Although early action was expected by the O'Brien Mines in connection with enforcing the advantages gained in the recent court decision against the La Rose Mines, yet nothing so far appears to have been done. The La Rose has a limited time within which to take the case to the Privy Council, and it is believed that this course will be pursued.

Assessment Work on Mining Claims

Late advice that the Amendment to the Mines Act of Ontario passed its third reading, without any provision for the protection of old claimholders, is just to hand in the mining district of Northern Ontario. The situation is that shortly after Hon. H. Mills was made Minister of Mines, he proceeded to modify the working conditions by reducing the total amount of work to be done on mining claims. This was done in face of considerable opposition and criticism. It now develops that the Minister has recognized the folly of the change and has now put through a bill which wipes out the changes brought by himself. The unfortunate feature of the situation is that with the old drastic working conditions again in force, those who recorded mining claims during the past couple of years under the Mills regulations are confronted with the fact that under the new conditions they are behind in their assessment duties and without time to do it before date of forfeiture.

EDITORIAL

We owe almost exclusively to the exploratory work of the Geological Survey of Canada our knowledge of the more remote and inaccessible parts of our Dominion, and its work indicates those portions of our hinterland which are especially worthy of attention on the part of the prospector and the capitalist interested in mining.—F. D. Adams — 1912.

"THE WRONG WORD"

An eminently readable article by Mr. T. A. Rickard appears in the May 27th number of our contemporary, the *Engineering and Mining Journal-Press.* It is entitled *"The Wrong Word."*

Mr. Rickard impales upon the point of his flashing lance misusers of the King's English. As a happy, though unquestionably apocryphal, illustration he quotes the Chicago lady who expressed her delight at having heard "the French pheasants singing the mayonnaise."

The article (which, we believe, is a chapter from a new book on technical writing) gives instance after instance of the wrong use of unoffending words and phrases. But Mr. Rickard strikes a higher note than the advocacy of mere verbal accuracy. His concluding sentence is, "Without sincerity, the words of a man are as sounding brass or tinkling cymbal."

Nevertheless, for the sincere and insincere alike, the right use of words is a matter of very great moment. Strange as it may seem, college graduates are the worst offenders against the laws of usage and good taste in writing. Probably the cause of this is the fact that a college course extends their vocabularies faster than it develops their powers of assimilation. On the other hand, the organic literature of our race has been enriched by the writings of many men who never listened to a lecture within college walls. We do not, however, conclude from this that a college training necessarily unfits a man for good writing.

It is our opinion that no school or college training can take the place of continuous reading. He who aspires to write well must have an intimate friendship with good books. Today the splendours of English literature are accessible to all. But it is ordained that the man who will not explore for himself, cannot gaze upon these splendours.

Mr. Rickard is fighting a good fight. We hope that in his forthcoming volume he will emphasize most strongly the need of a wholesale revision of present day literary dietetics.

A MARKET FOR ELECTRIC POWER

One of Canada's chief assets is her abundant water power, capable of development at moderate cost. We are now in the midst of a period in which the development of these water-powers is progressing by leaps and bounds. The materials and machinery for this development of hydro-electric power are now almost entirely made in Canada — a very satisfactory state of affairs.

The development of water powers is a direct and comparatively simple class of engineering work, in which the natural conditions can be definitely gauged, the artificial works designed to suit, and the cost definitely calculated beforehand (the last in spite of recent events at the new Chippewa plant!). The market for the resulting power is less subject to control and to definite pre-determination, but there is hardly likely to be an over-development of hydro-electric energy such as there has been in the field of railway-building. The publicly guaranteed bonds, bonuses and land grants that attracted speculators and adventurers in the latter field have no parallel in the building of power stations.

At any time, and particularly at this time, we wish to turn our natural resources to account by creating usable wealth. Here we have a resource whose use can be extended quickly and without undue expense to many times its present capacity — provided a profitable market can be found for the electric energy. This is where the mineral industry comes in.

In the Montreal *Gazette*, a correspondent recently advocates the imposition of a duty on refined copper, in order to stimulate the building of refineries on this side of the border. At present, he states, Canada produces from her mines more than sufficient copper for her own use, but most of this is exported to the United States as concentrate, matte or blister copper, and imported again in the refined state. If a reasonable duty on refined copper will prevent this double transfer of our native material by causing the erection of electrolytic refineries in Canada, this would seem to be a clear case for tariff intervention.

A tariff is, however, a weak support upon which to lean, and often it turns out to be a broken reed. That electro-metallurgical works are capable of successful operation in Canada without artificial aid has been demonstrated many times over within the last decade. The plants at Shawinigan Falls, Quebec, are an outstanding example of this fact. From the simplest of raw materials there are made by aid of the electric current a marvellous diversity of products. Limestone produces [illegible] calcium carbide, acetylene, acetaldehyde, acetic acid and acetone and the innumerable chemical derivatives of the last two. Quartzite and scrap iron give ferro-silicon. Aluminum and magnesium are reduced from the corresponding

oxides, raw material for the former having still to be imported.

In each of these cases rock material that is absolutely or relatively cheap is converted into a highly valuable chemical, metal or alloy, with the electric current as the chief or the sole agency. Research is constantly adding new processes of this sort to the number already established.

Electro-metallurgical plants are good customers of the power plants, as they consume power in large amounts and ordinarily, at constant load. Other such plants can use off peak power, obtainable at reduced rates, and so almost confer a favour on the producers. In this connection it is interesting to note the recent development at Shawinigan of an electric steam generator, which utilizes off-peak power to make steam at less cost than it can be produced by burning coal.

Bearing these various points in mind, we may reasonably expect a continuous and rapid development of the use of Canada's hydro-electric power for the conversion of the products of her mines and quarries into merchantable commodities.

AN OPTIMISTIC ENGINEER

Dr. C. V. Corless, in the June *Bulletin of the Canadian Institute of Mining and Metallurgy*, gives a clear and reasoned reply to the recent criticism to which his optimistic public utterances have been subjected by Mr. C. M. Campbell of Cassidy, B.C. In this letter to the *Bulletin*, Dr. Corless puts his finger upon what constitutes the point over which he and his fellow-member of the Institute disagree. Both are completely sincere in their conclusions, and both have been working hard on this subject, in a disinterested way, and purely for the public benefit. Their difference is due to their having adopted dis-similar points of view.

It is usually the rôle of a geologist to project his ideas far into the future, and to venture prophecies as to the discovery, growth and decline of mining regions in the decades to come. The engineer seldom allows his speculative thought to travel far beyond his own mine, or at most his own camp; for he is bound by the ties of money, and must hold himself strictly accountable for any predictions of ore reserves or of future production that he may make.

Thus there are two trends of thought, which in the ordinary case cannot be allowed to mix with safety.

Mr. Campbell speaks as the operator. He cannot allow ore to be included in estimates until it is put in sight by one of the approved methods. Speculative reserves are not good practice, and are liable to "come back" on the unwise prognosticator. This is sound, and should ever be kept in mind by the engineer.

Dr. Corless has been an operator, too, and has made his close and canny estimates of what his mines will produce for him. But now he has of necessity become more a student of men and affairs in general; it is his main concern to study history and the present trend of events, and to build for the future. It is this habit of mind that has led to the conclusions he has expressed as to Canada's ultimate capability of mineral production.

It is only fair, in following the discussion of the two sides of this question by two eminent Canadian engineers, to examine into the point of view of each; else we will mistake both the meaning and the motives of both. Each has something valuable to offer to the reader.

THE VALUE OF MINERAL COLLECTIONS

The recent announcement that the University of Manitoba has established an extensive museum of mineralogy and economic geology brings to mind the importance of such collections. In this case Mr. W. F. Ferrier, who has a fine instinct for the collecting and arranging of mineral specimens, was retained for the purpose of instituting for the University of Manitoba this important part of its educational equipment. Mr. Ferrier's wide professional and personal acquaintance has resulted in the gathering together during the past winter of specimens from the four quarters of this continent, as well as many from beyond the seas. The old-established universities have been generous in their assistance to their younger sister.

The recognition of minerals in the field is, more than any other thing, dependent upon comparison with samples previously examined. There is such an infinite variety in the appearance of common minerals (not to mention rarer varieties) that the wise mineralogist is seldom willing to commit himself on the strength of appearances only. The only way in which to gain a familiarity with the minerals is to gaze at them, handle them, "paw them over", conduct the simple field tests innumerable times, until a reasonbly close acquaintance cannot be in doubt. But one must beware of too much dependence upon particular specimens; one may examine a hundred pieces of the same mineral, and each may be different from all the rest.

The more numerous museums of mineralogy and public exhibits of minerals become, the more rapidly will the public become acquainted with the facts of the mining industry. This has been repeated time and again; but as yet it has been insufficiently heeded in a practical way. We have a growing number of public exhibits of minerals; but more often than not insufficient explanation is accorded to passers-by to make the exhibit intelligible. This fault can be remedied with a little careful labelling and brief written notes, as is done, for instance, in every art gallery.

During the past year, the Ontario Department of Mines has had placed in numerous Mining Recorders' offices, collections of minerals and rocks representative of each of the localities. The specimens thus made available to prospectors for reference should prove a valuable aid to these pioneers. This idea is worthy of adoption throughout all the mineral districts of Canada. Thus the office of each Recorder, or similar official, might become a centre of distinct educative influence, in addition to its present functions.

Another systematic effort to make the prospector familiar with the minerals for which he is searching, and the rocks that contain them, is the prospectors' classes conducted by the Ontario Department of Mines. A feature

of these classes is that each one attending is presented with a collection of over seventy-five minerals and rocks. These specimens are enclosed each in a separate envelope on which is printed information regarding the mineral or rock — its occurrence, value and physical features, and simple field tests.

A good deal is being done at present to help the development of our mineral industry by means of collections of mineral specimens; but much remains to be done before full use will be made of this simple and most effective device for instruction.

EDITORIAL NOTES

The Journal registers today one more point in the optimist's score. Mr. C. B. Dawson's brief description of the lead-zinc deposits he has opened up on the shore of Great Slave Lake has more import than would appear at first glance. We have not been accustomed to consider the mid-continental plain as capable of any but non-metallic mineral production. Here, on its northern rim, is announced a prospect that already shows up one million tons of thirty per cent. lead-zinc ore. Mr. Dawson's laconic account of his work is characteristic of the genuine engineer — the man that does much and says little.

Dr. Morley Wilson's brief memorandum on the Madoc talc deposits is a small item in a large bit of work in which he is at present engaged — a detailed study of the Madoc district, Hastings county, Ontario. This area has long been known as a veritable store-house of minerals, many of them rare; but not until Mr. G. H. Gillespie organized the mining and milling of talc was there any consistent mineral production. The stimulus of war prices resulted in a substantial output of fluorspar, which has since declined to zero. Systematic development under normal conditions might result in a profitable fluorspar production. Meantime Dr. Wilson's studies, both scientific and economic (and who can say which is which?) will provide the best possible means for making the district consistently productive of a maximum of mineral wealth.

Labour troubles and Government taxation are intensifying the difficulties of mine owners and operators in Australia. The coal miners of New South Wales are particularly restless. A manifesto issued lately by the Coal Miners' Federation announces that the miners are prepared to take over the mines to show "capitalistic society" what real efficiency is, and to pave the way for the "classless society" of the future. Labour is prone to overlook the patent fact that its own ranks are very decidedly "classified" by union organization. "Classless" communities do not exist, will not exist, and cannot exist on this oblate spheroid until such time as the Powers in charge of our destinies shall have standardized each and every brain pan and its contents.

A NEW SOURCE OF SOAPSTONE IN ONTARIO

Mr. H. S. Spence, of the Mines Branch, Department of Mines, Ottawa, examined, last October, a deposit of soapstone near Dryden, Ontario, that gives promise of being of economic importance. His report is not yet published, but a memorandum has been issued giving the main particulars.

Though only a small amount of stripping has been done, outcrops show the deposit to be large. There are two bands of the rock, separated by about 100 feet of a gritty rock. One band is 35 feet wide and at least 500 feet long; the dimensions of the other have not been determined, but it is probably larger than the first.

The quality of the soapstone seems to be uniform throughout the deposits. The structure is not schistose or foliated, as is commonly the case, but massive. Chemical tests show an unusually pure soapstone. Mechanical tests are satisfactory even on weathered surface samples. Fusion tests show that the rock is superior in refractory quality to "alberene stone", a standard variety from Virginia.

As the soapstone composes a low ridge near the shore of Wabigoon Lake, and is distant only 500 yards from the Canadian Pacific Railway, it is most favorably situated for shipment.

The main use suggested is for bricks for the lining of the smelting furnaces of sulphate pulp (kraft) mills. There are more than a dozen of these mills in Canada, and the soapstone bricks for these, of considerable amount in the aggregate, are all imported from the United States. Other suggested uses are for bake ovens, fireless cookers, etc., where the heat retaining use of soapstone is used to good advantage.

I MILLION

(As with most of these fugitive verses, the following is based upon actual experience in a mining camp. The sudden acquisition of a million is often disastrous.)

O! I saw him on the morning that he got his million cold.
And perhaps he wasn't normal, but he didn't act the fool.
He was just a bit uneasy, so I didn't say a word,
But I acted quite as natural as if nothing had occurred.

I must say that I was anxious that he shouldn't lose his
head,
Or attempt to start a riot [illegible]
Being proud, I merely nodded as I wandered on my way,
And refrained from talking to him [illegible]
did I say.

You are welcome to your millions, [illegible]
And I wouldn't share them with you. [illegible]
was. Hot damn!
For the million that he'd garnered [illegible]
wealth.
But [illegible] little [illegible]
wealth?

ANON.

Talc in Canada*

BY M. E. WILSON

Deposits of talc or soapstone occur throughout Canada in Nova Scotia, in British Columbia, in the Eastern townships of Quebec, and in southeastern Ontario, but most of these, so far as development work has shown, are either limited in extent or impure, so that the only extensive known deposits of highgrade talc in Canada are those occurring in the vicinity of the village of Madoc, Hastings County, Ontario.

Geology

The rocks with which the Madoc talc deposits are associated consist almost entirely of dolomite, quartzite, and interlaminated quartz and dolomite (called Eozoon by the early Canadian geologists); but batholithic masses of granite occur nearby. On the Henderson property several dikes of luxullianite, a rock consisting chiefly of

Henderson Talc Mine (foreground) and Connolly Mine and Mill (in the distance). Madoc, Ontario.

brown tourmaline, have been cut. These range from 2 to 8 feet in width.

Deposits

There are 3 properties in the Madoc district from which talc has been produced, the Henderson Mine, lot 14, Concession XIV, Huntingdon township, owned by the Geo. H. Gillespie Company of Madoc; the Connolly, lot 15, Concession XIV, Huntingdon township, owned by the Anglo-American Talc Corporation now the Asbestos Pulp Company Ltd.; and the Eldorado property, lot 21, Concession V, Madoc township, last operated by the Eldorado Mining and Milling Company.

Henderson Mine. — The deposit on the Henderson property consists of pale white to pale grey, flaky micaceous talc in which a few scattered crystals of pyrite and a small proportion of tremolite, calcite and dolomite are present. It occurs in a huge S-shaped mass from 15 to 60 feet wide and several hundred feet long, the form of the deposit being due to deformation of the drag-fold type.

Connolly. — The deposit on the Connolly property occurs as a lens 200 feet long and 15 feet wide at its middle. It is similar in character to that on the Henderson property and was probably originally a part of the same deposit, but has become detached as a result of the deformation to which it has been subjected.

Eldorado. — The deposit on the Eldorado property consists of an intimate mixture of talc, dolomite, and quartz. The deposit is extensive, at least 100 feet wide and several hundred feet long, but does not contain more than 25 per cent of talc, and is too low grade to be workable except possibly for roofing material or other products in which low grade talc is used.

Origin

The deposits are almost certainly of metamorphic origin and have apparently been formed from the dolomite member of the Grenville series as a result of the intrusion of the granite batholiths. The presence of the crumpled dikes of luxullianite on the Henderson property have an important bearing on the genesis of the talc deposits because these dikes were probably derived from the granite batholith that adjoins the property on the south, and indicates that the talc or the material from which the talc was derived was subjected to high temperature conditions at the time the batholith was intruded.

ONTARIO'S NATURAL GAS IN 1920

The rock strata of Ontario have afforded us no solid fuel; but in the southwestern peninsula this lack is compensated in some degree by the supply of natural gas. The failing supply drew public attention, in 1919, to the fact that this resource is far from inexhaustible, and in 1920 the office of Commissioner of Natural Gas was created, with power to control and coördinate the use of this fuel with a view to its conservation. That Mr. E S. Estlin, the present Commissioner, has applied his powers judiciously and with marked effect, is shown by his annual report for 1920, published recently as Part 5, Vol. 30, of the Ontario Department of Mines.

The natural gas supply has been wasted in two ways; first, by actually allowing it to escape into the air, unburned, and by buring it uselessly; and second ,by using it where some other form of fuel would be more economical, from the point of view of national conservation. Both these forms of waste have now been checked to a noticeable degree, though the process of education upon which a complete cessation of waste depends will require a number of years to become effective.

The Prospector and his Prospect

(Written specially for the Canadian Mining Journal)

Giving advice to the prospector seems to imply two things: first, great wisdom and greater temerity on the part of the giver, and second, unenlightenment and eagerness to learn on the part of the prospector. Both implications are wrong. As the writer can lay claim to little wisdom and less temerity, and as prospectors are notoriously resentful of advice, the only excuse for this brief article is the desire of the writer to oblige the editor. I don't know that the result will please any body. "Howeffer!" as MacPhairson said when the camp missionary loaned him a tract on selective salvation.

* * *

First Work on the Claim

On the great majority of nearly-staked gold claims (I have chosen gold because it is the most sought for metal) preliminary work is wastefully misdirected. Naturally, no hard and fast rules can be laid down. Much depends upon the situation and topography of the claim, and upon the time and supplies and cash available to the prospector. The generality of cases will be covered if we suppose that the prospector and his travelling partner have a superabundance of time, are fairly well stocked with food supplies, and have a very small reserve of money that requires the most watchful husbanding. All these things being so, the prospector must now decide upon what he is going to do and where he is going to do it.

It is an easy enough matter, even in closely-wooded country, to make a rough compass survey of a small tract of land. A rough sketch plan of the property, not drawn to scale but displaying compass directions and accurate measurements of distances and major contours, is absolutely requisite. Sufficient time and pains should be spent upon this very simple task. It is essential for future reference and for the intelligent carrying-out of the opening work. I am sorry to say that such sketch plans are too frequently either not made or are improvised from the imagination.

Stripping and Cross-Trenching

A fairly workman-like plan being finished, the next step is to consider where stripping and cross-trenching can be done to best advantage. And here it should be remembered that the fact that you have two similar exposures, some hundreds of feet apart, is not proof that these belong to the same vein. Closer demonstration is needed. Hence as much time as can be spared should be devoted to studying the placement of work in relation to overburden, local topography, accessibility by future roads, fuel supply, water, permanent workings, etc. In short, the prospector should keep ever in mind the fact that sooner or later the property, if it prove up well, is to be inspected by representatives of capital My only excuse for writing this obvious platitude is that the prospector does very often seem to forget it entirely.

I think that prospectors and engineers alike agree with me when I say that the prime object of preliminary work is to expose the vein as continuously or at as frequent intervals as will make representative sampling possible. This being possible, it is a waste of time to attempt shaft sinking. Indeed, the misguided prospector needs this piece of advice. He seems to have an irrepressible yearning to dig deep holes. The yearning is atavistic; its results are works of supererogation. (Editor's note—If the printer doesn't mind, we don't.)

This being the case, attention should be focussed upon preparing the property for sampling and inspection. When there is only a light overburden, two men can do an astonishing amount of work. Should the overburden be heavy, part, at least, of the vein should be stripped at short intervals from the discovery and at as frequent intervals as the topography will permit thereafter. With heavy overburden, also, trenches and crosscuts should be carefully covered with brush to facilitate winter inspection and to keep the exposed surfaces clear of muck. Every trench and all stripping should be marked on the sketch plan.

Sampling

"Channel sampling" is a phrase that covers a vast amount of sloppy work. "Channel", "grab", and any kind of sampling may be utterly worthless and positively misguiding if it be not conducted with method and commonsense. By far the most important thing for the prospector to do is to make and keep a complete record of how, where and when he takes his samples, what the vein looked like at the spots where he took them, what the character and variations of the "mineralization", what the appearance of the walls, etc. etc. With these precautions taken, samples will have some meaning and the risk of future misunderstanding and discredit will be removed.

Window-Dressing

Human nature, unchanged and unchanging since Adam and Eve had their little misadventure in Mesopotamia (Editor's note:—We disclaim all responsibility for the writer's geography.) demands that careful watch should be kept over "show" specimens of ore. I have known of instances in Northern Ontario and Northern Manitoba where properties have been robbed of hundreds of dollars worth of spectacular ore. In not a few cases other properties, perfectly innocent of gold, have been sold with the aid of these show pieces. They seem to be as fatal a lure to the layman as is the "Silver Doctor" to our finny victims. And, of course, "specimen" ore has a meaning all its own, but it very rarely makes a mine; never yet has it made a mine in Canada. In truth, the best it has done has been to help in the development of prosaically low grade veins.

If the prospector keeps this in mind he will refrain from being carried away into the mephitic mists of high finance by the sight of "free" gold. His window dressing, therefore, should be conducted in the same spirit that inspires the shopkeeper to display his wares to best advantage.

Prospector and Purchaser

More sales of mining prospects have been blocked by the unreasonable demands of the discoverer than by any other cause whatever. That's the plain unvarnished truth. Few prospectors are salesmen. Nearly all are imbued with a transcendant faith in their own claims. Hence when the time comes for talking "turkey" to the purchaser, there is no common ground on which to conduct negotiations.

Now whilst without the impulsion of faith and hope the prospector would not prospect for a day or an hour, yet he should make due allowance for the other fellow. No one wishes to pay heavily for the privilege of spending more money, and this is what the prospector frequently expects the investor to do. On the other hand, the prospector probably [illegible]

If he, the prospector, by giving careful thought to what it will cost to open up, develop, and bring his property to the point of production, puts himself in a position to appreciate the purchaser's point of view, he will (supposing him to be a rational animal) make his demands proportionably reasonable. He has a right to insist upon a "forfeit" payment if an option is taken on his property. This is essential as a proof of good faith on the part of the buyers. But he certainly should be sweetly reasonable in his demands thereafter. In short, he should ever be willing to trust to the future of the property for a great part of his returns.

On the other hand, if the buyer is willing to pay cash down, I, if I were now a prospector, would sell Golconda, and the Inds, and golden Ophir for spot coin of the realm, at a fraction of their estimated value — and I would be well advised in doing so.

Whatever may be the faults and frailties of mining investors, it is certain that prospectors do not give them the consideration that is their due. If I have helped to correct this failing in the prospector, I shall be forgiven, I hope, for taking up so much space in doing it.

(Editor's Note:—It is only fair to the writer to state that he is not on our regular staff and is paid by space rates.) CAPRICORN

Lead-Zinc Deposits Near Great Slave Lake, Northwest Territory

By C. B. Dawson

Northern Alberta and that portion of the North-west Territory lying immediately to the north of it and around Great Slave Lake has, for a number of years, been a centre of interest to the oil prospector; but, with a few exceptions, no real search of the country for mineral deposits has ever been systematically carried out. The Government Geological Survey has done excellent work, but the area is so vast that much of it is as yet untouched and practically unknown geologically.

In 1914, a prospecting party was sent by an English Syndicate to examine the country near Great Slave Lake. This party staked a number of claims to cover some lead-zinc deposits they found about ten miles south of Pine Point, on the south shore of Great Slave Lake. As it was then late in the season, little work was done and the conditions arising from the War prevented a detailed examination until 1920 and 1921, when the writer, with a small party, did a considerable amount of stripping and test-pit sinking.

Location and Topography

The claims are situated in almost flat country, about 200 feet above Great Slave Lake, to which the descent is imperceptible, save at a point about two miles back from the lake where some low shaley limestone ridges provide a slight local relief. The country consists for the most part of sandy or bouldery plains, interspersed with swamps and muskegs and very low esker-like ridges of gravel or sand. The prevailing timber is Banksian Pine, with which is associated in minor amount white and black spruce, tamarack, aspen, balsam-poplar and birch. The soil is almost invariably poor and unsuitable for a heavy forest growth; but trees up to 9 inch butts are found in sufficient numbers to provide ample timber for general mining purposes.

Geology

The underlying rock of the district consists of dolomite (locally described as the Presqu'ile formation) belonging to the Middle Devonian. Judging by the few exposures between the claims and Great Slave Lake, this dolomite passes downward into shaley limestone and bituminous shale, which may represent the lower measures of the same phase of the Middle Devonian or the upper part of the formation below, namely, the Pine Point limestone.

The lead-zinc deposits so far discovered and covered by the claims occupy the eroded crests of what are considered to be low anticlinal folds. Their outcrop is characterized by sink-holes which, in the case of three of the four deposits, almost completly surround the ore and in general appear to mark its surface limitations. The visible sink-holes are obviously post-glacial in age. Whatever their origin, it would seem clear that there is some connection between their occurrence and the pyritous outer portions of the lead-zinc deposits. Their maximum depth below the general level is about 20 feet. Where the deposits are capped by barren dolomite or dolomite low in lead and zinc or by boulder-clay, the surface, apart from the sink holes, gives no indication to betray the occurrence of mineral deposits beneath. Where, however, the ore actually outcrops, there is no vegetation and the surface is covered by a crumbly gossan throughout which cubes of galena are thickly scattered.

The Ore Deposits

The metallic contents of the deposits are galena, sphalerite, marcasite and pyrite together with the oxidation products of these minerals. Oxidation was evident at the greatest depth reached in a prospect shaft, namely, 32 feet.

While the mineralization commonly follows the bedding planes of the dolomite, increasing and weakening horizontally, irregular lenses of ore cross the strata at every angle, and bunches of similar material occur irregularly throughout the dolomite. The knowledge so far gained would seem to indicate that the deposits are roughly circular or elliptical in horizontal cross-section, and that as regards mineralization, lead minerals predominate over zinc towards the centre, and at depth the galena and sphalerite become very intimately mixed.

The depth of the deposits is as yet unknown, but it is believed to be considerable and to be limited only by the depth of the Presqu'ile dolomite at the claims. Near the south shore of Great Slave Lake this dolomite is about 200 feet thick.

Sufficient data is not yet available to correctly estimate the ore so far developed; but a close approximation will place it in the neighborhood of one million tons, as determined by the prospect shafts. Channel assays taken from all parts of the deposits average 30 per cent. lead and zinc, with a silver content of 1.5 ounces per ton.

Transporation is the only hindrance to the immediate development of the property; but this is rapidly becoming better, and soon will present no serious difficulty. With the completion, recently, of the Alberta and Great Waterways Railway there is now direct communication between the rail centre of Edmonton and Fort McMurray, the beginning of the great water route to the Arctic Ocean. This water route, via Athabaska River, Athabaska Lake, Slave River, Great Slave Lake, and the Mackenzie River, gives, save for a sixteen mile portage at Fort Smith on the Slave River, uninterrupted communication to the Arctic Ocean, and three trading companies have small steamers plying between all points en route.

The New Mining Curriculum at Toronto University

By O. H. Boyd

Of recent months, much attention has been given publicly to an analysis of mining engineering courses in American Universities. The investigation has disclosed the fact that academic curricula, designed for the education of mining engineers, differ surprisingly in various parts of the country. From the diversity of circumstances responsible for this condition, two factors stand out as largely determinative; first, the location of each particular university with regard to mining areas; and second, the personal convictions and ideals of each particular professorial staff. The first of the two factors, the geographical one, governs the relative stress laid on different types of mining and milling operations. For instance, universities situated in or near petroleum areas have specialized in petroleum courses; those located in coal areas naturally emphasize coal mining, and so on. But according to Mr. J. T. Hoover, who analysed no less than fifty mining curricula, the human, not the geographical, element is the more important of the two. He concludes that Mining Engineering courses in American universities have been built around men, each one an expert in some specialized field, who have constructed or modified their courses in the light of their individual experiences and interests. Judged by the size of student enrollments and the subsequent careers of graduates, academic success consists in maintaining a sanely adjusted equilibrium between general and specialized subjects, between the cultural and practical sides of the program.

Until very recently, the idea of giving engineering students intensive instruction in finance, business methods, technical writing, labor organization and kindred subjects was for some inexplicable reason, considered *infra dig*—it simply was'nt done. The technical graduate must at all costs be a technical graduate. As an embryo mining engineer, it was impressed upon him that his world consisted primarily of rocks and of such mechanical equipment as would facilitate the economic mining of those rocks. His business was simply to apply technical knowledge in the matter of rocks. That in doing this he must first deal with the owners of the rocks and with other people interested in them was an incidental and a comparatively insignificant circumstance. Traditional professional ideals made it appear more dignified, more fitting, to deal with rocks than to deal with men. The inevitable result was that the young graduate was so obsessed with the supposed omnipotence of technicalities that his performance in the business world was both pathetic and ludicrous. His handling of labor was as a rule, equally ineffective. Poor chap, he hadn't long left the academic apron strings before he found that the world of reality wasn't entirely made up of drill steel, ore bodies, flow sheets, and assay samples; and depending on each man's temperamental propensities, the realization came either as a disillusionment, or as the dawn of unanticipated opportunity. In either case the more agility he displayed in adapting himself to his newly discovered world of men, the more surely did he pave the way for a successful subsequent career.

If we are to judge by the new curriculum planned for the term 1922-3 in the department of mining engineering at the University of Toronto, traditional views of engineering education are undergoing considerable remodelling. The philosophy of mining education is broadening. The aim now appears to be to graduate potential business men as well as skilled technicians. It is becoming more generally recognised that a preponderance of emphasis on technicalities (at the expense of cultural and business elements) produces a distortion incompatible with professional ideals. The trend of academic instruction is beginning to show an appreciation of this fact.

A graduate of this year, comparing the projected course for 1922-23 with that offered him in his freshman days, would observe a number of important changes in the curriculum. In general the object is now evidently to introduce the student to mining at an earlier stage of the game than was formerly the case. Heretofore the first year program was identical with that of the other courses—civil, mechanical, electrical, chemical, etc. The new calendar shows that two new subjects peculiar to the mining student's special needs have been added, namely: mineralogy and mining. The latter will include practical examination of mining apparatus and an elementary study of mining methods.

It will be of value if it only serves to acquaint the beginner with the general appearance and function of a common rock drill. With this knowledge in his possession, his début as a drill-helper will be free from the wondering awe with which his less sophisticated predecessors have regarded the "bohunk" drill runner.

The second year has undergone a radical readjustment, and despite the transference of the heavier methematics to the first year, is still the most difficult of all four. With the new additions, Theory of Measurement, Ore dressing, Steam Engines and Theory of Mechanism, it embraces some fifteen formidable subjects. The series of lectures to be given next year by Prof. H. E. T. Haultain, in Theory of Measurement, is designed to deal with the causes of error in measurement and the practical application of approximations. Steam Engines and Theory of Mechanism have been added in recognition of the fact that the work of the miner frequently borders on, and may even include, that of a mechanical engineer. The chief innovation in the third year is the laboratory work in connection with Introductory Research. Three hours per week in the spring term are to be devoted to the application of the general principles of scientific investigation. The aim is not so much to solve specific problems as to afford practical experience in research methods. Two years ago a summer surveying camp was established at Gull Lake in Haliburton County. Mining students are required to spend four weeks there acquiring practical experience in field work before entering their third year. A considerable variety of surveying is undertaken during this month including stadia and boundary traverses, triangulation, cross sectioning and computation of earth works, topography and some hydrographic work.

In the fourth year, lectures in Business Management and Metallography have supplanted petrography and chemical lab. Apart from this, the most significant adjustment is the additional time set aside for research work. A thesis is required in the department of Mining based on original research work done in the milling, assaying and chemical laboratories. Its purpose is the development of individual initiative; each man selects some simple technical problem in which he is interested and devotes ten hours per week to solving it. It matters little that due to time limitations he seldom fully succeeds; the justification of undergraduate research lies in the fact that the

student's mental processes have been stimulated and developed.

The fifth year work in Mining for the degree of Master of Science is attracting an increasing number of graduates each year. A splendid opportunity for research work in assaying and ore dressing is afforded. Investigation and research are becoming more and more an integral part of mining operations and the fifth year work is a special training in this direction. In addition to some special research work, all candidates for the advanced degree are required to devote some time to the study of the following subjects. Cost keeping, in connection with efficiency and motion study, patents, and technical writing.

The business element is to be strengthened by the addition of a series of lectures in general business and technical writing in the first year. The latter will include compilation of data and writing of different types of engineering reports, and a study of technical terminology. There will be a cultural as well as a practical value in this course, since the expression of ideas which it aims to encourage is essentially a literary accomplishment.

In addition to the usual six months' experience in actual mining, beginning with next year each student will be required to spend at least two months of his vacation as office man or clerk. This will provide some understanding of office and executive routine and will supplement in a practical way the academic instruction in business, management and cost-keeping.

INVESTIGATIONS OF PEAT BOGS IN ONTARIO DURING 1921

In the Summary Report, Part D, 1921, of the Geological Survey, about to be published, there is included the result of Mr A. Anrep's annual investigation into the peat resources of the province. In view of what is generally believed to be imminence of its commercial use as fuel, various communities are now taking a decided interest in the potential sources of this fuel in their vicinities.

Last summer Mr. Anrep surveyed four bogs, having a total of over 10,000 acres. Three of these, in the vicinity of Port Arthur and Fort William, have a combined content of slightly over two million tons of fuel (as prepared), including only those parts of the bogs whence the peat can be economically recovered. The Verona bog, north of Kingston, contains over ten million tons of similar fuel.

Arthur Peat Bog

This bog, nine miles west of Fort William, has a total area of 1,474 acres, on 932 acres of which the peat is over 5 feet deep, with an average of 7 feet. Though mixed with roots and stumps, the peat is fairly well humified, and could be manufactured for fuel. The bog could be easily drained. 1,003,000 tons of peat fuel could be produced from the bog.

William Peat Bog

The William bog, near both Fort William and Port Arthur, contains 863 acres with an average depth of 7 feet of peat, the remainder of its 1,789 acres being less than five feet in depth. The peat is fairly well humified, and though slightly imferior to that of the Arthur bog, could be used for the manufacture of machine peat, of which 928,000 tons could be produced.

Both the above bogs are very conveniently situated as regards market.

Twin Cities Peat Bog

Though 993 acres in total extent, 895 acres of this bog have peat to a depth of less than five feet, which is not workable commercially. The 105,000 tons of potential fuel available in the remaining 98 acres is not likely to be used, as the ground is already drained preparatory for use, as it is within the limits of Port Arthur and Fort William.

Verona Peat Bog

Of the ten square miles covered by this bog, almost nine square miles, on 5,404 acres, has peat to a depth of five feet or more. The recoverable fuel is 10,636,000 tons. It is 30 miles north of Kingston, and is intersected by both C. P. R. and C.N.R. The bog can be easily drained, and the quality of the peat is good. "The bog is deepest between Verona and Bellrock, and if the surface there were cleared and the bog properly drained, it would be very suitable for fuel."

Gradually, year by year, the potential fuel resources of Ontario and Quebec have been thus determined. The total is now impressive; yet the work has been merely commenced.

Correspondence

To the Editor,
Canadian Mining Journal,
Dear Sir,

In your issue of May 19th last, Mr. Alex. Gray in his "News and Comments," refers to a certain advertisement which I published in the Montreal Star, headed "Gold Mining Opportunity".

There are so many of your readers who in the above satire will recognize my connection with the matter that I place great hope in your giving this reply the consideration which it deserves.

First of all I will correct my mistake in connection with Mr. Bancroft's title. Mr. Bancroft is with the Granby Company at Anyox, B.C. and not the Consolidated Company. That, however, does not affect the mine in question. The point at stake is whether my advertisement was a "come on" ad., as Mr. Gray states, or not.

Mr. Gray speaks of certain articles published in newspapers of two continents stating that "Labrador has the Mother Lode of Canada, one offshoot being near the Transcontinental Railway in Quebec". No doubt he infers that I inspired those articles. As a matter of fact I did not. I was interviewed in London about the mineral resources of Quebec and I described the magnesite, feldspar and asbestos deposits of the Province of Quebec. I also gave an account of the gold discoveries in the Harricana district and displayed to the reporters spectacular gold specimens from the very property which seems to rile my friend so. Some of these specimens of gold ore weighing from one to two hundred pounds, yielded on extraction from fifty per cent to two per cent in gold by weight. One specimen treated right here in Montreal weighed two pounds and yielded Three Hundred and Sixty Dollars of gold.

I told those reporters then what Mr. C. V. Corless told the members of the Institute of Mining and Metallurgy at Ottawa in March this year, viz: that the major portion of the pre-Cambriam area surrounding Hudson Bay is located within the Province of Quebec, and that as the minor part of this area had given Ontario such bonanza fields as Cobalt, Porcupine, Sudbury, Kirkland Lake, and others, so the major part might well hold in store for Quebec as great, if not greater riches. If the reporters then hashed up my remarks and served the public with a good-looking mince pie, that cannot reflect on me.

Mr. Gray, in his "Controversy over Canada's Horoscope," upholds Sir Percy Fitzpatrick when he says: "The Optimist is always right." Sporting spirit is what makes the world move, says Mr. Gray. Well, it was mighty poor sporting spirit on his part to attack me without knowing any of the facts. Mr. Gray never saw my property. If he had, he would now be boosting it instead of knocking it. He refers to Mr. Bancroft's report as "not being a thing to enthuse over." I say Mr. Bancroft saw this property in its very early development,and Mr. Bancroft's report is satisfactory under those circumstances.

Now we come to the point where Mr. Gray, in connection with the newspaper comments regarding Quebec's Mineral resources, says: "London sat up and took notice. An alert mining engineer visited Quebec and inspected this real gold mine, etc."

I emphatically deny this. Mr. H. S. Denny, E. M. of London, England, was appointed by friends with my consent to visit this and other properties. Mr. Gray never saw Mr. Denny's report, nor did Mr. Denny ever pass any of the remarks attributed to him. Surely Mr. Denny told him nothing, because Mr. Denny would not make anyone his confidant other than his principals who sent him here.

Mr. Denny's report on this gold property, as a matter of fact, was not unfavorable. His principals have repeatedly made me propositions in connection with this property, but I prefer to handle its development along different lines. Mr. Denny called the property "a very good prospect in an unknown and undeveloped district." Now that is quite different from what Mr. Gray says, don't you think so, Mr. Editor?

Furthermore my kind friend takes no notice whatever of the reports by Messrs. John W. Bell, Adhemar Mailhiot and Charles Spearman, all professional men in good standing; unless our modern crusader does not think their opinion worth anything. Was not Professor Mailhiot sent to my property by the Quebec Mining Department, and did he not publish a most interesting report on the whole district? Did not Mr. Bancroft conclude his report by advising that "not a single stone should be left unturned in this district to determine its true value?"

There only remains one more question to be answered. Mr. Gray seems to take it for granted that there is no payable ore in any quantity on this property. This opinion, no doubt, is unwarranted and unjustified. In the course of operations I have exposed numerous veins. One of these has been stripped for a distance of 650 feet; is 22 inches wide; has been sunk upon to a depth of 110 feet, and yields $30. of gold per ton. Another vein, over 300 feet, down to 60 feet, shows $26.10 per ton. An ore body, some 100 feet wide, shows spectacularly rich ore in many places, and in a shaft on part of this ore zone at a depth of 60 feet, Mr. Bell of McGill University, mined 8.3 tons of quartz, which were put through the stamp mill at McGill, and yielded $39.64 of gold per ton. This lot consisted of clean quartz, with no visible gold present.

Now, if this prospect is not worthy of spending $25,000. on it, and if I, after spending $57,000. of my own money on its development, have not got the right to advertise for a partner without being subjected to attack by Mr. Gray, will that gentleman please step forward and just say that we in Quebec cannot open our mouths about our Province's resources, and that this privilege is only reserved for our more fortunate brethren of Ontario?

Yours, etc.
S. E. Melkman

Montreal, May 26th, 1922.

MR. H. C. CROW

After twelve years as sales manager of the Canada Metal Co., Limited, of Toronto, Mr. H. C. Crow has resigned his position and opened offices in the McKinnon Building, Toronto, for the Blue Quartz Gold Mines Limited, of which he is president.

The development of this Nort[illegible] gold property has now reached a [illegible] Mr. Crow devote his whole [illegible] He intends leaving for Engl[illegible] ness of the Company w[illegible] and will be gone for several [illegible]

United States [illegible] figures for the [illegible] industry [illegible] not yet available for 1921. In the year 1920, a total of 6,365 tons of domestic sheet and scrap [illegible] was sold in the United States. The average price of all [illegible] was $109 per ton, and the average price per pound of sheet mica, 39 cents. Rough trimmed sheet [illegible] of good quality, split and sorted to [illegible] inches by [illegible] brought 51 cents per pound. [illegible] brought as high as $7.00 per pound. [illegible] ranged in price accordingly. England and Canada were the leading consumers of mica exported.

News and Comments

BY ALEXANDER GRAY

Lunar Green Cheese

Were it not for the after effects of it all, it would be infinitely more agreeable to pass unnoticed a good deal of the publicity being dispensed on behalf of the Argonaut and other areas extending over into Quebec. There will always be a certain amount of that sort of thing done in order to raise funds. It is not an easy matter to draw the line between prevarication and the truth — and every legitimate prospect is entitled to a limited amount of credulity and cash. Unfortunately, in the campaign on behalf of the Argonaut (for which the mine management may not be altogether reponsible) the tendency has been toward over-indulgence in "dope". To illustrate, a recent issue of "The Montreal Star" may be cited. A wire from Dane stated that "the success which has attended the efforts off the management of Argonaut Limited to demonstrate that the deposit of gold on their property can be mined at an exceedingly good profit", has resulted in "great activity" in the locality, and "it is believed the gold dyke extends along into Quebec", etc.

Montreal was given both barrels, so to speak; on another page of the same issue Lightning River gold values were certified in this picturesque manner:

"It is a fact that the veins of every Gold Mine in Northern Ontario have improved with depth, not only in richness of ore but in the size of the ore bodies.

"On the first 100 feet of sinking, the largest and most successful mine on the Porcupine District produced gold at the rate of $4.00 to the ton".

By contrast, Lightning River assays are quoted running six and ten times four dollars; so "it may only be guessed what the Lightning River Gold Mines properties will produce when in full operation."

This deduction is perfectly true. Rather than "guess" so far ahead, however, it is safer to stick to the text that "the most successful mine in the Porcupine District" made a trial shipment from its initial working that averaged quite a bit above $4. That, though is less relevant than the further assertion that the company concerned have four properties "every one of which shows unquestionably evidence of containing great wealth."

Those who adhere to the Cousin Jack maxim, "where it is: there it is", will not render drum-head judgment as to all of this, or part of it. The Argonaut has not "demonstrated" it can mine and mill "at an exceedingly good profit." It may do so; but the York mill did not do it, and the new mill will not be ready for some time, according to the rate of progress being made. At the moment, the management is dealing with a faulted ore-body, and nothing is being left undone to locate the ore by diamond drill. That there is excellent ore, is not disputed. Whether it will feed a mill long enough is not to be determined by "guessing". And as to Lightning River being the Aurora Borealis, Midnight Sun and all the orbs of day and night combined, it is as well to quote what Percy E. Hopkins says in his Historical Summary of Gold Mining in Ontario:

"Type of Gold Lode-Sheeted zone, e. g. minute fractures closely spaced and parallel. Examples are the Howey-Cochenour at Lightning River", etc.

"Lightning River—In August, 1917, gold was found on the Howey-Cochenour claim L. 7315, in Holloway Township. According to A. G. Burrows and C. W. Knight, the rocks comprise alternating flows of Keewatin basalt and rhyolite lying in a nearly vertical position. The rhyolite in many parts of the area shows the presence of gold in small quantities. The original discovery is a sheeted zone from 2 to 3 feet wide, in which is a persistent quartz vein up to 10 or 12 inches wide containing calcite, chlorite, feldspar, pyrite, zinc blende, galena and visible gold. A 70-foot incline shaft was put down on the vein, but values lowered considerably when the vein passed from the more basic rock into ryolite. Other important discoveries were made in the area during 1921."

Should the latest of the discoveries justify the representations contained in the newspaper advertisements, Lightning River differs somewhat from what Messrs. Burrows and Knight discerned. Anyhow, it is stretching it to make the claim that "Every vein has improved with depth".

A "Pool" There Was

Paraphrasing Kipling (though doing it apologetically may not be amiss in referring to expensive advertisements appearing in the daily press about "The Gold Pool". The heading is of the "Stop, Look, Listen" sort. Couched in reverse English, for the purposes of this comment, the more ominous word "danger" might be added. A "Funding Company" prposes to take "anything from $30 to $3,000", from anyone, and to deal "in the shares of an active listed Northern Ontario Gold Mining Company", upon whose property "sufficient development work has been done—sufficient test shipments of ore made to the smelter—to warrant the belief that untold profits are possible".

Nothing is said about the emoluments to accrue to the managers of this "pool". As a matter of course they will have a percentage. Their scheme is novel, though not new. Exactly what advantage there is going to be in the surrender of cash for what may be vendor or promotion shares, need not be dilated on. The "pussy-footing" tactics displayed convey their admonition, that if purchasers have no judgment of their own to exercise, they should avoid shares selling in the open market for 15 or 20 cents. There is money enough for every bona fide prospect in the North Country recommended by reputable, capable Mining Engineers, without enticing the public to plunge in a pool that has a "no bottom" sign. Only the other day this "Funding Company" was supposed to have taken an option on certain shares at 25c but the market price is considerably below that at present. *"A 'Pool' There Was—Even as You And I."*

Other People's Money

When a Montreal Exchange house blew up the other day it was made public that the only asset against a liability of over $600,00 was a membership in the Stock Exchange. The members of another firm were arrested for misappropriation. Other outside concerns that toppled have compromised with their creditors. More

whose money vanished while collateral disappeared, have little but the cost of liquidation to show for all the splurge they made. Prosecutions for mutifarious misdeeds, notwithstanding the exposes and disastrous consequences, have been together too few, and the only moral effect is that those who speculate probably will be more discriminating. As a rule, membership in strictly Stock Exchange firms is a guarantee of faithful performance. Daily clearances and close banking supervision provide safeguards. The integrity of many co partnerships and companies not included in Stock Exchanges is unquestioned. In the conduct of speculative business, no risks are taken that can be avoided; but there is no denying that markets have vagaries and human nature often is dereliet. A glaring example is the alleged "stockbroking" firm at New York, now in bankruptcy. The liquidator has sworn that between January, 1921, and January, 1922, "nearly four million dollars", (the amount involved) had been juggled with. The firm "spent over $2,500,000 on an income of $20,-000." Here is a partial schednle: For lunches, exclusives of lunches charged to petty cash, $35,000; Stamps, $33,000; Advertising, $71,000. Leased telegraph wires; $94,000; Branch Offices, $94,000; Stationery, $48,000; Travelling Expenses and Entertainments, $11,000, and Statistical Services, $18,000. It is hurriedly explained, however, that "these were only petty expenses". Un-administrative expenses amounted to $700,-000, mostly for branch brokerage houses. Salaries took $485,000, aside from the $310,000 in cash said to have been drawn by members of the firm during the year. General Administration cost $115,000, and Defalcations $210,237. "That's the way the money goes." Some of it is yours!

Mining Corporation of Canada, 1921

A combination of counter-currents is responsible for much of what is disclosed in the report of the Mining Corporation of Canada for the year 1921. What cheer the statement contains is substantial enough, if metal markets are responsive and speculative investments can be hastened to maturity. Whether in retrospect or in perspective, there is cold comfort in writing off $252,-939 on account of loss on Canadian Industrial Minerals, Ltd., and $231,023 on an optioned property. Failure of power, a break in the price of silver, combined with all else, precluded dividends and the maintainance of the carry-forward, which is $2,746,191 as compared with $3,268,628 the year before. While the Flin Flon and other optioned properties were written up from $109,-101 to $738,948, the total assets were written down from $11,666,686 to $11,125,945.

