debtors, legal restrictions have been put in the gold market, which practically means that it can only be handled by Governments; and the Governments, again, only handle it in such a manner as to cause them the least possible embarrassment towards their respective electors. The value of gold would very soon return to pre-war if there were a free market in gold, and if the various peoples of Europe, including England, realised how little, ultimately, the paper currencies will be worth.

A return to a sound basis for currency would make a demand for gold in England and pave the way for marketing goods in America. There being no market now in England for gold, the metal, instead of goods, is exported.

Commenting on Mr. Abbati's statements, the "Mining Journal" says editorially:

"We take it that the main distinction between conditions to-day and before the war is largely the absence of any international basis of values. Gold stocks are entirely immobilised. The world, being heavily in debt to the United States, cannot afford to buy gold from her, while Great Britain has set the fashion to the rest of the world by refusing to allow gold to be exported. As the gold is not used for currency here, this means that for the time being gold in the country is of no practical value. We have by this embargo on export, therefore, reversed what has been the trade policy of the country at any rate from the beginning of industrial times, and in doing so have for the time being stopped the operation of what was always described before the war as the automatic check on inflation or deflation—the "governor," as it was frequently termed, of fluctuating trade loads. Why, it may be asked, do we not revert to it? We have little doubt that Mr. Abbati is right when he attributes the cause to the reluctance of the authorities, Governmental and financial, to face the fact that for the purposes of the war we depreciated our currency. In the old days the Sovereigns of England and other European countries were wont to do this by debasing the metallic currency; in these days we have given up the metallic currency, and have produced the same result by diminishing the gold reserve against paper. What the real value of gold should be to-day it is imposible to say, the only standard we have is that of American currency. That, however, would appear to be too low, because gold mining in the United States cannot be carried on at a profit, while here the relation of the paper pound to the gold pound is a fluctuating one, governed almost entirely by the varying ratio between the paper pound and the dollar."

Such views as these are worthy of attention. They serve to remind us that those who are interested in gold mining must not sit idly by, while financial interests which have found it so difficult to find their way back to the gold standard are preparing the public mind to accept an experiment as a substitute for the real thing.

EDITORIAL NOTES.

The report of the Director of the United States Bureau of Mines, summarizing some of the work done during the past year shows that investigations that should prove very useful to the mining industry have been carried on. The report is a good example of what can be done by a well organized body of workers who are familiar with the problems of the industry. Research of this kind is, in our opinion, of very great value.

The meeting of the American Association for the Advancement of Science to be held in Toronto during the last few days of the year will bring to Canada a number of engineers and geologists. Meetings are being arranged for disenssion of many subjects and mining men will find some of the sessions of interest to them. The application of science to industry is kept well in mind by many of the members.

Interest in Kirkland Lake gold district has been given another impetus by the completion of the mill at the Ontario-Kirkland. This company has made good progress during the year.

Mr. C. A. Foster, who has been identified with the early history of several mining areas in Ontario is now engaged in making a mine in a new district. His new enterprise should be of special interest to the business men of Sault Ste. Marie. The development of a new area means much to the merchants as well as to the shareholders.

The Oil Industry of Canada

The history of the oil industry in Canada begins with the Indians, who in 1830 discovered layers of crude oil gathered on the top of the waters of Black Creek and Bear Creek, in Lambton, Canada West.

Production at that time consisted of spreading blankets over the surface of the waters carrying the oil and then squeezing it out into such containers as the Indians happened to have laying around. This product was known as "Medicamentum" and was a sure cure for everything from burns to bunions. Seneca oil or American Medical oil was a similar product discovered at Lake Seneca, N.Y., at about the same time.

It was not until 1859 that production of oil on a large scale began. In that year about 2,000 barrels were produced in Pennsylvania, which was sold at the staggering price of $20.00 per barrel.

But like all good things, "twenty dollar oil" could not last. Production increased so rapidly that four years later (1862) the total had reached the great amount of 1,796,712 barrels, while the price dropped from $20.00 per barrel to ten cents per barrel. This holds all records in price deflation of crude petroleum.

It was at this inopportune time that James Shaw made his big strike at Oil Springs. The well flowed 200 barrels per day, but owing to the lack of storage facilities most of the oil ran away into the creeks and ditches. Enterprising parties seeing an opportunity to benefit through salvage offered Mr. Shaw fifty cents per barrel for any of the lost oil they could save. However, Mr. Shaw was not at all interested in their offer, and told them so in the sulphuric vernacular of of the early oil period.

The First Oil Refineries.

A start was made to refine oil for illuminating purposes as early as 1862. William Spencer built a refinery at Woodstock, known as the Cedar Creek Oil Works, while J. H. Williams built another refinery at Hamilton. Mr. Spencer purchased lots 15 and 16, 2nd Con. Plympton, surveyed them and founded the town of Wyoming. He later joined forces with Mr. Williams, of Hamilton, and built a tie-road to Oil Springs.

The crude oil was transported in barrels by wagons from Oil Springs to Wyoming and thence shipped via the Great Western Railway to Woodstock and Hamilton for refining.

The process of refining crude petroleum was at that time a great secret to be guarded with utmost care. The refineries were fenced and a vigilant guard placed to "shoo off" all would-be pilferers of the secret.

The stills were made of cast iron of 15 to 20 barrel capacity, and had a solitary "goose-neck" leading to the condenser.

The treating process consisted of agitation by an agitator with a revolving paddle at the bottom. The washing with acid and water followed. Caustic soda was used to remove the acid.

This agitation and acid wash completed the process and the "refined" oil was barreled direct from the agitator.

The finished product was a fine amber-colored oil that would make any lamp chimney the same color in about twenty minutes, but it commanded the attractive price of $1.00 per gallon.

Notwithstanding the high price and the distinctly inferior qualities of the earlier refined oils, the demand continued to grow, and as it is typical of all oil men to move with the times, Mr. Spencer moved to London and greatly enlarged and improved his refinery. Herman Waterman was made a partner, and the firm of Spencer and Waterman launched out on their successful career. Many other refineries were built and great improvements were made in the processes of distillation and refining.

Important Discovery.

Mr. Spencer discovered that litharge would sweeten the oil and free it from some of the sulphur, thus greatly improving the quality of the oil. This process was accordingly adopted and the process sold to the other refineries as well.

Of the many refineries operating at London at the time, the largest were as follows:—

Greary Moncrieff & Co.
W. Spencer & Sons
F. A. Fitzgerald & Co.
Waterman Bros.
Duffield Bros.
T. D. & E. Hodgins.

These firms eventually amalgamated and operated under the name of The London Oil Refining Co.

In 1870 an European export business developed and many more refineries were built. The Silver Star Works was built in London by Englehart, Glugerheim & Co., at a cost of $200,000. This was regarded as an immense plant at that time and they carried on a large export business.

Buys Other Companies.

Business, however, took a downward turn, exports diminished, and general business declined. The Silver Star Works were brought by the London Oil Refinery Company, together with many others. The principal ones were:—J. L. Englehart & Co. Petrolia; John McMillan, Petrolia; John McDonald, Petrolia; Frank Ward, Wyoming; Woodward & Co, Petrolia; J. H. Fairbanks, Home Oil, Petrolia; Perkins & Gleeson, Petrolia; McMillan, Kittridge & Co., Petrolia; Millar Bros., London; Sir Melville Parker, Oakville; J. W. Sifton, Paris; W. of C. Oil Lands & Works, Petrolia; Producers Oil Company, Petrolia; Alex. Depper, Marthaville; Mutual Oil Company; Black Star Oil, Sarnia; Geo. Taylor, Wyoming; McKenzie & Sons, Wyoming; John Davis, Port Edward; John Baily, London; J. Robinson, London; Winnett Bros., London; Baltic Ref. Co., Hamilton; Petrolia Crude Oil, Petrolia; Consumers Oil Co., Petrolia; Ont. Carbon Oil Co., Petrolia.

Contrast.

1862.—First Oil Refinery received about 100 barrels of crude oil per week in barrel and distilled from it 20 to 25 per cent. of lamp oil and threw the balance away.

1921.—Imperial Oil Refinery at Sarnia receives about 10,000 barrels of crude oil per day by pipe line and turns out over 96 per cent. of it in gasoline, oils, waxes, greases, or over 100 articles of commerce.

With the development of refining, production of crude oil increased. In fact, it was overdone to such an extent that the crude oil supply greatly exceeded the market requirements. In 1886, the production of Canadian crude oil reached the million barrel mark

This reversal necessitated stern measures. A syndicate was formed to protect the refining interests. The refineries were leased, closed or given a fixed quota of oil to supply the market. Though this measure was successful in curtailing the output for a time, other refineries were built and other interests demanded recognition. Dissolution of the syndicate followed and over sixty leases were terminated.

The inevitable result was an upward shoot of production of refined oil similar to that of the production of crudes and an over supply was created. The prices of refined oil dropped from 35 cents per gallon to twelve cents, and from then on it was an open field. Business settled down to the "survival of the fittest."

Imperial Oil Limited Founded.

On September the 8th, 1880, the Imperial Oil Company was formed, composed of the following firms:—J. S. Englehart & Co., F. A. Fitzgerald & Co., W. Spencer & Sons., Waterman Bros., Geary, Minhennick & Co., T. D. & E. Hodgens, Walker & Smallman.

The paid-up capital was $500,000.00 and the officers were F. A. Fitzgerald, President, J. S. Englehart, Vice-President, W. M. Spencer, Secretary.

With the formation of Imperial Oil Limited, came greater improvements in manufacturing, as well as marketing petroleum products. Herman Frasch was engaged as chemist for the Company and fractional distillation was introduced.

The introduction of fractionation brought greater economy in production. It eliminated the great waste by recovering more products from petroleum.

The advent of the internal combustion engine created a market for naptha which had hitherto been a waste product. Likewise lubricants came more into prominence and as lubrication grew into a science, a greater variety of oil was demanded, thus enabling the refiners to utilize still more products from petroleum.

Steady Growth.

The demand for petroleum products grew apace until the Canadian refiners handled far more crude petroleum than the Canadian producers could supply. Crude oil had to be imported from the producers in the United States.

The Imperial Oil Company continued extending and increasing its business until in 1898 it was easily the largest oil refining Company in Canada.

Since then the development of the Company has continued.

From refineries covering from two to five acres and representing an investment of from $10,000 to $25,000.00 each, the oil industry in Canada has expanded until to-day it is represented by refineries covering 100 acres or more and requiring an investment of from $3,000,000 to $5,000,000 and more for one refinery alone. Where only one product was manufactured—kerosene or lamp oil—hundreds of different products are now recovered.

(IMPERIAL OIL REVIEW).

WISCONSIN-SKEAD.

Dewatering of the underground workings of the Wisconsin-Skead property is now under way, and the mining plant will again be in operation in a short time, following an idleness of about two years. Dr. Costello, one of the principals of the company, is directing the work of preparing the mine for operation. Cross-cutting to the veins was under way when work was suspended.

ONTARIO KIRKLAND GOLD MINES.

Ontario Kirkland Gold Mines, Limited, which started producing this week, has been financed almost entirely by Pennsylvania people. The company has an authorized capital of only $1,500,000, in shares of $1 par value. The officers are: president Frank Huth; vice-president, Wm. H. Meyer; secretary, W. A. Gordon; treasurer, Albert J. Bolton; manager, Ralph Hurd; directors, Walter E. Hurd, M. Y. Krauss and Wm. J. Yoell. The head office of the company is at Haileybury.

The property of the company is two claims comprising about 90 acres. The mine is about a half mile south of the townsite of Kirkland Lake. As Wright-Hargreaves Mine is directly north of the town and Lake Shore about a quarter mile west, adjoining Wright-Hargreaves, the Ontario-Kirkland is comparatively close to these other two producers. The Ontario-Kirkland has, however, developed its mine off what was considered the main ore zone of the camp. On the same zone are located the Hunton and Comfort, and probably the Canadian Kirkland, Highlands and other properties farther west.

Total underground development work at the Ontario-Kirkland totals about 5,000 feet. Of this about 3,000 feet is drifting, 940 feet shaft sinking and the balance cross-cutting. Levels have been established at 150, 300 and 450 feet. On two shafts, each down 470 feet, are complete mining plants. The main shaft, which was recently completed, is three compartments.

The mill's rated capacity is 100 tons a day.

Exposures of milling ore in the drifts show widths of from four to eight feet, assaying $8 to $28 to the ton. It is estimated that development work to date has placed in sight 100,000 tons of ore averaging $1,500,000. This tonnage is sufficient to keep the mill supplied for about three years. It is expected that the monthly production will be between $40,000 and $50,000.

Splendid housing accommodation for men has been built on the company's properties.

The mill has been erected on a natural mill site advantageously situated on a hill side near the new shaft. Many economies in operation have been effected due to the gravity flow of the ore and pulp through the mill. The plant is on improved lines, similar to those which have been successful in the treatment of Kirkland Lake ores.—The Northern Miner.

NEW MINING ASSOCIATION.

Mining men, prominent in the metallurgical industry of the Kootenays, formed an organization known as the Mining Association of Eastern British Columbia in Nelson last Friday.

Provisional officers and an executive committee were elected as follows:

President—R. Randolph Bruce, Invermere.

Vice-President—Clarence Cunningham, Alamo.

Secretary-Treasurer—W. H. Burgess, Kaslo.

Executive—S. S. Fowler, Riondel; Thos. W. Bingay, Trail; Major A. W. Davis, Nelson; J. P. McFadden, New Denver; W. T. McDowell, Ymir; Douglas Lay, Rossland; S. G. Blaylock, Trail.

President Bruce and President J. J. Warren of the Consolidated Mining and Smelting Company of Canada, Limited, will proceed to Victoria in a few days to interview the provincial government on the general mining situation, and on their return a general meeting will be called.

Some Rock Drilling Tests

By C. R. FORBES
(Consulting Mining Engineer)

During the past few years the question of rock drills, drill bits and drill steel have received much attention, and many improvements have been brought about, both in the design and in the use of rock drills and drilling equipment.

Among these improvements, the use of smaller changes in gage between the different steels has been one of the most important. With the old types of piston drill, gage changes of ¼ inch or more were often used, necessitating the use of steel of from 3 to 3½ inch diameter to start when deep holes were to be drilled. As the work of drilling varies almost directly with the quantity of material removed, the use of these large sizes of steel resulted in a great loss of time and energy. Until the development of the Carr bit and the modern double-taper bits, gage changes less than ⅛ inch were deemed impracticable. At the present time many companies throughout the United States are successfully using gage changes of 1-16 inch, and in some cases changes of only 1-32 inch are used. Although these very small changes require great care and accuracy on the part of the drill sharpener, both in forging and gaging the steels, and in proper heat treatment, still the cost of this extra work in the drill shop is more than offset by the increased efficiency of the drilling machines.

Another improvement in drilling practice that has been brought about recently by several companies is the use of 1 inch steel in place of 1¼ inch in the large mounted hammer drills. In the Michigan copper mining district 1 inch hollow hexagon steel has been used for some time in place of 1¼ inch round steel. This steel is used in drills with anvil block chucks requiring no collar or lug on the steel. The Copper Queen mine of the Phelps Dodge Corporation has lately standardized on 1-inch round lugged steel for all machines. The advantage of the smaller cross-section consists in the saving in steel, faster drilling speed, and saving in labor on the part of the miner in handling the lighter steel.

In order to find out whether or not these improvements were applicable in the Missouri-Kansas-Oklahoma districts, the Mississippi Valley Experiment Station of the Bureau of Mines, working in co-operation with the Missouri School of Mines and Metallurgy, conducted a series of experiments extending over a period of four months, beginning May 1, 1921.

The tests were made by I. F. and J. T. Hodges, senior students from the Missouri School of Mines and Metallurgy, who had considerable practical experience as miners. The work was done in the Bluebird mine of the O. M. Bilharz Mining Co., near Commerce, Oklahoma, and was under the immediate supervision of F. H. Gartung, superintendent for that company.

The kind of data recorded in the tests is shown by the following headings from a specimen data sheet: Length of Steel; Distance Drilled; Time Drilling in; Time Drilling out; Speed of Drilling in minutes; Gage at start, at finish, and loss; Air Pressure; Character of Ground; Condition of Used Bit; Remarks.

The first series of tests was made to find out the minimum change of gage practicable for conditions in this district when using the standard 1¼ inch steel.

A study of the practice in the district indicated that gage changes of from ⅛ to ¼ inch were commonly used. Drilling is done almost universally with the mounted type of hammer drills operated by two men. One and one-quarter inch round hollow steel is used with 24-inch changes in steel lengths.

In order to insure perfect uniformity in the hardness of the bits, a Sullivan oil forge with pyrometer control was used for heating the steel. The critical temperature of the steel was determined, and all bits were hardened by plunging from this temperature. The bits were forged on a Sullivan sharpener. Two types of bits were used, the Sullivan double arc and the cross-bit, both having the double taper. Bits were forged and hardened by the mine blacksmith and were exceptionally well made and uniformly hardened.

The results of this first series of tests showed an average gage loss of 3-32 of an inch for a 24-inch change of steel. In these tests 64 holes, varying in depth from 3 feet to 12 feet, and totaling 303.5 feet, were drilled. Three different makes of drills were used. Air pressures of from 60 to 85 lbs. per square inch were used in drilling.

These results indicated that changes smaller than ⅛ inch would be impracticable. However, to verify this, three sets of 1¼-inch steel were made up, using 1-16 inch drop in gage. The results of these tests indicated that it was possible to use the 1-16 inch drop in gage in loose water-course ground; but if a hard boulder or hard ground was encountered the gage wore off very quickly and caused trouble in changing to the next steel.

The conclusion from all these tests was that for conditions in this district, when using 1¼ inch hollow steel and a 24-inch change in steel length a gage of ⅛ inch is the smallest practicable. Larger changes than ⅛ inch are unnecessary, as in no case was the loss greater than ⅛ inch. Under these conditions a starter of 2½ inch diameter will permit a 16-foot hole to be bottomed with a steel of 1⅝ inch gage. The 24-inch change in length of steel in general use in the district is quite satisfactory, as in most ground the steel does not become too dull for efficient drilling in penetrating that distance.

The second series of tests consisted in using 1-inch steel in place of 1¼-inch. In order to conduct these tests it was necessary to equip one of the standard drills with a special chuck for 1-inch steel. Through the courtesy of the Ingersoll-Rand Company a special anvil-block chuck for 1-inch hexagonal steel was provided. A simple steel retainer was made at a local shop and attached to the drill. The steels were collared similarly to "jack hammer" steels. The 1-inch hollow hexagon steel was first tried, because it was the only 1-inch steel available. The use of lugless or collarless steel with anvil block chucks was thought to be impracticable for this district. The rock is mostly chert or cherty sale. The chert is often much fractured, and in some cases along the water courses is in the form of a loosely cemented breccia. Also the chert

varies in hardness. That which is known as the primary, or light-colored chert, is comparatively soft and brittle, and is called "shelly flint" by the miners. The secondary, or dark-colored, chert, is very hard. When drilling a hole which penetrates both kinds of chert the "shelly flint" will shell off into the hole and cause much trouble in removing the steel. Along the water-courses small cavities are common. These interfere greatly with drilling, causing a loss of water and accumulation of cuttings behind the bit. Another source of trouble is the dropping of small flint pebbles into the hole behind the bit. These pebbles wedge themselves between the steel and the rock and often cause great difficulty in removing the steel from the hole. A miner frequently spends a great deal more time backing the steel out of the hole than in "drilling in."

In view of these conditions it was decided that 1-inch round lugged steel would be the best section to use. However, as no 1-inch round steel was on hand and sharpener parts were not available for sharpening the 1-inch round steel it was decided to use 1-inch hollow hexagon, which was on hand and could be used immediately. In the meantime parts for the sharpener and a chuck for 1-inch round steel were ordered from the Sullivan Machinery Company.

The results of the tests with 1-inch hexagon steel were most encouraging. Nineteen holes from 4 feet to 10 feet in depth were drilled, with a total depth of 96.9 feet.

The longest steel available for these tests was 10 feet. The starters were made 1¾ inch diameter and 1-16 inch gage changes, with 2 feet changes in steel lengths were used. The drilling was done in different kinds of ground, including the hard flint, water-course, and fractured ground. The drilling speed as compared to previous results with 1¼ inch steel was increased about 90 per cent. The great advantage of the small steel, however, seemed to be in the ease with which the steel could be removed from the hole. This fact was evident in every test. The 1-16 inch drop in gage was sufficient except in very hard ground, where it was necessary to use two steels of the same length in drilling the 24-inch change. The only disadvantage noted with this steel was in cleaning and loading the holes. In the fractured ground, where the sides of the holes are rough, it was sometimes quite difficult to get the powder into the bottom of the holes.

The conclusion from the results of 1-inch hexagon steel was that holes up to 10 feet in length can be drilled faster and with much less exertion using 1-inch steel than when using 1—1¼-inch steel.

After considerable delay a quantity of 1-inch round steel was obtained from New York by express. Thirty-eight holes, varying in depth from 4 feet to 16 feet, and having a total depth of 315.7 feet, were drilled with the 1-inch round steel. The results obtained from this steel were not so good as with the hexagon steel. The chief reason for this was on account of the quality of the steel itself, which was of low carbon content and could not be made hard enough to stand up to the work. The most careful heat-treated bits wore down in a few inches of drilling. The drilling speed obtained with the 1-inch round steel was no greater than with 1¼-inch steel. In making up this steel a 1 15-16 inch starter was used with 1-16 inch gage drops, making a 16-feet steel of 1¼-inch gage. Several 16-feet holes were drilled in very bad water-course ground and much trouble was experienced in removing the steel and in cleaning and loading the holes after the steel was removed. However, it may be stated that in this connection that much trouble would also have been experienced in the same ground with 1¼-inch steel.

In all the tests on 1-inch steel, both with hexagon and round, there was practically no steel breakage. Also there was apparently no greater wear on the machine hammer than with the 1¼-inch steel.

The possibility of using smaller steel in this district is complicated by the method of mining which requires many deep holes to be drilled, and also by the character of the ground.

The use of deep holes necessitates large starting bits. With 1-inch steel a bit larger than 2-inch diameter is undesirable. This means that a 16-foot hole must be collared with a bit not to exceed 2-inch diameter, which makes it more difficult to keep the machine lined up and also causes more trouble in cleaning and loading than where holes are collared with larger starters. This is especially true in the "cavey" water-course ground. The results of these tests, which are still being continued, should show beyond question the possibilities of 1-inch steel in this district. Since the completion of these experiments at the Blue Bird Mine the Bilharz Company has continued the tests, using 1-inch hexagon steel with 1-inch round lugged shanks and are successfully drilling and loading holes up to 16 feet in depth.

The conclusions from all tests are as follows: 1. One-eighth-inch gage changes and 24-inch changes in steel lengths are best for conditions in this, the Tri-State, district when using 1¼-inch steel. 2. One-inch steel can be used successfully with the large hammer drills for drilling holes up to 10 feet in depth, at a considerable saving in time and energy on the part of the miner. Gage changes of 1-16 inch and changes in steel lengths of 24-inch can be used with 1-inch steel.—U. S. Bureau of Mines, Reports of Investigations.

MR. A. D. KEENE, ELECTRIC FURNACE ENGINEER.

Mr. A. D. Keene, Electric Furnace Engineer of the General Electric Company, Schenectady Works, is now connected with the Pittsburg Electric Furnace Corporation as engineer on electric furnace designs and applications in the steel and metal industries, where his long practical experience in the design of various electric furnaces and ovens should prove highly valuable. His joining with the Lectromelt Furnace forces indicates a broadening out of the Lectromelt Furnace line, which has heretofore been confined to melting and refining furnaces for steel, iron and brass, bronze and ferro alloys. Mr. Keene has moved his residence from Schenectady to Pittsburg.

BEAVER STAYS CLOSED.

There can be little doubt that the Beaver mine will remain closed for the winter. The management are satisfied that it would not be in the best interests of the company to reopen at this time and will not likely do so until spring at the earliest. It is hoped that next summer will bring higher silver prices and lower operating costs.

THE POUCE COUPE OIL FIELD

By E. L. CHICANOT

The oil strike and subsequent development of the Fort Norman field had the effect of largely overshadowing the search for oil in other sections of the West and North, where indications were just as favorable and the search just as zealously and strenuously prosecuted. The ceaseless influx and extensive staking about the find occupied all attention, to the exclusion of just as significant developments elsewhere, and it is only recently that the public has come to know anything about the developments of the Imperial Oil Company in the Pouce Coupe field. Though it has received comparatively brief and limited attention from the outside world, this is probably the most promising field at the present time, and the area has for months seethed with expectancy and thrilled in eager anticipation.

Despite the reports which have dribbled down lately that oil had been struck recently in the well being drilled there, the Imperial Oil Company gives definite assurance that this is not the case, and the reports would seem to have emanated from men on the spot acting in the very best of faith, but lacking the necessary technical knowledge. Little news, as a matter of fact, is permitted to get out. The premises for miles around the drilling are being zealously guarded against visitors, and no information is being given out by employees. All company work in the district is hedged about with so much secrecy, and it is so difficult to elicit reliable information, that correspondents have been led to draw their own conclusions, with the result that they have somewhat exaggerated the situation.

Certain it is that wet gas of an exceptionally heavy pressure has been encountered and that gasoline is being forced by the tremendous pressure through joints in the pipe. There are the very best indications of an oil strike, but the working season concludes without this search being satisfied. The appearance of gasoline has undoubtedly led to the too rapid conclusion that oil had been reached, but the explanation of this is the rich content of the gas.

The history of the well is briefly as follows. On September 26th a heavy flow of wet gas was struck by the drillers of the Imperial Oil Company at a depth of 1,650 feet, the volume of which was estimated at two million feet per day. When the flow was first struck in the boring operations, oil, sand, and pebbles were thrown high into the air and a vapor column could be seen for some considerable distance for a long time afterward. Drilling was of necessity discontinued, and it was apparently the intention of the company to reduce the hole, as indicated in the arrival on the spot shortly afterward of a quantity of three-inch casing. Drilling had been commenced with a 21-inch bore and was twice reduced in the course of the operation.

As the result of only fifteen minutes of actual drilling after the strike, the flow of gas increased from two million to eight million feet per day, and drilling was again suspended. Further development was undecided for a while to await the judgment of officials of the company. Either drilling on the well was to be resumed or the well capped pending the sinking of other holes in the vicinity and utilizing the discovered gas as fuel. It was believed that the latter would be the plan followed, which was supported by the arrival on the scene of a capping apparatus weighing over a thousand pounds. Now, however, the company declares its intention of cutting off the flow of gas, if possible, and resuming drilling on the well to a distance of three thousand feet, if necessary, in their oil search.

Before the beginning of November, the well was successfully capped, and this was followed by the appearance of gasoline, which gave rise to further rumors. The pressure on the well is said to be greater than has ever before been encountered in the history of drilling. When the valve is opened slightly the roar can be heard for miles, and it is necessary for the crew to be provided with protection against concussion. Though at the beginning of November there were no indications of winter, and prospectors in the vicinity were working on mineral claims, and some ploughing was in progress, the last word has been written in the oil search at Pouce Coupe for the season, and the developments of the spring can only be anticipated. All on the spot are, however, most optimistic, and engineers consider the chances of an oil strike highly probable.

According to word received from Pouce Coupe it has not been decided whether the flow is a vertical or lateral seepage, and a considerable amount of importance attaches to this point. If it were lateral it would indicate that it was being forced from a body of oil in the vicinity which might not necessarily be tapped by the present hole. On the other hand, if the flow were vertical, it is regarded as a certainty that the present well will be brought in. An authority in the district has advanced the opinion that the anticline has been tapped at its apex or crest, this accounting for the terrific amount of gas encountered, the latter naturally being stored in the highest point of the structure. The same authority believes that piercing the structure below the gas line would result in an oil gusher, and that to sink such holes lower on the anticline is the company's intention.

Oil was actually encountered in the drilling in small bodies at several horizons in this hole. A lateral seepage was struck at a depth of less than two hundred feet and was cased off. Several unimportant pockets of oil were met with between this horizon and that at which the present seepage was encountered. Work has been pressed as intensely as possible on the well, the crew working in two shifts of twelve hours each, and making as high as fifteen feet per day.

At the present time, while there is no foundation for the rumor that oil has already been struck, there is optimism of the well proving its worth when the opening of spring makes general activity possible again. Certain it is that the Imperial Oil Company intends extending its operations in the vicinity, as is evidenced by the quantities of supplies and equipment arriving in the district over the Edmonton, Dunvegan and British Columbia railway. Arrangements are made for a heavy freighting program during the winter months. Large tracts in the vicinity have been secured recently by purchase and lease, and there is unquestionably great development work to come at the hands of other corporations than the Imperial Oil Company. Though the summer's operations have not disclosed the precious fluid, there is every reason for optimism in the future of the Pouce Coupe area.

A POSSIBLE USE FOR SILVER.

By J. A. McRAE.

Again there is hope for bi-metallism, and again the silver miners of the world are coming to believe the metal which they produce will figure conspicuously in a solution of the financial problems of the nations.

"Repudiation" of financial obligations has been suggested by financial experts of high standing, but the power of suggestion in this instance may lose much of its force owing to such a procedure being foreign to recognized business principles and a shock to the pride of the British Empire.

The wholesale production of paper currency without adequate metallic backing has rendered all but impossible an adjustment of exchange rates between the trading nations of the world. The future earnings of all the people of nearly every country has been mortgaged for the next several decades, and the grandsons of the present generation will pay toll to collectors who will be part of their inheritance.

Gold is the only metal with a fixed value. The metal does not exist in quantities sufficiently large to lend a stable value to the great sheaves of paper now in circulation. As a consequence of this, rates of exchange may never become adjusted, and the debts of many nations may actually go unpaid, unless or until such time as some arrangement has been made for adding to the quantity of metal of fixed value.

It is inevitable that a solution will be found. The law of survival dictates that it must. It is also evident that the greatest promise of a solution lies in an international discussion of the problem, and that the whole world should "take stock" of its gold supply, which would be quite easy, and to also take stock of its silver — which would be comparatively difficult.

Out of the Disarmament Conference at Washington may come a better understanding of the financial situation of the world. As long as the nations of the earth maintain great battlefields, and so long as each country tolerates the clank of the sword, there could never come a solution of the monetary problems which are gnawing at the foundation of present day commerce. Should the Disarmament Conference decide definitely to minimise the construction of instruments of war, and should a joint agreement between the nations of the earth thereby offer to the world the fuller benefits of the energy of men, then it is only reasonable to believe that a "Financial Conference" should immediately follow.

Assurance that the countries of the world are determined to work in concert would be a basis upon which to attack the financial problems. A fixed value for silver in a ratio of 16 ounces of silver to 1 ounce of gold would greatly swell the amount of metallic backing of paper currency. This would constitute a second step, and would probably be sufficient to enable Great Britain to quickly place her currency at par. It would give to other European nations a substantial boost along the road to financial stability. In cases where even this additional metal of standard value would fall away short of bringing currency to par, there would probably follow a general liquidation of the excess supply of paper. That is to say, that where the currency of a country figured at a discount of 20 per cent. the general scheme of re-adjustment would be to immediately "fix" the value of paper currency at about four-fifths of its original value to issue new notes of the full value, but of a new design, for which only four of the new would be issued for five of what are at present in circulation. This scheme of adjustment, as in the case of Russia, for instance, would have to be carried to great extremes, and an investigation might reveal that a new issue of notes of "real" value could not be exchanged for those now in circulation on a basis of less than thousands of the old for one of the new.

Just what will be done at Washington will only be revealed as the Conference proceeds, but it would be a misfortune were the council of the nations to terminate without taking into account the monetary status of the world as a whole. This question is of paramount importance, second, perhaps, to the end of great wars. The normal movement of commerce is essential to progress, and this cannot be achieved under conditions where great uncertainty exists as to the solvency of trading countries.

In January, 1920, the price of commercial silver averaged $1.32¾ per ounce. At the closing month of 1920 it averaged only 64¾ cents per ounce. In March, 1921, it had declined to an average of 56 cents per ounce. Since that time it has been rising gradually month by month, until during October it reached an average price of 71 cents an ounce.

Whether or not the present strength in quotations for silver is a reflection of expected action at Washington cannot be determined at this early date. At any rate, it is interesting to keep in mind that to adopt bi-metallism on a basis of 16 ounces of silver to 1 ounce of gold would be to fix the price of silver at $1.29 per ounce. It is not improbable that this may comprise a part of the solution of the world's monetary trouble.

BOOK REVIEW

FIRST AID AND RESCUE WORK IN MINING. By Louis G. Irvine. Published in Johannesburg by the South Africa Red Cross Society. For sale by Mining and Scientific Press, San Francisco. Price $2.

This little book is designed to meet the need for First Aid instruction in mining. A general course in First Aid work is the subject of the Part I. The second part of the book deals with the special requirements of "First Aid in Mining." The author, Dr. L. G. Irvine, of Johannesburg, is well known for his work on miners' phthisis and the treatment of poisoning on nitrous fumes. Dr. J. C. Haldane in a prefatory note recommends the book highly. A large part of the volume deals with accidents due to poisonous or asphyxiating gases in mines, and with the use of rescue apparatus in connection with these emergencies. Among the subjects dealt with are: Treatment of accidents underground, transport of injured underground, accidents at reduction works on gold mines, cyanide poisoning, gaseous impurities in mine air and their effects, gas poisoning from the fumes of explosives, accidents in coal mines, use of rescue apparatus in coal mines.

DAVIDSON LOCATES VEIN.

According to information received from the mine by F. C. Sutherland & Co., development work at the 600 ft. level of the Davidson mine has resulted in finding good ore. Faulting had made necessary considerable work in picking up the vein. The company has about fifty men at work.

Copper's Importance in Domestic Commerce

An Officer of the Anaconda Copper Company, Greatest of All Copper Miners, Has the Following Interesting Article in "Iron Ore" of Ishpeming, Mich., Copper and its Development.

When the Santa Maria arrived off the coast of Honduras, Columbus captured a native canoe, and among other things it contained a number of copper hatchets. After reaching a point near Panama, he wrote a report to his sovereign and in mentioning the incident, spoke of these and other excellent examples of the coppersmith's art, adding that he believed the country contained great mines of copper.

Almost from that day forward, the mining of copper ores and the fabrication of copper metal have been important factors in the industrial and economic life of our country.

Early American historians all comment on the extensive use of copper by the native Indians and their amazing cunning in making domestic utensils as well as ornaments and implements of war. With such evidences of the use of copper about them and in view of the extensive use of the metal for domestic purposes in Europe, it was quite natural that the early colonists should adapt copper to their domestic needs. Thus we find the art of working copper to be among the first of the major industries to be developed in the Colonies.

In 1645, Joseph Jenks, a native of Hammersmith, near London, came to Massachusetts as principal workman and machinist for John Winthrop, Jr., and he deserves to be held in perpetual remembrance in American history as being the first founder who worked in copper and iron on the Western continent. Three years later Governor Endicott discovered copper deposits and brought smelters and refiners from Sweden and Germany.

Rapid Development of Copper Industry.

With the discovery of large copper deposits in New Jersey, Pennsylvania and Virginia, and the establishment of rolling mills in Boston, New York and Baltimore the development of the industry was rapid and in the middle of the last century we find copper or its alloys in general use for cooking utensils, roofing, ornamental ware, and a thousand other uses ranging from the manufacture of pins to the sheathing of ships. The copper-smith was as necessary to community life as the blacksmith. Except for that part of the country's production which was exported, the entire supply was used for purposes which we may broadly term domestic.

With the advent of the great era of electrical development, the demand for copper jumped enormously The production of the country was totally inadequate, the price rose rapidly and it became increasingly difficult to secure copper at a price which made possible its use for domestic purposes. Great new copper deposits were discovered, new mines were opened up, improved mining and smelting methods were developed, but still production was inadequate to meet demands.

The situation was further complicated by a series of wars and the consequent demand for copper for munition purposes; the development of the automobile industry and the great extension of interurban electric service. This enormous demand for copper resulted in an increase of production of 1,600,000,000 pounds per annum in ten years.

With the coming of the World War, the demand for copper became so great that its use in all but essential industries was expressly prohibited. Manufacturers were forced to cut out copper wherever possible and the use of the metal for domestic purposes was practically discontinued.

Changed Character of Copper Markets.

During this ten-year period when practically the entire copper supply was being absorbed in the development of new industries the old established markets were entirely neglected and hundreds of substitutes were placed on the market, claiming all the virtues of copper, and selling at a considerably lower price. Intensive advertising and intelligent sales promotion work resulted in the successful marketing of these substitutes notably in the roofing material field. The kitchen utensil industry also suffered.

In 1909 aluminium utensils were practically unknown. An effort had been made to market them some years previous but it had been entirely unsuccessful, so much so that aluminium was commonly known among retail hardware dealers as "lemon metal." The absence of competition in copper stimulated manufacturers of aluminum to greater effort and by improving their produce and an aggressive campaign of publicity, the use of aluminum kitchen utensils has increased by leaps and bounds until today 50 per cent of the kitchen utensils used in this country are made of aluminum, while less than 6 per cent are of copper.

In 1912 the average amount of copper used in automobiles of American manufacture was approximately 200 pounds per car. Today the average is less than 30 pounds per car. In 1914 a large manufacturer of screws, nuts, bolts, etc., in this country, consumed 10,000,000 pounds of brass. Last year they used less than 3,000,000 pounds.

The superiority of brass pipe, especially for hot water supply, is unquestioned, yet today brass represents only a small percentage of the total outlay for plumbing, even in our finest buildings. The plumbing in the Commodore Hotel in New York cost $90,000, of which only $3,150 represents brass pipe. The plumbing in the Woolworth building cost $450,000, of which only $32,400 went for brass pipe.

I will not dwell on the folly of permitting the preposterous claims of substitutes to go unchallenged for so many years, or the results of the apathy of the industry in the face of bold and aggressive competition. We are now aroused and fully determined that copper shall no longer suffer from public ignorance of the merits of the metal and its outstanding superiority in practically every field.

In no one industry perhaps has copper and brass lost so heavily as in building, yet most architects prefer to specify copper and brass as a matter of professional pride. A recent canvass of architects in and around New York developed the fact that 137 out 150 interviewed recommended copper for flashing and downspouts, and 128 recommended the exclusive use of brass pipe. Architects generally would gladly use copper and brass if prospective builders understood the rare

and exclusive qualities of the metals and would be willing to bear the extra expense.

Sheet copper is the best roofing material known, being very light, obsolutely impervious to the action of the elements, and practically everlasting. It is capable of being laid flat or being worked to any curve, and after being in use a short time it takes on a most attractive color, which harmonizes with practically all building materials. The first cost of copper roofing is greater than that of some other materials, but over a period of years copper with practically no maintenance cost, is considerably less expensive than any other material, and if a copper roof is properly erected it should last practically forever.

There are thousands of examples of copper roofs in service in all parts of the world. Nagoya Temple in Japan was roofed with copper 510 years ago, and is to-day in perfect condition and its many gabled roofs covered with the green patina of age have taken on added beauty every year. The dome of the State House in Boston was roofed with copper in 1831, and is still in excellent condition after 90 years exposure to the rigors of the New England climate. Christ Church, Philadelphia, has a copper roof laid in 1838 and I was recently informed that there is every reason to believe that the roof is good for another 100 years at least.

Copper Roofing Gives Unusual Service.

There are hundreds of less conspicuous examples of the wisdom of roofing with copper in the older sections of the country. Yet copper is rarely specified to-day because of a slightly higher initial cost which is saved many times over, even in the first few years of service.

For other roofing purposes such as flashing, gutters and rain conductors, copper is unequalled. On the Chew mansion in Germantown, Pa., one of the conductors bears the date of 1798.

It has been estimated that an average of 400 feet of gutter and conductor pipe are used on the typical American dwelling. Made of copper, it would cost less than $200 — a small item in the total cost of building a home—yet over 90 per cent of the spouting used is made of galvanized iron, which must be replaced at intervals of not over five years, while copper lasts a lifetime. The cost of erecting copper and galvanized iron is substantially the same, and the difference in initial cost is absorbed before the first replacement of galvanized iron is completed.

The use of copper in shipbuilding is as old as the industry itself. The ancients used it extensively and modern ingenuity has devised no better. Paul Revere sheathed the sides of the "Constitution" with copper in 1803, and the old "Granite State," having completed 75 years of service in the American navy, is now about to be burned to the water's edge in order that the charred hulk may be stripped of a copper bottom and the copper spikes in her hull reclaimed.

Lightning conductors, which we owe to the genius of Franklin, have been given an evil reputation by the machinations of fakirs and confidence men. Yet, the fire losses of this country due to lightning are enormous. The Department of Agriculture is constantly urging the use of lightning conductors, and fire insurance companies allow reduced premium rates on buildings so protected. But this great industry has been allowed to languish and become the prey of shysters. Copper as the premier conductor of electricity is the logical lightning conductor.

What copper and brass need is publicity. If you will pardon the colloquialism, we should "tell the world."

Where resistance to corrosion, easy handling of expansion and contraction, absence of upkeep expense and long life are to be desired, copper is supreme. My purpose is not to detract from the merits of other metals — all have their uses — but there are certain fields in which copper excels, and we intend to do all in our power to restore the metal to its former position of dominance.

Superiority of Copper Cooking Utensils.

In the kitchen utensil field, copper has marked points of superiority. In heat conductivity it is vastly superior to aluminium. In a copper utensil, food is cooked uniformly on the bottom and sides of the vessel. Fats and grease are not absorbed, and consequently it is easy to keep the utensil clean. Food flavors are retained, and in spite of certain minor handicaps such as the need of occasional retinning, copper utensils are and have always been the choice of the world's greatest cooks.

If the home builder knows that by using brass pipe his plumbing troubles are solved he will not hesitate to spend a few additional dollars to insure himself this comfort. Brass and bronze hardware can always compete successfully with plated steel substitutes if the prospecting purchaser knows that brass and bronze will outlive the building itself, and all that stands between steel and rust is a thin veneer.

The automobile industry will return to brass when the buying public is taught to demand quality where it cannot be seen, but counts the most. Copper roofing can be revived if the merits of copper are known. Brass plated screws can no longer pose as solid brass if the consumer is taught to demand the best.

Electric expansion and a revival of export trade will probably bring back a normal demand. But copper must get back into domestic commerce if the industry is to be established and protected against constantly recurring overproduction.

Let us revive the latent interest of the public in copper, and restore the metal to its rightful place as an important factor in the domestic life of the country.

UNION MINING CORPORATION.

Plans have been made for a more or less extensive diamond drilling campaign on the Union Mining Corporation property in Whitesides township, about 30 miles south-west of the producing area of Porcupine. The shaft is down 300 feet with lateral workings at 150 and 300-foot levels. The diamond drilling work is to be undertaken to determine the values of the downward continuations of the veins being worked on at present. H. W. Winton, of Chicago, president of the corporation, recently paid a visit to the property in connection with the work.

NEW MONEL METAL PLANT.

Contracts are confirmed for an International Nickel Co. monel metal plant at Huntington, W. Va. There will be 24, 20, 14, 10 and 9-in. mills, 6 x 30 in. bloom shear, No. 3 lever shear, 126, 141 and 155-in. squaring shears, Nos. 1, 2 and 3 vertical bar shears, annealing furnace charger, roll lathes, etc.

ACTIVITIES OF THE U. S. BUREAU OF MINES

Some American Researches in Aid of the Mining Industry.

Investigations conducted by the United States Bureau of Mines in the course of a special effort to aid the mineral industries to re-establish themselves on a safe business basis to meet the renewed foreign competition and the changed conditions of supply and demand of the post-war period point the way to the possible saving of vast sums through the application of improved methods in the production of various mineral materials, according to H. Foster Bain, Director, in his annual report, just made to the Secretary of the Interior.

Oil Losses by Evaporation.

An investigation of losses of crude oil through evaporation in storage and in transportation, conducted during the year by the bureau, disclosed losses of startling magnitude. It was found that in the few day in which crude oil is stored on the lease before being taken by the pipeline, the aggregate loss per year from evaporation amounts to about 122,000,000 gallons of gasoline in the Mid-Continent field alone. This has a value, at 22 cents per gallon, of $26,840,000, and represents about 3 per cent of the total gasoline produced in the United States from all fields and all sources. The bureau found that a large per cent of this loss could be prevented by the use of efficient equipment.

Gasoline from Still Vapors

The Bureau of Mines has pointed out the considerable losses which have resulted from the failure of many refineries to recover gasoline from uncondensed still vapors. The significance of this investigation is shown by the fact that one refinery in the Mid-Continent field is now recovering from still vapors approximately 400 barrels of gasoline daily that before the installation of this equipment was either lost or burned as fuel under the boilers and stills. The value of fractionating towers at petroleum refineries, by means of which some companies have increased the yield of gasoline from crude oil by as much as 5 per cent or 16 2-3 per cent of the total gasoline yield, has been demonstrated.

Large quantities of gas are now being wasted in the Osage Nation in Oklahoma because of low-pressure conditions, and the Bureau of Mines is investigating the feasibility of utilizing this waste gas by the use of low-pressure burners for oil-fire boilers. The demand of the export market for "sweet" gasoline led to the development of a process for treating gasoline to remove the objectionable sulphur compounds, by which treatment some grades of American gasoline heretofore objectionable were made suitable for export.

New Process for Cracking Heavy Oils

Under the arrangement by which supervision of the drilling and production of oil and gas on the public lands is vested in the Bureau of Mines, the bureau has supervision of about 100 producing oil properties which are producing at the rate of about 12,000,000 barrels of oil per annum. Even at the present reduced price of oil, the Government royalty from this should total perhaps $2,000,000 per annum. A special process, devised at the San Francisco station of the bureau, for cracking heavy oils and tars promises the recovery of large yields of gasoline and other lighter products, hitherto regarded as unrecoverable. Investigations made by the bureau in Colorado and Utah indicate that the oil-shale deposits of the Rocky Mountain states contain a potential fuel supply of almost unequaled importance.

Helium Investigations.

The experimental helium plant at Petrolia, Texas, conducted under the authority of the Army and Navy Helium Board, was in operation during the year at various times, and helium was produced for short periods. A study of the practicability of storing this rare and non-inflammable gas in mine workings was made at the bureau's experimental coal mine at Bruceton, Pa. At the cryogenic or low-temperature laboratory in Washington, D. C., liquid air in quantity is now being produced. The primary object of this laboratory is to investigate gases and liquids at low temperatures, with special reference to the separation of helium from natural gas. Field investigations of possible supplies of helium in natural gas were completed during the year in every known gas field in the United States having been tested. Results were markedly successful, as they have shown that this country contains the largest supply of helium-bearing natural gas in the world.