That the Mining Corporation remains in a strong financial position, is complimentary to the administration and management. The gross income of $578,913, as against $1,643,065 in the year previous (1,226,716 and 1,664,018 expressed in ounces silver) was mainly derived from the Buffalo property. Rather than sacrifice silver at the low market price production was curtailed; for it is to be noted that the ore reserves are estimated at 1,935,745 ounces, compared with 2,118,100 ounces. Buffalo silver reserves are estimated at 1,197,-915 ounces, a gain of 117,885 ounces after the property had yielded 731,201 ounces in 1921. Admittedly the Cobalt properties are approaching exhaustion and dividends are contingent upon the market for silver and operating costs; but the company are on the alert and "some of the properties acquired give promise of being substantial and profitable producers". In the Flin Flon alone, when capital and transportation facilities are provided, there are the elements of successful operations. Meanwhile working capital must be conserved. All of it and more will be required for larger enterprise.

Dr. Ruttan Urges Research Guilds

For reasons that need not be stated Dr. R. F. Ruttan as a pre-eminent Scientist is in a position to stand four-square when he addresses his fellows of the international British Society of Chemical Industry, of which he is President. It is the more appropriate to have a man of his achievements and independence make the retort courteous to legislative ostriches who seem to think Canada can keep on importing what she is able to produce, and exporting technical experts, graduates of her own universities, and retain those who remain upon a beggarly stipend. With about 4,000 engineers somewhere near the bread line most of them qualified by Canadian collegiate training and experience, Dr Ruttan made a patriotic appeal to the Canadian Branch of the Society of Chemical Industry for a higher valuation, a greater degree of public recognition of the services of Canadian Chemists. They had demonstrated their resourcefulness and economic worth prior to and during the War and their value can be enhanced in time of Peace and greater Competition. "More than a thousand of the best graduates of Canadian Universities have emigrated to the United States" urged Dr Ruttan, "whose industries and wealth they are developing", and if Research Guilds are provided "with simply-equipped laboratories, each costing $25,000, and sufficient salaries, it is hoped some of these brilliant men will return."

The plan advanced by Dr Ruttan is that Guilds similar to the research associations recently formed in Britain be formed from groups of industries interested in the same line of research. By this plan, and through research, he said, much can be done to liquidate the national debt.

One serious difficulty is the low standard of value maintained at Ottawa and elsewhere. Individual initiative will go so far; collective, group effort through Guilds is a practical solution. It is being proved so in the United States, not only in chemical research but wherever mechanics enter into industrial affairs. Leaders of industry have liberally subscribed funds. Inventors have the privilege of submitting their devices or formulas, duly patented or meriting consideration. Specialists pass upon the features of whatever looks like an added efficiency or an economy in any direction.

Ordinarily inventive geniuses fear sharp practice and decline to deal with principals who might regard really meritorious inventions as being inimical to their vested interests. The contrary is the declared purpose of those responsible for this central organization, to which money is devoted because progressive economies must be effected. Suppression is not contemplated. Whatever is better than anything Gary and Schwab now possess, is worth more to them, it is reasoned, than it could be to others. If there is something the General Electric and Westinghouse people need in order to increase production by simpler methods, the argument is that these great corporations will pay more for it knowing what it promises.

Dr. Ruttan has the right to call for Government aid more and than has ever been provided. Speaking to and for the Chemical Industry he exercised that right. At no time has there been greater necessity for exactly what is sought—the encouragement and retention of our Canadian made Scientists.

News of Mining

Coal buyers in the United States show an extraordinary apathy towards the non-production of anthracite. The demand for bituminous coal is increasing daily and prices are rapidly going up.

Production of coke in the Connellsville region is now about 250,000 tons per week, as compared with 150,000 tons before the strike was declared. Much dissatisfaction is reported to exist amongst miners and coke workers. Apparently no relief is being received from the United Mine Workers' Headquarters.

During January and February, 1922, Germany imported 1,131,700 tons of iron and manganese ores, and 136,912 tons of pyrites. The chief mineral exports were 1,121,800 tons of coal.

Exports of iron from Spain during 1921 came to 1,824,761 metric tons, as against 4,630,662 tons for 1920; iron pyrites, 1,195,435 tons, as compared with 1,331,150 tons; and manganese ore, 31,774 tons as compared with 47,250 tons. Similar falling-off is noted in the production of anthracite, bituminous coal, and lignite.

In the period 1914—1921, the average net increase in the weekly wages of mine and quarry workers in Great Britain is estimated at £790,100 per week.

The Government of the South African Union has introduced before the Legislature a Bill compelling the grading and certification of all coal sold for export or bunker use. An official Grading Committee are to be responsible for inspection and authorization of sales, and administration expenses will be met by levies on collieries in proportion to their shipment.

In thirty-six years the Mysore Gold Mining Company (India), Limited, has not passed a dividend. Last year the company distributed £61,000 in dividend payments. This was equivalent to 25 per cent. on its paid-up capital. The aggregate of dividends paid, including those of 1921, exceeds nine million pounds.

The Mount Morgan (Queensland) mine strike, terminated last March after it had lasted a year, is reported to have cost the strikers £300,000 in the lost wages. Work has been resumed under the disadvantageous condition of lower prices for both gold and copper. The Queensland Government is assisting the operators with weekly cash subsidies.

Gold prospecting in Nova Scotia is showing more signs of activity than at any other time in the last twenty years. Payments of the small license fees for gold and silver prospecting amounted to 3,595 in the last quarter of the fiscal year ending September 30th, 1921. This is an encouraging symptom. The projected development of water powers will largely benefit gold mining in the Province.

The United States Bureau of Mines purchased silver to the amount of 1,610,000 ounces during the week ending May 6th. Under the Pittman Act, fixing the price of domestic silver at 99 5-8 cents per ounce, the Bureau has purchased to date 109,471,356 ounces.

A lively debate on the proposed duty on cyanide (McCumber Tariff Bill) took place recently in the United States Senate. Senator McCumber, in support of the imposition of an import duty, stated that Germany, Canada, and the United States all have monopolies of the manufacture of cyanide. He cited the rise in price during the war from 10 cents to $2 per pound and claimed that without active United States production a like rise in price in the future would be inevitable. Senator Pittman answered this argument by asserting that he did not think Senator McCumber spoke candidly; that a duty would merely serve to keep the Roessler and Hasslacher Chemical Company going, and that the report of the Alien Property Custodian had shown that that concern could sell cyanide for about half their present price.

Germany has been one of the largest buyers of British iron and steel exports for some time. Her purchases in March were exceptionally heavy owing to the approaching exhaustion of supplies of scrap. Germany is forced, for this reason, to purchase foreign pig-iron.

An analysis of gold-dredging operations in California brings out the fact that the industry has been very sanely conducted. Up to the end of last year, the average earnings on investment represented a steady return of from 10 to 15 percent. There are 130 dredges in commission. Gold to the amount of about $125,000,000 has been produced since the inception of the industry.

The tacit recognition of the Soviet Government delegates at the Genoa Conference has had an important bearing upon the platinum mining industry of Russia. The resumption of normal production is foreshadowed by the fact that the Soviet Government has requested M. Louis Dupare, professor and director of the Geneva School of Chemistry, to visit Moscow for the purpose of superintending the re-organization of the crude platinum industry. M. Dupare has consented to go. He is to be given ample powers and authority.

The Council of the Federated Malay States Chamber of mines has decided against the policy of restricting tin ore outputs. Restriction of outputs had been urged on account of very poor present demand. The Council, however, is of the opinion that the remedy lies in encouraging the extension of market activities, rather than in artificial restraint of trade. In any case, the fact that very little development work was done last year will have the inevitable effect of curtailing production in the near future.

The development of large deposits of high-grade bauxite near the Dalmatian coast has had the effect of depressing the prices paid for French bauxite. Germany is reported to have purchased recently 100,000 tons of the Dalmatian ore. One shipment is stated to have had the following analysis: Alumina, 55.90 per cent.; silicia, 0.93 per cent.; titanium oxide, 3.50 per cent. It is not known to what extent this is typical of the ore bodies.

Notes From Nova Scotia

The thirtieth annual meeting of the Mining Society of Nova Scotia held its sessions in the Court House, Sydney, on the thirtieth and thirty-first days of May.

George D. MacDougall, Chief Engineer of the British Steel Corporation, was re-elected President at the opening of the session.

Other Officers elected were, C. M. O'Dell, First Vice-President, A. S. MacNeil, Second Vice-President and E. C. Hanrahan Secretary-Treasurer.

The Honorary Executive comprises T. J. Brown, Hon. Robert Drummond, F. E. Lucas, Malcolm Blue, R. E. Chambers, A. McEachern, W. H. Graham, H. B. Gillis, J. R. MacCann and J. J. MacDougall.

There were fifty members present at the opening roll call, many of them Officials of the Cape Breton Island coal and steel companies. Those from the mainland were C. H. Wright, Manager Canadian General Electric Co., Halifax, Hon. E. H. Armstrong, Halifax, Hon. Robert R. Drummond, Stellarton, W. B. Timm, Ottawa and J. C. Nicholson, Springhill.

President G. D. MacDougall's Address

President MacDougall greeted the officers and members of the Society. His address was brimfull of practical suggestions to the Society for its work of the current year. He briefly reviewed the work and progress of the Society since it was organized in 1892. At the beginning it had for many years a membership largely interested in the mining of gold and had its headquarters in the City of Halifax. With the decline of the gold mining industry and the rise of the coal mining and steel industries the headquarters was in 1913 moved to Sydney. After a successful start in 1914, the great war absorbed the energies of the members to such an extent that the regular practice could not be carried on until 1921. The success of the meeting last year and the attendance at the present meeting was sufficient proof of the vitality and excellent position of the Society.

He further said that "it is proper to read and discuss papers bearing on our Industries; it is splendid to get together as a Society to become better acquainted and to realize each other's problems. It is a satisfaction to know that we are qualified members of a Society essentially technical and the oldest Mining Society in Canada, and to be in a position to give advice to the Department of Mines when called upon. All these activities are excellent in themselves; but should we as a Society and as individuals in this present time of our country's history be content? I think not. I am not satisfied that the above represents the full measure of our capacities or responsibilities.

"What then should be our function? This may be difficult to outline but as a partial program of a suggested policy, I may be allowed to put before you some suggestions as a proposed beginning of a larger sphere of usefulness." Mr. MacDougall then outlined the following points:

Technical Research— This may not be the proper term for the activity in mind but may suffice for want of a better.

The coal output of Nova Scotia has not varied to any extent during the last ten years. The question of where in lies the solution of the problem is not necessarily a question only for the operating companies, but one that very much concerns the whole people of the Province and hence is particularly one for our Society. The questions of transportation, radius of distribution, qualities of coal for different markets, preparation of coal as may be required, the substitution of bituminous coal for anthracite, the total or partial carbonization of certain coal for specific purposes, the relation of our coal resources to steel manufacture, are some of the features which will govern our increased production. This is a most important feature of our coal trade, for without maximum production coal costs cannot be brought to the point of profitable business.

Gold mining— It is now about sixty years since gold mining has been a recorded industry in Nova Scotia. Its life has, more particularly in later days, been a fitful one with little success. The gold-bearing measures are said to be some five thousand square miles in extent, but in all this area there is today only one operating property. The general question is asked, whether we have yet learned sufficient about our gold measures and the latest systems for extraction of gold to give us confidence to apply ourselves to the opening up of the large gold-mining fields.

Geological information— It was pointed out by the President that we had added very little to the knowledge written by Richard Brown on the Cape Breton coal fields or by Mr. Faribault on our gold-bearing measures. It should be the duty of the Society to prepare a statement of this situation and forward it to the Federal Government, which would no doubt welcome from this body information tending to assist the geological survey in their investigations into all our minerals, not forgetting the extensive deposits of limestone, gypsum and salt.

Coal in Newfoundland

A paper entitled *Coal Mining in Newfoundland* was read by Mr. George Morley. The information conveyed was interesting although not encouraging. Mr Morley touched on the different attempts made by the Newfoundland Government, the Reid Railway Company and others, to open up the different coal districts. For a time he had personally supervised operations at South Branch, St. George's district. The coal was six feet thick of good quality, but not of sufficient quantity to pay for mining. On one side of the mine the coal was cut off by a fifteen hundred foot fault, while on the other sides it pinched out. Mr. Morley suggested however, that further prospecting should take place, as the work already done should be followed up to thoroughly prove the district. There was difference of opinion as to what might be found in the St. George's District seeing the country was so hilly. Those who knew Newfoundland believed that the Inland Carboniferous Basins would yield better results. The coal did not crop out there. Some boring had been done, but not sufficient to thoroughly test the measures.

Mine Explosions

Mine Explosions and their Causes with Suggestion for Prevention was the next paper. This was by Alexander MacEachern, Chief Inspector of the Dominion Coal Company. It was a most practical paper written by a man of large experience and evoked considerable discussion. It covered the whole subject from the time mine explosions began to interest scientific men up to the present when research has placed the causes of explosions beyond doubt.

The two principal causes were mine gas, (methane) and coal dust. The long period during which expert mining men investigated coal dust as a cause of mining explosions was gone over and the opinions of these experts brought out clearly. The precautions necessary against the accumulation of coal dust and of gas in the coal mine was dealt with in a masterly manner. The time was all too limited to permit of the extended discussion that was generally desired by the majority of members present. Mr. MacEachern was warmly congratulated on his efforts in bringing before the Society the subject matter of what today is everywhere a live question in coal mining.

Studies of the Past Generation

Men and Methods of a Past Generation was the subject of a paper by C. M. O'Dell, Mining Engineer. Mr. O'Dell,in his own inimitable way, which is always highly enjoyed by the members of the Society, added a new page of history to the mining industry of the Province. If we are indebted to Richard Brown for geological information, we are deeply indebted to Mr. O'Dell for his graphic sketches of the men who opened up in the early days the coal measures and mines of Cape Breton. It was most interesting to go with Mr O'Dell to the different early collieries, and to see the men who developed the work, to observe the difficulties they had to overcome, the courage with which they attacked their problems and the ultimate success achieved. The failures and causes of failure of many of the early companies as well as later ones were clearly pointed out.

Mr. O'Dell's paper is to be made part of the mining history of Nova Scotia and arrangements have been made to have it put into pamphlet form for general circulation.

Mine Pumping

Mine Pumping Problems by Karl Marsh, Mining Engineer, Dominion Coal Company was most instructive dealing as it did with the effects of the acid and corrosive properties of mine water. He pointed out that in the Dominion Coal Company operations in Cape Breton, five tons of water are pumped to the surface to each ton of coal.

As the mine water of some of the Dominion collieries and also of Inverness colliery is of an acid nature, the problem of mine pumps has been a most perplexing one. The high heads against which the pumps of Dominion collieries work makes it all the more difficult to get a material that will stand for any time. Rubber highly hardened has stood well up where heads are not too high.

Mr. Marsh's paper, touching as it did a problem which confronts every mine official, threw a flood of light on mine pumping and its difficulties as well as its successes.

Coal in Malaya

A very interesting paper on *Coal Mining in Malaya* was read by Thos. L. McColl, Mining Engineer, Acadia Coal Company. Mr. McColl had opened up a coal mine in Malaya and in doing so had met with great difficulties. The seam was seventy feet thick with clay bands of a few feet in thickness at intervals. Twenty-four feet of this seam was extracted. Spontaneous combustion was one of the difficulties encountered early in the operation. Indeed, so many fires occured at the corners of pillars that were split (the coal being friable and the air passing through), that larger air-space had to be given to relieve the pressure to prevent fires breaking out. About eight feet of coal was first extracted, and to prevent fires breaking out hydraulic stowage was adopted, sand and gravel, with a small mixture of clay to make the pipes smooth, being used. Wherever the stowage was done, fires ceased to occur. The difficulties of transportation and of electric motive power due to heating of the motors by hot weather, also poor labour supply, had all to be overcome. Yet Mr. MacColl had overcome all difficulties and succeeded in reaching an output of 240,000 tons per annum.

Electric Motors for Mining

A paper read by C. H. Wright on *Electric Motors for Mining* was illustrated by screen and many different types of electric mining machines, motors etc., were shown and explained. In the course of his remarks Mr. Wright said that the electric haulage engines, the electric pumps of some of the Dominion Collieries and a new switch-board lately installed were the best in Canada and could not be excelled in the collieries of the United States. As mining by electricity or electrical power is to be adopted in the Cape Breton collieries on a much larger scale than at present, this paper was very timely and helped to give needed information to the mining men present.

Mining under Heavy Cover

Past and Present Mining Methods in Springhill by J. C. Nicholson, District Superintendent, brought the problem of methods of mining under heavy cover before the Society. Like the collieries of Crows Nest Pass, No. 2 Mine Springhill had been affected by bumps. These had been a great source of danger and of loss of time and had taxed the ingenuity of the mining men at Springhill. Various efforts were made to change the method of mining, with more or less success, but finally a method had been adopted that had succeeded and no bumps had occured in Springhill for considerable time. Mr. Nicholson stated that the system was not, however, without its weak features, one of them being the small outputs from the different sections. This was impossible to overcome as too much coal extracted over wide districts led to bumping, loss of coal and loss of life. Sketches were shown of the method and the points where pressure was exerted by the overhead strata which, in breaking, caused bumping.

Mr. Nicholson is a comparatively young man and was highly commended in the success he attained in the Springhill collieries.

Research

W. B. Timm, representing the Moris Branch, Ottawa, read a paper on *Research*, dealing largely with gold, copper etc. A local touch was given when "Sterling Mine", Loch Lomond, Cape Breton, was referred to and an analysis of ores found in that district was read. It was found that the ore was "complex", carrying sulphides of copper, lead, iron and zinc, with gold and silver specks showing. .

Mr. Timm went out to the mine on the following day, and although the trenches had fallen in he succeeded in securing good specimens of ore which he intends to have analysed at Ottawa.

The meetings of the Mining Society were marked by enthusiasm, good will and a common desire of the members to increase their knowledge. The papers read were of a high order and calculated to arouse interest, to stimulate action and to broaden the intellectual horizon. The fields of knowledge traversed were diverse; but wherever we travelled we found "tongues on trees, books in running brooks, sermons in stones," and profit in all.

British Columbia Letter

Geological Survey Parties

There will be twelve parties of the Geological Survey of Canada working in British Columbia this summer. Nine of these will be on geological investigation and three on topographical surveys. Those who have been assigned to field work are: Dr. J. D. MacKenzie, head of the B. C. office of the Geological Survey; Dr. George Hanson; Dr. M. E. Bancroft; Dr. W. L. Uglow; Dr. S. J. Schofield; Dr. Victor Dolmage; Dr. G. A. Young; Dr. W. A. Johnston; Dr. C. A. Cairnes; Dr. W. A. Cockfield; C. T. Shepherd, R. G. Bartlett and D. A. Nichols. The aim of the department is to obtain the maximum results with the minimum expenditure, and to this end the field work is designed to produce definite results in particular areas and to maintain a sequence of research which will progress with the impetus derived from past results.

"In line with the policy of the B. C. office in keeping closely in touch with mining and prospecting development," said Dr. J. D. Mackenzie, "we are giving attention to the areas where greatest interest centres. Dr. Johnston and Dr. Uglow will both conduct researches in the Cariboo placer gold areas and their work should be of very great assistance to the development of that country. In Northern B. C., Dr. George Hanson will begin a reconnaissance of the eastern contact of the granite batholith, as it is of great importance to have its outlines and relations thoroughly studied. Dr. Hanson's work will have special reference to the possibility of the extension of the richly mineralized zones such as those in which the Premier and the Dolly Varden mines occur. He will investigate the Kitsumgallum Valley and will pay particular attention to the possibilities for petroleum there. Dr. Victor Dolmage will continue his investigation of the coastline of the province. This year he plans to finish it by covering the stretch of the coast and islands from Bella Bella to the Alaskan boundary. He is making a special study of the relation of economically valuable deposits, such as the mines at Surf Inlet and Granby Bay, to the general structure of the batholith, with the idea of outlining favorable areas for prospecting.

"The importance of coal to Canada is becoming more and more clearly recognized, and it is most desirable that the coal resources of the country be carefully inventoried. To fulfil a part of this requirement the department has instructed me to continue the investigation of the coalfields on Vancouver Island that I began last summer. A considerable knowledge of some of the peculiarities of these exceptional coal fields has already been gained, and it is hoped that this season's explorations will be of material value.

"The geological investigation that will probably command the widest public interest is the examination of the iron ore resources of B. C. that will be undertaken this year by Dr. G. A. Young. Dr. Young has made a specialty of the iron resources of the Dominion. A co-operative investigation of the iron deposits jointly by the Geological Survey and the Provincial Department of Mines has been arranged.

"The establishment of an iron industry in the province has long been hoped for, and certain basis factors are required before any industry can be established. It is the province of the Geological Survey to ascertain whether or not the raw materials are available in sufficient quantity.

"Dr. Young is especially anxious that no iron deposit of prospective value be overlooked, and he would be glad if the owners of any such deposits will send him all the particulars at their command. Such information as the location, elevation, means of access, type of ore, probable tonnage, and references to former reports will be most valuable.

"An iron industry would be of incalculable benefit, not only to the province but to the whole of Canada.

"Dr. W. A. Johnston will continue his study of the placer gold deposits in the Cariboo district begun last year. The work then done resulted in the conviction that there are areas in the Cariboo district where dredging can be profitably carried on. The field work will embrace a study of the bed-rock geology as well as an investigation of the surface deposits, with which the placer gold is associated. This part of the work will be in charge of Dr. W. L. Uglow, of the University of British Columbia.

"During the past two field seasons Dr. C. E. Cairnes has been studying the ore deposits and the general geology of the Coquihalla area. This year Dr. Cairnes will extend his results south and southeastward. One reason for so doing is to correlate the geology of the Coquihalla area and the section along the C. P. R. with the geology of the Similkameen and Tulameen Valleys and the Hedley gold mining area. Another reason is to gain information about the general distribution and habit of the peridotite rocks of this region. These exceptional igneous rocks are those in which platinum has its origin and it is from them that the platinum placers of the region have been derived.

"In the Lardeau Dr. M. F. Bancroft will conclude his study of the structure of the ore deposits of the region. His results have disclosed many interesting features about the mining camps of this part of the Province, and some of the data he has gathered are of the greatest scientific interest.

"Last season an investigation of the Windermere map area was commenced by Dr. S. J. Schofield. This work will be continued during the present field season. Dr. Schofield secured some very interesting and significant results from his work of last year.

"Dr. W. E. Cockfield has already passed through Vancouver on his way to Whitehorse, Yukon Territory, from where he will start on an investigation of a large area extending southeastward toward the Atlin district in B. C. Some parts of this region have already been examined by R. G. McConnell, the late Professor Gwillim and D. D. Cairnes for the Geological Survey. Dr. Cockfield's investigation is planned to correlate the results of these earlier workers. The information to be gained will fill a gap in the knowledge of the survey regarding the general geology of Northern B. C. and the Yukon.

"The topographical work of the survey serves a dual purpose. In most cases it is primarily intended to make base maps on which to delineate the areal geology of a region, but these maps also have great utility of their own.

"Topographical work is also being done east of Kootenay Lake by R. G. Bartlett. These maps, when completed, will serve as an aid in the study of an important area of pre-Cambrian rocks whose relations are at the present time obscure. A map for the purpose of forming the base for the detailed study of the very important ore deposits of the many properties in the vicinity of Copper Mountain and Voight's Camp, Smelkameen Valley, will be made this year by D. A. Nichols."

Oil and Gas

The Atlas Petroleum Co., Ltd., has started drilling

operations at Hall's Landing, 20 miles south of Revelstoke, B.C. W. F. Marrion, Field Manager, is in charge of the work. This Company has secured 3000 acres of crown granted and provincial leases. Those interested are confident that they will strike this season either oil or gas.

A party of 17 men has left for Hudsons' Hope in the Peace River section of the Province. They will commence drilling immediately on the property of the Consolidated Oil and Development Co., the principal shareholders of which are residents of Minnesota. An unusual feature of the equipment of this party is a wireless plant of sufficient power, it is said, to send messages from the scene of operations to Chicago, Illinois. Daily progress reports will be made to J. A. Merrill of Superior, Wisconsin.

Nineteen gas and oil claims have been staked in the Kispiox Valley by Henry Brelzin and Angus Beaton. They have made arrangements with United States financial men for a geological examination of the property. If this is favorable drilling operations will be started.

The Coal Mines

The situation in the Crow's Nest Pass coal-field remains unchanged. There are no indications that an early settlement of the strike will be effected. Although the Conciliation Board is at work it would appear from report that little progress is being made toward arriving at a basis for settlement. Meanwhile the men seem to be finding employment elsewhere and the Company does not seem to be disposed to make any concessions.

W. R. Wilson, President of the Crow's Nest Pass Coal Co., in giving evidence before the Board stated that since 1903 his Company had lost through strike and lockouts $3,429,045. He stated further that his Company had paid an average yearly return of only 2.46 per cent. since 1910 on its investment of $6,200,000. In 1921 his Company paid contract miners an average of $9.13 per day, and day miners an average of $7.75, the former being an increase of 125.5 and the latter of 152.5 per cent. compared with the wage rate of 1910.

The coal market on the Pacific Coast continues unfavorable. The mines of Vancouver Island are not working to capacity by any means. Domestic trade has fallen off with the advent of warm weather and the bunkering business has failed to show any improvement. The result is that the miners of Ladysmith, Nanaimo and Cumberland are finding plenty of time for indulgence in outdoor sports.

George Wilkinson, R. P. E. recently completed a survey of the coal areas of Alberni district, Vancouver Island, for the Provincial Department of Mines. This work was done at the request of the municipality of Port Alberni, officials of which are of the opinion that coal seams on municipal lands may be developed to the profit of the community. Mr. Wilkinson found that there are some promising outcrops and that near the surface the coal is of a very high grade. In fact at this point it is an anthracite and probably of better quality than any other island coal. It would seem, however, that generally speaking, these deposits belong to the same classification as those of the Comox district, and that with further opening up, the seams will yield coal of the same bituminous grade as is found on the east coast. Of course it is impossible to say how extensive the Port Alberni coal bearing lands are without further prospecting. It is possible that this will be undertaken and the result may be the opening up of a new and important area.

The Community Coal and Coke Co. has been organized to take over and exploit the Normandale property in the Nicola valley. Recently a 10 ft. seam of high grade coal was cut in a tunnel that was driven above the Government road. It is proposed to commence mining and shipping in a small way immediately.

It is interesting to note that the output of British Columbia Collieries for the first three months of the present year was considerably in excess of that over the same period of 1921. Following are the comparative statements:

District	Tons. 1922	1921
Vancouver Island	445,305	405,681
Nicola-Princeton	65,442	44,877
Crow's Nest Pass	239,608	186,775

Government mining engineers in British Columbia have addressed between three and four thousand prospectors or potential prospectors in lectures delivered during the past winter. In one district the engineer was called upon to speak to the children attending public schools. It is generally agreed that no more effective method could be found for stimulating interest in minerals and the mining industry.

The first of the vessels leaving British Columbia and Washington State ports for Nome, Alaska, is on her way North. The season has opened and mining operations there soon will be in full blast.

The extension of the Premier Mine road, the construction of a trail into the Unuk country, the building of a bridge over the Bear River and the rebuilding of that over the Marmot as well as considerable maintenance work are some of the likely activities of the Provincial Government in the Northwestern section of the Province this year. It also is suggested that a road should be built further up the Kitsault Valley than is reached by the Dolly Varden railroad, and that there should be a trail from Alice Arm to Stewart. The latter is rather an ambitious project, but the route will be surveyed this year.

If the Dolly Varden Mine and property passes into the hands of George Wingfield of the Goldfields Consolidated and associates, it is suggested that a new Company will be formed for the further development of the mine and adjacent claims. The plan now proposed is the formation of a company in which will be represented other creditors of the Taylor Company, shares being allotted them in proportion to their claims.

The Exchange Group north of Premier Mine, Portland Canal, is reported to be the scene of a new strike. The mineralized zone is said to be between 80 and 85 feet wide and has been traced on the surface for 700 ft.

The Mahood Mines, Ltd. owning the Divide, Sunrise and other claims in the Salmon River District is changing its name to the American Mining and Milling Co. Ltd.

The I. X. L. Mine near Rossland is reported to again be yielding very rich ore. The Bonanza ore shoot is said to have been recovered. This shoot has given a return during the last few months of more than $30,000.

There are 300,000 tons of coal in the heaps at Glace Bay. This is a large amount to stock but after all, it is only a small month's output when things are normal.

Northern Ontario Letter

Gold Production in May

According to preliminary estimates, the gold mines of Porcupine and Kirkland Lake produced upwards of $1,755,000 during the month of May. In the order of their importance, the producers were: Hollinger Consolidated, Dome Mines, McIntyre-Porcupine, Wright-Hargreaves, Lake Shore, Teck-Hughes, Kirkland Lake and Tough-Oakes. These eight mines are in a position to maintain production in each case, while the McIntyre will add to its output during the latter part of June through setting additional milling equipment in operation.

A total of approximately 3,480 men were employed at the producing mines, while approximately 172,000 tons of ore were mined and milled. This shows the interesting information that approximately 49 tons were handled by each man during the month. It also shows that the average grade of the ore at the mines as a whole was maintained at a little over $10 per ton.

In addition to the foregoing details about the producing mines, it is interesting to note that activity is increasing around the mines in the development stage. Notable among these was the resumption of work on the Porcupine V. N. T. where another important gold producer appears to be in the making. It is also to be noted that the Sylvanite at Kirkland Lake is rapidly developing to a point where another big producer is assured, while the Bighood Gold Mines are gradually being worked into a position where the installation of a mill will be undertaken. At the Argonaut Gold, ore has been found at a depth of 500 feet and this enterprise may be turning out gold bricks during the last quarter of the current year.

These non-producers, as well as numerous others under exploration and development, are employing a substantial aggregate of men, and it would appear that at least 5,000 men are now employed directly at the gold mines of Porcupine and Kirkland Lake.

Amendment Defeated

The bill to increase the amount of assessment work on mining claims having failed to pass through the Ontario House, the holders of mining claims are thereby relieved from the anxiety of uncertainty as to its application to claims staked under the prevailing regulations.

Information was sent broadcast through the press, that the Amendment was going through and that it was the product of Hon. H. Mills, Ontario Minister of Mines This was an injustice to Hon. Mr. Mills as the bill was being fathered by Howard G. Ferguson, and was subsequently defeated.

Good Results on Kirkland

The result of deep mining operations on the property of the Kirkland Lake Mining Company has been more favorable during recent months than at any point in the mine above a depth of 800 feet. Although net profits have been comparatively small during the past year, nevertheless the production has been sufficient to pay for the extensive amount of development work being done. All this work is an asset for the future, while a continuation of the favorable results recently obtaining should soon bring the enterprise to a position where net profits will increase substantially

Development Work on the Hattie Prospect

Carlos Warfield, formerly associated with Augustus Heintz, has been on the Hattie Gold Mines for the past two weeks, and expresses himself as favorably impressed with the property.

A force of sixteen men are now at work, and arrangements are being made to continue the shaft to deeper levels on No.2. vein. It is also planned to carry on additional surface exploration.

Some rich specimens have been taken out of the Hattie property, the work being supervised by Mr. Warfield, who is representing a Montreal syndicate.

Clifton-Porcupine

Work has been resumed in a small way on the Clifton-Porcupine property, and already some good results have attended the work. A new vein has been discovered, having a width of three feet and carrying visible gold, the deposit being called "The Lucky Strike".

No. 3 shaft is being de-watered and a small crew is engaged in doing surface work, stripping the outcrop of veins which occur on that part of the property. Among other things, it is planned to carry lateral work to the new vein underground as well as develop other parallel veins in the near vicinity.

Wm. C. Offer is in charge of operations on the Clifton Porcupine and expresses the belief that important results will follow the commencement of underground work. Mr. Offer will be in Toronto this week for the purpose of attending a meeting of the directors at which time the construction of a milling plant will be authorized, according to official advice. Plans have already been prepared for this new mill, and the plant will be used for treating high grade ore already placed in sight in the present underground workings down to a depth of 225 feet. Construction work may be expected to start within the next few weeks.

Canadian Kirkland

Surface work is under way on the Canadian Kirkland property, preparatory to carrying on general operations A new boiler-house and shaft house are being erected, and it is planned to resume underground work within the next three weeks

A shaft is already down 150 feet on the Canadian Kirkland, and the present plans are to continue this work to a depth of at least 300 feet There are two exceptionally strong veins showing at outcrop and these occur under favorable geological conditions

The Crown Reserve Mining Company is involved in the Canadian Kirkland, to the extent of something like 150,000 shares, this having been acquired some years ago when the property was under working option to the Crown Reserve

Hollinger's Ethon Lake Property

Late advices coming from Northern Manitoba would indicate that the syndicate led by Directors of the Hollinger Consolidated Gold Mines is meeting with good encouragement on the Murray Property at Ethow Lake.

Surface work has revealed a greater breadth of mineralized area although the average gold content of the deposit has not yet been determined. Work however, is now far enough advanced to proceed with sinking trial pits and taking a general sample free from surface concentration. Assaying equipment has been installed and

the future of the Elbow Lake section of Northern Manitoba will swing to a vital extent on the result of work and the assays obtained during the next few months.

Bidgood

As work proceeds at the 100 ft level of the Bidgood Gold Mines, the prospects of this property soon taking its place among the producing mines become greater. Some excellent ore is being developed and already the question of erecting a milling plant is being seriously discussed. There are those who are in favor of equipping the property with a mill this year. Others are in favor of continuing development work throughout the balance of the current year and then proceeding with transporting milling machinery to the mine over the snow roads next winter. This would allow construction work to commence in the early spring preparatory to placing the mine on a producing basis, and would give the enterprise the benefit of extensive development work in the meantime.

Goldale

Within a week, sinking operations will be under way on the Goldale property. The surface equipment has been thoroughly overhauled, while the roads have been put in good condition. The exploration work mapped out is perhaps the most interesting at the present time in the Porcupine field.

Porphyry is known to intrude the greenstones formation and thereby create geological condition which may reasonably be accompanied with important mineralization.

Claims Change Hands

One of the more important deals to be put through in recent months in the Kirkland Lake district has just been closed for a group of claims lying adjacent to the Tough-Oakes on the east. The group consists of four claims comprising approximately 160 acres. Two of the claims were formerly held by Wm. Wright, one by J. Post and one by the North-East Kirkland Company. The entire group had been held under option by G. W. Dixon of Cobalt through whom the deal was made this week with New York interests.

Porcupine Mutual Gold Mines

Among the new concerns that will engage in mining work in the Porcupine gold area is the Porcupine Mutual Gold Mines syndicate, having an authorized capital of 300 shares of the par value of $100 each, or $30,000. The promoters of the syndicate already own five mining claims situated immediately adjacent to the Hollinger Reserve property, and the purpose of the sale of the 300 shares as above mentioned is to provide capital to pay for exploration work in connection with proving the value of a gold-bearing deposit already found at outcrop. The plan of exploration will consist of diamond-drilling. It is planned to commence this work at the earliest possible date and it is agreed that on or before Dec. 31st of the current year, the manager and secretary of the syndicate will float a company known as the Porcupine Mutual Mines, Ltd., with a capital of $3,000,000, made up of 3,000,000 shares of the par value of $1 each. The original owners of the mining claims involved will be given 900,000 shares, while the holders of the 300 syndicate shares will be alloted 600,000 shares. This will leave the company in full ownership of the property, with exploration work paid for and with 1,500,000 shares remaining in the treasury with which to finance further work.

The plan is one that is commanding favorable comment, as it places within the reach of prospectors an opportunity to explore their property thoroughly and to share in the final result.

An encouraging report has been made on the property of the Porcupine Mutual Gold Mine Syndicate by J. H. Rattray. It is recommended that the diamond drilling should be done in an effort to locate the continuation of ore shoots which occur on the same vein on the Hollinger Reserve. In conclusion, Mr. Rattray says:-

"Expenditure in carrying out the above recommendations must be regarded as a speculation. You have however, a reasonably good chance of finding profitable ore bodies. The cost of determining this chance by diamond drilling is comparatively small, and if sufficient payable values are encountered, you will realize profits commensurate with the risk involved."

Silver Production Increasing

The silver mining industry of Northern Ontario is rapidly reflecting the increased demand for silver and the gradual rise in quotations for the metal.

Nipissing, O'Brien, Mining Corporation, Coniagas and La Rose continue to produce at full capacity, while the McKinley-Darragh is now in full operation and with the Peterson Lake and the Dominion Reduction starting up. Added to this are favorable indications that the Beaver will resume shortly and good prospects of the Temiskaming Mining Company taking similar action provided the price of silver shows signs of becoming stabilized at the present high point.

In South Lorrain, the Keeley Silver Mines continue to yield silver at a rate that is second only to the leading producers of Cobalt, while the Mining Corporation is in a position of promise in respect to establishing another important operation adjoining the Keeley.

From Gowganda and Elk Lake comes optimistic news that would indicate more widespread activity in that direction.

Exploration of Ruby Property

Reports on the street would indicate that the Coniagas is meeting with considerable encouragement during the course of exploring the Ruby Silver Mines by diamond drill. Geologists believe the possibilities of this neglected section are such as to warrant considerable work, and it would appear as though all that will be required to encourage a good deal of activity would be a rich strike on such a property as the Ruby.

Preparations have been made by La Rose to resume work on La Rose Extension, and the indications are that this may be developed into a substantial source of production.

EDITORIAL

The fuller and more accurate the knowledge which the geologist has of kindred branches of inquiry, the more interesting and fruitful will be his own researches. From its very nature, geology demands on the part of its votaries wide sympathy with investigation in almost every branch of natural science.—Sir Archibald Geikie, 1879.

CANADIAN FREIGHT RATES AGAIN

In our issue of May 26th we reviewed that anachronism, the Crow's Nest Pass Agreement. That the Agreement is unsuited to present conditions is, naturally, a proposition strongly maintained by Canadian railway executives, and they are entirely right in their contention that is is discriminatory and far too limited in its application. At this conjuncture we observe with much pleasure that Government and railway managements agree that drastic action is needed to give trade and commerce relief.

A few days ago an authorized representative of the railways submitted for the consideration of the Parliamentary Special Committee a definite plan for the reduction of freight rates. That plan embraces the formation of a special tribunal empowered to regulate and control freight rates. On the selection of the *personnel* of this tribunal will depend its efficiency. An immediate reduction in freight rates charged on the raw products of agriculture, mining, lumbering and fishing is recommended "wherever these commodities form the staple source of production and employment." This limiting clause, quoted from the railways' memorandum, is not altogether to our liking. Low freight rates are desperately needed in many parts of Canada to *make* mining a source of employment.

In the term "basic commodities" are included grain from the Northwest Provinces (again, why the territorial restriction?), all forest products, and all ores, coal, coke, building material, brick, cement, lime and plaster, fertilizer, wire rods and scrap iron.

The gravely involved state of our National Railway finances is a warning against unconsidered action. But whatever changes are made will and must apply equally to all operating lines. It would be the height of folly to discriminate against the Canadian Pacific. Hence, the prime considerations are, first, the immediate effect that reductions in freight rates will have upon the weaker lines, and, second, the result over a period of, say, two years. The latter consideration is of greatly more import than the former. If, for instance, lower rates stimulate the production of minerals (and we *know* that this will be the case), then the loss to the railways will be but temporary. The ultimate gain to the country at large will be immeasurable.

It is from this point of view that the problem should be approached. Candour compels us to state that Parliament displays an inexplicable inability to think straight in this matter.

In any case, the Railways have helped to clear the ground. For this we give thanks.

AMERICAN NICKEL CORPORATION

Canada's largest mining camp, the Sudbury nickel field, has probably reached a lower depth during the present depression than any other of the country's industries. Yet those conversant with the facts have never been doubtful of the ultimate resumption of the production and commercial use of nickel on its former scale, even though the Washington conference spoiled the better part of the former market. This confidence in the future of nickel has been held unshaken particularly by those familiar with the character and attainments of the men shaping the destinies of the respective nickel corporations. Recent events justify this faith.

Among the important developments noted lately, none has been more interesting than the reports that the Mond Nickel Company had solved the problem of producing malleable nickel. Now there is announced, through the twelve modest pages of a pamphlet, the fact that the American Nickel Corporation, of Clearfield, Pennsylvania, is prepared to produce and sell pure, malleable nickel, in various forms ranging from ingots and sheets to forgings and pipes. Evidently the metallurgists of the Mond Nickel Company have not been idle during the period when their regular activities have been curtailed. Likewise, Dr. C. V. Corless' frequent disappearance across the border during recent months is now adequately accounted for.

The first production of Monel Metal marked an epoch in the Sudbury nickel field, and therefore in Canadian metallurgy. The advent of malleable nickel is similarly important, and will, more than ever, carry the fame of Canada's nickel deposits throughout the world.

The properties of the American Nickel Corporation's new product, as set forth in their announcement, are quite unusual. The metal is at least 99 per cent. pure nickel. Cold rolled, it has a tensile strength of 100,000 to 150,000 pounds, an elastic limit of 80,000 pounds, and a yield point of 100,000 to 125,000 pounds per square inch, with an elongation in 2 inches of 10 to 35 per cent. and reduction in area of 20 to 65 per cent. Among the qualities noted are resistance to corrosion, erosion, oxidation, abrasion,

acids and scaling; it can be welded to iron or steel, or to itself, it is not affected by superheated steam or by liquid air; its colour is silver-like, it can be bent double, cold; it takes a high polish; and it can be forged, drawn, rolled and spun. Such a catalogue of qualities suggests innumerable commercial applications of the newly found metal.

It has become a habit with us of late years to welcome in Canada the establishment of branch factories of American firms. Here we have the beginning of a reciprocal movement that might will be carried further. The Mond Nickel Company will, of course, furnish all the material that the American Nickel Corporation will work into finished form.

The *Canadian Mining Journal* offers its congratulations to the men of the nickel industry who have succeeded in bringing it back thus far on the road to prosperity.

A MINE RETRIEVED

The Dome Mine, at Porcupine, has had a career of ups and downs. When the "Golden Stairway" was first uncovered, it seemed as if the Hollinger, along with all other prospects, and even mines, so far discovered would sink into insignificance. Many a prospector turned off the old portage trail to have a look at the wonder, and then struck off into the bush to try to locate an off-shoot of this mother-lode. Then came practical mining men, searching for a large tonnage of milling ore; and some of the shine came off the "Golden Stairway." Nevertheless, courageous investors, with their eyes wide open, took the chance that accompanies all mining development in varying degree. Their judgment and their temerity have been well rewarded.

After the first attempt at selective mining of the ore of higher grade, a policy of wholesale stoping was adopted. For a long time it was doubtful whether there would be any margin of profit. Eventually the cost of mining and milling was reduced to such a point that good profits were realized. Then, with the exuberance of new-born success, the management concluded that the mine was "made."

Disillusionment came when costs mounted during the wartime, and much of the ore was found to be unprofitably low in grade. Reserves of ore were found, on development, to be mainly reserves of quartz. Something had to be done. Mr. H. P. De Pencier was brought in to do it.

During the last year the fortunes of the Dome have taken another upward swing. Further development work has disclosed more of the irregular shoots of high-grade ore characteristic of the deposit. The mill heads have more than doubled in value, and the ore from development work is higher in grade than ore from the stopes. Dome profits are now at a rate never before reached, and a corresponding interest has been created on the stock exchanges. But the manager of the mine does not forget the mine's history.

The annual report of Dome Mines, Limited, for the year ending March 31st, 1922, is lucid and comprehensive. It can be studied with profit by those who wish to become well-versed in sound mining practice. The point to which we wish to draw particular attention is the fact that Mr. De Pencier has refused to estimate ore reserves. He gives unusually full data as to the development work that has been done and the pay-shoots delineated; but he considers it unwise to assure the directors of any ore-reserves that are not actually put in sight. There is at present a large reserve thus developed, and all evidence available warrants the statement that "we can confidently look forward to similar results" during the coming year.

To thus read the Dome's past history into its future is, no doubt, the only policy in accord with sound mining practice. There is every temptation in the mine's present condition, to go to an extreme of optimism, and to assume that the hard times of former years will not recur. Those whose chief concern is the stock market and not the production of bullion would have us believe that the Dome's present daily supply of gold is a permanency. This may be so; but shrewd engineers and knowing investors will not depend upon it.

Mr. De Pencier has now an enviable reputation as a shrewd and progressive mine operator. He is subject neither to coercion nor to undue influences. This latest refusal to speculate as to Dome's ore-reserves is completely to his credit. When Canada shall have developed more mining engineers of Mr. De Pencier's calibre and qualifications, her mining industry will more rapidly be put upon a firm and profitable basis.

PERSPECTIVE AND PETTUS

The Chinese honour their dead generations; we forget our predecessors. In our overweening pride and self-absorption we forget all save the present. We are the heirs of all the ages, yet we know next to nothing of our heritage. To lapse into the vernacular, it behooves us to get "wise" or "hep" to what was done before this terrestrial globe was honoured with our presence.

On another page of this issue will be found one of a short series of articles on Sir John Pettus, a mining man who flourished in the seventeenth century. Those who have read a little history know that in that period, the sycophant, the lickspittle, and the human satellite were distressingly numerous. The man of letters was foredoomed to failure if he could not find a patron. The man of science was in pretty much the same plight. The sciences themselves were still deeply encrusted with superstition and charlatanism.

Pettus, weighted though he was with the errors and prejudices and ignorance of his times, nevertheless was an enterprising and public-spirited citizen. His book on which the articles referred to are based, is a landmark in the history of technical literature. No doubt at all is there that it helped many an earnest young assayer to get his start in life—and the young man would deserve it, for Pettus was not the clearest or most accurate of writers. But there is this to be said for Pettus,—he

was a consistent optimist. Also he evidently possessed much charm of manner, for the Governor of Fleet Prison, Richard Manlove, Esq., who was his patron, helped him most substantially, although Pettus was enduring an habitation enforced.

We had thought to point a moral in this short editorial. But morals really should not need pointing out. It suffices to say that our real wish is to inspire some few of our readers with a genuine love of old books. Modern text-books do not contain all that is to be known of mining. A constant diet of up-to-the-minute literature entails excessively unpleasant consequences. In a word, one can get too much of a good thing, even of journalistic moralizing.

LESE-MAJESTE

Late in May the president of one of our large banking institutions, addressing the shareholders in annual meeting assembled, reviewed the business situation, dwelling at some length on manufacturing, farming, railways, and taxation. Mining he dismissed in this laconic sentence: "*Some branches of mining are yielding returns!*"

Now we happen to know that the bank in question has, ever since the discovering of Cobalt, had its deposits augmented by many millions of honest mining dollars, and these dollars have not been idle. It is not overstating the case to say that this particular bank would occupy to day a decidedly less secure position had it not been for the large business brought in by its mining *clientele*. Yet mining, an industry second only in present importance to agriculture, and by no means second to agriculture in future promise, is accorded nothing more than some words of the faint praise that damns!

Truly this is not edifying. What must or can we think of the vision of financial leaders when such utterances are possible? It is the duty of the whole mining fraternity to enlighten those who dwell in such perilous darkness.

EDITORIAL NOTES

More than any other branches of industry, mining and metallurgy are being nurtured and cared for by the German Government. German efficiency is not wholly a discredited fetish. The Teutonic mind has, at least, a sense of industrial values. Germany is far ahead of Canada in utilizing her mineral resources, although it is grievously true that Nature has endowed Canada with many times more mineral wealth than any country in Europe.

Parliament is shortly to be prorogued. The lately elected Government will then have lived through a voeferous session. We have read Hansard with praiseworthy assiduity. (This, we fear, is a redundancy, for no normal being can read Hansard without assiduity.) On more than one occasion topics touching directly on mining have come before the House. Not once have they excited even a simulated interest. For many years there has been no evidence to show that there is in the House of Commons a single representative adequately informed as to Canadian mining.

In the still watches of the night we have often wondered why ministers of the gospel are so susceptible to the blandishments of the wrong kind of mining promoter. One prime reason may be, no doubt is, the disparity in the rate of exchange (so to speak). Spiritual advice and comfort and guidance command low prices. The preacher's stipend is exiguous, excessively so. But this is not the only cause. Preachers, in the nature of things, have less worldly wisdom than most of us. To balance matters, they have so much other-worldly wisdom, and we so little, that they naturally become dogmatic and pragmatic in affairs spiritual. Now, as there is none more pragmatic than the off-colour promoter, and as mining is outside the preacher's ken, the appeal is irresistible.

Today we print, by courtesy of Dr. W. H. Collins, Director of the Geological Survey, Ottawa, an account of the work to be conducted during the coming season. The activities of the Survey are always of interest to those of the mining profession. This interest might properly be extended in much greater degree than at present, to the general public. All too few of our citizens know anything about the current activities from coast to coast of the men who contribute so much to building the foundations of the mineral industry, from which each member of the public benefits so largely. In spite of the pressure of work incidental to putting his 39 parties in the field, Dr Collins has found time to prepare this statement for the mining men of Canada.

Announcement has been made of the shipment of an unusually large consignment of copper nickel matte from the smelter of the Mond Nickel Company at Coniston, Ontario. With the re-opening of the International Nickel Company refinery at Port Colborne, this augurs well for the early resumption of activities in the Sudbury nickel district.

MONODI.

To the orators at Ottawa these lines do I indite —
Our natural resources, they are undeveloped quite'
I've heard this in the morning, and I've heard it in the night;
The way in which our orators expound it is a fright,
They talk in periphrastics, which, I take it, is their right;
But phrases get us nowhere when we all are sitting tight
Neglecting opportunities and shutting out the light
It is action that is needed to relieve our grievous plight'
So I pray the powers at Ottawa to take this as a slight,
To regard it as a thistle situated where 'twill bite,
And to give us fewer phrases but to gird their loins and fight
For rational development with their whole devoted might'

ANON

Field Work of the Geological Survey, 1922

W. H. COLLINS, DIRECTOR

Thirty nine parties will be placed in the field in various parts of Canada this summer by the Geological Survey. These parties range in size from three to eleven persons. Twenty nine will do geological work and ten topographical work. The most westerly one will be located in Yukon territory, and the most easterly in Nova Scotia. The northernmost party will work in the Mackenzie River region in latitude 66, just under the Arctic Circle.

In large part this work is aimed to give assistance to prospectors and explorers in the discovery of mineral deposits. Several of the parties are directly engaged in a detailed inventory of Canada's resources of coal, iron ore and other minerals. Nearly all, and more particularly the topographical parties, are contributing to the exact and fundamental mapping of the country according to standards as closely accordant as possible with the standards of other Government survey departments. The need for precise topographical maps for mining operations, forestry and soil surveys, highway development and general engineering purposes is becoming rapidly apparent, especially in the areas of rapidly increasing population in southern Canada and the prairie provinces. Two of the thirty-nine parties will be engaged in collecting mineral specimens and fossil remains for the Victoria Memorial Museum.

Besides results of direct value, the Survey obtains a mass of what may be designated negative information, the value of which is not always fully appreciated. It is of economic interest to the prospector in search for certain minerals to be warned against wasting his time in looking over certain areas in which these minerals are not at all likely to be found. It is also of economic interest to the investing public to know that certain ore-deposits cannot occur except under certain known geological conditions. One of the first tasks of Canadian geologists was to show that no coal fields, similar to those of Pennsylvania, need be looked for in the provinces of Ontario and Quebec. The Geological Survey and the Department of Mines, Toronto, have for years been informing the inquiring public that the anthraxolite which occurs in a fissure in the rocks north of Sudbury is not coal and should not be taken as an indication of the occurrence of coal, and have pointed out the futility of carrying on boring operations with the expectation of finding coal seams.

Concurrently with the investigation of ore-deposits an opportunity is afforded to most parties to carry on the purely scientific investigations which each year help to transform the exploration of our mineral resources from a haphazard search to one guided by increasingly well-recognized principles. For example, it has become well recognized that the vast series of intrusions of granitic rocks that forms the Coast batholith, extending along the Pacific coast of British Columbia, was the source of a large share of the metalliferous ore-deposits which occur in its vicinity. The two large copper deposits that are now being worked at Britannia Beach and at Anyox had their source in this intrusive body. Other ore bodies such as the Premier, the Dolly Varden, the Surf Inlet, etc., owe their origin to the same intrusive. The geological Survey has carried on investigations for a number of years in the Coast Range batholith.

BRITISH COLUMBIA & YUKON.—Work will be continued along the Coast batholith this summer with the object of mapping more particularly those areas in which the granitic mass comes in contact with the older formations and in which conditions have been provided favourable for the deposition of mineral deposits. *Dr. Victor Dolmage*, who has been engaged for two years in mapping the western edge of the Coast batholith along the Pacific coast, will continue his work northward to join up with that already done by R. G. McConnell, S. J. Schofield, and George Hanson, in the Observatory Inlet and Portland Canal areas.

Dr. George Hanson, who made a detailed study of the geology and gold and silver ore-deposits of the Upper Kitzault River area last summer, will map part of the eastern contact of the Coast Range batholith. He will also examine the geology of the Kitsumgallum valley where the possibility of the occurrence of petroleum-bearing rocks has received some attention on the part of the public.

The northward extension of the batholith into Yukon territory will be studied by *Dr. W. E. Cockfield* and an area in the southern part of the territory will be mapped to show more particularly the contacts between the batholith and the intruded rocks. The copper deposits of the Whitehorse district and the gold-silver deposits of Wheaton district in all probability had their origin in mineral-bearing solutions given off by the Coast Range intrusives. The summer's work of Dr. Cockfield should result in delimiting other areas favourable to prospecting.

In the southern part of British Columbia *Dr. C. E. Cairnes*, who spent two field seasons studying the ore deposits and general geology of Coquihalla area, near Hope, will extend his investigations southward for the purpose of correlating the geology of the Coquihalla area with that of the Similkameen and Tulameen valleys and the International Boundary. Attention will be given to the distribution of the peridotite rocks from which the platinum placers of the region have been derived. He will also spend part of the season making further investigation of the gold ore-deposits at Hedley.

Dr. J. D. MacKenzie will continue the detailed mapwardping and study of the underground structure of the Comox coal field which he commenced in 1921. The northward extension of this field will be examined and its relation to the Nanaimo field will be studied. The results of the season's work should be of material aid in the exploratory drilling of the coal-bearing areas. Data regarding the resources of the coal field will be contributed to the general study and inventory of the fuel resources of Canada.

Surveys for a contoured map of this coal-bearing area are being made by *Mr. A. C. T. Shephard* with a view to getting out a map of the Comox coal fields on a scale of 1 mile to 1 inch and a contour interval of 50 feet. The district is one of growing population and productivity in which a topographical map will serve many

purposes besides aiding in the exploration of the coal basin.

Interest in the placer gold deposits of Cariboo district has quickened during the past year and fresh discoveries of gold have been reported. The placer deposits are nearly altogether Tertiary in age and have since been obscured by glacial action and a covering of boulder clay, a condition which renders prospecting unusually difficult and calls for a careful geological consideration of the pre-glacial drainage of the area. *Mr. W. A. Johnson* will visit Cedar Creek, where the reported discovery of rich placers has led to a rush of prospectors. He will also complete his work on the placer deposits of Barkerville area. An investigation of the underlying bedrock, from which the placer gold must have been derived, will be made by *Dr. W. L. Uglow*, of the University of British Columbia, and a report on both placer and lode deposits will be made. This will be accompanied by a large-scale map.

In the Lardeau *Mr. M. F. Bancroft* will continue his study of the silver-lead-zinc, talc and other ore deposits and will conclude his investigation of the stratigraphic and structural features of this area, which furnishes one of the most interesting and one of the most difficult pieces of field work in British Columbia. Work in the Windermere area, East Kootenay, will be continued by *Dr. S. J. Schofield*, of the University of British Columbia. The mineral deposits will be examined and a careful study made of the stratigraphical relations of the Pre-Cambrian and early Palaeozoic sediments. This work is part of a scheme of geological mapping which is aimed to correlate and unify the many isolated pieces of geological work in southern British Columbia and permit of the compilation of one general geological map of this region. *Mr. R. Bartlett* will this year continue topographical mapping of an area along Kootenay lake, in which the correlational work of Dr. Schofield will be continued.

Dr. G. A. Young, in cooperation with the Department of Mines of British Columbia, will begin a detailed investigation of the iron-ore resources of the province. It is proposed to study and inventory the iron-ore deposits in a manner that will admit of determining whether there are enough ores suitably located and of satisfactory qualities to supply a future iron and steel industry on the coast if other essential requirements for such an industry are obtainable. The proposition of establishing a Coast iron and steel industry has been under consideration at various times in recent years and there is a distinct need for exact information regarding the basic requirements.

Surveys for a detailed topographic map of Copper mountain and vicinity will be made by *Mr. H. A. Nichols*. This will include the properties near Allenby, where extensive developments of copper deposits have been carried on and where large low-grade bodies of ore have been proved. It is contemplated that the topographic mapping will be followed in 1923 by a geological investigation of the area.

Dr. L. H. McLearn will do detailed geological work along Peace river above Hudson's Hope, with a view to obtaining accurate geological sections of the Triassic and Cretaceous formations. These formations are being drilled for petroleum by the government of British Columbia and by private companies and information is much needed regarding the succession, character and thicknesses of the formations that are being thus explored.

MACKENZIE DISTRICT.—In 1921 the Geological Survey, co-operating with the Topographical Surveys Branch of the Department of the Interior, commenced a systematic mapping and investigation of the petroleum-bearing possibilities of the country accessible from Mackenzie river. Three parties will continue this work during 1922, surveying canoe routes, and determining the geological succession and structure and oil-bearing possibilities of the sedimentary rocks of this area. *Dr. G. S. Hume* will carry on work of this nature in the country in the vicinity of Mackenzie river below Norman and along Carcajou river. *Dr. M. Y. Williams* will work east of the Mackenzie between Wrigley and Great Bear river. *Mr. E. J. Whittaker* will work between Providence and Simpson.

ALBERTA.—*Dr. D. B. Dowling*, at the request of local residents, will investigate the underground water resources of a dry area near Peace River, Alberta. In 1915 Dr. Dowling outlined a considerable area in the southern part of the province in which a supply of artesian water should be obtained by boring to an underlying porous sandstone known as the Milk River sandstone. This formation, which is exposed on Milk river and which derives its supply of water from the river, dips northward beneath later sediments at a low angle. A number of borings were made and an abundant supply of good water was obtained. Dr. Dowling will also make a general inspection of drilling operations for petroleum and natural gas in southern Alberta, and will investigate reported discoveries of placer gold and platinum in Red Deer river.

Mr. John R. Marshall will continue a systematic geological mapping of the coal fields of Kananaskis river where important coal seams of Kootenay age are found.

Mr. W. H. Miller will continue field work in the Mountain Park area of western Alberta for the purpose of making for subsequent geological work a topographical map on a scale of 1 mile to 1 inch. This is in one of the important coal fields of the province.

SASKATCHEWAN AND MANITOBA.—*Dr. F. J. Alcock* will map in detail about 50 square miles including the Mandy copper deposit and Flinflon gold deposit. A similar detailed map will be made of the gold bearing area around Elbow lake. The known ore deposits in each area will also be investigated carefully. It is aimed to provide good geological maps of the areas in which intensive prospecting is being carried on and to accompany these maps with reports indicating the character and mode of occurrence of the various types of ore deposits, and the extent of their development.

Dr. J. F. Wright will commence the systematic geological mapping on a scale of one mile to the inch of the "Keewatin" areas east of Lake Winnipeg. Last year Dr. Cooke made an intensive examination of the copper-nickel ore deposits at Maskwa river and Oscar lake and of the gold deposits at Rice lake and indicated in his report (Summary Report 1921, part C) issued that those deposits are genetically related respectively to certain gabbro and later granite intrusions. Particular attention will now be given by Dr. Wright to mapping in other parts of the region these formations which are of such significance to prospectors.

Mr. R. C. McDonald will commence a series of accurate control surveys in northern Manitoba with the

ultimate object of compiling and issuing a general geographical and geological map of the northern part of the province. It is recognized that prospectors and explorers require a good general map of the whole region in addition to the various detail maps of mineralized areas which have been issued by E. L. Bruce and F. J. Alcock. A feature of particular interest in connection with Mr. McDonald's work will be assistance given by the Air Board of Canada in making reconnaissance flights and carrying supplies to points otherwise difficult of access.

ONTARIO.—Dr. T. L. Tanton will continue mapping the section of country lying to the north of Lake Superior between Port Arthur and Nipigon. The Animikie and Keweenawan formations of this district contain ore-deposits of silver, iron and zinc. Other economic minerals are also to be found. *Mr. E. E. Freeland* will make a topographical survey for a map on a scale of 1 mile to 1 inch of Port Arthur, Fort William and vicinity. This map should fill many engineering and other needs of this important centre of population. It will also be used as a base map for a thorough geological survey of this interesting and economically important locality.

Mr. Ellis Thompson will continue his systematic geological mapping in Michipicoten district. This district contains deposits of iron ores, pyrite and gold, of which the Murphy gold discovery southwest of Goudreau is one.

An area of Huronian formation near lake Panache, southwest of Sudbury, will be geologically mapped by *Dr. Pentti Eskola*. Dr. Eskola is a member of the Geological Survey of Finland, temporarily carrying on research work at the Geophysical Laboratory of the Carnegie Institution, Washington, and the opportunity of his presence in America has been taken to have him associated for the summer with the Geological Survey of Canada. The geological problems of Finland, which possesses a highly organized Geological Survey, are very similar to those encountered by Canadian geologists who work in the Precambrian shield, and a practical exchange of ideas between Dr. Eskola and Canadian geologists should prove mutually profitable.

The study of the radio-active minerals of Ontario, commenced by *Dr. H. V. Ellsworth* in 1921, will be resumed during the summer of 1922. Dr. Ellsworth will also commence a systematic investigation of the Canadian occurrences of the minerals of cerium, thorium, beryllium and other rare elements, known to occur in the pegmatites of southern Ontario and Quebec and in other parts of Canada. New uses for these elements and their compounds are being found. At the present time the Imperial Mineral Resources Bureau of London, England, has in hand the investigation of new industrial appications of these materials. As progress is made along these lines of research, more and more accurate information will be needed regarding sources of supply.

Dr. M. E. Wilson will continue the systematic geological mapping of the Precambrian formations in the vicinity of Madoc, Hasting county. A number of minerals of economic importance, such as fluor-spar, talc, pyrite, gold, actinolite and molybdenite, are found in this area. He will also visit talc and soapstone deposits in Ontario and Quebec for the purpose of completing data for the preparation of a report upon the talc and soapstone resources of Canada.

An investigation of the clays and shales of Ontario will be continued by *Mr. Joseph Keele* with a view to ascertaining how they may best be worked to obtain the most satisfactory results in the production of such commercial products as brick, drain tile, sewer pipe, etc. Mr. Keele has already surveyed most of the other provinces of Canada for this purpose and issued reports covering these surveys. A similar report will be made upon the clay resources of Ontario.

QUEBEC.—Since the discovery of the Dome ore-deposit at Porcupine in 1909, gold camp after gold camp has been discovered and developed in northeastern Ontario until today it is producing about $18,000,000 worth of gold yearly. The geological investigation of the Geological Survey and the Ontario Department of Mines have demonstrated pretty conclusively that these gold ore-deposits are connected in origin with small intrusions of granitic rocks, and are chiefly localized in the vicinity of these intrusions. So far, nearly all the important discoveries have been made in Ontario, although apparently the same geological conditions continue eastward into Quebec. This year *Dr. H. C. Cooke* will map on a scale of one mile to the inch an area of about 800 square miles in northern Quebec adjacent to the Ontario boundary, chiefly for the purpose of assisting prospectors in searching for gold in Quebec. The resultant maps, it is planned, will show all small granitic intrusions which can be found, all extensive areas in which bedrock is concealed by swamp or drift, and other geological and geographical features of practical concern to prospectors.

A survey of four important peat bogs in Quebec and Ontario will be made by *Mr. Aleph Anrep*, in continuation of a systematic survey of the peat resources of Canada.

Mr. K. G. Chipman will make surveys for a topographical map on a scale of one mile to the inch of part of Gaspé peninsula in the vicinity of the Federal zinc and lead mine. This topographical work is preliminary to a continuation of the geological work done in the locality by Dr. Alcock last year. The area is one of considerable interest to prospectors. It is underlain by sedimentary rocks cut by basic and granitic intrusives favourable to the occurrence of metalliferrous ore-deposits.

Mr. W. H. Boyd will make, for the Federal Department of Public Works, a detailed topographical survey of Matane harbour on the north coast of Gaspé peninsula.

MARITIMES PROVINCES.—A detailed topographical map of the Minto coal field, New Brunswick, on a scale of 1 mile to 1 inch will be made by *Mr. A. G. Haultain*. This is preparatory to a geological investigation of thefield.

Triangulation control for New Brunswick surveys, both for present and future needs, will be made by *Mr. S. C. McLean*.

Dr. E. R. Faribault will continue the systematic mapping of Nova Scotia on a scale of 1 mile to 1 inch. Work will be carried on during the summer of 1922 in Annapolis county, where early Palaeozoic sediments are found in contact with the gold-bearing series of the province. A detailed investigation will be made also of the Nictaux-Torbrook iron range, which occurs in this locality.

Dr. W. A. Bell will complete his work in the coal field of eastern Cape Breton, spending a short time in the New Campbellton area. He will then commence a detailed investigation of the New Glasgow area, Pictou county, for the purpose of working out the stratigraphic and structural relations of this coal field.

A Mining Man of Two and a Half Centuries Ago*

I. MINERALOGY AS IT WAS.

(Written for the Canadian Mining Journal.)

All wisdom did not die with the ancients, nor will it die with us. Every generation has had its torchbearers, lights that have burned with undiminished glow throughout succeeding ages, or flickering flames that have illumined a corner of the dark world for a little and died out.

* * *

Sir John Pettus, of Suffolk, Knight, was born in the year of grace 1613. For 28 years, 1651-1679, he was one of the Deputy Governors of the "Society of the Mines Royal and Battery-Works," of which august body Viscount Halifax was then the Governor in succession to his "late Highness Prince Rupert." Reference to the functions of this Society will be made later. Sir John engages our immediate attention.

Although he was a stout cavalier and royalist, Pettus was thrown into the Fleet prison in the year 1683, for debt, when he was 70 years of age. He had previously undergone 14 months incarceration in Windsor Castle in the time of Cromwell because of his Jacobean sympathies. His confinement to the Fleet he attributed to his "being too kind to others, and too unjust to my self, and for not doing what was not in my Power to perform, by wanting the Justice of my Debtors whereby I am rather a Prisoner to them than to my Creditors." Sir John, however, was a philosopher. He struck up a warm friendship with Richard Manlove, the Warden of the Fleet Prison, and went so far as to persuade Manlove to give him pecuniary assistance in publishing a translation from the German of Lazarus Erckern's "five books" on assaying and metallurgy. To the translation he added a glossary compiled by himself.

Every bit of the translation, a large folio of 345 pages, is pregnant with interest. In this article it is intended to survey only those parts of the treatise that deal with the science of mineralogy as it was known in the reign of King Charles the Second. In doing this we shall follow the order observed by the translator, namely, first silver ores ("oars" is Pettus' mode of spelling); than gold ores; copper, and lead.

Silver Ores

"Silver Oars," remarks our author, introductorily, "are found to be of many sorts and Colours, yet if they be very fine, they are not to be judged by their Looks (how rich soever they are in silver) and therefore 'tis proved by Artists... that the worth of every Oar may be certainly found out, so that the very smelting, melting, refining and account thereof may be demonstarted both as to its worth and the Charges."

It is carefully explained that silver ores of various kinds must be variously tried according as they are "hard, harsh, gross, and crude," or "of a more mild, subtil and ductile nature." Then follows the system of classification evolved by Erckern.

First come the "Easy-flowing Silver Oars," in which category are comprised "all Silver Oars in all sorts of Mynes free from Flint, Blent, Cobolt, Mispickle, Glimmer, Wolferan, course [sic] spelter and Wismet." Pettus in his glossary, defines more closely these constituents that must be absent from "mild oars." "Metaliek *Flints* (Silix) are such as accompany the Veins of Metals." *Blint*, or blend, is found "when Metals are blended or mingled in lumps." *Cobolt* is "sometimes accounted to be copperstone, and reckoned by Dr. Salmon among the Recrements of mettals." "Recrement" here evidently signifies a product of weathering. Sir John's attempt at defining "mispickle" is a pretty obvious bluff. "I know no other word for it" says he, "but it may be derived from the next word." The next word is "Missy", indicating, we are told, an ore sparkling like gold. "So as I conceive" quoth Pettus, "Mispickle is an Oar of the same nature, only spotted." Despite his "Oars", the Knight is at sea. But he is admirably non-committal. *Glimmer* is "a shining Oar... and sometimes it is taken for Tallow." This last remark throws much more light on the subject than a learned etymological discussion that precedes it. *Wolferan* is omitted from the glossary. This surely means that Sir John could not make even a guess at its meaning. Moreover, he was coming close to the end of the alphabet. *Wismet*, as might be expected gisnifies bismuth, "a Crude Oar or kind of Silver Marchasite, and of a white, hard and brittle Body." It was variously wismut, wisunth oar and spelter, and sometimes tin glass.

We can grasp now the fact that silver ores were divided into two classes, those that were easily smelted and those that were refractory. "All spady Oars (or such as may be dig'd with a Spade) if they be red, green, yellow or white (if there be no other mixt silver Oars with them) for the most part do contain little or no silver in them."

In the quotations given above we have fair specimens of the determinative mineralogy of the time. Two and a half centuries had to elapse before a Dana could be produced.

Gold Ores.

"This Second Book describeth how Gold oars are to be known, and how to Roast, Boil and Prove them.... also to distill Aqua Fortis, and to rectify it."

"Experience" led the author astray. In his second paragraph he asserts positively that "no Oar hath Gold only of it self, without other incorporated Metals, unless it be apparent and seen." Admitting that native gold is not always pure, he explains that it is found "intermixed or commonly standing in a whitish Flint, and sometimes in a blew and yellow Hornstone, and also in a Blew shiffer streaky and yellow iron, but very small and flaming with gold." Readily enough we can distinguish quartz and weathered carbonate in this comparatively lucid description. Added light is thrown on the meaning when "shiffer" is explained as denoting ores that are loose and easily broken. It is mentioned that "Duke" gold, a very "high" form of the metal, comes from a mine in Bohemia. However, "all Goldish oars (which are commonly sandy) have good Duke gold," which gold, along with tin and wolfram,

* A short article on Sir John Pettus from the same source, Appeared in a contemporary publication three or four years ago.

Mr. C. H. Sternberg, who has been so successful in collecting the fossil remains of dinosaurs in Alberta, will, during the summer, visit the Joggins section, Nova Scotia, for the purpose of collecting plant remains and preparing a museum exhibit to illustrate the forests that existed there during the period of coal formation. *Mr. Allan McKinnon* will make museum collections of minerals in the maritime provinces, Quebec and Ontario.

"have been driven far by the Deluge." The reference to alluvial deposits is clear enough. But at this point the author digresses into an involved speculation as to the origin of alluvial gold, which is very poorly translated.

Returning to his mutton, he continues:

"Sometimes with the digg'd Gold... there breaks a small grey spissy Oar, which... is called Iron-man," which is rich in both gold and silver. (Note the calm manner in which the author contradicts himself.) This, we are warned, must be carefully distinguished from "the other dig'd Gold which standeth in Flints." Here is foreshadowed the distinction between free milling and refractory gold ores. With a word in favour of "Marcasite" (properly spelled this time) the elucidation of the nature of gold ores stops abruptly.

Copper Ores

"Now" we read "Copper Oars are more easily to be known than any other metallick Oars, as having in them varieties of Colour." They are of three sorts:—First, copper glass, which is numbered among the "deft and smooth flowing Copper Oars" that are "blewish, (and yet their colour come near to Grey) and are the richest Copper Oars, and contain the most Copper and Silver." Secondly, the "green Coppers which are rich in Copper but poor in Silver." So also the "lazare coloured Copper or blew and Green-mixt copper-Oars." Thirdly, "the brown copper Oars" and the "copper shiffers" in which there are resemblances to "corporeal Creatures," such as fishes and snails. In brief, all ores that are not "flinty or speizy (spissy)" are soft-flowing.

With this outline the budding mineralogist of the seventeenth century was fain to be content.

Lead Ores

"Concerning Lead oars they are usually to be well known among the other Metal oars, for they are mostly grey, heavy, bright of colour like the Lead it self... and such bright colored Lead oars are the richest, and contain above half lead." White lead ore, like a sandstone, and red lead ore, not so rich, a yellow ore and a mixed yellow and red ore are included in the list of "smooth-flowing" sources of the metal. The poor ores, we are informed, are taken from "flinty, blendy or mountainous places, and are either visibly or invisibly insperged or sprinkled with brightness (like the Lead oar at Goslar) and are very heavy... yet they do partly separate and purify in beating and washing, but partly they do stick fast in the water, that one with the other remain unseparated." The lead metallurgist assuredly had to do a bit of investigating for himself. Yet, read in the light of modern knowledge one may detect the adumbration of systematic classification even in this hasty sketch.

The fifth book treats of "Saltpetre, Vitriol, Allum and Salt-Springs," and therefore does not concern us at present.

In a succeeding article we shall glance over the methods of assaying described by Erckern and commended by Sir John Pettus.

CAPRICORN.

A HOME-MADE PNEUMATIC DRILL-PRESS

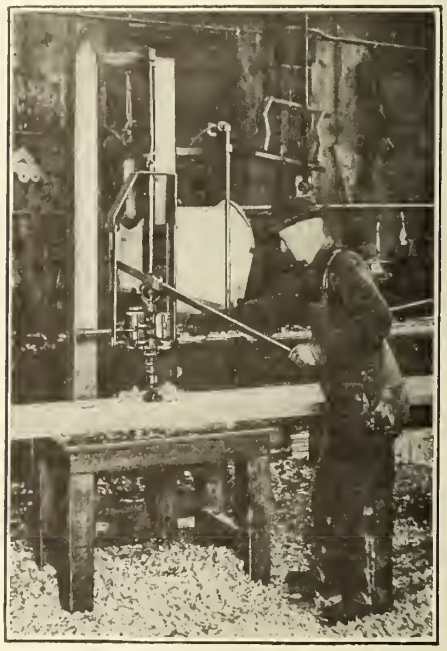
By F. A. McLean

There is a far wider field for the use of air-operated tools such as riveters, chippers, drills, grinders, saws, etc., around the average mining property than is commonly realized. Construction work is in a western mine, for instance, involved the drilling of several hundred 4 x 9 inch timbers for use as shaft guides. Experience soon proved that to do this work by hand was both too costly and too slow. The master mechanic, therefore, endeavoured to find a better method and finally rigged up a Little David Drill to form a crude, but nevertheless efficient air-operated drill-press. With this equipment the holes were drilled at an enormous saving in both time and cost.

The timbers were partly of oak and partly of Oregon fir, 10 holes being drilled in each with almost equal ease. A Jennings counter-sunk bit was used, the 7-8" portion going through 4 inches of wood and the 2-½ inch follower boring 1½ inches.

It is evident that an outfit of this kind could be adapted to a wide range of work such as metal drilling, reaming or tapping, woodboring, countersinking, etc., and the cost of building would be very low.

Referring to the accompanying illustration, it will be seen that the drill-press consists essentially of a heavy wooden bench to which two 4" x 4" oak posts or risers are bolted. These posts are connected at the top by a



heavy iron strap, which also forms a bearing for the counter-weight pulley.

Light iron strips are bolted to the posts to support the drill and prevent the holes being bored out of alignment.

A long lever hinged to the wall at the rear of the bench and fitting over the handle of the drill permits the latter to be raised or lowered as desired.

Considerable variation in the actual construction of an outfit of this kind could be made without affecting its operation, so that the nature and arrangement of the parts used need only depend on the ingenuity of the builder in adapting materials at hand.

OIL SHALE OF PICTOU, NOVA SCOTIA

Recently there has been shipped to London a large sample lot of the oil shale and oil-bearing torbanite of Pictou County, Nova Scotia. Retorting experiments and the refining of the resultant oils are to be carried out with this shipment of shale, in units of commercial size. It is expected that there will follow immediately the construction of a commercial plant in the field, on which work is to be commenced this summer in order to have cover provided for next winter.

This experimental work is being carried on under the supervision of the technical advisers of two London oil groups. The property is owned by Oil and Nitrate Products, Limited, of which Mr. Harold C. E. Spence is President and Managing Director.

A Problem in Crushing

THE MILLING OF ASBESTOS ROCK

At the end of last month, a meeting of the Thetford Branch of the Canadian Institute of Mining and Metallurgy was held to discuss the crushing of asbestos rock. Besides a representative gathering of the camp's operators there were present a number of visitors who have made a special study of crushing problems; in fact, the meeting was organized to take advantage of what information these latter had to offer, as well as to consolidate local opinion on the question. Mr. Roger Burrell, representing Chalmers and Williams of Chicago, provided a good deal of definite information, which opened the way for a clearer comprehension of the crushing problem. Chalmers and Williams manufacture a wide range of machines for crushing rock, and confine themselves to that line. Hence Mr. Burrell's estimate of the crushing of asbestos rock is free from the bias that might influence the advocate of a special machine. Messrs. H. A. Burbank of the Canadian Ingersoll-Rand Company was able to draw upon his experience in the asbestos field, and stimulated a good deal of profitable discussion. Mr. R. K. Carnochan, of the Mines Branch, Ottawa, told of experimental work on asbestos rock he had done.

The chairman of the Branch, Mr. N. R. Fisher, was ably seconded in stimulating and regulating discussion by Mr. J. W. Davis of Montreal, who has made the asbestos field his especial study for years past. Dr. Robert Harvie of the Geological Survey, who knows more than any other man about the Quebec asbestos field, and the editor of the Canadian Mining Journal "were also present".

Saving the Long Fibre

The first asbestos obtained for the Thetford district was turned up with a plow. Thereafter, pick and shovel served for some time as the chief equipment necessary. There was then a market for "crude" only. Since that time, and until quite recently, "crude" has been the main consideration in most of the asbestos quarries, and in fact "crude" controlled the market.

This situation is rapidly changing. Just at present there is little or no sale for asbestos of the larger sizes, while for the products of the mills there is a fairly brisk demand. So now it is natural that more attention should be paid to the recovery of fibre, not by hand-picking in the pit as is done for "crude" but by the milling of the rock.

Other things being equal, the longer the fibre the more it is worth. It is generally conceded that the present milling practice cuts and breaks the fibre into much shorter lengths than are contained in the original veins. This entails a loss of possible profits that in the aggregate involves a large sum annually. The object of a majority of the operators of the camp is now, by concerted action to discover ways and means of avoiding at least part of this annual degradation of vast amounts of good fibre into lower grades.

Crushing and Fiberizing

Asbestos in its natural state is hard and rock-like, but has a tendency to split into fibres. As the accepted method of collecting the fibre in the mill is by suction from shaking screens after crushing, it must be in the separated or fiberized condition at that stage. But to loosen the rock like vein material into fibrous form before all the crushing of the enclosing rock has been accomplished is to expose the loosened fibre to cutting action in the crusher. Hence the object of the mill must be, first to crush the rock and vein material sufficiently finely, and in such a way as to loosen from the barren rock the particles of vein material without fiberizing; and second, to effect the fiberizing mainly (and if possible wholly) after the ore has been reduced to the small size. By this means the fibre will be protected from breaking and cutting during the crushing period, on account of being itself still in rock like particles.

This is, of course, a counsel of perfection; it is impossible to crush the ore without producing a certain amount of fibre. Still the ideal should be kept in mind, and every possible effort made to approach the ideal, for that ideal means vastly increased profits.

MEETING OF THETFORD BRANCH CANADIAN INSTITUTE OF MINING AND METALLURGY

Front Row — W. M. Goodwin, R. E. Burrell, N. R. Fisher (chairman), Paul Hammerich, O. C. Smith
Back Row — G. W. Morrison, Geo. Dick, Jr., McLeod, Jas. Ferguson, Geo. Smith, R. K. Carnochan, J. W. Davis, Robert Harvie, W. A. Janitsch, W. A. Clearihue, J. E. Tregunno, H. A. Burbank

Requirements of Crushers

At the conference on May 29th, discussion was limited to the crushing problem. Fiberizing is a separate problem, in spite of the practice that still persists in some mills of deliberately combining the two stages of treating the rock.

The object to be pursued in crushing is, as outlined above, to reduce it in size with a minimum production of fibre. This can be effected best by a machine such as will give a minimum of fines. Any crusher with a grinding action is ruled out at once, as its movement produces a considerable amount of fines. Also, a crusher that reduces a piece of rock by too great a movement in one stroke will produce much fines on account of internal attrition in the rock being ground. Similarly a choke feed, or a slow discharge of crushed material is conducive to the production of an excessive amount of fibres due to this same attrition of particle on particle of ore.

Now, to outline some of the qualities to be possessed by the ideal crusher: It should reduce the ore in such a way as to crack it open, allow the immediate discharge of undersize, and the immediate descent to a narrower part of the pieces that need further reduction. The frame must be unusually strong as the serpentine rock of the district is prone to pack in the crusher, and consequently is at times more difficult to pass through than a harder but more brittle rock would be. Just in passing, it may be noted that a good deal of this packing or stoppage of ore in the crusher seems to be due to an attempt to make too great a reduction in one machine; also a tendency to use a choke-feed.

The Stages of Crushing

Primary.—At present there is in the camp no quarrying or mining operation of sufficient daily tonnage to warrant the installation of a crusher of primary size. Such a machine is capable of reducing ore from steam-shovel size down to, say, 18 inches, and has a capcity quite out of keeping with present asbestos pit requirements. However, the time will undoubtedly come, and may not be far off, when it will be expedient, for the sake of economy, to operate in large units instead of the present comparatively small ones. Then the problem of a crusher of primary size will have to be met.

Secondary.—The largest crushers at present in use in the camp are 36" by 42" solid-frame jaw crushers or gyratorys of equivalent size. Both are doing excellent work so far as reducing ore is concerned; but the feeding of over-size material by means of a choke-feed, and the attempt to make too great a reduction is one step mentioned above, result in a lamentable cutting and grinding of the precious fibres. This stage, at present the primary crushing of the camp, evidently needs more serious attention than it has had heretofore. The present reduction is from a feed as large as the jaws will take down to, say, 4 inches — a tremendous duty for a single machine.

Tertiary.—This, the present secondary crushing of the camp, reduces the rock from approximately 4 inch. size to, say, 1 inch. Corrugated rolls, small jaw-crushers and gyratorys are used, with good results. Here again, choke-feed results in an inordinate grinding action and the destruction of fibre, and should be asssiduously avoided. The present practice, logically conducted, does not injure the fibre excessively.

An innovation in two of the mills is the horizontal Symons disc crusher, a cleverly designed mechanism of very large capacity that cracks the rock with a sharp blow, and provides an immediate discharge of undersize by centrifugal force. Its possibilities have not yet been fully investigated.

The Final Stage.—It is still a matter of dispute whether or not the final stage of crushing from, say, 1 inch to $\frac{1}{4}$ inch, should or should not be accompanied by a fibersizing action. Those who have conducted systematic research on the question state that the two operations should be kept distinct and separate; and as there has been adduced on the other side no definite evidence, but only opinion, we must accept the researchers' conclusion. It is in the final stage of reduction that most of the damage is done to the fibre. Ordinary crushers are not suitable. Innumerable attempts have been made to develop a satisfactory machine; but most of these attempts appear to have been directed by mixed motives—the desire to fiberize as well as to crush. The natural result is that the "hammer mills" and "jumbos" at present in use are neither logical in design nor effective in performance. A considerable amount of practical attention is now being devoted to this marked discrepancy in the milling of asbestos rock, and there is no doubt that the problem of reduction in this final stage will soon be effected in a way that will prevent much of the present tremendous waste of fibre.

Fiberizing the reduced particles of ore is a separate problem not discussed in the present instance. The "cyclones" now in use do good work; but they might do better. The collection, sorting into sizes, and testing of the fibre also presents opportunities for improved practice.

Altogether, it seems as if an era of systematic investigation of the milling problems of the Thetford asbestos region had begun. Other regions, in Rhodesia, Australia, Russia and the United States, are producing asbestos in larger and larger quantities. Still the odds in favour of continued pre-eminence are all with Quebec, and it is to the Thetford region that all eyes are turned when asbestos is mentioned.

THE SCHREIBER GOLD DISTRICT

The report of Mr. P. E. Hopkins on the Schreiber gold area, north of Lake Superior, is expected to be issued at any time now, by the Ontario Department of Mines. In the meantime, it is interesting to note progress in the area.

Mr. Geo. Glendenning, who holds under option the McKellar-Longworth claims on Schreiber Point, intends to instal a mining plant and to drive a 1000-foot tunnel on the shear-zone containing the gold veins of the property. This will test the narrow, rich veins contained in the shear-zone, and will give, at the end of the tunnel, a "back" of 400 feet, thus constituting one of the few cases in Ontario where prospecting by means of an adit is feasible. The Hartness claims, 2 1-2 miles east of Schreiber, have also been optioned to Messrs. Glendenning and C. A. Foster. They contain narrow quartz veins with high gold values.

The Jackson claim, adjoining the Hartness, has been taken over by Detroit interests. A tunnel is being driven along a narrow quartz vein that carries good values in gold.

The Canadian Ingersoll-Rand Co. have recently published, in pamphlet form, *The Lubrication of Air Compressors, Practice Recommended by the Compressed Air Society, New York.* In its eleven pages are given the qualities required for a lubricating oil suitable for air compressors; the heat generated; descriptions of both paraffin-base and asphaltic-base oil; the quantity of oil required; and instructions for cleaning lubricating systems. Copies of this useful pamphlet can be had on application to any of the Company's offices.

News and Comments

BY ALEXANDER GRAY

James H. Curle Bound for Hudson's Bay

That inveterate globe-trotter, James H. Curle, is *en route* to Hudson's Bay, one of the by-paths of the earth he has not yet given the once-over and a fluent description. Being a confirmed bachelor, he travels without impediments, or "encumbrances", as they are regarded by irascible landlords. Gifted otherwise, he goes in light marching order, his wanderlust being put to profitable account in the way of entertainment. He is a living refutation of the precept that "a rolling stone gathers no moss". He is a keen observer and acute critic. He will, no doubt, luxuriate in the interior of an igloo—and it would not be surprising if he beat Amundsen to the North Pole!

Capital That Will Need Asbestos

Americans are about to resume mining of asbestos in the Ural mountains, having arranged a twenty-year lease and agreed to give the Soviet Government ten per cent. of the output. Sooner or later it was expected that more or less of the Russian inferior grades would be on the markets, but they will find their level. Providing capital, chancing markets, and giving the government a participation of the sort outlined, may be communistically ideal. The capital will require insulation.

Students Visit the Gold Mines

Chaperoned by Professor Bell, a party of McGill students gave the Northern Ontario Gold Fields the once-over during the past few days. A fresh impression was obtained of the importance and magnitude of mines in the respective camps, including those of the Sudbury district. While at the Dome, the management revealed the contents of a safe. Since the company entered the area of enrichment from which its current milling rock is coming, enough specimens have been gathered to make a collection so rich that it is safer under combination lock. As a display, it is forcible testimony to the attractive sections from which it came. The mill feed at present is averaging around $14; so there is no need of extra special chunks in other than the strong box. Should the lower workings continue to disclose anything like this better grade, the policy will be pursued of putting it over the plates, leaving the large quantity of low grade for future consideration.

At the Hollinger properties the student party found the management concentrating on ball-and rod-mill tests. Hollinger workings were not visited, Professor Bell taking the position that "it is too much of a job to go through unless you spend most of the recess there". An excellent opinion is entertained of Kirkland Lake, the courtesies of the Wright Hargreaves having been extended to the party. Discarding the scholastic, Professor Bell says "that two mile break is 'some' break. To look at a lot of Kirkland Lake surface, you might think most of it is unfit for much—not even for good pasturage—but the developments going on promise to make more mines." Sustaining this qualified optimism is the recent improvement in values at the Bidgood and discoveries elsewhere in that vicinity. The chief trouble is the indiscriminate distribution of cheap shares, which will preclude many of those who hold them from profiting commensurately.

Oil Over The Border From Alberta

Insofar as it comes, it is distinctly hopeful to have it reported that oil was struck on Monday the 5th, about eleven miles south east of Coutts on the borderland. First, Kelvin, then Coutts (both historic names) bring Montana production nearer to Canada. Lethbridge and Medicine Hat, as a consequence, are expectant. According to newspaper reports, "Simburst Number One well struck oil at 1550 feet in the Kootenay sands. The well stands at a depth of 250 feet in the casing." At or about that depth, should quantity production be indicated, an oil field may be shared with Southern Alberta, where it would be thrice welcome. If the information forthcoming in the daily press is verified there should be some excitement below Medicine Hat and Lethbridge.

Chibougamou May Need Help

The disquieting report that the present Quebec Government is averse to expenditures upon transportation facilities which will assist in the prompt development of mineral areas in that province, will hardly help contemplated developments in the Chibougamou district. An English Engineer, Major Yuill, has just arrived, and is leaving with H. L. Blake, M. E., of Ottawa, for Chibougamou, where they will test "mineral deposits in the interest of a powerful financial group in London". It is said "gold, copper, iron and asbestos" are the objectives; but if Quebec authorities are to continue unresponsive to outlying areas and new mining enterprises, who will risk capital expenditure to attain production?

British Metals Have a Copper Mine

Private advices are to the effect that the British Metals Company have found a copper mine near Little Bay, Labrador, and that they are now drilling near Gull Pond. By diamond drill, it is understood, between 5,000,000 and 6,000,000 tons of 3 per cent. copper ore has been indicated. So that's that. Newfoundland is in front of the map, while Quebec authorities appear to have nurtured antipathy for mining of all kinds. Newfoundland invites exploration and development. Quebec has assumed a reactionary attitude that is sadly out of focus. More will be heard of this anon.

Canadian American Industrial Life

Upon his arrival in London, Attorney General James M. Beck, of the United States announced that "economically Canada is becoming more and more interwoven with the industrial life of America". Racially and geographically that is a natural process, though Washington has an extraordinary way of dissembling its affections. Mr Beck speaks with authority, for he has been officially identified with the Asbestos Industry in Quebec. The trouble is, Washington would have the finished articles, while Canada cannot get along with "seconds".

The Engineer Mine

By a combination of tragedies and grim reapings, the Engineer Mine has reverted to the Alexander estate. Litigation may not be at an end, but title is clearer and it is possible the property before long will be worked. The lamentable death of Charlie Watson, the members of the Alexander family, and others, on the Princess Sophie, as a deal for the property was about to be closed, and a contest between claimants, has kept the Engineer Mine on the waiting list.

International Nickel Coming Back

It was taken for granted that the doings of the International Nickel Company for the year ended March 31,

would not evoke more than the thought that the industry has been through its worst, is passing toward convalescence, and gradually will resume normal activity. Letting the balance sheet tell it in figures, President Stanley makes what may be regarded as his inaugural address, in optimistic vein. "The company's business", he says, "during the first three months of 1922 indicates general improvement in the nickel industry. Monthly sales increased and inquiries for various products became more numerous. Foreign business is slowly becoming stabilized and further improvement is quite evident. Stocks of finished metal have been liquidated to such an extent that the Port Colborne refinery was started on May 1 and the mine and smelter at Copper Cliff will be started not later than September 1, 1922".

Meanwhile, the refinery will work off what was bequeathed to it from the abandoned refinery at Bayonne, and what nickel there is in hand. Market conditions are not such as to warrant operations in the mining and smelting departments. Revival in the steel trade in the United States having hastened the liquidation of whait nickel was being carried, Mr. Stanley from personal knowledge is enabled to forecast better days.

Otherwise the 1921-22 report shows a net loss of $1,335,581 after charges, taxes, depreciation and inventory adjustment against a net income of $2,029,700 or after payment of preferred dividends to 89 cents a share earned on the $41,834,600 outstanding common stock ($25 par) in the preceding year. After payment of preferred dividends the deficit was increased to $1,870,337 in contrast to a net income of $1,494,944.

The company's consolidated balance sheet shows a decrease of $741,652 in cash to $756,774, a drop of $1,001,000 in loans to $9,340,599. Accounts and bills receivable inventories to $9,340,599. Accounts and bills receivable increased $249,616 to $761,151. Accounts payable were reduced $9,890 to $494,846. The company's surplus was $10,015,840 against $11,886,177.

Mr. Melkman's "Chance of a Life Time".

Personalities other than complimentary are distasteful and should have little space in a technical journal. That is why no reference would have been made to an anonymous advertisement asking $25,000 for a third interest in a "gold mine upon which $75,000 has been expended," were it not that the "Chance of a Life Time" is still an off chance. If the infirmities of mortals and mines were less numerous, occasional lapses might be ignored. Mr. Saul Melkman (admittedly the author of the advertisement) has a prospect with some gold showings, to which he devoted attention. It is not a "mine", notwithstanding expensive propaganda and assiduous efforts elsewhere than at the property to make it appear to be "another Hollinger". Columns were written about it, both in Canada and London, principals went oversea with it; an outstanding Engineer came over to have a look at it and other things of merit presented by Mr. Melkman; but the "Chance of a Life Time" was rejected. Technically the Engineer may not have condemned it. His comment to the writer was: "There is not a ton of ore blocked out". At any rate Mr. Melkman insists he has a "mine". The proper thing for him to do is to be frank. Subtlety in such matters is unnecessary. When it was suggested to the London Engineer that this "mine" be entertained on an exploration basis and drilled, his reply was: "Considering the location, it is for the owners to do that before making estimates and before we could accept terms involving large outlay". So there are hopes—and fears— to be considered in estimating the value of Mr. Melkman's "mine".

NORTHERN MANITOBA MINING FIELD

BY REECE H. HAGUE

Mr Noah Timmins, of the Hollinger Consolidated Gold Mines Ltd., is expected to arrive in Northern Manitoba within the next few days, and his report on the Elbow Lake property is eagerly awaited by mining men in the district. Operations are continuing on the Murray and several other properties in the Elbow Lake area, and mining engineers who have returned to The Pas after visiting the new gold-fields report that things are going along very satisfactorily.

There has been a considerable influx of mining engineers into the Northern Manitoba mineral belt recently, new arrivals including Dr. R. C. Wallace, of the Manitoba University; Dr. W. F. Ferrier, of Toronto; A. L. Winekler and S. Ricker, representing the Canadian Mining Corporation; P. L. Foster, of New York, representing Exploration Company Ltd., of London, England; A. J. Bone, New York, representing large copper interests; D. J. Kennedy; I. D. D. Daimpre; Harry Darling; and Major Julius Cohen, Montreal, representing the Elbow Lake Mines Ltd.

Diamond drilling is in progress on a large sulphide body at Copper Lake on claims owned by J. P. Gordon and under option to the Nipissing group. Engineers Heidenreich and Wright are in charge of operations for the Nipissing interests, and while no official statement has been issued, it is understood that after drilling through 130 feet of solid sulphides, quartz veins running parallel to the sulphide body were encountered and followed to a considerable depth.

While very rich ore has been found on the Murray claims, and systematic assaying has been done, the results of the assay runs have not been made public.

Work by the Exploration Company on the Hanna claims has disclosed a very promising ore-body, and a party of Exploration Company men are at present at work on the Webb high-grade vein at the north end of Elbow Lake.

Several new and seemingly important gold finds have been reported from Elbow, Island, Claw, Barb, File and Reed Lakes in the western portion of the mineral belt; while copper discoverigs are reported from theAthapapuskow and Schist lake section.

Shaft sinking on the Hobson-Smith property at Neso Lake, a few miles from Lake Athapapuskow, has resulted in a large and promising ore body being disclosed with values of around 15 per cent copper, $3 in gold and a trace of silver.

The latest find from Herb Lake is only ten miles from Mile 94 on the Hudson Bay Railway and is some eight miles from the Rex property. This extends the area in Herb Lake over which gold-bearing quartz has been found. Samples from the new find have a high gold content and the vein is said to be well defined and some five feet in width. Several properties at Herb Lake are now under examination by mining engineers.

Every boat leaving for the mineral belt is packed to capacity and the travel routes from The Pas are busy continuously. Barge-loads of supplies are being taken in to the various camps and new prospectors and mining men are arriving in The Pas on every train.

News of Mining

United States

In the southern districts of Fayette County, Pennsylvania, the homes of many coal miners who have refused to join the union stikers have been dynamited. Hitherto no lives have been lost, but the families of the non-union miners are terrorized. A preliminary to these outrages was the theft of about 6,000 sticks of dynamite from the magazine of the Deyarmon Coal Company.

During the eighth week of the coal strike the production of bituminous coal was 5,000,000 tons, according to the estimate of the United States Geological survey. The output of the previous week May 13-20, was 4,472,000 tons. This is nearly 5,000,000 tons short of the 1921 weekly output. Estimates made unofficially indicate that approximately 514,500 miners are on strike and that about 121,000 are at work. The strikers include 117,000 non-union workers.