Saving Aluminum.

An investigation of scrap losses in aluminum-alloy foundry practice showed that the annual losses in the United States amount to $1,200,000, and that universal adoption of methods recommended by the Bureau of Mines would probably result in a saving of about $600,000 per annum. Melting losses in this industry, which are largely preventable, aggregate about $3,000,000 yearly.

Collection of Radium.

A new method was devised to simplify the collection of radium emanation from radium salts. Experiments are now in progress to perfect the process and to develop apparatus that can be recommended for public use in laboratories and hospitals.

Coal Washing

As about one-quarter of the bituminous coal produced in the United States is used in industrial power plants, the waste of unburned coal and coke in the ashes from boiler plants has been investigated by the bureau. It has been possible to recover the greater part of the unburned fuel by washing the ashes on a concentrating table. As the result of a study of coal-washing problems in the State of Washington, one mine has built a table washing plant to treat a pile of refuse amounting to more than one million tons, estimated to contain 200,000 tons of recoverable coal of coking quality.

Explosives

The bureau conducted studies regarding the use of liquid oxygen as an explosive. In co-operation with the Department of Agriculture an investigation was made of the use of cellulose from corn cobs in the manufacture of dynamite. Investigations were conducted to determine the best and safest conditions for the industrial use of 13,000,000 pounds of picric acid, held as a surplus by the War Department. During the year the bureau called attention to the danger in using certain low-grade foreign detonators which had been coming into the country in large numbers.

Gas Masks.

A universal gas mask has been developed by the bureau for protecting the wearer against all poison

ous gas not exceeding 2 or 3 per cent concentration in air where a safety lamp will burn. A fireman's gas mask has also been developed. A small gas mask for the use of train crews in railroad tunnels was devised. Investigations made in connection with the problem of ventilation in vehicular tunnels showed that from 20 to 30 per cent of the heat of the gasoline used as fuel for automobile engines is lost in the form of unburned gases in the exhaust, due to improper carburetor setting.

Other Work of the Bureau

More experimental work on mining explosives with reference to increased safety and efficiency was performed. Plans were initiated for an international conference on the standardization of mine-rescue apparatus. Methods for reducing losses of anthracite in mining operations were studied. Timbering methods for metal mines were investigated. A special study was made of the ventilation of metal mines and of the rock-dust problem in such mines. The bureau called attention to certain methods for the prevention of waste in the slate-quarrying industry. Methods for reducing waste in the mining and preparation of talc were pointed out. In the course of the year the bureau trained 12,525 miners in rescue and first-aid methods, the largest so trained in any fiscal year since the beginning of the training work.

PHOSPHATE INDUSTRY DECLINES IN CANADA.

A report issued by the Imperial Mineral Resources Bureau dealing with production of phosphates in the British Empire contains the statement that, prior to the development of the United States' phosphate deposits, Canada produced important quantities of phosphate rock, and exported considerable amounts to the United Kingdom, but in recent years the importation of cheap phosphate rock from the United States has seriously affected the phosphate mining industry of this country. Although the region extending from the Ottawa River on the south, northwards through the townships of Buckingham, Templeton, Wakefield, Bowman and Hincks, abounds in apatite deposits, the annual output of the Dominion in the past few years has amounted to only a few hundred tons, obtained during mica mining operations in Ottawa county, Quebec. Buckingham township in Quebec is the principal seat of the phosphate industry in Canada, where phosphate rock is manufactured into fertilizers, phosphorous and its compounds, but the raw material used in the process is almost entirely imported from the United States. Whereas, in 1914, there was a total production of phosphates in Quebec and Ontario of 852 long tons, the output dropped to 21 long tons in 1919. Imports from the United States for the year 1914 were 829 long tons, but, in 1919, the figures rose to 1,385.

ARGONAUT GOLD.

A recent report issued by the firm of Geo. Hamilton & Co., who sponsored the Argonaut issue, shows as follows:—During the past year considerable development work has been done, both on the 200 and the new 350 foot levels. Underground workings on the 200 foot level is in excess of 2,000 feet, while several hundred feet of drifting has been done on the lower level. The chief feature of the 350 foot gallery lies in the "Rainville Vein," which up to the present has been opened up for a total length of 250 feet, giving an average value of over $20 per ton. The workings on this level are 5 feet in width, so far, although the vein itself, along which development work is being carried out, is known to be much wider. In no case, in these workings on all levels, have the ends of any veins been reached. Another vein known as No. 354 has been cut for approximately 40 feet and has averaged over $20 per ton.

A summary of the engineers' reports shows that values of the different veins, taken at the surface and at the 85 ft., 200 ft., and 350 ft. level runs from $15 to $28 per ton. The concensus of opinion, based on the engineers' reports is that the property under the control of the Argonaut Gold, Limited, is one containing a very large tonnage of paying mineral and that its value is likely to increase with the deepening of its works, due to the presence of an extensively rich porphry dyke. Timber is now being cut with a view to beginning the construction of a new mill next spring and a standard gauge railway is being built to Argonaut and is expected to be finished by December next.

Northern Ontario Letter

THE SILVER MINES

November Silver Production

Silver production during the month of November from the mines of the Cobalt district reached approximately 900,000 ounces of silver, valued at about $630,000. After adding the premium on United States funds, the mines realized an income of close to $700,000 for the month. No further increase is anticipated until next spring, at which time a number of idle mines will probably be re-opened.

The preparation of preliminary estimates of silver production for the whole of 1921 from this district is under way and may be available for presentation next week to the readers of the Journal. An interesting feature will be that the aggregate silver production from this district since the discovery of silver in Cobalt in 1903 will show not far under $200,000,000.

The Cane Silver Mine

A representative of the Hudson Bay Mines has just completed an examination of the Cane Silver Mines, situated in the township of Cane on the Elk Lake Branch of the T. and N. O. Railway. Officials, acting in their individual capacity, are already involved in the ownership of stock in the Cane Silver Mines, and the present examination is for the purpose of determining whether or not the Hudson Bay Company itself will participate in the venture. There are three shafts on the property, but the greatest importance attaches to vein No. 8, where a shaft was driven to a depth of 42 feet, and from which about $1,200 worth of silver ore was taken. The vein is composed of aplite and is upwards of 12 inches in width. It differs from the aplite veins in the Elk Lake district in that the walls are exceedingly free, while the aplite in the majority of the Elk Lake veins appears to be frozen to the diabase. The representative of the Journal has obtained the opinion of A. G. Burrows, geologist for the Ontario Department of Mines, with respect to the occurrence of diabase in Cane township. Mr. Burrows announces the diabase to be in the form of a sill, and this encourages the belief that silver deposits may be found in commercial quantities. The area differs

from the Cobalt district in that at Cobalt the conglomerate formation with which the diabase came into contact fractured easily, and these fractures gave easy access to the silver-bearing solutions accompanying the diabase intrusion, whereas in Cane township, the diabase sill passes through quartzite formation which shows no evidence of having fractured. This tends to show that the more promising points to explore for silver ore in the Cane area lie in the fractured zones in the diabase itself at points in close proximity to the quartzite.

South Lorrain

Property owners in the South Lorrain district are optimistic with regard to the Mining Corporation of Canada having taken a working option on the Haileybury Frontier property. Silver is showing in encouraging quantities at four different points in the present workings. As work proceeds, it is not unreasonable to expect certain of these shoots to extend beyond their present known limits, with possibilities of leading to additional important silver deposits.

Working Deeper at Violet

Arrangements have been made to continue operations to greater depth on the Violet property of the La Rose Consolidated. Results achieved at the deepest point so far opened up have been exceptionally favorable, and the prospects are believed to be good for opening up additional ore at greater depth.

Nipissing Prospering

The Nipissing enjoyed another prosperous month during November, the official details of which are promised during the second week of December. Recent developments on this mine have comprised the brightest spot during the past year in connection with the silver mining industry of this country. There is considerable speculation as regards the January dividend. In recent years it has been the policy of the Nipissing to disburse a double dividend in January, and stockholders are wondering if the cut to 3 per cent quarterly during 1921, as compared with 5 per cent quarterly in preceding years, will alter the policy of making a double January disbursement.

Silver Prices May Be Affected

Cobalt mine operators are watching the trend of events at the Disarmament Conference, Washington, where the discussion of the financial status of the nations is expected to involve the question of metallic backing behind the paper currency now in circulation. Local operators do not appear to be enthusiastic in regard to the possibility of bi-metallism being actually adopted, but should such occur it would mean a new lease of life for many silver mines, as well as adding in a big way to the value of the present producers. This question is referred to elsewhere in this issue of the Journal.

Crown Reserve

Announcement is made that the Crown Reserve Mining Company contemplates forming a company for the purpose of operating the property recently explored in the Larder Lake district. It is proposed to include the Crown Reserve, Porcupine Crown and Imperial Crown companies in a scheme to provide about $250,000 with which to explore and develop the Larder Lake claims in a comprehensive manner. The group consists of thirteen claims.

Elk Lake and Gowganda Districts

The Alpine Silver Mines is being worked aggressively and is the second largest operation in the Gowganda district. The Miller Lake-O'Brien is the leading operation and constitutes the only steady producer. It is considered probable that a scheme will be arranged whereby the Trethewey may do some financing with a view to re-opening the Castle property and installing a small mill. This property was understood to be developing well prior to curtailment of work, and the suspension of operations came as a disappointment. The indications appear to be that arrangements will be made to get work under way before the new year is far advanced.

Work is being carried on on the Northcliffe property in the Gowganda district, and officials of the company are optimistic in regard to the outlook.

Freight Rate Reduced

The freight rate reduction which went into effect December 1st, and which reduced carrying charges 10 per cent, will tend to lower costs of operation at the mines throughout Northern Ontario. The feeling is that the cut, although small compared with the advances recorded during the past five years, is, nevertheless, a step in the right direction.

THE GOLD MINES

The Porcupine District

Gold mining in the Porcupine district is looming up as a greater industry than even the more optimistic pioneers ever believed possible. Facts now coming to light in the leading mines are so favorable as to show that in the case of the Hollinger Consolidate, McIntyre-Porcupine and Dome Mines there will probably be a steady growth in developed resources for many years to come, and with the necessity of adding in a big way to milling plants.

McIntyre's Outlook

It is believed that there is little question but that the McIntyre will ultimately add the Plenaurium and the Newray to its holdings, and there are mining men who openly express the opinion that the McIntyre may eventually be found among the mines of nearly the size of the adjoining Hollinger. This belief is based in part upon the fact that the mineral deposition on the zone of enrichment has a "rake" toward the east, and in part upon the fact that the ore bodies on the McIntyre are increasing in size, becoming more uniform, and carrying higher values accordingly as greater depth is attained. In fact, at great depth, according to a theory now taking form in the minds of careful observers, is that the area lying beneath the Pearl Lake "depression" may be found to comprise the backbone, so to speak, of this greatest zone of gold enrichment so far found in Canada.

Predicts a Billion from Porcupine

In this issue of the Journal will be found an article which points out the possibility of this area producing around a billion dollars in gold before its final history is written. Admittedly, this is an optimistic view, but is nevertheless based upon concrete achievement to date and is not unreasonable.

Dome Mining Higher Grade Ore

On the Dome Mines, the results obtained during the past year have been only second in importance to that of the Hollinger-McIntyre area. On the Dome, high-grade ore has been found at depth, a feature of which is the marked difference in composition of the ore as found on the Dome when compared with the Hollinger-McIntyre lodes. The Dome deposits at depth are rapidly elevating the mine to a position

where it is no longer a low grade mine of enormous tonnage but is a high grade mine of huge tonnage.

Developing Paymaster Orebody

Another development which promises to attract widespread attention in the Porcupine field is taking place on the Premier Paymaster property, situated in the township of Deloro, at a point about one mile southwest of the Dome Mines. At a depth of 200 feet on the Paymaster, formerly the Standard, a cross-cut was driven across a body of quartz porphyry measuring about 98 feet in width. Fine sulphides are evenly distributed through this body, and the average gold content is declared to be not far under $5 per ton. A drift is now being driven in the centre of this wide body with the object of again cross-cutting at a point about 100 feet from the first cross-cut. It has been learned that Walter Harvey Weed, well-known geologist of New York, will visit the property some time this month. The Paymaster is being worked by A. S. Fuller, of South Porcupine, together with associates of Butte, Montana.

Schumacher Deal Pending

A deal is said to be pending for the control of the Schumacher Gold Mines which may preclude the possibility of the property being taken over by the Hollinger or the McIntyre, as intimated recently in unofficial circles.

To Re-open Ankerite Property

Arrangements are being made to re-open the Ankerite property in the township of Deloro a short way south of the Dome Mines. Clifford Smith, who is identified with the scheme, has left for New York and is hopeful of having operations under way early in the new year.

Porcupine V. N. T.

No new developments have been reported this week with reference to the Porcupine V. N. T., although it is known that certain negotiations are pending which offer promise of comparatively early developments of importance.

Hayden Shaft De-watered

The plant on the Hayden-Porcupine mine, situated in the township of Ogden, south of the town of Timmins, has been overhauled and is now ready for operation. The shaft has been de-watered to the 300-foot level, and lateral operations are to be carried on at the 100-foot, 200-foot and 300-foot levels. A little later on, the shaft will be de-watered to a depth of 375 feet, and will then be continued to deeper levels. Col. Hayden visited the property this week, and in an interview wth the Journal expressed optimism with regard to the prospects. Col. Hayden believes the property is assured of success as a big low grade proposition near surface, with likelihood of the values becoming concentrated in veins at greater depth.

Teck-Hughes Reorganization

The re-organization of the Teck-Hughes has been one of the outstanding features in connection with mining in the Kirkland Lake field. The company will issue new bonds amounting to $600,000, which, together with $35,000 in cash, will be used to pay off the present bonded indebtedness. This amounts to an extension of time on the bonds. At the same time, the capitalization is being increased from $2,500,000, made up of 2,500,000 shares of the par value of $1.00 each, to $4,000,000, made up of 4,000,000 shares of the par value of $1.00 each. The additional shares are to be offered for sale at 15 cents each to the shareholders, and if not taken up will then be offered to the bondholders, who will be permitted to take them up for 15 cents each and be permitted to pay for them in bonds. This may reduce the bonded indebtedness by $267,750, minus $35,000, or $232,750 net, thereby leaving a debt of $367,250.

Ontario-Kirkland Joins Producers

The new 100-ton mill on the Ontario-Kirkland was set in operation during the closing days of November, and this mine is expected to produce from $1,000 to $1,300 daily.

King-Kirkland Re-organization

A by-law was passed by the King-Kirkland, authorizing an increase in capital from $2,500,000 to $5,000,000, par value of $1.00. The reorganization was based upon the purchase of the two adjoining Ferguson claims, for which 400,000 shares are to be paid, 250,000 of which are to be delivered immediately, subject to pool, and the additional 150,000 to be turned over upon payment of a certain amount of cash. This leaves the King-Kirkland with 3,070,000 shares in its treasury plus a fair amount of cash. Announcement has been made that mining machinery has already been placed on order and arrangements are being being made to conduct an aggressive and comprehensive scheme of underground development.

Kirkland Lake

Good ore is reported to have been found at the 900-foot level of the property of the Kirkland Lake Mining Company at a point comparatively close to the boundary of the Elliot-Kirkland. This immediately gave rise to reports of a possibility of the Elliott-Kirkland merging with the Kirkland Lake.

Larder Lake.

The Crown Reserve is considering the question of organizing a separate company for the purpose of exploring and developing property in the Larder Lake district.

Manley-Reilly Property Optional

James Flynn has secured an option on the Manley-Reilly property in the township of Skead and is planning the organization of a stock company to raise finances with which to carry on operations.

B.C. MINING NOTES.

Stewart, B.C.—Describing the Silverado Group of Mineral Claims in his 1920 Report, George Clothier resident Mining Engineer, said that the showings were at an elevation of 3,500 feet, a short distance south of the big glacier across the Bear River from the town of Stewart. He stated further that the vein "which lies very flat, has been traced for 300 to 400 feet on the surface," that "a showing of from 4 to 14 inches of quartz mineralized with grey-copper" had resulted from slight development, and that "a sample assaying 5 per cent. copper gave 360 oz. a ton silver and $10 a ton gold." These particulars give some idea of the property and the work that must be done on it to make it productive by J. J. Conghlan and his Associates, the Vancouver Syndicate that has taken over the claims. The showings since have been much more extensively developed and work has been proceeding during the past two months on a tramway and other outside camp necessities. It has been the endeavor to complete before the season altogether closes the tramway from the lower to the upper camp; the running of a cable across a canyon from the upper camp to the showings, a distance of 800 feet, to be

used in carrying men and supplies across a slide and also to convey the ore from the mouth of the tunnel to the head of the tramway. A considerable shipment of high-grade ore is to be rawhided out over the snow during the winter.

The S. S. Anyox, in her last call at Stewart, picked up 250 tons of concentrates from the Premier Mine consigned to the Tacoma Smelter. A small shipment of high-grade ore from the Fish Creek Mining Co.'s property, Fish Creek, also was received.

Satisfactory reports are received concerning the results of the season's work on the New Alaska, the Vancouver Gp., and the Idaho. Open cutting and stripping done on the Vancouver Gp. is said to have further exposed three showings, one of which is from 100 to 150 feet wide. The ore in this case is low-grade and can be traced for a distance of 600 feet on the surface. The other two showings have not the same vein width, but are reported to be considerably higher grade. On the Idaho, situated on the north fork of the Marmot River, a 100 foot tunnel has been driven opening a shoot of ore eighteen inches in width, samples from which have given returns running over $500 a ton in all values.

Alice Arm, B.C.—The Dolly Varden Mine has been closed, the railway having been washed out at several points and some of the bridges shaken by the floods. With reference to the Esperanza Mine, situated about a mile from Alice Arm, it is stated that several tunnels are being driven and the ore body opened up in a large way, it being the intention to continue work all winter.

Trail, B.C.—Included in the shipments received at the Trail Smelter of the Consolidated Mining and Smelting Co. for the first week, November 8 to 15 were 385 tons of ore from the Slocan District. Among the properties contributing were the Standard and Van Roi, Silverton. From November 15 to 21 the receipts at the smelter totalled 7,449 tons. Of this amount there were 25 tons from the Paradise, Windermere; 54 tons from the Surprise, Republic; 36 from the Sally, Beaverdell; and 49 from the Van Roi, Silverton. The aggregate tonnage received for treatment at the smelter for the year is 364,247 tons.

New Denver, B.C.—Considerable work is being done on the Bosun Mine, New Denver, owned and operated by the Rosebery-Surprise Mining Company. The Bosun is an old mine, as age goes in the Slocan, and its ore is exceptionally high grade. The original vein had a famous stope on the fourth level that showed continuous lead ore from two inches to a foot in width for a distance of 200 feet. The principal source of present production is the ore body beneath this level. This is being opened by means of drift and raises from the fifth level. About a year ago a second vein was discovered about 30 feet within the hanging wall. From this some very fine bunches of ore have been taken but nothing very large or persistent has yet been found. This vein, however, is much stronger and open than the old or footwall vein. One stope opened on it above the fifth level showed a perfect hanging wall with a dip of about sixty degrees and an average width of vein of eight feet. Both the lead ore and the zinc ore are high grade. The silver content runs up to 180 ounces in the former and to 100 ounces in the latter. As the veins are wide and soft it is found that greater efficiency is obtained from handwork than from machines. In this way the ore and waste are broken down in fairly coarse size, enabling the sorting out of most of the waste and the retention of it in the stope as filling. The mineral, with such fine waste as cannot be readily separated, is delivered at the lake bunker for shipment to the Trail Smelter.

Vancouver, B.C.—A verdict of "criminal neglect" has been returned by the Coroner's Jury against the Britannia Mining and Smelting Co. Ltd., because of the loss of thirty-six lives in the flood disaster at Britannia Beach on October 28th last. The finding of the jury in detail follows: "That W. Lonon and others came to their death on October 28th, 1921, at Britannia Beach, B.C. The disaster was caused by what is known as a railway fill or dump giving way, and we, the jury, declare that it was criminal neglect on the part of the Britannia Mining & Smelting Co. Ltd., under the general management of E. J. Donohue and K. B. Browning, general superintendent and mining engineer for the said company, for deliberately allowing the blocking of a natural mountain stream known as the Britannia Creek, causing a menace to persons living at Britannia Beach." More than forty witnesses were examined at the Inquiry including a number of civil engineers who investigated conditions at Britannia. The members of the jury also visited the scene of the catastrophe. The Attorney-General of British Columbia has under consideration what action the Crown should take with respect to the matter in view of the verdict and there is no doubt that there will be a number of claims for damages brought to Court against the Company by those who lost relatives.

It is announced that arrangements have been completed for the construction of a new Mill at Britannia Beach by the Britannia Mining & Smelting Co. Ltd. Houses also are to be erected for the employees on the bench north of Britannia Creek, where there will be no danger of a repetition of the recent disaster. The mill will be of 2,500 ton capacity, capable of treating under favorable conditions nearly 3,000 tons of ore a day and of producing per annum from 24,000,000 lbs. to 25,000,000 lbs of copper. It is not expected that the plant will be ready for operation before 1923.

Victoria, B.C.—It has been announced by the Hon T. D. Pattullo, Minister of Lands, who returned a few weeks ago from England, that definite action towards the establishment of an Iron and Steel Industry in British Columbia may be looked for shortly. In a published statement he said: "There are many people who consider the establishment of an iron and steel industry in this province to be visionary. Nevertheless sane and reliable men are giving it serious consideration. "Certain British interests, he added, were awaiting the arrival of the necessary data before proceeding with the development of the water power of Campbell River. Situated close to tidewater on the east coast of Vancouver Island, within 120 odd miles from the City of Vancouver and slightly more from the city of Victoria, with iron ore deposits of magnitude within a few miles, this has long been considered as a most attractive water power reserve and one that could not be overlooked by capitalists contemplating launching an industry of the kind in the province. Significance attaches to the presence in Victoria, almost coincidental with Mr. Pattullo's statement of Major A. Belton, who represents British capitalists, and who has been waiting on Hon. Wm. Sloan, Minister of Mines, and other members of the Government to obtain information as to what assistance the Government may be prepared to extend any Corporation

U.S. PRODUCTION OF SOFT COAL.

Production of soft coal in the week ended November 26 dropped to 7,083,000 net tons. The decrease of 1,811,000 below the output of the week preceding was due chiefly to the occurrence of Thanksgiving Day, but also to slackening demand for coal.

EDITORIAL

THE POLITICAL WORLD.

The result of the general election, which was not announced in time to enable us to comment on it editorially last week, has been to render the Liberal party practically independent of any probable combination against it in the new Parliament. The Liberals will not have an absolute majority in the House of Commons. But we can scarcely imagine an issue arising on which fidelity to their respective principles would permit of Conservatives and progressives combining to defeat them.

In one respect, Hon. Mackenzie King, whose accession to the Premiership in a few days' time now is indisputable, is exceptionally fortunate. He has ample material available to form a Government that shall be strong not only in the personalities of those who compose it, but strong, above all, in the confidence of the people of Canada. In particular, he will be fortunate if he is able to enlist the services of Hon. W. S. Fielding, and we trust not only that he will be successful in doing so, but that those services will be utilized in his aforetime office of Minister of Finance. Mr. Fielding's long and loyal service to Canada, his ability and his high sense of public duty have secured for him an almost unique position in the regard of his fellow-countrymen, and almost irrespective of party.

We confess it is with relief that we apprehend from the state of Parliamentary parties that the influence of the Progressive party on tariff legislation will be a far from dominant one. For, on grounds which we indicated at some length, a couple of weeks ago, in our judgment the fiscal proposals of that party, taken in their intirety, were of such a nature as to be likely gravely to impair the fabric of Canadian industry. In the heat of an electoral contest, extreme things are liable to be said, and hopes which, to a large extent, are impossible of realization, are liable to be raised. But, once in office, the Liberal party will represent the whole people of Canada, and will perforce take cognizance of the interests of the whole people. It will be by those interests, and not by any idea of "*Vae Victis!*" that its course will be shaped.

We believe that, in many respects, the tariff needs revision. But we believe, further, that the task of framing an adequate and equitable tariff — one which will have regard to the interests of producer, manufacturer and consumer alike — will prove to be well within the competence of the statesmanship of that party on which the responsibility for the government of the country must now devolve.

WILL INVESTIGATE POWER RESOURCES.

The Commissioners of the Ontario Government Railway have authorized Mr. S. B. Clement and Mr. J. G. Kerry to make a complete report on power possibilities and power required for electrification of the Temiskaming & Northern Ontario Railway. It is announced that the report is to be presented in three months time.

The electrification of this railway has been seriously discussed for several years. The former Commissioners gave the matter much attention and it has long been felt that electrification of the road is sure to be accomplished some time. The investigation now authorized will very likely result in the obtaining of information which will prove the project to be a feasible one.

Our special interest in this matter, aside from a desire to see our natural power resources utilized, is in the impetus to development of the mining industry that may be expected to follow development of the available water powers. Investigation for the purposes of the Ontario Government Railway should result in the obtaining of information which will help the Government to deal with the applications for water power rights in a reasonable length of time.

We have been asking for an investigation of water power resources for the benefit of the mining industry. The Railway Commissioners have been desirous of getting ahead with their electrification plans. Pulp and paper industries have also been interested in the water

power resources. The decision to proceed with the investigation at once should therefore be welcomed by all parties.

The investigation of the power resources is to be accompanied by an investigation on power required for electrification of the railway. It is reasonable to expect that the Ontario Government should at the same time make investigation of the needs of the mining and other industries that are making possible the development of the area served by the railway. We are pleased that something is being done that will be of assistance to both the railway and the industries and that the Government has approved of the Commission's proposals. We hope that we will soon be able to record that the power needs of the industries as well as the power needs of the railway are receiving attention. The checking of production by delays in obtaining more power is a matter of serious concern to the mining industry and should be of some concern to the Government.

"BLUE SKY" LEGISLATION.

The Ontario Government is evidently contemplating enacting what is known as "blue sky" legislation for that Province. And it is certainly taking a wise course in collecting a mass of opinion, with a view, no doubt, to the sifting and examining of the same before it puts the conclusions at which it arrives in definite legislative shape. This idea of looking before it leaps is to be very heartily commended. The statute books of the Dominion and the various Provinces alike would not contain as much crude, if well-intentioned, legislation as they do had all our legislative bodies always been imbued with the same laudable desire to inform themselves thoroughly on all the matters as to which they aspire to legislate.

Mr. A. H. O'Brien, the Ontario Government's investigator, recognizing that mining stocks and mining companies are the stocks and the companies with which "blue sky" enactments, as a rule, most intimately concern themselves, has naturally turned, in his desire to collect informed and authoritative opinion, to the officers of the Standard Stock and Mining Exchange, of Toronto, among other sources of information. He has addressed a series of questions to Mr. P. J. Cannon, the president of the Exchange, which, together with Mr. Cannon's replies thereto, we reproduce elsewhere in this issue.

The first question put by the investigator is as to the advisability or otherwise of licensing dealers or agents who sell securities. The Exchange is in favor of the licensing of both, and takes the view that a dealer should be a member of some organized stock exchange operating under a Canadian charter, and that agents should be responsible parties working for such a dealer. The president of the Mining Exchange evidently considers that no small part of the victimization that has been possible, in connection with the sale of securities, has arisen from the irresponsibility of dealers or agents, or both.

As to the amount of percentage that should be paid in the way of commissions to salesman, promoter and prospector and for advertising, the Exchange gives the opinion, based on information obtained from specialists, that a minimum of twenty-five per cent. of the money raised would be required for floating natural resources companies, this twenty-five per cent. to cover remuneration to sub-agents, advertising expenses and promoter's profit. On the whole, we are of opinion that, in the case of mining propositions, the twenty-five per cent. of the money raised, which it is suggested should be the maximum for the purposes named, is reasonable and usual.

Asked as to whether one commissioner would be sufficient to administer a "blue sky" law, in connection with stocks for industrials, mining companies, etc., the Exchange replies that there should be three commissioners to deal with natural resource companies—one to possess the requisite business and financial qualifications, another to be a man "who knows the mining business from the top to the bottom, and the third to be one capable of interpreting the legal respects of the Act. In this view, also, we are inclined to concur. At any rate, we regard it as essential that a man versed in the operations of mining companies, and in complete sympathy with the development of Northern Ontario, should be one of the commissioners for the administration of a "blue sky" law in connection with mining companies. But as such a law would presumably deal with industrial and other companies as well, it may be that a commissioner well versed in the concerns of such companies might also be a necessity in their cases.

There must be a great variety of opinion as to the best way of regulating the sale of shares and the "blue sky" discussion will doubtless bring forward many views. The brokers have responded quickly to the invitation to express their views. It is to be hoped that others interested will contribute to the discussion before any new legislation is enacted.

WILL WAGES COME DOWN?

When the cost of living was at dizzy heights, mining companies found it necessary to pay very high wages. The downward march of living costs and the difficulty of marketing many mine products has necessarily resulted in lower scales of wages at most mines. It is being freely predicted that there will soon be further reductions in wages to a level commensurate with the changed conditions. There has, however, been no reduction made at most of the Ontario gold mines, and no announcement has yet been made of coming reductions at the big mines.

One company, operating at Kirkland Lake, reduced its wages, but there has been no common action by the operators towards reduction. At Cobalt, wages have been lowered during the year and it does not seem unlikely that this will, sooner or later, affect wages at Porcupine. In looking forward to the coming year one

feels inclined to predict lower labor costs; but there is as yet little evidence of reduction at the gold mines. The depression in the American metal mining industry has made necessary many reductions in wages, and has, in many cases, made operation impossible at even the reduced wages which were paid for some months. It is beyond question that the cost of living is decreasing and that we are not likely to experience again, for some time, such high labor costs as obtained in 1920.

AN OPTIMISTIC VIEW.

The gold mines of the Porcupine district are doing very well and promise to produce large quantities of ore for some years. The success of the foremost producers is, however, leading to some very extravagant predictions as to the future. The assumptions made are far from ones that any gold miner would like to be responsible for. Views as to the future are, however, always of some interest and we reproduce below a rosy view from "Saturday Night." It is interesting as an example of the result of too much extra polation. Saturday Night's writer says under the caption "Bullion In Gold."

When the final chapter in the history of the Porcupine gold area is written and when the final analyses of the Hollinger Consolidated and the McIntyre-Porcupine are made, it is not improbable that an aggregate production of a billion dollars in gold will be shown. To arrive at this opinion, it is necessary to assume a great deal and to therefore write contrary to the wish of the operators of these mines. Nevertheless, some of the factors upon which the view is based are these:

From an area lying within 800 feet of surface, the Hollinger Consolidated has produced over 40 million dollars and has ore amounting to another 40 million dollars in sight. In addition to this are a large number of orebodies which have not yet been touched, and which may finally produce another 40 million from that area between the 800-ft. level and surface. This means that the prospects are that the Hollinger will yield about 120 million dollars from that zone lying between surface and the 800-ft. level, or, in other words will produce approximately 15 million for each 100 feet in depth.

Keeping these facts in mind, and taking into account that the management is considering sinking a shaft to a depth of 6,000 feet, it at once becomes possible to estimate an output of 900 million dollars from this property "assuming" the extent and richness of the orebodies continue as heretofore.

On the McIntyre-Porcupine, the number of orebodies are less than on the Hollinger, but the present indications appear to be that in that area lying below the 1,000-ft. level, the mine may reasonably produce 5 million dollars for each 100 feet in depth. Should such a condition prevail over the 5000 feet lying between the 1000-ft. level and a depth of 6000 feet, this section of the mine would yield 250 million dollars.

In addition to these two mines, there are other adjoining properties which may also figure in a big way in future production. These include the Porcupine V. N. T. on which an excellent vein system occurs and on which some very rich ore has been proven at depths down to 600 feet, the Schumacher on which ore has been opened up to the depth of 700 feet and upon which the chances of getting big ore bodies at great depth are good; the Plenaurum and the Newbray lying to the east of the McIntyre, and the Rochester lying to the north-west of the Hollinger, and the Northerown mines to the south.

This summary deals alone with that part of the Porcupine district known as the Hollinger-McIntyre section, and does not include that other important area known as the Dome section where many millions in gold ore is already in sight.

As for the basis of "assuming" a continuation of values to great depth, there is the fact that on the Hollinger and the Porcupine Crown Mines diamond drill holes have been driven a depth of 2000 feet and with no evidence of change in the geologieal structure. This has been further proven by actual underground operations on the McIntyre to a depth of 1,875 feet where lateral operations are now under way in cutting a station. The manager of the McIntyre, R. J. Ennis, is authority for the statement that the geological condition prevailing at that depth is exceedingly reassuring and has expressed the belief that mining will be carried to great depth, and that the life of mines will be long.

Present production is at an aggregate rate of between 17 and 18 million dollars annually. To produce a total of one billion dollars would require an output of 20 million dollars a year spread over a period of 50 years. It is already evident that production will easily attain a rate of 20 million annually, and the question left to decide is the number of years during which such a record may be maintained.

Therefore, there does indeed appear to be good possibilities of the Porcupine area producing a billion dollars in gold. Moreover, this area comprises but a small part of a vast territory throughout which there is likelihood of many new mines being developed.

T. & N. O. RAILWAY TENDERS

Chairman George Lee and members of his Timiskaming & Northern Ontario Railway Commission were closeted with members of the Ontario Provincial Cabinet during last week, preparing the plan of contract for the T. & N. O. 70-mile extension northward out of Cochrane. Tenders are to be called for, returnable January 9, for a completed railway line.

By the end of 1922, according to Chairman Lee, it is the expectation that 40 miles of the 70-mile extension will be completed, and the whole extension completed by December 31, 1923. The first stretch of work will probably be that from Cochrane to the Abitibi, where there is some bridge work to be undertaken as soon as the line reaches the point. The railway is estimated to cost $3,000,000.

Chairman Lee discussed most enthusiastically the prospects of the country to be opened up by the extension. "The extension," he said, "will open up the finest stretch of agricultural county in Northern Ontario it will open up the biggest gypsum beds in the world; give transportation facilities to the great prospective fishing industry of James Bay and Hudson Bay; serve 3,000 miles of coast line, and open up a power development proposition at Tin Can portage as big as Niagara itself."

Contrary to general belief, said Mr. Lee, James Bay is navigable during eight months of the year. Whitefish and sea trout are its principal yields.

Hollinger Nearing 1,000,000 Tons

What Hollinger 1921 Operations Look Like and What Is Expected in 1922.

By ALEXANDER GRAY

To the end of July, reckoning by the milling log, Hollinger Consolidated Gold Mines had crushed about 480,000 tons for a gross income of $5,126,050.65. It does not require higher mathematics to demonstrate that the total income per ton milled was $10.60, which, of course, includes the premium upon the company's gold.

Since then daily crushings have been increased—not so much in August, September and the early part of October. With the completion of secondary crushing arrangements in the latter days of October the stamp duty was brought to the peak; so calculations are being made that Hollinger Mines will be enabled to report a second tonnage milled. The figures will be so near to the million mark, either way, as to invite a forecast. The management may fall short of its objective, or it may go over the top. Undoubtedly more than a million tons would have been put through, were it not for the shortage of power in the earlier months of the year.

What will be the gross value of the tonnage treated can only be surmised, for the chances are General Manager Brigham reduced his grade when his mill began to hit the high spots—which is the sounder practice. Taking it that a million tons, or thereabouts, will be the Hollinger return, and that the grade will be about $8.75, simple arithmetic makes the grand total gold content extracted from the mines $8,750,000. From that must be deducted the metallurgical loss, which would make the value of the gold recovered around $8,400,000. Adding to this the premium upon the gold, it is confidently surmised the gross income should not be less than $9,500,000, if it does not go beyond that. Possibly Mr. Brigham will attain to his cherished ambition and mill the million tons and more—and few know what will be the average grade for the year.

In any event, should the ore reserves be fairly well retained, despite power shortage, and the profits are what they are understood to be—more particularly because of the gold premium—mining capitalists and scientists—perhaps a stray banker—will bestow a tribute upon this Canadian source of yellow metal. When the power failure occurred, coal as a heroic remedy was costly. Otherwise the record tonnage milled automatically would have reduced working costs. The evidence of this is understood to be obtainable in the results of recent four-weekly periods, when a profit of about $500,000 is alleged to have been earned, all of which sustains the impression that Hollinger will make more records in 1922.

Sooner or later Hollinger will take the lead among gold mines—but not without ample power and extensions to the plant. The limit has been reached in the matter of cyanide tanks—and more will be provided. Rolls and ball mills are to supplement the stamps. Eventually the stamps may be altogether discarded and a daily milling average of 6,000 tons maintained. In reality Hollinger capacity in the future will be measured by power, since labor is plentiful and the ore bodies continue to be more than the conservative management cares to emphasize until all the factors essential at surface are forthcoming. At the moment, the milling record is held by the New Modderfontein, at the Witwatersrand: 1,038,000 tons in the year ended June 30 last. That company made a total net profit of £1,720,202 and its operations as set forth by Sir Evelyn Wallers were:

Working Revenue	£2,969,198	54/10
Working Expenses	1,270,146	23/5
Working Profit	£1,699,052	31/5

Included in the revenue item is £751,427, received as premium upon the gold recovered. It was a handsome honorarium of 14 shillings and 5 pence over and above the mint value of what gold would have brought without the premium. Otherwise the grade of ore milled was only slightly higher than that of the Hollinger in 1920. Automatically the per ton profit was enhanced to a much greater extent than the Hollinger realized. The Rand mine premium was 44.2 per cent. That of the Hollinger may have been about a quarter of this. Which leaves it to the relative grades of ore to prove priority. Conceding the New Modderfontein recovery was approximately $10 per ton, it is doubtful whether that of the Hollinger during 1921 has been permitted to go above $9. In all probability the Hollinger grade averaged around $8.75, as already pointed out, consequently the aggregate comparative result is dependent upon the total tonnage milled.

Whatever Hollinger grand totals for this year will be, they cannot be attributed to boosting the grade. For the reason explained—the use of coal when the hydro-electric failed to meet requirements—Hollinger costs were increased. All of which does not alter the fact that Canada at Porcupine has the nearly greatest gold mine and it should head the world's outputting sheet in 1922, though New Modderfontein has ore reserves of 8,884,600 tons of the average value of 8.4 dwts. During its fiscal year New Modderfontein developed 1,234,100 tons of the value of 10.5 dwts. As against this the Hollinger reserves of 4,087,083 tons a year ago were valued at $10.20 per ton. New Modderfontein has a shade the better of it in value and over double the fixed quantities.

Had the Hollinger grade and premium as disclosed for the months ended with July been continued throughout the year, the story of 1921 as a whole would be more altitudinous. A million tons or thereabouts that would represent say $10.00 in gross income per ton would be a possibility. There the analogy will have to end for the time being, because New Modderfontein had almost 9,000,000 tons in reserve last June, had paid £7,433,750 in dividends, whereas Hollinger may have preserved its 4,087,000 tons, after distributing $16,556,000—which is 551 per cent. on the original capital of the Hollinger company—besides which there is over $6,000,000, it is understood, in cash, bullion and other liquid assets. At any rate, shareholders in the Porcupine company are amply covered by ore reserves, the further potential value of the areas, a strong treasury, being the profitable fruits of ten years of production, as follows:

Years	Gross Income	Profits	Dividends
1912	$ 924,571.44	$ *621,801,69	$ 270,000
1913	2,493,971.76	1,503,822.87	1,170,000
1914	2,764,130.64	1,611,058.55	1,170,000
1915	4,285,786.18	2,477,044.42	1,720,000
1916	5,285,862.11	**2,856,409.07	3,126,000
1917	4,271,260.10	1,820,414.93	738,000
1918	5,908,327.87	2,588,563.01	1,230,000
1919	7,063,099.21	3,840,482.11	1,720,000
1920	7,162,611.13	3,292,341.59	2,214,000
1921	9,500,000.00	***5,000,000.00	3,198,000
Totals.	$49,659,620.44	$25,611,938.24	$16,556,000

*Includes premiums upon shares sold.

**Includes premium upon shares sold.

***Necessarily all 1921 figures are estimated excepting dividends.

Manifestly Hollinger Consolidated caught up with its capitalization. No longer is it a stern chase. The mining position leaves no heartburnings, in which respect the Dome and McIntyre companies are sustaining themselves satisfactorily. Deeper development at the Dome and McIntyre is favorably impressive. Hollinger is endowed with so many ore bodies, it will be some years before the area between the 550 and 1,250 foot levels is fully determined, even though power and milling facilities are supplied. How much ore there is in the upper levels after taking out over $50,000,000 gross, cannot be estimated. A great deal of territory is unexplored. Recurring hindrances throughout ten years have handicapped the management, but they have not detracted from the merits of mines which began their crushing career with ore reserves estimated at about 500,000 tons valued at $11,000,000, yielded all that is recorded in the foregoing tables, from upper levels as yet removed from exhaustion—which have workings representing a league a year for every crushing year. In the ten years about 4,900,000 tons have been milled, each ton has represented better than $10 in gross income, practically $5 in profit, and has netted to shareholders $3.37 in dividends per ton, all of which attests that the upper workings—with their further millions in reserve—without risk of overestimation, played a conspicuous part for a decade. Many eminent engineers owe apologies to the section above the 450-foot level—from which the bulk of production has come. One such engineer—an actuarial scientist at that—in 1914 sent this to the writer, which will bear publication in the light of what has transpired:

Value of Hollinger Shares as Estimated in 1914

P. A. Robbins' estimate of ore actually developed January 1st, 1914, gives a share value of $12.90. The assured chances of finding more ore will considerably enhance this value. Mr. Robbins' estimate of tonnage and grade above the 550-foot level, as in Annual Report for 1913, was:

Tonnage 1,321,100
Grade $13.25
Extraction (96 per cent.) $13.25
Working costs $4, depreciation 75c. Total $4.75
Working profit, per ton, say $8.00
In 1914:—
Tonnage milled 203,000
Working Profit $1,624,000
In 1915 and thereafter:
Tonnage milled 365,000
Life from January, 1915 ..... 3 years
Annual Distributable Profit $2,920,000
Present value (factors 4 per cent. and 7 per cent. 3 years, $.390349—$12.46) .. $7,480,000

To this must be added approximately $1.50 for the cash reserve and 75 cents in dividends still to be paid in 1914, making the present value $14.76 per share.

On assumption that same quality of ore will be found down to 675-foot level as in levels above, this would add one more year life to that of estimate: (Factor .305490). Present value $9,558,300, say $16, or adding cash reserve and remainder of this year's dividend ($1.50 and 75 cents), making a total of $18.25 per share.

On assumption that $10-ore will be mined in same quantity down to 1,400 feet as found above 550-foot level, and that reduction plant will be doubled by end of 1915:—

Ore above 550-foot level January 1st, 1914, 1,321,000 tons at $13.25
Ore between 550 feet and 1,400 feet, 2,380,000 tons at 10.00

Total above 1400-ft. level 3,701,000 tons at. $11.16

Of this, 203,000 tons milled in 1914; 365,000 tons to be milled in 1915—leaving 3,133,077 tons remaining January 1st, 1916.

This gives a life of 4½ years at 700,000 tons per annum:

Grade $11.16
Extraction ..... 96 per cent.
Recovery $10.71
Total working costs, per ton $4.50
Distributable profit, per ton $6.21

Assuming dividends are continued in 1914 and 1915 at same rate (39 per cent.) and surplus applied to increasing plant, development, etc., in preparation for increased tonnage in 1915, we have:—

Dividends, 1914-1915 ..... $2,340,000
(Or $1.95 per share per annum.)
Surplus available $1,686,000

Through the remaining 4½ years' life will yield annual profits of $4,347,000. Present worth, January 1st, 1916, $15,521,700.

Discounting this 16 months gives the value at September 1st, 1914, as $14,189,900, or $23.65 per share.

Add to this 18 dividends payable between September 1st, 1914, and January 1st, 1916, or $2.70 per share, or allowing for discount, say $2.50 per share, and we get the present value per share, $26.15.

Summary:—

	Value per share
On ore developed Jan. 1, 1914	$12.00
On ore above 550-ft. level Jan. 1, 1914 ..	14.76
On ore above 675-ft. level	16.00
On ore above 1400-ft level	26.15

None of these take any account of ore in other veins than those at present being developed, beyond 60,000 tons at Jan. 1st, 1914 (12 veins).

At that time the Hollinger merger had not been effected. The author of the analysis quoted is one of that "hard boiled" species whose business it is to make money in mining for their principals. He took the Hollinger alone as he saw it without comprehending the structural features. My cryptic reply to his valuation was that "good is as good as it tastes." Hollinger development was only starting—the milling programme was not even formulated. A year later the Acme properties, as well as those of the Millerton, were consolidated. Then War intervened, de-

spite which the combined areas have "leaped from crag to crag," as it were, until the management is prepared to exclaim "Excelsior" in 1922. Notwithstanding the "hard-boiled" prognosis, two years after it had been registered the late General Manager of the Hollinger, in urging the amalgamation of the three groups of claims, put the tonnage developed underground, indicated by diamond drill and by surface outcrops, at 1,846,000 tons, valued at $17,824,800. Applying the same rule to the Acme, a tonnage of 1,876,360 tons was conceded to it, the gross value being $16,850,180. Whatever of hypothesis entered into those estimates, the deeper levels of the mines are largely undeveloped, and while 3,849,000 tons since then have been extracted from both mines—little having come from the Millerton, so far as is known—the combined ore reserves are greater than they were at the time of the merger.

Before other milling records can be made, however, it is to be reiterated that the company must have ample power undisturbed by seasonal setbacks, additional tankage facilities, and more mills other than the present stamp battery. The objective of the management is a daily crushing of about 6,000 tons—and then shareholders will have quicker action on their money. To accomplish that the Government and business interests will have to co-operate if the $15,000,000 or $17,000,000 production possible is to be put in circulation.

HAILEYBURY-FRONTIER PROPERTY.

Last week, says a despatch from Cobalt to the Toronto Mail and Empire, another Cobalt company launched into an outside enterprise, when Mining Corporation of Canada commenced work at the Haileybury-Frontier property in South Lorrain under a working option. The terms of this option cannot be learned: Mining officials state they are not prepared to give any details for a few days, and Mr. Horace Strong, who heads the syndicate that has been working the Frontier property for some time, cannot be reached.