John Munro Longyear, a prominent mining engineer operator, and capitalist, died at his home in Brookline, Mass., on May 28th. Mr. Longyear had large holdings of Michigan mineral and timberland. He was actively interested in the Michigan College of Mines for many years and was a member of the corporation of the Massachusetts Institute of Technology.

There was a very marked decrease in the output of aluminium in 1921 in the United States. While the value of the output for 1920 was $41,375,000, that for the year 1921 was only $10,906,000. Throughout the year the imported metal was selling at two to three cents less per pound than domestic aluminium of the same grade. The price per pound dropped from 28 cents in January to 20 cents in December. Both imports and exports were less in volume than in 1920.

The Anaconda Mining Company, Butte, Montana, has carried out a series of trials of the new Hawkesworth drill point. The point weighs less than four ounces, is made of vanadium steel, and fits into the shank with a groove. It is easily detachable. Its use obviates the necessity of hoisting and lowering the large supply of drill steel required for each shift. A drillman can carry in his hand sufficient points for his shift's work.

The ore reserves of the Miami Copper Company, as in January 18th, 1922, were estimated at 36,000,000 tons of 1.6 per cent. copper ore; 6,000,000 tons of 2 per cent. ore, and 8,900,000 tons of 2.26 per cent. ore. The sum of $1,191,228 was paid in dividends during the year 1921, and net profits amounted to $929,984.35.

The Yukon gold company reports a defiet of $316,875.31. for the year 1921.

Great Britain

Messrs. S. Pearson and Sons, drilling for the government, are reported to have struck oil at a depth of 1,810 feet at D'Arcy, near Edinburgh. This substantiates the belief in the existence of oil beneath the Lothian shales.

Figures published by the statistical department of the London Metal Exchange show the total amount of copper in stock at the end of April as 11,183 tons. This is less by 1685 tons than the quantity in stock at the end of March. Australia and Burma are at present supplying the London market with lead, only very small quantities coming from the United States.

The city of Middlesborough, England, utilizes coke oven gas for domestic purposes. It is computed that thereby a saving of more than 380,000 tons of coal has been effected within a few years.

Europe

Earnest Solvay, inventor of the Solvay soda process, died in Brussels on the morning of May 26th. M. Solvay was 84 years of age. He was the son of a salt refiner. His first patents were taken out in 1861, when soda cost $55 per ton. After a long struggle success crowned his efforts. The outstanding result of his process was the reduction in the price of soda to $20 per ton. During the war he was imprisoned for three months by the Germans on account of his activities in Belgian relief work. Eight years ago King Albert appointed him a Grand Officer of the Order of Leopold and he was also the recipient of the Lavoisier Medal of the Institute of France and the Grand Medal of the University of Paris. His gifts to educational and charitable institutions were munificent.

Changes in the scale of wages and in the working conditions in the iron industry of Norway have been authorized by the Norwegian Industrial Arbitration Court. The chief item of change is a reduction of about 14 cents per hour in the pay of skilled workers.

Coal miners in the Borinage district, Belgium, have struck in protest against reductions in wages of 12 per cent. and of 7 per cent. in the wages of skilled and unskilled workers respectively.

A commercial union, in operation May 1st, now subsists between Belgium and Luxemburg. The trade of Luxemburg with Germany and France subject to Belgium is subject to no customs or restrictions whatever.

A Government Bill has been introduced in the German Reichstag to legalize the seven-hour shift in coal mines. A special clause reserves for the minister of labour the right to extend the shift by one-half hour when deemed necessary or expedient.

Africa

Asbestos mining is assuming considerable proportions in southern Rhodesia, and is growing only less rapidly in South Africa. The Rhodesian output for 1921 was valued at £103,067. Practically all the Rhodesian production comes from the Shabani and the Mashaba districts. The De Beers group has a very strong hold here. Here, also, it is authoritatively stated, Canadian asbestos operators are investing. In the Union of South Africa, producers of crocidolite or "Cape blue" asbestos are establishing a good market in the United States. The industry as a whole is recovering from the sure slump of 1919-20 and is showing unprecedented activity.

The rapid growth of the manufacture of stainless steel has been directly reflected in the revival of chromite minings in Rhodesia. Rhodesia chromite is somewhat higher in chromic oxide and lower in ferrous oxide than Indian chromite. It is a physically hard ore that breaks in clean lumps. On the other hand, the new Caledonian chromite is friable and pulverulent, and of higher chromic oxide content than the Rhodesian ore.

The ore reserves of the States Mines Witwatersrand, South Africa, are now re-estimated at 10,232,000 tons, the stoping width of the veins being 77 inches and the average value per ton 8.5 dwt. The amount of ore milled in 1921 was 1,625,500 tons of an average value of 34s 9d. per ton. The costs per ton are 24s 7 6d. The working profit was £1,070,309. Near the centre of one property

a circular shaft 22 feet in diameter, is being sunk to a depth of 3,500 feet for ventilating purposes. The estimated cost is £125,000.

The ore reserves of the Randfontein Central Mine, South Africa, as on January 1st 1922, were estimated at 4,142,100 tons carrying an average of 6.2 dwt. gold over a stoping width of 49 inches. All ore of a value of 5 dwt. per ton and over is included in this estimate. About one and one-half million tons of ore are milled annually. A 300-drill steam turbo-compressor is being installed this year.

The daily wages of white workmen on the Rand have risen since the year 1913, 55 per cent; native wages, 18 per cent. The cost of stores has risen in the same period 43 per cent.

Australia

The Zinc Producers' Association, Limited, Australia, under its agreement with the British Government, has disposed to date of 836,000 tons of concentrates and 5000 tons of spelter, and small quantities have been used by the government.

The oldest iron and steel enterprise in Australia is the Hoskins Iron and Steel Company Limited, Lithgow, New South Wales. It is capitalized at £2,500,000, and is controlled by the Hoskins family. The principal plant is situated at Lithgow in the Blue Mountains, 100 miles west of Sydney. The Company owns large holdings of iron ore lands in New South Wales and Tasmania and operates collieries and coke-ovens 50 miles south of Sydney. At the Lithgow plant the coal supply is mined only a quarter of a mile away. The Company's ore reserves are stated to contain between 80,000,000 tons and 100,000,000 tons. The coke-oven plant at Lithgow consists of 95 Belgian type ovens with a capacity of 1,500 tons of coke per week. The capacity of the two blast-furnaces is 150,000 tons of iron per annum.

Asia

During the week ending May 27th India bought £800,000 gold. It was bought in the London market at one shilling above United States parity and was shipped on the P. and O. liner "Egypt".

In the province of Heilungkiang, China, seven gold mines are stated to be operating, one of the richest of these mines was worked by Russians for some time without the knowledge of the Chinese authorities. It and two others are now under Government control.

Book Reviews

CANADIAN MINING HANDBOOK—by W. A. Morgan. Published by Walter R. Skinner, 15 Dorogate Hill Cannon Street, London,E. C. 4.—Price 1s. 9d. post free.

A cautionary introduction, in which the investing public is warned to watch its step, opens this booklet. As further introduction, parts of an address by Mr. T. W. Gibson, Deputy Minister of Mines, Ontario, occupy seven pages. Mr. Gibson needs no commendation from us. His matter is ever pithy and exact. For the rest, there are more than fifty pages constituting a directory of Canadian mines.

In the main, this will be found exceedingly handy, and will assuredly serve to advertize Canadian mining. One feature grates somewhat on our feelings, although it would be totally unfair to blame the compiler in any way whatever. The Associated Goldfields Mining Company, Limited, is listed on one of the early pages. Against a capitalization of $30,000,000, its mining properties are given a book-value of $20,985,398. This, of course, is an arrant absurdity. It would be much nearer the truth to cut off the five figures to the right of the dollar sign and let it go at that. Another old friend crops up on page 44, the Porcupine-Davidson Gold Mines, Limited. We must confess that the Davidson is not in the same class as the Associated Gold fields. It, the Davidson, has something to show in the way of ore. Also it has a very decorative directorate. But its finances have been juggled so wonderfully and fearfully that only an expert accountant could tell a shareholder where he stands. Neither concern is a credit to Canadian gold mining.

However, this digression is quite unjust to the Handbook, which we welcome sincerely and commend to our readers. In time it may become the sister volume to Mr. Skinner's "Mining Manual"; but it will have a long route to travel to achieve that enviable distinction.

MINING HAND BOOK OF CANADA, 1922.—compiled by R. E. Hore and J. J. Kingsmill.—The Investors' Mining Hand Book Co., 56 King St. West, Toronto. Pp. 128; Price, paper covers, $1.00; leather, $2.00—

There has just been published a convenient little hand book of Canadian mining and mining companies. It contains, at the beginning, 36 pages of information about the occurence and production of the various minerals in Canada, and the dividends paid by gold and silver mines in Ontario. Then follow 80 pages giving details as to the various incorporated mining companies of the Dominion. The insertion of several small maps elucidates the text.

This little book does not pretend to be a "guide". It is a convenient source of information. It places Canadian Associated Goldfields (of Larder Lake) and Canadian Collieries (Dunsmuir) Ltd., side by side, and leaves it to the readers to discriminate between the going concern and the illicit promotion. The Hollinger Consolidated Gold Mines, Ltd., and the Holtyrex Gold Mines Ltd., are differentiated, for the discerning, by the note that the latter "is diamond drilling". The hand book will be useful to many interested in the mining industry.

NORTHERN ONTARIO PROPERTIES

Northcrown

The Northcrown Porcupine Mines Ltd. recently resumed exploration work at the Porcupine Crown property. Northcrown was formed to operate Porcupine Crown and Thompson Krist properties. Work was discontinued in 1921 owing to lack of funds. Controlling interest in Northcrown is owned by Porcupine Crown Mines and the latter company provided the money used in the work last year.

Night Hawk

Development at the properties operated by Night Hawk Peninsular Mines Ltd., at Night Hawk lake is reported to have given very satisfactory results. This company owns or has options on most of the shares of Porcupine Peninsular Gold Mines and is operating that company's property. Night Hawk also owns or controls several neighboring properties giving the company control of about 1500 acres. Mr. A. R. Globe is general manager. The drift at 180 ft. opened up a good ore body and work is now proceeding at the 300 ft. level.

Notes From Nova Scotia

Rebuilding 43 Miles of Airways

To reconstruct the airways of ten collieries is a big undertaking, costing large sums of money and it will take a long time to complete the work; but it must be done in order that the Empire Steel Company should be able to carry though the large program they have laid out for the development of the Cape Breton collieries. Forty-three miles of airways had to be rebuilt and placed in a permanent condition to last until such time as all undersea coal is taken from the farthest point.

The control of ventilation is under the Mine Engineering Department with Alex. L. Hay in charge. The work has been standardized wherever it is possible to adopt uniform methods of construction. In the main airways, 1,200 concrete stoppings had to be built. Half of these are finished and the other half are in process of construction. This is equivalent to 4,000 cubic feet of concrete. The mixture used is 1, 2 and 4. Slag from Sydney Steel Works was used in place of gravel with success. Steel supports for the roof have been largely used. These are simply old heavy rails discarded by the railways.

Ventilating System

The ascensional system of ventilation is being established. Fresh air enters the mine by way of double intakes and is carried direct to the working faces, where it is distributed and finds its way back up to the surface again.

The mines are divided into ventilating panels or sections for the purpose of having all haulage-ways neutral. Going hand in hand with the ventilation scheme, efforts are being made to control the dust situation by establishing wet zones at the entry of all panels. In working places sprays are used, but in abandoned workings dams are built. These are from 2 to 4 feet high and create wet zones over a distance of 200 or 100 feet according to the grade of the level.

While all this re-building is going on, the air courses have been made as tight as possible to prevent leakage and the results have been surprising.

An analysis of air is made at intervals. All Mine Managers are advised of the condition of the mine atmosphere. The introduction of this practice has been found to be most beneficial to the mine manager interested in the safety of his colliery.

In the secondary airways the stoppings formerly built were of double boards with brattice cloth between them. These were found to be inefficient and much leakage occurred. Stoppings built today are of boards with double battens across the joints and the whole is given a facing of hardwall plaster and sand in proportion of one and one, and in less important places of one and two. As the overburden increases, it may be found necessary to built all stoppings of solid wooden blocks laid either in cement or plaster.

The expenditure on air-course construction has been great, but there can be little doubt that when the work is completed the gain made by saving in power will be large, and will, while adding much to the safety of the mine and the health of the miner, reimburse the Company in course of time.

Electric Power in Mines

Compressed air is the power now used to operate mining machines and all the small donkey haulage engines underground. Over long distances the efficiency of this power is greatly reduced, and the upkeep of air lines is heavy. The time has been reached when electricity must be used and air power gradually discarded.

For this purpose the collieries are being electrified. To the two large power plants now in operation, a third is to be added. This will be of 60 cycle frequency and can be linked up with the Sydney Steel and Sydney Mines systems.

In preparation for this change the ventilation of all the large collieries is being reconstructed. Fresh air will be led direct to all working faces and electric mining machines will be installed. The Nova Scotia Government in 1908, foreseeing the time when the working of the undersea areas would become a great economic problem, appointed an Electric Commission, who gathered evidence in Nova Scotia and at the collieries of the United States. The report of the Commission headed by Judge Patterson caused the Government to draw up and approve rules and regulations governing the use of electricity in coal mines. Under these rules, electrically driven pumps and electric mining machines have been operated for years. The general application of electric power can only come about gradually, there being many valuable air compressors and much air-driven machinery in use at the present time.

Training in First-aid

Following out the original plans of instructing their workmen in first-aid to the injured with the purpose of having a large number of trained men all over the works and in the collieries of the Empire Steel Company, the Safety Department has completed the work of organizing classes.

In the mining districts of the United States and most other coal producing countries, miners have entered upon this work with much enthusiasm, and the attendance and interest has been most surprising. Competitions in first-aid are features in many of the mining towns, and the operators, the labour unions and the Government bear a third each of the expense incurred at these trials of skill. We in Nova Scotia have not reached that fortunate stage of hearty co-operation, but we are not without hope of something attaining it.

Over five years ago the Mines Department of the Halifax Government called a meeting in Halifax of representatives of employees and employers to discuss safety work. It was a very enthusiastic meeting, and while it accomplished the purpose for which it had been called, yet the Government has not seen fit to become a contributing factor to work of this kind at the collieries they supervise. The matter has been left entirely to the Coal Companies to carry on in their own way. In order to arouse more interest in this work, it is the intention of the Empire Steel Company to hold a competition during the summer. Teams from Sydney, Sydney Mines and other colliery districts will take part.

The First Aid Classes under the Safety Department of the Empire Steel Corporation were a little late this year in getting together. This was largely due to unsettled conditions at the collieries, the inactivity at the steel works, the hard winter weather and the prevalence of flu which kept all the doctors busy.

Last year sixteen classes with a roll membership of 180 succeeded in qualifying 261 students, 21 of whom passed their examinations and received certificates.

The number of classes this year is sixteen. Thirteen of these are at the collieries, one at Sydney, one at the general shop, and one at the railway and auxiliary department. The total enrollment is 300, a good number, everything considered.

Details of the Course

The course consists of six lectures given in six consecutive weeks. The classes are taught by the colliery doctors. A student to qualify for examination must be able to show that he has attended at least five lectures. Records of attendance are kept at the collieries and forwarded to the Safety Office, Glace Bay. When the classes show a falling off in attendance the Safety Office gets busy and a truancy man is sent out to hunt up non-attenders. In all cases this method has brought the class up to normal.

The text book of the St. John's Ambulance Association is used. The lecture lasts about one hour, after which a practical demonstration is given by a first-aid expert. Thus theory and practice go hand in hand. Second year students qualify for the Voucher Diploma of the Association. The Medallion is granted to third-year classes and a Bar for each one of four years study afterwards. Eight first-aid stations have been established at the collieries and one at the central machine shop.

All buildings are conveniently placed at the collieries and on the works. They are finished inside with white enamel, are kept spotlessly clean and are comfortably heated. Besides hot and cold water, they are supplied with all necessary medicines, bandages, splints, etc. Each station has a hospital cot. At the No. 6 and Birch Grove collieries, operating tables are installed for emergency cases, as these places are at a considerable distance from the larger hospitals.

Eight ambulances serve these stations, besides doing the work of carrying sick workingmen and their families to and from the hospitals. These ambulances have been lately fitted up with rubber tires and electric lights within and without for night travel. An improved stretcher carriage to further lessen the jolts in transportation is about to be adopted.

First aid has been extended to meet underground conditions and stretchers with all necessary supplies are kept at central places underground. The American Army type of stretcher is used, and with other necessary equipment is kept enclosed in a metal cylinder.

With years of continuous instruction a large number of workmen should become efficient in rendering first aid to their fellow-workmen when necessary. No situation can arise where trained men cannot be of great benefit to the injured.

When war broke out and Britain, France and Belgium needed stretcher-bearers faster than they could train them, the colliery and large manufacturing districts provided a small army of men who had been taught how to aid the injured. We are not instructing for war, but in the course of industrial life, the services of such men are most valuable and much needed.

Big Coal Seams Continue under Lingan Bay

It will no doubt be interesting to the non-mining as well as to the mining population of the Cape Breton Colliery Districts to learn that both the Phalen and the Harbour seams are found in the New Waterford and Sydney Mines districts. There are changes, however, in the height of the seam and in the nature of the overlying strata, and also of the angle of dip, but nevertheless the Phalen seam is worked at New Waterford and the Harbour seam runs on to Sydney Mines. The general belief has heretofore been that the collieries of New Waterford and Sydney Mines were on seams known only to that district.

Besides Nos. 1, 2, 4, 5 and 6, collieries, Nos. 15 and 16 collieries, New Waterford are working on the Phalen seam. The old Lingan mine was also working on the Phalen.

No. 9 Harbour seam is tapped in New Waterford by collieries Nos. 12, 14 and 17, and at Sydney Mines by Princess and Florence collieries.

To those of us who had the pleasure in days gone by of knowing Mines Inspector, Patrick Neville, it was most interesting to sit and listen to his theories of the Phalen seam under Lingan Bay. Mr. Neville was a natural prospector, and had a most wonderful knowledge of the Cape Breton coal fields. He held that there was an anticline about the centre of Lingan Bay which affected the Phalen seam, but that it would be found as the seam ran to the dip that this anticline would end and the coal would be found running far off to the north in regular formation. This was just what was found. For a time it appeared that the north side of No. 1 colliery had struck the northern outcrop, and the levels were much shortened. But as greater depths were reached it was discovered that the supposed outcrop was an anticline, which had affected the rise workings but disappeared entirely on the dip. As the seam now is, it can be traced direct from either No. 1 or No. 2 collieries under the bed of the Lingan Bay and the proposed new colliery of No. 26 may yet drive right on into the workings of Nos. 15 and 16, New Waterford. No. 9 colliery, operating from the same shaft as No. 2, may also find its way into the workings of 12 and 14, as it lies directly over the Phalen seam. But it keeps on, crossing under Sydney Harbour, and the output of Sydney Mines collieries is largely drawn from this same seam, (the Harbour). How far these two seams continue under the ocean is a problem which the future only will reveal.

The Quality of Sydney Coal

There is another feature common to both of these seams and that is the change in quality of the coal as it is found in the east or the west. In no place is the quality poor, but both seams are found at their best the further they run to the north-west. The old Sydney Mines coal, famous for many years, sold at a higher price than other Cape Breton coal, although it has now been fully demonstrated that it is just the Harbour seam of Glace Bay. The coal of Nos. 12 and 14 collieries is excellent in quality. Reserve Mines coal was a good seller, but superior as the quality was, it is surpassed to-day by the product from Nos. 15 and 16 collieries.

The rock roof in the Waterford district, especially to the rise, is heavy and hard to hold up; but towards the dip the stratum becomes firmer and is not so difficult to support. In the New Waterford district the angle of dip is slightly heavier, but it has been found that it eases off in the lower workings, and it is believed that greater depths will find a uniform and easy pitch over the entire coalfield.

The mainways of Nos. 1 and 9 collieries are being built to stand for many years, and the time may not be far distant when we may be able to enter a mine on the southern side of the Island and pass underneath the waters of Lingan and Sydney Harbour emerging on the other side by way of Princess or Florence Collieries.

Berlin capitalists are planning the development of coal deposits and the establishment of briquetting plants in the Dragoman Region, Bulgaria.

Northern Ontario Letter

The outstanding features of the mining industry of Northern Ontario during the first quarter of the current year, are the facts that the production of gold was more than doubled as compared with the first quarter of 1921, while the output of silver also increased to an important degree.

In turning out $4,675,475 during the first three months of 1922 (according to official figures), the gold mines of Northern Ontario easily established the highest record so far in their history, this being an increase of $2,378,953 over the output for the first three months of last year. This production is at the rate of $18,701,900 a year. Add to this the fact that the enlarged McIntyre-Porcupine mill will go into operation next week and that the Teck-Hughes will increase its output, as well as other increases at other mines, and it is evident that the aggregate yield for the whole of 1922 will exceed $20,000,000.

Power Development Still Delayed

The question of allotting rights to develop power on the Abitibi River is still unsettled, according to advice received officially by the representative of the Journal from Premier E. C. Drury, who says, in answer to the direct question:

"I am unable to give you the information you desire, as this matter is still under consideration."

Therefore, although about 300,000 h.p. is running to waste and in spite of there being interests in Northern Ontario who have the money and the inclination to develop the power, the entire proposition is held in abeyance indefinitely.

In view of the momentum which industry would gather from the present wave of enthusiasm throughout the north where natural resources are being developed, it is considered little short of a calamity that such lethargy (or something worse) should be made so manifest at the capital city of Ontario.

"This is not progress!" is the somewhat disparaging remark made this week to your correspondent by a prominent Northern Ontario citizen when shown the evidence of uncertainty in connection with power development on the Abitibi.

High-Grade Vein on Lake Shore

Developments of importance continue at the Lake Shore mine, particularly at the 600-ft. level. The drift at this depth has attained a length of approximately 2,000 feet on vein No. 2 and upward of four-fifths of the total length is in good ore.

So rich is the ore and so consistent the mineralization, that it is now possible to classify this vein as the most valuable individual gold ore deposit so far developed in Canada. Not only this, but in addition to the millions known to lie in the deposit as found within the boundaries of the Lake Shore, this is the same vein that continues to the west across the adjoining Teck-Hughes and the Kirkland Lake, as well as to the east across the Wright-Hargreaves, Sylvanite and into the Kirkland Lake Proprietary.

Dome Takes Option on Foley O'Brien

According to advice just received here, the old Foley O'Brien property has finally been optioned by the Dome Mines Company, the option being for eleven years. No details have been known as to the amount to be paid. It has been intimated, however, that the Foley O'Brien is to be paid for with Dome treasury shares.

In connection with the question of further capital returns on Dome shares, the follwing unofficial comment comes from New York:—

"There is reported to be no prospect of increasing the Dome dividend rate this June, but another large capital return is scheduled to be announced around the end of the calendar year for distribution about the end of the fiscal year, March 31st, next."

Coniagas in Kowkash District

It has been announced that the Coniagas Company has secured a working option on a big group of claims in the Kowkash mining division and will carry on exploration work by use of a diamond drill.

The property involved is known as the Hull-Kipper, and is known to have a big but low-grade ore deposit within its boundaries. Offers were formerly made by Cobalt companies to explore the property with diamond drills, but the original owners were opposed to this method of exploration. The deaths of both Nelson Hull and his partner, Kipper, the original owners, have been followed by the granting of the option to the Coniagas.

Values of from $3.50 to over $4 a ton have been mentioned as having been obtained from channel samples taken over exceptionally great width on the property. This fact, together with the property lying in comparatively new territory to the east and north of Lake Nipigon tends to attract widespread interest.

Teck-Hughes

During the month of May the Teck Hughes mill treated 4,840 tons of ore, showing an average daily capacity of upwards of 156 tons, and comprising the largest tonnage ever treated in any one month so far in the history of the mine.

The ore continued to come from the upper levels, with the exception of a small tonnage from the new vein found at the 730-ft. level on which drifting is being done. Consequently, heads of around $10 a ton were maintained, and would indicate a production of between $40,000 and $50,000 for the month.

Owing to delay in connection with delivery, the new hoist which is to be installed at the 500 ft. level will not be in use until during the third week in June. However, the installation of this machine will signalize a commencement of drawing ore from the 605 and 730 ft. levels and will mark an early increase in the value of the mill feed and the monthly production.

About 200 feet of lateral work has been done at a depth of 730 feet, including drifts in both directions on the new vein as well as a cross-cut to the main deposit. The cross-cut has reached the main vein at the 730 ft. level and the work of the next few weeks at this point promises to be interesting. Meanwhile, drifting on the new vein has shown the deposit to be important, the width in the east face being between six and seven feet and the average gold content, very satisfactory.

The Teck Hughes is employing a force of about 95 men, including surface crew and office staff. The large tonnage being handled by such a force is pointed to as indicating a high degree of efficiency.

Kirkland Lake Proprietary Mill in Operation

After having been non-productive for a number of years, and in complete idleness for a large part of that

[illegible] the Tough-Oakes mine of the Kirkland Lake Proprietary has once more commenced to turn out gold bricks, the first clean-up in the mill having been made a few days ago.

It was nearing the close of last year when Mr. Thomas, manager of the mine, got work under way at the Kirkland Lake Proprietary (Tough-Oakes and Burnside), and the fact that the transformation from a run-down property to a gold producer has been accomplished in so short a time is a matter that merits favorable comment.

The main "break" at the 100 ft. level has been the chief source of ore for the time being, the present work being preliminary to getting the enterprise on a normal basis at such time as the development program can be completed. As to this, the cross-cut north to vein No. 11 has been completed and already the drift on this vein is in about 65 feet and will soon reach the point from where ore will be drawn. Also, the cross-cut from the bottom of the shaft at a depth of 550 feet is at a point where the downward continuation of the main deposit as found at the 400-ft. level is expected to be encountered with each round of holes.

Hollinger Reserve to Resume Development Work

Arrangements are stated to be under way to re-open the Hollinger Reserve property within the next three weeks. The property was originally worked by Benny Hollinger, the prospector who staked out the Hollinger Gold Mines. Development work was carried to a depth of 300 feet and some very good ore was opened up. After the death of Mr. Hollinger, the property passed to Barney McEnnany and until last year remained the property of the McEnnany Estate following the death of the owner.

Late in 1921 a deal was closed whereby a Toronto syndicate secured the property, and it has been intimated that A. E. Osler of Toronto is identified with the new enterprise.

Shaft of Kirkland Lake Still Sinking

The work of continuing the main shaft of the Kirkland Lake Mining Company to deeper levels is now under way. The present deepest workings are at 900 ft. and it is planned to open up another development level at 1,050 and until another at 1,150 feet. At the time of visiting the mine, the representative of the Journal found the miners at work at a depth of 940 feet, this being the deepest point so far attained in the Kirkland Lake field.

The result of development work at the 900-ft. level has been favorable, and a very good shoot of ore has been opened up in a drift to the west. Milling is still restricted to less than full capacity for the reason that development work is not yet sufficiently advanced to utilize the full equipment. However, production is paying for all development work and is leaving a fair margin of profit. Should the result of work at the two deeper levels, prove the occurrence of ore of equal richness to that found at the 900-ft. level, no difficulty of 150 to 160 tons daily and realizing good profits. A total force of about 90 men are employed, including the crew engaged in shaft-sinking.

King-Kirkland

Contracts have been let to sink the shaft to a depth of 300 feet on the King-Kirkland Gold Mines. During the course of previous exploration and development work, a shaft was driven to a depth of 100 feet, at which point some drifting was done in good ore. This encouraged the company to install a modern mining plant and arrange plans for extensive operations. The plant is now in readiness for work, and the enterprise will take a place among the more promising of the active gold properties in the development stage.

This information has been secured in official circles and, coming almost concurrent with advice that the Bidgood has commenced to sink from 400 to 600 feet in depth, tends to show the importance to which mining has attained in this part of the Kirkland Lake district.

Hayden-Porcupine

Work is proceeding steadily on the property of the Hayden-Porcupine, and there are prospects of this being a busy summer in that section of the Porcupine gold area, where there are situated the Hollinger Reserve and Porcupine Mutual Gold Mines Syndicate in addition to the Hayden.

Kenogami Lake

Some very good ore has been found on property situated in Eby township on the west side of South Bay, Kenogami Lake. In addition to mineralization of importance being visible, the assay sheet shows favorable average values.

Georgg Andrews of New Liskeard and Jack Leat are among those interested in the property.

On a visit to Swastika, the representative of the Journal learned that there are perhaps more prospectors engaged in exploration work in Eby township than at any previous time with the exception of the first rush some years ago to that section.

One Diamond-Drill on Porcupine-Davidson

Operations on the Porcupine-Davidson property still consists of one diamond drilling machine. It has not yet been announced what course will be pursued in the light of only about 25 p.c. of the recent stock offer having been taken up in England.

Many Prospectors in Northern Ontario

Mr. Percy Hopkins, geologist for the Ontario Department of Mines, who is making a survey of the eastern part of the Kirkland Lake district, covering Lebel and Ganthier townships and extending to around Pancake Lake in the Larder Lake district, made the statement to this paper that there are more prospectors working throughout Northern Ontario than ever before in the history of the Province. Mr. Hopkins expressed the belief that some important discoveries might reasonably be expected to be made as a consequence of the widespread search now being conducted.

Coniagas Active in Pioneer Work

The Coniagas is stated to have employed a diamond drilling machine with which to explore a group of claims situated in Holmes township, lying to the north-east of Fort Matachewan.

The Coniagas is proving itself to be an excellent pioneer company. In addition to maintaining heavy production from its Cobalt property, the company is exploring the old Ruby property in Bucke township, the Hull-Kipper property at Tashota, the Newray property in Porcupine and a group of claims in Holmes township.

Road to Oxford-Cobalt

In the report by Mr. Cyril Knight, for the Ontario Department of Mines, reference is made to south-east Coleman meriting discriminating attention. For this and other reasons, the Ontario Government has sanctioned the building of a short road to connect the Oxford-Cobalt property at Kerr Lake, and has made appropriations for this work.

As soon as the details about the road have been completed, the Oxford-Cobalt will resume work, according to J. W. Russell, manager. The first work will consist of driving a drift for the purpose of intersecting the junction of a strong north and south vein running into deeper Keewatin formation.

EDITORIAL

Scientific prospecting is not yet really begun. I know of no field of greater promise for the applied scientist than that of scientific prospecting. —C. T. Corless, 1922.

AIDING PROSPECTORS IN QUEBEC

A well known Canadian geologist has written, for this issue of the *Canadian Mining Journal*, a resumé of the conditions under which gold is now known to occur in Northern Ontario and Quebec. His conclusions are based upon a study of all the known facts, correlated in a broad way such as precludes the chance of serious error. His opinion is the consensus of opinion of a number of well qualified students of the subject. Their knowledge of the subject is, necessarily, not complete; but the conclusions recorded here are safely within the bounds of observed facts.

These deductions from geological observation are now to be put to the test in a practical way. It will be a comparatively simple matter for Dr. Cooke's trained geologists to gather the data for a map that will be of incalculable benefit to prospectors. With the aid of this map, the work of trained prospectors will be fully effective, and that of men less skilled in their calling will be facilitated to an extent that an outsider can hardly realize. If there is gold to be found in the region to be mapped by Dr. Cooke, to the Geological Survey will accrue the credit of having adopted the most logical means of finding it.

But there are important factors in the development of mineral bearing lands other than the mere finding of promising outcrops of ore. Chief among these is the law under which mineral deposits found by prospectors can be acquired by them.

From ten to fifteen years ago, that part of the province of Ontario to the north of Lake Temiskaming and adjacent to the Quebec boundary was swarming with prospectors. The interprovincial boundary, a line almost or quite invisible, formed a barrier across which few of them ventured. Why was this? There were no terrors on the Quebec side, and the lure of gold and silver was just as strong to the east as to the west of this boundary. Yet any well informed prospector would smile in a superior way at the unsophisticated one who proposed a trip into Quebec.

It was, at that time, a well known fact that if a prospector found, say, a promising gold vein east of the boundary, he had little chance of retaining it unless he had the key of a back door entrance to the recording office in the city of Quebec. The provincial mining law of the time was faulty, and its administration was worse. Hence, Northern Quebec was virtually a preserve, from which were excluded all prospectors except those with "influence" at Quebec City.

The situation is now radically different. The new mining law of the Province of Quebec is drawn up in a sound and logical way, and is more than usually favourable to prospectors. It is said that the maladministration characteristic of the old law has been superseded by a regime under which a prospector can openly claim and retain the rights to which the law entitles him. It is now, apparently, quite logical for a prospector to march through the front door of the recording office of the Province, confident that his just claims will be respected.

The full benefit of Dr. Cooke's present exploratory work in Northern Quebec will be gained only if it is realized among the generality of prospectors that the conditions that artificially restricted prospecting in that province in former years no longer exist. The old idea will linger long unless active measures are taken to combat it.

BRITISH MONEY FOR BRITISH DOMINIONS

There has evidently been launched in London lately a well organized and decided movement in favour of the development of the natural resources of the Empire. The slogan "Britons for British Dominions" is to be accompanied by "British money for British Dominions." One cable dispatch quotes *The Times* as saying that, since the Soviet has decided to remain apart from the world, British capital must look to the Empire for its opportunities of investment. Another announcement is to the effect that a group of prominent British manufacturers will enter seriously into supplying the Canadian trade in competition with the United States, using Canada itself as their base of operations.

All this, and much more that has transpired recently, speaks well for future Anglo-Canadian solidarity. A large part of the British investment in Canada to date has been of the long distance variety, and consequently less of a cementing force and less satisfactory altogether than the investment it is now proposed to make.

It is true that there will not be in Canada the opportunity for quick and easy gain that there would be in, say, Siberia. The British industrial pioneer in Siberia may have chances of development which will fall to the lot only of

those that penetrate far among untutored peoples. In Canada the British investor will have to meet the competition of native Canadians and of our southern neighbors. Still, this will not by any means deter those who have for centuries got more than their quota of gain from the free markets of the world.

The chief undeveloped resource of Canada is her mineral deposits. It is fortunate for Canada that this is so. To quote Dr. C. V. Corless in his presidential address of last March, "Mining is the basic industry of progress, as agriculture is of subsistence." Except for unfortunate (though unavoidable) mishaps in the food supply of some parts of the world, and the present unbalanced state of war-torn Central Europe, the subsistence of the human race is pretty well provided for, and so the possibilities of the development of agriculture in Canada by means of the export of food-stuffs is limited.

Mineral production is in quite a different case. The consumption of the products of the world's mines has, through successive ages, measured roughly the attendant degree of civilization. Creature comfort and the leisure that is the pre-requisite of mental development are almost entirely dependent upon the products of mines and quarries. We are as yet far from the end of the advancement of our material civilization, and hence our consumption of mineral products will continue to increase vastly.

It is most desirable that the capital necessary to develop Canada's mineral industry should come, as much as possible, from Britain. In this connection it is interesting to note, in the London *Financier,* a series of ten articles on "Ontario's Mineral Wealth," published during May. A special commissioner from this paper spent some time in the mining camps of Northern Ontario last summer, and the present series of descriptions is the result. They set out vividly, and very fairly, the conditions that exist in the northern mining district, and display the confidence in the future of the region that is characteristic of those concerned in its legitimate operations. There is, perhaps naturally and inevitably, a bias evident in favour of those properties in which Londoners are already interested, which upsets somewhat the balance of what is otherwise a highly commendable estimate of Northern Ontario's mining camps. For instance, it is hardly credible that the South Lorrain district will rival the adjacent Cobalt district in its silver production. But this series in the *Financier* cannot but give the British investing public a rational estimate of the possibilities of shrewd investment in Canadian mineral resources.

Inter-imperial relations have, since the commencement of the Great War, made most decided steps forward in various spheres. We are already commencing to reap benefits from this intercourse. By all means let us aid and encourage by every means in our power the development of Canadian mineral resources by means of British capital.

MINING ORE AND MINING THE PUBLIC

A prominent Canadian daily newspaper re-printed, last week, an article from the *Magazine of Wall Street,* entitled "New Traps for Investors." The caption used in this case was "Exposure of Current Methods Employed by Stock Swindlers to Fleece Unwary Investors." The article is a good one, giving explicit information about the methods of fake mine promoters,—how they circumvent the law, how they attract the attention of certain sections of the public and then convince them, and how they then disappear with the public's hard-earned cash. This is an excellent effort, which the *Canadian Mining Journal* heartily commends. The more frequently such interesting exposés of current methods of legalized robbery are made in the public press, the sooner will the operations of these light-fingered gentry be suppressed. It is, after all, only the force of well-voiced and well-informed public opinion that is really effective in dealing with such a case.

Unfortunately there is another side to the case in point. Turning over the pages of the same newspaper, we notice advertisements, larges and small, of mining promotions, some of which we know to be of very doubtful character, while others exaggerate in an entirely unwarranted way (which should be illegal) the facts upon which their claims are based. Inference and suggestion that is merely silly to the trained mining man is used to convince the unknowing reader. Truth, inference and downright falsehood are intermingled in these advertisements in a way that makes the whole fabric hard to unravel. A study of the more pretentious of them shows that much thought and ingenuity has been expended in playing the cards of a hand that, as dealt, could win a jack-pot only on a bluff, but, reinforced by judicious additions from the promoter's sleeve, is sure to win a good slice of the public's money. There is no law to prohibit this sort of robbery, and the only protection the public has is its own good sense (which is very unevenly distributed) and such warnings as that to which we here draw attention.

Our two-faced contemporary is, we are afraid, doing nothing to further the cause of honest mining promotion—for such a thing as honest mining promotion actually does exist. Its exposure, at second hand, of the methods to which it consistently lends its own pages is calculated rather to blind the public than to educate and warn it. The man who reads the warning will surely be inclined to believe that here is a newspaper on whose discrimination he can depend. Yet if he acts upon this belief, his purse-strings are unloosed and he is undone—or "done."

Most of the illicit stock flotation that curses our mining industry is done by certain stock brokers, who approach the public by means of daily papers and through the Royal mails, and by warrant of publicly-granted charters. We cannot logically condemn separately one of these agents or accessories to the swindle without including, to some degree, the remainder. By means of judicious attention to and by each of these four agents the present unwholesome

condition can be improved. The annual waste of funds that might be available for mining development, but is actually transferred to the pockets of human leeches, is appalling. The problem is worth much more serious and more general attention than it has ever yet received.

MINERAL PRODUCTION IN QUEBEC DURING 1921

The annual report on *Mining Operations in the Province of Quebec* for 1921, just issued, is this year a very slender volume. It records a production from the asbestos mines and quarries which, though substantial, is much below that of preceding years. All other mineral industries of the province declined in production during the year 1921 with the exception of feldspar. The development of the newly-found deposits of the Buckingham district near Ottawa has provided an assurance that "Canadian 'spar" will continue for long to hold the unique position it now enjoys in the United States market.

It is rather disappointing to notice that so little progress has been recorded in the mineral development of the province containing the greater part of the pre-Cambrian "shield," whose potentialities are now so well recognized. That the administration of the Bureau of Mines are, however, confident of what the future will bring is demonstrated by the inclusion in the Report of a long extract from Dr. C. V. Corless' presidential address of last March, setting forth the possibilities of Canada's, and particularly of Quebec's, ultimate capacity for mineral production.

The operations of the Federal Lead and Zinc Company in the Gaspé peninsula are given only short notice. This development promises to be one of the most important in Canada. The operations of the Canada China Clay Company, sixty miles north of Montreal, are not mentioned at all, presumably on account of work there having been resumed so recently. This also is a prospect whose future production may constitute a notable share of Quebec's mineral production.

EDITORIAL NOTES

The session of Parliament about to be prorogued, if it has done little to help the progress of the mining industry has done nothing to hinder it, which can be counted a blessing. The abysmal ignorance of matters pertaining to Canada's second basic industry has been obvious, as usual, among our elected representations at Ottawa. A bright spot, full of promise for the future, is the reputation earned during the session by Hon. Charles Stewart. His associates and staff in the Department of Mines are confident that the neglect that has formerly marked the ministerial administration of their Department will not continue under the present régime.

Canada has now another, and an eminent, spokesman in Britain. Our recent Governor-General, the Duke of Devonshire, says publicly that Canada's resources must be developed by British labour and by British capital. This idea must be re-iterated and impressed by every possible means, until it is firmly implanted in the consciousness of both Canadians and Britons.

The close relation between the building of railways and the development of mineral deposits is, apparently, better realized in Africa than in Canada. It has long been the ambition of various railway builders to finish the last links of the Cape-to-Cairo chain. Its completion within the near future is again being considered, and the exploratory work now in hand is not for a route, for arable land or for forest products, but for — adequate mineral deposits.

A prominent feature in the news of last week was the good roads convention in Vancouver, in which Premier Drury of Ontario took a prominent part. In the reported proceedings of the meetings we have failed to find any adequate discussion of the question of long-enduring, hard-rock surfaces to the permanent road foundations upon which so many of Canada's millions are now being spent annually. It is apparently a fact that has not yet penetrated to the consciousness of our road-builders, that enough money is now being wasted annually on putting down shoddy, soft rock surfaces to pay the expenses of good roads conventions for the next generation.

THE EDITOR IN ERUPTION

Deep on the laden desk the proof
Lies waiting to be done;
More will be making 'neath this roof
Ere setting of the sun.
The shadow of the make-up man
Darkens my dingy wall;
I'll murder him whene'er I can,
If time permits at all.
The copy that I get is vile,
Confounded badly writ—
How should I love to burn the pile
And see the last leaf lit!
My correspondents seem to think
That I have naught to do
When I am fairly on the brink
Of going up the flue!

* * *

So let me straightway confess,
So far as I'm concerned,
My job means intimate duress
With mighty little earned
"With mighty little earned", said I
Nay, what I should have said
Or had it wrong, I know not why)
Is "Mighty little paid!"

ANON

The Search for Gold

CO-OPERATION OF GEOLOGISTS WITH PROSPECTORS

(Written for the Canadian Mining Journal)

During the last ten years our knowledge of the gold deposits of northern Canada has increased considerably, and bit by bit we have been gathering information tending to solve the all important question, *why* the gold occurs *where* it does. It is obvious, of course, that until the answer to this question is known, prospecting for gold cannot be carried on intelligently, but that prospectors must waste the bulk of their time and money searching in places where they will find nothing. Once let it be proved that gold occurs only under certain definite conditions, and the field of prospecting will be so narrowed that the same expenditure of money and effort on the prospectors' part will be productive of much greater results.

Although our knowledge of gold deposists is still far from this goal, certain things have been definitely determined which help to narrow the field of prospecting quite notably. It has been found that all the known occurrences of gold ores in northeastern Ontario and northern Quebec belong in age to certain definite metallogenetic epochs, to use a term coined by Lindgren. The gold of the Havilah mine, near Sault Ste Marie, of the Crystal Mine on lake Wanapitei, that which has been found with the silver ores of Cobalt and in other occurrences of this type, has originated from the diabase intrusions of the Keweenawan period. The gold at Long Lake gold mine near Sudbury, and of other occurrences in the same vicinity appears, with less certainty, to have come from intrusions of late Precambrian (Killarney) granite. The great bulk of the gold produced in Ontario, however, is now known to come from the Keewatin and Timiskaming formations where these are invaded by granitic rocks of pre-Huronian age. This has removed from the gold prospecting field the huge areas of granite, and the smaller but still large areas of Cobalt series, in the Precambrian shield. A still more notable step was made when it was proved that the gold-bearing solutions which gave rise to these pre-Huronian gold ore-deposits have emanated from the granitic intrusives, and hence that the deposits are to be looked for in the Keewatin or Timiskaming formations near the contacts of the granite bodies. It is needless to point out that this determination again narrows the field of prospecting. Within the last few years a third idea has been gaining ground, though it is as yet no more than a theory: that the gold deposits occur around only the *small* granitic intrusions. These smaller bodies have a characteristic porphyritic texture, and it is well known to every prospector that "porphyry" is a favorable indication of good prospecting ground. However, there are many porphyries and few gold deposits, so that probably still other things, yet to be learned, have governed the formation of the deposits.

The area from which most of the facts regarding the origin of gold deposits have been gathered is the Matachewan-Kirkland Lake-Larder Lake belt in northern Ontario. As this belt extends eastward into Quebec for more than 100 miles, with very similar geological conditions, the question has often been raised whether gold deposits might not be expected there also. The Geological Survey of Casanda this summer proposes to investigate this question, and is sending Dr. H. C. Cooke to map a large area adjacent to the Ontario boundary, on a scale of one mile to one inch. All bodies of granitie intrusives, particularly the smaller ones, are to be carefully delineated. Areas in which bed-rock is hidden by swamp, sand or other surface accummulations, and which from the propector's standpoint may be called negative areas, will also be shown. The resultant map will afford prospectors going into the area something definite to work on; they will be able to confine their efforts largely to the vicinity of intrusive masses of granite, and thus, if gold deposits exist there, they should be readily located.

Dr. Cooke, it may be added, has been devoting his time for some years to this very question of the origin of the gold deposits of northern Canada, and particularly those of northern Ontario. Some years ago in his paper on "The Origin of the Gold Deposits of Matachewan area" he gave the first conclusive proof of the connection of the gold deposits with the granitic intrusives, while a recent paper (Summary Report of the Geological Survey, 1921, Part C) proves that the gold deposits of Rice Lake district, northern Manitoba, have a like origin. Valuable contributions to our knowledge of the origin of the gold deposits of northern Ontario have also been made by the officers of the Ontario Bureau of Mines, particularly by Mr. A. G. Burrows and by Mr. P. E. Hopkins, whose recent report upon the gold ore deposits of Ontario reviews the subject in a very useful and comprehensive manner.

CHEMICAL EXPOSITION IN NEW YORK

During the week September 11-16 next, the eighth National Exposition of Chemical Industries will be held in the Grand Central Palace, New Cork. As this exhibition is designed to show not only the products and processes of chemical industry, but its raw materials, which are in large part mineral products, it is of prime interest to mining men. The Exposition has been timed to come between the meetings of the American Chemical Society in Pittsburgh, and those of the American Electrochemical Society in Montreal.

The Geological Survey, Ottawa, has just issued map No. 1882, *Bridge River (between Rexmount and Gun lake), Lillooet District, B. C.*, scale 2 miles to 1 inch.

A Mining Man of Two and a Half Centuries Ago.

II. ASSAYING

Sketchy and vague as Erckern and his translator, Sir John Pettus, may be in matters mineralogical, in many things pertaining to assaying they are, in contast, refreshingly clear and definitive. Teutonic terminology, as interpreted and adopted by Pettus, is easily recognizable in its similarity to that current today. In a general way the book could be used as a guide to assaying at the present time, although it would be found somewhat infirm.

The Assay Furnace and Accessories

"There must be special Furnaces (for Assaying)" we are told on page 8 "made of good Potters Clay, and bound with strong Iron wyre or Hoops, that they may not fall asunder by reason of the heat they must endure." It is noted that some diligent assayers "do adorn their Furnaces fairly and comely, so as they may be pleasing to the Sight." Our author hardly approves of this, for, says he, "This indeed do's give them an adornment, but there is no more done with it, than with a Common Furnace (that is made well though plain)". Lasting wisdom in these words!

The assay-oven of ancient times is first described. It was "made square, of strong iron Plates," and was, indeed, not much unlike such a furnace as any assayer might improvise today if he were cut off from access to supply houses.

The recipe for making a "special good loam" wherewithal to line and lute the furnace is as follows: "Take good and well-wrought Loam, beat among it Flocks of Wooll, or Horse-dung, Blood of Oxen, scales of Iron and common Salt". A lining of this material two and one-half inches thick was plastered in the furnace and dried. Then there was superposed on this a luting of a finely ground mixture of "Venice-glass, Bone ashes and a small quantity of Loam". After further drying, the whole was "nealed" by putting a "gentle fire in it." In this, on a finger-thickness of "Copell Ashes", was now placed the muffle. The luting of "Venice glass", etc., imparted a protective glaze, and all was now ready for the "tryal". The reader is warned that "if you intend to make anything of Clay, then you must add so much as the Clay useth to shrink, because one sort of Clay doth shrink more then another, but most commonly Clay doth shrink the tenth part."

There follows a meticulous catalogue of types and accessories, illustrated by delightful engravings.

Stress is laid upon the necessity of every assayer being able to design and manufature his own apparatus. To this end clear directions are given. "Take good Potters Loam (as good as may be had) but the Loam or Clay that is blew and becomes white in the fire, is found to be the best for use." After drying it in the sun, it is pulverized. To avoid adding too much or too little "Washings of Pebble-stones or very fine sand," trial crucibles must be made and tested in the fire with refractory or "hard flowing Oar". "Chalk stone" or "Talk" or "glimmer" was use by some unthinking persons to impart strength to the loam, but it is considered better by our author to grind up old pots and crucibles and add the grindings to the mix.