The Frontier Mine has been developed at the 150 and 300 foot levels. At the 150-foot level 90 feet of ore has been opened up, which can be classed as high-grade milling rock, with some high grade. At the 300-foot level, where work is now progressing, over 100 feet of ore has been developed, running in grade similar to that on the upper level. On the whole it is an extremely promising proposition. Considerable mill rock has been opened up, and if development continues as successfully the mill property should very quickly be in shape for a mill.

SMUGGLING GOLD FROM GERMANY.

Messrs. Samuel Montagu and Co., of London (Eng.), write as follows under date of the 17th ult:—Reuter reported from Copenhagen, under date of November 10th last, an occurrence, which can be described as the work of a super-smuggler, in the following words: "According to a telegram from Aabenraa (Slesvig), Customs offices at Harreslev, on the Dano-German frontier near Flensburg, were to-day inspecting a locomotive constructed in Germany for a Danish firm, to be delivered on November 8th, when they found in it gold ingots to the value of 24,000,000 gold marks (£1,200,000), the intention evidently being to smuggle the gold out of Germany. The Customs officers confiscated the ingots."

HAROLD B. FISK.

New Manager of the Walsh Plate Works, Drummondville, Que.

HAROLD B. FISK who was recently appointed Manager of the Walsh Plate & Structural Works, Limited, at Drummondville, Que., was born in England, 1885. He was educated at the Bishops Stortford Grammar School, the Kings College, London. After serving as a pupil with Baily Grundy & Barrett, a firm of mechanical and electrical engineers, at Cambridge, England, he came to Canada in 1907, entering the service of the Shawinigan Water & Power Company as Operator in the Montreal Terminal Station, being shortly transferred to the head office of the Company, in Montreal,

Mr. Fisk also saw service with the British Canadian Power Company, at Cobalt (now the Northern Ontario Power Company Ltd.), being first assistant to the General Superintendent and afterwards Superintendent of the Metatchouan River Power Development. Also with the Toronto Power Company, at London, Ont.; the Kaministiquia Power Company at Fort William, Ont.; and from 1916 to his present appointment with the Southern Canada Power Company, as Superintendent of the Drummondville Division.

Mr. Fisk was admitted a Member of the American Institute of Electrical Engineers, August 1919.

Northern Ontario's Gold and Silver Mines During 1921

By J. A. McRAE.

The Gold Mines.

During the calendar year 1921, according to preliminary estimates prepared early in December, and based on achievements up until that time, the gold mines of Porcupine and Kirkland, situated in Northern Ontario, produced approximately 677,866 ounces of gold, valued at about $14,011,504.

This production compares with a grand total of 564,312 ounces during 1920, valued at $11,665,797, and which was the previous high record gold output in Ontario. In comparing these figures it should be noted that the increase of $2,345,707 in gold production took place almost entirely during the last half of 1921, and thereby tends to show that an output of close to $17,000,000 may be produced during the new year soon to begin.

The most noteworthy development of the year in the gold mining industry of Ontario has been the sustained good results at the great depth in the Porcupine district. The McIntyre-Porcupine is now operating at a depth of 1,875 feet, while the Hollinger is considering the question of extremely deep developments, and has mentioned the possibility of a new central shaft to be driven to 4,000 feet, and possibly 6,000 feet.

Developments in the Kirkland Lake district have also been extensive and generally favorable. Two new producers, namely, the Wright-Hargreaves and the Ontario Kirkland were brought in. A feature of the year's progress was at the Wright-Hargreaves, where the construction of a 175-ton mill was completed early in May, and which enabled the company to declare a dividend of 5 per cent. payable January 1st.

Three mines in the Porcupine district produced bullion to the extent of over $12,000,000, these being the Hollinger Consolidated, McIntyre-Porcupine and Dome Mines. Great as is the record, it was substantially restricted owing to a shortage of hydro-electric power during the first four months of the year.

Five mines in the Kirkland Lake field produced gold, these being the Lake Shore, Wright-Hargreaves, Teck-Hughes, Kirkland Lake and Ontario-Kirkland, the total production for the year being well over $1,500,000.

The Outlook.

As regards the outlook for the coming year, the McIntyre-Porcupine is assured of an increase of 50 per cent. in its milling capacity, while the Hollinger plans a further increase of about 50 per cent. just as soon as the necessary hydro-electric power may be assured. The Dome also plans a substantial increase, while such mines as the Porcupine V.N.T., Porcupine Crown and Schumacher may reasonably be re-opened and resume production. It is also probable that the Tough-Oakes mine at Kirkland Lake will be in condition to warrant re-opening the mill, and thereby adding another substantial producer to the list.

The Dividend Record.

During 1921 three gold mining companies paid dividends amounting to $4,269,809, the order of their importance being Hollinger Consolidated, McIntyre-Porcupine, Dome and Lake Shore.

Following is a summary of the dividend record of the gold mines of Northern Ontario, it being noted that the Wright-Hargreaves is not included, for the reason that its initial disbursement of $125,000 will not be paid until the opening day of the new year:—

Company	Dividends to to end of 1920	Dividends During 1921	Total Dividends to date
Hollinger Con.	$13,360,000	$3,126,000	$16,486,000
McIntyre-Porcupine	2,002,155	546,042	2,548,198
Dome Mines	1,919,416	477,677	2,397,083
Lake Shore	280,000	120,000	400,000
Tough-Oakes	398,625	———	398,625
Rea Consolidated	12,000	———	12,000

The discovery of gold was made in Porcupine in 1909, and not long after that date the discovery of gold was made at Kirkland Lake. The rise of these two fields has been rapid, the following summary of production since 1910 showing the manner in which the Province of Ontario has risen to prominence as a producer of gold:—

Ontario's Gold Output.

Year	Fine Ounces Gold	Value
1910	3,089	$ 63,849
1911	2,062	42,625
1912	86,523	1,788,596
1913	219,801	4,543,690
1914	268,264	5,545,509
1915	406,577	8,404,693
1916	497,836	10,339,259
1917	420,894	8,698,881
1918	411,976	8,516,299
1919	505,739	10,454,553
1920	564,312	11,665,797
1921 (est.)	677,866	14,011,504
Totals	4,074,939	$74,075,504

VIPOND—NORTH THOMPSON

At a directors' meeting of Vipond-North Thompson held in Toronto, it was unanimously agreed to accept the cash offer received for the remaining block of stock in the company's treasury, thus assuring a continuance of underground development at this mine as quickly as possible. However, it is not likely that actual dewatering operations of the mine will be started before the end of March or the beginning of April, as the officials of the Northern Ontario Power Company find themselves unable to supply the necessary power for mine development work before this time.

Ratification of this deal by shareholders being necessary before such can be actually closed, it has been decided to call a special meeting on Wednesday, December 28. Notices of such will be mailed to shareholders within the next few days.

ONTARIO'S GOLD OUTPUT

The outstanding feature of the Ontario Department of Mines' returns for the nine months ending September 30, 1921, is the growing importance of Ontario's gold mining industry. "Provided the output for the last quarter equals that of the third quarter," says the report, "Ontario's gold production for 1921 will be approximately $13,870,000, and, with the premium added, $15,200,000." Not only does Ontario lead the Canadian Provinces in gold output, but it is quite probable states the report that this year Ontario will have a production exceeding that of California.

Metalliferous Production in Ontario

Returns received by the Ontario Department of Mines from the metalliferous mines, smelters and refining works of the Province for the nine months ending Sept. 30th, 1921, are tabulated below, and for purposes of comparison the quantities and values are given for the corresponding period in 1920. Tons throughout are short of 2000 lbs.

ONTARIO'S METALLIFEROUS PRODUCTION, FIRST NINE MONTHS—1921.

Product.		Quantity 1920	Quantity 1921	Value $. 1920	Value $. 1921
Gold	Ounces	424,297	474,956	8,735,768	9,818,073

Iron, pig ***	"	49,422	82,318	1,395,948	2,079,729
Total				35,920,418	20,994,172

General Remarks.

The outstanding feature in connection with Ontario's metalliferous production is the growing importance of her gold mining industry. Provided the output for the last quarter of the year equals that of the third quarter, Ontario's gold production for the full year 1921 will be approximately $13,870,000 and with the premium added, $15,200,000. Fortunately the success or failure of Ontario's gold industry does not depend on the exchange premium. Not only does Ontario lead the Canadian provinces in gold output but it is quite probable that this year the Province will have a production exceeding that of California, which provides about 25 per cent. of the entire gold output of the United States.

Conditions in the iron and steel industry are showing improvement, an indirect result being that absorption of the surplus nickel supplies will be expedited. Unfortunately the nickel-copper smelters and refineries of the International Nickel Company of Canada and the British America Nickel Corporation have been forced to suspend operations completely, the Mond Company alone carrying on at a reduced rate at the present time. Details regarding the principal metals are given under the several headings.

Gold.

Ontario's gold production for the period under review exceeded the 1920 figures by over one million dollars, despite the handicap of hydro-electric power shortage during the first quarter of 1921, when the output was $656,514 less than in 1920. Using the production figures for the third quarter of 1921 as a basis we find that the present production from Ontario gold mines is at the rate of $16,300,000 per annum without the exchange premium or about $17,650,000 including the premium.

Ore milled at the Hollinger mine is now averaging between 3,800 and 3,900 tons daily. The McIntyre is proceeding with the erection of a new 250-ton unit, bringing their total milling capacity up to 800 tons daily.

The Wright-Hargreaves started its mill in May. It will be noted in the table hereunder that the output from this mine for the 9 months was the largest of the producers at Kirkland Lake. An initial dividend of 5 per cent. has been declared, payable on Jan. 1st, 1922. The Ontario-Kirkland 100-ton mill is being started early this month (December).

Details of production are given hereunder:

Silver.

For foreign silver the average New York price for the period was 60.8 cents as compared with $1.09 in 1920. Production shows a decline owing to several properties closing down during the winter of 1920-21 on account of power shortage and the slump in price. A recent find at the Keeley mine has revived interest in South Lorrain. In addition to the shipments of 6,498,019 ounces, worth $4,328,899, from the silver mines, nickel-copper refineries recovered 8818 ounces and gold mines 80,073 ounces.

Refineries—During the period 1685 tons of ore and concentrates and 2597 tons of residues were treated

---

* Copper in matte was valued at 14 cents per pound in 1920, 8 cents in 1921, and nickel in matte at 25 cents per pound in both years. Total matte produced was 17,013 tons, of which 7,011 tons were exported.

** Shipments of iron ore totalled 27,775 short tons valued at $119,262. The figures in the table cover shipments to points other than Ontario blast furnaces.

*** Total output of pig iron from both domestic and imported ore was 393,303 tons worth $9,936,597. Figures in the table represent proportional product from Ontario ore.

Source	Daily Milling Capacity tons	Ore Milled tons	Gold Recovery Ounces	Gold Recovery Value $	Silver Recovery Ounces	Silver Recovery Value $
PORCUPINE						
Dome	887	243,280	76,462.5	1,580,619	10,509	6,363
Hollinger	3,500	719,007	290,946.7	6,014,402	54,115	32,623
McIntyre	550	124,174	59,893.3	1,238,105	11,118	6,674
Total	4,937	1,086,461	427,302.5	8,833,126	75,742	45,660
KIRKLAND LAKE						
Kirkland Lake	150	33,871	8,676.1	179,552	1,283	762
Lake Shore	60	15,991	13,462.6	278,383	879	527

Wright-Hargreaves	150	20,669	13,596.7	280,938	1,158	727
Total	480	96,359	47,474.6	981,342	4,331	2,626
Recovery from Nickel-Copper refining			178.6	3,605		
GRAND TOTAL	5,417	1,182,820	474,955.7	9,818,073	80,073	48,286

Silver recovered was 2,958,900 ounces. Apart from nickel sulphate and the bulk of the nickel oxide (962,914 lbs.) which were shipped by nickel refineries, all the cobalt and nickel compounds as noted in the table were marketed by silver-cobalt refineries in Southern Ontario. At Deloro an insecticide plant has been erected for the utilization of the arsenic recovered in refining operations.

Nickel-Copper.

The market for these metals is overstocked. Electrolytic copper declined in price from 18.45 cents per pound for the first 9 months in 1920 to 12.30 cents for the corresponding period this year. Nickel supplies which have accumulated since the close of the Great War have not yet been absorbed. In consequence of these unfavorable conditions production of these metals has been greatly curtailed. The ore smelted at Copper Cliff, Coniston and Nickelton totalled 319,967 tons from which 17,013 tons of nickel-copper matte were produced. Matte shipments to Canadian refineries were 6,069 tons, to Great Britain 5,608 tons, and to the United States 1,403 tons. There were 5,558 tons of matte treated in the refineries at Port Colborne and Deschenes, the products being electrolytic and blister copper, nickel oxide, nickel sulphate and metal, also gold, silver and metals of the platinum group.

Iron Ore, Pig Iron and Coke.

Apart from a 22-ton sample lot of hematite from the Wallbridge mine near Madoc, and 27,753 tons of nodulized siderite shipped by the Algoma Steel Corporation from the Magpie mine to Sault Ste. Marie blast furnaces, there were no shipments of iron ore. The shipment was from stock pile, the Magpie mine having been closed down since March 9th.

During the period seven blast furnaces were in operation as follows:

Company	Location	Furnaces operated	Average time, days.
Algoma Steel Corp.	Sault Ste. Marie	3	173
Steel Company of Can.	Hamilton	2	190
Canadian Furnace Co.	Port Colborne	1	94
Midland Iron & Steel Co.	Midland	1	41

A total of 537,475 tons of iron ore were smelted, of which 109,227 or 20.9 per cent was of Ontario origin. Pig iron produced totalled 393,303 tons valued at $9,936,597. Of this quantity 230,857 tons in addition to 176,666 tons of old material were used in steel making, the output of steel being 364,602 tons valued at $13,056,376.

The Algoma Steel Corporation operates 160 and the Steel Company of Canada 80 by-product coke ovens, using imported coal. The total coke consumed by Ontario blast furnaces was 421,434 tons valued at $4,114,118. By-product ovens were charged with 593,359 tons of coking coal worth $3,989,531. The coke product was 390,717 tons worth $4,054,196 and the total value of by-products was $1,006,055.

MINING BROKERS AND "BLUE SKY."

President J. P. Cannon, of the Standard Stock Exchange, Toronto, gives the views of that organization on certain points connected with the administration of "Blue Sky" law.

In the course of collection of information respecting measures that should be taken for the protection of investors, a reply to questions submitted by A. H. O'Brien on behalf of the Ontario Government has been given by President J. P. Cannon, of the Standard Stock and Mining Exchange. The answers indicate a desire for reform, including the appointment of commissioners to administer a blue sky law, the prompt listing of securities after the sale of stock, and precaution for the protection of prospectors. The licensing of agents or persons who sell securities is favored, and it is urged that agents should be responsible parties.

The questions and answers are as follows:—

Licenses Favored.

(1) Is it advisable or otherwise to license agents or persons who sell securities? If so, are there any restrictions which should be applied to a license?

Yes; both dealers and agents should be licensed. A dealer should be a member of some organized Stock Exchange operating under a Canadian charter. Agents should be responsible parties working for such dealers.

Percentage for Promoters.

(2) What is the lowest percentage in mining, gas

and oil proposition (presumably upon the price the stock is selling at) that it is reasonable or possible to pay as commission to (a) salesman, (b) promoter, (c) prospector, (d) for advertising?

As very few of the members of this Exchange are "promoting brokers," we find it difficult to state a definite percentage. However, based on information obtained through inquiry from specialists, we would say that a minimum of 25 per cent. of the money raised would be required for successfully floating natural resource companies; this 25 per cent. to cover remuneration to sub-agents, advertising expenses and promoter's profit. We would suggest, however, that the prospector, who usually receives stock for his property be allowed to sell a portion of his stock along with the Treasury stock of the company; say, on a basis of three shares of treasury stock to one share of prospector's stock. Stock could all be deposited in escrow with the trust company, with instructions from all parties concerned to issue stock in this proportion.

Commissioners Needed.

(3) In your opinion would one commissioner be sufficient to administer a blue sky in connection with stocks for industrials, mining companies, etc.?

In our opinion there should be three commissioners to deal with natural resource companies. One should be well qualified from a business and financial standpoint to judge of the matters coming before him; another should be a man well trained and versed in the operations of mining companies, and who has a lively sympathy in the development of Northern Ontario from a mining standpoint; in fact a person who knows the mining business from the top to the bottom; and the third should be a man capable of interpreting the legal aspects of the act.

Would List Securities.

(4) Do you consider that when a company proposes to sell stock in a Province its shares should be listed? And when do you think shares should be listed?

When the original amount of money authorized by the commissioner has been raised by the sale of treasury stock, the stock should be listed on some recognized Stock Exchange. This should be done for the protection of the shareholders. It would prevent the promoter from arbitrarily putting a higher price on the stock, in which the shareholders could not participate.

Transfer Agent Here.

(5) Is there any advantage in compelling companies selling mining shares to have a transfer agent in Ontario through whom all transfers of stock must be made?

We deem it advisable to include a section in the act which would render it necessary for all mining companies selling shares to the public to have a transfer agent in Ontario, through which all the transfers of stock must be made, and the transfer agent should consist of a recognized trust company. Such a provision would do away with the over-issuing of stock by a company.

When Is a Speculation?

(6) It being admitted that many enterprises, including mining, are speculative, is there any valid reason why a statement should not be printed on all advertising matter, certificates, etc., to the effect that "this is a speculative security," or some similar wording?

As, in our opinion, a certain element of speculation enters into the purchase and sale of all securities, we cannot see how the Government proposes to define that certain stocks are always speculative, and that certain other stocks are always investments, nor can we see how the Government proposes to designate where speculation ceases and a status of investment begins. The mere fact that a company pays dividends does not cause it to cease to be speculative, as, for instance, C.P.R., which has sold up to $280 per share and down to $106 per share without any change in its 10 per cent. dividend. The public are quite aware that in some degree a new issue is more speculative than one which has been quoted on the open market for some considerable time, and if, in the opinion of the Government, any marking is required we would suggest that the words "new issue" would fully meet the requirements of the Government in this particular section of the proposed act. The words "new issue" to be only printed on securities sold on flotation and prior to listing on the exchange.

Protecting Prospectors.

(7) What provision, if any, do you consider should be inserted?

As in our opinion the natural resources of Ontario are only in the initial stage of development, the natural resource companies should deal with as leniently as possible as commensurate with the objects of the act. The development of this great source of revenue to the Government is absolutely dependent upon the prospector, and he must be guaranteed a living wage: he cannot possibly be expected to wait for perhaps a period of five years for his property to make good before he receives anything from the company which is developing his property.

Any and all penalties that the proposed act may impose should be upon the officers of the company and not upon the company itself (to the extent of precluding the sale of the company's stock in Ontario to the detriment of the company's shareholders), as it is, to our mind, a rank injustice that the wrongful acts or the neglect of the officials of a company or their agents should be allowed to, in any way, jeopardize the marketable value of the holdings of innocent bona-fide shareholders who practically have no control of the company in which they hold stock.

GOUDREAU GOLD MINES.

A telegram to the Toronto Mail and Empire announces that Clem Foster, head of the Goudreau Gold Mines, was a visitor in the city and was officially welcomed by the Board of Trade council at luncheon. Mr. Foster told Board of Trade members that there were prospects of several large mining camps being established in Goudreau in the next year, including his own, on which $200,000 was being spent in development. Local business men will accompany him back to Goudreau on Wednesday by special car, the guests of the railway, to make an inspection of the new camp and to establish business connections with the "Soo."

BAILEY CUSTOM MILL

The gross earnings of the Bailey Custom Mill for November were approximately $12,877, according to a report just issued by the Bailey Silver Mines, Ltd. The Bailey mill treated 4,292.63 tons of ore during the month and the mine shipped 1,183.18 tons of ore to the mill.

B. C. MINING NOTES.

Pacific Coast Mines Sold.

The Suquash and Morden Mines of the Pacific Coast Coal Co., Ltd., situated on Vancouver Island, have been sold to E. R. Ross for $316,100. They were put up for sale by Order of the Court, the auction being conducted by Sheriff Trawford, of Nanaimo, B.C. The money was to be paid practically in cash, 10 per cent. on the spot and the remainder on Monday, November 28th. The receipts will be devoted to the defrayment of a number of charges, one of the first of which is some $68,000 owing to the coal miners of Nanaimo and Wellington districts in wages. Mr. Ross has refused to make a statement as to whom he represented. It is assumed, however, that it is the intention of the new owner, or owners, as soon as a clear title is obtained, to proceed with the operation of the mines and plant at Morden and with the development of the Suquash property. The latter is situated considerably further north on the east coast of Vancouver Island. As yet this field has been comparatively little developed, and should, judging from engineer's reports, ultimately prove to be one of the important producers of the Province.

Institute Meeting at Cumberland.

At a meeting of the district branch of the Canadian Institute of Mining and Metallurgy, held recently at Cumberland, B.C., addresses were delivered by J. D. McKenzie, chief geologist of the western division of the Dominion Geological Survey, on coal formation; by Col. J. E. Leckie, chairman of the western division of the Institute, on the aims and objects of the Institute; and by Nichol Thompson, chairman of the Mining Bureau of the Vancouver Board of Trade, on the mining industry. There were talks also by Prof. Turnbull, University of B. C.; Prof. R. W. Brock, Dean of the Faculty of Applied Science, University of B.C.; and Professors Schofield, Freeman and Williams. Thos. A. Graham, district superintendent of the Canadian Collieries (D) Ltd., welcomed the visitors, and described working conditions in the coal mines of Vancouver Island, the problems connected with the operation of the mines, and the future of the industry. A considerable party was made up by the visitors and others for the purpose of inspecting Number Five Mines, Canadian Collieries, and the mine plant and general equipment of that section. The meeting generally was a pronounced success, all members of the Institute profiting by the experience both in point of instruction and of entertainment.

Pouce Coupe.

The Imperial Oil Company, after a short shut down of over a month in a successful effort to control a gas pressure unprecedented in the history of drilling on this continent, has re-opened operations in the Pouce Coupe River bottom, near Rolla, B.C. It is said that the feat of controlling this pressure to permit of the resumption of drilling will stand unique in the history of petroleum development. At first the gas was light and fairly dry, but the oil content, it is stated, has been increasing constantly, until now what is described as gasoline is being forced from every joint in the casing.

BRITISH COLUMBIA COAL OUTPUT.

Present prospects are that the total coal output for British Columbia in 1921 will fall short of the production of the previous year. In 1920 the coal mined in this Province totalled 2,696,774 tons, of which 101,649 tons were used for coke making purposes. This year, up to the end of the month of October, the output was 2,160,000 tons, as compared with 2,295,000 tons for the same period in the last twelvemonth.

These figures clearly show that the collieries must make a greater production in November and December than was done in 1920 to reach 1920 totals. It should be understood, in considering this possibility, that the two last months of the previous year saw the operators working almost at top notch, while 1921 finds the industry anything but in this position. The reason for the difference cannot be definitely pointed out, although it may be ascribed generally to industrial slackness, and to some extent specifically, as far as the British Columbia market is concerned, to the competition of cheap imported fuel oil. There does not appear to be much chance, therefore, that the final totals for 1921 will be equal to those of 1920.

The statistical details up to the end of October, both for 1920 and 1921, together with some notes on conditions in the producing coal fields of the Province, are appended:—

Coal Output to End of October, 1920 and 1921.

Year	Crow's Nest District.	Nicola-Princeton District.	Vancouver Island.	Total
1921..	622,000	154,000	1,384,000	2,160,000
1920..	706,000	125,000	1,464,000	2,295,000

The coal output recorded to end of October, 1921, is 2,160,000 tons, as against 2,295,000 tons for a similar period in 1920.

Crow's Nest Pass District to above date shows a decrease of 84,000 tons, of which at least 80,000 tons is due to the fact that Corbin Coal and Coke Co. has been operating on a reduced scale.

The Nicola-Princeton District has reported an output of 154,000 tons in the first ten months of 1921, as against 125,000 tons for the same period in 1920; the Coalmont Collieries being responsible for the greater part of the increase.

Vancouver Island.

The Western Fuel Corporation of Canada has reported 504,000 tons up to the end of October, 1921, a decrease of 66,000 tons as compared with 1920, when in a similar period this company produced 570,000 tons. tons.

The total output reported by the Canadian Collieries is practically the same to date as last year, 615,000 tons.

The Pacific Coast Coal Mines, which, in 1920, produced 94,000 tons, has not operated during 1921.

Nanoose Collieries have increased from 32,000 tons in 1920 to 42,000 tons in 1921.

Granby Consolidated M. S. & P. Co. has done much to balance the output of 1921 against 1920, as they have produced 222,000 tons this year as against 150,000 for a similar period in 1920.

The Island Mines, during November, have been working irregularly, and it is unlikely that the last two months of 1921 will produce sufficient coal to permit the output of 1921 to equal that of 1920.

THE MINE MANAGER.

Interesting Sketch In Toronto Newspaper Of The The Personality And Duties of Mr. De Pencier, Manager of the Dome Mines.

[The Toronto Telegram is to be congratulated on the following sketch, written we understand, by a member of its staff, which appeared in its columns recently. Ed. C.M.J.]

The knowledge which people possess in general of the big mines up North is very impersonal. Nearly everyone is familiar with the names Hollinger, Dome, McIntyre, and have an approximate idea of where they lie. Some who hold or have held stock in these respective properties know what dividends they pay, what capital they possess, and are probably well posted in their plans and prospects as far as can be known from shareholders' reports. But it is always of the mine that information is sought. Little is known or cared about the men who are behind the scenes—the mine managers. It is the same remote interest which a man might show who asks of a ball game, "Who won?" without caring about the pitcher or any of the players.

The Mine Manager.

Back of the directors' board room and a long way from the broker's ticker is a man who has a set job. His job is a profession, an honorable profession, and his task is a constant combat with mother earth to make her reveal her treasures and yield them up with a minimum amount of treasure put back into into her. He is on his job ceaselessly, he is the central brain where all the numerous sense nerves register, the dominating figure, whose judgment and drive are behind the whole giant system, which man has devised to wrest gold from its rocky beds beneath the ground.

The Person Behind.

One reads in the paper every day of strikes being made, new veins tapped, rich ore encountered, cross cuts, drifts, stopes and what not, and one gets the impression that a mine is something which runs automatically, or that workmen are constantly digging everywhere for fresh funds of gold, much as some people imagine that a newspaper is something which has reporters running about the street in constant quest of news. A half hour spent with the manager of one of the big mines, that is a half hour, including the incessant interruptions of such managers, clerks, foremen and heads of different departments is a revelation as to the organization of a mine and the responsibility of the manager. It also reveals the fact that there is a human personality holding the ends of all the different wires. Such a half hour your correspondent spent with Mr. De Pencier, the manager of the Dome Mines.

A Canadian Graduate.

Mr. De Pencier, as the name would indicate, is of French extraction, but a long way back. He is of U.E. Loyalist stock, settled in Ontario, but his home he claims now as Vancouver. He is only 46 years of age, young for a mine the size of the Dome, but his experience was gained at an early age. Before ever entering university he was prospecting in B.C., was all through the Rossland rush and saw as a boy the trail of '98. So he knew a good deal about gold besides the laboratory specimens when he entered McGill University in 1898. On graduation in 1902 he put an extra year on research work, then in 1903 hiked for the Ra

Globe-Trotting Gold Miner.

There is one thing common to all gold miners. The world is a small place, and they speak of taking a trip over to South Africa or Australia much as the laity would speak of taking a trip to Port Credit or Newmarket. And they are the most cosmopolitan and interesting people to meet, for they are in live touch with international affairs, all over the world. It is significant of the youth of the mining industry in Canada that in almost all outside countries the mining engineer has a much higher comparative social status than in our own. Forty or fifty years from now perhaps Canada, too, will arouse to a realization of the importance of her mining industry, and accord the same esteem to the men who are now quietly building it up. In the meantime it is instructive to listen to these men who have seen the sights and the greed of gold in other lands.

Wide African Experience.

Mr. De Pencier spent about seven years on the Rand on gold properties. The outstanding feature of the Rand, and it is comforting to have the truth from a travelled Canadian, is not their high value, but the uniformity of their values. All the mines there he states, are on a rugged reef, which dips. The first mines were staked and worked on the outcrops of the reef. Then diamond drills were put down to locate the reef where it dipped below the surface. Other mines commenced operations by sinking vertically twelve to fifteen hundred feet before the reef itself was reached. Once the ore-carrying reef was entered, values were so safe and reliable that engineers did not bother to diamond drill to block out the extent of their ore body. They just started to work to take it out. On of the most recent mines there sank 7,000 feet of dead shaft before the reef was reached. One would suppose that this was the height of mine gambling, but, according to Mr. De Pencier, the huge mining firms did not hesitate to sink millions in the ground before they took a penny out, the values in the reef being sure once they were reached. This is obviously a different crowd of mining people to the majority of those who sink a shaft a couple of hundred feet in prospects in Northern Ontario, and then close down for the want of capital to go further. The unions in South Africa are, however, shoving expenses up to the peak at present, and whether some of its capital will be attracted to Ontario's north will probably depend on the volume and continuance of the few leading mines here. The Hollinger and Dome are setting a pace here which is sure to draw attention to our gold district, particularly as the control of most of the Rand mines is not so far away as South Africa, but is held in England. The recent visit of Sir Archibald Mitchelson, partner of the late Lord Rhondda, and his favorable comments on the Ontario gold fields in London papers is sure to bear fruit. Only three weeks ago the Kingston claims in Shining Tree were turned over to an English syndicate, which shows that some of them have their scouts in the field now.

Africa To Canada.

When Mr. De Pencier returned to Canada from the Rand he went up north quite naturally with the early discoveries, and was on the Reddick mine, Larder Lake, before going on to Porcupine. In 1912 he relieved Mr. Meek on the Dome, and has remained there ever since, working up to his present post of general manager. His assistant, C. W. Dowsett, an English mining graduate, also came to the Dome from South Africa. He is one of the best mill experts on the continent, and is now general superintendent and metallurgist.

He is a few years younger than Mr. De Pencier. It is a village of its own which they rule over at the Dome mine, with its neat commodious houses, its stores, its hockey rink, its recreation room and countless office buildings, all hewn out of the bush, which eleven years ago covered the entire district.

Northern Ontario Letter

THE SILVER MINES.

Nearing 200 Million.

The silver mines of Northern Ontario will have a production record of 200 million dollars before the end of the first quarter of the coming year. In this issue of the Journal will be found a summary of annual output together with estimates for 1921. It will be noted that the dividends paid by the successful silver mining companies, together with the ease in the various treasuries, amounts to well over 50 per cent of the gross yield.

Alladin-Cobalt.

Announcement is made officially to the Journal that the office of the Aladdin-Cobalt has been removed to the Tough-Oakes mine at Kirkland Lake. The operation of the Chambers-Ferland mine of the Aladdin-Cobalt which was carried on through the shaft of the Right of Way Mines has been temporarily suspended.

La Rose.

The work of deepening the workings on the Violet property of the La Rose Consolidated is under way and the management is hopeful of adding to the amount of developed ore. The Violet has come to be regarded as the backbone, so to speak, of the La Rose holdings in Cobalt.

Operations are being conducted on a limited scale at the 9th level of the Kerr Lake mine. Some raising has recently been done, but the results have not been very satisfactory. The company continued to disburse dividends during the year 1921 from profits realized as a result of the operation of property in Utah and in New Zealand. There is a substantial quantity of low grade ore remaining in the Kerr Lake dumps, but the handling of this will not yield very great profits until such time as the cost of labor and supplies undergo further declines.

Victory Silver.

Promising results are being met with on the property of the Victory Silver Mines, formerly known as the Hylands property. Surface work uncovered a vein about 26 inches in width, along which some extremely rich pieces of "float" were found. It is believed that an ore shoot occurs at some point along the vein and that it may only rise to surface in a limited section of the vein at some point where trenching cannot be done on account of the overburden. Lateral work is being done at a depth of 185 feet, where the vein is exceptionally strong and uniform, without finding commercial silver values as yet.

Silver in Gillies Limit.

An encouraging amount of silver has been found recently on the Cobalt-53 property, situated in Gillies Limit. Further work will be required before the importance of the development may be determined.

Nipissing.

It will be another week before the official statement may be secured showing silver production during November from the Nipissing mine, but it is generally understood to have exceeded 300,000 ounces.

The Price of Silver.

A disappointing feature of the silver mining industry is that in spite of talk about the possibility of bimetallism, yet the price of silver has undergone a recent decline. This would tend to indicate that whatever hope may have been entertained for the remonetization of silver no longer exists, and that the monetary situation of the world may be straightened away without substituting silver as metallic support of paper currency in some fixed ratio to gold.

Haileybury Frontier.

It is estimated in mining circles in Cobalt that the working option which the Mining Corporation of Canada has taken on the Haileybury Frontier property in South Lorrain is based to a great extent upon the favorable prospects of the Wood's vein on the Keeley mine extending across the boundary onto the Frontier.

Silver Discovery in Gowganda.

Another discovery of silver is reported to have been made recently in the Gowganda district, in the township of Van Hise. The discovery was made on a small claim or "friction" which had been previously overlooked, lying adjacent to the Sanderson property. High grade silver ore occurs at surface, but the importance of the discovery will only be determined by further work.

To Resume Work at Castle Mine.

Reports reaching Elk Lake tend to indicate that the Trethewey-Cobalt Company will re-organize so as to provide funds for carrying on work on the Castle property in Gowganda. Preliminary work has already commenced in connection with resuming work. The equipment is being gone over, and it is believed an effort will be made to have development work under way early in the new year.

Asbestos at Rahn Lake.

An examination of asbestos properties at Rahn Lake is being made and there are good prospects of a deal being put through which would assure aggressive operation of the property by mining men who are already engaged in the asbestos mining industry. The deposits lying at Rahn Lake in the vicinity of Mt. Sinclair are said to be extremely promising and their successful operation is believed to lie in a solution of transportation difficulties.

THE GOLD MINES.

Goldtellurides.

Among the more favorable news in the Porcupine gold area is the development of extremely rich ore on the Dome Mines, some of which has the appearance of "pressed mud." No official statement has been issued, but the Journal representative has consulted the opinion of mining men with experience in mining gold tellurides, and the impression is gathered that the "pressed mud" is in reality a leached out tellurides ore, and that this material may be found to lie at the apex of a big deposit of gold tellurides. By a quite remarkable coincidence, W. E. Simpson, manager of the Miller Independence Mines, wrote a special article for a Northern Ontario paper in which he discussed the subject of tellurides in West Australia. It is interesting to review the following remarks by Mr. Simpson:

"A perusal of all the recently published information, however, would lead to the belief that the tellurides in Ontario, where discovered, appear suddenly and unexpectedly whereas, in Western Australia, what at depths proved to be some of the greatest telluride gold deposits

ever discovered, showed on the surface no trace of tellurium whatever, the change taking place gradually from one ore state to the other. The most noticeable alteration was that of color, the ore being brick-red, at the surface, the result of ages of oxidation, and gradually charging through the various shades of yellow, brown and gray to the well known usual variety of colors, characteristic of rock formation throughout the world below the zone of surficial influences, frequently called "the permanent water level."

"Similarly, the minerals of economic value in the ore were found to have steadily changed in chemical composition, the gold, "free-milling" and almost pure at the surface giving place to bright grey and black combinations with varying percentages of tellurium, silver bismuth, lead, mercury, etc., which go to form calaverite, petzite, sylvanite and the other tellurides with compositions that are all very wel known.

"In the intermediate zones there were frequently found quantities of a soft, earthey material, dry as dust from the waterless nature, of that desert country and coated with a spongy substance to which the name "mustard gold" was given and which although assaying highly was amenable only with great difficulty to the simple methods of treatment by amalgamation and percolation with cyanide then in operation.

"Microscopic examination showed that the sponginess must have resulted from countless geological ages of leaching of the tellurium, silver and other oxidizable elements with which the gold undoubtedly had been originally associated. Continued observation of each succeeding zone proved the correctness of the suppostion, the soft yellow material in the oxidized ore gradually changing to a greyish mineral containing tellurium in a partially oxidized form and rich in gold, but which with each increase in depth, became increasingly difficult to treat."

Schumacher.

The deal for the Schumacher property is said to be making fairly good progress, but official advice is still withheld. The fact that on the adjoining Hollinger mine there is a "drag" in the mineralization toward the east tends to add to the merit of the Schumacher, and offers good possibilities of the property having important ore bodies at depth.

Dome Section Attracting Attention.

While the Hollinger-McIntyre section of the Porcupine district is far in the lead as regards production to date and ore reserves blocked out, yet the manner in which the Dome Mine is developing and the evidence of ore on other properties is encouraging the belief that the so-called Dome section may ultimately be found to also have very widespread mineralization. The favorable developments on the Premier Paymaster are pointed to, while the outlook is promising for the consolidation of the Dome Lake with the West Dome, together with good prospects on such properties as the Preston East Dome, Clifton-Porcupine, Porcupine Imperial, Ankerite, Maidens-Macdonald, etc.

Blue Diamond.

Reports reaching Timmins go to show that the Blue Diamond Coal mine in Alberta is realizing encouraging profit, one report having it that a profit of approximately $1,000 is being shown daily.

Davidson.

At a depth of 600 feet on the Davidson property, drifting is beng carried along a vein which contains average values of $10.60 per ton, according to official advice given out. The company is said to be well financed and in a position to erect a large mill provided the developments continue favorable.

McIntyre.

Net profits on the McIntyre-Porcupine have recently rised to close to $100,000 monthly. There are approximately 350 men on the pay-roll and the physical condition of the mine is steadily improving.

Teck-Hughes Reorganization.

Some criticism has developed in respect to the reorganization scheme of the Teck-Hughes Gold Mines. In a fairly general way, however, the scheme is meeting with favor. Two objections raised are that the circular sent out did not contain any information in regard to the amount of ore in sight nor the amount of money on hand, and that the increase in capital is not justified in view of the issue of new bonds amounting to $600,000. This criticism seems to miss the point that the holders of bonds are to be permitted to take up stock and pay for it with bonds, and that the indebtedness may reasonably be reduced approximately $250,000.

Tough-Oakes Coming Back.

Developments at the 500-ft. level of the Tough-Oakes Mine of the Kirkland Lake Proprietary (1919), Ltd., have been very favorable during recent weeks, and there are good prospects of sufficient ore being developed to assure steady operation of the mill not later than during the coming spring. The Tough-Oakes produced gold at the rate of $60,000 monthly prior to becoming involved in litigation and finally handicapped by the economic condition caused by war. The better ore shoots were mined-out and the property was left in a very weak physical condition. However, as announced recently in the Journal, a thorough study of the geology of the property was made late last summer and the problems have been largely solved. As a consequence of this, the development work now being done is steadily "bringing the mine back."

Activity in Lebel.

Cold weather has frozen the surface of the ground, and snow now lies in sufficient quantity to make excellent sleighing in the mining districts of Northern Ontario. This is a big help to transportation in the outlying districts and, as in the case of Lebel township, the activity during the present winter is gathering increased momentum.

At the time of writing, the cross-cut at the 400-ft. level of the Bidgood property has not encountered the vein, although this is expected almost daily.

Success in a big way on the Bidgood, King-Kirkland, Queen-Lebel, or any one of the various new properties which are looking better with every blow being struck, would probably go a long way toward encouraging more capital to come into use in this exceptionally promising part of the Kirkland Lake district.

Skead.

Winter roads have encouraged an increase in work in Skead township where property owners cling to optimistic views with respect to prospects in that area, and where numerous promising showings of gold are in evidence.

Gold Nugget.

Advice direct to the Journal representative from the Wanapitei Lake district carries the information that on the Gold Nugget property, a vein about 34 feet in width has been opened up on surface and arrangements are being made to sink a shaft to a depth of 150 feet. A mining plant is being installed this winter with a view to expediting the work. The foot-wall side of the vein is very rich and by sinking the shaft in this ore it is hoped to get sufficient gold from the operation of a two-stamp

mill to pay for work. At a depth of 150 feet it is planned to cross-cut the vein so as to ascertain the average gold values in the quartz and schist body.

Goudreau.

C. A. Foster is proceeding with plans to operate the Porter property in the Goudreau gold area. Quite a number of business men of Sault Ste. Marie have paid visits to the property and are understood to be interesting themselves in helping to finance the enterprise. Surface showings are favorable.

Hollinger.

The Hollinger Consolidated recently treated 4,700 tons of ore in 24 hours. This does not represent the average, but it does greatly exceed the former record of 4,200 tons daily and tends to indicate that for the month of December the average will be upwards of 4,000 tons daily. The increase has been brought about by crushing the ore extremely fine before letting it pass through the stamps.

Porcupine V. N. T.

Directors of the Porcupine V. N. T. have entered into a deal for the sale of the remaining 475,000 treasury shares at 15 cents per share. The shareholders will be asked to ratify the deal at a meeting to be held Dec. 28th. This would provide upwards of $70,000 and would be sufficient to continue the main shaft from a present depth of 600 feet to the 1000-ft. level. There are prospects of interests in this country making a bid to secure control of the company, in which event a scheme would be entered into to raise sufficient money to finance the construction of a large mill provided the developments down to the 1,000-ft. level proved to be up to present optimistic expectations.

TORONTO MINING QUOTATIONS.

Quotations on Active Stocks on Standard Stock Exchange, Toronto, 13th December, 1921.

Antimony	9	9

TORONTO COAL PRICES

Toronto, Dec. 13.—There is no very appreciable change in the coal situation in Toronto. It has, perhaps, improved slightly in this way—that there is less coal under demurrage in Toronto than formerly. But market conditions are much the same, with the exception of the fact that slump is not so plentiful as it was. Altogether, coal men are the very reverse of optimistic. So far as they are concerned, a heavy snowstorm would suit their book better than anything else at the moment.

U. S. PRODUCTION OF COAL

Production of soft coal continues to plunge downward, and during the week ended December 3 touched the lowest level reached at any time since last April. The total output, including lignite and coal coked, was approximately 7,077,000 net tons. The daily rate—1,179,000 tons—showed a decrease of 16 per cent. in comparison with the rate in Thanksgiving week. In comparison with production in late October, the decrease was 36 per cent. The present slump is in large part a reaction against the artificial stimulus let by the apprehension of consumers over a possible stoppage of transportation. While that apprehension was felt, coal was flowing into storage. Now that it is for the moment allayed, coal is flowing out of storage. How acute is the present depression may be judged from the fact that the output of 7,077,000 tons was the smallest in any full-time week since that of April 30, when 6,984,000 tons were produced.

THE MINING CATALOG.

The Keystone Consolidated Publishing Co., Pittsburg, has published the initial issue of the "Mining Catalog," metal and quarry edition. This is a splendid book, containing much useful data. The publishers have aimed to make it a distinct contribution to the working library of operating companies. It is a sister volume to Coal Edition, Mining Catalog, which is already well known in the coal districts. The concerns represented in the catalog provide its entire support and the publishers make free distribution to individuals and companies in the mining and quarrying industries. It is a consolidated catalog in which a large number of firms advertise their products. A considerable part of the book is devoted to engineering data.

DEVELOPING GOLD PROPERTY IN MANITOBA.

It is stated by the Financial Times, of Montreal, that Montreal and Toronto financial circles have been giving a good deal of attention recently to gold mining activities in various sections of the Dominion. The great success that has already attended many of the operations in the Canadian gold camps is advanced as one of the principal reasons why Canadians are willing to devote so much consideration to the new mining developments. In addition to the renewed activity in the Porcupine district, Winnipeg reports that a number of Canadian and American engineers are going into Elbow Lake district, about 50 miles from The Pas, and securing options on various claims.

Hollinger interests are reported to have an option on some first choice areas in the new gold region where surface conditions are more or less sensational. It is understood that another Montreal syndicate has secured options on properties in the same mineralized zone. Recent private advices received from the district indicate that there is considerable excitement over the discovery and that all available properties likely to share in the wealth have been eagerly acquired.

S. W. Cohen, the well-known mining engineer, has visited the Elbow Lake district, and his reports on surface conditions were favorable. He has disposed in part of the option he held to the Hollinger interests, and some adjoining blocks to another local syndicate.

The properties, located by the Murray brothers, are about fifty miles from The Pas. General Manager Brigham has detailed a member of the Hollinger staff to superintend the preliminary work, for which equipment will go forward at once. It is not expected to make much progress at surface during this winter. If the initial results are sufficiently encouraging diamond drilling probably will be resorted to next year.

Last spring, or early summer, the Murray brothers made what was heralded as a spectacular find, some fifty miles northeast of the Flin Flon. Free gold and a large mineralized section promised what the prospectors assumed to be a great high grade mine. Commissioner Wallace, on behalf of the Manitoba Government, verified original reports.

Mr. Cohen speaks reservedly because of his personal share in the transaction. He recommended thorough trenching and sampling, and enough diamond drilling to determine the nature of the structure. In a mineralized zone resting on secondary granite, metamorphosed rocks, greenstone, porphyry, syenite and other features are exposed, iron pyrite predominating, and free gold existing throughout what quartz there is. Across about 400 feet, and for a distance of 3,000 feet along the strike, the zone offers tonnage and a payable grade, when the factor of depth is assured. Seemingly the gold is generally affiliated with the quartz, for wherever there is quartz, there is gold, otherwise the section is lean. So far as noted, there are no defined veins. The values are contained in bunches of quartz and veinlets lying horizontally.

Mr. Cohen does not attribute the enrichments to secondary or surface deposition. Some of the quartz exposures are from ten to twenty feet wide, and it is in those that values ranging from the payable to the pyrotechnic were secured by Mr. Cohen, who merely states that "if it will average it is the greatest thing of its kind I know of. The quartz bunches and veinlets, or stringers, lie flat. This condition may continue with the varying results characteristic of such occurrences. At any rate, the find is important—and the thing deserves the treatment it will receive."

THE ADVANTAGES OF AIR RE-HEATING.

By F. A. McLEAN.

When compressed air is to be transmitted for appreciable distances, particularly out-of-doors, as in mining, quarrying, shipbuilding, etc., the use of an air re-heater is highly desirable, as through its use losses in transmission and shut-downs, due to freezing troubles, are largely eliminated.

Owing to the heat developed in compression, compressed air in the majority of plants enters the pipe lines at a much higher temperature than that of the surrounding atmosphere. By radiation in transmission, however, its temperature is greatly reduced, with a corresponding reduction in its volume, and, therefore in its working capacity.

A re-heater placed as closely as possible to the point or points of use will raise the temperature of the air to about 250 deg. F., increasing its volume with proportionate gains in its capacity for doing work.

Broadly speaking, the use of re-heaters not only eliminates any chance of the moisture—always present in the air—freezing in the exhaust ports and clogging the tool, but also increases the capacity of the plant 20 to 30 per cent. with a very insignificant increase in fuel cost, and no more attention than that required by an ordinary stove.

The most common form of re-heater consists of a cylindrical cast iron body constructed with an inner and outer shell, the outer shell being covered with non-conducting material surrounded with a sheet iron mantle to prevent heat loss.

The air enters the top of the re-heater and is forced in a thin film between the inner and outer shells, passing out at the bottom into a short pipe line and thence to the tools. The inner shell, over which the air passes, is heated by the combustion of coal, coke or other fuel, to a temperature necessary to heat the air to about 250 deg. F.

PERSONALS.

The Toronto branch of the Association of Women of the Mining Industry will meet this week at the residence of Mrs. Geo. E. Silvester.

Dr. E. S. Moore, secretary of the geological section of the American Association for the Advancement of Science is in Toronto for the meeting of the Association. Dr. Moore, who is a University of Toronto graduate, is Dean of the School of Mines, Pennsylvania State University.

Mr. A. L. Mudge and Mr. A. G. McMaster of Toronto have been engaged to assist Mr. J. G. Kerry in investigation of water powers along the Ontario Government Railway, which serves the gold and silver mines.

THESE SHOW AN INCREASE

Gold, platinum metals, lead and pig iron are the only metals which show an increase in production in the Province of Ontario for the first nine months of 1921, as compared with the corresponding period last year.

POWDERED COAL.

A report by J. A. Blizard on the preparation, transportation and combustion of powdered coal, has just been issued by the Department of Mines. Mr. B. F. Haanel says of this:

The Division of Fuels and Fuel Testing, since the organization of the Mines Branch, Department of Mines, in 1907, has been engaged in conducting investigations which have had as their objective the development of the fuel resources of the Dominion.

Owing to the long haul from the coalfields in the extreme east and west of the Dominion, the immense intervening territory—which is highly industrialized, but devoid of any coal deposits of economic value—is practically isolated from our great national assets of coal. This unfortunate isolation has made it imperative (1) that the most efficient methods be employed for converting the coal imported from the United States into heat and power for industrial purposes; and (2) that effective methods be devised to make it possible to utilize the extensive areas of low-grade fuels found in the intermediate provinces—such as peat and lignite—for domestic and other purposes.

With this end in view, investigations involving a large amount of research work have been conducted, from time to time, to show how peat fuel can be utilized for the generation of power through the media of the gas producer and gas engine, and also through the steam boiler and steam engine. Tests on a commercial scale have been carried out with western coals, both bituminous and lignite, for the purpose of determining their special value for steam raising, and the production of a power gas when burned in a gas producer. Research work of a very important character has also been under way for several years, in the carbonization and briquetting of the Saskatchewan lignites. The investigation on which the following report is based, logically follows the practical work already done.

The utilization of powdered fuels for steam raising is not new. A steam boiler designed for burning powdered coal was operated some years ago in eastern Canada; and experiments were conducted at the Baldwin Locomotive Works, Philadelphia, U.S.A., with regard to the burning of powdered coal in locomotives. Moreover, peat powder has, for some time, been successfully burned in place of coal on certain of the Swedish State Railways. During the last few years, however, very important developments have taken place in the methods and apparatus for burning powdered coal—not only for the generation of steam, but also for metallurgical and other purposes. The advancing price of coal, due to increased cost of labour, and, to some extent, to increased difficulty in mining and preparing the coal for the market, has made it possible in certain instances to economically generate power from the lower grades of coal, by burning them in the powdered form; but the economy of any process for burning coal in the powdered form for the generation depends on the cost at which a good grade of coal can be obtained suitable for steam raising, when burned under a boiler in the usual manner. Higher efficiencies, it is true, can be realized with powdered coal systems properly installed and designed; but unless the saving in coal bills due to these higher efficiencies, coupled with the resulting reduction in labour costs, more than offsets the cost of burning the higher grade coals in the ordinary manner for the generation of power, it would not pay to re-design old power plants for burning powdered coal. It is quite possible, however, that the lower grade lignites of western Canada, which rapidly disintegrate when exposed to the weather, may be efficiently burned in the powdered state for the generation of power and other purposes. The Blizard report will show how the lower grade fuels can be advantageously employed for metallurgical and steam raising purposes, when burned in the powdered form.

FACTS ABOUT CANADA.

Few people realize that Canada's water-power development represents an investment of $475,000,000, while the power produced would otherwise require 18,000,000 tons of coal yearly; or that nearly 88 per cent. of the world's supply of asbestos comes from the Province of Quebec. The Natural Resources Intelligence Branch of the Department of the Interior has just issued a revised edition of "Compact Facts," which contains in concise form information regarding Canada, its area, population, trade and industries; their extent, capital invested, wages paid, values of live stock, principal crops and amount produced; mineral resources and present production; also forest resources and forest products. Copies of the booklet are available on application to the Superintendent, Natural Resources Intelligence Branch, Department of the Interior, Ottawa.

EDITORIAL

WILL WE HAVE A REAL MINISTER OF MINES?

During the past several years there has been frequently voiced dissatisfaction with the manner in which matters relating to the mining industry have been dealt with by the Federal Government. Some of the misunderstandings and inefficiency might be avoided by having in the Cabinet a man familiar with the mining business and by giving him the responsibility of working out a mining policy for the Government. Any man who understands the nature of mining operations and their importanee to the country and who has some appreciation of the possibilities of development, could, if given some measure of authority, soon show that a real minister of mines would be an asset to the country.

We have, during recent years, seen numbrous members of the Cabinet designated as "Minister of Mines". All of them were gentlemen who were chosen members of the Cabinet for some more or less good reason; but if any were chosen for their familiarity with the mining industry or with the intention that they should take an active part in the development of the country's mineral resources it has escaped our attention.

A few years ago it was pointed out to the Premier by a deputation of mining men that the industry was not being given fair representation in the Cabinet. It was mentioned that the Ministers of Mines were so out of touch with the industry that they could not possibly be helping the Government to formulate a proper policy with respect to the development of mineral resources. The deputation had a sympathetic hearing; but evidently made no lasting impression, for, in later shuffles in the Cabinet, the portfolio of Minister of Mines was given scant consideration.

Now that a new Cabinet is being formed it is to be hoped that the Mines portfolio will be given to a man who will be expected to devote his attention to mines and mining—a man who can be a real help to the industry and develop a sound and progressive policy for exploitation of mineral resources.

The new Premier does not need to follow all the bad habits of the former Government. If he does so, he will tag the portfolio of Minister of Mines on the holder of some other important portfolio who has been chosen for his willingness to wear the tag, rather than for his ability and intentions to act in a manner befitting a real Minister of Mines.

A Minister of Mines who will devote some attention to matters pertaining to mining would be welcomed by the mining industry, and would be able to count on the advice and help of large numbers of men in the industry. He could be a real factor in the development of the country and could keep the Government in touch with the industry to a degree which has been impossible for many years. A better understanding of the industry and its contribution to the national welfare is much to be desired. This would come from the activity of a man of Cabinet position made responsible for the formulation of a helpful mining policy for the country.

CLASS LEGISLATION.

The Professional Engineers' bill, which was introduced at the last session of the Ontario Legislature, is to be reintroduced, it is understood, at the forthcoming session of that assembly. This bill contains clauses with regard to mining engineering which directly affect the mining industry and its operations. In brief, the idea is that mining engineers should be licensed by an examining body appointed by the Ontario Government and that those who do not present themselves for, or who fail to pass such examination, should not be permitted to perform responsible mining work.

Now, we freely admit that in many States of the United States, legislation of this kind has been popular — largely, we imagine, on the alleged ground that it affords a certain amount of protection to the public. We admit, too, that civil engineers, who, presumably are the parties concerned in promoting such legislation in Ontario, can claim, by way of precedent, that doctors

and lawyers are not allowed to practise medicine or law unless, and until, they have passed examinations and obtained diplomas qualifying them so to practise.

But in some of the States where legislation of this character has been adopted, it has proved practically a dead letter. Moreover, while an examination may be, in the case of medicine or law, the best way of deciding who shall be entitled to practice as doctors or lawyers, that is very far from being the case with regard to mining engineering. The last-named is a calling in which theoretical knowledge is of little value in comparison, with practical ability and experience. The things that a mining engineer has to know are things to be learned, in the main, not from books, but from mines. In essentials and incidentals alike, they have far more in common with railroading than they have with the so-called "learned professions."

Practical experience and natural aptitude—these are the two prime factors which go to the making of the successful mining engineer. And neither examinations nor licenses can give him, or ensure his possession of, either the one or the other. What legislation of the kind contemplated would do, however, would be seriously to handicap the man, however, experienced or however naturally apt, who would not afford or whose parents, could not afford to give him, a certain standard of education.

There are those who will say that such legislation would result in the protection of the public from unjustifiable mining promotion propositions. With this, we do not agree. The best protection the public can have in this respect is that of its own alertness and the active operation of the Company laws of the Province, backed up by the general law, to act as a check on "wild-catters" whose motive is to batten and fatten on the credulity of others.

What we fear about legislation of the kind in contemplation is that the motive behind it may be not so much the protection of the public as the wish to keep a certain class of lucrative work in the hands of a clique. In the state of the mining industry in Ontario, this would do a good deal of harm. It needs the best brains obtainable in its service, irrespective of diploma and so forth. It wants to "get on with the work," and it asks of its engineers that they should possess only the supreme qualification of all—merit.

THE GOVERNMENT AND THE TARIFF.

The Liberal party being now in power we may, if platforms are to be lived up to, soon see changes in the tariff on many items that are used by producers. Among the resolutions adopted at the great National Liberal Convention held in Ottawa in August 1919 was the following resolution on the tariff:

"That the best interests of Canada demand that substantial reductions of the burdens of Customs taxation be made with a view to the accomplishing of two purposes of the highest importance: *First*: diminishing the very high cost of living which presses so severely on the masses of the people; *Second*: reducing the cost of the instruments of production in the industries based on the natural resources of the Dominion, the vigorous development of which is essential to the progress and prosperity of our country.

"That, to these ends, wheat, wheat flour and all products of wheat; the principal articles of food; farm implements and machinery; farm tractors, mining, flour and saw-mill machinery and repair parts thereof; rough and partly dressed lumber; gasoline, illuminating, lubricating and fuel oils; nets, net-twines and fishermen's equipments; cements and fertilizers, should be free from Customs duties, as well as the raw material entering into the same.

"That a revision downwards of the tariff should be made whereby substantial reductions should be effected in the duties on wearing apparel and footwear, and on other articles of general consumption (other than luxuries), as well as on the raw material entering into the manufacture of the same.

"That the British preference be increased to 50 per cent of the general tariff.

"And the Liberal Party hereby pledges itself to implement by legislation the provision of this resolution when returned to power."

If this resolution means anything it means that mining machinery will be placed on the free list.

MORE VIEWS ON SALE OF SHARES.

In our last number we printed some comments by the president of the Standard Mining Exchange on the sale of shares. We have been expecting to hear from other quarters in connection with the proposed "blue sky" legislation, but apparently the organizations of mining men have not yet been asked for their opinions. We note, however, that views are being expressed in some of our newspapers and we reproduce in this number some comments by writers in the "Northern Miner" and the Toronto "Telegram". These writers are evidently in close agreement with one another and their opinions differ markedly in many respects from the opinions of the stock brokers. It is to be hoped that others will give expression to their views. The proposed "blue sky" legislation may result in good or ill according to the interest that is taken in it now.

As the "Northern Miner" aptly expresses it, the encouragement of speculation in mining enterprises rather than in mining stocks is the desired aim of those interested in developing mineral resources. The future of mining in the Province will under any legislation continue to depend more largely on the ability of the men known as promoters than on stock brokers. The promoter's business is to find the money for mining enterprises and his work is quite distinct from that of the broker whose clients are looking for profits from trading in stocks. The mining exchange and the stock broker have a proper place in the financial world, but not in the capacity of promoters. It is the latter who

should shew their interest in the legislation governing the sale of shares; but since they have no organization it is unlikely that we will hear from them collectively. Indirectly the broker is interested since the activity of the promoters results in the creation of enterprises whose shares may later on be traded in, which means more business for the brokers. Trading in stocks is quite a different business from the sale of shares to finance mining enterprises. Mine operators and many others interested in mining have reasons for expressing their views on the sale of shares and it would be well if they would give expression to their thoughts as promptly as the brokers have done, for while the proposed legislation is of special interest to those who undertake to find the money to make mines it has a bearing on the whole industry.

MR. A. J. YOUNG.

The Sudbury "Star" in its issue of Dec. 14 says:

"In the opinion of The Star, it is important that Northern Ontario's interests should be heard, forcibly, in the development of our natural resources, so abundant and rich.

"We believe that an effort should be made to influence the men in control of the situation to select as Minister of Mines a man thoroughly familiar with the Mining industry and a resident of Northern Ontario, because Northern Ontario stands foremost in mineral possibilities among all the mining districts of Canada.

"In this respect the name of Mr. A. J. Young has been frequently mentioned and The Star believes an effort should be made to have Mr. Young made Minister of Mines, and a seat found for him in the North. Under present conditions, and as politics go, this would be in the interests of all. Mr. Young has had a life-long experience in lumbering and mining in the North Country and would speak with knowledge and experience."

Mr. Young is well known in mining circles. He has been for several years actively interested in mining enterprises. He has on many occasions shown an active interest in the industry and is familiar with the problems and has an understanding of the possibilities of developing our mineral resources.

In our opinion he has many qualifications for the office and he would undoubtedly receive the support of many men in the industry. He is also a prominent man in politics and a staunch supporter of the policy of the party now in power. It would be a good thing for the mining industry and for the country if such a man were chosen as Minister of Mines.

ADVANCEMENT OF SCIENCE.

On another page will be found the programs of the engineering and geology sections of the American Association for the Advancement of Science, which meets in Toronto next week. It will be noted that among the papers to be presented are many of interest to the mining world. The Association is serving as a medium for the spreading of useful information and its visit to Toronto should serve to show that science is playing an important part in industry in this part of the country as elsewhere. The program shows that the Association is interested in a wide variety of subjects, and that while some of these seem remote from industry others have an industrial importance that is plainly evident.

EDITORIAL NOTES.

Last week we published an article by Mr. Alexander Gray on the Hollinger. Mr. Gray's estimate of production was based on an estimated recovery of $8.75 per ton. The returns published by the Ontario Bureau of Mines show that the recovery was not so high during the nine months period. The total value of the output is probably somewhat less than Mr. Gray's estimate.

The power situation at Porcupine remains unchanged and unsatisfactory. There is little to encourage those who consider the reopening of the small mines. The large mines could themselves make good use of more power than is now available.

TIMKEN ROLLER BEARING CO.

It will be of interest to readers of this paper to learn that the Timken Roller Bearing Company, of Canton and Columbus, Ohio, in line with its program of expansion, has just broken into a new line—that of mines and mine equipment. This step was definitely taken, so far as the public is concerned, at the annual convention of the American Mining Congress recently held in Chicago, when the company featured an exhibit of its Roller Bearings which attracted much attention and favorable comment. The Timken booth was one of the features. Mine car axles built by two prominent mine car manufacturers and equipped with Timken Bearings stood at the entrance of the booth and played no small part in making it a drawing card.

The salient parts of Timken Bearings that have caused their universal adoption in front wheels as well as other points of hard service in automobiles, trucks, and tractors appeal to mine operators as a solution of the wheel bearing problem in mine car service. Due to the tapered feature, the Timken Bearing carries both radial and thrust loads and all combinations of both, and when, after long and severe service, wear develops, a slight adjustment eliminates it at once. These bearings have exceptional capacity per unit of space required for installation; therefore, more economical than other types. The bearings are easily mounted in the wheels, and ample space is provided for packing with lubricant, so that mine car wheels should not require attention for lubrication or adjustment for a period of from one to two years of hard service.

The Timken Roller Bearing Company has two large modern plants at Canton and Columbus, Ohio, with a capacity of 100,000 bearings a day, and can handle not only the heavy demand from the automotive industry, but the additional business that will come from the industrial field, of which the mining industry is such an important part.

Ontario Silver Mining

General Summary of Ontario Silver Mining Industry Since Discovery of Cobalt.

Production of silver from the mines of Northern Ontario, chiefly from Cobalt, for the calendar year 1921 has reached an aggregate of about 9,900,000 ounces, as near as may be shown by preliminary estimates prepared during the closing month of the year under review.

This production compares with an output of 10,831,146 ounces during the year 1920 and tends to show that the heavy slump caused by the decline in price of silver has probably run its course. A feature of the current year's achievement is that a substantial increase took place in silver production during the last quarter of this year.

Another outstanding feature of the year's development on the silver mines was the discovery of additional rich ore shoots on the Nipissing mine, where silver was found to occur over widths up to as high as 26 inches and assaying 2,500 ounces of silver to the ton.

In the order of their importance, the silver producing mines for 1921 were:—Nipissing, Mining Corporation, Coniagas, O'Brien, Miller Lake-O'Brien, La Rose Consolidated, Keeley Silver Mines, Bailey Silver Mines, Kerr Lake, Aladdin-Cobalt and Hudson Bay. A small amount came from the Haileybury Frontier in South Lorrain and from the Reliance property at Cobalt.

Dividends were paid by three companies, namely, the Nipissing, Kerr Lake and Mining Corporation. In addition to these, the O'Brien, Keeley Silver, Miller Lake-O'Brien and La Rose realized substantial net profits, the first three being closed corporations.

Following is a summary of silver production to date from the mines of Northern Ontario, since the discovery of silver at Cobalt in 1903:—

Year	Average Price cents per ounce	Ounces	Value
1904	57.2	206,875	$ 111,887
1905	60.4	2,451,356	1,360,503
1906	66.8	5,401,766	3,667,551
1907	67.5	10,023,311	6,155,391
1908	52.9	19,437,875	9,133,378
1909	51.5	25,897,825	12,461,576
1910	53.5	30,645,181	15,478,047
1911	53.3	31,507,791	15,253,847
1912	60.8	30,243,859	17,408,935
1913	57.8	29,681,975	16,553,981
1914	54.8	25,162,841	12,765,461
1915	49.69	24,746,534	12,135,816
1916	65.661	19,915,090	12,643,175
1917	81.417	19,401,893	16,121,013
1918	96.772	17,661,694	17,341,790
1919	111.122	11,214,317	12,738,994
1920	100.900	10,831,146	10,687,687
1921 (Est.)	63.00	9,900,000	6,237,900
Totals		324,331,329	$198,956,032

In addition to the silver production as above recorded, the silver mines have produced a large volume of cobalt metal, as a by-product, as well as arsenic.

Dividends from Silver Mines.

The dividend record of the silver producing mines is one without parallel in the history of mining, taking into account the total production and the percentage distributed in the form of dividends.

Nipissing was the heaviest dividend payer during 1921, this company paying 19 p.c.. amounting to $1.-140,000. The Kerr Lake paid dividends regularly from profits derived from operations on foreign property, the total disbursements from this company for the year amounting to $300,000. The Coniagas paid 5 p.c., amounting to $200,000, thereby making a total of $1,640,000 in dividends during 1921 from the silver mines, not including the profit made and distributed by closed corporations.

Silver Mine Dividends.

Name of Company.	1921 Dividends.	Total Dividends to Date
Aladdin-Cobalt	.....	$ 75,000
Beaver Consolidated	.....	710,000
Buffalo	.....	3,637,000
Caribou (Drummond)	.....	225,000
Casey-Cobalt	.....	203,249
Cobalt Central	.....	192,845
Cobalt Comet	.....	230,000
Cobalt Silver Queen	.....	315,000
Coniagas	$200,000	10,240,000
Crown Reserve	.....	6,190,849
Foster-Cobalt	.....	45,774
Hudson Bay	.....	778,909
Kerr Lake	300,000	9,160,000
La Rose	.....	7,505,409
McKinley-Darragh	.....	5,955,391
Mining Corporation	.....	5,499,867
City of Cobalt	.....	145,000
Cobalt Lake	.....	465,000
Cobalt Townsite	.....	1,042,259
Nipissing	1,140,000	24,223,297
Penn Canadian	.....	256,443
Peterson Lake	.....	462,350
Right of Way Mining Co.	.....	324,643
Right of Way Mines	.....	252,825
Seneca Superior	.....	1,579,817
Temiskaming	.....	2,159,817
T. and H. B.	.....	1,940,250
Trethewey-Cobalt	.....	1,211,998
Wettlaufer	.....	637,465
Closed Corporations	.....	7,000,000
Total	$1,640,000	$93,256,562

Grand Summary of Output and Dividends from Silver and Gold Mines of Northern Ontario.

Industry.	1921 Dividends.	Total Dividends to end of 1921
Silver Mines	$1,640,000	$93,256,562
Gold Mines	4,269,709	22,241,906
Totals	5,909,709	$115,498,469

Industry	1921 Output	Total Output to end of 1921
Silver Mines	$6,237,000	$198,956,032
Gold Mines	14,011,504	74,075,255
Totals	$20,248,504	$273,031,287

Orderly Readjustment in Asbestos Industry

By ALEXANDER GRAY.

The best judgment in the Asbestos Industry decided it could not force markets. It was taken for granted that demand for the various grades inevitably is governed by restricted consumption. While fundamental conditions are sound, therefore, producers in general faced the facts—rather than break prices they shut down or reduced the output, recognizing that it may take a year or so to right matters. South African companies have had the same experience as their Canadian and American contemporaries. The latest advices are that they have ceased operations or are doing little or nothing. Quebec producers are somewhat more fortunate in that their fibers have quality and variety to commend them—what the world will take they can supply. Admittedly, with few exceptions, marketing organizations have failed to move acumulating stocks. As one well-informed official naively expresses it: "The trouble lies in the purchasing power of consumers, rather than in over-production. We must be content to await broad industrial revival and relaxation of credits," a familiar admission that is not confined to the Asbestos Industry. It is understood those that thought to flout inexorable trade conditions found difficulty in distribution, reduced prices not being more than an incidental inducement. Even where lower quotatons were preferred for larger and longer contracts, the retort courteous has been: "We thank you, and will be pleased to return to the subject when the opportunity arises." Consequently warehouses in several instances are overstocked with short fibers—and banks are not averse to more action.

Superintendent Denis of the Quebec Department of Mines estimates the 1921 production of asbestos has been about 40 per cent of what it was in 1920. In other words he thinks it has amounted to 75,000 tons valued at about $5,250,000, allowing for lower prices obtained. The net effect is to make the value of the 1921 production about 35 per cent of what it was in 1920.

From another source it is intimated that the 1921 output was about 50 per cent of that of 1920, with the value reflecting a lower range of prices. Either estimate acknowledges the situation. Mr. Denis specially notes the continuance of the demand for the medium grades and a slackening market for crudes. Notwithstanding this it is understood one or two companies do not complain of the volume of business in No. 1 crude at $1,500. At the same time Mr. Denis states:

"At present most of the sheds are full, and operations have been curtailed to a minimum. Several properties are not producing, but nevertheless, so as to keep the staffs and the workmen from disbanding and emigrating, as they can do, the pay-rolls are still heavy. Moreover all the companies are doing what they can to alleviate the unemployment situation."

As usual, in such circumstances, there has been more or less pressure upon the markets, and undertandings as between producers have not been strictly adhered to. The stronger factors have earned all their dividends—the weaker find bankers importunate and buyers inadequate. For a while, the Rhodesian and Cape Colony production was a cause of apprehension, but this was eliminated and it is clearly understood that a short period of revival would restore the essential equilibrium between the world's production of 220,000 tons and the world's consumption of between 215,000 and 220,000 tons. Cape blue never has approached in price Quebec's crude. The former with 35 per cent of oxide of iron; the latter with 2 per cent, establishes the superiority of the Quebec product. That is why those who have thoroughly standardized crude have held their fairly satisfactory markets at $1,500 and foresee a trade improvement that will enable them to dispose of their surplus stocks of various grades. They do not expect No. 1 crude to bring War prices. On the other hand, Quebec first quality fibres outrival all others. Survival of the fittest applies to Asbestos—and to Asbestos producing companies, the weaker elements in which will become more of an object lesson than a source of unsettlement. Acquisition of asbestos properties became a vogue. Not a few of them are a vacuum—or will be; for the processes of deflation and results of overestimation more than once have brought discomfort to hastily improvised asbestos promotions. Fully realizing this, the largest producers have no misgivings, however much they deprecate malafides on the part of those who probably cannot be passive.

Obviously the Asbestos Industry met with a temporary reverse. Attempts to hold prices have been more or less successful. Labor has been reactionary, and sought to compel some of the companies to maintain production regardless of markets. These difficulties solved themselves—the mills that are operating are the exceptions. Constructively much has been accomplished. Explorations have extended the areas of the Asbestos Corporation and other companies, and new deposits have been undergoing development in Coleraine, Wolfestown, Cleveland, and other Townships. Responding to the popular desire for the fabricating of asbestos materials in Canada, the Canadian Johns-Manville people prepared for a large factory, to be erected near their mine, at Asbestos. Owing to the general depression, the enterprise has been deferred.

The sympathetic Quebec Government may make affirmative reply to petitions for a modification of the royalty rate. This rate is being levied on the invoiced value of shipments; so the consumer has to pay it. Formerly the rate was 3½ per cent. Now it is 5 per cent. Owing to trade developments and competition, Quebec producers hope to have this tax abandoned or modified. An Asbestos Mine Operators' Association has the matter in hand. The Government have been impressed with the world wide complications. For 1920 the Asbestos Industry contributed about $750,000 from this rate. Meanwhile Rhodesia, the Transvaal, Cape Colony, Arizona and California, have bestirred themselves. In the immediate future competition is not likely to be bothersome, notwithstanding the identification of wealthy men with several Rhodesian ventures, as yet far removed from large markets. Moreover, Quebec extraction of 109.1 lb. of fibre per ton of rock mined, valued at $4.53 per ton, conveys its own meaning, qualities considered.

Despite the prestige of Quebec Asbestos, and the commendation of the trade, it is becoming more apparent that a greater degree of co-operation within and without the Quebec Industry is imperative. Internal economies are enforced, and may become more effective.

Asbestos-bearing areas are all-sufficient; so production is assured. Yet it is conceded, as Superintendent Denis emphasized, that the territory south of the Zambesi possesses "four varieties of asbestiform minerals in commercial quantities": chrysotile, crocidolite, amosite and tremolite. Mr. Denis explains, upon the authority of Mr. A. L. Hall, assistant director of the Union of South Africa Geological Survey, that the crocidolite is what is known as "Cape Asbestos and Blue Asbestos," a composition of silicate of iron and sodium. "It is quite perceptibly heavier than chrysotile, having a specific gravity of 3¼, while chrysotile is 2½. The rocks in which are found the deposits of this pecular mineral have an extensive distribution. They occupy a wide belt, starting at Cape Colony, thirty miles south of Prieska, on the Orange river, and extending in a northern direction for a distance of 240 miles, beyond Kuruman. The belt varies in width between five and twenty miles." The geographical disadvantage and transportation problems are recognized, but production has increased and there are admonitory elements in the amosite, in that it is "more closely related to crocidolite; is distinguished from crocidolite by the absence of sodium; is a silicate of iron, with or without silicate of magnesium, and is charaeterized by the extreme length of the fibres, 5 to 8 inches being frequent, the greatest observed length being eleven inches."

Sooner or later that new variety—a ferrous amphibole—may have possibilities. It exists in the northeastern part of the Transvaal and is alleged to have merit as a spinning fibre. It has been located in a section sixty miles long and three miles wide along the Oliphants river, and while it was discovered in 1907 it was not a commercial quantity until 1916. South Africa is awake to the importance of its deposits of Asbestos and has erected plants at Cape Town, Durban and Johannesburg. Production of amosite increased from 55¼ tons in 1915 to about 4,000 tons in 1920.

Given the industrial revival awaited, the Quebec Industry will continue to provide over eighty per cent of the Asbestos. The stability of prices rests with the stronger producers. Price-cutting and haphazard marketing it is not believed will induce buyers to stock up while trade conditions are uncertain. There is all the more reason for concerted action, because South Africa cannot be ignored. Fourteen years ago chrysotile was reported from the Shabani-Belingwe area in Rhodesia. At that time markets were discouraging and transport almost prohibitive. Immediately prior to the war another find was made in the Victoria district, in the Umvukwe Hills, in the Lemagundi area. It is in the Mashaba Hills that the King Mine is located. The Shabani section has been a center of activity. What is represented to be the largest and richest chrome and asbestos property in the world is being developed at Umvukwe by Latilla-Hamilton interests, also identified with Ontario's gold and silver country. Speaking of this deposit last September, Mr. H. G. Latilla in London said:

It could be quickly brought to a point at which a large production could be made, but under existing industrial conditions, when the steel industry is more depressed than it has been for a generation, it would manifestly be unwise to incur such an expenditure. In the meantime, a great deposit has been demonstrated, and sooner or later the demand for chrome will assuredly reassert itself.

The asbestos section has made very satisfactory progress. During this year very considerable sections of the ground which were thought to be unpayable have been opened up with favorable results, and prospecting operations have proved the existence of the deposit for a mile to the eastward of the older workings, and as work goes on the deposits appear to be increasing in width and value. Asbestos is being regularly shipped, and, judging from the valuation made in London and the sales already effected, the value of the fibre we are producing would appear on to-day's low basis of prices to average about £100 a ton.

It is owing to the reaction and indisposition to belittle competition that the solicitude of the Quebec Government is sought—and no doubt it will be granted.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Programs of engineering and geology sections.

Section M.—(including the Society for The Promotion of Engineering Education).

Programme for Sessions, Dec. 27 to Dec. 30, 1921.

Sessions will be held in Room 21, **Electrical Building.**

TUESDAY, DECEMBER 27.

10 a.m.

1. Address of Retiring Vice-President, Dr. Carl Leo Mees, Director of the Research Laboratory, Eastman Kodak Co., Rochester, N.Y.

2. "Natural Resources and National Welfare," by The Honourable Sir Clifford Sifton, K.C.M.G., etc., formerly Minister of the Interior, and Head of the Conservation Commission of the Dominion of Canada.

3. "The Super-Power Project," Mr. W. S. Murray, Consulting Engineer, New York.

2 p.m.

1. "Optical Determination of Stress Distribution in Engineering Problems," Mr. Paul Heymans.

2. Return Current along sea cables," by Charles Mannebeek.

WEDNESDAY, DECEMBER 28.

10 a.m.

1. "Ice Formation and Prevention with Special Reference to Frazil and Anchor Ice," (Illustrated by moving pictures), Mr. John Murphy, Electrical Engineer, Department of Railways and Canals, Ottawa, Canada.

2. "Engineering Standardization," Mr. R. J. Durley, Secretary, Canadian Engineering Standards Association, Ottawa, Canada.

3. "Fifty Years of Progress in Mining in Canada," Mr. John E. Hardman, Consulting Mining Engineer, Montreal, Canada.

2 p.m.

1. "Recent Progress in Metal Mining in Ontario," (Illustrated by Moving Pictures), Mr. Thos. W. Gibson, Deputy Minister of Mines, Ontario.

2. "Gold Mining in Ontario," (Illustrated by Moving Pictures), Mr. A. F. Brigham, General Manager, The Hollinger Mine, Ontario.

3. "Nickel Mining and Smelting" (Illustrated by Moving Pictures), Mr. W. L. Dethloff, Chief Engineer, The Mond Nickel Company, Ontario.

THURSDAY, DECEMBER 29.

10 a.m.

1. "Toronto Harbor Development," Mr. E. L. Cousins, Chief Engineer and Manager, Toronto Harbour Commission.

2. "Industrial Research," Mr. R. A. Ross, Chairman,

Honorary Advisory Council for Scientific and Industrial Research, Canada.

3. "Railway Development in Canada," Mr. H. K. Wicksteed, formerly Chief Locating Engineer, Canadian Northern Railway.

2 p.m.

1. "Exploration for Oil in Western Canada," Mr. A. M. McQueen, Vice-President, Imperial Oil Company, Toronto.

2. "Coal Mining in Alberta," Mr. James McEvoy, Consulting Coal Mining Engineer, Toronto.

3. "Oil Resources of the Valley of the Mackenzie River," Mr. D. B. Dowling, Geological Survey of Canada.

4 p.m.

In Convocation Hall.

"Hydro-Electric Development in Ontario," (Illustrated by Moving Pictures), Sir Adam Beek, Chairman, Hydro-Electric Power Commission of Ontario.

FRIDAY, DECEMBER 30.

S. P. E. E.

10 a.m.

"Relation of Industry and the Practicing Engineer to Engineering Education"—Addresses by R. C. Harris, Commissioner of Works, Toronto, Prof. Chas. F. Scott, Yale University, President of the Society for the Promotion of Engineering Education, and others. A discussion of the type of engineering graduate now demanded, the character and training he should receive and the character and training of instructors needed in engineering colleges.

2 p.m.

"Engineering Education Versus Vocational Training"—Addresses by Dr. F. W. Merchant, Director of Industrial and Technical Education, Province of Ontario, Prof. Dugald C. Jackson, Massachusetts Institute of Technology, and others. Delimitation of respective fields of these types of training to be discussed.

7.15 p.m.

Dinner. Place to be announced.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE TORONTO MEETING

DEC. 27-30, 1921.

Section E.—Geology and Geography.

Vice-President and Chairman, Willet G. Miller, Toronto, Canada.

Retiring Vice-President Eliot Blackwelder, Cambridge, Mass.

Secretary—Elwood S. Moore, State College, Pa.

Programme of Section E. Dec. 27-30, 1921.

Tuesday Morning Session—Dec. 27, 10 a.m. Room 64, Mining Building, University of Toronto.

Dr. Eliot Blackwelder presiding.

(1) **The A.A.A.S. and Canadian Geology; a Retrospect,** W. G. Miller Provincial Geologist, Toronto Ont.

(2) **Some Physiographic Forms of Western North Dakota** (Lantern 20 minutes), Harry N. Eaton, Syracuse University, New York.

(3) **Mineralography or the Microscopy of the Ore Minerals,** (Lantern 20 minutes) Ellis Thomson, University of Toronto.

(4) **A New Genus, and Species of Dinosaur from the Belly River Beds of Alberta** (15 minutes) W. A. Parks, University of Toronto.

(5) **The Pre-Cambrian of Western Patricia** (15 minutes), E. M. Burwash, University of Manitoba.

Tuesday Afternoon Session, Dec. 27, 2 p.m., Room 64, Mining Building, University of Toronto.

Dr. Eliot Blackwelder presiding.

Session on Glaciation.

(6) **The Glacial Period, its Record in Iowa** (Lantern 45 minutes) George F. Kay, State Geologist of Iowa.

(7) **Some Recent and Pleistocene Glaciers of Argentina and Bolivia** (20 minutes) A. P. Coleman, University of Toronto.

(8) **The Drumlins: The Cause of their Formation** (15 minutes) Colonel John Millis, Chicago, Ill.

(9) **The Stratigraphy and Palaeontology at Toronto** (25 minutes) W. A. Parks, University of Toronto.

(10) **Outline of the Physiographic History of Northeastern Ontario** (Lantern, 20 minutes), W. H. Collins, Director Geological Survey, Canada.

Wednesday Morning Session, Dec. 28, 9.30 A.M., Room 64, Mining Building, University of Toronto.

Address of the Retiring Vice-President, Dr. Eliot Blackwelder, on "The Trend of Earth History."

Session on Sedimentation.

(11) **Sedimentation in Lake Louise, Alberta, Canada,** (presented by permission of the Director of the Geological Survey, Canada). (15 minutes), W. A. Johnston, Geological Survey, Ottawa.

(12) **Sedimentation in MacKay Lake, Ottawa, Canada** (15 minutes). E. J. Whittaker, Geological Survey, Ottawa.

(13) **A Natural Classification of Sedimentary Rocks** (20 minutes). Richard M. Field, Brown University, Providence, R.I.

(14) **The Present Status of the Medina Problem in Southeastern Pennsylvannia** (Lantern, 20 minutes). Harry N. Eaton, Syracuse University, N.Y.

Wednesday Afternoon Session, Dec. 28, 2 P.M., Room 64, Mining Building, University of Toronto.

Dr. W. G. Miller, presiding.

(15) **Some of the Physico-Chemical Properties of Colloidal Solutions and their Relation to Geological Processes** (20 minutes) E. F. Burton, University of Toronto.

(16) **The Mackenzie River Basin** (Lantern—20 minutes). D. B. Dowling, Geological Survey, Ottawa, Canada.

(17) **The Fluorspar Deposits of the Madoc District, Ontario** (15 minutes). M. E. Wilson, Geological Survey, Ottawa, Canada.

The Section is cordially invited to visit the Royal Ontario Museum and inspect the collection. At 3 p.m. the session will adjourn to the Museum.

Thursday Morning Session, Dec. 29, 9.30 A.M., Room 64, Mining Building, University of Toronto.

Dr. W. G. Miller, presiding.

(18) **The Geology and Surface Features of the Torngat Mountains in Northern Labrador** (Lantern 20 minutes), A. P. Coleman, University of Toronto.

(19) **The Influence of Rock Structures on Quarrying Methods** (15 minutes), Oliver Bowles, Bureau of Mines, Washington, D.C.

(20) **Gaspé Peninsula; The Country, Its Geology and Economic Possibilities** (20 minutes), E. J. Alcock, Geological Survey, Ottawa, Canada.

(21) **The Geology of Oil in Canada** (Lantern, 30 minutes). D. B. Dowling, Geological Survey, Ottawa, Canada.

Dust Reduction by Wet Stopers

By D. HARRINGTON.
(Supervising mining engineer, U. S. Bureau of Mines.)

In the study of miner's consumption it has been found that dry drilling, especially in unventilated places, is by far the most dangerous underground occupation. Detailed study indicates that in general the drilling of upper holes creates the worst condition as to dustiness of air breathed by drillers. The introduction of machines with water injection through the drill for cross cutting and driving readily controls the dust menace for practically horizontal holes or those with a downward inclination. Where the hammer type of dry drill is used for the same work, the dustiness of the surrounding air is likely to be as great as or even greater than in dry drilling of upper holes with the stoper types.

The following table gives some data as to air dustiness with various kinds of drilling in two mining regions, "A" and "B" of the western part of the United States, air sampling being done by the sugar tube method.

It will be noted that for 17 samples taken in mines of region "A" dry drilling approximately horizontal holes with the hammer type of machine (with average dust content in air breathed by driller, 345.1 milligrams per cubic meter of air) gives the most dusty condition; dry drilling of upper holes by stopers coming next in dustiness with average of 208.3 milligrams of dust per cubic meter of air for 23 samples; drilling of approximately horizontal holes with water injection type giving an average of but 9.3 milligrams per cubic meter of air for 24 samples taken. As shown by the table, the average dustiness when shoveling in these mines is 17.7 milligrams per cubic meter of air as determined by 24 samples. It may be of interest to note that the South African maximum allowable dustiness of mine air even at working places is 5 milligrams per cubic meter of air, and a letter from South Africa states that recently an extended series of samples of air breathed by drillers using various types of drills and working under various conditions in South African mines uniformly gave less than 5 milligrams of dust per cubic meter of air.

It will be noted from the table that in the mines of Region "A" the use of external sprays in 3 samples with dry drilling of nearly horizontal holes by hammer drills there was considerable reduction in the air dustiness compared with when the sprays were not used (average 263.2 with spray against 345.1 without spray), yet even with the spray the air dustiness was much greater than the excessively dusty condition of air when drilling upper holes with dry stopers (263.2 milligrams for dry hammer drills with spray against 208.3 for upper holes with dry stopers.) Hence the use of the external spray can not be considered a success even though the average dust content of the surrounding air was reduced over 25 per cent as compared to conditions without its use. The inefficiency of this external spray is also brought out in a few tests with dry stopers in Region "B" (see table) where 3 samples of air when dry drilling upper holes with stopers gave an average of 305 milligrams per cubic meter (minimum being 282.2 and maximum 327.8). When the external sprays were used with these dry stopers the average was 458.9 milligrams per cubic meter of air (minimum being 193.8, maximum 735.3). Here the average dust content of air breathed by the driller was actually greater with the spray than without it, as one driller directed the spray in such manner that mist, laden with minute mineral particles was thrown back onto his face.

In all of the above cases the men using the spray did not manipulate it properly to protect them from the dust, yet it was evident that even had they been expert and utilized the spray with maximum efficiency there would still have been dangerous quantities of dust in the air. On the other hand, it was shown by 16 samples that the use of *water stopers* on upper holes (see also above table) by men unfamiliar with their use, reduced air dustiness in drilling of upper holes from an average of 208.3 milligrams per cubic meter of air with dry stopers to 28.8 milligrams with wet stopers. These wet stopers were out of order and working very poorly. It is probable that had the wet stopers been in good repair and in the hands of experienced men, the air dustiness would have averaged less than 10 milligrams per cubic meter of air, or approximately the average for water-injection piston drills. Even with maximum precaution in drilling, the South African standards of freedom from dust can not be reached without adopting their stringent regulations as to the sprinkling of surrounding areas in addition to dust prevention in drilling.

It is my opinion that the use of external sprays in connection with dry drills is an inefficient method of dust prevention. It is evident that use of water through hollow steel has been effective in dust prevention where piston types of machines have been used in driving, and even in stoping and in raising where conditions were such that they could be used. Inasmuch as stoping and raising is usually done with stopers, and as stopes and raises are ordinarily poorly ventilated, one of the main

Dustiness of Air of Underground Workings Breathed by Drillers Using Various Types of Drilling Machines. Two Mining Regions in the Western Part of the United States.

Type of machine	Region	No. of Samples	Method used	Kind of holes	Dust content of air in milligrams per cubic meter Minimum	Maximum	Average
Hammer type	A	17	Drilling dry	Approx. horiz. and some down holes	29.2	765.1	345.1
Hammer type	A	3	Drilling dry but using external spray	do.	78.5	412.9	263.2
Stoper type	A	23	Drilling dry	Inclined 60 deg. to vertical	26.8	675.5	208.3
Stoper type	A	16	Drilling wet-water through steel	do.	5.9	93.9	28.8
Water injection type	A	24	Water through steel	Slightly inclined at horizontal	3.7	49.4	9.3
No drilling-men mucking	A	25	.....	.....	5.2	123.6	17.7
Stoper type	B	3	Drilling dry	Practically vertical	282.2	327.8	305.0
Stoper type	B	3	Drilling dry but using external spray	do.	193.8	735.3	458.9

Note: South African standard of air dustiness is 5 milligrams per cubic meter of air.

dust prevention problems in metal mines has been that of providing a water injection with a stope drill. At the present time at least three (perhaps more) practical stopers have been perfected, which force water through the steel and "kill" the dust as it is formed at the drill bit.

In the development of wet stopers it has been found that the use of water not only practically eliminates the dust but also has numerous other advantages, together with a few disadvantages.

While there are numerous distinctive features of the different makes of present-day water stopers, there are two main types — the self-rotating and the hand rotated, both having hollow steel through which water is forced to the bit. In general, the self-rotating wet stopers weigh about 110 pounds while those hand rotated weigh about 95 pounds, the ordinary hand-rotated dry stoper weighing 80 pounds or less. Some dry stopers are readily convertible into hand rotated wet stopers at a cost of $50 to $75 per stoper and this type is giving good satisfaction in at least one large mine. The first cost of the self-rotating wet stoper is 50 to 75 per cent. greater per machine than that of the dry machines paralleling the situation as to the higher cost of upkeep of water injection piston machines as compared with the old piston type. In general, the breakage of drill steel is less with the wet than with the dry stoper and greater footage can be obtained per sharpening with the wet than with the dry type.

For some years a large copper mining company has been experimenting with water stopers and now has more than 200 self-rotating water stopers. Two of its mines for a period of about a year prior to the shut-down in April, 1921, had wholly discontinued the use of dry stoper and the cost of upkeep of the wet stoper is much greater per machine that that of the dry stopers. At present its only operating mine is using wet stopers only. Three makes of self-rotating wet stopers have been tried and all pronounced commercially successful. All are applicable to drilling of any kind of ground encountered in the district, hard to soft, solid to broken. This flexibility is due largely to the brake with which the machines are equipped. The self-rotating wet stopers drill nearly double (frequently more than double) the number of inches per minute drilled by dry stopers. Moreover, they prevent dust formation in the drillhole and the water used wets the surroundings sufficiently to lay at least partly the dust in broken ore, on timbers, in chutes, etc., and also materially decreases the temperature of hot places. While the first cost of the machines is nearly double that of dry drills and the cost of upkeep more than double that of dry drills, yet the company referred to, after a thorough tryout extending over two years has determined to adopt wet stopers as standard equipment in its mines.

The most difficult feature connected with the introduction of the wet stoper is the opposition of the miners who are prone to say that they prefer to "swallow" the dust, taking chances as to subsequent miner's consumption, rather than become, as they say, crippled with rheumatism from the water, especially from upper holes. Where one or two wet stopers are given to miners to be tried out in a mine where dry stopers are used, the miners will almost invariably condemn the new machines from almost every possible viewpoint; and even when the dry stopers are wholly eliminated and wet stopers substituted, the men try to drill dry with the wet stopers, generally with rather poor results. However, after compelling the proper use of wet stopers by strict disciplinary measures, the very men who were bitterest in opposition soon become the greatest advocates of the new machines. The best demonstration of this is the fact that contract miners accustomed to the new machines demand them for use in raises and in stopes.

The wetting of the driller is largely a matter within his own control, except of course where there is neglect in assembling parts or when some accident occurs, such as breaking of drill steel, hose, or other part of the equipment. There is, of course, much more probability of getting wet with the water stoper than with the dry stoper, just as with the water-injection piston machine, yet men now complain very little about wetting caused by the latter. Some mining men say that due to getting wet with water the use of wet stopers, especially for upper holes, will be restricted to places with air temperature above 70 deg. F. however, a large mine with air temperatures at working places as low as 50 deg. F., is using *hand-rotated* water stopers for raising and the superintendent reports that the men refuse to work when asked to drill dry. The only dry drilling in the mine is done when talc plugs the hole in the end of the drill steel, the practice then being to drive a short piece of wood into the bit and continue drilling until the steel is dull or has drilled its limit. The wooden plug is readily burned out while sharpening the bit, and prevents the talc from entirely filling the hole throughout the steel with probable destruction of its further usefulness.