Brass moulds or frames were used for forming the crucibles. These were "anointed", with a little bacon grease. The pestle was called the "Monk". It also was "anointed" — quite appropriately. Muffles were painstakingly moulded on wooden "frames" or patterns. All were then baked in a kiln or "Potters Oven." Especial care was taken in choosing material for "Copels" (our "cupels"). Sifted and lixiviated boneash is highly commended, without any admixture with loam. The conclusion of the whole matter is that "when a man hath good ashes that are well washed good Copels may be made that need no mixture, and those Ashes may well be moistened with fair water, but the Copels are more brickle by it, and not so firm, as with the strong Beer or glew water." (We refrain from an unseemly jest about the former of these two moisteners.) Warning is given that the cupel must be brought to red heat before the assay is placed in it, as only thus "the Proofs (bottons) will not leap, but be purely finished... then may the Grain be taken off very pure and clean."

The Fluxes or "Fusses."

Preliminaries being done with, we now proceed to our fluxes, the first and last of which in assaying silver ores is "Lead Glass." "Lead glass is a Fluss, and is used to the very hardest and unflowing Oars... that they may as easily be boiled up as the soft Oars." To prepare this "fluss," "fair and white pibble-stones" are burned in a potters oven, pulverized, and passed through "an hair seeve." (Certainly a hair sieve must have been a trying device to work with.) The pulp was washed, dried, mixed with an equal part of "red Littorage or Littarge," placed in a crucible, covered with common salt, sealed with clay and strongly heated in a wind furnace. A second melting with "a little Niter" rendered the lead glass clearer.

The preparation of flux for good ores is tersely prescribed in one short paragraph: "Take one part of Salt Peter and two parts of Argol (both stampt small and mingled together), cause a glazed Pot to glow, put the matter into it, and cover the pot quickly, so the fluss will be presently burnt out and become a black grey powder... then is the fluss ready."

The Gold Assay

Silicious and non silicious ore were subjected to different treatment. Some common assayers roasted the "flinty harsh Oars," and quenched the roast "with Urine, or with a particular prepared Lye, thinking thereby to obtain the more." This was not, however, the approved method. In the latter, one part of ground ore, 15 parts of granulated lead, and one part of lead glass were mixed, placed in a crucible and heated and cooled alternately until the assay was clear. The lead button was beaten and cupelled and the resulting lead was parted in "Aqua Fortis". The remaining gold was "dulcified" with warm water, annealed and weighed.

There follows a long dissertation upon "Touch Needles" with which at present we have no concern.

It may be noted in passing that the standard of weight in calculating assay results was the "centner," 110 pounds at the Royal Mint, 100 pounds. An approximation to the "assay ton" was based upon the centner. "Therefore every assayer is to take heed with good Diligence, that he may order his Assayers this, that he may always find the Contents as near as he can, so that he may afterward in melting great quantities find the same according to proportion."

Assaying Copper Ores

"To the copper Oars which are to be proved for Copper, one must have little and good Crucibles for them, which the Goldsmiths do use". For the making of these crucibles and of the "little Ovens" in which they are used,

we are given explicit instructions. They differed radically from the furnaces used for gold and silver.

The flux prescribed is thus compounded: "Take two parts of Argol, and one part of Sulphur, grind them small and mingle them, put it in an unglazed Pot, then put live Coals in it . . let it burn till it gives over of it self, let the pot be cool, so the Fluss is prepared." This was effective only with "good and deft Cooper Oars." It was too weak for "flinty Oars, and there must something be added to it, as you will hear in the sequel." We learn then that refractory copper ores were to be finely ground and roasted (in successive stages both of grinding and roasting) "till it stinks no more Sulphurish." The aforementioned flux is now used with the addition of "flowing Glass Gall" and common salt. "Glass Gall" is, seemingly, speiss or slag, or both, from former assays.

The Weights Used

We cannot here do better than quote Pettus' own original definition of the assay centner. "It is considered only as a small Assay weight for trying how much a little Part of an hundred weight do hold of Gold, Silver, etc., whereby (as *ex ungue Leonis*) the whole proportion of the Lion may be known from his claw; so by the small Assay weight, the goodness of the whole piece may also be estimated. . . and this shews the skill of an Assayer in the skilful use of Arithmetick."

* * *

Assuredly every page of Sir John's contributions to the volume displays his "skill in the skilful use of rhetoric to hide the slimness of his knowledge.

* * *

In the next and last article we shall review Pettus' "Essays on Metallick Words", which is a highly original effort to elucidate textual and technical difficulties connected with the translation of Erckern's work.

CAPRICORN.

To the Editor,
Canadian Mining Journal.
Sir.

The invasion of the field of technical journals by engineering societies and mining institutes has received much criticism during the past few years. The members of the Canadian Institute of Mining and Metallurgy have now an opportunity of realizing why Mr. T. A. Rickard and others have raised strenuous objection to the journalistic activities of the American Institute of Mining Engineers. The campaign for advertising support for the publications of mining institutes brings out the fact that the ordinary member is becoming of secondary importance to the advertising member at institute headquarters. The difficulty of raising enough money to carry on the work of the institutes is rendering it necessary to supplement membership fees by advertising revenue. To get this advertising revenue the journals of the institutes are being made more and more to resemble the ordinary technical journals.

This endeavor to cover the field already covered by independent journals consumes money which the members pay each year for quite a different purpose. The publications of the institutes are made more attractive and newsy and considered from these points alone the member has reason to be pleased with the change. But to offset this is the fact that the status of a member has depreciated. He has become more and more regarded as an unprofitable subscriber, who will only be put in the preferred class if he helps to increase the advertising revenue. Even though his ordinary membership fees are two or three times the price of subscription to the mining journals, he is not paying his share of the expenses of the institute unless he advertises in the institute publications, which have been made more costly by the endeavor to change their character in such a way that they will appeal to advertisers.

There are many people interested in mining who are quite uninterested in the mining institutes. These people are quite as important factors in the mining industry as are the members of mining institutes. The men who prospect for minerals and the men who supply money for prospecting and developing properties are among the most important factors in the industry. Mining institutes do not have a large proportion of these men among their members, and yet it is in the interests of members that good mining journals should be available to these people at fair prices. Members of mining institutes defeat their own interests when they increase the difficulty of making mining journal profitable enough to warrant continual expansion and improvement. And yet, carelessly, I believe, many members of the institutes permit the use of the money they pay for membership fees for the purpose of building up a journal of a type more and more simulating that of established journals.

I have no doubt that this journalistic activity of the mining institutes is but a temporary thing and that it will die a natural death when members generally realize what is being done. In the meantime, however, your journal will doubtless feel the effects of the unfair subsidized competition, and I think it only right that the opinion of members should be asked for, with a view to determining what percentage of members approve the recent campaign for advertising.

Yours, etc.

A Member

Toronto, June 16, 1922

OPTION ON SCHUMACHER MINES

One of the largest deals in mining property for years back in Northern Ontario reached consummation today when officials of the Hollinger Consolidated Gold Mines, Limited, announced that they had purchased the Schumacher Gold Mines, Limited, which adjoins their property on the east. Rumors have been prevalent for some time that the Schumacher property, which comprises 160 acres, was much in demand and various companies as well as American interests were connected with the bid.

The Hollinger Company has been given an option on the entire assets, plant and undertaking of the Schumacher company for $1,650,000, of which $165,000 has been paid as a deposit. Within six weeks, which are allowed for an examination of the property, $300,000 will be paid provided the option is exercised. With the exercising of the option the balance of the purchase price is to be paid in four equal quarterly payments of $296,250 each. The carrying out of the sale will net the shareholders of the Schumacher company about 90 cents per share.

A notice calling a special general meeting of the shareholders of the Shumacher company for June 30 was mailed last Monday. This is for the purpose of ratifying and confirming the action of the directors of the company in giving the option and to authorize the sale.

Explosions and their Causes*

WITH SUGGESTIONS FOR PRECAUTIONARY OR PREVENTATIVE MEASURES TO BE OBSERVED

By ALEXANDER McEACHERN

Since the writer first entered the mining profession, some forty years ago, mine explosions have taken place at different times and in various countries. These terrible and sudden catastrophies attracted the attention of mining men everywhere, who began to seek a cause. In the early days of mining it was generally believed and accepted that mine or fire damp set off by a shot, the flame of an open lamp, or a mine-ventilating furnace was the main cause of explosions. Later on, however, after precautionary measures had been taken against gas explosions, it began to be doubted whether some other undiscovered agent was not at least one of the contributing causes of mine explosions. Doubt led to investigation and experiment, and although the search for truth took years of patient toil, during which time the coal industry developed rapidly, and many lives continued to be lost through the frequency of explosions, it was finally demonstrated that coal dust was not only a contributing factor, but was in many cases the real cause of some of the larger explosions.

It affords most interesting reading to a mining student to follow the different phases of thought and the different experiences as expressed in the written opinions of the leading mining men of the past, who made mine explosions a special study. To all such men we are deeply obligated, and in common with all others here today, I desire to express my indebtedness to those patient and in some cases brilliant men of former times. To the great men of our own day we are no less indebted.

Detection of Coal Dust as Explosive

About twenty-seven years ago, while employed as underground manager at Old Bridgeport Colliery, and standing on a headway watching a number of shots being fired, I remember seeing flame pass out of a room where the blasting took place, and travel out past the room end. I felt at that time that there was some other agent at work than explosive gas, and I began to seek for it. The mine had then an output of 800 tons per day, the total quantity of air returning to the furnace was only 18,000 cu. ft. per minute, a small quantity indeed compared with present-day volumes. There was no explosive gas present in this part of the mine at that time, and one would naturally suppose that unless the flame was fed on the way, or accelerated with more than ordinary force, it would die out quickly from the lack of oxygen, and also on account of the presence of a certain percentage of carbon dioxide, but such was not the case.

While manager in No. 2 Mine, Glace Bay, in 1902, there were four cases where men were badly burned by flaming shots. In one of the instances three men were seriously burned; three mine officials and the miner himself had examined this place before the shot was fired, but no gas was found. After this the use of black powder was discontinued, and compressed powder was introduced to prevent flaming. In some cases of flaming shots the coal itself caught fire, and was with much difficulty extinguished. The writer finally became convinced that gases liberated from the coal and those generated in the process of blasting (chiefly carbon monoxide) acted as agents to set off the explosion, and that these were stimulated by coal dust, as there was no explosive gas present in the place where this flaming occurred. Among mining men (the writer included) there began to be doubt as to the part coal dust played in explosive mixtures. To offset this suspected danger, watering of the mine was begun. Pipe lines were laid into all sections of the mine. This was the first known instance of systematic watering in Eastern Canada. In addition to this the dust was gathered up and loaded away.

Coal Dust in European Mines

In respect to precautionary measures against coal explosions, we were then perhaps as far advanced as many European countries. The first record of the influence of coal dust in mine explosions is contained in the report of John Buddle on the Wallsend explosion in 1803. He states that the mine workings were dusty, and some of the survivors were burned by sparks from ignited dust. In 1844 Faraday and Lyell drew attention to the effect of dust in extending the explosion in the Haswell Colliery in that year. Speaking at the Royal Institution Faraday said, "The ignition and explosion of the fire damp raised and kindled the coal dust, which is always pervading the passages, and these effects must in a moment have made the part of the mine which was the scene of the calamity, glow like a furnace."

M. Vital, in 1875, proved that fine coal dust would increase the intensity of a fire damp explosion; Wm Galloway came to the same conclusion in the same year; but notwithstanding all this, in 1882, M. Mallard and M. Le Chatelier, members of the French Fire Damp Commission, recording the results of their investigations, said that coal dust was not a serious danger, and that no colliery explosion of any magnitude could be traced to it.

Thus up to 1891, the large-scale experiments of Galloway, Abel, The Chesterfield Institute, and the more important ones of Hall and the Austrian Commission were inclusive. In the final report of the Austrian Commission, it was stated that their experiments confirmed the results of their previous investigations, but showed that the dangers were much greater than had hitherto been admitted. They concluded that black powder and similar explosives were dangerous and should be prohibited in gaseous mines. They showed that the explosibility of coal dust depended more upon its physicial than upon its chemical composition. They classified the various kinds of dust as (a) explosive, (b) slightly explosive, (c) inflammable, (d) safe.

Researches in England and France

A Royal Commission, to investigate the question of coal dust explosions in mines, was appointed in England in February 1891, and began hearing evidence in the following month. Its first report of evidence, without conclusions, was published in July of the same year. In 1892 its sittings were adjourned pending further experiments by Mr. Hall, which were conducted at intervals in that year and in 1893. The Commission made its second report in 1894, giving the additional evidence and their final conclusions, which were summarized in the following words, 1. The dangers of mine explosions in which gas exists is largely increased by the presence of coal dust. 2. A gas explosion in a fiery mine may be

* Paper read before the Mining Society of N. S., May 192[illegible]

interrupted and carried on indefinitely by coal dust raised by the explosion itself. 3. Coal dust alone, without the presence of explosive gas, may cause a dangerous explosion, if ignited by a blown out shot, or a violent inflammation; but to produce such results, however, conditions must be exceptional, and are only likely to be produced upon rare occasions.

After this, a second Royal Commission was appointed, which began hearing evidence in June 1906. The second report of this Commission appeared in 1909, and the coal dust question was discussed, together with other questions. Witnesses who included those best qualified by scientific knowledge and practical experience to deal with the subject, expressed opinions which were often widely divergent, but which generally agreed that coal dust was liable to explode, with or without the presence of fire damp.

After the Courrières explosion in France in the year 1906, the French established a testing station at Lievin, to study the relative explosibility of the different coal dusts, and as had been proved at other European testing stations, it was found that there was no difficulty in causing explosions of coal dust without the presence of fire damp, by discharging black powder or dynamite from a cannon at the end of the gallery. Although there was no official report attributing the cause of the Courrières explosion to coal dust, it was the general opinion of the English investigators that this was the cause.

Pittsburg Testing Station

In the United States, the greatest coal producing country in the world, the coal dust factor attracted scant attention until 1907, when the total death roll in that one year from so called "windy shots" and powder explosions, reached the appalling total of 1148. Mr. Geo. S. Rice, who summarized the results of these explosions, said that these powder and "windy shot" explosions were in reality dust explosions. While it is true that they generally originate from a blow-out shot, it is without question the coal dust that carries the flame and death in its trail.

From the above, it will be seen that no definite conclusion had been arrived at in European countries until 1909, and in the U. S. A. not until after the disastrous year of 1907, when they had so many deaths from this class of explosions. In 1910, a station was erected at Pittsburg, and a mine was started also for the purpose of finding out if coal dust could be exploded in the absence of explosive gas. The result of the findings of both the testing station and the mine, was that coal dust could be exploded, and did explode, in the absence of explosive gas. In Canada, unfortunately, there are no testing stations, and some mining men and numbers of miners may be found who doubt that coal dust will cause an explosion in the absence of other explosive agents.

Thus, the summary of the latest reports on explosions is fairly conclusive, and the essence of it is, that there are two principal causes for explosions, explosive gas, and coal dust, and of the two coal dust is more insidious than fire damp. The fire damp carries its own flag of warning in the shape of the cap in the safety lamp, but coal dust does not attract attention until present in large quantities. Fire damp is usually of local occurrence, and except in notable and very exceptional cases, is controllable by careful manipulation of the ventilation currents. If, by mischance, a body of fire damp is ignited in the mine, the force of the explosion is terrific, but the effect is localized unless dry coal dust is present, or unless, as very rarely happens, an explosive mixture of methane and air extends throughout the mine.

Stone Dust and Water

Various methods have been devised for dealing with an explosion that has occurred through the temporary failure of the methods for neutralizing the explosive dust. Experiments were tried in the workings of Lievin. In the path of the dust explosions, short zones were prepared, in which dusting and watering had been carried out to the limit. A study of the results of these prepared zones led to the conclusion that a moderate length of well-watered gallery has a modifying influence on the propagation of explosions, and that the efficiency of such zones, considered as means of not only moderating, but completely suppressing the explosion, depends upon a number of circumstances, notably the intensity of the initial explosion, the length of the arresting zone, and the degree of humidity. Briefly, a zone of 100 yards, which has been treated with a weight of water equal to four times that of the stone dust, would resist, probably, the progress of the flame of an explosion occurring within the previous 100 yards, but would not be sufficient to arrest the flame from an explosion of much greater violence.

The efficiency of arresting zones treated with stone dust only is practically nil; even when the initial explosion is slight, and the zone is 150 yards long, to be of any use, the proportion of incombustible material must be in excess of seventy-five per cent. Although the watered zone is clearly superior to that treated with stone dust, the method of providing arresting zones is of little value when a violent explosion occurs. When the road is dusted only, the powerful blast of air in front of the explosion mixes its inflammable dust with that of the surrounding galleries, and carries the incombustible stone dust ahead of the flame, thus rendering it useless. When the isolating zone has been freely watered, it is true that the inflammable dust it contains will not rise, but the blast of air carries along sufficient material to propagate the flame through the watered portion of the workings. Although the evaporation caused by the passage of the flame tends to cool and finally extinguish it, this action would have to take place for a considerable time. The arresting zones, then, are not effective when a violent explosion occurs, because, owing to the evaporation caused by the ventilating air, it would be impossible to maintain over a sufficient length, the degree of humidity necessary for success.

Preventative vs. Palliative Measures

From the foregoing the reasonable conclusions are that no practicable method has been found to arrest a violent dust explosion in a dry and dusty mine. It therefore becomes necessary instead of attempting to arrest explosions to remove the causes, and use preventative measures as far as reasonably practicable. Let us first look into the nature of a dust explosion. Where a source of heat, such as an incandescent wire, an electric spark, or the flame from a blown out shot, is introduced into a cloud of coal dust, rapid combustion takes place between the particles of the coal dust and oxygen of the air. If the quantity of heat transferred to the dust cloud is relatively small, combustion may proceed only in the immediate vicinity of the heating agent; if on the other hand, sufficient heat is available, the temperature of the dust cloud is raised to such an extent that combustion takes place, developing more

heat than can be readily conducted away; consequently the adjacent parts of the dust cloud are heated to a temperature sufficient for rapid combustion, and by its combustion it develops heat, which in turn raises the temperature of the next dust layer. This process continues, and the flame travels through the dust cloud with rising temperature and increasing velocity. When the conditions are favorable, a true dust explosion results, and the velocity of the flame rapidly increases to over 2,000 ft. per second, and great pressure is produced. In coal dust explosions pressures have been known to increase to 119 lbs. per square inch, after they had travelled a distance of 750 ft. from the point of origin.

There are various methods of controlling, resisting or limiting these explosions, but the two principal ones are: — 1. humidifying the air currents by water sprays, and water zones; 2. inoculating the air currents with stone dust, and stone dust zones. These zones must be within a reasonable radius of the parts of the mine where blasting is done, and it is necessary to prevent shots from being fired in any other part of the mine, other than the working places, without the written consent of the Manager, stating the conditions, and the precautions to be taken before the shot or shots are fired.

Stone Dusting on the Continent

It may be interesting at this point, to look into the system of stonedusting in the Continental collieries. In general, stone dusting is confined to main roads and airways,—sometimes the inclines as well,—the precautions at the face and in the gate roads being limited to increased care in preventing the risk of ignition in shotfiring. With this object in view, the blasting charges are not allowed to exceed 250 grams, or 9 oz. in each hole. The cartridge is encased in waxed paper. Shot holes are carefully cleared of dust and stemmed up to the mouth. A plate of sheet iron, 10 in. by 32 in. at least, is set up a few feet from the hole, and all coal dust in the intervening space is removed. Workings are divided into districts, which are insulated form one another by means of barrages, etc. This is to limit as much as possible the propagation of the explosion, should one occur.

Summary of Preventative Measures

To summarize briefly, some of the preventative measures are; seeing that the dust from the screen on the face does not enter the air intake to the mine; taking extra precautions with respect to safety lamps; setting up walls of non combustible dust or water vapor between the particles of inflammable coal dust, or if reasonably practicable a combination of both. These walls should extend sufficiently far away from the working places, or the places where shots are fired, to prevent ignition of coal dust from the flame of a blown out shot, a windy shot, or a shot that has been overcharged. In addition to this, water or stone dust zones should be prepared in close proximity to the places where explosives are used, for the purpose of dividing the mine into districts, isolated from one another, and thus helping to prevent the spread of an explosion if one should occur.

It should be seen that all fine dust is taken out of the mine as far as practicable, that roads are ballasted with non-inflammable material, that mine cars are properly built to prevent dust escaping, that sprays of water are turned onto the top of the coal to prevent dust rising from the mine cars, that shot holes are properly cleaned, and are not gripping or fast; that the charge of explosive is limited to the prescribed amount as determined at the testing stations, and that all dust is allowed to settle before shots are fired. Tamping should be done with non-inflammable material, bearing in mind that tamping with clay containing 11 per cent. of moisture gives the most efficient results, increasing the useful energy of the shot to about 93 per cent. Moist tamping therefore does two things, it increases the efficiency of the shot, and also increases the safety.

It should be seen that ample time is given between shots, 1. to allow the heat generated by blasting to pass off; 2. to give the surrounding air time to dilute the gases generated by the explosive, and liberated from the coal; 3. to allow the dust to settle; 4. to render it non explosive by treating it with stone dust or water vapor.

Safe Explosives Practice

Having dealt with some of the precautions to be taken with respect to blasting, it is now important to deal with explosives, stating the precautions necessary with respect to their use, if we are to have a reasonable assurance that no ignition of gases or dust will take place from the blasting. The ignition temperature of all explosives exceeds that of all mine gases, but fortunately, the duration of flame of permissable explosives is much shorter than that required to ignite gas. The duration of the flame of permissable explosives is only a fraction of a second, while it is said to take as high as ten seconds to ignite fire damp, which is the chief mine gas.

The difference between permissable and non permissable explosives is clearly brought out in a comparison of black powder and ammonium nitrate. The ignition temperature of ammonium nitrate is 1121 degrees centigrade, that of black powder is 2215 degrees, or nearly twice as great. The duration of the flame of black powder is between 2,000 and 4,000 times as great as that of ammonium nitrate. In this connection also, the importance of detonators should not be overlooked, and a weak detonator should never be used.

If the above precautions, particularly with regard to limiting the charge of explosive to conform to the standards as set by the testing stations, and neutralizing the inflammable dust are observed, it will go a long way towards insuring safety in our mines.

In presenting this paper to the Mining Society, I take the opportunity of expressing the pleasure it affords me to be able to add my experience to that of other mining men. Each mining field has its own problems to solve, but in working these out, the essential qualities needed everywhere are close application, courage, and the determination to succeed.

An enterprising foreigner, said to be the editor of a Carpathian newspaper published in New York, was arrested in Herkimer, N. Y. on May 1[illegible] on the charge of being one of the six promoters of the [illegible] Workers Gold Mine." Vasily Chernoff, the arrested man, carried with him documents showing that he had secured a six months option on a Herkimer County farm, the consideration being $2000 cash and [illegible] $10 shares in an operating company known as the [illegible] Platinum Gold Company, Inc." A bag of soil samples from Herkimer County was found in the house where the resourceful Chernoff was staying. He and his associates are charged with the fraudulent sale of more than $200,000 worth of stock.

News and Comments

BY ALEXANDER GRAY

Victoria Cross Mining Hero

In these buoyant days when prospects are capitalized at a million or two, and mills are planned before sufficient ore for conclusive mill runs is developed, it is heroic to have a young Mining Engineer do a daring deed entitling him to the Victoria Cross—for he risked his official life. The property, or properties, shall be nameless. They were merged. One had a mill and put through some ore, the heads being heralded as most satisfactory, but the ore broke badly. The other had been prospected in a way, but had little other than proximity to warrant its being linked up with the property with milling equipment. It was resolved by those interested to amalgamate the areas. Acreage, plus new capital, it was in felt, would make a stronger combination. So, the details being arranged, a capable, highly thought-of young Engineer was put in charge. And what did he do? Well, that brave man sent for an able-bodied carpenter, told him to find the necessary plankind, and nailed up the mill! He did not put up a sign reading: "Those who enter here leave hope behind". He declared a close milling season, and this as his policy:

"I'm going to see if I can find enough ore to feed a mill".

Yet he has not been decorated!

"Smelters" Gathering Momentum

Ratification by shareholders of the $6,000,000 convertible bond issue came as a matter of course; so the Canadian Consolidated Mining and Smelting Company will have a clean sheet and a concentrator for the Sullivan Mine. Private enterprise will supply hydro-electric power. These twin economies are what the Sullivan needed, instead of shipping raw ore to Trail and having somewhat expensive power, however capable the management. So great a mine can stand almost anything, if it has to, but the concentrator on the spot will permit of run-of-mine rock being treated as well as the higher grade. Until now the Directorate has not been able to put its plans into effect. The bond issue meets the entire fiscal requirements, and hastens the day when Consolidated will earn larger profits and command greater respect in metal markets. Moreover, the concentrating department at Trail automatically will become available for general business on behalf of other producing companies, and incidentally of those Rossland ores of which the Consolidated has a goodly share. By having this capital expenditure and the added efficiencies it will provide, the Consolidated will go a long way toward meeting the requirements of British Columbia as a whole, and the Canadian Pacific Railway will have its compensations. The Pacific Province is fortunate in its possession of diversified minerals. Sympathetic metallurgical works, reasonable freights, and lower operating costs are inducements likely to attract discriminating capital.

Northern Explosives, Limited

Having a market with its affiliated corporations in the Maritime Provinces, Quebec and Ontario, the new Northern Explosives Company will undertake to cover broader fields. The line-up is indicated by the roster of the officials, as follows: D. H. McDougall, president; W. A. Layfield, vice-president in charge of operations; George C. Riley, vice-president in charge of sales; Alex. Fasken, secretary; J. B. Waddell, C. M. Doolittle, C. V. Corless, W. J. Webster, J. P. Bickell, J. F. Van Lear, Leonard Richards, jr.; Leland Lyon, George E. Leighton, comptroller, and E. V. E. Bard, plant superintendent.

Manifestly British Empire Steel and Coal, Dome and McIntyre Gold, Mond Nickel, Consolidated Asbestos, Provincial Stone, and other interests are identified with the organization, which is capitalized at $1,500,000, with 15,000 shares of $100 and 5,000 preference 8 per cent. shares. All the capital stock is issued.

The former site of the Curtis and Harvey plant on the Ottawa Canadian Pacific short line has been secured and approximately 100 persons, it is understood, are employed, a production this year of five million pounds of high explosives being anticipated. The plant, it is said, will lend itself to extensions at slight additional cost, the idea being to avail of regulations covering permitted explosives for coal mining purposes. Seemingly Atlas Powder Company, of Delaware, formulas will be availed of. The Atlas people have fifty per cent of the total capital issue. When the Company's features have been rounded out, it is the avowed intention to manufacture by-products, such as celluloid and leather cloths, the latter entering into automobile upholsterings.

Giving Canadians The Adargas

The Buffalo Bond Corporation has favored Canadians with a folder containing glowing accounts of the stupendous worth of the Compania Minera San Pascual De Las Adargas, S.A., Mexico, capitalized at 20,000,000 pesos—or dollars 'Mex".

Irreverent persons, given to profanity, might misinterpret this as a new-fangled gas (or a "gift-bearing Greek") were it not that Conrad E. Wettlaufer, of Buffalo, is President, and is qualified to prescribe substantial stimulants.

The Vice-President and Managing Director is Paul Ginther, a seasoned promoter not unknown to fame in select Toronto circles. Mr. Ginther has a penchant for profits—a commendable trait—if. Those Canadians who partook of Parral properties have not waxed wealthy by following Mr. Ginther's lead.

Perhaps, as strenuously maintained, Adargas is different. The folder bearing the name of Arthur G. Penman of Toronto, has it that the Adargas is a "group of mines", has been worked for ten years, and is liable (more than liable) to last forever and thereafter. To quote the folder verbatim: the properties are "estimated by eminent engineers to contain an inexhaustible supply of gold, silver and lead ore."

That will do. We are unconcerned about what the ore reserves will be in the Life Everlasting, when money, marriage and giving in marriage will be verboten.

Managing Director Ginther does not indulge in this limitless projection. The brokers did that. Mr. Ginther rests his case upon the assertion "there is enough ore in sight and ready to ship, at the bottom of only one of the eight shafts now open on the property, to keep the mine running at the rate of 500 tons a day for a period of five years, without touching any of the other ore bodies that have been exposed, some of which run assays as high as $400 a ton."

It is not claimed that this tonnage is in the sump at the bottom of one shaft. The ore "is ready to ship", seven or eight hundred thousand tons of it, to say nothing of the other seven shafts and all the high-grade there. Just as soon as a 14-mile railway is finished and rolling-stocked,

and a plant adequate to handle 500 tons per day is provided, there will be no curfew bells around Adargas premises. Oh! Boy!

With "not a dollar of debt", at this writing, (everything having been paid for "in advance"), Mr. Hugo Schoellkopf, Treasurer, saw to it that every peseta reached its destination and found its worth.

Once shipping commences "production promises" to reach (at a low estimate) throughout eternity, "the astonishing sum of $9,000,000 per annum."

No less important to Canadian recipients of this unpretentious folder, is the announcement that Joseph C. Houston, erstwhile of the Right-of-Way, Porcupine Crown, Schumacher, St. Anthony, etc., and "the man who put the Dome Mines in Canada on a paying basis," as the document reads, is the Mining Engineer in charge of the Adargas. His presence and his expressed optimism suggest that he substantiate some of the estimates and the further claim that the Chihuahua Mining district has "produced more of the previous metals than any other region on earth". Undoubtedly Mr. Houston has had varied experience and possesses versatility. He may not insist that he alone and unaided "put the Dome Mines on a paying basis"; yet that is a trifle alongside of this capsule from the brokers:

> "Estimates by competent and accepted mining authorities indicate that all of the mines listed above (Dome, Hollinger, Lake Shore, McIntyre, Schumacher, Wright-Hargreaves) could be dumped into part of the mineralized acreage of Adargas and, with equal equipment, Adargas could produce several times the combined earning capacity of all the above mines".

That being so there is singular apathy in not planning more than a small mill and talking of only $9,000,000 per annum regardless of Father Time and his reaping iron. This does not imply that it is not an act of magnanimity, even though it be an afterthought (since Buffalo and environs are well supplied with Adargas shares) for the officers of this company and the formidable Advisory Board, which included Mr. Houston and the capable A. G. Kirby, to permit Canadians to contribute $1 a share. Messrs. Houston and Kirby are so well known in Canada (notwithstanding Mr. Ginther needs no introduction) to vouch for so much that it requires sedatives which the technical chiefs can supply. Mr. Houston feels "that when the property is properly opened up it will develop into one of the most productive mines in the Republic".

It almost seems as if Mr. Houston and the forecast recorded in the folder, are not in harmony. If the property is "inexhaustible", why is Mr. Houston so reserved?

Pending explicit details, subscriptions for shares need not be telegraphed. Accepting the suggestion of Mr. Houston, "when the property is properly opened up", it will be time enough to buy, even at a premium upon the price now quoted.

While on the subject of this extraordinary Mexican proposition, which Canadians are asked to support, it is pertinent to add that a leading Mining Engineer, respected and popular throughout the Ontario North Country, visited the Adargas about two months ago. *The Mine had not been de-watered,* according to his statement. Its everlasting ore reserves were not on exhibit.

Elbow Lake Sampling Results

Superheated air to the contrary, and painful as it may be to record the fact, initial Elbow Lake sampling results have not evoked other than a doubt around Hollinger premises. Enrichments and impoverishments are extremes which may not meet—and, to be frank, that is why President Noah A. Timmins went there. A final decision may be deferred and it is hoped there will be a revision of preliminary judgment; but the sum and substance of what has been shown rather tends to the belief that the section needs careful determination—by those who can afford to make it. Where there is a chance—a sporting chance—Mr. Timmins always has been an optimist. There are spectacular features in and about the Murray claims held by individual Hollinger Directors. Whether the lean will dilute the fat "spatterings" (as the advertisements describe them) to the point of unpayability, is a question that is in the balance. One authority, whose opinion will be more or less decisive, "does not like it". Possibly this may not be the best Elbow Lake has to offer. It would be unfortunate to have an adverse decision so soon. Nevertheless I give the situation as I get it, for what it is worth to those who may not have a thank you for the information. Too many fast-days make an occasional Lucullian feast enervating rather than nutritive.

Overproduction of Superlatives

There is considerable risk in the overproduction of adjectives, when they are so promiscuously superlative. The promotor has an inexhaustible reserve of these, but the public may not be able to supply the necessary if the "greatest ever" mines or veins "follow fast and follow faster" in the advertising columns of the daily press. Lightning River, according to representations, has the longest, strongest, richest ore body in the Northland. The sufficiently-excellent Lake Shore has something unparalleled—good enough in all truth without stretching it. In reality there is nothing in common between Lightning River and the Lake Shore, other than that developments at the latter are eminently satisfactory and do not need exaggeration. Not to be outdone, Harper, Mount and Company, the firm that recently announced Hollinger Consolidated had ore enough to cover milling requirements for forty years (say a paltry 60,000,000, or 80,000,000 tons) offers the Chaput-Hughes as a near greatest. In so doing, these gentlemen felicitate their clientèle upon the fact (no doubt it is a fact) that "there are only 1,400,000 shares of this stock outstanding". The diminutive issue is intentionally so. At 28 cents, the total market valuation of the property undoubtedly "would only amount to $392,000, or $3,150 an acre", which is ridiculously low for something contain a "golden opportunity for tremendous profits". That word "tremendous" is preferable to "unbelievable wealth", as applied to some Elbow Lake prospects. It provides gusto, there is no negative element. "If Chaput Hughes was producing gold the shares would easily be worth a dollar"; nor would they stay there. Yet "you never can tell" Why it should be reasoned that Chaput Hughes has a chance of duplicating the Lake Shore, which "has located $18,000,000 in ore", or why it is assumed Chaput Hughes is "in the same area and the same vein system" as the Lake Shore, Teck Hughes and Tough Oakes,—well, perhaps Attorney General Raney can find a reason why it is not. "Area" is a very broad generalization. "Vein system" is definite. "There isn't much of our original allotment left", the Montreal Mining Exchange brokers assert. That, too, may be another argument in favor of checking up the assertion that the producing mines of the Kirkland Lake "area" are in "the same vein system as Chaput Hughes". What the Chaput Hughes has and what its near by northern neighbors have, is more than the difference between Tweedledum and Tweedledee. All of which does not imply that the Chaput Hughes may not have something worth having more of. It needs less imagery, a trifle of the positive rather than the superlative in its literary output. The "pleasures of ignorance", putting it mildly, are expensive.

News of Mining

United States

In the construction of motor cars and trucks in the United States enormous quantities of metals are used. During the year 1921, 1,514,000 passenger cars and 151,550 trucks were built. The iron and steel used amounted to 1,464,000 tons or about 4 per cent of the country's output; 43,250,000 pounds of aluminum, 22 per cent. of the total output; 83,425,000 pounds of copper, 16 per cent. of all produced; 12,510 tons of tin, or 20 per cent. of the country's supply; 6,670 tons of lead; and 3,400,000 pounds of nickel.

The American Gold and Silver Institute advocates the organization of a United States export silver association, strong enough to control and stabilize the market by extending credit to such United States producers as may require it and by placing itself in a position to be able to purchase the world's entire supply. It is pointed out that the United States and Mexico produce 70 per cent. of the world's silver and that London control is based upon the speculative demand for the metal in the Orient. The purpose of the organization will be to become active after United States Government purchases under the Pittman Act shall have ceased.

After very acrimonious and protracted debate, the Finance Committee of the United States Senate has been overruled by the Senate in reference to the proposed duty of 10 per cent. *ad valorem* on cyanide. All cyanide compounds were returned to the free list.

The last week in May witnessed a slight gain in the supply of bituminous coal. Visible stocks in hand, however, are rapidly reaching the vanishing point. A return to normality in freight rates and wages, it is predicted by a few publicists, will come before September first. However this may be, there is a singular lack of interest in the strike situation. Rarely has the public paid less attention to the causes and merits of a national labour movement. The Hoover Conference at Washington, however, is being followed with interest. Mr. Hoover, in opening the conference, declared that in "times of emergency some one must take the responsibility, assume the leadership, and say what is fair. I do not believe a man is worthy to hold public office who will not assume responsibility in times of emergency... I propose to inquire through you as to the situation in various districts and I will take the responsibility on my own back and will ask every operator to accept this basis in his own district."

In the first week of June copper prices were steady and higher at 13.875 cents and 14 cents, the latter price for carload lots. High-grade zinc advanced to 6 1/8 cents; lead, 5.65 cents to 5.75 cents. Silver was steady at over 72 cents per ounce.

Great Britain

Under its present management the South Crofty tin mine, Cornwall, has had twelve years of prosperity, out of fourteen years of operation. The South Crofty management had asked permission of their mineral lords to stop pumping. The mineral lords acquiesce on condition that the incoming water should be dammed. The inspector of mines, however, refused to authorize the building of underground dams on account of the dangerous nature of the work. In this impasse the Government Trade Facilities Committee came to the rescue and advanced £30,000 to finance the re-equipment of the mine. New pumps are now being installed and the lower levels are being developed.

The British Ministry of Labour reports a slight increase in the number of wage earners at work in the collieries at the end of April, the total being 1,088,512. The number of days of pit operation per week was also larger, being 5.30 as compared with 5.17 in March. Reduction of from one to 2 per cent. in weekly wage rates were partly offset by corresponding increases in Northumberland and other districts.

The total saleable coal raised in Great Britain during the first quarter of the current year was 61,000,000 tons, about 7,000,000 more than was raised in the corresponding period of 1921. The number of persons employed (above and underground) was 1,091,000 for 1921 (1st quarter) and 1,233,000 for 1922 (1st quarter).

In answer to questions asked in the British House of Commons, it transpired that the Geological Survey has a staff of 84 as compared with 51 in the year 1914. The yearly expenditure is now £44,560 as compared with £16,828, in 1914. The scope of the Survey's activities has not been expanded.

At Scottish coal mines there are now 25,100 surface workers and 100,900 underground. During the first quarter of 1922, 41 persons were killed and 161 seriously injured.

On May 22nd, English and Welsh companies put into effect reductions in freight in rates in iron and coal. Scottish railways do not participate in this reduction.

Europe

The Swedish Government has overridden the Swedish Railway Board's recommendation against the use of Spitzbergen coal and has placed contracts for delivery of coal with the Spitzbergen Coal Company for this summer and for the summer of 1923.

With certain provisions and conditions, the German Government is now permitting the importation of foreign coal free of duty. This arrangement will obtain until the end of August.

The French *Société de Nickel*, operating in New Caledonia, has issued its report for the year ended June 30th, 1921. In January, 1921, the sales of the *Société* fell 50 per cent. Labour difficulties were met in part by importing workmen from Indo-China. High fuel costs had caused the shutting down of the Company's foundry. The utilization of water-power, to be completed within two years, will bring much-needed relief.

Poland's production of crude oil has fallen, almost continously, since 1910. This is due largely to the exhaustion of the Borysław-Tustanowice district. The Polish Government offers large concessions and wide privileges to companies that will undertake the sinking of wells in new districts. At present crude oil is being much used for power generation owing to the shortage of coal.

Australia

The New South Wales Board of Trade has fixed the basic market wage for the State at £3.18s. per week. This is a reduction of 4s. 1d in the existing rate.

The Australian Miners' Federation Executive has formulated a plan whereby, "job control" is to be established. No union member is to leave one calling to accept work in another without permission of the district secretary. Members of Unions will refuse to work with a new em-

ployee until he produces a note from his district secretary. Fines and penalties are provided to enforce obedience.

For the first three months of the current year the gold output of the State of New South Wales was 8740 ounces as compared with 15,628 ounces for the first quarter of the year 1921.

Africa

The Fanti manganese ore deposits, Gold Coast Colony, controlled by the Fanti Consolidated Mines, Limited, are being opened up and equipped for large production. The ore is reported to contain 50 to 53 per cent. manganese, 2 to 4 per cent. iron, 3 to 7 per cent silica, and 0.1 to 0.12 per cent. phosphorus. Up to the end of 1920, in a short period, the company shipped 140,000 tons of detrital ore. This was mostly made up of clay-coated boulders from which the clay was easily washed. The known ore bodies are estimated to contain 3,000,000 tons. To equip the property for the production of 200,000 tons per annum will cost in the neighbourhood of £250,000, including the establishment of lighterage facilities for transshipment to steamers. Geographically the property is advantageously situated compared with other European and Asiastic producers.

A strong movement is under way in mining circles on the Rand to supersede the established method of measuring efficiency by the cost per ton of rock mined, by the cost of gold per ounce produced. Too much rock is being mined. Stopes are too wide. In some instances the waste rock mined exceeds 75 per cent. of all material handled.

No effort is being made to utilize the sand and slime dumps on the Rand for the manufacture of bricks. Small plants are now in operation near Dreifontein Station. Government tests of the products have been favourable.

Asia

A forecast of Japan's output of coal for 1922 places it at 25,700,000 tons. As the estimated consumption is 24,200,000, the balance is not large. The decision of the Japan Coal Miners' Association to curtail production has been modified by the fact that prices have steadily advanced. Exportations for the year are estimated at about 2,400,000 tons.

QUEENSLAND COAL FOR AMERICA

The coal mining industry of Queensland has of late presented several interesting and important features. A 6 ft. coal seam was discovered on the Bowen Coalfield railway line, about 4 miles outside the State Coal Area. Commenting on the find, the Minister for Mines (Hon. A. J. Jones, M. L. A.) said that the seam had shown 6 ft. of thickness when the telegraphic advice was despatched to the Department, and then had not been fully penetrated. It has been decided not to grant any licenses or leases in the vicinity until full reports have been received. On the Styx River, the Department of Mines is equipping a new colliery. This action is warranted by the discovery of four more eminently satisfactory seams, and the boring operations which are being conducted give promise of additional important developments. Mr. J. W. Brophy, General Manager of the State Steel Works, has been appointed Superintendent of State Coal Mines. His duties will be to deal with the economical working of the mines and to supervise their management. On him also will devolve the securing of trade, both local and overseas, the equipping of new mines, such as the one at Styx River, with machinery and plant, and conducting boring operations for coal. The Department considers the coal at Styx River to be the equal, at least, of any gas coal obtainable in Australia, and are preparing for production on a large scale. With the construction of the Railway to the State Mine at Bowen, which should be accomplished before the end of the year, export business in steaming and coking coal will be practicable. It is the intention of the Government to establish trade connections with the United States of America and with the far East.

RIBBLE MINES

Ribble Mines Ltd., which a few months ago acquired a controlling interest in Wasapika Consolidated is now developing the property. President Rogers who was in Toronto for a few days last week states that drifting is in progress north and south at the 100 ft. level and that the shaft is being timbered to the 200 ft level. Drifting on the second level will be begun soon. Eighteen men are employed.

The company is also having a survey made of the water power on the Montral river at Ribble Falls a few miles from the mine. Preliminary estimates by the surveyors indicate that between 700 and 1000 h.p. can be developed here.

The road to the mine from Westree station has been much improved during the past year and it is now possible to travel the road in motor cars. Westree has been made a regular stop on the National Railway. It is twelve hours from Toronto to Westree on the Winnipeg train. The increased traffic to West Shiningtree has resulted in the improved passenger service and the operators expect that the railway will soon provide improved freight handling facilities at Westree station.

Ore being encountered in the drift on the Ribble vein is well mineralized with pyrite. Engineers who have visited the property recently have remarked on the similarity of the ore to that of the producing mines at Porcupine. The ore is pyritic quartz and with the grey carbonated volcanic rocks that enclose the quartz the similarity to the Porcupine deposits that are producing most of Ontario's gold is striking. Those who know the West Shiningtree area only from the results of early surface examination will find a visit to the area now well worth while. There is Pullman service now from Toronto to Westree and motors on the road to the mines.

The directors of Ribble Mines Ltd., are George R Rogers, R E. Hore, J. E. Day, L. J. Labay and J. t Mahon. Mr Rogers is president and general manager Mr. Hore is vice president and consulting geologist.

A correspondent of the Sydney (Australia) "Morning Herald" describes the present state of the mining and metallurgical industries of New South Wales as lamentable — "languishing, practically dead, oppressed by labor union domination high wages, short hours poor quality of labour, unduly high freight rates, increased smelting and refining charges, added costs from awards," and other distresses too numerous to detail. He states that nearly every mine is closed down. There are 10,000 unemployed, and that the Government's action in assisting Broken Hill strikers with £50,000 was about the last straw.

A plant for manufacturing asbestos products is to be established near Perth, Western Australia, under the auspices of the State Government. It is considered probable that the Government will also assist private owners with cash subsidies.

Notes From Nova Scotia

Mines and Mills Busy Again

"Our Isle is full of noises, sounds and sweet airs, that give delight and hurt not". They are the noises of the mine, the workshop and the factory. The low hum of machinery, the whirr of rapidly revolving wheels, the pulsating of the great engines and the hearty voices of the workers all tell of new life throbbing through the veins and body of the two giant industries of Cape Breton — coal and steel.

Already coal is rising to a normal output and in a short time will exceed it. Collieries that have been dormant for over six months are now in operation, while a half-constructed colliery is again the scene of much activity. The word has been spoken and "every man is expected to do his duty."

It's "braw" to see the ships coming in for Cape Breton coal, great ten-thousand-ton cargo boats, taking away at one load three-fourths of a day's output. A short time ago fears were entertained in some quarters that the four hundred thousand tons of coal now in the stock piles might not be lifted this season and that a dull winter would naturally follow. But the steam shovels are busy, and we hope to see the coal heaps quickly transported to other quarters of the globe.

No. 24, the newest of the Dominion collieries, which was closed down early last December, is in operation again. This mine had just been put into condition to give a good output when depression struck the coal trade. Consequently none of its new equipment was put into motion. A new bank-head, with concrete decks, new tracks and tipples and screening machinery for assorting the coal, with new bank and haulage engines, have been awaiting the turning on of the power. The mine is equipped for an output of twelve hundred tons per day, but usually the calculation of tonnage is exceeded.

Miners Now Hard at Work

Mine labor is less restive and after the Award of two Conciliation Boards, it seems to have fallen into a more moderate mood. This may be due to the re-action after the prolonged efforts of agitators; but we are inclined to think that quiet reflection is settling down over the minds of men who were badly misguided and who are beginning to realize their best friends among the Executive Officers were those who counselled them against hasty action. Anyhow the workmen of Nova Scotia will think twice before again following a line of action that will still further lose them the sympathy and support of the public. The Executive Officers are giving little lead to the rank and file as to how they should vote on the Scott Award, and while it is desirable that the Award should be accepted, yet the greater injury will come to the workmen rather than to the Company from its non-acceptance.

President Baxter Vindicated

The vote on the recall of President Baxter was very small and therefore very disappointing to the Reds and their leaders. The only excuse that can be offered for such vile treatment of a faithful officer was the chagrin felt over the award of the Gillen Board, and the inflammatory speeches made by J. B. McLachlan. Men were "stirred to mutiny and rage". The Board, it was said "had failed to make full investigation", "the Coal Company were tyrannical" and "President Baxtor was a traitor," fit only to be cast out of society. Subjected to the "pelting of the most pitiless storms" of abuse, Bob Baxtor kept steadily on. This was base ingratitude to the men who had in the early days of the U. M. W. lead many a forlorn hope. Even his comrade in war, J. B. McLachlan, seemed anxious to follow the funeral car so long as he had full liberty to fire the funeral pile. Surely "judgment had fled to bruitish beasts and men had lost their reason." But President Baxter has been fully vindicated and to-day he stands higher than ever before in the eyes of the Canadian public, and of those who know him best.

Steel Plant Busy Again

The Sydney Steel Plant has two thousand men employed and rumors are rife that better things are in store for the immediate future. As it is, the number employed is a large addition to that of two months ago.

A number of Bethlehem steel experts and some New York financiers made a thorough inspection of the plants and property of the Empire Steel Corporation in Nova Scotia and elsewhere lately. Whether this means a new bond issue or a merger, is as yet an unanswered question. It is generally hoped that it will bring steady employment to the inactive steel plants of Nova Scotia.

The Ottawa Government was petitioned by the Board of Trade and the Town Council of Sydney Mines, to buy and use more ecoal on the National railways, so that more employment might be given. Whether the Government will take any action in the matter remains to be seen, but at present a searching investigation is being made into the contracts of coal made for these railways during the Spring. The Nova Scotia members of parliament seem to be forcing the matter, and they are quite right.