Notwithstanding the disadvantages mentioned, such as greater weight, higher first cost and upkeep, and probability of the driller's getting wet, there is no doubt that water stopers are to be preferred to dry stopers when the above disadvantages are weighed against dust elimination, greater flexibility as to drilling various kinds of ground, greater speed of drilling, and lessened breakage and amount of sharpening of drill steel, together with the cooling effect of water in hot places and the protection against fire offered by the presence of water lines in all places. The health feature alone should cause the elimination of dry drilling and when to this is added greater speed and probably lower total cost of drilling per ton, progressive mine operators should see that wet stopers are given a thorough and a fair trial. — Reports of Investigations, U. S. Bureau of Mines.

U. S. SOFT COAL PRODUCTION.

Although soft-coal production is normally at a maximum at this season, it has in fact dropped back to the level of last April, normally the lowest month of the year. For two weeks in succession production has hung around 1,200,000 tons per day, whereas the smallest daily output in any December of the preceding eight years was 1,379,000 tons. The total output during the week of December 10, including lignite and coal coked, is estimated at 7,235,000 net tons, asagainst 7,104,000 tons in the week preceding. A year ago production was 12,813,000 tons. In connection with this subnormal production two facts should be remembered. The first is that the movement of coal up the Lakes has now virtually ceased. The second is that during October, with a railroad strike in prospect, consumers hastened to increase their stocks, and some millions of tons flowed into storage. At present the flow is out of storage, for 7,200,000 tons a week is not sufficient to meet current consumption and exports. Clearly, if it were continued for long, the draft on stocks might carry reserves below the danger point.

Northern Ontario Letter

THE SILVER MINES

Silver Cliff Reopened

Announcement is officially made to the Journal that the Silver Cliff mine will be reopened this week and that the shipment of ore to the Baily Customs mill will commence at an early date. There is approximately 3000 tons of medium grade ore in sight, and the possibilities are good that the present known ore bodies may be found to extend far beyond their present known limits. No statement has been issued in regard to those behind the movement, but it is rumored that the Bailey Silver Mines will operate the property under lease.

Cobalters Visit Soo District

An expedition made up of Jas. Rattray, H. W. Hartley and J. McLeod, headed by Hugh Park, manager of the Nipissing Mining Company, left Cobalt this week for Sault Ste. Marie. The object of the trip has not been officially announced, but has to do with the examination of mining property in that district, possibly at Goudreau.

Right-of-Way Mine Sold

The Right-of-Way Mines, which went into the hands of a receiver not long ago, has been purchased by E. J. Daly, of Montreal, according to authentic information just secured by the Journal.

Hudson Considers Cane

A meeting of the Hudson Bay Mines will be held within the next few days to consider the question of taking over the operation of the Cane Silver Mines, situated in the township of Cane in the Elk Lake district. A representative of the Hudson Bay visited the property some weeks ago and made a general examination. Surface showings are quite spectacular, and about $1,200 was realized from ore shipped by the former operators during the course of sinking a shaft to a depth of 42 feet.

Silver in Gillies Limit

Silver has been encountered in encouraging quantities on the property known as the Cobalt-53, situated in the Gillies Limit at Cobalt.

Nipissing's New High-Grade Ore Shoot

During November the Nipissing mine continued to produce silver at a heavy rate, the output for the period amounting to an average of $8,375 every twenty-four hours. In his regular monthly report to the president and directors, Hugh Park, manager, says:

"During the month of November the company mined ore of an estimated net value of $251,253 and shipped bullion from Nipissing and customs ores of an estimated net value of $71,807. The value of the month's silver production was estimated at 66¼ cents per ounce.

"A few small veins were discovered in November, but in the absence of development work they do not appear to be of importance. Preparations for active sinking on vein 251 at 63 shaft have almost been completed. The winze is now down 5 feet and shows three inches of ore assaying 5000 ounces. The 70-foot ore shoot developed at the second level on this vein assayed 2500 ounces over an average width of three inches. The depth of the underlying keewatin at this point is unknown, but it is expected at about 90 feet.

Development work, by raises, at the third and fourth levels of 64 vein continued throughout the month, generally with good results. No further work was done on the high grade ore found in October, as the area will be stoped eventually.

"The low grade mill treated 6,343 tons. The high grade plant treated 197 tons. The refinery shipped 100,602 fine ounces of bullion."

Silver production	$237,183
Cobalt	14,070
Total	$251,253

Dividends

Dividends measured in scores of millions from the silver and gold mines of Northern Ontario is already an accomplished fact, while dividends measured in hundreds of millions are actually in sight.

Figures show an aggregate of 115 million dollars already paid out in dividends from these mines, while the various company treasuries contain many additional millions, and with probabilites of an aggregate output of over a billion dollars in precious metal pointing the way to hundreds of millions in dividends.

The precious metal mines of Northern Ontario have already made a number of millionaires and a great many men have been made moderately rich. Mining history already contains the names of such prospectors as Harry Oakes, Benny Hollinger, William Wright, Jack Miller and so on who made fortunes out of mining claims. The names of men who have made big fortunes out of the operation of mines are numerous and generally quite well known.

The question is this: Who among those now engaged in the business of prospecting and mining in Northern Ontario are to share in a big way the multiplied millions which are assured from these mining fields in the years to come?

Bailey Silver

Production and development at the Bailey Silver Mines during November were very satisfactory. The report shows that gross earnings of the Bailey Customs Mill for the month reached approximately $12,877, the mill having treated a total of 4,292 tons of ore. Of this total tonnage 1,183 tons came from the Bailey Mine itself.

Several small stringers were encountered during the course of development work in a cross-cut at the 4th sub-level. Development work has been started on a winze at the 4th level west where good silver values are in evidence. This work will be carried on and drifting will commence at the contact to follow the known veins.

"Negotiations with the La Rose Mines," says the official statement, "for the treatment of their ores at the Bailey Mill have been concluded and assures the Bailey Company of the La Rose ores for treatment in the custom mill for several years to come."

Shipments from Cobalt

During the month of November, according to official figures submitted by Arthur A. Cole, mining engineer for the T. and N. O. Railway, the mines of the Cobalt district shipped an aggregate of 213½ tons of ore over the railway.

tons. The Mining Corporation of Canada sent out

The heaviest shipper was the Coniagas with 64½ tons, while the O'Brien was a close second with 64 53 tons, while the Hudson Bay shipped 342 tons. Of the total 64 tons were consigned to Canadian and 149½ tons to United States smelters.

During the period, the price of silver reached a

maximum of 70.250 cents per ounce on Nov. 2nd and a low point of 66.250 cents on Nov. 26th, while the average for the month was 68.234 cents per ounce.

THE GOLD MINES

Dome Mines

During the third quarter of 1921, according to official figures in the hands of the Journal representative, the Dome Mines realized an income of approximatly $700,000. The mill recovered an average of $7.12 per ton, the heads having averaged approximately $7.50. The mill treated an average of 983 tons every twenty-four hours and produced $644,052, added to which was the premium on gold, which brought the total up to approximately $700,000. This achievement is believed to indicate that the Dome will experence no difficulty in establishing a uniform production of approximately $3,000,000 annually, beginning with the opening of the next month.

Schumacher

"The tale of the tape" in the brokerage office tells a story about the Schumacher Mines. The Journal's correspondent last week reported a deal under way for control of the property, and the quotations for the shares have recently been soaring. No official announcement has been made as to what interests are behind the movement to close a deal, although the "street" carries rumors of it being either the Hollinger or the McIntyre, while still another rumor has it that the Nipissing Mining Company of Cobalt is bidding for control.

Nipissing Drilling Rochester

Drilling of a seventh hole on the Rochester property has been commenced by the Nipissing Mining Company, and there is a general belief that the big silver mining concern will become established in Porcupine through acquiring the Rochester. The working option holds good until next spring, however, and the outcome of the exploration work may not be announced before that time.

Hollinger

The Hollinger Consolidated will disburse a 1 p.c. dividend on Dec. 31st, thus rounding out a total of 13 p.c. during 1921, or an aggregate of $3,126,000. The company has recently established a new high tonnage record, and is stated to have accumulated a large surplus during the year in addition to paying the present high rate of dividends. Production for the year 1921 will be close to $9,000,000 in spite of the adverse conditions during the first four months of the year due to shortage of hydro-electric power.

Road to Lightning River

Residents at Ramore station on the T. and N. O. Railway have exhibited genuine public spirit and have joined with claim owners in clearing a winter road from Ramore to the Lightning River gold area. This will shorten the haul by about 15 miles as compared with the road from Matheson. The Lightning River Gold Mining Company has let a contract for sinking a shaft to a depth of 50 feet.

Wright-Hargreaves

During the third quarter of 1921 the Wright-Hargreaves mill handled an average of 136 tons of ore daily and recovered an average of $14.15 from each ton treated. Including the premium on gold, the company realized an income of $15.50 on each ton of ore going through the mill. Total income for the first three months was $194,420, and was therefore the highest in the history of any mine in the Kirkland Lake district. In view of the mill beng designed to ultimately treat about 175 tons daily, it is obvious that the Wright Hargreaves stands in line to ultimately realize an income of around one million dollars from the present plant.

Kirkland Lake.

During the third quarter of 1921 the Kirkland Lake Mining Company produced approximately $70,090. The mill treated an average of 125 tons daily, or a total of 11,489 tons during the period. Recovery averaged $6.10 per ton, plus the premium, which brought the income up to approximately $6.70 from each ton of ore sent through the mill.

Ontario-Kirkland

The Ontario-Kirkland mill is in operating condition again, after suffering a delay through breakage in the hoisting equipment.

Comfort-Kirkland

Good progress is being made on the property of the Comfort-Kirkland Gold Mines, and the prospects on this property are very favorable. The company has been financed chiefly in Toronto, and the enterprise is being conducted along conservative and efficient lines.

The Comfort-Kirkland lies directly between the Ontario-Kirkland, which is now producing gold, and the Hunton-Kirkland, on which exceptionally rich gold showings are in evidence. Up to the present time, work on the Comfort has consisted of surface exploration as well as sinking a shaft to a depth of 150 feet, at which point lateral operations are now under way. Already a number of small veins have been encountered, but it is the intention of the management to keep on cross-cutting with the object in view of picking up the westerly extension of the orebodies which have been developed extensively on the adjoining Ontario-Kirkland.

King-Kirkland

An official statement has been issued by the King-Kirkland Gold Mines, confirming information presented recently in these columns. The statement points out that the plan to increase the capitalization to 5,000,000 shares was ratified, and that the company owns its original property plus the two Ferguson claims, and with only 1,650,000 shares of stock issued.

Regarding future plans the statement says: "We have already purchased two 80-h.p. boilers, locomotive type, and placed an order for a new Ingersoll-Rand compressor, capacity six drills, cross-compound, convertible for steam or electric motor drive. This machine is under contract to be delivered Feb. 1st, 1922. * * * The power house and new cook camp are under construction, and when completed, with the machinery installed, we will sink the present shaft deeper and carry on extensive underground operations."

COAL RESOURCES.

A complete and authoritative work on the coal resources of the world was published in connection with the meeting of the International Geological Congress held in Canada in 1913. It may be of interest to readers to know that this three-volume work with accompanying atlas, which originally sold for $25.00, can now, be had at a cost of $100.00 per set by applying to the King's Printer, Ottawa.

British Columbia Letter

Nanaimo District.

While the actual mining done during 1921 in the Nanaimo Mineral Survey District, which takes in Vancouver Island and a considerable section of the British Columbia lower mainland, has not been equal to average years, it would appear from a report prepared by Wm. M. Brewer, resident mining engineer, that there has been considerable development work and a general tendency displayed by operators and owners of prospects to prepare their properties, in order that the better markets and the greater prosperity of the early future will find them ready to take the fullest advantage of the improvement.

After referring to the burning of the Concentrating Mill at Britannia and to the more recent flood disaster, Mr. Brewer proceeds:

"The concentrating mill at Britannia was closed down on November 30th, 1920, and the mill at the Indian Chief Mine, Sidney Inlet, West Coast Vancouver Island, was also closed down about the same time, while production at the Marble Bay Mine, Texada Island, ceased during 1920. As these were the only producing metalliferous mines in the Western Mineral Survey District, and no others have been added to the list during 1921, consequently when considered from a production basis the condition of the metalliferous mineral industry in this District during 1921 has been discouraging, but on the other hand, when the results from the development work and prospecting that have been carried on during the year in various sections of the district are considered, there is every reason for a feeling of optimism to prevail with regard to the future condition of the industry."

Shipped Iron Ore.

The administration of the "Iron Ore Supply Act, 1919," occupied considerable time during the month of May, when acting on instructions from the Honourable Wm. Sloan, Minister of Mines, the writer made a shipment of 502 sacks of magnetite, weighing 45,000 pounds, from the Lake Mine, on the west side of Texada Island, owned by the Puget Sound Iron Company to Thomas Summerson & Sons, Limited, Darlington, England, also a smaller shipment to W. Perrins of Nanaimo for experimental purposes.

The Consolidated Mining Smelting and Power Company of Canada have had parties of Mining Engineers engaged in field work prospecting the section of Vancouver Island known as the E. & N. Railway belt, but no results from that work have been made public. This examination was made by the smelting company at the request of the E. & N. Railway Company, and in accordance with an agreement entered into by the railway company with the Honourable the Minister of Mines, in an effort to consummate some arrangements by which the present coal control of the minerals in the railway belt can be eliminated. At present the E. & N. Railway Company are the owners of all coal and base metals occurring within the boundaries of the railway belt, while the title to any precious metals occurring within that belt are in the Crown.

Referring to his own activities during the Summer of the past year Mr. Brewer says in part:

Nearly all of the month of July was devoted to a visit to Tatlayoko Lake and Klina Klini River Sections on the mainland in the extreme northerly part of the Nanaimo Mining Division, which owing to the lack of any trails from the coast from either the head of Bute or Knight Inlets can only be reached, at the present time, by travelling into the Chilcotin Country and crossing the low summit between Chilco and Tatlayoko Lakes.

The chief point of interest in this part of the Nanaimo Mining Division is that within its boundaries the Easterly boundary of the grano-diorite batholith of the Coast Range is found to follow an irregular line and the contact between those granitic rocks and the sedimentaries of the interior can be traced. This fact is also referred to by Wm. Fleet Robertson, Provincial Mineralogist, in his report on the Tatlayoko Lake section published in the Annual Report of the Minister of Mines for 1910, in which he also draws attention to the possibilities of the section as a promising field for productive mineral deposits to occur.

The writer during his trip examined the property of the Tatlayoko Lake Gold Mining Company, Limited, near the foot of Tatlayoko Lake. At the headwaters of the Klina Klini River he examined the iron ore property

Later in the season a trip was made to Siwash Creek near the head of Powell Lake where the *Copper Bowl* group of mineral claims was examined. Near Olsen landing on Powell Lake, the mineral claims owned by George Kennedy and Jack Howse, were examined. The *Ophir* and *Shamrock* mineral claims near Powell Lake, about three miles from the Powell River Pulp Mill were also examined on this trip. Development work has been done to all of these above mentioned prospects.

Powell Lake Section.

It is interesting to find that the ore deposits on the properties mentioned in the Powell Lake section on Siwash Creek, occur in a zone of metamorphosed sedimentary rocks, one of the roof pendants as described by Chas. Camsell and other geologists as occurring as inclusions in the grano diorite batholith of the Coast Range. The values carried by the ore range from traces to 0.42 oz. in gold; from trace to 43.2 oz. in silver and from 0.5 per cent to 1.3 per cent in copper.

Texada Island.

On Texada Island development work has been done during 1921 which has been examined during the past season. This work has been chiefly confined to the Marble Bay Mine, the *Marblehead* and *Majestic* groups, and work done by John D. Edwards on a group of mineral claims near Gillies Bay, Texada Island.

Quadra Island.

On Quadra Island development work during 1921 has been confined to that done on the *Wanderer* and *Prospector* mineral claims near Deep Water Bay, which were examined in June last. Samples from these claims assayed: Gold, trace; Silver, 1.8 oz.; Copper 19.0 per cent. and gold, trace; Silver, 1.8 oz.; Copper 15.5 per cent.

Silver Leaf Claims.

From June 23rd to 26th was occupied in examining the *Silver Leaf* and *Mountain Ash* mineral claims owned by Thos. Service of Cowichan Lake. These are on a small creek, one of the headwaters of the Jump River which flows into the south fork of the Nanaimo River. The interesting feature about this property is the values carried by the ore which occurs in a well defined vein in a shear zone. The samples from the *Silver Leaf* claim, assayed:

Gold oz.	Silver oz.	Copper, p.c.
0.32	2.2	14.5
0.66	2.0	3.7
0.2	1.2	4.7
0.2	0.4	11.2

Samples taken in October by the owners from the same claim, after some development work had been done, assayed:

Gold oz.	Silver oz.	Copper. p.c.
0.80	1.6	5.5
0.66	1.0	5.0
0.86	1.4	5.1

Vancouver Mining Division.

In the Vancouver Mining Division the development work done during 1921 has been confined almost exclusively to that done by the Britannia Mining and Smelting Company on the Britannia Mine, also by D. McKinnon, D. McCallum and O. W. Rafuse, on Bay Creek, a tributary of the Stawamus River and by J. Habrick on the Indian River.

The Britannia Company has kept about 250 men employed in extending the development work in the mine and blasting out available ore. This work has resulted in largely increasing the tonnage of ore in sight, as well as exposing bodies of ore carrying very much higher values in copper than the usual run of mine ore heretofore worked.

The development work done on Bay Creek during the past year has resulted in determining the occurrence of what may be termed as the pay shoot in the wide zone of schist. Samples taken at the time an examination was made by the writer early in September, assayed from 0.1 per cent to 6.8 per cent in copper.

Victoria Mining Division.

The only activity in the mining industry in the Victoria Mining Division during 1921 has been the prospecting work done on the Gabbro Group of mineral claims, which adjoins the Sunloch Group on Jordan River. A company known as the Gabbro Copper Mines, Limited, non-personal liability, was formed, with Geo. E. Winkler for President, which did considerable systematic prospecting work, during which it was discovered that some of the ore occurring on the group carried values in nickle.

West Coast Vancouver Island.

From September 10th to October 7th last the writer's time was occupied in making examinations in the Alberni, Clayoquot and Quatsino Mining Divisions where there has been but little during 1921.

The chief feature of interest is the opening up of the *You* Group of mineral claims on Ptarmigan Mountain about 15 miles from the head of Bedwell Sound, Clayoquot Mining Division, at an elevation of about 2,700 feet above sea level.

The development work is being done on a narrow quartz vein which fills a fissure in granodiorite country rock. Samples of the quartz vein filler, assayed:

Gold oz.	Silver oz.	Copper. p.c.
6.92	0.8	Nil
3.56	3.4	0.2
2.92	2.6	0.5

Omineca and Cariboo.

All the vast territory known as the Omineca, the Peace River District, and the Cariboo are included in the area over which John D. Galloway, resident mining engineer at Hazelton, B.C., has jurisdiction so that it is interesting to find him observing, in a recent report regarding mining conditions in 1921, that, considering adverse conditions, the condition of the mining industry in that section has been better than might have been expected.

"While but little lode-mineral production was made," he proceeds, "a substantial increase in the placer gold output as compared with 1920 is an encouraging sign for the future.

"Development of mineral properties was proceeded with in many parts of the District and more prospectors were in the hills than for some years past. Besides the actual exploratory work of looking for new mineral discoveries much work is done in the course of a season by prospectors on the properties that they own. In quite a number of instances of work of this nature done this summer the showings of ore have been improved and the general results very satisfactory. There are now in the North-eastern District a considerable number of prospects, carrying a great variety of ores and metals, which should prove attractive to those who are looking for prospects that have some chance of developing into profitable mines.

Placer mining was vigorously prosecuted in the Cariboo and the indications are that the yearly placer gold production of that section will soon again increase to equal that of pre-war years. Particularly interesting is the re-opening of the old *Bullion* mine at Quesnel Forks, which property was at one time the most important hydraulic mine in British Columbia.

The *Silver Standard* mine and concentrating mill at Hazelton was closed all year but it is expected that operations will be resumed in the spring of 1922. The condition of the mine is satisfactory and the reason for closing down near the end of 1920 was owing to the difficulty of marketing silver-lead and silver-zinc concentrates.

The development of a very promising coal property on the Telkwa river was commenced during the year. This property, known as the *Betty* mines, has a thick seam of good grade coal which will prove highly satisfactory as a steam coal or as domestic fuel. The operations at the mine are as yet on a small scale but once the high quality of this coal is known, it will command a good market. The opening up of a source of a steady supply of good coal will undoubtedly assist the growth and prosperity of Nothern British Columbia.

As far as is known the only ore shipment made this year was a carload of concentrates from the Silver Standard (clean up of mill bins), a shipment from the *Hazelton View* and a few tons as test shipments from different properties. The production of placer gold is estimated at $80,000 as compared with $69,000 in 1920. The coal shipments from the *Betty* mine are estimated at 865 tons.

COAL BRIQUETTING.

We have received from the Mashek Engineering Company, Inc., 90 West St., New York City their catalog No. 5 on Coal Briquetting Machinery and Plants.

This catalog contains 129 pages, and approximately one-half of it is devoted to the question of briquetting of different fuels, descripticns of different commercial binders that are available, costs of manufacture, approximate costs of plants, and especially the article on Lignite, which is of considerable interest to the Canadian mining companies, is covered in a thorough manner after making exhaustive laboratory and commercial tests on the different lignites, their method of reduction by partial and complete carbonization and briquetting so as to convert these fuels into coal equal in heating value to Pennsylvania Anthracite and practically smokeless. Part of this catalog contains descriptions and illustrations of machinery, photographs of plants erected, and reduced working drawings which will give engineers considerable information as to what briquetting involves.

The price of this very complete reference book is $2.00 but Mr. G. J. Mashek advises us that a copy will be gladly sent free to anyone engaged in coal mining or coal merchandising or to consumers or investors who may be interested in the briquetting of fuels in the future provided the request is sent on their letterhead.

ANOTHER WAGE REDUCTION PENDING AT MINES OF NORTHERN ONTARIO

The silver mining industry in the Cobalt district is on the eve of another drastic readjustment in the costs which enter into the work of producing silver. The tendency is still downward, and is made inevitable by reason of it being impossible for only such mines as the Nipissing and O'Brien to feel secure under the existing conditons when the cost of producing silver clings so closely to the value which the metal commands on the open market.

Work is also being carried on profitably by the Mining Corporation of Canada, the Coniagas and the La Rose Consolidated, but the margin of net profit is not commensurate to the capital and the effort involved.

In the continued slow decline in the cost of supplies, and in a further reduction in wages to the miners lies the security of the majority of the mines. Not only this, but in such a concerted readjustment lies reasonable assurance that a number of the mines which are at present unable to operate may be reopened.

Miners are available in large numbers, but the present high rate of pay has caused total working forces in Cobalt to be reduced to around 1,000 men. These high wages preclude the possibility of any general resumption of work on present idle mines.

From the point of view of the mining companies, a reduction in wages would be extremely beneficial. From the viewpoint of the present workers in the mines, such a reduction would probably meet with opposition. However, from the standpoint of benefit to labor as a whole and to the community and country in general, a reduction in wages might reasonably be for general good. The fact is that such a readjustment would pave the way to the employment of possibly 50 per cent more men than at the present time.

As matters stand, the skill of many experienced miners is being lost on the handles of axes or on the ends of cross-cut saws in the lumber woods at from $25 to $30 per month. These men, unable to secure work at from $4 to $4.50 per 8-hour day in the silver mines, are working for $1 per day in the lumber camps, where 10 hours per day is a minimum. The question is, would they not be better off working at from $4 to $3.50 per day at the mines?

The writer has made inquiry and has learned that with such a reduction in wages, such properties as the McKinley-Darragh, Beaver Consolidated and Temiskaming could be operated on a moderately profitable basis. As in the case of the McKinley-Darragh, the mine and mills are lying in idleness, instead of producing half a million ounces of silver annually and offering employment to at least 100 men, and thereby contributing a substantial pay-cheque monthly to at least 100 homes. There are 25,000 tons of broken ore in the McKinley-Darragh and there are a number of points in the mine where ore of a medium grade may be mined. This work could be carried on at least without loss under a wage scale of $3 to $3.50 per day, but is quite impossible when paying men $4 to $4.50.

The question may be asked: Why do not the mine operators take steps to adjust the wage scale to a point where the idle mines could be operated without loss? The answer to this is difficult to find, unless it lies in part in the fact that the reduction of 15 per cent. made last spring has not yet been followed by a cut at the gold mines farther north, and perhaps in part to the fact that the present producing concerns are not anxious to disturb the present harmony between employer and employed.

At Cobalt the Nipissing is the leading employer of men and has been meeting with favorable developments which assure good profit without cutting down expenses.

At Porcupine, the Hollinger Consolidated is the leading employer, and where also there is a tendency to defer wage reductions due to the enterprise being on a highly profitable basis.

These two big mines are probably directly responsible for the present wage scale having been continued throughout the past several months, but there are gathering signs of early action on the part of certain of the other important mines to reduce expenses, and there is likelihood of an endeavor being made to have the situation cleared up before the arrival of spring, at which time the activity in both the silver and gold mining industries promises to become extremely widespread.

The Sale of Shares

Commenting on the proposal made by mining exchange brokers that sales of shares in mining enterprises should be limited to stock brokers, the "Northern Miner" says:

So many of the Northern Ontario mines have been financed by interests unassociated with exchanges that the question as to whether it would be a wise move to limit all future financing to brokers will not find general agreement in answer. For instance, the two latest gold-producing companies, Wright-Hargreaves and Ontario-Kirkland, were financed by private interests almost entirely. Some of our best prospective properties, notably the Bidgood, are finding their money privately, without benefit of brokers.

The Standard Exchange would like to see stocks of all mining companies listed upon the company securing sufficient money to develop its properties. In a sense, this opinion is not subscribed to by "promoting brokers" of the exchange, for some of the members are promoting companies which they have seen to it are not listed.

Whether a stock should be listed before the property has reached the producing stage is decidedly a debatable point. Our opinion, based on what would do the mining industry most good, is emphatically that no stock be listed until at least a full year after the full development money is raised. During the period of development most properties pass through half a dozen crises, and if the stock is listed it becomes a football for speculators. A few shareholders who want to sell out are given a chance to do so when a stock is listed, but the large majority of shareholders, who bought originally with the set purpose of sticking to the end, see their interest greatly damaged by boardroom speculators. If the company requires more money than originally thought necessary (and it is difficult to estimate in advance how much development money will be required), it is likely to be severely handicapped if the stock has been depressed by market manipulation. There are cases illustrating this on the Standard board today; mines that require new financing cannot get it because the shares are at such low levels as to make a new issue unattractive or insufficiently productive of funds. Unless artificial means are resorted to, and the quotations run up, these promising properties will remain half-developed and idle.

What must be sought is the encouragement of speculation in mining enterprises and the discouragement of gambling in mining stocks.

To our mind the fact that so many people have been bitten while gambling in mining stocks is the reason why it is often difficult to interest investors in mining.

Looking over the recent flotations, the key to success of the most important was the pooling of all stock. Those who invested in the first place with the idea of speculating in the outcoming of a mining enterprise are protected against those whose purpose is to make money purely on the stock. The striking manner in which holders of pooled stock have stuck together through all kinds of weather is proof that mining enterprise is the intention of the great majority.

Anything that will encourage people to invest in a mining enterprise is very much needed. What keeps much money out of mining is the fear that a stock will be raided and a company's operations crippled. Marketability of a mining security is a desirable feature but it is a secondary one to the unhampered development of a property.

Trading in Shares and the Promotion of Mining Enterprises

Commenting on the proposed "blue sky" laws and on trading in mining stocks, a writer in the Toronto "Telegram" says:

There is no objection to established mines being upon the trading lists of the brokers. Every shareholder of mining stock likes to know from day to day just what he can get for his shares should he want to sell them at a moment's notice. There is just as much justification for the listing or trading in Dome, Hollinger or McIntyre as there is in the shares of the Bank of Montreal or the C.P.R. These are commodities representing going solvent concerns, and are just brought into the market. The necessity of bringing as substantial in a way as potatoes or other produce an indefinite number of buyers and sellers together and striking a ruling daily price has become a feature of modern commerce.

But the promoters of undeveloped properties argue that the stock exchange, which performs an indispensable function in dealing with commodities of established value, becomes an abuse and a detriment when it assumes the control of shares in properties which are only in the making stages. With properties like the three Porcupine leaders there is a close connection between the market price of the stock and its earning power. The fluctuations in these arise from the expectation of a higher or lower dividend due to the inherent changeability from time to time of the ore values, cost of labor, power, etc. But always the basic relation is preserved between the value of the mine as a producing business and the reflected value of its stocks in the open market. The gamble element is on an elastic band which however is always tied to a steadfast centre. And this is rightly recognized as legitimate when good faith is preserved in company reports.

But the situation is different when an undeveloped property must go to the public for its funds. There are two ways of doing this. The company may, as did the Associated Gold Fields of Larder Lake, make a private campaign for funds by selling stock and protect their price by obliging each subscriber to agree to a pool of his purchased stock for a given period. In this way, the stock is protected from the erratic prices of a gambling market where the value of the stock bears no relation to anything proven in the mine. But this first is a slow and painstaking method of filling a treasury with funds. Most people are reluctant to tie up money for a long period, and besides the mining investor usually is induced by the hope of making a quick turn over and landing a long shot. The thought of high return urges them to take a chance and makes them easy victims to the second and most favored way.

What happens when the company in need of funds and with perhaps good surface showings goes to the broker? We are not dealing with the wild cat promoter, who has no intention of developing, but is quite willing to fall in line with the broker's terms provided he can unload a block of promotion stock himself before the stock is kicking about the bottom of the scale. We are speaking of the honest intentioned promoter

who have faith in their property, who have put their limited capital into getting it into shape and obtaining competent engineers' reports on their mineral, but who need further funds to carry on to the producing stage. These are the people who complain that the quotation of a daily arbitrary market price out of all connection with any proved merit in their property is a detriment to their continuance of work.

The broker will say, "Well, this is altogether a gamble and if I am to underwrite the stock I must have a good whack." If he underwrote in the sense that he put up a cheque for an amount which would provide funds enough to carry work to completion, then one would not grudge his getting the stock at a figure much lower than that at which he would put it out to the public for consumption. In that case he would run the risk that future developments might fall short of all that the engineers had promised.

In the early Porcupine days many properties were financed in this way, and a heavy buying public, under the influence of the Hollinger success, even subscribed enough to do considerable work on the numerous properties lying about an area radiating from the Hollinger and Dome. A broker of long experience has a large list in Canada and the States, and though the price per share is small, it rains in when times are good. There are scores of properties with plants and buildings and shafts full of water, and a solitary watchman. What happened to them?

This is what happened to them, and will always happen when small capital starts in at gold mining without funds in sight to carry to the producing stage. They work piece-meal, closing down and opening up as funds run out and are replenished by additional stock sales, thus adding greatly to their cost and inefficiency, to say nothing of interest on their investment. In a good period they may drag along looking ever forward to the day when a strike of phenomenally rich values will bring in a flood of investors, and wilfully oblivious to the fact that these abnormal values never persist as a milling condition, and that rock mining is a tonnage and milling business. The broker gets tired holding up the value of the shares and dumps his loose stock for what he can get for it, two cents is high when he gets it for nothing, the stock slumps permanently, the mine is finally closed down and the stock remains a forlorn name on the broker's list, a dead stock.

Now here is where the honest developers protest. They still have a big bunch of treasury stock, and their mine prospects are no worse nor better than when they started, except that they may have accomplished some sinking and drifting, and have an equipment to go on with. But their stock is still listed at half a cent or a cent, and how induce any financiers to buy treasury stock at ten or fifteen cents when they can buy it at one cent on the market. And if they buy there that does not fill their treasury.

And moreover, in a great many cases, the stocks have been dealt in if not actually listed upon the exchange without the consent of the company. They argue that they should have enough control over their shares to prevent them being sold in open market and a fictitious price put upon them. If the company is a going concern, a paying business, then they don't care how much their shares are quoted, that doesn't affect their business. But until they are on their legs and producing, it certainly does militate against their getting funds to fill their treasury to have their shares quoted at a fraction of a cent. And if a strong buyer of treasury stock should be encountered and the stock run up on the market, the one to profit most would be the broker, who can dump his remaining shares at a good figure after practically wrecking the company.

There are two sides to every question, but if any protective legislation is intended it should have reference not only to the publication of prospectus reports, but also to the meethods of brokers.

METAL QUOTATIONS.

Following are the fair average prices for ingot metals (in less than car-loads) at Toronto, 20th Dec.:

	Cents per lb. (Unchanged since last week.)
Copper, Electric	18½
Copper, Casting	17¾
Tin	38½
Lead	7
Zinc	7½
Aluminum	27
Antimony	9

COAL WASHING.

The investigation of bituminous coal washing practice in the Middle Western States, being conducted by the United States Bureau of Mines, the mining department of the University of Illinois, and the Illinois Geological Survey in cooperation, has been extended by a survey of methods in use in Alabama. The object of the work is to conserve coal resources by minimizing coal losses and to increase the utilization of Middle Western coals for coking and other purposes by reducing the sulphur and ash content. A number of coals have been examined in the field and at the laboratory in order to determine the practicability of washing them. Coals from Clay County, Ind., and from Columbiana County, Ohio, have been washed successfully. Particular attention has been paid to the cleaning of coal on concentrating tables, and to a determination of the factors that affect the washability of coal.

For the purpose of aiding the industry in securing washing plants adapted to cleaning a particular coal, data have been collected for a bulletin describing methods to be used in the examination of a coal to determine the general type of washery required.

PERSONALS.

A meeting of the Toronto branch of the Canadian Institute of Mining and Metallurgy was held on Saturday, Dec. 17. Mr. David White of the U. S. Geological Survey addressed the meeting, his subject being resources of coal and oil.

A number of geologists and engineers are in Toronto for the meeting of the American Association of the Advancement of Science. The program includes several papers and discussions that should prove interesting to mining engineers.

Sir Clifford Sifton is to address the Association on Natural Resources and the National Welfare.

Among the mining engineers on the program are Mr. Brigham manager of the Hollinger and Mr. John Hardman the veteran engineer from Montreal.

The Toronto members of the Women of the Mining Industry will entertain visitors at a dinner to be held on next Friday evening. A number of members of the Mining Institute will on the same evening attend a dinner being arranged for by the Engineering section of the Association.

Mr. Robt. A. Bryce has moved his office from the Bank of Hamilton Bldg., to 8 Wellington St. E. Toronto.

POSITION OF MINING CORPORATION OF CANADA AND McKINLEY-DARRAGH

By J. A. McRAE

After having curtailed operations for several weeks during the past winter pending a reduction in wages to the mine workers, and during which time the milling equipment was altered and added to, the Mining Corporation of Canada is rounding out another big year of production.

An oustanding feature in connection with operations during the past six months has been the large amount of ore coming from the Buffalo mine, which was purchased by the Mining Corporation last year. This old Buffalo property has been the chief source of production during the past several months.

While production has probably amounted to the equivalent of 75 per cent. of the total ore in reserve at the beginning of the year, yet it is learned that certain of the ore bodies have been found to extend well beyond their previously known limits, and which leaves the corporation with a substantial reserve on which to continue 1922 operations.

Success attending the purchase of the Buffalo mine on the one side has given rise to the belief that the purchase of the McKinley-Darragh Mine on the other side might reasonably be expected. It is conceded by those in close touch with these mines that the larger equipment on the Mining Corporation would enable this concern to handle McKinley-Darragh ore more cheaply than is possible in the mill on the McKinley-Darragh. Also, it has been learned that the matter of connecting up the underground workings could be quickly carried out through the old Cobalt Lake property which is a part of the Mining Corporation, and which lies immediately adjacent to the ore-bearing section of the McKinley-Darragh.

Considerable ore lies in the McKinley-Darragh, and the management is highly efficient. However, the ore being low grade, and the present wage scale being abnormally high, the only way in which the ore may be handled profitably is by some arrangement whereby it may be treated on a larger tonnage basis or under a greatly reduced wage scale.

On another page of this issue of the Journal will be found a discussion of the general situation which has compelled such mines as the McKinley-Darragh to remain in idleness and in a state of more or less deterioration.

Neither the Mining Corporation nor the McKinley-Darragh paid any dividends during 1921, but the prospect of more favorable conditions with the passing of time is expected to witness further substantial profit distributions from their operation.

BRITISH COLUMBIA NOTES.

Alice Arm, B.C.—Considerable road work has been done in the Alice Arm District in the past few months. There now is a good trail up the Illiance River Valley and the Provincial Mines Department has assisted in trail construction on the northeast fork of the Kitsault River as well as in other parts of the district. This is facilitating actual mining as well as prospecting.—The Moose Group, Kitsault River section, is rapidly taking a place as one of the most promising properties of the north. A considerable tonnage of ore is in the bunkers awaiting shipment, and development work, which still is underway, has disclosed a large body of ore.

Stewart, B.C.—The Bear River Bridge, which was washed out recently, is being re-placed by the Provincial Government. There will be no interference with mining operations in this section, therefore, because of the absence of transportation facilities.—R. L. Clothier announces that the Selvator Gp., situated on the south side of the Marmot River, will be worked all winter. There are some good showings on the property and samples of the ore have assayed high.

Vancouver, B.C.—Announcement has been made that the responsible managers of the Britannia Mining Company will be subjected to criminal prosecution by the Attorney-General's Department as a result of the recent flood disaster at Britannia Beach. Negligence on the part of the managers in regard to the protection of human life will be alleged, it is understood. It will be recalled that in this catastrophe some fourteen lives were lost.

Coalmont, B.C.—It is stated that a valuable discovery of amber has been made on the property of the Coalmont Collieries, Coalmont District, British Columbia. The opinion of Edwin S. Oliver, of the Oliver Chemical Processes Syndicate, in this respect, has been confirmed by reports based on samples forwarded to Ottawa and New York chemists. Mr. Oliver has been engaged in certain tests of the product of the Coalmont Mines and, while making a personal examination of the property, noticed a dump of supposed dross containing over two hundred tons. Through it was a yellow glassy substance that was hard to burn. Mr. Oliver's curiosity was roused and in laboratory tests of the strange substance the presence of succinic acid was disclosed. Since then further tests have been made and small quantities have been rendered plastic with catalytic oils and refined into a beautiful amber, pronounced by Ottawa authorities to be the true succinite or amber. Steps now are being taken by the Coalmont Collieries to handle the amber product apart from the distillation and by-products plant which has been under discussion for the treatment of coal and shale.

Trail, B.C.—During the last nine days of the month of November ore receipts at the Trail Smelter of the Canadian Consolidated Mining and Smelting Co. totalled 7,510 tons, bringing the total for the year to date to 372,109 tons of ore and concentrates. With one month to go there is a possibility of the record of 400,000 being established. Of the receipts for the nine days 7,072 tons came from the Company's Mines; 105 from the Josie, Rossland; 161 from the Knob Hill, Republic; 112 from the Surprise, Republic; and 53 from the Horn Silver, Similkameen, B.C.

Rossland, B.C.—Two tons of ore were shipped recently from the I. X. L. Mine, Rossland, to the Kellogg Smelter. For this a return has been received of 296 ounces gold and 47.5 ounces silver. Twenty tons of second grade ore gave a return of 4.195 ounces in gold and 5.75 ounces in silver per ton. The smelting company paid for the whole of the gold in the high grade ore and 96 per cent of the gold in the second grade ore at $20 an ounce and made a charge of $8 a ton for treatment.

Mr. E. S. Moore, dean of the Mines Dept. State College, Penna, is secretary of the Geological Section of the A. A. A. Sc., which meets in Toronto next week.

Mr. D. B. Dowling will present a paper on oil resources of the west at the Association meeting next week.

EDITORIAL

1921—A REVIEW.

The year just closing has been a trying one for many mining companies though a very successful one for some. The demand for many mine products has been far below the levels of previous years. Quantity of minerals produced has decreased considerably and the value has decreased greatly. A number of mines that have been steadily operated for some years were closed down during 1921 and many others are being operated far below capacity. A few mines, including the gold mines of Northern Ontario are making new production records and planning increased production, but these cannot in a short period of time show an increase comparable with the loss of output occasioned by the closing down of the nickel-copper mines at Sudbury.

The International Nickel Company's great mines and works have been closed down for some months, and the British America Nickel Corporation's plants have been idle nearly a year. The Mond Nickel company is still operating, but on a much reduced scale. The accumulated stocks of nickel are large and until there is a general resumption of business there will be no pressing need for more metal. For the present, nickel mining is not a profitable business.

While the Sudbury nickel industry is passing through a crisis, the other Ontario metal mining industries are doing fairly well and gold mining is prospering. The three companies operating big gold mines at Porcupine will all pay dividends in January. So also will the Wright-Hargreaves company which during 1920 joined the producers in the Kirkland Lake area. While the silver mining companies are not doing so well as the gold, it is worthy of note by the unduly pessimistic that the Nipissing pays a bonus in addition to its dividend in January.

Hollinger, McIntyre and Dome mines at Porcupine and Lake Shore and Wright-Hargreaves at Kirkland Lake all being operated very profitably. The Teck-Hughes is also reported to be making a profit on operations. It may confidently be expected that the gold mines of Northern Ontario will produce much more gold during the coming year than ever before and that the profits will be large.

Among the silver mines Nipissing has stood out even more prominently than usual during the year and has made discoveries of ore which make its prospects bright for the coming year. Less notable has been the success of the other silver mines; but those which have been operated have given a fair measure of good results. Several companies found operation impossible under the conditions as the costs have been too high for profitable operation at the ruling prices for silver.

In Quebec, the asbestos industry has passed through a poor year with a fair measure of success. Production was much lower and lower prices were obtained for the product; but efforts to keep the price up to a reasonable basis met with some measure of success. Some mines were closed down and output of others curtailed.

Coal mining in Nova Scotia, Alberta and British Columbia, while much below capacity, was fairly active and made a better showing than many of the metal industries. In Nova Scotia the slackness of business in the iron and steel industry naturally lessened the demand for coal. In the western fields also there was a slackening of demand owing to general depression in industries and smaller demands by railroads. On the whole, however, the production of coal was fairly well maintained.

The search for oil in the west attracted much interest during the early part of the year and the Mackenzie River district came to notice as a possible great oil field. The discovery of oil at Fort Norman brought into the district several exploration parties and in spite of transportation difficulties preparations were made for testing several properties. The short season closed without any very notable results and the enthusiasm has died. Those who are carrying on exploration work in the far northwest are convinced that there are possibilities there that warrant expenditure but they con-

sider that it will take some time to determine whether the Fort Norman field is likely to be an important addition to our oil resources.

MECHANICAL SHOVELS.

In all mining operations there is perhaps no part of the work that is so poorly done as the loading of cars underground from the floor of drifts and other mine openings. In nearly all cases in Canadian mines the ore and rock is loaded by hand into the tram cars, small pieces being shoveled and large blocks lifted by strong backed 'muckers'. Attempts to utilize machinery for this work have not as yet been very successful. In large openings some measure of success has been attained, but in the ordinary small mine opening the mucker has only his trusty shovel to aid him.

It is reasonable to expect that the attempts to make satisfactory mechanical 'muckers' will ultimately result in the design of small and efficient machines. During the past few years many underground car loaders have been in use in mines in America where conditions are for some reason specially favorable. Since it is from the operation of these machines that we may expect the development of useful small machines it is interesting to note what progress has been made.

In this number of the Journal we publish extracts from a report on underground loading devices used in metal mines, from investigations carried on by the U. S. Bureau of Mines. The data gathered by the investigators shows that progress is being made towards the design of machines suitable for small openings; but that we are still far from the goal.

IT CAN BE DONE.

At the recent meeting in Baltimore of the American Institute of Chemical Engineers, Dr. Raymond F. Bacon made strong claims for the research worker. He pointed out that with organization and determination we can overcome all obstacles and he incidentally let in a little light on some of the work done at Washington during the war. Dr. Bacon said in part:

"One of the greatest lessons of the war, which so far has gone almost unheeded, was that large-scale research can solve practically any problem. We had in Washington a research organization in which were gathered many of the best brains of the country. That research organization was able to solve every problem put up to it by those in command of the military forces. It showed that things which seemed to be impossible to do could be done and done in a rather short time by research backed by adequate resources of brain power and apparatus. The total cost of that organization, put together and run admittedly not at the highest efficiency in the stress of war time, was about two million dollars, and for this comparatively small sum no one could deny that results were obtained which did more toward winning the war than any two hundred million dollars spent in other ways.

"If this government would efficiently spend a few million dollars a year on war research, methods would surely be devised which would make us absolutely safe from attack without the necessity of maintaining such extensive army and navy organizations as at present."

While Dr. Bacon in his paper dealt particularly of the application of research to war purposes, his statements are of very general interest from the viewpoint of the solving of industrial problems. No problem is too hard for such a man as Dr. Bacon and when more men hold his opinions there will be greater use made of our resources. He is a firm believer in the ability of men to solve any ordinary problem. Those who are desirous of having more attention paid to research in industry will find Dr. Bacon's paper very interesting.

CONCENTRATION OF IRON ORES.

The magnitude of the problem before those who would take up the beneficiation, or concentration of Canadian Iron Ores is illustrated by the following quotation from the Mining and Scientific Press, concerning the plant that is being built on the Mesabi range of Minnesota.

"The narrow margin of profit that is anticipated when the entire plant is in operation is indicated by the fact that the present $4,000,000 unit is not expected to earn more than enough to cover the cost of operation; a plant of 22 units with a combined daily capacity of 75,000 tons of ore, rendering possible a wider distribution of the overhead cost, will be required to make the venture profitable. Steel is the backbone of industry and it is inevitable that the deposits of the eastern Mesabi should be utilized eventually. Let us hope that the time has arrived."