The Executive Officers of the United Mine Workers have decided to make no recommendation to the members on accepting or rejecting the award of the Scott Conciliation Board. A convention will be held in Truro on the 25th inst., when the matter will be discussed. It may, however, develop that the advice of the Executive may be sought, and some direction to the rank and file may be asked for. In the light of what has already taken place on this vexed question of wages, this may be a very difficult thing to do.

If a two year agreement could be made on present wage rates it might be of great benefit to the industry. With American freight rates falling and miners and operators of the United States in deadly grips over wages with the certainty of wage reductions, no mistake would be made if the men could get the Empire Steel Co. to agree to a contract running over a period of eighteen months at least.

The Southern Rhodesian gold output for April 1922 amounted to 54,318 ounces, as compared with 54,643 ounces for March 1922, and 47, 858 ounces for April 1921.

British Columbia Letter

Premier

Although the Premier Mine, Portland Canal, northern British Columbia, better known in western Canada as the "Wonder Mine", already has paid two dividends aggregating $900,000, another substantial dividend will be announced in the near future.

Mr. R. W. Wood, of the Premier Mining Company, who accompanied Mr. H. A. Guess, vice-president of the American Smelting and Refining Company, in a call upon Hon. Wm. Sloan, Minister of Mines, lately, is responsible for the foregoing statement. He states that the Premier is fully meeting expectations in the course of its development. The new aerial tramways from the Mine to Stewart, B. C., the longest ore haulage installation known, is giving every satisfaction in operation.

The actual management of the Premier Mine is lodged in the A. S. and R. Co., of which Mr. Guess is the active head. This is one of the greatest mining corporations of the American Continent. Mr. Guess has just completed an inspection of the British Columbia property. While he has little to say regarding the results of recent work in the direction of further opening up of the ore bodies, the fact that provision has been, and continues to be made for the plant necessary for development on a large scale is conclusively indicative of the confidence of himself and his associates in the future of the mine.

It was announced that the Premier Mining Co., with a view to the assurance of an adequate supply of ore to maintain shipments on a large scale for an indefinite period, has bonded the Northern Light Group of Mineral Claims. These adjoin the Premier and the work of developing the mineral showings of this property will be proceeded with this season.

The Trites Wood Co. Ltd., the company largely responsible for bringing the riches of the Premier to the notice of the world, has bonded the "Big Missouri." This also is in the Salmon River section of the Portland Canal Division. Sir Donald Mann, of Mackenzie Mann fame, held the property for some years. He did considerable development. It is the intention of the new bond holders to carry on the work started in order to definitely establish production possibilities.

Mr. Guess will next visit Peru where the American Smelting and Refining Company has large mine holdings. Plans have been completed for the installation there of a 22 mile aerial ore haulage system. When this is in operation the Premier Mine's aerial will have to take second place. It is this and other large scale Peruvian mining projects that are taking Mr Guess to South America at the present time.

Silversmith

The Silversmith Mine, Slocan, is now equipped with a flotation plant which is producing a 50 per cent zinc concentrate, containing on an average 35 oz. of silver per ton. About 400 tons of zinc and 500 tons of lead concentrate are being turned out monthly. Under the new zinc schedule announced by the Trail smelter this should net the Company about $23.00 per ton. There had been no market for this concentrate previously and some 5000 tons of zinc concentrate had accumulated from the old gravity milling operations. As soon as the new Trail zinc plant is completed this will be forwarded for treatment.

The Cork Province Mines, Ltd., at a general meeting held recently, authorized the increase of the capital stock of the Company to $150,000. This, it is stated, will provide a working capital of $50,000 after all obligations have been retired.

Ore receipts at the Trail Smelter, Canadian Consolidated Mining and Smelting Co., for the week ending May 31st last aggregated 6,649 tons. Among the independent shippers were the Black Rock, Northport; Ottawa; Quilp; Republic; Roseberry-Surprise, New Denver; Silver Hoard, Ainsworth; Silver Standard, New Hazelton; Surprise, Republic; and Silversmith, Sandon. The total receipts for the week ending May 31st were 12,530. Of this total the Company's mines contributed 12,530 tons, the chief independent contributor being the Silversmith, 367 tons.

The Bayonne group of gold claims is reported to be the scene of a rich strike, exceptional values having been encountered in the course of underground development. The vein was struck 60 ft. ahead of the expected point of contact. It is 2½ ft. wide and is considered of such importance as to have a stimulating effect upon mining throughout the district.

There has been a strike of rich ore in the workings of the Reno mine, Sheep Creek. The vein matter exposed 20 ft. from the surface shows free gold, but whether development will prove this to be only a pocket remains to be seen.

Sullivan Mill

A definite announcement has been made regarding the plans of the Canadian Consolidated Mining and Smelting Co. at Kimberley, it being stated that a concentrator of 1500 ton capacity is to be installed immediately for the handling of the ores of the Sullivan Mine. The cost is estimated to be between $1,250,000 and $1,500,000 and the plant is expected to be ready for operation early in 1923. Construction will be in charge of G. F. Chapman, Mechanical Superintendent of the present Sullivan plant at Trail. The mill will be designed and built by the Company. With the completion of the new concentrator the output of the Sullivan Mine is expected to be greatly improved. There also will be more adequate provision at Trail for treatment of the ores of the Rossland Camp. In connection with its expansion it will be necessary for the West Kootenay Power and Light Co., to arrange for further power development at Bonnington Falls.

George W. Cormack, whose name is associated with the discovery of gold in the Klondike, died a few days ago in Vancouver B. C. It was he, who on August 17th, 1896, found gold on Bonanza Creek, the news of which took thousands of prospectors into the Yukon. Mr. Cormack recently addressed a meeting of the Yukon Pioneers' Association recalling some of the most interesting of his experiences in the far North.

It is possible that the Dolly Varden Railroad, Alice Arm, will be put into condition for the operation of hand cars this summer. This would be only for the convenience of mine operators and prospectors. The Public Works Department of the Provincial Government has been inspecting the road to ascertain the cost of the work necessary.

Granby's Annual Report

The Granby Consolidated Mining and Smelting Power Co. has just issued its Annual Report in which it is stated that after writing off $100,000 for depreciation there was

a net operating deficit of $287,161.64. This deficit would have been far greater but for the splendid team work on the part of the mining and metallurgical staff and the employees; team work that reduced the cost of copper production from 15.94 cents in 1920 to 11.65 cents per pound in 1921, which is equal to a reduction of 27 per cent. The average price obtained for copper was 12.76 cents per pound, compared with 17.85 cents in 1920, and it was this great difference in the selling price that was responsible for the deficit.

The company smelted in its furnaces, 913,008 tons of ore, of which 16,206 tons was custom ore, and produced 29,970,651 pounds of copper, 193,283 ounces of silver, and 8,858 ounces of gold. This production compares favorably with 25,744,327 pounds of copper, 1,054,206 ounces of silver, and 9,481 ounches of gold produced in 1920, when it is remembered that three-quarters of the silver production in that year came from the Dolly Varden mine. The decrease in gold production last year is accounted for by the fact that barren quartz was used for fluxing purposes, instead of very low grade gold quartz.

Owing to metallurgical improvements that were made in the smelting practice, less coke was required, and the coke-oven plant was operated at only 43 per cent. of its capacity. From 89,543 tons of coal charged into the ovens, 56,021 tons of coke, 2,193,555 pounds of ammonium sulphate, 188,001 gallons of motor fuel, 661,046 gallons of tar, and 137,000,000 cubic feet of gas were produced.

The Company's colliery, at Cassidy on Vancouver Island, produced 215,211 tons of marketable coal. Of this 89,529 tons was used by the company at its colliery and smelter and 125,686 tons was sold, the principal market being in Seattle.

Besides the new storage dam, which already is well under way, and which when complete the directors estimate will bring about an annual saving of from $150,000 to $200,000 in fuel oil, the directors recommend the erection of a concentrating plant of 1000 tons daily capacity at Anyox, to treat a large reserve of silicious ore that cannot profitably be smelted directly. It is likely that work will be commenced on the erection of this plant before the end of the year. It is emphasized that considerable economy will be effected by mining the two classes of ore at one time and treating them separately, instead of leaving the low grade ore in the mine and returning to recover it later.

Although an inroad to the extent of 224,893 tons has been made on the ore reserve, there still is a reserve of 10,751,527 tons of ore averaging 2.24 per cent. of copper, and new high-grade ore has been discovered by diamond drilling during the year. A considerable body of massive sulphide ore, running about 0.5 per cent. of copper, but running very high in sulphur and iron, has been found, and though this has no commercial value at the present time, it may become valuable for the manufacture of sulphuric acid, should a demand occur for a large quantity of that substance.

With a further decrease in operating expenses through the erection of the new reservoir and with a general stimulation of the copper market, which is shown by the sharp upward movement in all copper mining shares, there is every indication that the company will have a far better year to record in its next annual report.

Injunction in Cedar Creek Placer Claim

Mr. Justice Morrison of the Supreme Court of British Columbia has enjoined Alfred Platt, original staker of Cedar Creek from committing a tresspass upon the property of Edward G. Stevens, known as placer mining lease No. 180. It seems that the claims belonging to Messrs. Platt and Stevens adjoin and it is stated that Platt's stakes do not cover the ground in which he first found gold. The matter is of importance because at the point in question there has been an output recently of from 4 to 12 ozs. of gold daily.

No More Foreign Coal for B. C.

The practise of the importation of foreign coal by vessels of the Canadian Government Merchant Marine operating on the Pacific has been protested by the Honourable Wm. Sloan, Minister of Mines, with good effect. The matter was taken up both with the Honourable W. C. Kennedy, Minister of Railways and Canals, and the Right Honourable W. L. Mackenzie King, Premier, it being pointed out that Canadian ships were bringing to British Columbia on their return voyages from Japan, Australia, and other outside ports sufficient fuel to meet the bulk of the requirements of the fleet. This, it was argued, had a tendency to discourage the production of the provincial coal field and was particularly reprehensible having in view the present weakness of the bunker and domestic trade. A continuance would have the effect, it was pointed out, of increasing local unemployment when all endeavours should be in the opposite direction. On this question Hon. Mr. King made a statement in the House of Commons, Ottawa, denying that it was the intention of the Government to buy Japanese coal for use on the Pacific and that the coal already purchased there has been used as ballast because it was cheaper to do this than to secure other material for that purpose. He asserted that as far as possible it was the policy to use only British Columbia coal on Government ships operating on the Pacific.

The Coal Mines

In the Crow's Nest Pass field the strike is still under way and there is no prospect of an early settlement. If anything the employers and employees are further than ever apart. The output from this district for the past month therefore has been negligible. On Vancouver Island lack of demand has enabled the mines to work only part time. Following are the Vancouver Island production returns for the month of May:

Mine	*Tons.*L
Western Fuel Corporation of Canada, Nanaimo	35,840
Canadian Collieries (D) Ltd.,	
Comox	26,299
Extension	16,229
South Wellington	6,193
Granby Consolidated, Cassidy	19,458
Nanoose Wellington Collieries, Wellington	4,860
Old Wellington Colliery, Nanaimo	574
TOTAL	109,453

The semi-official China Year Book for 1921-1922 gives the latest available statistics of coal and metal production. Gold production for the year 1916 amounted to 108,000 tacts (a tact is the equivalent of one and one-third ounces avoirdupois), most of which was derived from alluvial workings 73 per cent. of the workings are , or were, under Government control. Antimony outputs came to 10,000 tons. No reliable statistics are obtainable for zinc, lead, copper or silver. There are large possibilities for expansion in the production of all these metals. The coal production of 1920 was 19,500,000 tons, of which about half came from mines controlled wholly or in part by foreign capital. This is an increase of 20 per cent. over the year 1916.

Northern Ontario Letter

Crown Reserve at Larder Lake

The work of developing the property of the Crown Reserve Mining Company at Pancake Lake in the Larder Lake district is now well under way, and the work of the next six months will probably determine the approximate outcome of the venture.

Surface showings were encouraging, although not such as would assure success. The results of diamond drilling operations, however, were favorable and encouraged the management to go ahead in the hope that the property would develop into a paying mine. Accordingly, the property has been equipped with a mining plant and the work at hand will consist of 300 feet of shaft, three compartment in size, in addition to a large amount of lateral work.

The deposit does not lie in that part of the Larder Lake field where the Canadian Associated Goldfields spent about a million dollars in a futile effort but is on the easterly continuation of the rock formations, which are commonly referred to as the "Kirkland Lake series". Success here would point the way to several miles in length of important mineral lands beyond the point already proven in the Kirkland Lake field.

McIntyre Mill

Within the next few days the additional milling equipment on the McIntyre-Porcupine will go into operation and will enable the company to handle from 750 to 800 tons of ore daily, as compared with 550 tons daily heretofore. Not only this, but it will mark the commencement of the treatment of carbonaceous ore which the additional equipment is especially designed to handle. Some of this ore is high-grade, some of it running from $20 to $100 per ton.

Wright-Hargreaves Dividend

Official advice to the Journal from Edwin Lang Miller, vice-president and secretary of the Wright Hargreaves Mines, Ltd., that the company would pay a 2½ p.c. dividend on July 1st to stockholders of June 17th did not come as a surprise to close observers of this enterprise.

It has come to be recognized that although the company has not gone on a regular dividend basis, yet the physical condition of the mine and the high efficiency obtaining in the mill combine to assure regular disbursements at intervals of every three months. The mill first went into operation a little over thirteen months ago and already the company has paid $275,000 or 10 p.c. to its stockholders, including the dividend just now announced.

In the meantime, an exceptionally rich strike has just been made on the Wright Hargreaves, in a stope in the east drift at a depth of 400 feet. This drift has been yielding good ore during the course of development work, but all former ore in the mine has now been surpassed in richness by the shoot encountered at this point. Not only is native gold apparent in spectacular quantities, but gold tellurides are present to a important degree. Some of the ore will assay hundreds of dollars per ton, and is quite typical of that found in sections of the adjoining Lake Shore mine.

During the month of May the mill continued to operate at an average of close to 200 tons of ore daily, with mining and milling costs held down to a level that assures a wide margin of profit.

Kirkland Lake Production

Figures secured from the Ontario Department of Mines with regard to the gold production from the mines of the Kirkland Lake district for the first quarter of the current year show five mines equipped with mills, having an aggregate capacity for handling 770 tons of ore daily. The figures show the Ontario Kirkland as having a capacity of 200 tons daily, but this is an error, as the plant was designed to treat 100 tons a day. Therefore, the correction shows that the mines of this field are equipped to handle 670 tons of ore daily.

These mines produced an aggregate of $349,742 in the three months, made up of $348,031 in gold and $1,711 in silver. A feature of the silver production was that $742, or nearly 50 p.c. of the total came from the Wright-Hargreaves.

The one disappointment in the entire field was the fiasco at the Ontario-Kirkland, where the impression had been sent broadcast that the ore would average upwards of $10 per ton, but where actual achievement showed 5,300 tons treated and $9,558 as the pitiful result; that is to say, $1.79 a ton.

However, taking the other mines, namely, Wright Hargreaves, Lake Shore, Teck-Hughes, and Kirkland Lake, the result was extremely good, the ore in the aggregate averaging $12.15 a ton, in spite of the grade being quite low at the Kirkland Lake Mining Company's property.

In the following summary, it will be noted that the Teck Hughes made a remarkably favorable showing and is running the Lake Shore a close race for second place in this field:

Company	Gold	Silver
Wright Hargreaves	$197,471	$742
Lake Shore	152,931	363
Teck Hughes	138,191	337
Kirkland Lake	19,260	186
Ontario Kirkland	9,175	83

It will be noted that the Tough Oakes mill of the Kirkland Lake Proprietary is not included in the list, as this plant, good for 120 tons a day, only went into operation during the second quarter.

Crocsus

The Dominion Reduction Company is considering the question of interesting itself in the Crocsus mine in Munro township. The workings of the mine are being dewatered preparatory to making an examination.

Surface showings were extremely rich, but subsequent work showed the gold to occur in small patches and the operation proved to be a disappointment, thereby leading to curtailment of work some years ago. The present examination will hinge a great deal on a study of the geology and the possibility of working out the serious problem caused by faulting of the formation.

Dome Lake—West Dome

At last it would appear as though the long discussed consolidation of the Dome Lake Mining and Milling Company with the West Dome Consolidated, will be brought about. A meeting of the stockholders of the West Dome Consolidated was held on June 16th, and approval of a plan to merge with the Dome Lake into what is to be known as the Consolidated West Dome Mines.

The new company is to have an authorized capital of $5,000,000, made up of 5,000,000 shares of the par value of $1 each. The West Dome is to be given 1,000,000

shares while an equal number will go to the Dome Lake shareholders, thereby leaving 2,000,000 shares in the treasury with which to raise the money necessary to carry on additional development work and re-open the mill already installed on the Dome Lake.

It has been intimated that there are certain legal aspects to the proposition that may further hold up the consolidation plans, but whether this is correct or not will probably be determined today.

Cobalt Refinery at Niagara Falls

Considerable interest is taken here in the report that the Coniagas Reduction Company may be amalgamated with the Electric Gas Bleaching Company of Niagara Falls. The Coniagas plant, which is at Thorold, was erected originally for the purpose of treating Cobalt ores, but the enterprise met with serious difficulties both in connection with its process being expensive and finally in a collapse of the market for cobalt products. As a result of this, a considerable quantity of cobalt residue and speiss is on hand, while additional residue is accumulating from the ores that are being treated from the Coniagas mine.

The Electric Gas Bleaching Company is said to have an inexpensive process and it is this process that the company has to trade as against the supplies of raw material held by the Reduction Company. It is said that in addition to cobalt metal and oxides, caustic soda, chlorine gas, and liquid chlorine will be produced.

O'Brien Only Shipper

During the week ended June 9th, the O'Brien Mine was the only company appearing on the list as having shipped ore over the T. & N. O. Railway, this company sending out one car containing approximately 64,000 pds.

Development in South Lorrain

Good progress is being made by the Mining Corporation of Canada in the work of opening up its newly acquired properties in the South Lorrain silver area. The crosscut from the prospect shaft at a depth of 300 feet has reached the continuation of Wood's vein from the adjoining Keeley, and drifting is under way.

More importance attaches to the operation than is generally recognized. Not only does the Mining Corporation hold the Haileybury Frontier, but it has also secured the Haileybury Silver, Forneri and Crompton properties. Success in a like degree as has been met with on the Keeley Silver Mines would add largely to the chief assets of the Mining Corporation.

Keeley Production

Production of silver from the Keeley Silver Mines in South Lorrain has been averaging about 50,000 ounces monthly, and arrangements are now completed whereby it is expected the output will be increased.

The mine commenced production toward the end of the first half of 1921 and had a production record of about 313,000 ounces by the end of the year. Since the beginning of 1922, the production has averaged close to 50,000 ounces monthly and was not far under a total of 250,000 ounces for the first five months of this year, thereby establishing a record of between 550,000 and 600,000 ounces of silver during the first full year of operation. During the month of May, the mill handled an average of approximately 85 tons of ore daily, and this will be followed by a larger average during June.

By reason of the Keeley having been looked upon as a doubtful proposition, and passed up for a number of years by the experienced miners of the nearby Cobalt field, the success now being achieved by Major J. Mackintosh Bell for his Old Country principals is all the more interesting. Not only is the mine on a producing basis almost equal to the leaders in the Cobalt field, with the exception of the Nipissing, but a large ore reserve has been placed in sight. By reason of this favourable physical condition of the mine, which has been brought about by the fact that very little stoping has so far been done, it will be reasonable for the Keeley to produce on a basis at least equal to the current output of the O'Brien, Coniagas or Mining Corporation.

The shaft on the Keeley has been extended to a new deep level. It is too early to estimate the importance of the veins at this horizon, although in the limited amount of work so far done the "pre-glacial" oxidation which pointed the way to the heavy silver deposits at the preceding levels is now in evidence at the deepest level so far opened up. Lateral work is proceeding at this point and the ultimate result is a matter of great importance to the enterprise.

Castle Trethewey to make Large Shipment

Arrangements are being made at the Castle-Trethewey property to make a quite impressive shipment of high-grade ore. The consignment will probably be the largest so far sent out from that property and will be the product of several months' work.

From a vein about three inches in width, the richer parts have been hand-picked and the shipment will run high. In addition to this, a substantial quantity of medium-grade ore has been either taken out or placed in sight, pending the erection of a small mill on the property. As regards such a mill, the power situation in the Gowganda district is unsatisfactory, the only hydro-electric plant being owned and operated by the Miller Lake-O'Brien, with no more energy than is required by that company itself. This tends to surround the question of a mill on the Castle-Trethewey with uncertainty for the time being at least.

To operate with coal is very expensive, particularly at a distance of between 25 and 30 miles from the railway. Indeed the Miller Lake-O'Brien, even with electric energy, finds it necessary to treat only such ore as contains from 25 ounces of silver per ton and upwards. The solution for the power situation as it applies to the Castle-Trethewey appears to lie in the work now under way at Indian Chutes on the Montreal River where it is planned to develop about 3,000 h.p. A power line some 20 miles or more in length would convey this energy to the Gowganda district.

Regular Nipissing Dividend

The Nipissing Mining Company has declared a regular quarterly dividend of 3 p.c., payable July 20th to stockholders of record June 30th. The financial statement shows liquid assets of $4,510,129.20.

EDITORIAL

So then, in the buying of shares, as in other matters, there should be a certain limit of expenditure which miners should set themselves, lest, blinded by the desire for excessive wealth, they throw all their money away.—Georgius Agricola—1550— (from Hoover's translation.)

UNFINISHED PRODUCTS

In the metallurgical industries the term "finished product" is loosely used. We may take it to mean that, although smelter and refinery products may require further manufacture before they enter the markets of the world, they have been brought to the final stage so far as the prime producing establishments are concerned. For instance, concentrate, matte, impure bullion, or refined metal may be shipped and sold by a mining and smelting company. Only the refined metal, however, represents the "finished product".

There is something of an analogy here between the production of metals and the output of our universities. We fear that our institutions of learning are not yet giving us the properly finished articles. The substitute is often attractive, but it does not serve the purpose it is supposed to serve. It is very apt to have its value diminished by "segregations," "slag inclusions and adhesions" and so on.

To be specific, there is not much evidence that our technical graduates are better fitted today to cope with the world, the flesh, and the devil, than they were twenty years ago. Today it is as true as it was a generation ago that a fairly bright young office man, without college training, has a vastly greater chance of becoming the general manager or president of a large mining or smelting company than has the technical graduate.

In part the "segregations" and "slag adhesions" mentioned above, impede the graduate's progress. He leaves college with pre-conceived ideas that it may take years of hard knocks to correct. In the three or four years of his college course he is taught nothing at all that touches directly on the making and handling of money. Even the marketing of mineral products is totally neglected. The results speak for themselves in no uncertain way. Unemployment or constant change of employment, no hope of a competency unless he permit the promoter to misuse him, these are the guerdon of the mining engineer. And yet our colleges continue cheerily to turn loose increasing numbers of mining graduates, to wander in the parched and perilous pastures of the business world!

NEWSPAPERS AND MINING NEWS

One of the most convincing evidences of the spread of genuine education on this continent is the expanding market for good literature. "Best sellers" and "yellow" journals still seem to hold the field, as ever; but those able to speak with knowledge assure us that the appreciation of wholesome, well-written English is growing faster than our population.

The most influential of all mediums whereby the written word is presented to modern civilized man is the daily newspaper. One of the signs of the times is that there are now on this continent at least two prominent daily newspapers that have declared flatly for a high ideal, and are consistently living up to their resolve. The New York "Times" and the Chicago "Tribune" are now, in that regard, on a par with the best newspapers in Europe. That their efforts toward improvement are appreciated far and wide throughout the continent is shown by their circulation. Both papers are now widely read throughout Canada, as well as in the United States; and either can be had conveniently in London and other British centres.

One of the most obvious defects in the ordinary newspaper is its inclusion of statements that, even to the ill-informed, are incredible and ridiculous. Moreover, a large fraction of its columns appears thus to a man who is well informed. There are those among its readers, of course, whose gullibility renders them capable of believing the nonsense they read, but such ones are surely hardly worth catering to. It can be fairly stated that the average intelligent reader is sceptical of whatever modicum of truth his daily paper presents to him, on account of the obvious untruth that he discovers intermixed. The reader who discerns the improbability of a man's making his escape from an enraged panther by means of climbing a tree (as was recently reported throughout the continent) is not likely to believe the next item, which may be a perfectly true account of the wonders of the Hollinger mine or of the Trail smelter.

Mining news is particularly susceptible to false statement or to exaggeration. Certainly the public and the staff of the central news agencies are too ignorant of the elements of mining knowledge to use much discre-

mation in what they print, read, or believe. To cope with the situation, it is necessary for those newspapers that wish to rise above the ruck, to add to their staffs men with special knowledge. Even the central news agencies, such as the Canadian Associated Press, lack this simple means of ensuring that they propagate the truth throughout the land in lieu of falsehood.

It is a curious fact that in this respect many a great city daily places itself on a par with the struggling small-town paper. One may read in both, the same account of the fabulous riches in gold to be got from the bottom of the Fraser River, enough to pay off the whole debt of the Imperial Government! Surely there are among our leading Canadian newspapers one or two whose self-respect places them above complaisance when such stuff gets into their pages. We hope it is so, and that in these years following the war, when quality is commencing once more to asserts its superiority over mere quantity, mining news, along with other specialized information, may be presented in our daily press in such a way that the specialists need not smile.

MINES AND MANUFACTURERS

It has recently been announced that the Johns-Manville Company has taken over the Bennett-Martin asbestos properties in the Thetford district, Quebec. These properties consist of the long-established pit and mill at Thetford Mines, in the centre of the producing area, and the Vimy Ridge quarry and mill, recently opened up on the southwestern border of the field as well as a large area of undeveloped property.

For years past the Johns-Manville Company (one of those long-established and substantial concerns, organized and managed by family rather than corporate interests, and hence more characteristic of Britain than of this continent) has owned and operated a quarry at Asbestos, Quebec. Here there was produced only those short fibres whose chief use is in insulating coverings, or as a binder in fire-proof paper or cement products. The Vimy Ridge property produces fibres of greater length and flexibility, while the Martin-Bennett pit in Thetford produces the usual quota of "crude", as well as mill fibre. Thus the Johns-Manville Company has now provided for the independent production of all the grades of fibre it requires in its manufacturing establishments, and likewise for a sufficient annual tonnage to meet its needs.

This acquisition of the sources of its principal raw material by a company whose main concern is manufacturing and marketing, is a tendency that is becoming increasingly evident on this continent. Particularly is this so in the asbestos field of Quebec. The independent producer of raw asbestos has had rather a thin time of it during the recent industrial depression. His whole capital has been tied up in the production of raw material. During the boom, manufacturers carried an overstock of raw material, which they have since been gradually working off. Their operations were curtailed; but those of the asbestos mines providing material for these factories, had meantime ceased. On the other hand, the factories that were provided with a sure supply of asbestos from their own mines, even during boom times, did not find it expedient to carry an unusually large stock. Consequently, the recent curtailment of manufacturing activities meant for them only a corresponding reduction in mining operations.

The tendency toward the consolidation of mining and manufacturing interests is sound. A diversity of products is one of the best of assurances against the vicissitudes of trade. Few mines can provide this diversity, while it is characteristic of a manufacturing establishment. Hence we may look for the repetition, a number of times, of the move that has just taken place.

THE APPEAL OF A NEW REPUBLIC

There is now established in Washington a mission or delegation from the Far Eastern Republic, whose concern is, evidently, to promote such intercourse with the people of this continent as will be to the benefit of both, and, particularly, will result in the commercial development and consequent prosperity and stability of the new republic. A series of pamphlets, compiled under the direction of this delegation, has recently been issued. They describe the mineral resources of this trans-Pacific land.

We must confess to having been, for a time, completely mystified as to the identity of this new Republic. A map at the end of one of the pamphlets solved the riddle. The Far Eastern Republic is a fragment of the late Russian Empire, with Vladivostock as its capital. Its coastline extends northward from Vladivostock for about 1,500 miles. To the north is the Siberian territory of the Russian Soviet Republic, and to the south, Manchuria and Mongolia, in the Chinese Republic.

The mineral resources of this vast territory are evidently known only in the vaguest way. Some mining development took place under the paternal direction of the Czars, in whom the mineral rights were vested, and who exercised this right through the agency of convict labour. Of that rational and consistent development due to the exercise of individual initiative, upon which the human race's progress mainly depends, there has been little or none.

The emissaries of the new Republic now invite the cooperation of the plutocrats and technologists of the American continent in opening up their land to the influences of civilization. For the first time in history, America attracts the attention of such delegates, rather than Europe. America is not yet accustomed to the new rôle, and the response is likely to be hesitating, and somewhat awkward. But the beginning of such a movement has been made in China, where engineers of the United States are directing the initiation and operation of a number of Manchurian undertakings; and its logical growth will naturally include the territory of the Far Eastern Republic.

Canada is in a totally different case from her southern neighbor. While the world's surplus wealth is now concentrated in large degree within the borders of the United States, Canada's heritage from the war has been mainly a debt of staggering proportions. Unlike Britain, we had no reserve of accumulated wealth upon which to draw in the time of need. Our wealth is in our fields, forests and mines, and these are the banks upon which we must draw to meet our obligations. So far as our assets go, we are in much the same case as the Far Eastern Republic. We need capital to develop our natural resources. Fortunately we have the men, trained as well as unskilled, whom we can thus employ once the necessary capital is found. Thus it is more with a fellow-feeling that we Canadians look upon this appeal of the Far Eastern Republic for a share of that accumulation of wealth by means of which a rapid development of natural resources is alone possible. We trust, however, that the stability of Canada's government will provide an incentive to foreign investors more powerful than that which might attract them to the next-door neighbor of the Soviet Republic.

LABOUR, LAW AND ORDER

Murders, comparable in their bestial wantonness to the Irish assassinations, have occurred in the coal fields of southern Illinois. These are not the first that have been committed during the continuance of the present wide-spread strike, nor are they the last that will be perpetrated. The agitators who precipitated the strike can no more escape the awful onus of blood-guilt, than can the deposed Kaiser and his advisers. The labour-union leaders must have known all too well, what it means to throw more than half a million men out of employment. No strike of this kind in the United States has ever been unaccompanied by bloodshed.

The peculiarly atrocious character of the Illinois murders, as reported in the daily press, is appalling. That, in this country and in a Christian country, men can fall so desperately low, is a grave indictment of the whole body politic.

Canadians, keeping in mind the all too recent incidents of the Winnipeg *émeute*, cannot lift up their hands in holy horror.

The world should be told the unvarnished truth about the labour agitator.

EDITORIAL NOTES

The mining fraternity will welcome the announcement of Hon. Charles Stewart, Minister of Mines at Ottawa, that active measures have been taken to foster an overseas export trade in Canadian mineral products. By this means, more than by any other, will Canada's burden of debt be reduced and eventually removed, and our country enjoy the smiling prosperity that is our natural inheritance. In Dr. Charles Camsell, Deputy Minister of Mines, Canada has an emissary not only eminently qualified by his personal attributes to represent our country, but personally conversant to an unusual degree with the mineral resources that will be discussed. His eminence in geology is marked by the bestowal upon him this year of the Murchison grant.

The Imperial Mineral Resources Bureau, which is coming more and more before the public notice, is an institution the importance of which to Canada is as yet not at all fully realized. It has been formed for the purpose of developing a self-sufficient inter-Imperial mineral trade, and its express intention is to have this development done, as far as possible, by means of British capital. Though the war made tremendous inroads upon the accumulated wealth of the motherland, still there is ample remaining for the purpose contemplated, provided it is applied judiciously. We look forward with interest to the reports of Dr. W. G. Miller on his return from the Bureau's latest conference.

We learn that Eastern Canadian mining capitalists have taken over the well-known Engineer Mine in Northern British Columbia, now happily clear of the courts and subject to active operation once more. It is satisfactory to note that Canadian capital is to be thus identified with the mineral development of the Pacific province—a field left largely to American capital of late. The Engineer Mine has produced some phenomenally rich ore, but its continuity and average grade have still to be proved.

PROMOTERS

Pray tell me briefly, if I may
Be so bold as to ask,
If ever for a month or day
Promoting's been your task

Promoters come, promoters go,
But mostly, soon or late,
They leave a load of waste and woe,
A heritage of hate.

And yet, and yet, they're not to blame
A wee bit more than those
Who take a chance, and are not game
To stand the chance they chose.

The moral's obviously seen:—
Promoters will exist
Until promotees grow less green,
So why complain— oh! whisht!

ANON

A Budget from New York

By KIRBY THOMAS

An Early Canadian Record

In the miscellaneous papers in the mining alcoves of the New York Public Library is an interesting early-day record relating to a Canadian operation which after several business vicissitudes is again receiving serious attention — namely, the unique gold placer gravels in the vicinity of Beauceville, Quebec. The author of the prospectus of the "De Lery Gold Mining Company", issued in 1866, was either an amateur or was over-conscientious. The opening paragraphs of this appeal set forth that "The business of mining the precious metals is confessedly one of great risks. All prudent men regard its allurements with suspicion. None but the bold will fearlessly venture money in a direct search for gold and silver. The history of Mexico and the Pacific Coast furnishes abundant proof that these apprehensions are well founded." After the alarums the writer proceeds to offer the "guaranteed stock" of the company, "capital $1,000,000, guaranteed stock, $500,000. It would be interesting to know how the stock was "guaranteed", but this information was not vouchsafed. The company was formed to operate the gold placers in the Seigneury Pigand Vaudreuil, on the Chaudiere river, in Quebec. It is blandly asserted that "merely initial exploration has revealed some forty miles of gold-bearing quartz ledges". Surely this fact should have been sufficient without the "guarantee". The company's office was at 72 Cedar Street, New York.

Sources and Uses of Feldspar

The resumption of activities in the American plants engaged in the production of clay products in the form of pottery, crockery, sanitary enamel-ware and surfaced tile for building, has led to increased demand for feldspar, which is used as a flux in the glaze. This increased demand is being supplied in large part from Ontario and Quebec, where a number of old mines have been re-opened and new ones developed recently. The Canadian product, which is imported without duty, is in competition with the domestic supply, which now comes largely from the southern Appalachian region. The chief consuming centres for the product are in the Ohio valley district, and therefore the imported feldspar has about an even break as to freight rates with the domestic product. Many of the Canadian properties are American owned and operated.

There is increased activity in the demand and development for feldspar properties in the South, particularly in the Carolina region accessible to cheap railroad transport to northern points. A part of the supply for eastern plants comes from New York state and Maine. The quoted prices of crude feldspar range from $8 to $18 per gross ton at points of production f. o. b., depending upon the grade and quality, particularly the potash content of the product. Most of the Canadian product is imported crude, but the domestic production is quite largely ground at the mines and brings a correspondingly higher price.

The attempts to utilize feldspar as a source of potash which were made during the war when potash was at a high price, owing to the exclusion of the German supply, have quite generally been abandoned, having been a failure from a commercial standpoint. This has left the chief market for feldspar, as before the war, in the field of accessories to the varied clay operations, and as flux. Some feldspar is used in glass making. There are no imports of this material regularly from other countries than Canada.

Migrant Diamonds from Canada

Many years ago, a small boy, playing in a newly dug gravel pit on the edge of a village in southern Wisconsin, gathered, as boys will, a big pocketful of bright and colored pebbles. One of these, more transparent than the others, his mother jokingly told him was a diamond. Taking her at her word, the boy went straight to the village jeweller, a former gem cutter in Holland, who told him that he had found a real diamond and that it was worth $600. Since this incident, many boys and some few men have searched the gravel banks and beds, which are spread over a wide area south and west of Lake Michigan like a rumpled blanket. As a result, more than eighty diamonds have been found, some of them worth several hundred dollars apiece. For the most part they are small, but of a pure quality.

An inquisitive professor in the University of Wisconsin several years ago undertook an investigation concerning these diamonds. After a time he came to the disappointing, though interesting conclusion that these widely scattered gem stones were not native to the Lake Michigan locality but had been brought there by the glaciers, which had moved rough-shod from the northeast many thousands of years ago, bringing a great burden of smooth and worn boulders, of rounded pebbles, and of sand. He suggested that the diamonds had been torn from some natural deposit, perhaps in distant Labrador, by the lobe of the great glacier sheet, which had extended into the Lake Michigan locality where the diamonds were found. Recently, the Canadian geologists have found some real, but very small diamonds, in a solid rock formation near the gold camp of Porcupine in northern Ontario. This formation is in the path of the Lake Michigan glacial lobe and it may have been the source of the diamonds found far distant from it in the Michigan gravels.

The National Research Council, Washington, has rendered yet another service to the technical public. It has just published a new edition of its pamphlet, "American Research Chemicals", in which are given thirty pages of chemicals used in laboratories, particularly research laboratories, and a list of eighty manufacturers in the United States from whom various specified chemicals can be obtained. As a large fraction of Canada's supply of pure chemicals comes from the United States, this bulletin (No. 35, May, 1922) will interest many researchers and laboratory workers here.

A Mining Man of Two and a Half Centuries Ago.

III. THE GLOSSARY.

To elucidate the difficult phrases and passages in Erckern, Sir John Pettus compiled a glossary, or as he elegantly terms it: "*Essays in Metallick Words, as a Dictionary to many pleasing Discourses.*"

Before plunging *in medias res*, Sir John apologizes to the reader for sundry sins of omission and of commission committed by his printer: "The Reader is desired to amend or connive at the Omissions of the *folios* of the first 80 pages... want of *points*, or *vowels*, or *consonants*, or misplacing of Capital Words, wherein I hope the *Reader* will pardon the *Printer*, considering my circumstances." Indeed it would be churlish not to forgive the good knight. He was behind prison bars.

The glossary opens with a short exposition of the word "alchimie." Pettus remarks that sometimes the word is "writ *Orchimia*, which may well have relation to our word Ore or Oar." A shocking bad guess, Sir John! "The Lord Verulam tells us" continues our precious author, "'Tis an Art of Distilling or Drawing Quintessences out of Metals by Fire, setting at liberty such Bodies of Metals as are bound and imprisoned, and bringing to perfection such as are unripe... Fire, in this Definition, seems only to relate to Culinary Fires: But I apprehend this Art looks higher, even to the use of Celestial Fires; from the Sun and Stars, and their influential Heats." Here we have, in tabloid form, the *credo* of the mediaeval scientist.

In proceeding to tell what are the functions of the Alchimist or Chimist, or Assayer or Extracter of Quintessences, Pettus draws up for us a scheme, or flow-sheet, of a mining and metallurgical establishment of his time. First comes the miner, "he that finds out and digs (or causes to be dig'd) the Metallick Oar out of such mines. The second is the Washer, or he that washeth the Oars from their useless Excrements or adherences. The third is the Stamper, that knows how to beat or stamp them by mills or otherwise into such particles as that they may be fitted for smelting Ovens (which are the great melting Works, but called Smelting for distinction from the lesser.) The fourth is the Smelter of the great Quantities in those great Ovens or Furnaces. The Fifth is the finer that smelts them over again, and separates the metals in the great Works. The sixth is the Refiner, that melts them again, so often as he thinks fit... to their several perfections and intireness. The seventh is the Prover or Assayer, who by Tests, Crucibles, Weights and other Experiments is able to judge by all Oars, either as they come from their Veins or made into melted, fined or refined Metals." This leads Pettus into a recondite dissertation upon the origin of Lazarus Erckern's name, in which he quite loses sight of the matter in hand. However, he adverts to his theme before he finishes and delivers a shrewd buffet to such "Alchimists" (not *bona fide* "Chimists") as believed in the transmutation of metals. "By wofnl Experience of some mens credulity, instead of turning everything into Gold, they have turned all their Gold into nothing."

Here are two definitions of laboratory staples: "Aqua fortis... is a composition of Nitre and Vitriol, etc., and this liquor is used for dissolving and separating Gold and Silver, and hath many other excellent properties."

"Aqua regis is a water made of Aqua fort, and other compositions" [a little hazy, this!] "... it will touch only gold and not silver."

The current knowledge of metals other than gold and silver, is well indicated by the following:—

"Antimony, Speiz and Speiz-glass, is also called by some Mineralists Red Lion, Wolf, and Proteus... It is a heavy, bright Oar, like Lead, but more Speizy, and porous... and the extracts made out of it are of singular Virtues, of which his late Highness Prince Ruperts red drops were chimically made, and given with good success for most Diseases."

The efficacy of bacon derived from a boar as compared with that derived from a sow, in improving gold, is very solemnly debated. Pettus favours the boar, "because" says he "I know it is as effectual in curing of wounds at distance, as the so admired... Weaponsalve; and since it hath such a kindness to metals" he knows not why it should not be used instead of imported articles.

The description of the assayer's balance is a masterpiece of evasion. "The ballance" has "two little Vessels to contain the things to be tried"... "and the tongue of this Ballance... by standing in an equipoisure or not, doth as it were speak or tell you the difference or certainty of the Weights." "The tongue is called *trutina* and from this we borrow the word Truth" [which we don't].

All of us remember the word "blick", describing the play of iridescence over the silver assay bead. Pettus renders it "Blink" and says that "it is commonly used to describe those that are blear Ey'd, or often twinkle with their Eyes; it is also applied to dead and sharp Beer... but in our Author only applyed to bright Oars, or melted Metals".

The vulgar error of confounding brass and copper is corrected at great length. Pettus feels safer on this ground. But he is at his best when a moral of any kind can be extracted. In discussing "calcination" he remarks that "metals seem to be dead in their Oars, but by this calcination revived, to hint to us the advantages of our Resurrection, by the general Conflagration".

Quartz crystals are thus touched on: "Christal...is the purest Earth dissolved by water, and for want of Water, congeal'd to the Christal-Stone."

Chemistry is rightfully placed upon a lofty pedestal "In the best and truest Sence, by the addition of Al l., [to the word "chimistry," thus getting "alchimistry"], we are to understand, That Chymistry doth comprehend All Sciences and Mechanical Arts and Trades, even from the Coblers Awl to the Astronomers Astrolabe, for nothing can be performed without some Metallick Instrument."

"Declination", we learn, "is almost the same with Precipitation... and in a Vulgar sence, a man is said to decline in his Fortune, when he falls from Prosperity to Adversity but in the Metallick sence, it is to fall from the top to the bottom, by which means the Metal is better than when it was at the top; and 'tis often seen that adversity, makes Men better and of more use (as Metals are) by being Cast down." Having read this definition we were curious to discover what Pettus would write of "precipitation". This is what we found: "The general way [of the precipitation] of Metals is first to dissolve them in Aqua Fort, or Aqua Regis, or Spirit of Nitre, or Vitriol, and then they may be precipitated with Sea water and Alcalious Lixiviums". By the last is meant alkaline solutions.

Pettus is an inveterate moralizer. "Dissolving, that is, a metal easy to be loosed from such other metals as are fixt or intermixed, and thence Death is called a Dissolu

tion, when the Soul is loosened from its Terrestral part, and becomes a Coelestial Metal."

"Flame" is the "Oyly part of Wood, or combustibles, impregnated by fire, for the more easy passing it self into all the porous parts of Metals."

Because "Norfolk Flints are full of Ignitous matter", Pettus hints that some wealthy persons should try them for metals, "and then the great Labour and Expence of digging in Mines might be saved." Quite as rational this is, as many a project financed today.

For descriptions of several important implements we are referred to "Utensils." But here, on finding the reference, Pettus calmly refers us back to the text of Erekern, where we can get little satisfaction.

As quicksilver is called "Mater," the mother of metals, so gold is called "Pater Metallorum." "Therefore there may be some Dispensation for a filial Love to the nobler Part of our Mother Earth, especially if it be without idolatrous and covetous Applications." From this observation, Pettus is led by perceptible steps to discuss the locus of Eden and to affirm that Adam must have had a knowledge of assaying, for the simple reason that otherwise he could not have got any gold.

A good touch occurs in the definition of "Graduation", which "in its Metallick sense is applied to the melioration of Metals, by certain degrees... and the Word is also applyed to Gradnates in the Universities, who by degrees are sensibly Refined by the Literal Arts and Sciences."

Lead is described as governing "Gold and other Metals in their Precipitations." It is noted (and this is historically interesting) that "of late, it is curiously formed into cases of Deal or Cedar, and so sold as Dry Pencils, something more useful than Pen and Ink."

A very diffuse essay on the "Load-Stone" contains not a little sound thought in it. We have space for only one or two extracts. Pettus expresses the belief "that there is an Astral Influence that darts it self through the Globe of the Earth from North to South (and is as the Axel-Tree to the Wheel, and so called the Axis of the World)." He reached this conclusion from observing demonstrations conducted by Sir William Persal who had devised a globular "load-stone" fashioning in the shape of the earth. However, Pettus allows his enthusiasm to carry him a bit too far when he ascribes to a "Knife touch'd to a Load-Stone" the power of entering any part of a man's body without causing pain.

We must pass over a long, but by no means tedious dissertation on mines, noticing only the concluding sentence. Pettus is at a loss to know why the Government did not avail itself of the revenue to be derived from mining. "The Duke of Saxony's Mines (the Territory not so big as England) yields him about £130,000 yearly; now why ours are not made so beneficial to us: I attribute it either to Reasons of State, or want of Knowing the several Arts which belong to the Working of them." It is appropriate to wonder how good Pettus would diagnose the attitude of our own Government.

Under the heading of "Money", a story is told that goes to show that differences in exchange were expertly traded on, even in those days. "It is good for a Traveller to be skillful in the different allays, [alloys], whereby, as a Friend of mine told me, That he had carried out an £100 with him, and with his art of Exchanges, in Country where allays differ'd, he bore his charges of Travel, and brought his stock home again." In other words, the friend manipulated matters so that he came home, after a costly trip through Europe, with as much money as he had when he set out.

Pettus cannot resist the temptation to digress when alphabetical progression brings him to the word "Needle". St. Matthew is quoted, of necessity. "It is easier for a camel," and so on. A couplet from an ancient translation of psalm 45 is thrown in for good measure:—

"Shee shall unto the King be brought,
"In Robe with Phrygean Needle wrought."

All of which, along with much more, lead up to a few sentences about the magnetic needle and the "touch-needle."

Of "Paper", Pettus sapiently remarks that "the Ten Commands were writ upon stone: but for more essay Portage, and transmitting the minds of men one to another, Paper was invented in Egypt from the Bark of a Plant."

A "little Oven of Potters-Clay" was called a "pellican... in allusion to the Bird called a Pelican, which hath a bended Bill, by which when her young ones are poisoned with eating Serpents, she picks an hole in her Brest, and gives her Blood to them, which cures them; and so this Instrument" [the Pellican] "doth as it were suck the blood or spirits out of several Ingredients of which the Aqua Fortis and Aqua Regis are made, and by those waters both Gold and Silver are cured of their poisonous natures." A trifle strained, friend Pettus, a trifle strained!

Stalactites and petrified wood puzzle Pettus very much indeed. Petrefaction he attributes to the action of "volatile lapidinous water," an approximation to the truth.

"Pulverizing" leads Pettus far, far afield into an eloquent discourse on the resurrection, which, in turn, gives him a chance to refer to two discoveries of his, one a cheap powder for firing salutes, the other a preservation powder for pickling meat. Not content with this, he goes on to mention "Powder of Dulcification," or sachet powder, and quotes the poet Herbert:—

"When Hair smells sweet through Pride or Lust,
"The Powder hath forgot the Dust."

We invite our readers to search out the meaning of these lines.

Quicksilver affords another opportunity for a theological and astronomical digression. *Regulus* gives him a chance to work in a trifle of entomology, thus:—Regulus he takes to mean a small king, a king that gives soul and temper to the metals, that they may be of benefit to mankind. Similarly, (though obscurely), the letters of the alphabet are orderly servants of man. So, also "the Bees have a King, and by their obedience to him they enjoy the fruits of their Labours, and take pleasure in returning each to its own Cell, or House, which is guarded with Waxen walls, and filled with Honey... whilst the stubborn, refractory, or lazy Droans are thrown out of their Hives, Houses and Homes." This is not metallurgy, but no forgiveness is required.

The only property of steel specifically mentioned is that if it be "once imbrewed in Men's Blood, it is given ever after to rust and canker."

Towards the last, Pettus has evidently scamped his work. His definitions become more and more meaningless. The definition of yeast, spelled "yest", is, however, worth while. "Yest is... more properly to be attributed to Gold himself, for communicating so great a Secret for the Benefit of Mankind."

* * *

Pettus' attitude towards science was receptive. He was devout, after the manner of the times, but he cringed to the Almighty in much the same way as he cringed to the King.

His Glossary is a vividly human document. From it can be had a fairly adequate conception of how men thought

A Coal Miner's Ears

HEARING THE MOST IMPORTANT SENSE UNDERGROUND

By JOHN MOFFATT

It is not generally realized how much a coal miner depends upon the sense of hearing for his safety and the success of his work while he is in the mine. Even the miner himself does not take the trouble to sit down and think it out, even if the point has come to his notice. But from the moment he leaves the surface through the mine shaft, until he reaches it again, his ears have been of invaluable service to him. There are few deaf working miners, for no man knows better than the miner how much his life depends upon acute hearing. Examination by eyesight plays a comparatively small part in the every-day working life of the men who toil in the coal mine.

Danger Signals

It becomes second nature to the miner, the instant he steps on the cage to descend into the mine, to listen intently. His ear notes every noise, however slight. He knows that overhead is the roof-rock, and with the continuous advancing of the mine the overhead pressure and the influence of the mine atmosphere, this roof is apt to loosen and fall. In the process of loosening, small particles of rock are thrown down, which indicates to a trained ear the condition of that particular place. Even where supported by timber, the first indication of any rock movement above or on the overhanging sides are slight noises or little pieces of dropping rock.

No miner while travelling will pass on after hearing these danger signals without first stopping and listening, after which he will make close examination. To go on would in many cases mean sure death; and if the sounds were directly overhead, to stand still would be dangerous. Usually, however, when travelling, the acute ears of the miner detect all such warnings, and instinctively he knows and does the right thing. Standing almost breathlessly, he notes the movement of the roof rock. He can tell if a great quantity of loose material is forcing its way down or if the amount of falling is small, and he usually knows what length of time such falls will consume.

The Horse's Instinct

Even the pit horse that has been underground for many years understands the meaning of the noises that he hears around him, and the dangers of falling rock. With their quick ears, horses can hear the earth movements far up in the rock beds, and they cannot be induced to pass through dangerous zones when these movements are very active. Most miners have watched the nervous restlessness of the horse at such times. His deep snorting tells of great terror, and if he is confined and cannot rush away from the place he knows is dangerous, his whole body quivers and he cowers as if under some great load.

Sounds at the Face

But is it at the working faces that the real dangers of a coal mine lurk and are to be found. Here new extensions and openings are being made every day and new conditions encountered. Here the miner is on guard for every sound, and his ears keep flashing their signals to the brain all day long. The trained judgment interprets the meaning of every separate sound and determines the closeness as well as the amount of danger indicated.

A large block of coal is being undercut. The miner has to work away under this block, and while he is digging with might and main his ears are set. A slight cracking noise occurs overhead and he must immediately decide whether this is due to some unforseen cause of danger or is the result of the work he is doing. A wrong decision may have serious results, while undue haste to examine the cause of every crackling sound might develop nervousness, lead to a loss of time, and make him the butt of more experienced men.

Or he has blasted down a large block of coal and laid bare new rock, the condition of which is determined by sound. He strikes it with a pick; a solid sound denotes firmness and therefore safety, but a hollow sound tells of danger. Indeed the first thing the miner did when he entered his place of work in the morning was to take a pick and sound all overhead rock to ascertain its condition. During the day and after each shot is fired this work is repeated, for displacement of coal all over the mine means further movement of the overhead strata, and consequently greater pressure exerted over the area that is being advanced. Sometimes in his haste he neglects to sound the roof above him. A small piece of rock falls and he is at once alert. An examination is made and he probably finds enough loose rock overhanging to bury both himself and his "buddie," for coal miners, by law, must not work alone. This he pulls down. Sometimes with all his training and experience he is deceived by sound. It often happens that rock roof contains what are designated by miners as "pots." They resemble "pots" in size and shape and are very smooth, but in reality they take more the form of a cone, being heavier at the bottom than at the top. Herein lies the danger, for suddenly and without warning these "pots" drop, with injury or death for anyone underneath. There are many kinds of these "pots," but from their shape and their smoothness they are all equally dangerous.

Drawing the Pillars

The drawing of pillars requires, in many collieries, miners of great experience. Here the last supports of the earth above are removed. It is dangerous work, and the sense of hearing and sound judgment are called into play as in few other callings. A large part of the pillars have been taken out and the roof rock gradually becomes heavy. The wooden props placed for safety begin to grind under the weight. All day long this low grinding noise is heard. Sometimes a timber cracks like a pistol. The whole earth above seems to be settling. Coal is being crushed and falling from the pillar in large quantities, while the rock above is sagging as if under terrible stress. Flat pieces of rock are dropping. Everything around and above is portentious of some great earth movement. Even the atmosphere is tense with coming catastrophe. This is the miner's harvest, for coal is freely tumbling down and he knows

---

and wrought before the re-birth of the sciences on which our civilization is founded.

"To conclude, I have writ some things from Authentick Authors and some from my own Conceptions and Observations; now as they pleased me in writing, so I hope they will not displease others in reading."

CAPRICORN

that if it is not quickly loaded away it will soon be buried beneath hundreds of tons of rock. He is now working fast and at high pressure. All inside rails, all tools and everything useful has been removed to a safe distance. The danger increases; the rending and rumbling of breaking rocks is heard far back in the exhausted workings.

Timbers are now snapping, still he works on and listens quietly. Few words are spoken, for danger and death are all around. Experience has taught him that the break will occur far enough back in the gob to give him time to get out, and so he works rapidly to load out the last possible pound of coal. At last it comes and great masses of rock fall with a crashing noise like thunder and a great blast laden with rock-and-dust rushes through that section of the mine, throwing open the trap doors, half blinding the uninitiated and almost knocking down the workmen who have run away to places of safety. But it is all over just as suddenly, and in a few moments workmen walk quietly back to examine the extent and nature of the break and to begin to remove the remaining foundations of the earth until once more another part of it falls with a dreadful roar in angry protest against the rude disturbance by the creature, Man.

ACTIVITIES IN THE CARIBOO

(From a Quesnel, B. C. Correspondent)

Gold mining, the Cariboo's basic industry, is showing signs of asserting its pre-eminence to perhaps a greater degree this year than at any time in the past. The district is receiving the "once over" by a large number of mining men, particularly Americans, who already have a number of scouts in the field.

Among those investigating Cariboo properties is Mr. C. F. Law, who recently arrived with an engineer from New York to develop gold quartz on the old Pinkerton properties on Lowther Creek, as well as other quartz claims on Red Gulch near Mosquito Creek. It is Mr Law's intention to investigate a number of quartz and placer claims throughout the district.

Mr. Joe Errington, representing the McIntyre Mine, Porcupine, is expected to arrive in the Barkerville district about July 1st., to investigate the Proser Pine quartz properties.

Mr. Crow Sowards, who is installing a dredge on Quesnel Lake at the mouth of Cedar Creek, has been examining Barkerville quartz properties and is trying to secure an option on the old Black Jack mine situated on the Williams Creek slope of Proser Pine Mountain. In the early days a one-stamp mill operated on the Black Jack claim, and the several hundred tons milled is said to have been the highest in grade found in the old days.

Mr. L. D. Bonner has spent the past winter drilling to prove up an old channel of Lightning Creek, near Lajoutane. According to drill tests, he has proved a channel paralleling the rich old channel, but considerably deeper. Mr. Bonner is highly elated over the proof of his theory that there was another channel. He expects to operate his property later in the season.

The Hopp properties are operating full-blast. Owing to the extremely warm weather, a short hydraulic season is predicted, unless there is an abundance of rain.

Mr. James Harrison has secured an option on ten leases on Cunningham Pass for $100,000. Mr. Harrison intends testing the placer ground for dredging and expects to have a Keystone drill operating some time in July. He represents an American syndicate.

On Antler Creek, Mr. C. W. Moore, who is handling American capital, has staked a large number of dredging leases. Some of these leases have already been drilled, and have yielded a yardage value of 65 cents per yard. Mr. Moore states that his principals are preparing to instal a dredge.

On Cottonwood and Drift rivers Mr. Dunlop, representing an American dredging company, has secured options on a large number of leases. He has had a drill working on these for some time, and, it is understood, he is getting very satisfactory results. His leases adjoin those of Mr. H. C. Foster, who is drilling the Jim Harrison leases above.

The Pilling property, on the lower Cottonwood, is being drilled by Messrs, Lafferty and Darby, from California.

According to reliable information, Col. C. J. S. Baker, who is at present in England, is expected to reurn to Barkerville shortly, and intends to ereet a stamp-mill somewhere on Williams Creek. Col. Baker owns a group of claims on Proser Pine Mountain, and intends to convey the ore to the mill in a chute by gravity. He is a pioneer in the district, where he has spent the greater part of his life testing properties and conducting researches.

Mr. Clarence Fuller and his partners have bonded their quartz properties on Burns Mountain to mining men from Spokane.

A large number of properties are being opened up in the Kerthley Creek district.

Tertiary Mine, situated near Cottonwood Canyon, has been re-opened after a number of years of idleness, under the management of Mr. D. D. Fraser, who has 20 men employed and is milling approximately 75 tons per day. The material is conglomerate, requiring crushing. Mr. Fraser states that results are very satisfactory.

Mr. S. J. Marsh, who has been in the United States during the winter arranging for funds, is expected back in Quesnel shortly. He intends to instal a dredge on his placer properties on Quesnel River, as well as to ereet a mill near Quesnel to separate gold and platinum values from the black sand concentrate. He has been carrying on experimental work in Quesnel for a number of years.

There is a large dredging area on Quesnel River owned by the Pat Burn interests. Mr. A. D. Whittier, representing these interests, has engaged Mr. James W. Neil of San Franciso to report on this property.

Book Reviews

COAL SAVING BY MODERN METHODS OF STEAM GENERATION—by David Brownlie, B. Sc. (Lond.) F. C. S. etc.—Price 2s. 6d. Obtainable from D. Brownlie, 4. Grangethrope Drive, Burnage, Manchester England.

That reviewer is lucky whose task is the appreciation of books that are the fruitage of intelligent effort, well applied and clearly described. The present reviewer places Mr. Brownlie's modest brochure in this category.

Mr. Brownlie's thesis is that "the average net working efficiency of the boiler plants of the dyeing and allied industries is only about 61.5 per cent., and that by..... reorganization ..... on modern scientific lines it is possible to run on a net working efficiency of, say, 75 per cent. with a consequent saving of about 18 per cent. in the coal bill. That is to say, there is far more money to be saved in the boiler-house than in any other portion of the works."

In Mr. Brownlie's opinion this sad lack of economy is in great part due to the fact that the engineer does not regard the boiler-house as within his sphere, nor does the chemist.

In the branch of Industry here referred to the use of coal is not confined to generating power. In fact, between 20 per cent. and 40 per cent. only is thus consumed. The remainder is used for heating and general technical purposes.

The exhaustive series of tests carried out by the author were conducted at 65 plants, large and small. The greatest care was taken to see that every test was made under conditions exactly corresponding to those obtaining during the average working day. Adequate precautions were taken to ensue the accuracy of results. Two detailed tests, one of one day, and one of a week's duration were made at each plant. The fuel used was sampled each hour and each half hour, thus providing continuous checking. As for analysis, the heating value was determined by the Mahler-Donkin oxygen-bomb calorimeter. Ash determinations were arrived at by complete combustion in a muffle furance, thus providing an exact datum point. For the measurement of water evaporated, a pressure type of hot-water meter was used in most cases, working between the boiler feed pump and the economisers.

Feed-waters were sampled every half hour and analyzed by the Wanklyn soap-test method before and after boiling. The temperature of feed-water, draught measurement, temperature of flue gases, carbon dioxide in flue gases, steam pressure, and so on, were matters of constant recod.

Analysis of tabulated results shows that 31 of the 65 plants had a working efficiency of less than 60 per cent., only five plants exceeded 70 per cent., and 6 plants did not reach 50 per cent. Obviously investigation was needed.

It is not practicable, within the limits of this review, to discuss Mr. Brownlie's work in detail. It is sufficient to say that there is every evidence of thoroughness and capacity. It is his deliberate conviction that by raising the efficiency of boiler plants to from 70 to 75 per cent. (an ideal readily attainable), 15 to 20 per cent. of the 75 to 100 million tons of coal burned yearly in Great Britain can be saved.

The author's practical suggestions are to the point. We suggest to all of our readers who are interested in steam power plants, the desirabilty of reading and digesting the pamphlet.

THE COLLIERY FIREMAN'S POCKET BOOK—by Thomas Bryson, A. R. T. C., M. I. Min. E. Second Edition, price, 5 shillings; postage, 6d. Published by Thomas Wall & Sons, Limited, "The Science and Art of Mining" Office, Wigan, Eng.

The duties of a colliery "fireman" are not what the name signifies ordinarily. In colliery parlance the fireman is employed to inspect the mine for the presence of noxious gases. His duties comprise examining and reporting upon the ventilation of the mine, the condition of roof and sides, and in general looking after the safety of those employed in the mine. His responsibility, therefore, is by no means light. He must be quick of hearing and sight, and fully alive to the necessity of being always on the *qui vive*.

Mr. Bryson's *Pocket Book* epitomizes very handily the theory and practice that the colliery "fireman" should have at his fingers' ends. Only the simplest of working formulae are used in the course of 19 instructive chapters. The chapters on ventilation and haulage are particularly lucid.

The object of the book is to transmit to the reader a sound grasp of elementary principles, along with sufficient practical details to enable him to understand the application of these principles. Mr. Bryson has achieved that object with commendable clarity.

The British Government, on the recommendation of the Trade Facilities Committee, has advanced the South Crosby Mine, Cornwall, the sum of £30,000. The money is to be used in preparing for further development and for the production of tin ore in larger quantities than in the past.

The imports of iron ore through the port of Middlesborough during April aggregated 108,887 tons. This is the largest amount on record for the last [illegible] months.

According to figures and statements published in the Australian Metal Exchange, through the production of pig iron grew from 209,253 tons in 1918, [illegible] in 1921, overseas competition [illegible]. Labour troubles have brought what promised to be a thriving industry to a practical standstill. The effects of labour troubles are even more vividly exhibited in the silver, lead and copper industries. Whereas the lead output for the year 1918 alone was 9,756,[illegible] for the three years 1919-20-21 it amounted to only 11,553,051 ounces. The copper [illegible] bad, but lead is in a much worse position.

The Lung Yen Mining Company, operating [illegible] deposits in the region [illegible], has completed the erection of a modern [illegible] which will have a capacity of 250 tons of [illegible] per day. Nearly all the equipment was purchased in the United States. The Chinese engineers who [illegible] mining in the United States are in charge of the plant. Penn and Marshall, New York, are [illegible] to the company.

News and Comments

BY ALEXANDER GRAY

Hollinger Interests Far Afield

While President Noah A. Timmins and General Manager A. F. Brigham of the Hollinger are at the Elbow Lake, Manitoba properties under option to individual Hollinger directors, the same interests have a party making a preliminary examination of the Engineer Mine, situated in the Atlin district of British Columbia, just this side of the Yukon. Results of the sampling of the Murray ground at Elbow Lake have been disappointing, but the district may yet make good. The prospecting has been thorough and it will be interesting to have such facts as those concerned may care to impart. Already various companies have been capitalized and are in the market with market with shares. Elbow Lake is acclaimed as giving "every promise of becoming one of the richest gold fields so far discovered", positively "amazing" in its riches. Mr. Timmins no doubt will have something to say — when he can say it, and knows it. To have another gold occurrence comparable with those of Northern Ontario would be a welcome development. "Unbelievable riches", "unprecedented showings", are delightfully adjectival, and we earnestly hope it will come true. Meanwhile Alphonse Pare is at the Engineer Mine, not far from White Pass, of which his father Dr. Pare, knew something in those exciting days. It is understood an option on the Engineer is held, subject to the termination of litigation since the tragic death of Capt. Alexander. Title is clarified by the decision of the courts.

Why Ontario-Kirkland Mill?

A flagrant departure from sanity was the construction of the Ontario-Kirland mill. The milling grade on 5,300 tons shows a recovery of $2.83 per ton. Who did it? Kirkland Lake mineowners are not speaking kindly of a venture that should not have been attempted. They had enough of misadventure with two other Kirkland Lake companies, now redeemed from mismanagement. What Forbes has accomplished at the Teck-Hughes and Thomas and Goodchild at the Tough-Oakes, may be repeated by Young at the Montreal-Ontario Kirkland, as the merger is styled; and yet that mill is a monument to somebody's silliness.

Dome Mines Developments

Directors of Dome Mines are so reassured that they have doubled the dividend. Their milling grade of $11.11 , even though costs are high, is making satisfactory profit and there is $2,000,000 cash in the treasury, it is said. Of the costs, a third is chargeable to development, and that development is more than compensatory. A 7th. level section is ready to shoot, and then it is expected to have about 500,000 tons of broken ore in reserve, with only a loading, tramming and hoisting charge to apply against it in the underground cost. Now if those fortuitous lenses will only repeat their performances (and there are more of them) with Dome Extension and, perhaps, the Foley-O'Brien doing something, Dome Mines shareholders will have nothing to complain of.

"Promising Gold Find" . .

Cables to the Toronto GLOBE describe " a promising gold find" near Canbelego, New South Wales, a mile and a half from the railway, as having "nine separate reefs, each a mile long", some of the ore "yielding thirty to forty ounces to the ton," the average being "twelve ounces" — the whole thing outrivaling anything ever seen. Where the emu grazed, sourdoughs are planting their pegs. Excitement is intense. Ballarat, Bendigo, Koolgardie and Kalgoorlie being somewhat out of date, the hardy annuals who used to "carry the swag" (which is another form of "packing" your own worldly belongings) are digging in for all they are worth. To have twelve-ounce rock by the nine miles puts other recent finds in eclipse. New South Wales climatically and geographically is admirably suited for such a development — if the labor unions do not confiscate proprietary rights. Without the Ballarat and Bendigo gold rushes, Victoria would have had more kangaroos for a longer time. When my old partner, "Tom" Cue discovered the Murchison county in West Australia, he did some map-making. Mt. Morgan, in Queensland and Broken Hill, in South Australia, each served to keep alive mining in Australia. Now it is just possible, when that country is in need of gold, New South Wales may supply the element necessary. But no one hereabouts has ever seen anything so near the miner's ideal as the "find" the Globe announces.

Incoherent Legislation

Along comes Thomas A. Edison, at the instigation of Henry Ford, with a panacea for agricultural producers. Perhaps Mr. Ford put one over on the Menlo Park wizard, or the suggestions may be the sequel to their alarum lest synthetic gold upset the apple-cart (or the beanery). At any rate, Mr. Edison proposes a Central Farm Bank that will loan money without interest to the extent of 50 per cent. of the value of crops, based upon twenty or twenty-five years' average prices of agricultural products. All the borrowers would be required to do would be to pay the overhead for a chain of government warehouses in which the crops are to be held as security against loans.

Mr. Edison also would make loans upon bituminous coal, (why not anthracite?) and would provide storage facilities, thereby insuring regular production and more scientific distribution. The latter arrangement, in the Edison reckoning, would give the coal miner steadier employment and would permit of the lowering of wage schedules. Unfortunately, though, there are others who would not object to a share of these benefactions. Altruism of this variety and as outlined, to be satisfactory to all, would have to include manufacturing establishments, trades, and other miners. A few months ago, there was strenuous objection to bonusing gold producers, who sought less than silver producers are getting under the Pittman silver purchase act. The purport of the outcry against the McFadden Bill was that it was an obnoxious specific, a sort of patent medicine with a dash of "hootch" in it. In seeking to bolster a class or

two at the expense of all other classes, therefore, Messrs. Ford and Edison are rather chasing chimeras. Gen. Smuts, being an ideal materialist, prescribed a more effective remedy for farming and labor grievances, namely, work and sweat. Farm and Labor Blocs would be in all-the-year-round clover with such banks keeping open house, while the generality of industries and trades took their chances in the hard, cold world.

Laying it on Thick

Bryant Brothers joined the refrain when they advertised Elbow Lake, in this strain:

"The ore body is a tremendous one and the values received from careful assaying over a large area are amazingly rich".

Why go to the jungles of the Congo, as New York's Gullible Gullivers have done, to pick up gold nuggets by the ton in a donga?

Pity 'tis, 'tisn't true!

Doubly "tremendous", "unbelievable", "amazing"! If Elbow Lake averages up to sample the literary specimens the New York Argonauts who have gone after the equatorial Eldorado had better make a strategic retreat and trek to where "every prospect pleases".

It is an unfortunate fact that the most prominent participants in this Elbow Lake development—the gentlemen whose field force knows more about the section than all others—think the Arab who folded his tent and silently departed, was exercising a discretion that is the better part of valor.

Those of Toronto and Montreal who hold to the opinion that the values are not what the advertisements represent them to be, do not seem to be credited with even common sense, notwithstanding as a private syndicate they subscribed a tidy amount, made a road, built camps, provided the equipment and paraphernalia requisite for prompt determinations. Speculators accuse them of "knocking". They are to get out, not in.

Hollinger Buys Schumacher

Hollinger Consolidated hold an option to purchase the Schumacher mines and belongings for $1,650,000. Of this sum, ten per cent has been paid as earnest money on the option. If upon examination during the ensuing six weeks the Hollinger management so decides, $300,000 is to be paid and the remainder, $1,185,000 is to follow in quarterly installments of $296,250 each. The transaction is in the nature of a speculative investment, made with knowledge which the Hollinger Administration alone possesses. Acquisition of a further 160 acres, as acreage, is not the reason for it. Nor is the Schumacher Townsite a consideration. As greater depth is attained in the Acme area of Hollinger, it has been noted that the drag of a very important vein series is toward the Schumacher. At least one vein of the series is so rich, it will not take much of it to materially assist in earning the purchase price of the Schumacher. So Schumacher shareholders get their portion in cash and "the rich, they ride in chaises".

Dean Adams has More Honors Conferred

McGill University announces that Frank D. Adams, Vice Principal, Dean of the Faculty of Applied Science, and Logan Professor of Geology, has been appointed Chairman of the Advisory Council for Scientific and Industrial Research, Ottawa, by the Governor General In Council. The selection has everything to commend it. Something more than a grub stake for Research now would further national purposes.

ANNUAL REPORT OF THE DEPARTMENT OF MINES OF NOVA SCOTIA FOR THE YEAR 1921

Prosperity did not smile on Nova Scotian mining last year. In every branch of mining save one, either a decline was recorded or else there was complete stagnation. Better things are confidently expected this year.

Coal production, which has already received attention in these columns, dropped from 5,687,970 long tons (1920) to 5,373,230 long tons. We refuse to reproduce the half ton attached to both these tonnages, because the fraction does not strike us as being exact. It may have been jettisoned in both cases by distraught mariners. The production of pig-iron, steel and coke also fell, as has been heretofore recorded. Limestone and dolomite outputs dropped to 79,132 tons, the output of the year 1920 having been 249,993 tons. Gypsum is credited with a slight increase, the total production being 185,943 tons. Calcined gypsum, we are glad to note, rose from 5,089 tons to 16,415 tons.

To the list of coke oven by-products is added motor fuel to the amount of 292,452 gallons.

Gold production was nominal, 379 ounces, as also that of manganese ore, 450 tons.

Salt, from the Malagash salt deposits, yielded a smaller tonnage than in 1920, the amount being 2,606 tons. Infusorial earth would have been worked on a larger scale (only 300 tons reported) had it not been for poor transportation from the deposit (Silica Lake, Colchester County) to the railway. The mining of barytes has fallen into an innocuous desuetude.

Coal mining, which is a well-organized and admirably modern industry in Nova Scotia, is the support and stay of the Province. It needs no advertising. What is needed, however, is that Canadians in other provinces should realize the enormous industrial possibilities that are offered in Nova Scotia in connection with mining and quarrying non-metallic minerals. Gypsum, for instance, should and could mean much more to the Province than it does. So should barytes and so will, unless we are much mistaken, the exploitation of salt beds.

We note with pleasure a distinct revival in gold prospecting. This, we hope, will lead to tangible results. The staid and utterly respectable Province needs, above all things a thorough investigation into mineral wealth. This cannot be done in a day or a year and should be done by Land picked outsiders.

Our subeditorial eye is pleased with the [illegible] printing and paper of the Annual Report. Much however, is left to be desired in [illegible] The pages assigned to non-metallic products are [illegible] The information vouchsafed on [illegible] a trifle amateurish. Also, the Lord-[illegible] referred to, has noticed two [illegible] have escaped the proof-reader. [illegible] fore. One is the use of the word "[illegible] ear" is meant (page 111) and the [illegible] —chute" when "shoot" (scarcely the correct word) is meant (p. 97). An index would add [illegible] Report.

Despite our trouble-[illegible] much above the average in [illegible]

News of Mining

United States

As reported to the United States Geological Survey by producers, there was a decrease in the amount of all lead pigments sold in 1921 as compared with 1920, with the exception of white lead in oil, which advanced 2% per cent. Prices per ton also fell during 1921. Of white lead in oil there was sold 143,631 tons; of dry white lead, 26,695 tons; of litharge, 11,953 tons and lesser amounts of other pigments.

Official figures show a great falling-off in the production of magnesite in the United States during 1921, the output being 17,901 short tons, less than half of the preceding year's output. Production was confined to California, where the magnesite was almost wholly used as plastic material. Imports of crude magnesite were greater than in 1920. The apparent total consumption was 113,500 short tons, the market for refractories being unsettled.

Only a few hundred tons of chrome ore was mined and shipped in the United States last year. The tonnage imported was 81,836 long tons, having an average value of $8 per ton. From French Oceania came 35,-108 long tons, and from the British South Africa, 23,-318 long tons. Greece and Asiatic Turkey produced most of the remainder.

Great Britain

The British Fuel Research Board has issued a report of progress in its investigation of low temperature carbonization of coal. Stress is laid on the unimportance of pulverization and pre-briquetting. Research is being continued in the development of methods of coal-carbonization at temperatures approximating the fusion points of given fuels.

Exports of coal from Great Britain for the four months ended April 30th., 1922, totalled 17,333,082 tons, of an average value of 22s. 8d. per ton. France was by far the largest buyer, taking 4,572,147 tons. Italy came next with 2,022,520 tons; then the Netherlands, 1,-551,778 tons. Germany and Belgium were important customers. The Argentine Republic purchased 562,630 tons.

In answer to questions asked in the British House of Commons, the Secretary of Mines, Mr. Bridgeman, gave out the information that the sums paid out by the Government to the coal mining industry exceeded the sums collected from it by £25,767,443 during the fiscal year 1919-1920. Taxation was not included in the estimate of collections. The excess of payment for the last 12 months was £6,873,883.

Europe

A revival of gold mining is reported in Bavaria. A small area in the Fichtel Mountains in the scene of considerable activity. From arsenical ores a yield of 15 to 20 per cent. of arsenic has been obtained. The ore carried an average of 35 grains of gold and 22 grains of silver to the metric ton.

Excepting a few coal mines in Upper Silesia, the 7-hour bank-to-bank shift is in force in Germany. The German Government has submitted to the Reichstag a bill to legalize the 7-hour shift throughout Germany, with the probable exception of upper Silesia, where the 7½-hour shift is likely to be maintained.

Oil production in Rumania is showing an increase of more than 20 per cent. over the rate of output during the year 1921. The production in the Baku (Southern Russia) fields has also been considerably enlarged.

Denmark imported 531,918 tons of coal during the first quarter of 1922. Nearly all of this came from Great Britain. Imports from the United States fell to only 86 tons, as compared with 61,265 tons during the corresponding period of 1921.

The Norwegian Arbitration Court has fixed the number of legal holidays for industrial workers at eight working days in the year.

The first deliveries of Wabana iron ore were made to German purchasers during the middle of May. They amounted to 20,000 tons.

French consumption of coal has declined so markedly as to affect domestic production. German coal producers are urging a reduction of the amounts of coal deliverable by Germany to France under the indemnity rulings.

Australia

Reductions in wages of two shillings per day at the smelters, and a lowering of the price of coal, are two recent developments that are expected to give timely help to the Broken Hill mining companies. Another encouraging feature is the strengthening of the market for lead.

For the first three months of the year, the Queensland output of gold was only 2,717 ounces. During that period the Mount Morgan plant was closed. Work at Mount Morgan was resumed in April and the month's output of the State was brought up to 6,219 ounces.

Africa

According to the official returns of the Government of the Union of South Africa, the value of supplies purchased by the gold mines during 1921 was £14,439,-837; coal mines £1,854,205; diamond mines £917,268; other mines, £347,548; making a total of £17,558,858. Of this amount more than £2,000,000 was spent in explosives, and about £414,000 in cyanide. In addition to the tremendous total mentioned above, £811,916 was expended on machinery and machine tools, and £524,554 on electrical machinery and equipment.

The output of asbestos in Southern Rhodesia during March, 1922 was 436.58 tons, valued at £15,179. The principal producer was the Rhodesia and General Asbestos Corporation Limited, operating in the Victoria District. This company produced 377.19 tons, valued at £9,429. No chrome ore was mined.

The total output of gold from the Transvaal for the month of April, 1922, was 511,388 ounces, valued at £2,352,155. Of this the Witwatersrand contributed 493,-402 ounces.

The Swaziland April output of tin concentrate is reported as 23.5 tons, valued at £262.

Notes From Nova Scotia

STORING COAL

Since coal began to be mined and shipped in large quantities from Cape Breton, the storing of coal in winter has been a common practice. This is due chiefly to the climatic conditions — when the great water-way of the St. Lawrence is frozen up and the distance by rail is too far to permit of profitable business. In the latter part of November the river buoys are taken up and shipments of coal to Quebec ports practically cease.

As navigation only opens about the middle of April, or later if the drift-ice is on the coast, the shipping season is short and preparation must be made during the winter months to supply the St. Lawrence market within the time available. And so, year after year large coal heaps or piles are stored to facilitate rapid shipment.

A large coal heap looming up in mid-air at a distance may not be an attractive sight. One must get to the top of it, however, and walk over it with a person who understands its different moods, to know that it is not the black, dead, inert mass it appears to be. It can at times become very lively and if not under the control of a master hand, it will by its own action quickly consume itself.

A 300,000-Ton Heap

The writer had the pleasure the other day of walking over one of these great heaps containing about three hundred thousand tons of coal. He was accompanied by the foreman, who for many years has been building and shipping the coal piles of the Dominion Coal Co. This heap was 800 ft. long by 800 ft. wide, being 22 ft. high at the beginning and 38 ft. at the apex. The walk with Mr. Mullins, or "Joe," as he is familiarly called, was most interesting and instructive. A man whom most others call by his first name, to retain the respect of his fellows must have some popular quality to permit of the use of the name used only by his closest friends. Joe Mullins has many fine qualities. At first sight he strikes one as somewhat rough, but it is only the roughness of the unpolished diamond. Joe has a heart big with human instinct and with that "spark of nature" which "makes the whole world kin." And although at times he can be volcanic in temper and use the English language as "soldiers did in Flanders Field," yet few were the men who ever worked for him who did not carry away a respect bordering on affection. Probably the precarious nature of his duties blends itself with his disposition, and Joe is only acting in unison with the hidden, heated, struggling elements of the coal pile that are forcing a way out to larger liberty. Whatever vent the pent up feelings of Joe may have, he allows the coal pile none but in his own way. It must, of course, at times be relieved of its heated breath but only through the breathing tubes prescribed by its master builder.

The Storage Floor

The coal floor is of hard, dry clay, well drained and of ample size, five hundred thousand tons of coal having been stored on it at a time. As run-of-mine coal from many different collieries is placed in the pile, it will be seen that the many precautions of theorists cannot all be followed out. Where coal of low and high sulphur content is mixed, together with lump and small coal at the rate of thousands of tons per day in rain, snow, sleet and sunshine, one who knows anything about stocking coal knows that only average care can be taken and the heap may become at any time a dangerous proposition to handle. Yet the storing of coal in this way has been carried on for many years, and no fire has ever occurred necessitating the removal of any part of the pile or the use of water. This is no doubt largely due to the fact that the work of piling and caring for such great bodies of coal is under the supervision of a man of long experience and one who is still a student with ever deepening interest as new problems arise.

In the storing of coal, besides the quality and the size, the height of the pile and the length of time it must remain before it is moved must be considered. These are two very important factors.

The Causes of Spontaneous Combustion

It has been thoroughly demonstrated that heating in the coal piles arises from oxidation of the coal. Fine coal, sulphur and iron pyrite are conducive to heating. Mr. Mullins tells of having uncovered and examined a small "hot pot" which was about to be shovelled away. In appearance it was yellowish, being mixed with impurities and fine coal. Through heating, a crust had formed above, which would render it impervious to water. This crust was due to the distilling of volatile matters under heat. As heating usually begins at the centre of the pile, or half way between the floor and the surface, it has been found that thirty eight feet is high enough for safety and control.

Heating usually shows itself within ninety days, and great care must be taken where coal of all kinds and sizes have been indiscriminately mixed. Of course this [illegible] is only done when it is understood that the pile will be removed within four or five months. By careful turning and ventilation, such heaps may be kept cool for a longer period but where piles are expected to remain for eighteen months or two years, lump coal only should be stored. At the end of two years the lump coal begins to disintegrate and heating [illegible].

Run-of-mine coal with fifty per cent lump can be safely stored for nine months provided coal high in sulphur is not mixed in. But a large heap of this coal requires careful watching and constant attention to keep it cool.

Slack coal in large heaps will [illegible] within three months and is harder to cool off than larger coal. The heat makes its way downward instead of upward as in other cases. Even washed [illegible] has been known to heat and reach a dangerous state before it is removed.

Weather conditions do not seem to effect the [illegible] of coal, but men of experience prefer dry to wet weather. Pointing to the top of a wooden breathing [illegible] was asked if it was not almost [illegible]

dump coal around a wooden structure. The answer was that experience had taught there was no danger, and the legs of the trestle did not seem to make channels for air circulation which would cause heating. To avoid breakage, the trestle is low where dumping begins and gradually increases in height as it extends. Care is taken in all dumping from the trestle that fine coal is not allowed to gather in quantity around the legs of the trestle.

Heating in the early stages is hard to detect, especially if the weather is dry, clear, and warm. But in the late evening and early morning, if close watch is kept there is no difficulty in discovering heat if present. Of course the iron rod for temperature tests is freely used after coal has been in the heap for about three months. In the absence of steam or an iron rod, heating may be detected by the oily appearance of the surface of the coal and sometimes by smell.

Cooling Hot Spots

Once located, the "hot pots" are cooled off by means of holes left in the coal after the iron rods that have been forced down through the pile have been withdrawn. Cones made of roofing paper, nine inches long and three inches in diameter are stuck into the months of these holes. The cones keep the holes open and allow the heat to escape, which cools off the pile. Hundreds of these cones can be seen in clusters here and there over parts of the great heap. This method of cooling has been found most effectual, and no case of fire has ever occurred where it has been used in time and the pile has been removed within the period set at the beginning.

After a hot place has cooled off, heating may again occur. This second reaction sets up a greater heat which is harder to control than was the first. In 1918, when the war was on and vessels for coal shipment were scarce, re-heating occurred in three separate places because the pile had to remain on the surface much longer than was at first intended. It was a matter of grave concern to the Company, and after consultation, it was decided to reventilate those places. The heat, however, became more intense and continued to spread. Instructions were issued to continue ventilating. The danger of carrying this practice too far was pointed out but was not heeded. Two of the "hot pots" were ventilated and the third was secretly damped down. This was a test case "on the quiet". The result was that when the steam shovel reached these places, it was found that the re-ventilated "hot pots" had spread over a considerable distance and the heat had been more intense than in the one that had been damped down.

Skepticism may arise in the mind of the inexperienced as to holes made in the coal remaining open, but this is soon dispelled after once seeing a ventilated hot spot bared by the steam shovel. Hundreds of holes, the whole length of the twenty-foot iron rod used, may be seen standing just as they were when formed.

"Bumps" in Nova Scotia and British Columbia

Bumping is a condition common to coal seams with a strong roof and a floor not quite so hard but yet harder than the seam itself. It is usually brought about by faulty methods of mining, hence its only correction lies in improving these methods. It is not known to good methods of longwall mining. There are, however, other causes which in very thick seams are hard to control.

The experience of Crow's Nest Pass collieries, which led to an investigation by Mr. Rice of the United States Bureau of Mines, was eagerly followed by all mining students. His report was most illuminating and his recommendations are being closely followed.

Speaking of No. 2 Mine Coal Creek, affected by bumps, Mr. Rice states: "The workings are irregular. In some places longwall mining was started in irregular panels. In the bump area 50 or 60 percent of the coal had been mined out. This correspondingly increased the load on the pillars which bore the weight of 2,000 feet of cover." The remedy applied was to shut up the area of disturbance and in the East and West side very large pillars were left. This seam is from 4½ to 5 feet thick.

"No. 1 was the most systematically planned of all the Coal Creek workings, and the advance plan was rigidly adhered to. There was a 150 ft. pillar between each pair of rooms. Only 25 percent of the coal was taken out by this method until the mine was retreating as a whole. The mine passed over the bump area of No. 2 mine without noticeable effect. Later on, however, No. 1 Mine was affected by bumps, but it is thought that if No. 2 Mine, which underlies No. 1, had been worked as systematically as No. 1 and large pillars left in, no bumping would have taken place."

The 10 yard seam, South Staffordshire, has been seriously menaced by bumps, due no doubt to the breaking of the massive strata higher up, which gives way after the subsidence of the immediate roof, which takes place when large areas of coal are extracted.

The great danger in Springhill when bumps occurred was the sudden heaving of the floor, and the road bed being raised to the roof over long distances.

Away back in the eigthties and nineties it was considered good mining practice to open up large areas in Springhill Collieries. The room and pillar system was used, but it was found that great loss of coal occurred through crush, and the sections opened were gradually reduced to a few balances or chutes on the same lift. This method has had to be further modified, and concentration on small districts is now the practice. The success of the improved method clearly proves that when the overburden is relieved by caving in the waste workings, the pressure of the strata above is regulated and the danger of bumps eliminated.

A recent authoritative review of the iron and steel business of Great Britain shows that the mother land is now in as sound a position as world conditions will allow. Costs have been so completely deflated that Britain can now sell her iron and steel, as formerly, in free competition with the world. Only a resumption of the home demand for iron and steel products, such as would be occasioned by the renewal of shipbuilding, and the strengthening of the markets for export will bring production up to normal. Meantime, it is satisfactory to note that Britain is still able to hold her high place in the world's production of iron and steel.

British Columbia Letter

Alice Arm

The new ore-body above the old workings at the Esperanza mine is opening up well, the ore showing well in native and ruby silver, and it seems probable that a good body of ore will be developed. Some 500 sacks of high-grade ore and 30 tons running $45 per ton have been taken from the mine recently, and this will be moved to Alice Arm for shipment as soon as the trail is in a fit state. An Anyox syndicate has taken a three years' bond on the Midway group, adjourning the Esperanza. Surface stripping has exposed a strong vein, showing ruby silver freely in places. The purchase price is $25,000.

Anyox

A fire at the Granby smelter, caused by the spilling of matte from one of the converters, completely destroyed a couple of motors and did other slight damage, all of which is covered by insurance. The damage will not delay production. Work on the new dam is progressing rapidly, a number of carpenters having been taken on recently to make the forms for the concrete work. It is rumored that the company shortly will start work on the concentrator for the treatment of a large reserve of silicious ore of too low a grade for satisfactory treatment by pyritic smelting. The directors recommend the erection of a 1,000-ton concentrator for this purpose in the annual report for the year ending December 31, 1921.

Dredging on Peace River

The Peace River Gold Dredging Company is making preparations for extensive placer mining operations on a series of benches, known as Brennan's Flat, on the Peace river above Hudson's Hope. A saw mill with a capacity of 40,000 feet of lumber daily has been erected, and lumber for flumes and other purposes is being manufactured rapidly. Seven carloads of machinery including the machinery for a suction dredge, are on the way here from Edmonton, which is the headquarters of the company.

Activities Round Nelson

A compressor, which has been purchased from the owners of the old Standard mine, has been erected at the McAllister mine, for the purpose of driving a long tunnel to cut the ore body at depth. This work was recommended by R. H. Stewart, who recently made an examination of the mine, and will be pushed through with all possible speed. In the meantime some fairly good ore has been found in the bottom level of the present working, and ore shipments are likely to be continued.

The Cork Province mine, which has been reopened recently after a long period of idleness, is said to be in excellent condition. There is a large body of ore in sight and it will require comparatively little outlay to develop this ready for shipping purposes.

The new zone schedule at Trail, which went into effect on June 2, seems likely to cause a marked revival of mining in the Slocan district. Already the Silversmith, the Standard, the Rosebery, and the Noble Five have shipped concentrates that they have had on hand for some years, and to avoid a congestion of the concentrate at the smelter the Consolidated company has had to notify shippers to advise it in advance of making shipments of this class of concentrate. After the accumulation that has been piling up for years at some of the mines has been treated, there will be ample capacity at the smelter for handling all the concentrate produced in the district.

There has been quite a revival of mining in the Sheep Creek district, new discoveries having been reported from the Bayonne and the Reno groups where steady development was carried on through last winter. The Bayonne group is under option to J. B. White president of the Silversmith Mines, Ltd., and the Spokane associates, and the Reno group is being operated by a local syndicate. Another local syndicate has just been formed to explore ground in the neighborhood of the Reno group.

At a meeting at Nelson, recently, the Mining Association of the Interior of British Columbia decided to petition the Provincial Government to amend the Engineer's Act so that its provisions shall not apply to mining and metallurgical engineers. It is claimed that in its present form the Act is detrimental to the mining industry, in that it hampers the movement of engineers and tends to prevent the investment of capital in the mining and metallurgical industries of the Province. The Association decided to send a request to the Minister of Mines, too, that it be consulted before any further steps are taken to safeguard metalliferous mines.

Activities in the Omineca

J. R. Turner, manager of the Mamie mine, on Hudson's Bay Mountain, has secured permission to tunnel through the Payroll claim, in order to tap the vein on the Mamie claim. Work on the tunnel will be started as soon as the compressor and other necessary plant can be got to the property. It is expected that the tunnel will be about 1,250 feet long, and will cut the vein at 100 feet depth.

Milling operations have been suspended temporarily at the Silver Standard mill, pending the installation of additional plant to better effect a separation of the zinc and lead sulphides. W. Norrie Lowenthal, general manager of the mine, has left for Vancouver, where he will consult with the directors of the mine with regard to the new plant.

The Cedar Creek Placers

An Okanagan syndicate represented here by [illegible] F. Guest and Fred Munsen has purchased the Snowden and Sheridan Company's claims, on Cedar Creek, for $200,000. The purchasers made a sworn [illegible] to the effect that the pay-gravel was [illegible] an ounce to the yard, and that on May 29, [illegible] and sixteen pennyweights of gold were [illegible] cubic yard of gravel.

Several law cases already have arisen [illegible] ing of claims, and many others are likely to [illegible] fore the season is over. Alfred Plair, who discovered gold in the high benches above Cedar Creek, has been enjoined by Justice Morrison from trespassing on the property of Edward G. Stephens. The Snowden lease adjoins the Plair leases, and the [illegible] latter was staked in such a manner as to [illegible] the former.

A considerable number of prospectors, who ignored the warnings of those familiar with the [illegible] gar-

here long before the snow had melted and not suffiently provided with funds, are now stranded and unable to get away.

The Portland Canal District

G. D. B. Turner, of New York, has secured a bond on the Del Nort group, which is situated on Porter Creek, a tributary of White River, across the glacier from Bitter Creek. A belt of ore is said to have been traced for 4,500 feet and is in the neighborhood of 200 feet wide. The average of 24 assays taken here and there on the belt is said to be $40.80 in gold and silver, the lowest being $1.80 and the highest $285.00. This is practically the first property on the Naas slope on on which any development has been done. Mr. Turner has also secured options on the Portland Canal mine and on other properties on Glacier Creek.

Owing to the fact that the creeks are full of water, the Premier hydro-electric plant has had a surplus of power recently, and the company has been running the mill and the tramway on three shifts daily, consequently a considerably larger tonnage of ore and concentrate is being shipped from the mine. The line has given a little trouble, owing to the towers settling since the frost came out of the ground, and the tramway has had to be stopped for short periods from time to time while the level of the towers was being readjusted. Shipments for the first five months of the year run well over 30,000 tons.

While denying the rumor that the Jacklin-Thane interests have purchased a controlling interest in the Fish Creek Mining Company, W. R. Tonkin, president of the company, who recently has returned from the the South, stated that they had put considerable capital into the concern and that an active campaign of development would be pursued during the present summer

The Trail Smelter

The ore shipments received at the smelter for the first five months of the present year amounted to 193,387 tons which is 17,000 tons in excess of the same period of last year. The great bulk of this has come from the Sullivan mine. Soon after the news that the shareholders of the Consolidated company had approved the floating of a $7,500,000 convertible refunding debenture bond issue at a special general meeting, held in Montreal on May 30, G. F. Chapman, mechanical superintendent for the company, was sent to Kimberely with a small force of men to start on the construction of the new 1,500-ton concentrator for the Sullivan mine ore. It is expected that the plant will be finished early in 1923, and that it will cost between one and a quarter and one and a half million dollars. The new plant will be constructed almost entirely on the site and in the well-equipped machine shops at Trail. When the plant is completed it will release the 1,000-ton concentrator at Trail that now is being used to dress the Sullivan ore for use on the company's Rossland ores. Thus with the new year, increased activities may be expected at both the Kimberley and the Rossland camps.

Engineer Mine

In the British Columbia Court of Appeal on June 6, Chief Justice Hunter gave the ownership of the Engineer mine at Atlin to the estate of the late Captain James Alexander. The case has dragged through the courts for so long, that Alan I. Smith, to whom Alexander left the mine, has died; so his heirs, and not he, will reap the benefit. The purchase of the mine was under consideration by the Mining Corporation of Canada at the time that Alexander died, the price, it is reported, being set at one million dollars. There was a fabulously rich shoot in one of the veins on the property, from which Alexander must have taken a small fortune by the crudest methods. There are some 25 other veins on the property about which little in known, as no important development has been done..

BRITISH COAL TRADE

The important feature of the coal trade during the past month is the effective recovery by the United Kingdom of markets which were lost to the United States of America during the European War. The dispute in the American mining industry has undoubtedly hastened the inevitable change. The American exports to Argentina in February, 1922, amounted to 4,000 tons as compared with 51,000 tons in February, 1921; the corresponding figures for Brazil being 17,000 and 42,000 tons respectively, while those for Chile are 7,000 tons and 40,000 tons respectively.

The figures of exports of United States of America coal to South American markets for the eight months ending February 28th, 1922 and 1921 respectively, are still more striking. These figures are as follows: Argentina, 277,000 tons and 1,243,000 tons respectively; Brazil, 174,000 and 672,000 tons; and Chile, 14,000 and 458,000 tons. In all cases the 1922 figures show a substantial falling away from the 1921 figures.

In South Wales particularly, there is a very definite expansion of proceeds, which doubtless reflects the influence of the rise in price (2s. 6d to 3s 6d. per ton for large steam coal) that took place in February. The rise, however, is not only in value, but also in bulk. These two factors together may perhaps be taken to portend a definite and progressive recovery in the industry.

Coal Output.—The Easter period naturally caused some falling off at that time, but the rate of output marked a very rapid recovery in the last week of April, when the figure of 5,160,100 tons was reached. This is not only the highest since the coal stoppage of 1921, but has not been reached since the week ending 18th December, 1920.

The total output for the four weeks in April was 18,049,500 tons, as compared with 19,920,100 tons in March.

A Stockholders' Committee of Investigation of the American Smelting and Refining Company has issued a majority report urging the election of a new board of directors, the bulk of whom would be independent of the present management. The Hon. Elihu Root concurred in the minority report. The majority report embodied the following criticism: "We believe that the present policy of having a Board of Directors composed so largely of salaried employees is not the best form of corporate organization, and that it has not always worked to the advantage of the Smelting Company..... The interests of the Company imperatively demand a Board of Directors of whom a clear majority, while co-operative with, would not be dominated by the management." Senator Root, contrary to current belief did not act as arbitrator, but as the attorney of the company. The company's annual meeting is to be held on June 27th. Proxies are being actively solicited by a committee of the management.

Northern Ontario Letter

Dome's Output in May

According to official advice just received by the Journal the Dome Mines handled 28,400 tons of ore during the month of May and produced $325,328 in gold, this being the second highest production for any one month so far in the company's history.