The operation of the great concentration plant at Babbitt is being watched with a great deal of interest, since success there would bring into the range of possible profitable operation some large low grade iron ore deposits. The comment of our San Francisco contemporary will attract attention to the fact that hope is being placed at present on the possibilities of large scale operations. The process is evidently not well suited for production on a small scale under present conditions.

ENGINEERING LEGISLATION.

Commenting on the Professional Engineers Bill which is to come before Ontario legislators at the next session the "Northern Miner" says: "Not one mine operator in the Cobalt camp is in favor of the bill that is being advocated by men who for the most part are not engaged in mining. Mine employees and mine employers are on common ground in their opposition to it. The actual makers of mines are against it. The bill where it relates to mining should be killed." Replying to a defense of the bill by Mr. James Hylands and criticism of the "Miners" opposition to a bill before "the men whose life interest at stake have passed on the merits of the bill" the "Miner" replies that there are others than the engineers whose "life interest" is at stake.

We are pleased to see that the "Northern Miner"

agrees with us. We believe that it is of interest to the mining industry that engineering work should as far as possible be done by capable men. We are not convinced, however, that this will be accomplished by legislation and we have more faith in the ability of employers to choose suitable men for certain duties which they will pay them for, than we have in the proposed engineering councils. We are moreover very doubtful whether the proposed legislation is so much in the interests of the industry and of the public as in the interests of engineers. And we are also convinced that no larger number of Canadian mining engineers are very much enamoured of the proposals.

In our opinion there would be very little attention paid to the effort to obtain this class legislation, were it not for the fact that such legislation has recently been obtained in many places. The chief thing that can be said in favor of it is that it is popular, and that it may not do a great deal of harm and possibly some good. We do not believe that it is needed nor that it will not do harm. Under ordinary circumstances there would be no great measure of support for it and advantage is doubtless being taken of the fact that it has been recently a popular fad.

Since such legislation is enjoying a wave of popularity it behooves mining engineers to recognize that the bill might meet with approval of the Ontario legislators. Under the circumstances some mining engineers have endeavored to see that the harm that may be done to industry by the bill is reduced as far as possible. It will be found that these engineers will be not greatly disappointed if the legislators disapprove of it. There are doubtless some engineers who really believe that engineering legislation is necessary and in the best interest of the industry. They are entitled to a fair hearing and we will be pleased to give publicity to their views. We may be mistaken in our view, but while we can see some possible good in such legislation, we are not convinced that there is much of good in it and we believe that there is no great demand for it from those engaged in the mining industry.

SCIENTISTS MEET IN TORONTO.

Toronto, Dec. 27. Some 2,000 men of science have been pouring into Toronto all day from every corner of the continent, from Belgium, from Mexico, and from Honolulu, for the 74th meeting of the association, invited to Toronto by the University and by the Royal Canadian Institute. The American Association, which is an amalgamation of all branches of scientific societies on the continent, represents in organized form the highest scientific achievements of mankind.

The American Association for the Advancement of Science is the central or general organization of a score or more of the great scientific and educational associations of Canada and the United States, and for three-quarters of a century it has assisted in the advancement of mankind along the paths to knowledge and achievement. Through its affiliated units it comprises a membership of nearly 12,000 persons, of whom, it is expected, at least one-fourth will attend the sittings of its seventy-fourth convention.

The feature of to-nights general session was the address of the retiring President, Dr. L. O. Howard. Dr. Howard is Chief of the Bureau of Entomology, United States Department of Agriculture, and one of the foremost entomologists of the day. Speaking of the value of research, Dr. Howard recalled the prophecies of his predecessors, of Sir William Crookes in 1898, and of Nichols, who, speaking at Baltimore in 1908, had said:

"We need not merely research in the universities, but universities for research. . . Beyond lies that future in which it will no longer be a question of supremacy among nations, but of whether the race is to maintain a foothold on the earth."

Had Britain acted upon the advice contained in the Presidential address before the British Association in 1903, Dr. Howard said, she might have found herself in better shape to confront Germany in 1914. Sir Norman Lockyer on that occasion had urged the necessity of wider research work and the establishment of a scientific national council.

Minerals in Patricia.

Among the papers of interest to readers of the Journal was one by E. M. Burwash on the resources of Patricia. Dr. Burwash, who spent last summer in exploring the terrain of Patricia, declared that its geology, resembling closely that of the area around Porcupine and Cobalt, held out promise of rich mineral resources.

Delegates to the convention evinced interest in a description by Dr. W. A. Parks, of the University of Toronto, of the recently-discovered Belly River dinosaur. This specimen, whose name, Dr. Parks said, meant "terrible reptile," was unique; it represented a new species and a new genus, and had been found by a Toronto expedition in the Bad Lands of Alberta. The new genus was characterized by an unusually low-set and massive body, and more particularly by its extraordinary head, the backward-set horn of which was longer than the head itself.

In "A Retrospect," W. G. Miller, Provincial Geologist for Ontario, recalled that it was during the first meetings of the A. A. A. S., over 70 years ago, that the terms "Huronian" and "Laurentian" were first used, and Dr. Miller emphasized the fact that friendly commingling of Canadian and American scientists in the long interval had been an important factor in preserving and promoting friendly relations between the two countries.

Prof. Ellis Thompson, University of Toronto, gave an entertaining account of a method of studying ores. By polishing the ore surface, he said, and examining it under a high-power microscope, the individual minerals it held might be observed at 1,000 times their natural size. Polishing of the specimen allowed its surface to act as a reflector, thus aiding the work of the mineralogist.

Following the close of the opening session, the members of the association were the guests of the University at a reception given in honor of the retiring president and the president in the hall at the rear of Convocation Hall.

No effort has been spared by the local committee to see that every need of the visitors is catered to. Up till a late hour last night nearly five hundred association members had secured quarters in the University residence, those of University College, Knox College, Victoria College, Wycliffe College and the women's residence in Queen's Park being pressed into service. At the University library a post office has been installed, telegraph service has been provided and an information bureau established.

Diamond-Drill Sampling Methods

By ROBERT DAVIS LONGYEAR.

From a paper to be presented at New York Meeting, American Institute of Mining and Metallurgy, February, 1922.

In diamond-drill work, a true sample consists of all the material cut by the bit—both core and cuttings. As the recovery of this sample is the object of diamond drilling, the utmost care should be taken to secure it. Speed of drilling and low costs are of little value if an inaccurate sample is obtained. The engineer in charge must study his material and lay out the plan of sampling, and then see that the drill runner follows his instructions; for the runner may be more interested in obtaining a large footage than in developing accurate methods of sampling.

When the core has been removed from the core barrel, it should be placed in a core box in the exact order in which it is taken from the ground. This box, is usually a shallow tray 4 or 5 ft. long, with partitions running lengthwise between which the core fits snugly. It is so designed that, after the cover is fastened in place, the core will retain its position when the box is moved. As the core from each run is placed in the box, a wooden block, upon which the depth of the hole is written, should be placed after the last piece or core. Each run is thus separated and shows the exact depth at which it was made. If the core is to be used for certain types of inspection, such as foundation testing, a mark on each piece should show which end was uppermost in the hole. This will prevent a piece being placed in the box in the reversed position. Frequent checks of the depth of the hole should be made with a steel tape.

In oil reconnaissance work, where the drill is used to determine the structure by establishing the elevations of certain key horizons, the essential information desired is the exact depth at which certain correlated beds are reached in different drill holes. It is, therefore, especially important to preserve the core in its original position in order to study the various criteria of correlation such as fossils, shale partings, color changes, and contacts. It is often desirable to have the runner keep a separate record of the depth of the harder and softer beds, as indicated by the pressure on the drill feed. This will serve as a check against the record given by the core.

The ideal sample of the material drilled would consist of 100 per cent. core of uniform size, but this ideal is seldom reached. In certain ores, the rich and softer streaks will tend to grind, so an analysis of the core that is left will not give the true grade of the material drilled. In such case, the cuttings or sludge must also be collected and analyzed. The correct grade of the ore is obtained by analyzing both core and sludge separately and combining the results.

In order to obtain a correct sludge sample, all of the water pumped down the rods must be returned, for if any is lost in crevices or in broken and porous rock part of the sample will go with it. To avoid this, the openings in the walls of the hole must be closed by casing, cementing, or other treatment. Care must be taken that the sample is not enriched or impoverished by material caving from the wall of the hole above the bit. If there is any tendency for this to take place, the casing must be kept well down toward the bottom of the hole. There are three methods in common use for collecting the sludge; the one to be adopted depends on the character of the material drilled and the results desired.

Method 1.—When the material shows little tendency toward concentration, the water may be run into a tub and allowed to overflow. Enough cuttings will be retained in the tub to furnish a sample. By this method, however, the sample is usually enriched, for the lighter particles are carried off; this method, therefore, is rarely satisfactory.

Method 2.—The sludge box will give much better results. This box is 12 to 18 in. wide, 6 to 10 in. deep, and 4 to 10 ft. long and contains two or more baffle plates to aid in the settling of the cuttings. The water may run into the box through a tee, or the casing may pass through a properly packed stuffing box or gland in the bottom of the box. Samples may be removed at any time that the rods have to be pulled, but preferably at 5 or 10-ft. intervals. In any case, care should be taken that core and cuttings represent the same interval in the hole. At the end of each interval, the drill is stopped and water pumped through the rods until the hole is clear of all cuttings and the return water clean. After the cuttings have settled in the sludge box, the top water is carefully siphoned or poured off, leaving the residue in the bottom. This is dried and quartered to convenient size for analysis or assaying, a representative sample being permanently preserved. This is the method most commonly used when diamond-drilling iron ore. In most ores, there may be considerable concentration of the heavier minerals, especially if the metallic content is small or if there is a great difference in specific gravity between the ore minerals and waste. The sludge box should be used only with due regard to its limitations.

Method 3.—In the third method, which is the most reliable, the return water is run into three or more barrels through a pipe or launder. When one barrel is filled, the pipe is swung to the next barrel, and so on. After the material in the first barrel has settled sufficiently so that the clear water can be siphoned off, the barrel is again filled. The process is continued until the end of the interval to be sampled. All of the material is then poured into one barrel and allowed to settle further. After all of the clear water has been drained off, the residue is removed, slowly dried over a fire, quartered, and sacked. The number of barrels used depends on the time necessary for the material in suspension to settle. When this method is used, the hole must be in such condition that all of the cuttings are washed to the surface. On one of the large copper deposits in Arizona, this method gave remarkably accurate results even though less than 50 per cent. of the core was recovered. Later test pits and mining operations checked the drill sampling within 0.005 per cent. in carbonate ore and 0.05 per cent. in sulfide ore. A bit recovering a 1 1/8-in. core was used. The choice of sampling methods must depend on the engineer's judgment of the character of the material to be sampled. In case of doubt, it is better to err on the side of accuracy than to risk getting a worthless sample.

It is often desirable to retain a complete core sample to show structure or banding and at the same time have a portion of the core analyzed, especially where the results of exploration are to be submitted to a prospective purchaser. In such cases the core may be split longitudinally by a core splitter; it is then possible to grind up one-half into a pulp for analysis while the other half is preserved in its original state.

Permanent Filing of Samples.

The method adopted for permanently filing samples

depends on the needs of the company doing the drilling. Sludge may be preserved in sacks and the core in the boxes. Some companies find it more convenient to keep the cores in drawers with partitions similar to those in the box; the core is then accessible for future study. In the Lake Superior iron district, nearly all the mining and exploration companies have filed both core and sludge in tin boxes 12 by 1½ by 1 in. with hinged cover. In the ore, the core recovery is small. Half the split core, or often a few representative pieces, are placed in the tin box with a sample of the sludge and the end of the box is properly labeled. A representative sample of the hard rock above the ore is kept also in the tin box. By this method samples can be stored in a relatively small space.

The foregoing is a brief description of a few of the common methods of collecting and preserving diamond-drill samples. Variations of these methods will suggest themselves on every new piece of work. The essential point to bear in mind in all diamond-drill sampling is that the sample must comprise all of the core obtainable and all of the cuttings. This involves the proper operation of the drill as well as the careful collecting of the core and sludge. The engineer must use his own judgment as to the practical methods that will give the desired results under the conditions obtaining.

COAL MINING ON VANCOUVER ISLAND.

After some general comments on the coal mining industry of Vancouver, in which it is stated that the production for 1921 is not likely to be as large as that of the previous year, Wm. M. Brewer, resident mining engineer, makes some interesting observations as to conditions that have obtained and recent developments.

He says: The great importance of the coal mining industry on Vancouver Island can be appreciated when it is considered that between 4,000 and 5,000 employees of the companies mentioned find continuous employment underground and on the surface under normal conditions, the year through. During 1921, the conditions can hardly be considered to have been normal because the demand for coal has been quite irregular, so much so that the Harewood Mine at Nanaimo, of the Western Fuel Corporation of Canada, was closed down from the end of February until July, and the Pacific Coast Coal Company, which employed a total of 286 employees during 1920, has been idle during the year 1921.

The relationship between employer and employee in the Vancouver Island coal fields has been quite harmonious during 1921. In October the Canadian Collieries (Dunsmuir) Limited, renewed the working agreement with their employees for two years from that month. As compared with other industries the world over the conditions of coal mining on Vancouver Island have been quite satisfactory, there has been no unemployment to cause agitation and the balance between supply and demand with regard to labor has been well adjusted.

During the past year the first really serious efforts have been attempted to improve the method of washing coal so as to save a large proportion of the slack coal, which has in the past been wasted. Successful experiments were made by P. E. Peterson, an acknowledged authority on the Oil Flotation method for concentrating metalliferous ores, in an attempt to apply that process to coal. The first experiments were made at the Granby No. 1 Colliery at Cassidy, but later Mr. Peterson became connected with the Western Fuel Corporation of Canada, where he is now engaged in reconstructing the washery plant. In the Annual Report of the Minister of Mines for 1921 the writer expects to be able to publish a full report on the improvements made in the washery plant, together with the results obtained as compared with the old system.

The importation of fuel oil for locomotive and steam vessels has, of course, had a very serious effect on the market for steam coal, the effect has not only been the direct one reducing the demand for coal but the indirect one of sending hundreds of thousands of dollars out of Canada in payment for oil and exchange. In order to endeavor to offset these very undesirable conditions, experts are working to determine the possibility of substituting powdered coal in place of oil. On this subject the writer expects to have considerable information for publication in the Annual Report of the Minister of Mines.

PRESIDENT CORLESS TO HON. MR. KING.

The great importance that the mining industry of Canada possesses is being impressed on the Premier-elect by the members of the mining fraternity, who are anxious to see a vigorous policy of encouragement and extension of the mines of Canada carried out by the new Government.

A number of mining men in Toronto met recently and forwarded to Hon. Mackenzie King a strongly-worded resolution asking for the appointment of an experienced and energetic Minister of Mines. The Canadian Institute of Mining and Metallurgy has now gone on record officially as favoring such an appointment.

The following telegram, signed by C. V. Corless, President, on behalf of the institute, has been sent to Mr. King in Ottawa:

"On behalf of the Canadian Institute of Mining and Metallurgy, I tender you sincere congratulations on your accession to the position of Premier, and express hope and confidence that Canada's greatest industry of the future, namely, mining, will be represented in the Cabinet you are now forming by the broadest minded, most capable and best-informed man to be found, one who clearly realizes that Canada's future greatness in industry rests more on her minerals than on any other natural resource.

"It is a startling and not generally realized fact that 90 per cent. of Canada contains inconceivable wealth in minerals, and that not over 15 per cent. is suitable for profitable agriculture. The ultimate permanent material sources of wealth of any country are its soil and its minerals. We hope that, in the great pressure of public affairs, these vastly important, silent, but incontrovertible facts will receive their proper weight in organizing the new Cabinet."

INCREASED EFFICIENCY IN COAL MINING.

A striking exhibition of greater labor efficiency is afforded in the English coal industry, as attested by an article in the London, Eng., "Economist." Despite the fact that many pits are closed, and that such as are operating are on short time, the average weekly production of coal for the last four weeks has been practically on a par with that of earlier in the year, when the industry was much more active. Although the number of man hours now being worked is barely 50 per cent of the normal, yet the output is only 2 per cent below what has recently been considered normal. The net effect is that the wage cost per ton of coal is barely 15 shillings per ton against 30 shillings in the first quarter of the year.

Underground Loading Devices in Metal Mines

By C. LORIMER COLBORN, (Mining Engineer, U. S. Bureau of Mines).

The diverting of men from industry to combat in the world's war focused the attention of the operators in this country upon mechanical means of doing things. The demand for man-power was so insistent that every available agency for multiplying it had to be employed. It was during the period of the war and immediately thereafter that development of the use of underground loading devices made most rapid progress. In all parts of the United States, mining engineers and mine managers were diligent in their efforts to develop mechanical loaders. The mining engineers of the U. S. Bureau of Mines in every section of the country have secured, with the co-operation of the mine operators, data on the actual performance of the mechanical shovels in their districts, and have made them available to the author of this paper.

The adaptability of a machine to a particular work depends not only upon the construction of the machine but also upon the ability of the operator to make the machine perform. Part of the data herein given may appear to reflect upon the loading device in question when the failure may be actually chargeable to lack of skill on the part of the operator. Likewise, the costs given do not represent a comparison of the machines, because no two mines are alike, and the shoveling costs are extremely variable. Thus, the hand loading costs in Mine A may be 45c. a ton, and a mechanical shovel may handle the same material for 40c. a ton. The conditions in Mine B may be such that hand shoveling can be accomplished for 25c. a ton, and mechanical shoveling for 24c. It would be unfair to state that the loader in Mine B is better than the one in Mine A because its operating cost is less.

Hunt Rotary Shovel.

The Hunt rotary shovel is made up of a cylinder, carrying four digging buckets, and a belt conveyor to take the material from the buckets to a car. The entire machine with the necessary plant and transmission parts is housed in a steel case; none of the working parts are, therefore, exposed to the dirt and moisture of the mine. It is mounted on a truck and will run on the ordinary mine track. The power is furnished by a 15 h.p. motor placed immediately below the belt conveyor. The buckets are arranged so they can swing back inside the cylinder. The operating motion to the buckets is imparted by two cams which force the buckets out of the cylinder at the proper time and retract them inside the cylinder again after the material has been discharged. The revolving cylinder with the digging buckets can be moved either to the right or left by a rack and pinion arrangement on the truck. The machine is so pivoted at the rear end of the conveyor belt that it makes it possible to deliver the material to the car irrespective of the position of the revolving cylinder. The Hunt rotary shovel is a very low, compact machine and apparently is powerful as well.

When in operation, the shovel is controlled by an operator who stands to the right of the machine near the front where he can see the digging operations. In order to shovel from a pile of broken material, the machine is run up to it and the revolving cylinder is pushed into the pile, the bottom of the cylinder almost resting on the floor. As the cylinder revolves, each bucket in its turn takes a load of material and later drops it upon the belt conveyor. Immediately after dumping this load, the bucket swings back into the cylinder. As soon as it has passed the lowest position of the cylinder, the revolving motion imparted to the bucket by the cylinder together with the protruding motion given to it by the cams pushes the bucket into the pile with a motion somewhat like that of an ordinary shovel.

As soon as the material is dumped upon the belt conveyor, it is carried up an incline and discharged into the car at the rear. The edges of the belt conveyor are concealed by a guard strip which gives a trough shape to the conveyor and prevents any of the material from falling off at the sides. By the rack and pinion arrangement described above, the revolving cylinder can be swung either to the right or to the left, which enables the machine to dig within 10 ft. to either side of the centre of the track.

The Hunt rotary shovel has been in operation at the Maryville Iron mines operated by the Steel & Tube Company of America. The management states that the machine has loaded as many as 116 cars of three-ton capacity in 8 hours. No records of the performance of this machine over a long period of time are available.

Myers-Whaley Shoveling Machine.

The Myers-Whaley shoveling machine is composed of three principal parts: the main frame, the swinging jib and the rear conveyor. The main frame is mounted on wheels running on the ordinary mine track. The machine is self-propelling and can be moved forward or backward at the will of the operator. It is driven by a 20 h.p. motor which is mounted on the main frame. The jib section and the rear conveyor are attached to the main frame near the centre of the machine by a king pin and both can be swung to the right or left. The jib section carries an automatic shovel mounted on its forward end. Behind the shovel is an armored belt which receives the material from the shovel and delivers it to a second armored belt mounted upon the rear conveyor section. The jib is pivoted on the king pin and can be swung 45° to either side. The rear conveyor section consists of an armored belt mounted on a frame which is pivoted on the king pin, allowing the rear conveyor to be swung 20° to either side.

The Myers-Whaley machine is manufactured in two sizes: No. 3 and No. 4. Number 4 is the standard size machine and weighs 18,500 lbs. The machine can be arranged for any track gauge. It can be transported on track gauge as narrow as 18-in., but while operating it is necessary to have it supported on at least 42-in. gauge track. With narrower gauges than 42 in., it is necessary to lay extra rails at the place where the machine operates, for unless this extra support is provided, the machine may tilt sufficiently to cause derailment when digging at extreme distances from the centre of the track. The overall length of the machine is 22 to 26 ft., depending upon the length of the rear conveyor, which, of course, is controlled by the length of the mine car. The width is 5 ft. 4½ in., and the height 4 ft. 9 in. In some places the height of the mine car makes it necessary to raise the rear conveyor

which, of course, raises the height of the machine. The wheel base is 42 in., width of shovel 34 in., and size of motor 20 h.p. The shovel on the jib has a reach of 10 ft. to either side of the centre of the track.

The No. 3 machine weighs 13,000 lb., and the track gauge is adaptable just as for the No. 4 machine. Length of machine is 23 ft., width 4 ft. 8 in., height 4 ft. 3 in. The shovel on the jib has a reach of 8 ft., to either side of the centre of the track. The shovel is 33 in. wide. The power is obtained from a 15 h.p. motor.

All the parts of the Myers-Whaley have been standardized. The machine has been designed for strength and the various parts are well protected, and are able to withstand heavy knocks.

The operator is seated on a platform at the right of the jib section well above the work where he can observe the action of the shovel and the belt conveyor on the jib section.

The shovel is automatic, the front part having an orbital movement, down, forward, upward, and back, which clears the material away for the next stroke. In lumpy material, this action of the shovel is augmented by moving the machine bodily forward as the shovel comes down and forward, then moving the machine partly backward in preparation for the next stroke. This bodily reciprocation of the machine is at the will of the operator. The shovel discharges its load upon the front conveyor belt, on the jib, from which it is discharged onto the rear conveyor belt, which in turn carries the load backward and delivers it to the mine car.

The Myers-Whaley shoveling machine was one of the first to be placed on the market. It has, perhaps, been given more general use and has been tried in a greater number of mines than any other machine. It has, to a certain extent, been the pioneer and borne the brunt of the criticism that is usual when new methods are urged for doing things. The experience with it has been varied.

In one mine, the Myers-Whaley has been in use for three years. The management gives the following results: During 1918, more than 30,000 tons of material was shoveled at a cost of 20.07 cents a ton. This cost was divided between repairs, 9 cents a ton, and operating labor and supplies, 11.07 cents. During 1919, nearly 39,000 tons was shoveled at a cost of 19.15 cents a ton, and during 1920, nearly 40,000 tons was shoveled at a cost of 20.69 cents per ton.

In another mine a test was observed by a Bureau of Mines engineer. The machine had one runner, two helpers, and a shoveler in attendance. A locomotive was kept constantly at hand for switching purposes. The machine readily shoveled the four and one-half tons necessary to fill the car in three minutes, after which ten minutes was taken to switch the loaded car about 500 ft. and to replace it with an empty. Over a period of two hours this machine handled cars at the rate of one car for every fifteen minutes, or eighteen tons per hour. A shift's work was about 125 tons.

In another mine, the Myers-Whaley machine was used to handle material in a slope. The machine in this mine was compelled to work on a grade of from five to ten per cent. It worked nicely on a five per cent grade and with difficulty on ten per cent. The face was ten feet high. During the period that observation was made, the machine shoveled 2,653 tons, which was at the rate of twelve tons per hour. The costs were as follows: Shoveling 20.80 cents, drilling 8.71 cents, blasting 15.39 cents, total 44.9 cents per ton. The cost of doing the same work by hand was 58.5 cents per ton.

In October, 1918, a Myers-Whaley machine was put in operation at the Priest Portal of the Hetch-Hetchy Aqueduct, Tuolaume County, California. On January 1, 1920, three machines were being used on this property, and on January 1, 1921, thirteen machines were employed. Eight of the thirteen were kept busy in the headings and five in reserve.

The outside section of tunnel was broken 11 ft. 3 in. by 11 ft. 3 in., making 126.56 cu. ft., or $10\frac{1}{4}$ tons of material for every lineal foot of tunnel. The cost of shoveling $10\frac{1}{4}$ tons was $8.08 or 79 cents per ton.

Cost of handling similar material in the South Fork heading where the entire work was done by hand was $1,278.00 for labor. The distance made was 201 feet. The size of the tunnel was the same as that of the Priest Portal. The cost was, therefore, $6.35 per lineal foot, or 60 cents per ton.

It will be noted that the cost per foot of loading out the broken rock was $1.90 greater in the Priest Portal tunnel where a mechanical loader was used, than in the South Fork where hand labor was used exclusively, but with the loader greater speed was obtained. It took the machine four hours to load the broken rock from each round in the Priest Portal heading against eight hours to do the work by hand. When the loader was working, the material could be cleaned out of the tunnel by the time the upper holes were drilled, and the drillers did not have to wait for the face to be cleaned up as in the case of hand shoveling. With greater speed, the overhead expenses are less per foot.

The Conweigh Digger belt-loader consists of a dipper mounted on the forward end of a dipper arm, a belt conveyor, an electric motor, and various accessory mechanical parts. All these parts are mounted on a truck which runs on the regular mine track. These various parts are so arranged that the dipper after digging into a pile of loose material and receiving a load, slides it upon the belt conveyor which discharges into a car in the rear.

The dipper is hinged to the dipper arm and can be swung 90° in a vertical plane on this hinge. Both the front and top of the dipper are open. The dipper arm is so constructed that it forms a trough through which the material slides from the dipper to the belt conveyor. The movement of the dipper on its hinge and the vertical motion of the dipper arm is controlled by a chain which is attached to the dipper. The discharge of the dipper is accomplished by swinging it upwards and back, so that it discharges through its top instead of swinging it horizontally and discharging through the bottom as in the usual way.

The edges of the belt conveyor are protected by a guard strip and the sides of the conveyor section are built up with wing boards. The power for the entire machine is furnished by a 15 h.p. motor.

The machine is controlled by an operator who stands on a small platform on the right of the machine, near the front, where the digging operations can be observed. The mine car is coupled to the machine in the rear. The dipper arm is lowered so that the bottom of the dipper scrapes along the floor. The machine is then moved forward which crowds the dipper into the pile. As soon as the dipper is full it is raised 90° on its hinge so that the open front of it is now at the top. The dipper arm is then raised, which allows the material to slide out of the dipper down the trough-shaped dipper arm into the pocket which feeds the belt conveyor by which it is carried to the car in the rear.

(To be continued)

Northern Ontario Letter

THE SILVER MINES.

850,000 Ounces Silver Monthly.

The concluding week of 1921 finds the silver mines of the Cobalt district producing silver at the rate of about 850,000 ounces monthly. It also finds quotations for the metal quite steady at a few points below 70 cents an ounce. This condition is expected to prevail until next spring at least, at which time a broadening in the scope of operations is probable by operations on a number of present idle properties.

Although the wage reduction in Cobalt of 15 p.c made last spring was a compromise with those in favor of a greater cut, yet the year has passed without steps being taken to place a further reduction in operation. The date upon which a further reduction is made will probably mark the turning point for the industry, in that an increase in work and output would probably follow such a step.

The Nipissing mine continues to produce silver at an exceedingly heavy rate, and will have a million ounces of the metal to its credit for the last quarter of 1921. The development of important new ore shoots has been responsible for this big increase in production, and the indications appear to be that the greatly strengthened physical conditions of the mine will reflect itself favorably upon achievements during the new year just beginning. The company has declared a dividend of 3 p.c., payable Jan. 20th. This will also be accompanied with a bonus of 3 p.c, the double disbursement amounting to $360,000. The company has a treasury surplus of upwards of four million dollars as of the end of 1921.

January Dividends.

The precious metal mines of Northern Ontario will distribute over a million dollars to their shareholders during the opening month of the new year. The gold mines alone will distribute $684,630.90, a feature being that the distributions are entirely regularly dividends and do not include any bonuses.

The Nipissing Mining Company is the only silver mining concern on the list, and this company will make a regular dividend disbursement of 3 p.c. as well as a bonus of equal amount, the combined disbursements being $360,000.

Following is a summary of the dividend-payers in January, it being noted that the last four are gold mining concerns:—

Nipissing	$360,000.00
Hollinger Consolidated	246,000.00
McIntyre-Porcupine	182,014.15
Wright-Hargreaves	137,500.00
Dome Mines	119,166.75
Total	$1,044,680.90

The Minister of Mines.

At a meeting of the Cobalt branch of the Canadian Institute of Mining and Metallurgy the following telegram was authorized, and was despatched to Hon Mackenzie King, by Arthur A. Cole, Secretary:—

"The Cobalt Branch of the Canadian Institute of Mining and Metallurgy expresses the hope that the Department of Mines will be presided over by a Minister who appreciates the important part the mining industry is destined to play in the general plan of Canada's development."

A meeting of the Cobalt Branch of the Institute was also held in connection with the proposed "Professional Engineers' Act," but no action was taken other than to invite the Secretary, Mr. Mackenzie, together with Mr. McEvoy, to visit Cobalt and explain the purpose of the bill.

Negotiating for Ruby Property.

One of the important producing companies in the Cobalt district is said to be negotiating for the old Ruby property, situated in the Township of Bucke. The property is owned by a company or syndicate comprised largely of business men in Cobalt and Haileybury.

Elk Lake and Gowganda.

Tenders are being called for putting gravel on another two-mile section of the road from Elk Lake to Gowganda. The snow roads are to be used in hauling the material, and this all points toward a still further improved motor road to that district during the coming summer.

Reports at Elk Lake tend to indicate that a power development scheme in the Fort Matachewan district may be successfully financed, and it is intimated that the Matachewan Gold Mines Company may be included in the venture.

Further details in regard to the reported find on the Sanderson claim in the Lost Lake section of the Gowganda district have been received in confirmation of the earlier reports presented in this column of the Journal. The new vein is said to be about four inches in width and is one of the more promising finds made in recent years in that district.

Drilling Results on Rochester.

Perhaps the most important information coming from the Porcupine district in connection with developments on properties outside of the producers, has to do with the diamond drill results on the Rochester property, on which the Nipissing holds an option. Various reports have been in circulation in regard to the results, and one mining paper in Northern Ontario went so far as to state that no commercial values had been encountered during the course of drilling six holes. This information was presented as being definite. However, the Journal has kept in close touch with the situation and is in a position to announce that out of the six holes drilled, only one was a blank, while No 2 and No. 5 each show high gold values across substantial widths. One 5-ft. section in hole No. 2 showed a gold content of $88.00 per ton. Hole No. 5, penetrated 15 feet, which assayed about $13 per ton. This hole was at an angle of 45 degrees and would tend to indicate a width of 7 or 8 feet of good ore. The assay result of the first 100 feet of ore in hole No. 5 was unsatisfactory, owing to the core being broken up, etc., and this led to putting down hole No. 6 to a depth of 100 to confirm first 100 feet of No. 5. At the present time, hole No. 7 is down over 200 feet and is travelling at an angle which should intersect the mineralized zone at a depth of between 500 and 600 feet. A feature of the work is that holes No. 2, 5 and 6 are so placed as to prove the continuity of the mineralized area.

Foley-O'Brien.

The Dome Mines Company is negotiating for the purchase of the Foley-O'Brien mine, and the prospects of a deal being consummated appear to be favorable. The property adjoins the Dome Extension section of the Dome Mines on the northeast and lies just outside of the town of South Porcupine. Its acquisition would give to the Dome the greatest acreage and the greatest

length of possible and probable gold ore deposition of any established gold producer in the Dominion.

Considerable work was done some years ago by the Foley-O'Brien Company, but no ore of any consequence was developed. Nevertheless, the geological structure is favorable and the intruding porphyry rocks occurring on the Dome itself are found to extend across the Dome Extension and into the Foley-O'Brien. This also holds true of the Bewick-Moreing claims lying along the south side of the Foley-O'Brien and is leading to the belief that the Dome may also have in mind the purchase of this part of the Bewick-Moreing holdings, now controlled by the Goldale Mining Company.

Porcupine Paymaster.

The Journal representative made a special visit to the property of the Porcupine Paymaster for the purpose of seeing the quartz porphyry body in which commercial gold values are said to occur. The body is about 98 feet in width and contains evenly distributed iron pyrites with which the gold content is said to be associated. Officials declare the body contains an average of $5.00 per ton in gold. Arrangements have been made to continue the shaft from the 200-ft. level to a depth of 400 feet, and this work is now under way.

Davidson.

Operations have been suspended on the Davidson property owing to difficulty to make arrangements for hydro-electric power. The company has no contract with the power company. Between now and next spring diamond drilling will be carried on from the surface.

Schumacher.

No definite developments are reported this week in connection with the pending deal for the Schumacher mine. It has been learned officially that two offers for control have been made, but none has been accepted up until a few days ago.

Lake Shore.

Excellent results are being met with at the 600-ft. level of the Lake Shore mine where the size and richness of vein No. 2 greatly exceeds even the favorable conditions at the 400-ft. level. During November, production exceeded $54,000, thereby setting the highest record so far in the history of the mine.

Wright-Hargreaves.

The Wright-Hargreaves is now treating an average of over 170 tons of ore daily and is yielding close to $13.00 per ton. It is believed the present mill may in due course be brought up to an average of approximately 200 tons daily.

Tough-Oakes.

In a cross-cut on the Tough-Oakes at a point about 200 feet or so east of the boundary of the Sylvanite mine, two important veins have been encountered. They are believed to lie in the main "break" and the ore is exceptionally rich over a good stoping width. Between the boundary and the fault is an area about 400 feet in length in which the Tough-Oakes has every indication of developing a large volume of high grade ore.

Sylvanite.

The shaft on the Sylvanite is down 200 feet and will be continued to a depth of about 400 feet. Levels will be established at intervals of every 130 feet. The shaft is in the main "break" in which the producing mines of the district get their ore. The Sylvanite has about 1,500 feet in length of this zone.

The Light Railway.

All Kirkland Lake is aroused against the methods being employed by the Northern Light Railway Construction Company in preliminary work on the project. Men are alleged to have been employed, but have gone without pay. Individuals as well as the board of trade have or are lodging complaints with Toronto authorities.

Argonaut Gold.

Prospects of securing money with which to finance the construction of a mill on the Argonaut Gold are promising. The property contains considerable ore of good grade.

British Columbia Letter

Portland Canal District.

Stewart, B. C.—Much more capital is to be invested in the Portland Canal District of British Columbia and there will be developed there more than one Premier Mine. Such is the opinion of Dr. R. E. McKechnie, of Vancouver, B.C., who is interested in a number of properties in the Marmot River section of the northwest coast. Referring to the group of claims in which he is chiefly concerned Dr. McKechnie, who spent a considerable part of last summer on the ground, said that there were many rich but small veins with surface exposures and that the whole region seemed to be mineralized. The point, of course, was to find the main leads, to develop them, and then to interest men able to put up the capital required to make a producing mine. That was the policy he and his associates were pursuing and he had every confidence that the Portland Canal zone would be responsible for just as notable a mining boom as were the Slocan and other boundary sections of the Province some years ago.

The Premier Mine.

The aerial tramway to the Premier Mine has been completed and shortly will be in operation. There still is a little work to be done on the bunkers at the dock. The tramway is eleven and one half miles long, contains 46 miles of cable on which there are 125 buckets with a capacity of 7 cubic feet each. The traveling speed is six miles an hour. Ten tons of ore per hour can be handled over the line. Three telephone lines have been strung along the route, two for operation purposes and the other for the use of the company. Three men will be employed walking over the line continuously and the power necessary will be generated at the mine from which point, of course, the whole installation will be controlled. The bunkers have a capacity of 1,500 tons. The bunker itself is about the centre of a three storey building, 210 feet long by 36 feet in width, and containing some 100,000 feet of lumber. The top floor is taken up by the tram terminal which runs into it a distance of 150 feet. Trap doors have been let into the floor, through which the ore will be dumped from the buckets to the bunker. On this floor ahead of the terminal rails is a large space to be used for incoming freight and in front of this again there are two sleeping rooms and a large office. An incline elevator will be operated by a 10 h.p. Fairbanks Morse Gasolene Engine which also is installed on this floor. The elevator is so constructed as to permit the delivery of freight from the dock to each of the floors

of the building. The second floor is confined to the bunker itself and makes provision also for considerable warehouse space. The first, or ground floor, is devoted to the conveyor belt, on either side of which is space for the storing of 1,000 tons of concentrates. A 20 h.p. Fairbanks Morse Gasolene Engine operates the conveyor belt, which runs the full length of the building from behind the bunkers. The transfer of ore across the dock is provided for by another belt which lifts when not in use. A Delco Plant has been installed for lighting purposes, capable of carrying at least 100 average size lamps. The work has been done by Riblet Brothers, of Spokane, Wn., under the superintendence of L. H. Graham.

Alice Arm.

Alice Arm.—A lower tunnel is being driven on the Esperanza Mine property. Already it is in 110 feet and ore is expected to be encountered at 135 feet. It then is the intention to open up a raise in order to connect with the upper drift. Work is being continued during the winter. The residents of Alice Arm are signing a petition to the Government asking that other companies be permitted to operate the Alice Arm—Dolly Varden railway next year in the event of its being left inactive by the Taylor Engineering Company. The explanation is that lack of transportation this year has seriously handicapped the development work on many properties of the upper Kitsault Valley.

Eastern B. C. Mining Association.

At the organization meeting of the Eastern British Columbia Mining Association, held recently at Nelson, B.C., it was explained that the objects were to protect the industry from ill advised legislation and generally to do anything that will stimulate interest and educate legislators in the problems and needs of the industry. Officers were elected as follows: President, R. Randolph Bruce, Windermere; vice-president, J. P. MacFadden, New Denver; secretary-treasurer, W. H. Burgess, Kaslo. Executive, W. A. Cameron, New Denver; James Anderson, Kaslo; E. G. Montgomery, Kimberley; W. T. McDowell, Ymir; Douglas Lay, Rossland; E. E. Fowler, Riondel; L. H. Biggar, Slocam City, Clarence Cunningham, Alamo; T. W. Bingay, Trail; S. G. Blaylock, Trail; and J. H. Turner, Nelson. Reports were submitted as to the results of the representations made to the Provincial Government with reference to mining taxation and it was considered that the concessions obtained already had justified the existence of the Association. A resolution was carried asking Hon. Lyon Mackenzie King, who will be the next Premier of Canada, to appoint R. E. Beattie, member elect for East Kootenay, Minister of Mines in his Cabinet. It was put on record that Mr. Beattie represents a rich mineral district, that he has been engaged in mining operations, and that he has the confidence of the operators of British Columbia. The intention is that the Association shall meet from time to time in the different mining centres of the Province.

Bullock Mines.

R. H. Graves, managing director of the Bullock Gold Mines Ltd., operating at Poplar in the Lardeau Valley, reports completion of the installation of a Ross gold mill and crusher at the mine. Crushing operations have commenced. The ore of this mine is of a peculiar character. Although containing free gold, it carries an extraordinary assortment of other minerals. A single sample taken from the shaft in sinking revealed, on assay, platinum, gold, copper, silver, lead, cinnabar and galium. An extraction of $30 a ton in gold is looked for from the ore waiting treatment and the question of saving values in other minerals, previous and base, is under investigation by Dr. Ben F. Koerning, of Salt Lake City. On the Bullock a crosscut has been driven south 400 feet to cut the arsenical dyke. At 300 feet depth the face is in ore showing coarse free gold. A vertical shaft sunk thirty feet through white quartz, carrying the variety of minerals enumerated, connects with a thirty foot raise. In all nine distinct veins are being worked and a considerable tonnage of first class ore has been blocked out for stoping.

Lead Market Improved.

Trail, B.C.—Messrs. Grant Hall and D. C. Coleman, vice-president and second vice-president, respectively, of the Canadian Pacific Railway Company, visited Trail recently and inspected the smelter and refineries of the Canadian Consolidated Mining & Smelting Co. Ore receipts at the Trail Smelter of the Canadian Consolidated for the week ending December 7th, totalled 8,707 tons. For the week from the 8th to the 14th the total was 9,080 tons. The latter was the heaviest week's receipts of the year, bringing the aggregate for 1921 up to date to 389,896 tons. Recent independent shippers include the Horn Silver, Similkameen; Knob Hill, Republic, Mohawk, Kaslo; Rosebery-Surprise, New Denver; and the Utica, Kaslo. The Canadian Consolidated Company has issued the following self-explantory notice to custom lead contributors: "When we issued Schedule "D" lead ore rates we expressed the hope that lead marketing conditions would improve so that we could reduce the time of payment. We are pleased to be able to announce that our surplus stock is reducing so satisfactorily that beginning with January 1, 1922, we shall make payments as soon as possible after sampling; in other words, pay spot cash. (In recent weeks payment has been made by 90 day notes). We are therefore amending the settlement clause in Schedule "D" to read as follows: 'Settlement: Payment will be made in full shortly after sampling to such shippers as select the spot settlement basis for lead. An advance payment will be made to those selecting the pooling scheme on the same basis as if they had selected the spot lead quotation, but less 25 per cent of the net value of the lead. In this case there will be an adjustment when the lead value is finally ascertained in the operation of the pool. All ore received in December, after this date, will be paid for in full in 30 days from the date of arrival."

Will Rebuild Concentrator.

Vancouver, B.C.—Tenders have been received for the rebuilding of the concentrator of the Britannia Copper Mines at Britannia Beach. It is expected to cost about $500,000. The reconstruction of the plant in its entirety will run well over a million dollars. Orders for considerable machinery, it is understood, have been placed at Allentown Pa. The rebuilding of the destroyed residential section is to be commenced immediately on a higher site.

BELITTLING CANADIAN EFFORT.

By ALEXANDER GRAY.

New York journals should be more circumspect when they scornfully allude to the mining development in the Canadian northwest in this strain:

"Promoters are endeavoring to solicit sufficient British capital to develop these (Le Pas) mines, instancing the case of Cobalt, where, out of the enormously valuable properties which were developed after the first rush some years ago, 26 were financed by American capital, 2 by English capital, and only 1 by Canadian capital."

Verily "we live to learn." Canadians cannot complain of this strange conceit—so long as the clientelles

of those journals think they did it. An impression has prevailed hereabouts — and it still prevails — that central Cobalt mines really financed themselves. Temiskaming & Hudson's Bay scrambled what loose change there was in a few bush towns. Trethewey got enough out of its initial shipments to clear the trail toward a castle in Merrie England, go yachting in his own pleasure craft- and take an occasional flyer in other mining ventures. Messrs. Leonard and Longwell did not have to enlist outside capital; for the Conigias began at the grass roots to make a noise like millions. La Rose owners brought their properties to a producing stage where New York and Toronto capitalists in combination created La Rose Consolidated. O'Brien ownership was a duet—and now is the personal possession of the Senator whose name it bears. Crown Reserve made an emergency shipment of high grade—and then started on its extraordinary career—but it is admissible that American smelters paid cash for the company's bullion—and did not lose anything in the transactions. Cobalt Lake had Canadian parentage.

Had it been contended by American financial journals that Canadian capitalists of large affairs did not participate in Cobalt until Cobalt had made enough millionaires to take care of itself, there would have been more truth in the recent comment regarding Le Pas requirements.

Kerr Lake was a joint account affair—eventually becoming almost wholly American. Nipissing—greatest of all—is a standard of excellence—for which service E. P. Earle and R. B. Watson are entitled to honorary membership in the Royal Canadian Society. Buffalo certainly did not drain any bank balances when Charles L. Denison bought it. Temiskaming and Beaver were of international origin.

But why dwell upon the self-adulatory over-the-border writers! Marketwise, undoubtedly Americans mopped up a great deal of money. American engineers aided Canadians in acquiring millions—and are continuing their efforts to make those millions reproductive.

THE "NEW TRAIL" AND THE BETTER TRAIL.

Montreal is being surfeited with page advertisements depicting the "New Trail" mining proposition. Shares at a dime a-piece that could not be had for less than 15 cents after a specified date have been offered. All the evidence indicates that the promoters are duplicating the performances of the "Pan Extension" coterie. The public—gullible public—having a short memory, a house-to-house canvass was instituted—and the general inference conveyed is that the "New Trail" is part and parcel of a district that has disclosed the Flin Flon, Mandy, the Elbow Lake prospects and other things with possibilities.

The fact of the matter is: "New Trail" is in the taradiddled class, and is a fairly long hike away from whatever has aroused the interest of mining scientists and capitalists. All the dimes collected—and all the display to which reputable newspapers have lent themselves—may befool subscribers but it will take more than map-making to associate this ten-for-a-dollar venture with the Murray properties, the areas acquired by McCuaig interests, the Flin Flon, or the Mandy. It would be more appropriate and more truthful to have dubbed the "New Trail" the Extension of the Pan Extension, in which the fish hooked are on the bank gasping.

And yet the episode was not unexpected when certain of the Hollinger directorate took an option on the Elbow Lake claims upon which the Murray Brothers made a discovery deserving of the qualified commendation of Commissioner Wallace and the consideration of a Hollinger engineer. Whether the surface indications and gold showings will conform to the law of averages is what those who are investigating them will determine forthwith. If there are enough streaks of fat to make palatable the lean, those Elbow Lake areas will have the working capital needed for their exploration and development. About all that is to be said of them until they are trenched and closely scrutinized is that they look better than Rice and Herb Lake prospects, which have been on exhibition for nearly ten years.

New Trails are laborious at best. When far removed, as these are, they are unadapted to tenderfeet. They cannot be carpeted with 10-cent script, nor made less difficult if the price be raised to 15 cents a share. For this reason the Manitoba areas have been fortunate in attracting discriminating mining capital. Tonapah people made the Mandy, despite its transportation handicaps. Hayden-Stone, W. B. Thompson and the Mining Corporation of Canada dealt with and are dealing with the Flin Flon. Now Hollinger engineers are giving the Murray Elbow Lake ground the third degree, and there is a feeling that the enrichments at outcrop may serve to provide a paying average in a large mineralized zone. Structural irregularities at Elbow Lake, notwithstanding the distribution of gold wherever there is quart, exact the most thorough prospecting.—A. G.

SMALL PLANTS FOR TREATING GOLD ORES.

By F. A. McRAE.

There has been considerable interesting discussion during the past year regarding small individual plants for small gold mines. Various opinions have been expressed and one point generally conceded is that while the larger properties are in a position to instal the big standard equipment, yet there are numerous properties with good gold ore resources but in only limited quantity.

The problem has been to find a plant small enough yet having all the modern appliances, including the use of cyanide. There are various instances where attempts have been made to recover gold by amalgamation and concentration, but the Province of Ontario has yet to record a single success in this method.

On such properties as the Bourke's Gold Mines, the Croesus Gold Mines and the Murray-Mogridge, there are limited quantities of gold ore in sight, but not in sufficient volume to return a profit after covering the heavy expense of installing a mill with big standard equipment. Further development may add to the amount of ore in sight, but the fact is that as such mines now stand they could be operated successfully were they equipped with small milling plants of modern design.

Through Bolton, Hurd & Co., of Philadelphia, I have received some interesting information on the subject of small mills. This firm is interested in mining in the Kirkland Lake field, and like many other mining interests have been searching for a solution of the difficulties of successfully operating the smaller deposits of ore which lie throughout Northern Ontario. Inquiry was made in New Zealand, and, in reply to a letter to the Minister of Mines of that country, the following information was offered:

A New Zealand Cyanide Plant.

I have pleasure in supplying the following information regarding a Cyanide Plant of 10 ton capacity as

used by miners in New Zealand. I have to point out, however, that the detail cost of machinery is very difficult to supply and costs are uncertain as they depend on the supply of second-hand material.

The actual details of the process would depend on the class of ore, but in general the Flow sheet shown could be adapted to most varieties.

The treatment would involve—

Rock breaking to 1½ inches.
Stamping through a 20 or 30 mesh.
Amalgamation of free gold or copper plates.
Concentration on Wilfley table.
Separation of sands and slimes.
Dewatering the slimes.
Percolation treatment of sands.
Precipitation of bullion by zinc.

,The output of the stamps should be about 3tons per stamp, per 24 hours, so that if one shift only is worked, 10 head would be reuired; if two shifts, then 5head would be sufficient.

Should the sands not be amenable to cyanide treatment, two grinding pans would be necessary to fine-grind these sands.

The plant could be obtained for about £4,440 as at the present time there is a good deal of milling plant lying idle.

The plant could be put up at this figure, only by buying the units in the cheapest market and by choosing a battery site that would not require a great deal of preparation.

An alternative plant which would be suitable for a small mine, but would cost a little more in treatment charges, per ton, could be designed and constructed more cheaply. In this case, the ore, after leaving the Wilfrey would be discharged into one of the settling pits. These mixed sands and slimes would then be cyanided in 30 ft. vats.

By getting a thorough mixture of sands and slimes there would, with most classes of ore, be no difficulty in percolation treatment.

The rock breaker might also be omitted and the ore hand-spalled. The cost could be further reduced by leaving out the housing for the cyanide plant. The approximate cost is £2,690.

AEROPLANES AND PROSPECTING.

According to the latest report of the Air Board the aeroplane may assist the prospector in a way that was not contemplated by those who advocated its use in pioneer work, namely in battling the mosquito. The report gives details of reconnaissance work carried out in the mosquito-breeding areas in the Lower Fraser Valley, B.C., with the result that the Entomological Branch of the Department of Agriculture has been enabled to recommend means for the control of the pests, which have been so bad at times as to kill off cattle, impair fruit picking, and even oblige entire lumber camps to close down.

For years there had been a demand for an investigation into the breeding places of this pest, and this was commenced over an area embracing 2,000 square miles, resulting in the discovery that the nuisance had its origin in the low-lying areas of the Fraser River subject at times to flooding of high freshet. These breeding areas were often many thousands acres in extent, and expeditions to locate and define them, which have been carried out by auto, boat and on foot during the last two years, found it impossible to obtain sufficient data over such an extensive territory, and the value of air surveys presented itself.

The result is that, with aerial observations and photographs, combined with the entomologist's skill, the little terrorists of the air will play a minor role in another act of "the survival of the fittest."

Combatting mosquitoes was not the only activity of the Air Board during the summer. Nine departments of the Dominion Government called the service of aerial operations to their aid.

Outstanding among the exploits of the year was the assistance rendered by aeroplanes from the High River Air Station in connection with the great 12 days' forest fire in the Crow's Nest Reserve, Alberta, last August, the demonstration flight of 1,000 miles around Lake Winnipeg, and the operations in connection with reclamation service in the flooded areas of northern Manitoba.

The Air Board's mobile unit in Northern Ontario demonstrated another of the useful purposes served by aircraft in the seaplane flight made for the Mines Department of the Provincial Government to assist in the geological examination of that district. Prof. E. L. Bruce of the Department of Mineralogy, Queen's University, took part in this flight, which enabled him to make valuable observations, adding to previous geological knowledge of the district around Lake St. Joseph. The time and labor which can be saved by the use of the seaplane in a general survey of such areas, making it possible for the geologist to devote more time to examinations of more promising fields, was emphasized by Prof. Bruce in his report.

The photographic reconnaissance of international boundary waters, which included operations on the St. Lawrence River and the canal system between Montreal and Brockville, the Waterton Lakes in southern Alberta, the Welland Canal, and St. Croix River, N.B., were also important parts of the Air Board's activities.

This modern development of national life, whose operations range from the fighting of mosquitoes to the study of great glacial formations, has had a good year in the training of officers and airmen for the further extension of its usefulness.

THE OLD CARIBOO.

A writer quoted in Financial Post says:

"The completion of the Pacific Great Eastern Railway to Quesnel last August, brings railway transportation to within sixty miles of Barkerville and puts an altogether new aspect on the future of our mining. Hitherto, the main draw-back to outside capital has been the excessive cost of freight and its time in transit. Also, it took four days each way by horse stage for passengers, and this meant a good deal to men whose time was valuable. Freight from Vancouver, by way of Ashcroft on the C. P. R. was rarely less than four and often eight weeks on the way. Now it can be delivered in about three days and a traveler can make it in half a day from the railway. This means that more prospective investors will visit us, especially so since the elusive and ever-attractive metal is in more demand than ever. It also means that a number of known deposits—both in gravel and ore — that hitherto cost over $20 to produce an ounce of gold, can be worked at a profit.

"A number of the larger valleys, well within the limits of the zone, are unknown quantities to-day. Paying creeks, in some instances very rich ones, dump into them. Numerous primitive attempts have been made by individuals or groups of miners, but always with the same results—too deep, driven out by water. Modern drilling machines could test these old leads with certainty and accuracy both as to depth and values for either dredging or drifting purposes. The existence of

these unprospected, but ideally situated, channels is one of the reasons why so many mining men are of the opinion that a much larger amount of Cariboo's original gold than has been taken out is still waiting for a chance to hit the sluice rifles and help relieve the present stringency. One such valley, within ten miles of Barkerville, has, dumping into it, four side creeks at intervals of from one to three miles apart which between them, produced within recent years close to a million dollars in dust. They are only small streams and the valley into which they empty is over 1,000 feet wide; yet absolutely nothing is known about this immense body of gravel other than that it carries more or less gold as far as it has been penetrated by shallow holes."

The writer goes on to tell that the large streams contain big possibilities for dredging, and that on the Cottonwood River, not far away, preparations are being made for the installation of a modern California dredge.

VISITING GEOLOGISTS.

Among those who are attending the Toronto meeting of the American Association for the Advancement of Sciences are two college deans who some years ago were employed in Northern Ontario by the Bureau of Mines. They are geologists who follow with interest the development of the north country, in which they did pioneer work some years ago.

Dr. E. S. Moore, who was born at Clarksburg, graduated from the University of Toronto in 1904, taking his M.A. in 1907, and a Ph.D. degree at the University of Chicago in 1909. Dr. Moore was Professor of Geology and Mineralogy at the Pennsylvania State College from 1909 to 1917, and is at present Dean of the School of Mines there, a position which he has held since 1917. Besides teaching, Dr. Moore has had considerable practical work, having been geologist with the Ontario Bureau of Mines from 1904 to 1910; geologist on the Canadian Geological Survey, 1912; on the Sir William McKenzie expedition to Hudson Bay in 1916; for the Texas Oil Co., in Cuba, 1917; on the Pennsylvania State Survey and the United States Geological Survey. He attended the British Association for the Advancement of Science in Australia in 1914.

Dr. Moore is Secretary of Section E (geology and geography) of the American Association for the Advancement of Science.

Dr. Geo. F. Kay was born at Virginia, Ontario, and graduated from the University of Toronto in 1900. He took his M.A. in 1902, and then went to the University of Chicago, where he was a fellow, and was awarded his doctor's degree in 1914. While a student in Toronto he was engaged in work for the Ontario Department of Mines. He was later geologist for the Lake Superior Power Co. Since then he has shown his ability in work for the U. S. Geological Survey and other organizations in the United States, studying, among other things, the coal deposits in the Bering field, Alaska, and in Iowa and Southwest Oregon. Dr. Kay is now Dean of the College of Liberal Arts at the University of Iowa, having been Professor of Geology from 1907 to 1911, and head of the Department of Geology from then until 1917.

LAKE SHORE.

Although the Lake Shore mill operated only 92.36 per cent. of the possible running time, yet the output of gold for November amounted to $54,343.51, thereby exceeding any former record. The mill treated a total of 1,810 tons of ore, the production being at an average rate of $30.02 per ton. Therefore, both in regard to total output for the month as well as the richness of the ore, the Lake Shore established new records.

This achievement was made possible by the development of bonanza ore at the 600-ft. level, where considerable material coming from development work has been found to contain upwards of $100 per ton. A feature of the work is that each ton of high-grade ore taken out during the course of development work is adding to the ore reserves at the rate of several tons, and is resulting in the Lake Shore looming up as a much larger mine than has generally been supposed.

Summary Report of the Mines Branch, 1919.

The Helium Sources of the British Empire, by D. J. McLennan and others.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

Applicants for publications not listed above should mention the precise area concerning which information is desired.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to The Director, Geological Survey, Ottawa.

Ontario's Minerals

PROVINCE OF ONTARIO

DEPARTMENT OF MINES.

HON. H. MILLS, Minister of Mines.

Mineral Areas.

Ontario, with its 407,262 square miles, contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent of the area being underlain by rocks of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Magpie and Moose Mountain mines.

Economic Minerals.

In addition to the above, practically all economic minerals (coal and tin excepted) are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, lead, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt, talc and zinc. This Province has the largest deposits on the continent of talc, feldspar, mica and graphite.

Building materials, such as ornamental marble, limestone, sandstone, granite, trap, sand and gravel, lime, portland cement, brick and tile, meet every demand.

Mineral Production.

Ontario in 1920 produced 36 per cent. of the total mineral output of Canada. Preliminary returns show the output of the mines and metallurgical works of the Province for the year 1920 to be worth $68,456,781, of which the metallic production was $46,228,827.

The following figures show the rapid growth of Ontario's mineral industry by five-year periods since 1891:

Year.	Value.	Year.	Value.
1891	$4,705,672	1906	$22,388,383
1896	5,235,003	1911	41,976,797
1901	11,831,086	1916	65,303,822

Dividends.

Dividends and bonuses paid to the end of 1920 amounted to $18,802,166 for gold mining companies, and $82,403,185 for silver mining companies, or a total of $101,205,351.

Mining Regulations.

A miner's license costs $5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 200 days' assessment work on a claim, patent may be obtained from the Crown on payment of $2.50 or $3.00 per acre, depending on location in unsurveyed or surveyed territory.

Assay Office.

The Provincial Assay Office at No. 5 Queen's Park, Toronto, is maintained by the Department of Mines for the free identification of minerals, free assays under the provisions of the Mining Act of Ontario, and also for general assay work as per the Schedule of Charges which may be obtained on application.

Publications.

Our Fuel Problem. A Subject For Study

For his first official activity as President of the Canadian Institute of Mining and Metallurgy, Mr. Corless has chosen to draw the attention of the members to the inter-related problems of coal supply, railway deficits under Government direction and the discount on the Canadian dollar; and has invited discussion in the columns of the "Bulletin."

The President could not have asked those who are happy in serving the Institute under his direction to join in a more difficult task, nor a more necessary one. If the Institute is really representative of the mining profession of Canada, as its guests at annual dinners—without noticeable demur from the members—have so often announced it to be; then the President has every right to expect some constructive action to follow from his definite assignment of a difficult duty to the body that by composition and repute is best fitted to discharge it. The President is entitled to receive the loyal support of every member of the Institute. As a body it has not made any worth-while contribution to the solution of the fuel problem. The task may be an impossible one, but it is heartening to see it tackled by the Institute's head, and the membership should not let Mr. Corless down, or disappoint him by silence.

Since the President's letter was written a parliamentary committee has looked into some phases of the fuel-supply question, and has discovered that its solution is beyond the ability of men who are not specialists, that the questions at issue are too many, and of too great difficulty to be reviewed in a few weeks, and as an addition to parliamentary duties.

All that could be asked of a parliamentary committee charged with such a herculean task as full enquiry into "all matters pertaining to the future fuel supply of Canada," was a suggestion as to how the matter might be exhaustively and maturely studied. The Fuel Committee, in its tabled report, suggests a good many things that ought to be done, but is unable to suggest how they should be accomplished, except through the appointment of a Government officer "to keep in close touch with the fuel situation in Canada, and with sufficient power to cope with any emergency which may arise in order that the Canadian people suffer no inconvenience through fuel shortage."

We regard the suggestion as entirely unsatisfying. The man who could, alone and by himself, and unfortified with the advice and backing of the fuel and transportation specialists in active practice in Canada, make any real progress towards solution of our fuel problem does not exist. The brightest intellect and the strongest personality in our country would fail, were he to attempt such a task.

Our fuel problem is not connected with a shortage of fuel in North America. It arises out of a shortage of fuel in Canada. We need enlargement of production in Canada, and ascertainment of the extent to which state aid is required to help the production and distribution of fuel from home sources. The economics of the problem are desperately complicated by national considerations. No fuel officer could undertake to decide personally what should be Canada's national fuel policy, unless he were seeking trouble for himself and others. "The future fuel supply of Canada" the Fuel Committee states, "is a great national problem, and as such requires national action for its solution." This sentence has become trite through much previous restatement, but it is none the less true. National action is only possible after determination of a national policy, and such a policy can not be outlined until many men have taken much thought together. How can the initial efforts of the Fuel Committee be referred to such combined thought?

The "Journal," in this issue, contains a suggestion, made by the Editor in response to Mr. Corless's invitation, which is published in the June Bulletin of the Institute and was written long before the Fuel Committee had reported. It attempts to indicate how a national fuel policy might be worked out, and emphasises the necessity for studying the problem before embarking upon legislative action.

Criticisms of this suggestion, and other letters in response to the President's invitation are asked for in forthcoming issues of the "Bulletin." If by tearing the suggestion to pieces, and exposing its weaknesses, the elucidation of the national fuel problem is assisted,

the Editor's object will be achieved. The Fuel Committee's report, with Mr. Corless's letter and the suggestion referred to afford sufficient points of attack for the least combative of the Institute's members. If the Institute desires to please Mr. Corless the members should do as he has asked them to.

MANITOBA SALE OF SHARES ACT THREATENED WITH ABROGATION.

Writing in "Saturday Night," of Toronto, Mr. F. C. Pickwell confirms an intimation in a letter from Dr. R. C. Wallace, the Commissioner for Northern Manitoba, in our issue of May 13th, that the existence of the Utilities Commission of Manitoba, and with it the administration of the Sale of the Shares Act is threatened with abolition. The forces that are combining to cancel laws of admitted necessity and excellence are stated by "Saturday Night's" contributor to be subversive of good government and commercial probity. One of our most valued Manitoba correspondents states his utter inability to sufficiently express his disgust of those parties in Winnipeg who are endeavoring to break down wise laws that it has been the work of good men, over many years, to put upon the statute books of Manitoba. The article previously referred to states that the movement to abolish the Utilities Commission "having at least partially succeeded, it is safe to assume that the Sale of Shares Act will be next in order . . . to eliminate the present barriers against the itinerant promoter and his get-rich-quick schemes."

It is sincerely to be hoped, for the good name of Manitoba, and for the protection of its nascent mining industry against frustration of growth and indefinite deferment of its development, that the wishes of the reputable members of the mining profession in Manitoba will be listened to before any such suicidal action is permitted. As this journal has previously stated, Manitoba started out well in mining matters. The judicious and public-spirited character of the administration of the mining laws has elicited the admiration of competent judges in the other provinces. Manitoba's mining possibilities have become widely and favorably known. Capital has been attracted, and real progress has been made, and when the Attorney-General of Manitoba at the Winnipeg meeting of the Canadian Institute of Mining and Metallurgy said he regarded the choice of Winnipeg as a meeting place for the Institute as recognition by mining men of Manitoba's great possibilities and as appreciation of the wisdom of its mining administration, he summed up the general opinion of Canadian mining men at that time. It is for Manitoba alone to say whether that fair name shall be perpetuated, or whether a dishonest and seditious minority shall be permitted to undo a good work, well done, the real benefits of which Manitoba is only just beginning to experience.

The Canadian Mining Journal is of course unable to comment on the political complexities that have made an attack on the Sale of Shares Act possible, but it can and will maintain that the act is a good one, a very necessary one, and one that should be enforced to the limit of its powers in protection of the mining industry against those whose chief desire is to achieve fraudulent gains.

THE FLIN FLON PROPERTY.

The recently issued annual report of the Mining Corporation of Canada contained the definite information that this enterprising company now possesses by purchase a majority interest in the Flin Flon property. The extent and worth of the Flin Flon ore-body is familiar to the readers of the "Journal," and Mr. J. P. Watson's remark to the effect that this Manitoba property is viewed by the directorate as "an important acquisition" is conservatively expressed. It is well that so important an ore-body, in a young district of much promise and potential importance should have been acquired by a Canadian company having substantial financial connections with British interests overseas. The range of mining properties which the Mining Corporation has examined during the past year is geographically very wide, including Latin America and Asia as well as Canada, and in view of the small number of properties which the Corporation has definitely interested itself in, in comparison with the very large number examined, its selection of the Flin Flon property is of good augury. The definite announcement to the shareholders will give pleasure to all genuinely interested in the development of Canadian mines by Canadians. We trust that substantial reward for its enterprise will come to the Mining Corporation.

BRITISH COAL STRIKE

One of the leaders of the striking British miners, representing the Derbyshire men, has had the courage to tell the miners that they are dead beaten on the question of their demand for a national wage-pool. Now the miners have been given a chance to vote on the owners' wage proposals, without reference to the vague generalities of the pool proposal, a likelihood of settlement is in sight. It looks as though the present strike would last about three months from its inception, as did the great strike of 1893, after which there was peace in coal-mining in Britain for nineteen years. When Mr. Lloyd George says the public want a permanent settlement, he expressed a general desire that is largely based on the experience of the summer strike of 1893. The miners are so far to be congratulated on their abstention from violence, which was a feature of the 1893 troubles, for which the miners as a class were not responsible. Much the same may be said of the Cowdenbeath riots that marked the opening of the present strike.

ASBESTOS MANUFACTURE IN CANADA.

A recent comment in this column called attention to the desirability of Canadian asbestos companies undertaking manufacture of asbestos into finished articles at or near the asbestos mines in Canada, and the announcement from the Canadian Johns-Manville Company that it is about to erect a manufacturing plant at Asbestos, Quebec, is a sign of the times that will be very generally welcomed. It is especially of hopeful augury that such a large and important user of asbestos as the Canadian Johns-Manville Company, itself a large owner and miner of asbestos in Quebec, should have shown its initiative and faith in Canada at this particular juncture. As a persistent advertiser, with a very pleasing sense of the value of colour and artistic design in its advertisements, the Johns-Manville Company has done a great deal to popularise the use of asbestos, and other fireproof building materials of Canadian origin, throughout North America, and we are glad to note that the first large-scale asbestos-fabrication establishment in Canada is to be owned and directed by competent and responsible people.

SUBMARINE COAL MINING OFF SYDNEY HARBOUR, N.S.

This issue of the "Journal" contains a paper read before the Mining Society of Nova Scotia by Mr. Alex. S. McNeill, reprinted from the "Bulletin," which sketches the history of undersea coal-mining in the Princess Mine from its beginnings and details some of the difficulties under which coal extraction has proceeded in this mine during recent years. The paper, being a plain record of practical experiences, belongs to that category which most enriches the transactions of mining societies, but which it is most difficult to induce practical men to add to. The absence of such contemporary records have caused regrettable gaps in mining literature, and one of the chief objects of mining societies should be to encourage contribution by the members of just such papers as Mr. McNeill's, particularly in regard to matters where the literature is meagre, as is the case in regard to undersea coal-mining.

The difficult working conditions experienced in the Princess Mine, apparently chiefly associated with the heaving bottom, are fortunately, not to be regarded as typical of those that may be expected in the as yet unworked undersea coal-areas of the Sydney field. Some of the difficulties experienced in the remoter workings of this pioneer undersea colliery arose out of lease inhibitions. It was of course unthinkable that the sufficiently difficult extraction of coal at a point approaching three miles under the sea should be rendered still more difficult by configurations of lease boundaries. Natural difficulties were sufficient without the unnecessary imposition of artificial and man-made restrictions, and recognition of this, combined with pressure from the Nova Scotia Government acting as landlords and trustees of the coal-areas for the people of the Province, has led to unification of areas. Attention will now be concentrated on the extraction of coal, which is not a bad idea in coal-mining. Careful perusal of Mr. McNeill's paper will indicate that methods of coal extraction in the undersea coalfields of Cape Breton Island are entering upon a phase that will call for the best professional advice available, for some recasting of methods, and much hard work. It is therefore good to know, in the best interests of the Province, that so far as removal of irksome and quite indefensible lease boundaries, and unification of direction, may prove to be helpful, they have already taken place.

OIL SHALES IN THE MARITIME PROVINCES

We are pleased to include in this issue a letter from Mr. Harold C. E. Spence, of New Glasgow, emphasizing the value of the oil-shales of Nova Scotia and desire to say that this journal does not regard the oil-shales as of "entirely secondary importance," but as "secondary to the availability of flowing petroleum and bituminous coal." There is no doubt about the richness of the oil-shales of Pictou County, particularly the Stellar "oil-coal" seam from which the town of Stellarton was named. There is also no doubt that the possibility of economic competition of oil, distilled from shales, against bituminous coal (used "raw") is greater than at any previous time. The success of an oil-shale distillation industry in the Maritime Provinces would hardly be based upon competition with bituminous coal on the ground, but would turn on to the ability of the oil and distillation by-products to stand the cost of transport to outside markets.

It is understood that large sums of money have been spent in research work on Nova Scotia oil-shales, and that capital is available to undertake large-scale production should markets appear favourable. There is no presently visible reason why the cost of petroleum and its products should materially decrease in Nova Scotia, and (apart from post-war readjustments to fit commodity indexes) there is little reason to expect reduction in the cost of coal production in Nova Scotia. The time is therefore approaching when oil shales may be profitably distilled.

CANADIAN JOHNS-MANVILLE CO. TO MANUFACTURE ASBESTOS PRODUCTS IN QUEBEC.

The Canadian Johns-Manville Co., Ltd., with sales offices at Montreal, Toronto, Winnipeg and Vancouver —which for some years has been operating one of the largest asbestos properties in the world, located at Asbestos, P.Q., has placed contracts for a large manufacturing plant to be located at Asbestos, P.Q., where they will manufacture all classes of asbestos products formerly imported from the United States. These products include asbestos paper, asbestos roofings, asbestos shingles, packings, pipe coverings, asbestos textiles, brake band lining, etc.

Notes on Mining Coal in Submarine Areas at Princess Colliery, Sydney Mines

By Alexander S. McNeil. *

Annual Meeting of the Mining Society of Nova Scotia, Halifax, April, 1921.

IT IS proposed here to present some of the important features connected with the mining of undersea coal from the famous main seam in Princess colliery at Sydney Mines with a view of inviting discussion that may be beneficial and helpful to all concerned.

Perhaps it is not out of place at the moment to say something of the history of mining in this locality; for although it is well known to many, yet there are some to whom it is not so familiar. The story of the General Mining Association's activities at Sydney Mines from inception to the moment of transfer to the Scotia people is interesting, and it is permissible that it should be briefly rehearsed for the benefit of those who are not familiar with the facts.

In the year 1825, Messrs. Rundell, Bridge and Rundell, of London, organized a company called the General Mining Assoeiation, Ltd., which acquired coal seams known and unknown in the whole Province of Nova Scotia from the Duke of York, the latter holding a lease for sixty years by the royal prerogative of George the Fourth. In 1826, the above lease was executed, and Mr. Richard Brown, an eminent mining engineer and geologist came to Cape Breton as manager for the General Mining Association. In 1827, the General Mining Assoeiation, Ltd., took formal possession of the property granted to the Duke of York, and from this time forward coal mining has been carried on uninterruptedly at Sydney Mines.

The first shaft was sunk in 1830 at what is known as the Yard Pit. It was 200 ft. deep. The second shaft, known as the Jacob Pit was sunk in 1834, and was 320 ft. deep.

In 1838, the coal from what was then, and is now, known as the "Old Sydney Main Seam" was for the first time used for bunkering purposes, and its good name was fully established and universally acknowledged both at home and abroad.

In 1849, the Crown released to the Government of Nova Scotia all its interests in the minerals of the Province.

In 1854, the third shaft, known as Queen Pit, was sunk on the Old Sydney Main Seam. This shaft is about 400 ft. deep.

In 1857, the General Mining Association surrendered their claim to all mines and minerals except coal within certain defined limits, thus ending the Duke of York's lease.

In 1864, Mr. Richard Brown retired and was succeeded by his son, Richard H. Brown, lately deceased. Mr. Brown, a worthy successor, continued to manage the affairs of the General Mining Association and their successors, the Nova Scotia Steel and Coal Company, Ltd., at Sydney Mines, up to the year 1901.

In 1868, the sinking of the "New Winning" or "Prineess" was begun. This pit is also on the Old Sydney Main Seam, and was not completed until 1876. The coal was encountered at a depth of 680 ft. The sinking of this shaft, with its attendant difficulties, formed the subject of an interesting paper which was presented before this Society some years ago by the late R. H. Brown.

It is to be noted here that all the above mentioned operations by the General Mining Association were confined to what may be deseribed as the peninsula between Big Pond on the north and Sydney Harbor on the south; a comparatively limited area.

The Princess pit was located as near the coast line at Cranberry Head as possible, for all the land area overlying the main seam in this district was included in the workings allotted to the previous sinkings.

The New Winning or Princess was to be the outlet for the submarine lease of four square miles taken out by the General Mining Assoeiation in 1858, extending one mile southerly into Sydney Harbor from Chapel Point and two miles direetly out to sea, in a north easterly direction, and having an outside boundary parallel to, and two miles from, the coast line. In 1886 this submarine lease was further extended, parallel to the coast line in a north westerly direction, making a total outside boundary of 3 miles in length and coming ashore at Little Pond—making in all about 4 square miles of submarine territory. The underground projection for the new mine included two main haulage ways or angle deeps, one on the north and the other on the south, evidently at a minimum angle of dip to ensure the operation of a plain rope haulage. Later, at a point 2,000 ft. from the pit bottom on the south angle deep, another deep was begun on or about the pitch, to win the coal at the lower levels, as the distance between the angle deeps was increasing rapidly and the haul on the "in between" level was becoming too great.

The underground operations of the Nova Scotia Steel and Coal Company, from the time of their taking over the holdings in Sydney Mines in 1901, followed along the lines adopted by the General Mining Association until about the year 1910, when all deep workings were practically up against the east boundary of the property and it became necessary to acquire additional territory ahead for this colliery. In 1912 a sublease was granted the Nova Scotia Steel and Coal Company, from the Dominion Coal Company's adjoining holdings. This sublease contains 2 sq. miles and is one mile in width. It extends eastwardly 2 miles, where it in turn is bounded by outside leases held by the Nova Scotia Steel and Coal Company. On the acquisition of this sublease, a new haulage way was projected from the shaft through the old workings into the outside territory in a direction best suited to take the coal from the sublease, and at the same time enter their own outer holdings at a desirable point. This new haulage way was completed to the barrier in 1915. It is 6 ft. x 10 ft. inside the timbering and perfectly straight to the face, which is today 12,000 feet from the pit bottom.

It is intended by the foregoing to indicate the extent of operations by the General Mining Association in the

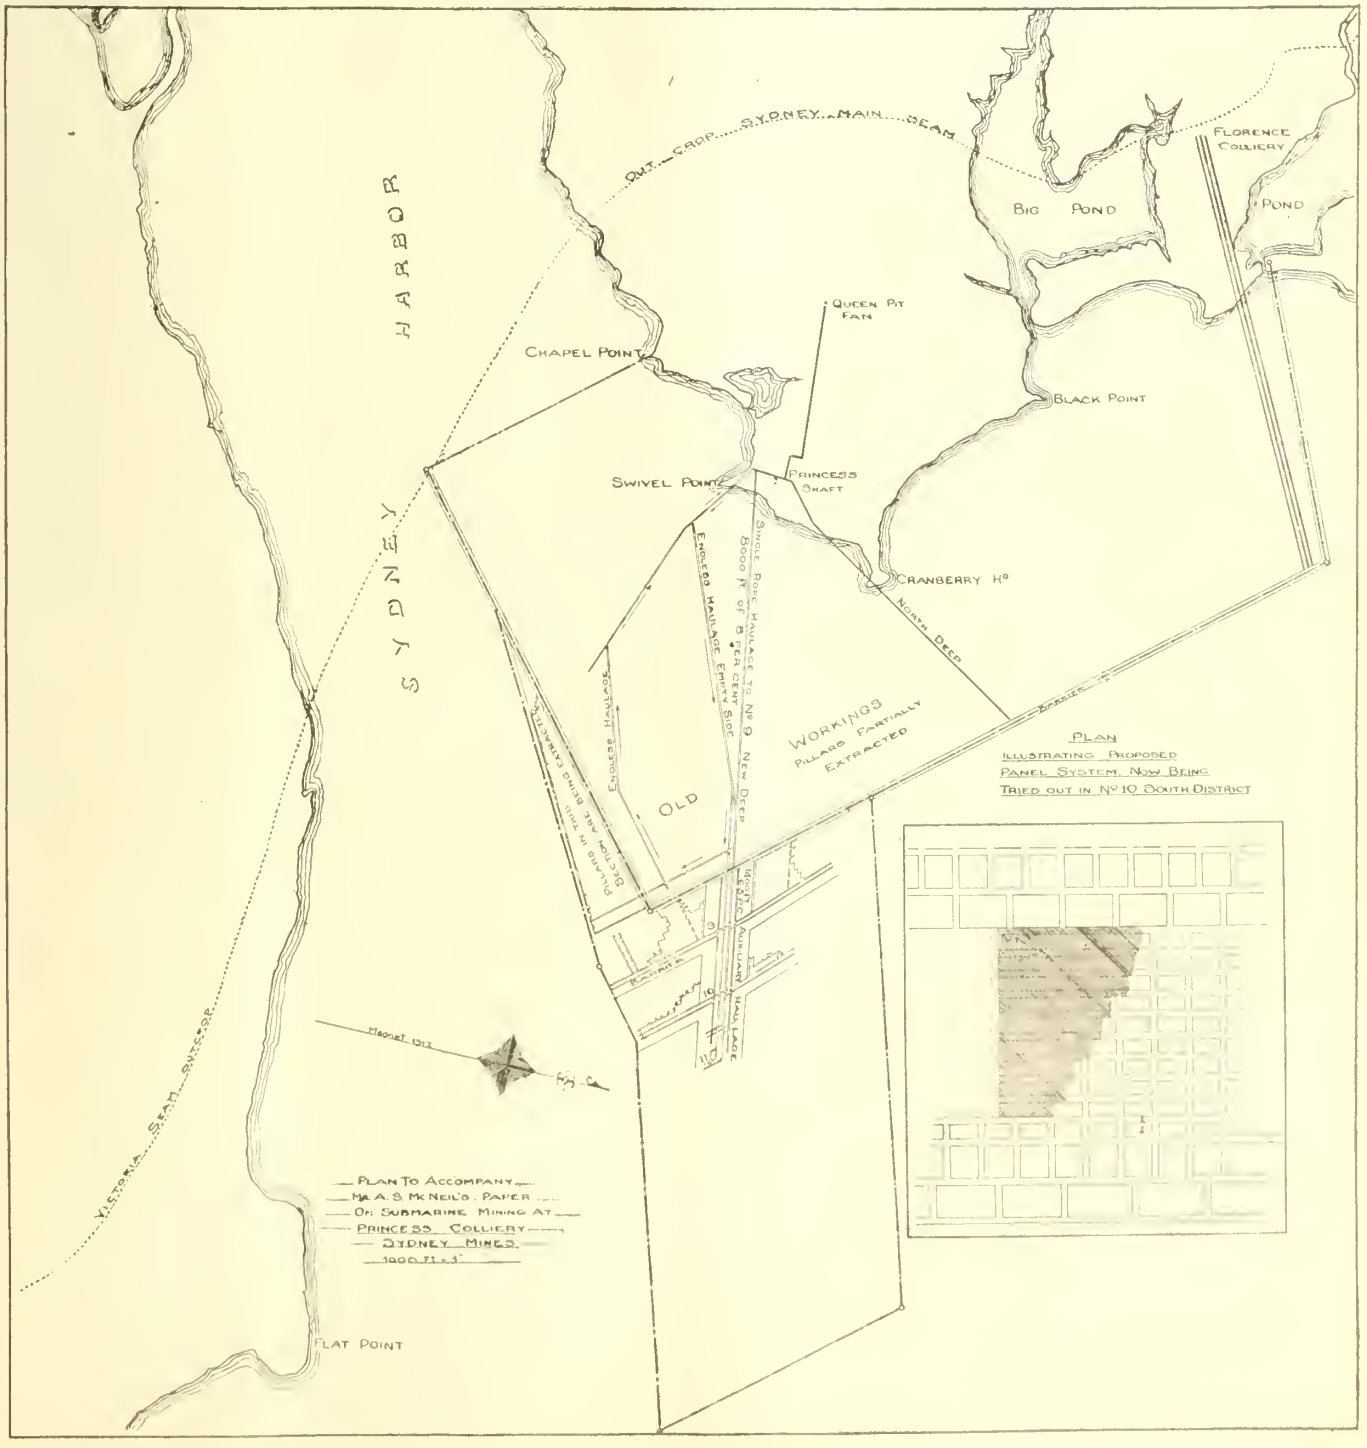
*Superintendent of Mines, Nova Scotia Steel and Coal Company.

famous Sydney Main Seam in the original holdings on land and under the old submarine lease. Future operations, therefore, will be confined to coal lying not nearer than 2 miles from the shore. With the increasing distance, new difficulties arise to tax the ingenuity of those responsible for the colliery's life, not to speak of cost of production.

Under the land, the method adopted by the General Mining Association was room and pillar. Rooms were about 18 feet wide, pillars 30 feet. This proportion of room to pillar did not vary to any great extent.

In the new pit, the workings were laid out with 40 ft. pillars and 16 ft. rooms. This proportion was held for a distance of 2,000 ft. from the pit bottom. The cover at this point was about 760 ft. It appears that the increased size of pillars from 30 to 40 ft. was intended to take care of the additional weight due to increase in cover, but evidently no difficulty of any kind was experienced and eventually the policy reverted to 30 ft. pillars and 16 ft. rooms, which proportion was maintained for another 700 ft. to the dip. At this point the pillar size suddenly jumps to 60 ft. with room 16 ft. as before. Probably indications of the bottom coming up and the other troubles developing were attributed to the smaller pillar in this section. This change from 30 ft. pillars to 60 ft. pillars occurred at a point about 2,700 ft. from the pit bottom, with a cover of about 830 ft. From this point to the outside boundary or to a point about 7,000 ft. from the shaft, 60 ft. pillars and 18 ft. rooms were maintained.

Long previous to this time, pillar extraction was commenced by the General Mining Association, at about the



Plan of Princess Mine, Sydney Mines, N.S., showing Submarine Workings. The charted line indicates lease boundaries, not now necessary to be adhered to. (Plan much reduced from original.)

800 ft. cover line, and a considerable section of the south side was left in bad condition, owing to pillars having been drawn too near their haulage and travelling roads. The effect of this is still evident, and at many places on the working deeps men are constantly employed retimbering and taking up bottom. Evidences of "Crush" are visible in many localities on the new main haulageway through the old workings, and the consequent necessary upkeep of roads is a large item in cost.

The new development from the old Barrier into outside territory is carried on by four deeps, driving in line with the new main haulage way, which is approximately on the pitch. These deeps are 10 ft. wide inside the timbering. Pillars 100 ft. thick are left between each deep; cross cuts in deep pillars are spaced every 100 ft. A barrier pillar 300 ft. thick is left on each side of these deeps. Levels are broken off north and south every 1,400 ft. All pillars in working districts are 70 ft., and rooms are 18 ft. A barrier pillar 200 ft. thick is also left on the low side of the low levels.

The south side of old workings was also extended into a sub-lease of about one-sixth of one square mile, triangular in shape, or about 900 ft. wide on the east to nothing at a point about 4,000 ft. west of this on the south barrier. Rooms had reached the limit in this section in 1919, and pillar extraction had begun, retreating towards the old workings.

Experience in pillar drawing in this district proves conclusively that, under such conditions as obtain in Princess with a cover of 1,000 ft. or over and a roof of the nature found so far, some method must be adopted whereby pillars can be removed simultaneously with the advance of the workings, or, in other words, a panel system, similar to that in some of the large English collieries, must be put into operation.

It is quite possible that a longwall system could be adopted that would give good results, and this may be tried later on. There are, however, in the writer's opinion, seeming objections to longwall, among which may be mentioned a lack of available stowing material and the existing nature of the roof.

It might be mentioned in passing that practically all the area covered by a certain district in this mine one year ago, where cover is about 1,100 ft., is down completely today. To recover pillars will cost as much now as it would to recover them in much older workings. In view of the above the question of timbering might be raised here. It is sufficient to say that one stick of timber was used for a ton of coal, as against one stick for three tons at Florence colliery in the same seam and distant only 2 miles north, where the cover is 700 ft.

It is not intended to infer that the difference in cover referred to is altogether responsible for the difference in conditions at these mines. Undoubtedly the roof in Princess colliery is, on the whole, not so good as at the Florence.

The experiment is now under way in No. 10 district south, to take the pillars almost simultaneously with the advance of the rooms, by the following method. The lift is to be split in two; that is, another pair of levels, 600 ft. to the rise of No. 10, will be driven. Headways are carried up every 200 ft., rooms to be 16 ft. and pillars 30 ft. When top rooms are in 200 ft. both ways, pillar extraction begins and comes along behind the rooms. The inside head is, of course, always a straight line of cross cuts, and when the pillars are extracted up to the working headway, the track is shifted in, and so on. The necessary pillars to support this level will of course be left. If this method can be successfully carried out, the result will be a great saving in datal labor, with a maximum tonnage from the involved area.

The words "successfully carried out" are used advisedly, for it is difficult to foresee how any method of working in the deep sections of this colliery is going to affect the bottom and roof, particularly the bottom. The writer believes that a 70 ft. pillar and an 18 ft. room is the greatest proportion adopted in Cape Breton. Notwithstanding this, the bottom (which is fireclay weathering to a semi-plastic state) squeezes up, seemingly with almost any proportion of pillar to room, where cover is 1,000 ft. or over. To take this heaving bottom up accelerates its movement, and there are places filled by this upheaval from bottom to top. On the whole it is best not to touch it, but to gain any required height by brushing the roof.

At present the coal is hauled from the new deep by plain rope, operating a trip of 40 boxes to a point about 9,400 ft. from the pit bottom. The coal from the lower levels is brought to this point, a further distance of 3,000 ft., by an auxiliary plain rope air driven haulage.

It is interesting to note here that a plain rope haulage is capable of operating over a distance of 9,400 ft. under the conditions obtaining, namely, 8,000 ft. of 8 per cent grade and 1,400 ft. of 6·5 per cent, the road being straight. The writer thinks that this distance may serve as an example of the "ultimate" that may be accomplished by this system of haulage for similar conditions, and, from this, possible conclusions may be drawn by any who contemplate plain rope on haulage ways having a similar pitch. In other words, the best that could be done with a plain rope haulage in this case was to get 40 empty pit tubs, weighing 1,000 pounds each, to drag a one-inch rope a distance of 9,400 ft.; the first 8,000 ft. was falling 8 ft. per 100, and the last 1,400 ft. falling 6.5 ft. per 100. In order to accomplish this, special care was exercised in having rollers, as wide as the road permitted, spaced every 50 ft. and constantly watched in order that they functioned properly at all times. A satisfactory performance for a long haul with plain rope haulage means, primarily, to keep the rope from dragging.

The coal from the pillar sections is taken up on an Endless Haulage System operating on the old south deeps and forming a loop about $3\frac{3}{4}$ miles in length.

It is proposed to handle the coal from the new deep districts by endless haulage on the new road from face to pit bottom, a distance of 12,000 ft. The haulage engine will be motor driven and installed in the pit at the head of the deep and in line with the road.

The ventilation problem at Princess is an interesting one. The deep workings are almost $2\frac{3}{4}$ miles from the down-cast shaft; the fan is 3,600 ft. further to the rise from the down-cast. Two intakes and two returns are available at present with a total cross-sectional area of about 100 sq. ft. each way. The loss in air due to short circuiting is heavy, and the present workings have reached a point where a change in system of ventilation becomes necessary. Much of this loss in short circuiting cannot be overcome, owing to the fact that 8,000 ft. of the air-ways pass through the old workings which are in a fallen state, and in process of crushing at various points. The old stoppings of brick and stone plastered with mortar follow down from pit bottom to barrier intact as far as the stoppings themselves go, but innumerable falls have occurred inside and outside, making it difficult if not almost impossible to prevent leakage of air through shattered roof. In many places, it is impossible to find the stoppings as they are blinded by falling material, to-

OBITUARIES

(Concluded from page 460.)

gether with clay stowed from bottom digging. An examination of these blinded cross cuts and room ends, in which stoppings are built, does not reveal any perceptible short circuiting of air; nevertheless there can be no question but that a loss is occurring in many such places. In the face of such a situation it is an interesting problem, considering the cost involved, to know just how far to go in order to remedy the difficulty.

In a paper written by Mr. Tonge and read before the Manchester Geological and Mining Society in 1906, he speaks of a case where 105,000 cu. ft. of air per minute delivered at the fan resulted in only 73,000 cu. ft. per minute reaching the working districts, a loss of 31 per cent; 9,800 cu. ft. per minute were accounted for as being unavoidably lost at certain doors, but the balance of the loss, 23,000 cu. ft., could not be found although diligently hunted for, as he puts it. He does not state the water gauge under which the above loss was made, but does say that assuming a 20 per cent air loss with 1 in. water gauge, a loss of 44 per cent would occur with a 5 in. water gauge. It looks as though the loss that would be unavoidable in Princess colliery, due to the abnormally high water gauge required to give the necessary air, will necessitate an attempt to ventilate this colliery by means of underground booster fans in series, in addition to a surface installation. With workings situated as far from the air-shafts as at Princess, and having a limited cross-section of intake, and return air-ways, there seems to be no other remedy in order that the required volume may be obtained at a pressure sufficiently low to ensure against abnormal leakage, and other consequent difficulties that would arise. The nature of such an installation will be more or less new to Cape Breton mines, but this method is resorted to in other places, as at Hulton Collieries, England, where three underground units, working in series through one down-cast and one up-cast shaft, supply air to three mines.

The pumping problem at Princess colliery is comparatively simple. The old workings to the dip of the shaft are practically dry, and what little water is made from the pit to the face is handled by six small pumps, lifting about 50 gallons per minute, from one to the other, and discharging into the sump at the bottom. At this point a Jeansville pump with a capacity of 500 gallons per minute is located.

This pump was installed in 1902, taking the place of the original Cornish pumping plant erected when the shaft was sunk. It discharges about 300,000 gallons during a 14 hour shift, this being the rise water let into the lodgment through the barrier from the old Queen pit workings, together with the small quantity mentioned before as coming from below.

A new duplicate motor driven installation is now under consideration to take the place of the "Jeansville", as the cost of maintenance on this old pump is becoming too heavy.

In conclusion, the author feels that, while much has been written here which undoubtedly is reiterating ordinary mining practice, as we know it under general conditions in Cape Breton for the past decade, yet a description of operations at Princess colliery from the beginning up to the present was permissible, inasmuch as this mine has been a pioneer in submarine working, and furthermore will in all probability continue to be the pioneer in deep mining for some years to come. Any out of the ordinary phases of operations encountered during development, and there are a few, mentioned here, must be of more or less interest to the profession at the present time.

WORK OF THE GEOLOGICAL SURVEY IN THE MACKENZIE RIVER BASIN.

The Geological Survey has sent four field parties to investigate further the oil and other mineral resources of the Mackenzie river region. The parties are in charge of Dr. D. B. Dowling, Dr. G. S. Hume, Dr. M. Y. Williams and Mr. E. J. Whittaker.

Dr. Dowling will make a detailed examination of the succession and fold structure of the Devonian sediments in the Fort Norman district, where oil was obtained last August by the Imperial Oil Company, and where much additional drilling will no doubt be done this year. He fill follow closely the results of drilling in order that this information may be applied to advantage in the similar underground exploration which is likely to be undertaken in other parts of the Mackenzie basin.

Dr. Williams, Dr. Hume and Mr. Whittaker will begin a systematic mapping and study of the geological formations on each side of the Mackenzie between Great Slave Lake and Fort Norman, with a view to supplying maps and information regarding the depth and form of the oil-carrying rock formations. As the Mackenzie river is the great highway through the region, it seems most likely that future prospecting for petroleum will extend southward along it.

Dr. Williams and Dr. Hume will jointly explore the country on either side of the Mackenzie, from Fort Simpson downstream. Mr. Whittaker will devote his attention similarly to the section from Great Slave lake downstream.

The Topographical Surveys Branch of the Department of the Interior will co-operate in this work by making a careful survey of the Mackenzie river from Great Slave lake downstream, controlled at intervals of about 150 miles by astronomical stations.

The foregoing information has been given for publication in the "Journal" by the courtesy of the Director of the Geological Survey.

IMPERIAL OIL COMPANY'S PLANS.

On his return from Edmonton, Mr. A. M. McQueen, vice-president of the Imperial Oil Company, gave the following statement to the Toronto "Globe":—

"We hope to arrive this year at the stage at all our locations in Alberta and Saskatchewan that will either prove or disprove the existence of oil in commercial quantities. We are drilling thirteen wells outside of the far north, with four at Fort Norman and one at Great Slave Lake, in addition."

Mr. McQueen said that the company's airplanes had been much delayed in their service to Fort Norman through accidents at the outset and now, by reason of the risks, the company was fitting pontoons to each plane in case of necessity of descending on water. One plane had been left at Fort Simpson to be repaired after the first flight toward the north, and the other recently left Peace River, carrying a geologist and a surveyor for the company. The necessity for carrying pontoons reduced the man carrying power of the planes considerably.

Mr. McQueen said that the number of prospectors going to the Fort Norman field was not as great as had been expected, but there was now a considerable traffic by the water route.

The Study of the Fuel Problem of Canada

A Suggestion in Response to the Open Letter of the President of the Canadian Institute of Mining and Metallurgy.

By the Editor, from the June "Bulletin".

THE President of the Institute has invited individual expressions of opinion on three inter-related difficulties that accompany the current stage of national development.

The general problem is complicated by world conditions, the future variation or duration of which no man can forecast. These are, in the main, results of social changes, racial movements, war, and the abolition of old conceptions of time and distance by invention.

Some of the causes of adverse exchange, railway deficits, and shortage of material supplies, are ascribable to these indeterminate factors, but this phase is without bounds, and certainly incompressible into a letter to the BULLETIN. It is mentioned merely to indicate the temporary character of many of our national difficulties, and to lend weight to an assumption that is here ventured, namely, that much of present Canadian financial disability is due to an arrested development, and to a capital expenditure that was made in expectation of an increase in population and wealth that has not materialised. The war has been the principal cause of this arrestation.

The writer, not being either a railwayman or a financier, but only a coalman, inclines to the belief that the difficulties of the railways and of our trade exchanges are temporary only, except insofar as they arise from fuel insufficiency.

This, unfortunately, is an inherent disability of Canada's geographical and national status, but it has been, and will be, a major factor in permanence of railway deficits and in weakness of our exchanges.

A consideration of the President's letter will reveal that, although he has covered the whole ground of national economic independence, population, incidence of business between East and West, and taxation and exchanges, the burden of his presentation is a disclosure of the difficulty Canada is meeting in making herself an independent manufacturing and commercial entity, while retaining national self-government,*in face of an insufficiency of fuel at moderate cost at points of necessary maximum use, in our present stage of development.*

Therefore, it is fair to assume that the most fruitful line of enquiry will be directed towards remedying this admitted fuel insufficiency.

Canada has slowly awakened to the menace of her fuel problem, but at this time is probably more alert to its dangers than ever before.

Long consideration of the problem, and much thinking aloud, has strengthened the writer's belief that no palliation of this country's difficulty is quickly possible, and that relief can only come as a result of the concentration of a number of our best minds upon the problem for a long period.

The course of the enquiry of the parliamentary fuel committee has shown how difficult it is for non-technical men to wrest the essentials of a problem that is in large part technical out of the smother of irrelevant considerations that attend this period of transition and unrest. The assistance of the Institute and other technical bodies in Canada has not been asked by this Committee. The evidence of witnesses has been conflicting, and will be found incapable of being assessed except by engineers of ripened experience. Snap judgments, temporary considerations, personal fads, bias of various kinds, arising from local, provincial and technical affiliations and governmental exigencies, all enter into and vitiate any enquiry into the fuel supply of Canada, *if that enquiry is temporary in its purview.*

The Fuel Controller, Mr. C. A. Magrath, in his final report in 1919, summarised excellently the things that need to be done to assist our fuel insufficiency, but he was unable to suggest the agency through which his recommendations should be carried out further than to recommend that the technical problems involved should be referred to the Honorary Advisory Council.

This body has, in the meantime, made real progress in investigating possible improvements in methods of utilizing lignite and peat, and, under a recent Act of Parliament, will doubtless make more rapid progress.

The fuel problem of Canada is, however, at least as much one of economic and political independence as of technical research.

But for our national frontiers we should have no fuel problem.

Technical research is therefore only one consideration.

The federal interest in the fuel question is complex, and we have not yet evolved in Canada what may be termed the pure federalist, that is to say, a school of thought free from fiscal doctrinism, from provincial affiliations, and from national predelictions entirely absolved from any other interest than that of Canada. How can we obtain a symposium of minds that will give us this single viewpoint?

The problem of fuel supply is inherent in Canada's organism. It is perpetual in its duration and in large measure ineradicable. No single remedy will serve. Many things, many men, must be considered, competently, judicially and maturely.

How can such continued study be given?

Some of the questions relating to our fuel problem which urgently need to be studied, may be mentioned, merely to indicate how great is the field for consideration, and how foolish it would be to attempt a snap judgment, or to recommend any one "cure-all". These questions are, in part:

a. *Extent of Reserves.*

This question is of importance (so far as coal is concerned) only in the two most extensively-worked fields of Vancouver Island and Nova Scotia. In both fields the time has arrived, and gone by, when scientific search should be instituted for hidden coalfields, and for a recapitulation of calculations on the basis of economically recoverable coal.

b. *Use of inferior coals and oilshales, peats and hydro-electric power.*

c. *Economies in use of bituminous coal.*

Super-power stations at pitheads, long distance transmission of electricity and electrification of railways. Central by-product cokeoven plants, furnishing coal-gas, coke (in substitution for anthracite) and heat for communal uses.

d. *Economies in transportation and purchasing of imported coal.*

Summer storage and transportation of imported coal, under government supervision (provincial or federal) to avoid maximum transportation and purchasing costs, and eliminate seasonal panics.

Full use of Canadian railways and canals in transporting coal to Canadian markets.

e. *National Considerations.*

Determination of the extent to which provincial and federal governments are justified in assisting private enterprise in erection of community cokeoven installations, and in developing coalfields and transportation routes.

Determination of zonal areas of coal distribution, and what portions of Canada should use domestic coal and what portions should use imported coal.

What development of Canadian coalmines should be aimed at to secure Canada against cutting-off of coal imports from outside.

The problem is large, difficult, complex and permanent. How can it be given consideration that shall be correspondingly broad-minded, competent, many-sided, and lasting?

The writer suggests selection for this task of a group of men of large affairs, created for advisory purposes only, and given only such powers as shall enable them to obtain relevant facts on which to base recommendations.

Such a body could work in co-operation with producers of fuel, and their enquiries would be made with a view to assisting the producers. No inquisitorial or controlling powers are suggested, because they are unnecessary, and not helpful.

No immediate assistance could be expected from the creation of this suggested body. Their first task would be study, and the partial list of subjects needing study above cited, suggests that study is a most necessary precedent to intelligent action.

No formal taking of evidence, and no publicity of any kind, except reporting of progress and transmission of recommendations, should occur, and the constitution of this select group should be permanent and self-perpetuating to correspond with the everlasting and inherent nature of the problem itself.

The President has asked for concrete suggestions, and the avoidance of generalities, and for this reason the following suggestion is made in some detail. It is, of course, only a suggestion, and it takes for granted what others may well dispute, namely, that the fuel problem is at the root of our railway deficits, and that the necessity to purchase coal abroad, combined with the railway deficits, explain a good deal of the exchange discount.

The constitution of the suggested body might be:

a. Two appointees, nominated by the Canadian Institute of Mining and Metallurgy, preferably a coal miner from the West and one from the East.

b. Three appointees, nominated by the Engineering Institute of Canada; namely, an electrical engineer who has specialised in railway transportation; a hydro-electric engineer versed in generating and transmitting electricity from water-powers; a fuel engineer skilled in modern fuel-applications such as coal and water-gas, oil fuels and coal-distillation products.

c. Two railwaymen; one C.P.R. man, nominated by the Canadian National Railways, and one C.N.R. man, nominated by the C.P.R.

d. A competent economist, preferably in active financial pursuits.

e. An engineer, thoroughly acquainted with North American canal and river transportation and costs, nominated by the Commissioners of Toronto and Montreal Harbours in consultation.

f. The Deputy Minister of Mines at Ottawa, or his nominee selected from officers of his Department.

g. The Chairman of the Research Council, or his nominee from that body.

h. The ex-Fuel Controller, Mr. C. A. Magrath, as Chairman.

As to railway operation, a suggestion has been made in the meantime by the one man in Canada most competent to make it, namely, Lord Shaughnessy. The suggestion is very much what would be made by an average business man if he viewed Canadian railway matters with the detached and unbiased vision that he would bring to bear on any ordinary business deal.

The only additional suggestion one dare make is that Canadian railroads might fit themselves to be coal-carrying roads in Canada, and not coal-owners in and coal carriers from the United States.

F. W. Gray.

Gardenvale, Quebec,
20th May, 1921.

CORRESPONDENCE.

New Glasgow,
Nova Scotia, June 3 21.

The Editor Canadian Mining Jonrnal.

Dear Sir,—Permit me to say I do not think your point is quite tenable in your editorial of the 20th issue in stating that in the Province of Nova Scotia the production of Oil Shales is of "entirely secondary importance". This is not the feeling of those paying over 60 cents a gallon for gasoline, but there are other reasons. The production of oil, whether from Oil Shales or flowing wells, wherever found, seems to me to be of primary importance, to the world to the British Empire and therefore to Nova Scotia, or any locality where found in paying commercial quantity.

Nova Scotia's geographical position to Canada's interior ports, and its accessibility to the markets of the Atlantic and the world, places it in a premier position for the creation of such an industry for export, although its farms, foundrys and fisheries, its steel and shipbuilding works, require the products of its Oil Shales.

World wide conditions make it necessary that Canada be self-sustaining in regard to its petroleum requirements. The Fort Norman oil, if found in abundance cannot be marketed for years, and then can have no influence on Nova Scotia from any conceivable point of view. It must find its way to the Pacific.

The production of oil from inferior coals, coaly shales or screenings will not be able to compete with the low temperature carbonization of Oil Shales, found in such abundance and quality as in the Pictou field.

Yours truly,
HAROLD C. E. SPENCE.

Portland Canal Mines A'coming

By ALEXANDER GRAY, Montreal.

The Portland Canal Mining District in British Columbia is courting more favor from men who know what mines should be than appeared possible ten years ago when premature excitement created more of doubt than confidence. Situated close to the Alaska border, easily accessible by excellent railway and sea service direct to Prince Rupert and Stewart, those who participated in the first rush acquired ground in haste and repented at leisure.

Great mineralized zones were noted, but gave surface values which were not such as to arouse capitalists capable of dealing with a section so remote. Reports that there was a mountain of ore with a shear exposure of a thousand feet vertical, and on one side of which enough ore was assured at outcrop to feed a thousand-stamp mill for a century, started a real-estate boom at Stewart at the head of the Portland Canal and gave added impetus to the boom under way at Prince Rupert where the Grand Trunk Pacific was just completing the western terminus of the Transcontinental Railroad.

The country was difficult; the Great War intervening, it was impossible to bring what pioneers possessed to the attention of mining engineers representing those able and willing to exploit and to fully develop properties whose potentialities never were questioned; although it was felt by open-minded engineers and geologists of repute that where there was so much ore, there should be mines—and mines of magnitude.

Even today, with transportation facilities provided, and notwithstanding the recent activity of leading international mining groups, Portland Canal might not be in the lime-light, had it not been for the advent in 1910 of the blacksmith Logan and fisherman Morrison who staked most of what is the Premier Mine, to which the Guggenheims and affiliated interests are now devoting themselves. The blacksmith and fisherman could not wait; Portland Canal was not for prospectors or small syndicates. Had it not been for Pat Daly, originally a champion wrestler of Kildare, and since then a personality in most of the mining camps of British Columbia, the Logan Group of claims, now incorporated as the Premier Company, certainly would not have induced "one arm" Bush, then champion two-mile amateur skater of the world, to risk what he did, little as it was, before he organized the Salmon-Bear River Mining Company.

Between Logan, Morrison, Daly and Bush, this Company lacked about everything essential to prove a mining country, excepting the practical knowledge of Pat Daly and his optimism. Bush, in 1910, thought he could sell enough stock on a sliding-scale down to a cent or two a share to put the Salmon-Bear Mining Company on the producing map. Daly fancied the large sulphide-zone. He took what petty cash he could get, most of his pay, however, being in shares. What surface work, trenching and stripping he did with the money available, sustained him in his first impression that the Salmon River section was going to furnish both tonnage and values.

The champion skater continued to win honors at rinks. Daly plodding along with hardly more than a grub stake, but stuck it out until the skater wrote him from Vancouver ordering all work stopped. When Daly and his men came out there was no money on hand, and the silver-heeled skater seemed to be beyond the reach of appealing letters. Daly, and his co-workers, could have enforced the thirty-day mechanics-lien law and obtained a lien upon Salmon-Bear Mining properties. Instead of that, Daly went to a bank, put up what stock he had earned in wages, stood good for the amount of the payroll and subsequently the overdraft was squared. In reality, Bush, the skater, had forwarded checks but the person to whom they were addressed mislaid them and they were not found until after Daly had saved the situation. Anyhow, the property was shut down in December, 1912, and work was not resumed throughout 1913.

Daly, however, was not to be denied his opportunity to prove the worth of this district. He interested himself in the International Group of claims south of the Salmon-Bear River Mining properties. These he optioned to the Canadian Mining and Exploration Company which had been financed by wealthy Canadians and Americans. When Engineer Rolph, representing this Mining and Exploration Company, reached the Yellowstone property, Daly, with characteristic candor, stated to him that there was something worth having. Rolph was accordingly taken to the Salmon-Bear River Mines. The surface-showing appealed to Rolph. Daly was entrusted with the expenditure of what he says was the first real money he had seen since he had been in charge of the work. For some unexplained reason other than that the Exploration Company wound up its affairs, the influential people directed Rolph to desist, notwithstanding the work done had established most encouraging values and widths. Rolf left in mid-Summer, 1914, on the outbreak of the war.

In October of that year another group of American capitalists took an option on the properties, the price being fixed at $150,000. Again, under resident and consulting engineers, Daly was installed to superintend the work. Prior to this, it should be explained, two claims sold by Richards and Kerrigan were added to the original holdings of the Salmon-Bear River Mining Company. Meanwhile Daly was not luxuriating on what meant to him a little more than tobacco and overalls. A mineralized zone extending for a distance of 1,700 feet was disclosed. Underground work, while disconcerting, did not discourage Daly. He was obeying orders. Engineers failed to correctly read the section. Certain dislocations seemed more serious to the engineers than they were to Daly.

The engineers carrying on this prospecting and development work gave it up after spending something less than $100,000. Daly, alone, declined to be discouraged. He went to Spokane in June, 1916, after failing to interest others. There he interested R. K. Neill and his partner, Morris Bacon. Daly wanted to get a lease from Bush for $75,000. Daly wrote to Bush who assented to a joint arrangement on a fifty-fifty basis. On those terms Daly took the lease, proceeded to the property, and generally experienced the slings and arrows of outrageous fortune. Heavy snowfalls prevented the pack train from keeping the trail open.

Those tortuous years would have discouraged a less optimistic person than Daly who, being of the type of Mackay, Flood, Fair and O'Brien, of the Comstock Lode, followed the knife-blade of ore. Pat Daly always

had his own ideas but he obeyed instructions. The engineer on the spot, however dubious of the results being obtained at and near the outcrop where No. 1 Tunnel was started on a 40-foot showing, averaging somewhat better than $3, wished to continue the work. The tunnel was to be true to the compass, regardless of the ore. At about 40 feet in, a change in the country was noted. Daly wished to swerve the tunnel. The engineer decided not to. At 80 feet, a slip occurred. Waste rock was being encountered. The engineer on the job was in favor of going ahead on the section. Daly again urged that the tunnel be curved back into the ore. He was disregarded. The tunnel was taken along for a distance of 310 feet. Then an engineer-in-chief, representing the prominent New Yorkers who held the option on the property, arrived. He ordered the work stopped. Daly stuck to his own opinions. So when the engineers abandoned the property and Daly resumed work, he started a crosscut east at a point where the slip had cut out the ore in the tunnel. The second round brought him into ore—and ore that gave him $60. Ordinarily that would have made a tenderfoot, or less experienced than Daly, follow precedent by painting red a town or two. Daly preferred to chase yellow metal rather than invest in "red ink." He enthused over his No. 1 Crosscut and its width. Then, at a point 150 feet from the mouth of the tunnel, he ran another crosscut. He had to go six feet before he got out of the waste and into his ore, but he proved up 35 feet of ore going from $30 to $90. Daly was doing things. He went further along into that tunnel and had another try at crosscutting. This time he was 230 feet from the mouth of the tunnel, and so much further on the angle from the large ore-body. When he reached the ore and got through it, he thought 65 feet of $60-$70 ore was good enough for him though rather rough on those who would not listen to him. Satisfactory as those three crosscuts were, Pat Daly went to the face, 310 feet from the portal, ran No. 4 crosscut and in due course made a note of it that the eighty-seven feet of ore there gave him values of from $150-$300. Besides, he had 200 feet of backs—that being the distance from the roof of the tunnel to the surface. The high-grade character of the large section averaging 87 feet in width proved that the practical miner, familiar with the country in detail, was worthy of more credence than leading engineers who were within two rounds of the ore were prepared to concede to him. At that moment the Premier Mine was a great unnamed. Daly, on his own initiative, had made it a mine—the Premier Mine of its kind.

The nearest telegraph office was at Anyox, 135 miles away. Daly guarded the samples he wished to have assayed at the Granby Smelter. He concluded that if Leander could swim the Hellespont, there was no earthly reason why a determined son of Kildare could not take a chance in a row boat and get across to Anyox. It was February, the dead of Winter, and in that latitude the most intrepid either stay on the work or seek more congenial surroundings. Daly would not be dissuaded. He took a row boat and with the aid, when the wind was aft, of a jury-rigged gunny sack, in three days and three nights, reached Anyox, made the tests of his ore, and got in touch with Bush and Neill, who gave little thought to what Daly was undergoing to convince them he had the makings of a mine.

At any rate, Daly turned the trick and eventually Bush dealt with Neill, Trites, Wood and Wilson. The Premier Mining Company was organized. As this transaction is somewhat involved and law suits are pending, details need not be recited. Daly had not seen Bush from March 6, 1917, to March, 1918. He had superintended all prospecting and developing. He was persistent and his sole reward thus far is the knowledge that the old Salmon-Bear River Mining Company is now the Premier Mine, owned by the Guggenheim-Keith-Untermeyer-Trites-Wood-Wilson Combination. This occurred in 1919 after the Guggenheim engineers had passed judgment on the properties.

Since then, development work has more than borne out the rugged confidence of Daly. The judgments of previous engineers have been shown to be at fault. An aerial tramway to tidewater is almost completed. A plant has been constructed. Meanwhile, when the roads to Stewart permitted it, continuous shipments have been made to the Tacoma Smelter. Unofficial reports give the average of what has been shipped at between $200 and $300 to the ton. Of course, this cannot be regarded as an average of the large zone developed.

Daly says the grade is good enough for the most exacting. He is more than ever a firm believer in the present and future of the Portland Canal District, and in this he has the advantage over those who misunderstood the structural features. In manifesting this optimism, Daly declares "Portland Canal is big enough for the biggest—and that should be big enough for anyone who knows what it means to have such great sections and strong mineralization."

Capital expenditure under way and authorized by Guggenheim engineers, is a sufficient rejoinder to those who felt the Portland Canal would be too low-grade to warrant such expenditure. Pat Daly has seen the Premier mine, in the finding and developing of which he played such a conspicuous part, ship 320 tons worth $62,000 and 410 tons worth $68,000, other shipments correspondingly profitable, and now declares the mine to have a present day value of $50,000,000. He is suing to recover $2,000,000 as his portion. That, however, is another story. Daly has more pride in the properties strung along that "hog back" than anything else. Like successful men of his type he never could be pessimistic, but finds himself divided in his affections, between the Big Missouri properties north of the Premier, the Eva, Young and other groups south of the Premier. Leading engineers are now being convinced that Daly common-sensed what the scientific could not discern. In this respect, history has repeated itself. Many discoveries have violated the conventionalities. The diamond fields of Kimberly, were denounced as a rank attempt to promote speculation in worthless lands. One of the greatest authorities of that time went on record as staking his reputation that the Witwatersrand pebble-beds, discovered by Struben, were a mere superficial occurrence. Trusted chiefs in the employ of diamond magnates, after Tom Cullinan found it, turned down the Premier Diamond Mine, the largest individual mine of the kind on record. The wisest of engineers ridiculed Cobalt; others regarded the Porcupine gold-fields as a flash in the pan. Had it not been for Pat Daly's dogged persistence, reinforced by his intimate knowledge of the Portland Canal mineral zones, the Premier mine today would not exist. Daly insists that well meaning engineers have condemned what they did not comprehend. He has the intense satisfaction, contained in the official announcement of the Canadian Department of Mines, that the Salmon River District has arrived. Mr. J. J. O'Neill, of the Canadian Geological Survey, in a report which

was recently issued by the Ottawa Department of Mines, fully confirms Daly's contentions regarding the Premier, Big Missouri and other properties. In part Mr. O'Neill says:

"In 1904 prospectors from the Bear River Valley crossed the divide into the country at the head of Salmon River and staked the Big Missouri claims, which have an enormous outcropping of mineralized rock. This discovery caused an influx of prospectors, and soon most of the district was staked. The district was considered, up to 1917, to be one of large deposits of low-grade complex ores, and the development was with a view to ascertain if sufficient quantities of workable ores could be proved to warrant the large expenditure required to exploit them. During 1917 very high-grade silver-ores were found on a number of properties, and the district has rapidly come into prominence as a prospective high-grade camp, as well as a possible low-grade one on a large scale; all efforts at present are devoted to proving the high-grade properties, and one exceptionally rich property has become a producer. Several others show a reasonable prospect of becoming such.

"The primary high-grade silver-ores are found in quartz veins or silicified shear-zones about the borders of the granodiorite-porphyry intrusive. These veins for the most part stirke northwest, although a few strike northeast, and they cut the regional shearing at 45 degrees. Properties containing high-grade ores, so located, include the Big Missouri, the Mineral Hill, Bush Mines, Ltd., and the Premier. There are many other properties, but the occurrence of high-grade ore in them has not been demonstrated."

SUDBURY NOTES.

D. E. CUSHING.

Continued Search for Coal in Chelmsford Area.

After 25 years of uncertainty, during which much money has been spent and practically wasted, the question of whether or not the Chelmsford area will produce commercial coal is soon to be solved.

A company called The Financial Underwriters Limited, has been organized by Toronto and United States people and it is the intention to soon explore the whole area at great depth. The diamond drill will be used. Right now the agents of the company are purchasing the mineral rights of the farmers. When they have secured all the rights they desire they will start work.

The agreement with the farmer calls for the payment of $1 for their mineral rights. If coal or salt is found, the farmers are to be paid 10 cents a ton for all taken out. If gas or oil, the needs of the farmers are to be supplied. The purchase or lease is for 21 years. The company is endeavouring to secure a lease on the mineral rights of a strip of land about one mile wide and stretching through the townships of Dorling, Rayside and Blezard, a distance of about fifteen miles. This strip passes about seven miles from Chelmsford. It is understood that the diamond drilling, already carried on in the district was all done in the township of Dorling. Recently some geologists and a Pennsylvania coal man paid a visit to the district. It is understood that the coal man was favorably impressed with the formation.

Goudreau Dstrict.

A new gold find in Goudreau is reported by W. F. Webb. It is in Township 28, range 26, and according to Mr. Webb, one of the owners of the original find in the area (the McCarthy-Webb claims) it out-rivals the famous Croesus in Munroe Township. He claims that without doubt it is the most spectacular free-gold discovery ever made in the province. The new find extends the known free-gold area of Goudreau camp from the centre of township 28 in a northerly direction through townships 48-49-47, a distance of over 22 miles and connects up with the C.P.R. at Lochalsh station.

The gold zone occurs in Keewatin rocks similar to those that have been so productive in other parts of the Province, and has a width around 12 miles. Many express the opinion that the North east arm of the body connects with that of Porcupine. Niven's base line runs through the village of Franz and also through the town of Timmins, a distance of 184 miles.

The Goudreau area has been favored with a large percentage and assortment of porphyry rocks, which seem to be essential to all gold camps of economic value.

At the same time this camp can also boast of the largest known deposits of commercial pyrites in America. Some of these deposits have been diamond-drilled, and have shown very large tonnage and average sulphur content up to 45 per cent. This ore is equal to any of its kind anywhere in the world. It is preferable to the Spanish ores on account of its free-burning quality, with exceptional transportation facilities, both by water and railroad.

Since the recent strike quite a number of prospectors have gone into the area. It is understood that James Perry and Thos. Murphy are the owners of the claims in question and fifty new claims in their vicinity have just been recorded. On one of the claims, it is said one of the spectacular veins has been opened up 200 feet. There is said to be lots of free gold but so far systematic sampling has not been carried out.

Shining Tree District.

Quite an interest is being taken in Shining Tree these days by outside capital. Several parties have gone in from this point during the past week or so to look over properties, but it will be some time before it is known if deals go through. There is not a tremendous amount of work being done in the camp on the main properties, outside of perhaps The White Rock, but the promise is that there will be a new activity there shortly.

Sudbury is not pleased with the news that the new light railway from the mining camp is to reach Shining Tree from the T. and N. O. Ry. At the present time all the Shining Tree supplies go in from Sudbury. The outlook is that the light railway will divert all business from Sudbury, as it does not seem to be the intention of Premier Drury to allow the light road to connect with the C.N.R.

TORONTO COAL PRICES.

Toronto, June 8th.—The price situation of coal is absolutely unchanged since last week. Prices are exactly the same as last week's in all lines. There is practically nothing doing. It is unquestionable that the public are holding off from buying, at the present time, in the expectation of a reduction in freight rates. But what is most likely actually to happen is that the market will strengthen up before the expected reduction in freight rates takes place. If people, who, in normal circumstances, would buy their coal now, continue to hold off, there will be a rush on the market, when the buying of coal can no longer be postponed, and prices will be sent up with a rush. It is surely better to store up coal rather than trouble, which is what the public are doing for themselves by postponing their normal purchases of coal.

Northern Ontario Letter

THE SILVER MINES.

The Cobalt Field.

What has the appearance of being an important ore-body has been encountered during the course of lateral work at the lower levels of the Chambers-Ferland mine. This work has passed through 30 feet of ore in which the silver content averages over 50 ounces per ton and, as yet, the walls of the deposit have not been determined. The peculiar formation of the ore-body renders it impossible to tell whether the lateral work is being carried in the direction of its strike or crossing the deposit. Further work is proceeding, and the shipment of ore from the new discovery has already commenced, arrangements having been made to send approximately 50 tons daily to the Bailey Customs Mill.

The annual statement of the Mining Corporation of Canada contains a number of favorable surprises. Among these may be noted a very substantial increase in ore reserves, the total being estimated at 2,181,000 ounces as compared with 1,307,220 at the end of the preceding year. It is announced that Sir Henry Pellatt has resigned from the Board and has been succeeded as president by J. P. Watson, formerly first vice-president. Other new members on the board are E. H. Rose and Captain C. E. Trafford, while D'Arcy Weatherbee's name disappears from the list of directors. In summarizing the situation, J. P. Watson, president, states: "Our old properties are being gradually exhausted, as is seen by our reduced estimated reserves, but we are pleased with our new acquisition, the Buffalo Mine, from which we have taken practically no ore during the year, but our exploration and development work there has put so far into reserve the amount estimated by our engineers. As is plainly evident by our year's operations, the profit of the Corporation in the future will be largely determined by the price of silver."

Reference is made in the report of the consulting engineer of the Mining Corporation, Mr. Scott Turner, to an interest held in an option on a gold, silver and copper property in Northern Manitoba (the Flin-Flon). This option lapsed on March 31st, 1921, and Mr. Watson states that the Corporation early in May acquired by purchase a majority interest in this property. "There has been spent on it during the past few years, $500,000 in exploration work and proving the ore bodies with diamond drills and we view it as an important acquisition to your corporation."

Following are some leading features of the report of the Mining Corporation:—

	1920	1921
Silver production, ounces	1,661,018	1,230,652
Net profits	$ 579,569	$ 908,712
Total income	$1,693,065	$1,698,996
Income per ounce, cents	101.75	137.32
Bal. profit and loss	$3,268,628	$3,311,577
Dividends paid	$ 622,518	$ 622,518
Cash in bank and on hand	$ 119,057	$ 538,282
Total assets	$11,666,685	$11,712,350
Profit per ounce, cents	36.58	76.80
Average number of men employed	226.63	196.79
Ore reserves, ounces	2,161,000	1,307,220

Since 1908 the properties of the corporation have produced 32,217,505 ounces of silver.

Work is being carried on in a small scale on the Silver Leaf property under lease. The ore is shipped to the Bailey Customs Mill.

It is reported in Cobalt that the Bailey Silver Mines Company is negotiating with a view to acquiring an interest in a promising gold property in the Kirkland Lake district. The Bailey is making regular daily shipments of ore, and mill-heads have recently averaged approximately 28 ounces of silver per ton. Underground developments are favorable at the 5th level.

Elk Lake and Gowganda.

The representatives of a big steel corporation in the United States has gone in to inspect the Hartley-Wescott property in the townships of Morel and Yarrow where recent discoveries of high grade iron-ore were made. It is regarded as being unfortunate that the Ontario Department of Mines gave out quite pessimistic views in regard to the new find. Officials there took it for granted that the reported discovery was that on which one of their geologists made a survey in 1911. As to this, Mr. Percy Hopkins, the geologist who was in that vicinity in 1914 was consulted and made the statement that his visit was only to the deposits lying along the boundary of the two townships and not to the new find which was recently made. Mr. Hopkins believes that even that part of the deposit which he saw warrants detailed investigation and appears to be quite optimistic as regards the reported new high grade find. Like Mr. Hopkins, the discoverers of the deposit share the belief that it is purely a diamond-drilling proposition and that exploration work will be a necessity as a means of determining whether the deposit occurs in sufficient volume to be of commercial value on a big scale, or not.

Work is being carried on on a small scale on the property of the Alpine Silver Mines, and some high grade ore is being bagged preparatory to making a shipment in the Autumn.

During the month of May, the O'Brien Mine at Cobalt produced 312,000 ounces of silver, thereby jumping to the front rank of all silver mines in Canada. Taking the premium on United States funds into consideration, which makes silver worth about 65 cents an ounce in Canadian money the month's output from the O'Brien had a value of over $200,000. Heretofore, the Nipissing has been the leading Canadian silver producer, but at no time during the first four months of the current year has the output exceeded $150,000 a month. The O'Brien treated 6,066 tons of ore which yielded an average of a a little over 51 ounces per ton.

THE GOLD MINES.

The Porcupine District.

Following the meeting of the directors of the Porcupine V. N. T. Mines., a committee was appointed for the purpose of making arrangements to reopen the mine. The company has 175,000 shares in its treasury, and it is understood the committee may make arrangements to have this underwritten at a price which will provide the money required to enlarge the mill and extend the underground workings to a depth of 900 feet. A price of 40 cents a share for the treasury stock is being mentioned.

A Toronto syndicate is stated to have purchased control of the Hollinger Reserve property, situated in Deloro Township, a few miles south from the Hollinger. It is planned to carry on exploration work this year.

The directors of the Hollinger Consolidated have just concluded a visit to the mine where a special meeting was held. The nature of the business has not been officially disclosed, although the question of hydro electric

power development is believed to be among the important matters discussed.

A party of stockholders of the March Gold property visited Porcupine during the past week. It is understood a limited amount of exploration work is being planned on this property during the current summer.

Production from the Hollinger, Dome and McIntyre now amounts to an aggregate of close to $1,500,000 a month and the net profits being realized amounts to approximately 40 p.c. of the gross output. Dividends this year from these three mines promise to reach a greater aggregate than in any previous year, as well as witnessing a big increase in the treasury surpluses as shown at the end of 1921. It is also believed the ore reserves will increase substantially, due to the companies now being able to get a full supply of men. It is considered not at all improbable that the aggregate reserve at these three mines may approach $60,000,000 by the end of this year.

Among the various new gold discoveries reported recently on outlying properties is one in the township of Midlothian. The details about the find are lacking except that it was found by Nease Twain, a local Indian, but the location of the find makes it interesting as it lies almost in a direct line between the West Shining Tree gold-area and the Fort Matachewan district. It appears to form another link in that long belt of territory over which gold has been found, extending all the way from West Shining Tree on the south-west through Midlothian, Fort Matachewan, Kirkland Lake, Beaverhouse Lake and Larder Lake on the north-east, a total distance of about 150 miles in length.

Kirkland Lake.

Contracts for the milling machinery of the Ontario-Kirkland are being closed, and early delivery is specified. All will be in readiness to commence pouring cement for the mill foundations within the next few days, and it is planned to place the mine on a producing basis by late Autumn. A substantial quantity of the ore will average around $15 per ton.

A high rate of recovery is being established in the new mill on the Wright-Hargreaves. This mill will treat an average of about 170 tons daily when operating at full capacity, and mill heads are expected to average about $15 per ton. This would indicate an output of over $900,000 a year by such time as the enterprise is brought up to full capacity which may be by early Fall. The former highest rate of output for any company operating in the Kirkland Lake district was on the Tough-Oakes which some years ago produced at the rate of over $60,000 a month for a short period.

Fire destroyed the mill and transformer house at the property of the Argonaut Gold, at Beaverhouse Lake. The loss incurred is estimated at $5,000. The mill was more or less obsolete and was being used chiefly for testing purposes and for this reason the loss will not seriously retard the development of the mine. A new transformer has been purchased and is already in course of transportation to the mine. This company is making good headway in developing ore at depth, in spite of having been operated under the handicap of poor transportation. The question of installing a new modern mill will not be taken up for the present, and in the meantime the prospects are that rail transportation will be provided by that time through the construction of a line by the Northern Light Railway Company, the proposed route of which lies right across the Argonaut.

Mr. Burrows and Hopkins have completed their geological survey for the Ontario Government in the northern part of the township of Skead, and a map will be ready within the next two months.

A diamond-drilling contract has been given to Messrs. Smith and Travers for the purpose of exploring the Cockeram property near the Fort Matachewan Gold Mines. This work is already under way.

It is learned that a great many mining claims have been staked during the past two or three weeks in the Fort Matachewan district on the strength of the prospects of light-railway transportation being provided this year for that field.

TORONTO MINING STOCK QUOTATIONS.

Quotations on Active Stocks on Standard Stock Exchange for Week Ending 4th June 1921.

Silver.	High.	Low.	Last.
Aladdin Cobalt	1	1	1
Beaver Consolidated	32.4	32.4	32.4

British Columbia Letter

Stewart, B.C.: Labour trouble, growing out of a reduction of wages, has stopped work at the Premier Mine, Salmon River, Portland Canal District. Dale L. Pitt, the manager, recently announced a "cut" which would place the men's pay as follows: Miners, $5.50 a day; muckers, $5; laborers, $4.75 and $5. The men claim that this is too drastic a change, that it means a reduction ranging from 75 cents to $1.25 a day, and that there has not been a corresponding drop in the board and lodging charge of $1.25 a day. For these reasons the mine workers left their work and, according to reports, 200 of them "hit the trail" to Stewart. There a meeting was held to voice their protest and to organize for a strike. Resolutions were passed providing for the housing of the strikers and for the picketing of the road to the mine, it also being decided that no freight for the Premier would be handled at the dock and that the workmen on the tramway would be interviewed. The mill crew and the tram workers, from last advices, are not affected. Two hundred tons of ore were shipped south by the Str. Prince Albert which left Stewart a week or more ago, the same having been loaded by men who had not joined the strike.

The Mineral Hill Group of Claims, Salmon River, is likely to be extensively developed this summer. R. Martin, one of the original locators, is at the property now to ascertain the condition of the buildings, preparatory to starting operations. He says that, although 700 feet of underground work had been done, it had not yet been satisfactorily proved that a mine can be made of the group. He thinks, however, that the prospects are just as good as they were in the case of the Premier at its opening stages.

The Patricia Group, Marmot River, is another property to receive attention. Crawford McGee has outfitted and left for the claims. He states that ore has been taken out running $12 in gold and $10 in lead and silver and that there is a promising lead.

The Georgia River Mining Company has taken an option to purchase a one-quarter interest in claims known as the Georgia, Georgia No. 1 and Georgia No. 2, situated on the west side of the north fork of the Georgia river, seven miles from tidewater and seventeen miles from the town of Stewart. As the option expires in September it is assumed that considerable work is to be done this summer. Nothing has been done since 1918, but prior to that a 700 foot tunnel was driven and a 40 foot winze sunk. There are two leads, a 20-foot quartz vein, running east and west, and an 18-inch fissure vein running north and south. Both are traceable on the surface. The values are in gold, the quartz vein averaging about $100 in gold.

Alice Arm B.C.: The Dolly Varden Mine, which closed down towards the end of last year, is to be re-opened for development according to a statement by Major G. B. North, the manager. Major North has returned to make a survey and a report on the properties. With market conditions as they are shipping will not be resumed. When it is started the expectation is that the output will exceed all previous records in volume. Properties on the Illiance river are showing up well and the trail now is being put in condition for the shipment of supplies to the Bellevue, Silver Star, Monarch and to the properties of other smaller operators.

Queen Charlotte Islands: A party of miners is engaged in another attempt to separate the fine gold from the black sands of the beach near Masset, Graham Island. They have taken in a machine for the purpose, but their work is not yet far enough advanced to say whether or not it will be successful. For a long time it has been the opinion that these sands were just rich enough to keep the miner working but poor. If the patented process now being employed gives the results predicted there is no doubt that a number will be introduced and operations carried on extensively.

Copper prospects on the Islands are idle at present because of lack of a market for the products but considerable interest is being manifested in iron ore deposits, no doubt by reason of the continued activity of those agitating for the establishment of an iron and steel industry on the coast. There are immense bodies of magnetite of high grade and options have been taken on several properties, notably those on Lyell Island, Louise Island, at Jedway, and on Collison Bay.

Hazelton, B.C.: Preparations are being made by the Kleanza Mills, Mining, and Development Co. for an exhaustive examination of the mineralized zones of Kleanza mountain. Near the base of the mountain is the great contact zone between the coast-range thrust and the older formations of the Interior. The field is considered to be one meriting attention and the Company proposes to give it thorough exploration.

Revelstoke, B.C.: The Walters Investment Co., of Spokane, Wash., is reported to have purchased the Waverly-Tangier Mine Property, situated at the head water of the Downie Creek. The monetary consideration had not been disclosed but $20,000 already has been paid and $10,000 is being spent in preliminary development, this including the re-construction of eight miles of the wagon road from Albert Canyon to the property. As early as 1896 a considerable amount of prospecting work was done on these claims by a company called the Gold Fields of British Columbia, Ltd. To give access to the property a wagon-road was built for a distance of about 28 miles up the north fork of the Illecillewaet river from Albert Canyon, on the main line of the C. P. R. Work was abandoned many years ago, the old wagon-road became obliterated in many places, and it was not until 1918 that work was resumed by a small crew of men. There are possibilities, it is reported, of opening up a considerable body of low grade silver-lead ore. The mine is situated in the heart of a vast undeveloped country and its progress will be watched with interest, for if successful it should lead to more mining activity north of the C. P. R. line.

Nelson, B.C.: The Omineca Branch of the B.C. Prospectors' Association has written the Nelson Branch expressing approval of the fight being made against the Engineering Professions Act, which speaking in broad and general terms is designed to protect members of the profession against the competition of unqualified men by compelling all who would practice to become members of the Engineers' Association. The

Omineca prospectors also have declared against the present reserve on coal lands and are asking the Provincial Government to remove the same forthwith.

Mrs. Alice E. Jowett, one of the pioneer prospectors of the Lardeau District, B.C., and probably the only genuine "sourdough" woman prospector of the Province, has returned to her home at Trout Lake after attending the International Mining Convention at Portland, Ore. She quotes Americans as saying: "We are willing to invest in your mines, but we would lose our investment as the smelter situation is agains us. If we produced ore your smelter would not take it and we would have to ship it on this side to be treated." The Trail smelter, she asserts, does not seem to want to be bothered with the small shipper. With this preparation Mrs. Jowett asks that the government provide a customs smelter or make some other provision for the treatment of the product of the small operator. At this point it is only fair to say that there is a circle in the Kootenays who hold very different opinions regarding the Trail Smelter, considering its policy a fair one and its enterprise of incalculable benefit to the country. Mrs. Jowett, be it understood, is not a fair-weather prospector. Mining is her business and she has a practical grasp of its problems as well as of its possibilities. The Foggy Day Group, one of her properties, she considers to be a "bonanza". She tells with pride of its four-foot gold-bearing ledge, refers to the schist on either side as being studded with particles of gold, and describes it as a quarrying proposition. She has explored this gold-bearing schist for 18 feet without finding the walls and says that the whole hill could be worked with a steam shovel. There also are the You and I Group, the Bronze Group, and the Hercules and the Arraloo Groups. All are in the Alpine basin where are a creek and three lakes, assuring the necessary water-power for the operation of the mining plant which some day, she is confident, will be handling the mineral treasures of her district.

Trail, B.C.: Ore receipts at the Trail Smelter of the Canadian Consolidated Mining and Smelting Co. for the week ending May 14th last totalled 8,676 tons, all of which came from the company mines. The total receipts for the year thus are brought to 158,075 tons.

Vancouver, B.C.: D. G. Marshall, K.C., one of the directors of the Britannia Mining and Smelting Co., has stated that the plans for the new concentrating plant, to be built in place of that recently destroyed by fire, are being prepared and that work will be started in the course of one or two months.

Victoria, B.C.: Twenty tons of iron ore are being shipped from the Lake Hill Mine of the Puget Sound Company's Group on the west coast of Texada Island for a test run in the electric furnaces of the firm of Thomas Summerson and Sons, Ltd., Darlington, England. Hon. Wm. Sloan, Minister of Mines, has ordered that this ore be forwarded and, in order that the trial of the magnetite of the province may take place early this summer, it is to be on its way by the 1st of June. Application for the ore was made by Percy Scott Leggatt, of Thomas Summerson and Sons, Ltd., through F. C. Wade, K.C., agent general for British Columbia in London. Mr. Scott observes that "we are much interested in the potentialities of your Province as an iron and steel producer." His firm is prepared to offer technical experience in the development of the iron ore resources of British Columbia and in this connection Mr. Scott expresses a preference for the electrical smelting process as against the blast-furnace practice to achieve the economic exploitation of the magnetite deposits of the Pacific Coast. He adds:

"Before proceeding to detailed discussion of ways and means of bringing suitable iron areas into productivity, we would wish to assure your government of our ability to smelt the ores. If, therefore, you can arrange for shipment to these works of at least 20 tons of magnetite, we shall be happy to give you and your appointed technical experts a demonstration 'smelting-run' in our electrical furnaces."

W. H. Craigo, Frank Hutchinson, L. D. Davenport, W. R. Appleby, W. J. Mead, and W. H. Emmons are among American geologists and mining engineers who are looking for passage to the Orient by the N. Y. K. liner, Kashima Maru, which sails on June 3rd next. They are being sent to China, it is said, by American agents of the South Manchurian Railway Company, for the purpose of making a survey of the iron and coal deposits of the territory traversed by the railway indicated.

Dawson, Y.T.: Navigation has opened. Winter's grip is loosened. Steamers are beginning to traverse the rivers. Miners, prospectors and freight are on their way to the Mayo Silver Camp. Some gold dredges already have started and others are ready to commence the season's operations. The first gold of the season has left Fairbanks for Dawson and shortly steamers will be en route out with the results of the spring clean-ups of the various Klondyke camps. F. R. Short, manager of the Yukon Gold and Silver Mines, Keno Hill, on arrival at Dawson from Mayo City reported that development work already is well underway at the new camps and would continue throughout the open months.

A SILVER INDEX-NUMBER.

Taking the parity of 1 gold to 15½ silver as 100, the Journal of the Royal Statistical Society in its issue for March last calculates as follows:—

		Price per oz. in pence.	Index number.
Average	1873	59.1/4	97.4
"	1893	35.5/8	58.6
"	1896	30.3/4	50.5
"	1909	23.11/16	38.9
"	1912	28.1/32	46.1
"	1913	27.9/16	45.3
"	1914	25.5/16	41.6
"	1915	23.11/16	38.9
"	1916	31.5/16	51.4
"	1917	40.7/8	67.2
"	1918	40.7/8	67.2
"	1919	57.	93.6
"	1920	61.9/16	101.2

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is $10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of $10.00 on issue. It is valid for one year and is renewable on the same terms on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of $5 an acre for SUPERIOR METALS, and $3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE J. E. PERRAULT,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, $75,722,603; Lode Gold, $100,272,431; Silver, $50,432,304; Lead, $43,821,106; Copper, $153,680,965; Zinc, $16,818,487; Coal and Coke, $199,123,323; Building Stone, Brick, Cement, etc., $29,991,757; Miscellaneous Minerals, $786,918; making its mineral production to the end of 1919 show an

Aggregate Value of $670,649,894

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive $94,547,241; for five years, 1896-1900, $57,605,967; for five years, 1901-1905, $96,509,968; for five years, 1906-1910, $125,534,474; for five years, 1911-1915, $142,072,603; for the year 1916, $42,290,462; for the year 1917, $37,010,392; for the year 1918, $41,782,474; for the year 1919, $33,296,313.

Production During last ten years, $322,829,310

Lode-mining has only been in progress for about twenty-five years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 20 cents per agate line (14 agate lines make one inch). $2.80 per inch, each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" or "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany order. If box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 50 cents.

ELECTRIC STORAGE BATTERY LOCOMOTIVES FOR SALE, Two, 36 inch Gauge. Complete and in good condition. R. T. Gilman & Company, Dept. "R" 211 McGill Street, Montreal.

FELDSPAR PROPERTY FOR SALE—One hundred acres situated in Eastern Ontario. Considerable development work has been done. Government assay shows spar of good quality. This property can be economically worked and is convenient to railroad. For further particulars apply P. M. Lewis, 816 College St., Toronto, Ont.