The only previous month in which the Dome produced more gold than during May was in the month preceding when the high total of $377,000 was produced. These figures now show that for the first five months of the current calendar year the output from the Dome has reached approximately $1,630,000 and points to the likelihood of the output for the full half-year reaching close to $2,000,000. Approximately three-fifths of this gross yield may be estimated as net profit.

A feature of current achievements at the Dome is that during the two months since the Company commenced its fiscal year on April 1st it has produced $702,328, or at the rate of about $4,213,968 a year.

During the month of May the mill treated an average of 916 tons of ore daily and the ore yielded an average of $11.52 a ton.

Progress on Goldale

Sinking operations are under way on the Goldale property ,and rapid progress is being made. Four machines are being operated and the shaft is going down at the rate of between 25 and 30 feet a week. A small station will be cut at a depth of 350 feet, but the first working objective will at a depth of 500 or 550 feet.

Lake Fortune, in Quebec

A small force of men are at work on the Lake Fortune property, situated in the Province of Quebec and lying about 25 miles east from Larder Lake.

This old property was staked out about two decades ago. An effort was made to develop it at that time, and a twenty stamp mill was installed about 14 years ago. It is stated that the cost of machinery and the heavy expense in transporting the equipment over so great a distance without the aid of a railway amounted to about $275,000.

Present work is for the purpose of determining whether the gold content of the veins is such as to offer promise of yielding a profit under the present improved methods of mining and milling.

Success in this venture would attract widespread interest to a big district in the province of Quebec.

More Ore Located in Kirkland Lake

One of the more important developments in recent months in the Kirkland Lake district has just taken place on the Tough-Oakes and Burnside mines of the Kirkland Lake Proprietary, this being the discovery of the continuation of the "main break" to the east of what is known as the north and south fault.

Up until recently, the occurrence of this main break was only proven on the west side of the north and south fault and as this fault lies within 300 or 400 feet of the west boundary of the property, the length of the ore zone was limited to this 300 or 400 feet. It is now learned that the break, after being faulted a limited distance, continues toward the east apparently through the full breadth of the property.

Other information coming to hand about these properties is that the work at the 550-ft. level is producing highly favorable results and that the drift on the foot-wall side of the break is in high grade gold ore.

It is also learned that the drifting being done at the 400-ft. level on what had appeared to be No. 11 vein has been suspended for the time being while a cross-cut is being driven farther north. The nature of the vein drifted on has led to the belief that it may only be running parallel to No. 11 and that the latter may lie 40 or 50 feet farther north.

All this work is well in hand under the management of Mr. Thomas and the whole enterprise is gradually being built up to a positionof importance. The mill is operating on from 60 to 70 tons of ore daily for the time being, and, in due course, will be brought up to full capacity of 120 tons daily.

While this work on the Tough Oakes and Burnside is producing such good results, it is important also for the Kirkland Lake Proprietary that the adjoining Sylvanite mine is developing in a big way, in that the Proprietary owns a fifty per cent. interest in the Sylvanite.

Mr. Harry Oakes and Lake Shore

Now that Mr. Henry Oakes is home, the question of mill enlargement on the Lake Shore will come up at an early meeting of the Lake Shore, and the indications appear to be that such a plant will become a reality and be producing bullion during the coming year.

The manner in which the affairs of the Lake Shore have been directed from the very beginning under the guidance of Mr. Oakes may be pointed to as one of the finest examples of the kind in the annals of mining. This includes the staking of the mining claims, the straight forward method of promotion and the entire process of performing assessment work through all stages righ up to the production of gold bricks and the payment of dividends.

Now the Lake Shore is on the eve of an attainment for which even Mr. Oakes' fondest dreams scarcely provided at the time of his undertaking the enterprise.

Development in Lebel Township

A force of 18 men are at work on the Bryce group of claims in the central part of Lebel township, in the vicinity of the Lebel Lode.

Also, a force of men are at work on the Munro Kirkland, this being recently taken over by the Thompson interests of New York.

Indeed, in almost every direction in this section of the Kirkland Lake field, exploration in one form or mother is other under way or being arranged for on the great majority of mining claims of promise.

Cobalt Frontenac Curtails Operations

According to advice just reaching here, the Cobalt Frontenac property, situated near Kalador, has curtailed operations. No official advice has been secured but workmen have brought the information that milling operations provided a distinct disappointment and that work was finally curtailed.

The proposition has been promoted by the Fletchers of Hamilton.

Prospecting on Mutual Porcupine

The Scheme of the Mutual Porcupine Gold Mines Syndicate to raise money with which to explore property lying adjacent to the Hollinger Reserve shows indica-

tions of success. Surface work has already commenced and the question of diamond drilling will be taken up at an early date.

Murray Mogridge

An endeavor is being made in New York to finance the Murray Mogridge property at Wolfe Lake, in the township of Maisonville. It has been reported that Mr. Jury may not be connected much longer with the company, and that the whole policy of the company may undergo a change.

Among the peculiar tactics employed for some unknown reason in the past has been the mailing of letters to certain shareholders, offering a fancy price for the shares, but with no replies coming back to those who expressed a wish to accept the offer. These offers did not come from company officials, but seemed to originate with private individuals, one in particular being quite active in Buffalo and sending the letters to stockholders resident in Canada.

The Murray-Mogridge property is one of considerable merit. Underground work has shown the presence of ore of good grade and across a good stoping width. The company, however, is in debt and seems to have received poor return for the $250,000 outlay to date. This is not attributable to lack of merit in the property itself.

The Mr. Jury spoken of as being identified with the proposition was a leading influence in connection with the West Comstock fiasco of some few years ago.

Deferred Assessment Work on Veterans' Claims

War Veterans who complained about alleged unjust operation of the Mines Act in regard to deferred installments of assessment work on their mining claims have the satisfaction of learning that the matter will be adjusted at once, and in time to prevent more than one installment of work falling due on July 1st.

The Cobalt branch of the G. W. V. A. took up the question and pointed out to the Minister of Mines for Ontario that several installments of work would fall due on these claims unless action could be taken before July 1st. The Minister replied as follows:

"I have for acknowledgement your favor of June 9th with reference to the extension of time to perform assessment work. This matter has received favorable consideration by the Department, and instructions will be sent to the various Mining Recorders in due course, directing them as to how they should deal with the subject matter of your letter."

This decision tends to remove considerable anxiety from among was veterans who are holding mining claims in this province.

Kerr Lake Dividend

Owing to successful operations in the state of Utah as well as on property owned in New Zealand, the Kerr Lake Mines, Ltd., will pay a dividend of 12½ cents a share on July 15th to stockholders of record at the close of business on July 1st.

Meanwhile, the company's property at Cobalt remains closed, the belief being that no effort will be made to resume production until such time as the cost of producing silver declines considerably or unless the quotations for silver advance substantially.

Spectacular Ore on Wright-Hargreaves

Following the announcement recently in these columns that exceedingly rich ore had been encountered in a stope in the east drift at the 400-ft. level of the Wright-Hargreaves, it has been learned that further stoping has proved the occurrence to be one of importance.

Some large specimens of this ore have been selected and will be sent to the Department of Mines, Toronto. These contain spectacular quantities of visible gold as well as a considerable quantity of gold tellurides.

Mining and milling is going on at normal rate, with production averaging well above $2,000 every twenty-four hours. Development work is progressing at normal rate, and arrangements are nearly completed for the commencement of aggressive lateral operations at the 700-ft. level.

Victory Silver Shaft

The shaft on the Victory Silver Mines has reached its objective at a depth of 475 feet, and the work of cutting a station from which to carry on lateral work is now under way. This cross-cut work at the 475-ft. level is intended to intersect veins which were found closer to surface and which showed excellent promise.

The fact that the present work is at a point close to the underlying contact tends to add greatly to the possibilities of finding ore shoots at that horizon.

McKinley-Darragh Mill

Operations at the McKinley-Darragh are settling down into a uniform stride. The mill is now handling an average of about 125 tons of ore daily, and the higher efficiency in all departments as a result of the improved labor supply already offers promise of reducing costs to a point where satisfactory profits will be made with silver at current quotations.

The amount of gold used for manufactures and the arts in the United States of America is very considerable, and has had a tendency to increase. During the years 1880 to 1920 the total consumption of new material has been no less than $897,374,855 in value or about an average of $21,887,191 per annum. From 24 millions in 1901, it rose to 42 millions in 1910, and in 1920 reached a total of $82,215,087.

During 1921, according to refiner's report to the United States Geological Survey, purchases of 847 ounces of crude platinum were made in California; 96 ounces in Oregon; and 78 ounces in Alaska. Purchases from foreign countries amounted to 56,654 ounces, of which only 1,286 came from Russia, and 63 ounces from Canada. The remainder was derived from Columbia, South America. Consumption of platinum in 1921 totalled 151,077 ounces. Two-thirds of this went to the jewelry trade, the next heaviest consumption being credited to the electrical industry, 20,574 ounces. Jewellers bought 59.55 per cent. of all the platinum, iridium and palladium sold.

Recent movements in the copper market are encouraging. Stocks on had in the United States are estimated at 400,000,000 pounds. Fully half this is marked for export. Copper sales last year totalled 1,700,000,000 pounds. It seems probable that the sales for the first four months of the current year will aggregate 1,000,000,000 pounds. It is predicted that the metal will sell at 15 cents before the end of June, and will reach the price of 6 cents before the beginning of September.

Germany purchased 26,360,000 pounds of copper in the United States during March. France was the second largest purchaser, with 10,227,000 pounds; Japan third with 8,848,000 pounds. Germany purchased more than double the amount bought by any other country during the nine months ending with March, and is rapidly approaching her pre-war status as an export customer.

EDITORIAL

By this Art of Refining and the Profit that accrues to it, many good and rich Mines have been discovered, which otherwise would have lain concealed: and by the Advantage of these Discoveries many Cities and Villages have been built, Lands have been improved in their Values, and People thereby increased and plentifully maintained.—Lazarus Erekern—1580.

CANADA'S BIRTHDAY

Last Saturday we celebrated our Dominion's fifty-fifth birthday. There are many now living who can remember the first Confederation day, when the unconnected British colonies of North America promised solemnly to become a unit within the British Empire. These fifty-five years have wrought a change that is beyond the vision even of those men of steadfast faith to whom the Act of Confederation was due. East and West have been brought together across a distance greater than ocean's width, and the barren plain between has become one of the world's granaries. The word *Canada* has come to signify, not merely a half of the North American continent, but the home of a young nation, as yet only partly conscious, elementary in its ideas, and unformed in its habits; but still (thanks to the late war) anxious and able to take its place among the nations. For the miner, these fifty-five years have meant the growth of his productiveness from a mere beginning in 1867, to a staple industry that today is becoming a serious rival to agriculture in its importance in our national economy.

These are a few of the great things accomplished during the past half century — mainly, be it noted, by the generation that is now handing over its burden to its successor. But not all the developments of that period offer us the same reasons for self congratulation. It is well to look at both sides of the picture.

Though we have now a budding national consciousness, we must not forget that its growth is as yet not at all robust, and its full bloom and fruition will be assured only if we tend and nurture it as its value deserves. The national interest is still subordinated, in large degree, to provincial and sectional interests; while personal interests at present exclude a view of the common weal to an extent that alarms many students of Canadian men and affairs. This immersion in our personal affairs, to the virtual exclusion of public duties, is so prevalent in Canada that our trans-Atlantic relatives commonly take it as typical of our country. The natural result is that Canada is today ruled to a great extent by demagogues and others of like tendency, whose interest is self centred, to the exclusion of the interests that they publicly profess.

Nor are our habits unimpeachable in the sphere of social existence. Our chief city has lately earned the reputation of being the pest house of the North American continent. The finger of scorn is being pointed at us by our southern neighbors with increasing regularity, and for just cause. Not until we make a united, national effort to control the illegal traffic in liquor and drugs, and other vicious tendencies for which our country is rapidly becoming notorious, can we consider ourselves on an equality with the citizens of the United States. They are at least making an honest attempt to "clean up" their country from coast to coast.

In the realm of finance, we have allowed, on a huge scale, a selfish manipulation of public and manufacturing services, of our natural resources and even of food-stuffs, that has made many millionaires, but has impoverished our country to a degree that we do not yet fully realize. Financial manipulators, still increasing in number, batten and grow fat on the bodies of those whose honest toil results in Canada's material well being.

In the sphere of mining we have much to be thankful for, yet much to fear. The interest in mining in Canada, which is fast becoming world-wide, has been accompanied by a breeding in our midst, as well as an importation from abroad, of a host of human leeches, whose mission in life it is to filch the earnings of honest workers. The growing display of advertisements of mining stock promotions in our daily newspapers and the avalanche of prospectuses delivered through the mails, are tangible evidences of this.

We have here presented, deliberately, the sombre side of the question, as an antidote to the self satisfaction and self congratulation that usually accompany and succeed the national birthday. If we are to have an ordered and logical development in Canada, in mining as in other departments of our national life, we must face all sides of each question squarely.

THE VERSATILE MINING ENGINEER

The rational training of an engineer consists mainly, now as always, in a thorough study of the fundamental sciences. The division of the student's time among the

various sciences, mathematical, experimental, and economic, is a prolific and ever-recurrent source of argument; but that these foundation studies should be concentrated upon instead of the innumerable specialized superstructures that can be raised upon them, is becoming more and more clearly recognized throughout the world of education.

Nowhere is the necessity for a firm grasp of fundamental principles more evident than in the mining engineering profession. No other engineer has such a diversity of problems with which to deal. This diversity not only lies in the choice of numerous widely different fields in which the mining engineer can cast his lot; but in the majority of cases his daily routine involves a wide range of occupation. A mining engineer can specialize in exploration, economic geology, underground operation, milling, construction of plants, mine management, or the marketing of mineral products; and each of these branches offers numerous sub-divisions, any of them of sufficient scope to employ the most energetic and able brain. On the other hand, the mining engineer in charge of a small property must be sufficiently proficient in all these various departments of his professional work to ensure him against serious error, thus to give his property a good fighting chance for profitable existence. It is to this latter qualification of the miner that our attention has lately been drawn by a striking example.

A number of years ago Canada's first promising China-clay deposit was opened up, and the natural conditions in which it occured were of such promise that a large amount of money was made available for its development. But things went wrong and most of this money was virtually thrown away on development and equipment that yielded a very meagre result. Expedients were adopted that had proved successful elsewhere, but failed to suit the present case. Experimental work was costly and unsuccessful. Those in charge had not a sufficiently clear grasp of the fundamental conditions involved. Their foundation work was poor, and their superstruction toppled over.

Eighteen months ago a mining engineer with good training, both scholastic and practical, was engaged in an attempt to retrieve the fortunes of this prospect. In viewing the property now, one can see, at first glance, little but the wreck of the former undertaking. But appearances are deceptive. The foundations of a successful mining enterprise are being laid, both wide and deep. By patient trial, a system of mining suitable to the ore-deposit has been evolved, and a comparatively large tonnage of ore has been blocked out. The bits of equipment inherited from the former managements have been pieced together, at little expense, and ordered so as to produce consistently a product of the first grade. A market more than sufficient for the present limited output has been developed, and satisfied customers ensure a steady market for the larger amounts that will be produced in the future. Simple devices for effecting economies have been evolved through the course of operating the present crude milling apparatus, and these will be installed as occasion warrants. The ore-bodies promise to be large, milling on a large scale will yield a handsome profit, and the establishment of a successful mining operation is in sight.

It is unnecessary to dilate upon the variety of problems with which this engineer has had to cope. He has had to deal with capitalists and labourers; with problems of mining and milling; with the provisioning and running of his camp; with the marketing of his product. It is to such men that credit is due for turning prospects, of merely speculative value, into the mines that provide an increasingly important fraction of the country's revenue. They seldom are accorded the credit they deserve.

BOLSHEVISTS IN NOVA SCOTIA

The recent meeting in Truro of the delegates of the coal miners of Nova Scotia, reported today by our correspondent (who earned his daily bread as a miner for many a year, and is in full sympathy with the miners' legitimate aims), shows clearly two things. It demonstrates the power of a demagogue over those untutored in the ways of the world, and it shows that this particular demagogue is so saturated with the doctrines of Lenine, Trotsky and Co., that he exudes Boshevism at every turn.

One cannot but admire the way in which Mr. Robert Baxter, the President of the United Mine Workers' organization in Nova Scotia, has taken the hot-headed and unthinking insults that have been heaped upon him by would-be social reformers at this meeting. Indeed, such men cannot insult a man such as Mr. Baxter. They may annoy him, and their agitation may even result in his being turned out of office; but he is superior to their attempts to insult, though he may be deeply hurt by the disloyalty to himself, their true leader, of so many of those miners whose cause he has made his own. We hope and trust that a majority, and a handsome majority, of the rank and file of the mine workers will come to their senses presently, and will discern the difference between real leader and demagogue.

Light and air kill most harmful germs, whose breeding place is normally amidst filth in dark corners. This fact, translated to human affairs, is, no doubt, the justification for the British custom of allowing free speech and open discussion under almost any circumstances. It is almost invariably the result, in such a case, that plenty of rope bangs the fractious calf. So we may infer that J. B. McLachlan, leader of the "Red" element among the Nova Scotian miners, will soon fade into the background of their affairs. He is now in the spot-light, and is doing a lot of strutting; but he has succeeded in making himself ridiculous in the eyes of most Canadians who have troubled to watch his antics, and we may expect that soon even his present followers will acquire grace to see him in his true light. Time is a great healer of such diseases as McLach-

ian is attempting to spread through the body politic of Nova Scotia and Canada.

We wish to refer, in this connection, to the warning and the protest that issued some months ago from some of those with intimate knowledge of the Nova Scotian coal miner—a protest that was printed in the *Canadian Mining Journal* on April 7th, under the caption "Tinkering with the wages dispute." Our Nova Scotian correspondent there pointed out that the chief result of the appointment of a second Conciliation Board would be a prolonging of unrest among the miners, who were then beginning to settle down to work in earnest. The result has justified this prediction. The Scott Conciliation Board showed a consideration for the miners' case that was more than just, and their findings included every concession to the miners that did not exclude the profitable operating of the coal mines. Yet the result is that the "Red" agitators, then almost on their last legs, have had a new lease of life, and are now prepared to carry further their ill-conceived Bolshevist propaganda. Still there is hope of a satisfactory settlement, and we may hope that Ottawa's ill-timed interference in a domestic quarrel will not have deranged seriously the affairs of the Nova Scotian coal industry.

EDITORIAL NOTES

We are pleased to notice that Toronto *Saturday Night*, the *Financial Post* and other weekly and daily papers are spreading broadcast the information contained in Mr. Alexander Gray's exposé of Canadian Associated Gold fields, published in these pages on June 2nd. Our own readers are more amused than informed by the recital of such an interesting example of how the public has been taken in. We appreciate the good offices of those papers and periodicals that have carried the information to a wider circle of readers, where its influence cannot but be of an educative nature.

We wish to draw attention to Mr. Denis' letter, printed to-day on another page, which refers to an editorial that appeared in the issue June 23rd. In contrasting the difficulties under which prospecting was carried on in Northern Quebec 15 years ago with the conditions to-day, we may have done an injustice to those that administered the old law. But the point of view expressed is fairly representative of that prevalent among prospectors at that time, some of which remains, without reason, to the present day. It is the favourable conditions under which prospecting can now be carried on in Quebec that we wish to emphasize.

It is indeed satisfactory to find that the coal and iron industry of Nova Scotia is at last coming back to its own. It has long been predicted that the advantages conferred by her natural resources, her population, and her maritime location would eventually cause Nova Scotia to rival Old Scotland as a centre of iron and steel production and of ship-building. The newly acquired export trade in semi-finished steel products in competition with any and all producers round the Atlantic seaboard augurs well for the future. It is here, some students of the subject say, that her chief profit will be made. The export of Wabana iron ore to Germany and of Nova Scotian coal to New England ports is satisfactory meantime, but seems to be due to a temporary disability of competitors more advantageously situated. It is Nova Scotia's inherent capacity to produce good steel at a low price that will eventually place her among the world's foremost producers in this Iron Age.

In response to our recent verse, "The Editor in Eruption", we have received the following from a

"SALES MANAGER IN ERUPTION"

My Dear Old Chap, I read your verse,
Bad as your case, it might be worse;
I take my pen in hand to scrawl,
I don't get any pay at all.

THE PROSPECTOR'S PRAYER

Oh Lord, let me find a "hootchite" * spring
Ere my span of life is o'er!
And I'll camp beside the blessed thing,
And roam the hills no more.

I'll build o'er the spring a little shack
With roses round the door,
And I'll promise the world, I'll ne'er go back
To combing the mountains for ore.

No more will I hump the hefty pack
While the sweat runs in my eyes,
I'll lie in the shade in my little shack
And guard my precious prize.

When pilgrims flock to my boozy shrine,
I'll cheerfully turn the tap,
And let them throw, for the juice benign,
Their treasure in my lap.

Thus life for me will onward roll,
"One grand sweet song," I think,
Slaking the thirst of the drouthy soul
at fifty cents a drink.

Then, too, I'd be "esteemed by all,"
As my pile grew wide and high,
But surer still would be my fall
If my precious spring went dry!

Donald C. Simpson

* "Hootchite" is a new mineral, said to run high in alcohol reported by the late "Mining and Scientific Press" as a recent find in Nevada.

Wilfred A. Fairchild, M. E., Married in England

An Aeroplane Wedding With a Northern Ontario Flavour

Northern Ontario is an extraordinary country, breeding unusual things — big mines, big forests, many lakes, big snows, strong cold, big black flies, great big mosquitoes with great big appetites, and as a natural result of all these big things, unusual men who do things in an unusual way.

I returned last week from a short visit to the prosaic little island containing England, Scotland and Wales, and whilst engulfed in the archaic atmosphere of Old World national and international squabbles, stumbled across an approaching event doubtless of much interest to Cobalters, Porcupiners and Northern Ontarians in general.

Unfortunately my boat sailed four days before the culmination of the event and I certainly would have liked to have been in at the finish.

On June 1st, "Fred" Fairchild, only recently out of the bush, ostensibly for a holiday in the Old Country, was married to Miss Helen Spensley of Australia. The wedding took place at Westoning Manor, the palatial country seat of the bride's cousin in Bedfordshire. It was no ordinary wedding either, for Fred Fairchild is first and last a Northern Ontarian, whose old bald head has offered many a delectable meal to big mosquitoes with great big appetites. Incidentally, Fred had only recently come out from an oil-hunt in the Mackenzie, and the lavish — (but I might be giving secrets away — anyhow everyone knows what oil is these days, and Fred always said he would never marry unless he made a million of something or other.)

Anyway, Fred was not going to be married in an ordinary way, for he was a Northern Ontarioite, recently a Mackenzieite, and his ideas savoured of mosquitoes and oil — large mosquitoes and much oil.

We discussed the prospective arrangements over a sparkling icy whiskey and soda (yes, hang out your tongues, ye dry ones) in the luxurious lounge of the New Metropole. The dreamy strains of a "Love" waltz floated through the air from the distant orchestra. The setting was just right for the discussion of wedding arrangements, and after about the third whiskey and soda poor old Fred looked hopelessly, terribly, miserably love-sick, — Imagine it!!

I made several wedding suggestions, but Fred would have none of them.

"No!" he said at last, "I want to give this thing a Northern Ontario flavour — something to startle the natives! Am I not an Oil and Mosquito King!?" and he gulped another mouthful from his sparkling glass.

"Frankly, Fred," I said, "I don't see how you can bring mosquitoes and oil into a wedding, — gold, silver, cobalt, nickel or dynamite if you like. ..... but mosquitoes and oil ..... for the love of Mike, man!!"

He seemed crestfallen and with those love-sick eyes stared blankly into space. Then suddenly his eyes flashed fire and assumed their normal expression of enthusiasm. I followed the direction of his gaze. There on an artistic placard was written "The Mosquito Fleet of Commerce".

"I've got it!!" he ejaculated with a roar, "Areoplanes!! The nearest thing in this country to a Northern Ontario mosquito!! The blackguards have bitten me to death — eaten all the hair of my head, and now I'm going to make 'em fly with me and my girl!!" He drained his glass with one vicious gulp and flew for the aeroplane office.

Right then and there a special aeroplane was chartered to be at the parish church door in the sleepy little Bedfordshire village at 12.30 p. m. on June 1st, and the cold, hard cash paid down. The landing spot was to be marked by a large sheet. To the tune of the wedding march, Mr. and Mrs. Wilfred A. Fairchild would step into the gigantic mosquito and, clasped in each others arms (just think of it!) be wafted off to Paris on the first leg of their honeymoon. Where they will fly from there the Lord only knows. Probably by this time the happy couple are perched on top of the Pyramid of Gizah in the grand isolation of a desert sunset.

"But what about the oil?" I asked Fred timidly. "Why, you silly ass" old Fred replied in true London lingo "that's what that blamed mosquito will eat all the way to Hellangone!"

"Umm umm!" I said, much enlightened.

"And then, besides, I'm going to christen that bug 'Dome' with a bottle of Mackenzie oil before we step into it!"

I suppose he was thinking of his old mosquito-scarred pate . . . . . or was it perhaps a mine?

This thing perhaps has had a sequel; that is why I surely would have liked to have seen the finish.

At a little reunion in the Metropole the night before I sailed, at which were Dougherty (formerly of Dickson and Dougherty, assayers, Porcupine), Alex Grundel and Dick Shone (the original stakers of the Keely), a plot was hatched to place a huge sheet in front of another church from which would emerge Mr. and Mrs. Dick Shone, who would fly over to Paris for afternoon tea.

By jingo! I would like to have seen the finish!

Anyhow, I am sure we all wish Mr. and Mrs. Wilfred Fairchild the very best of luck and happiness for all time. We will all miss Fred Fairchild in this country, and I am sure the mosquitoes will.

J. T. M.

COAL STATISTICS FOR MARCH

The *Coal Statistics for Canada, March,* 1922, are now available from the Dominion Bureau of Statistics, Ottawa. The total production for the Dominion was 1,400,000 tons, which was 107,000 tons more than in February. The imports were, 1,615,000 tons, which was 615,000 tons more than the preceding month. The exports amounted to 174,000 tons.

Output of Coal by Provinces in Short Tons.

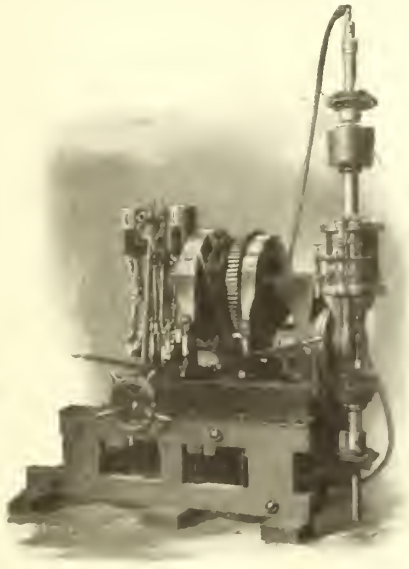
	March 1922	Feb. 1922
Alberta	618,000	634,000
Nova Scotia	434,000	344,000
British Columbia	302,000	262,000
Saskatchewan	30,000	35,000
New Brunswick	16,000	18,000
Total for Canada	1,400,000	1,293,000

The Diamond Drill for Oil Wells*

By FRANK A. EDSON

The drilling of a 1,200-bbl. well by the use of the diamond drill, accompanied by the securing of some 80 per cent of core and a substantial saving in drilling costs, has been a matter of considerable comment among both operators and geologists. Since the work was done under the actual direction of the writer, he has thought that an account of the operation would be of interest both to members of the association and to oil men in general.

The well was drilled for the Panuco-Boston Oil Co., a subsidiary of the Atlantic Refining Co. It was located on the Ugarde lease in the Panuco district of Mexico,



The Drill used

about 40 kilometers from Tampico. The formation is similar to that found elsewhere in the district. There is about 200 feet of surface soil, mainly river wash which contains some boulders. Underneath this there are about 1,200 feet of shales, presumably Mendez, underlaid by some 700 or 800 feet of the shaly limestone of the San Felipe series. This lies directly upon the Tamisapa limestone, which, however, was not penetrated by the drill as the production was found before this formation was reached. Judged from a drilling standpoint the upper 1,400 feet is good rotary ground, although it can be drilled with cable tools. Below this depth the ground is much better for standard than for rotary tools.

The upper part of the formation, down to 1,407 feet, was drilled by attaching a fish tail bit directly to the diamond drill rods by a special "sub" or bushing, and operating as an ordinary rotary. The customary mud-laden fluid was used, an ordinary mud pump being employed for this purpose. The main points of difference between the rotary and the diamond drill in this part of the work was the manner in which the drill stem was rotated, and the way in which it was held in suspension.

The drill stem, or "rods," as they are called in diamond drilling, is directly connected to the engine by bevel gearing very similar in type to that used in the modern gear-driven rotary. The effect is to give a higher speed of rotation to the bit, the diamond drill ordinarily running from 200 to 400 revolutions per minute, while the rotary normally averages between 60 and 100 revolutions per minute. This higher speed must generate greater centrifugal force, which slaps the mud against the side of the wall somewhat harder than does the ordinary rotary. This is a point which it is probably impossible to actually demonstrate, but rotary drillers with whom the writer has discussed the matter all agree in thinking this to be of practical benefit to the hole.

The drill stem is made up of flush-jointed steel rods, which are of uniform outside diameter. These rods are passed through a chuck, which, while being free to revolve, is attached to a hydraulic cylinder. This cylinder moves vertically, either upward or downward, carrying the rods with it. In effect it is a hydraulic jack which carries the weight of the rods and yet allows them to revolve freely. As the water is allowed to escape from the under side of the hydraulic piston the drill stem moves gradually downwards, or, if the direction of the flow in the cylinder is reversed, it moves upward. The escape of the water is controlled by a valve and is capable of a very fine adjustment. This method allows the driller both a more positive and a more delicate control of the movement of the drill stem than is enjoyed by a rotary driller. This was well illustrated by a fishing job which took place at 2,100 feet. At that depth the top of the core-barrel, which had been obtained locally and contained defective material, twisted off. A screw tap was attached to the rods, and the engine was revolved at the slowest possible speed, while the driller fed the drill stem down so delicately that it entered at the proper speed to firmly thread its way into the inside of the core-barrel. Incidentally the entire operation only took a little over seven hours.

This absolute control of the movement of the drill stem enabled the drill to go through gumbo without "balling up." The secret is to feed the bit down evenly and slowly so that it cuts the ground a little more slowly than the pump can take it away. If this is properly done there is little danger of a ball up for there are no

The drilling rig

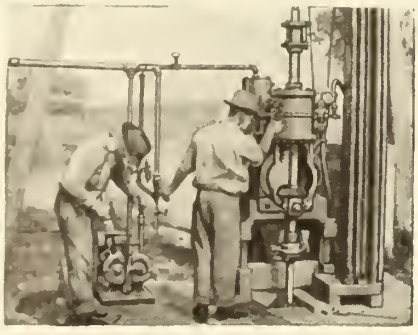
* For the above interesting article we are indebted to the Sullivan Machinery Company.

cuttings there to ball up. The value of being able to go through soft ground without being troubled in this way is hard to overestimate.

The cuttings were much finer than those obtained from ordinary rotary drilling. Probably 80 per cent. would go through a 50-mesh sieve. This is probably due both to the higher speed and more even feed of the diamond drill. Finer cuttings undoubtedly work farther back into porous strata and thus mud up the hole better. On the other hand they do not afford as much information to either the geologist or the driller. Mr. Elledge, the geologist for the Panuco-Boston, complained that when he washed the samples he had nothing left. When the diamond drill uses the fish-tail bit the log will be even less reliable than the ordinary rotary log because of this fact.

The hole was cased with three lines of casing. For surface conductor 223 feet of 7⅝ inches pipe was used. Inside of this was placed 548 feet of 6-inch pipe, while the final string was 1,407 feet of 4-inch pipe. The casing was all of the ordinary type, no flush-joint being used. The 6-inch pipe was an unnecessary precaution taken because this was the first hole ever drilled in this way. It is being omitted on succeeding holes. The 4-inch pipe was cemented into the lime in the ordinary way by the use of a top and bottom plug. The cementing was done in accordance with the Mexican Government regulations, and under its supervision. It is required on all wells drilled in the high pressure area. In conformity with these regulations the cement was allowed to set 10 days before being drilled out.

On derrick floor using diamond drill



In the upper part of the hole difficulty was encountered because the drill stem, 2⅜ inches in outside diameter, was too small for the large size hole which the drill was then making. The side play of the stem caused frequent breakages. This was temporarily remedied by using 4-inch rotary drill stem with only enough diamond drill rods to make the connection through the hydraulic cylinder. Drill stem of a diameter of 3½ inches had been ordered from the manufacturers, but had not arrived at the time the writer left Panuco.

Diamond drill rods are ordinarily unscrewed by hand, using a 36" pipe wrench, and the machine was not equipped with mechanical means of breaking joints. This slowed up the operation of coming out or going into the hole, as breaking apart rotary tool-joints by hand is a slow and laborious process. Also the drilling was, perhaps, slowed up somewhat by the fact that the downward pressure of the hydraulic could not be used on the drill stem without danger of breaking it. This, of course, would only apply to the upper part of the hole. No records were broken so far as an individual day's run was concerned. The average cutting speed with the fish-tail bit was from 10 to 18 feet per hour, depending upon the formation it was working in. It is probable that, with the use of the proper drill stem and the greater familiarity of the crew with the operation, a speed of from 150 to 200 feet per day can be averaged.

After drilling out the cement, work was carried on by the aid of a diamond bit. A 3 5-8 inch bit, which cuts a 3-inch core, was used. None of the holes in the Panuco district are cased below the top of the lime, so it was unnecessary to carry a larger hole.

A 13-foot core-barrel was used, which necessitated coming out of the hole several times a day. An average speed of approximately 75 feet per day was maintained down to 1,850 feet, where enough oil was struck to fill the hole. From there down to 2,153 feet, where the hole was bottomed, the drill averaged between 35 and 40 feet per day. The former average was somewhat above the average of cable tools in this district, while they can only make from 8 to 10 feet per day when drilling in a hole full of oil. Lest the Panuco cable tool driller be unjustly criticised, it should be remembered that Panuco crude is of about the consistency of molasses and very effectually cushions the blow of the bit. The total time spent in drilling the well, including all delays, was less than 90 days. The writer is informed by statisticians that the average time for the Panuco Field is five months.

A cutting speed of approximately 10 feet per hour was made by the diamond bit. The loss of speed came from the time required in coming out and going back into the hole. At 1,500 feet it took about 45 minutes to come out and about 35 minutes to go into the hole. When the hole was full of oil it took nearly two hours to pull out and about the same length of time to go in. A 64-foot steel derrick was used, which allowed the rods to be pulled in 50-foot lengths. The speed of the drill is governed more by the number of times it is neeessary to pull out, and by the length of time required for this operation, than by any other factor. The number of times it is necessary to pull out is governed largely by the length of the core-barrel. A 30-foot one is to be used on the next hole, and it is very probable that an average speed of between 100 and 125 feet per day will be maintained.

Considerable doubt was expressed as to whether or not the drill would operate satisfactorily when the hole was full of oil, and if the drill stem might not be blown out of the hole when the high pressure was encountered. The oil in the hole seemed to act as a lubricant on the rods, and, if anything, the drill worked more smoothly. On the other hand, while an oil saver was used when the drill was running, it had to be removed to take the core-barrel out and the derrick and floor became so covered with oil that it was almost impossible for the men to keep their footing. This was the main reason why not over 40 feet per day was made in the last of the drilling, as the cutting speed of the bit was approximately the same as before.

The high pressure gave no particular trouble except that the last 500 or 600 feet of drill stem had to be snubbed out of the hole with a manila rope. It was unnecessary to use the stronger and more elaborate apparatus which had been provided for this purpose. While not over 750 pounds of pressure was encountered the writer has no hesitancy in stating that three or four times this amount could have been satisfactorily handled. The secret is never to let the well get away from you.

To the surprise of every one about 85 per cent of core was obtained. This was due both to the large size of the core and to the flat bedding of the rocks. Probably no one feature of the drilling attracted as much attention as the core. It was a new and satisfactory experiment to both operators and geologists to be able to see and handle the rocks which were actually producing the oil.

Some times the gas could be seen bubbling out of the core. Many of the cores contained fractures which, when broken open, were found to contain drops of oil. As the drill reached greater depths the fractures contained more and more oil, until at about 1,850 feet they began to give actual production. The well came in rather gradually from that point, until at 2,153 feet enough oil was struck to bring the production up to 1,200 lbs.

It was observed that these fractures occurred in zones. The drill would penetrate 20 or 30 feet of fractured ground and then go back into solid rock again. This would continue for 50 or 60 feet and then another fractured zone would be encountered. This information would have been very important had it been desirable to shoot the well. The shooter would have known, almost to the inch, just where to put the shot, as he could have judged much more accurately as to the amount of explosive required. In general it is hard to overestimate the practical value of the information to be obtained from such cores. The ordinary practical oil operator can obtain more information from them than the trained geologist does now from a microscopic study of well cuttings.

Use of Sullivan double tube core barrel

Doubt was also expressed as to whether or not the 1 inch pipe would be large enough to accomodate the oil. As stated above, the well came in with 1,200 bbls., but the oil coming out of the pipe did not fill more than one tenth of its area. There may be occasional wells so large that a 4 inch pipe really will not accomodate the oil, but they are few and far between.

An interesting discovery was the fact that the ordinary mud laden fluid which is used by the rotary can also be used with a diamond bit. It has generally been thought that the latter would require clear water, but about a 20 per cent mud solution was used in this hole with satisfactory results. It is probable that even thicker mud could be used if larger waterways were cut in the bit. The fact that mud can be used with a diamond bit makes it possible to drill in caving formations, recover the core, and at the same time hold up the sides of the hole with mud. This makes the diamond drill practicable for softer ground than has been thought before. Just what the limits are in this respect remain to be worked out.

An equally welcome discovery was the fact that a very considerable saving was made in costs. The well was completed for less than 60 per cent. of the current contract price in the field. This figure covers the complete cost, fuel, water, casing, rig, labor and diamond wear (which amounted to less than one cent per foot), all being included—a "turn-key job" in other words. It should also be remembered that neither the writer nor any of the drillers had ever worked in the Panuco Field before, and that the well was, therefore, to all intents and purposes, a wildcat to them. The writer has no hesitation in stating that as the men become more familiar with the work and develop the technique required in this field the costs will be cut to less than 50 per cent of those of drilling by ordinary methods.

It should be noted that the well was cored all the way through the lime. Had the plugged bit, which is solid and takes no core, been used it is probable that an even greater cut would have been made in the cost of this well. The writer has talked with drillers who have worked in both the Panuco and the Mid Continent Fields. They unite in stating that the rocks in Panuco drill about the same as the average rocks of the Mid Continent. He is, therefore, inclined to believe that a very substantial saving can be made in drill costs in the latter fields as well as in Mexico.

The writer also had charge of a drill in the Southern Fields which was doing structure drilling. This outfit had just gotten nicely started when he left Mexico, but one observation was made which is of importance in the Mid Continent. The drill was operating in the upper part of the Alazan shales, which are fully as soft as the ordinary rotary ground in this country. Men who have operated in both places say they are about equivalent to the softer portions of the Redbeds.

Yet by taking certain precautions over 95 per cent of core was obtained with a single-tube core barrel. From this experience it is believed that no great difficulty will be encountered in obtaining cores from either the softer shales or sands of the Mid Continent fields.

NOVA SCOTIA COAL IMPORTS

The first cargo of coal to be received at this port in 20 years from Nova Scotia mines arrived at Providence, R.I., last Saturday in the United States Shipping Board Steamer *Bethlehem*, totaling 3,600 tons, and consigned to the New York, New Haven and Hartford R.R. from Sydney, N.S. It is regarded as good quality bituminous and is admitted free of duty. The last coal from Nova Scotia came to New England during the winter of 1902-1903 when there was a shortage of domestic coal. Other cargoes will follow. It is reported that the New Haven fuel reserve is well stocked, following the receipt of two cargoes of coal from Charleston, S.C., the past 10 days, in addition to the Canadian coal.—*Seaward's Journal*, June 24.

PROSPECTS IN BRUCE TOWNSHIP NORTHERN ONTARIO

On the George Borgford claim (lot 9, con. II, Bruce twp.) a test pit is being sunk on a gold-bearing vein. The gold occurs with quartz and pyrite in narrow rusty shear zones in andesite rock of Keewatin age.

On the Quesnel claim, to the northeast in lot 1 con. IV of Bruce twp. trending easterly and westerly, a quartz vein two feet wide in andesite and porphyry of the Keewatin series, has been uncovered for the gold content of the vein is not yet known.

The Relationship Between Mining and the other Industries in Canada

A STATEMENT PRESENTED TO THE ANNUAL MEETING OF THE ONTARIO MINING ASSOCIATION IN PORCUPINE ON JULY 6th, BY THE SECRETARY, B. NEILLY

What do the people of this Province as a whole obtain by reason of the Mining industry? This is a question familiar to practically every member of this Association. Through the press the public is informed concerning the direct and apparent benefits, such as dividends paid by mining companies, the amount of revenue derived by the Government from the industry, and the part played by mining in opening up and developing the North. But to the hard-headed business man of Old Ontario, the information available has been incomplete and in some cases inconclusive. He comes back with the question "What do *I*, having no investment in mines, gain by reason of the Mining industry?"

The following figures have been prepared with a view to answering the last question.

The value of the gross production for 1920, the amount paid in dividends, for Compensation Insurance and wages, have been taken from Government reports. The $6,000,000 set up to cover increase on surplus accounts and profits made by non-metallic mines, may be accepted as reasonably correct.

To arrive at the percentage distribution of funds spent for mining supplies, the disbursements of a North Country gold-producing mine, were taken as the basis. It is of course apparent that the conditions at no one mine can properly be taken to represent all the mines. Had a Sudbury Nickel mine been taken as a basis, the freight and fuel expenditure would have been proportionately much higher. Had we taken a mine increasing its capacity and equipment during the period, equipment cost and customs duties would have increased. This then is an estimate, based upon the data available, and it is hoped sufficiently correct to indicate the market possibilities arising out of the development of the Mining industry.

To estimate the final distribution of wages, no better basis could be found than that upon which the Family Budget is estimated by the Department of Labour at Ottawa. The cost of food, fuel and rent has been taken as representing two-thirds of the expenditure of the average family of five, and the remaining one-third as covering cost of boots and shoes, clothing and incidentals.

Table II

SUPPLIES, ETC., PURCHASED IN 1920 $30,492,249

This amount was distributed, approximately as follows:—

For			
Ball Mill Liners, Castings and Machine Shop Work	13.00%	equals	3,963,993
Customs Duties	1.00%	"	304,923
Chemicals & Apparatus	9.36%	"	2,854,074

Drill Steel	1.65%	"	503,122
Express	.95%	"	289,676
Equipment	6.45%	"	1,966,750
Explosives	11.95%	"	3,643,824
Electrical Supplies	1.53%	"	466,531
Freight	8.21%	"	2,503,414
Hardware	4.58%	"	1,396,545
Insurance - fire	3.27%	"	997,097
Lumber	4.33%	"	1,320,314
Legal Expenses	.57%	"	173,806
Machine Drills & Parts	2.27%	"	692,174
Oil	1.08%	"	329,316
Power	18.95%	"	5,778,281
Pebbles	.93%	"	283,578
Rubber Goods	.48%	"	146,363
Stationary & Office Supplies	.63%	"	192,101
Telephone & Telegraph	.43%	"	131,117
Incidental Expenses	4.04%	"	1,231,887
			$30,492,249

Table I
1920

Gross value of metallic production		$48,281,553	
Gross value of non-metallic		24,795,194	
Gross value of mineral production in 1920			73,076,747
Dividends Paid			
Gold Mines	3,256,928		
Silver Mines	4,067,242		
Nickel Mines	1,910,800	9,234,970	
Taxes Paid			
Ontario (including share of municipalities)	370,667		
Dominion	878,772	1,249,939	
Compensation Insurance paid		335,628	10,820,307
Balance			62,256,710
Deduct amount estimated to surplus account of the metallic mines and profit earned and taxes paid by non-metallic mines			6,000,000
Amount remaining for compensation of labour and purchase of supplies, etc			56,256,710
Amount actually provided for wages			25,764,461
Amount provided for supplies, etc.			$30,492,249

Rent in this list, taken at approximately $25.00 per month per man, and railway fare introduced largely to take care of street-car fare in urban districts, are manifestly in excess of the amount spent by the average miner. His actual saving on these two items, added to the amount his average earnings exceed the cost of the Family Budget, represents savings.

Table III

GROSS WAGES PAID BY MINING INDUSTRY IN ONTARIO 1920 . . . . $25,761,461

Meats	11.19%	$2,883,043
Dairy Produce	12.79%	3,295,275
Flour, Bread, Rolled Oats, Beans	7.27%	1,873,076
Sugar	2.98%	767,781
Fruit	1.43%	368,432
Tea	.85%	218,998
Coffee	.39%	100,481
Vegetables	3.39%	873,415
Incidental Groceries	.87%	224,151
Fuel & Lighting	9.41%	2,424,436
Rent	16.09%	4,145,502
Boots & Shoes	2.86%	736,863
Clothing	11.43%	2,944,878
House Furnishings	2.86%	736,864
Railway Fare	2.86%	736,861
Health, Doctor and Dentist	4.76%	1,226,388
Insurance	2.38%	613,194
Charity, Church, etc.	2.38%	613,191
Newspapers & Education	1.43%	368,432
Sundry	2.38%	613,194
	100.00%	$25,764,461

The above figures show, then, approximately the market provided by Ontario's Mining Industry for the benefit of the producer and manufacturer of Old Ontario.

As a comparison it might be added that the 56 million-odd thus disbursed in 1920, exceeded the gross value of all Canada's exports during the same period, to the following countries:—

Brazil,	Cuba,	Columbia,
Costa Rica,	Chile,	Guatemala,
Honduras,	Mexico,	Peru,
Dutch Guiana,	Nicaragua,	Panama,
Dutch East Indies,	San Domingo,	Hawaii,
Philipines,	Porto Rico,	Uruguay,
Veneznela,	Bermuda,	Ceylon,
British India,	British Guiana,	Barbados,
Trinidad,	British Honduras,	Australia
Fiji Island,	Jamaica,	New Zealand,
	Straits Settlements,	

MINING OPERATIONS IN THE PROVINCE OF QUEBEC DURING THE YEAR 1921

The Annual Report of the Quebec Bureau of Mines is now available to the public.

Last year's mineral production had an estimated value of $15,522,988, as compared with $28,392,939 for the year 1920, a very serious drop indeed, but not necessarily discouraging when the facts are considered. The general depression in trade and commerce hit Quebec's asbestos industry hard. From $14,750,000, the value in 1920, the asbestos produced in 1921 fell to $5,200,000. Chromite dropped from $247,730, the value of production in 1920, to $22,696 in 1921; magnesite from $512,755 to $71,110, copper ore, from $98,854 to $10,463, and so on through the list with the notable exception of feldspar, the production of which represented $11,252 in 1920, and $79,752, last year. The increase was largely due to shipments from the O'Brien and Fowler quarry in the Buckingham district. The deposit here worked is one of great promise.

Asbestos. Quebec's pre-eminence in the asbestos market is not yet seriously challenged, although a cloud the size of a man's hand appears in the horizon. Of the asbestos imported into the United States, our chief markets, the province produced 65,700 tons in 1921, the rest of the world producing 940 tons, of which 449 tons are credited to South Africa. Of a total estimated value of $2,949,662, Quebec contributed $2,588,799. It is pointed out that actually 877 tons represents South Africa's output, shipments being made from ports not in the Union and the origin of these shipments being erroneously attributed to other countries.

The Report contains a timely review of the asbestos situation, along with useful information as to grading and uses, and a summary of the world's total output.

Copper. The Weedon Mining Company was the only shipper during the year. It was operated for three months only.

Chromite also was shipped from only one property, that of the J. V. Bélanger Mining Company, Coleraine district. The shipments wer consigned to the United States Ferro Alloys Corporation, which Company has now acquired the property. Two other mines were dismantled.

Molybdenite ore was not produced during the year, but renewed activity is expected.

Zinc and Lead.—The Tetreault mine, at Notre Dame des Anges, was the only shipper. 778 tons of lead concentrate were produced, valued at $18,080.27. No zinc concentrate was shipped. The mine was operated for only three months. At the mine of the Fereral Zinc and Lead Co., Limited, Gaspé, only development work was done. A large amount of high grade ore is blocked out in this mine and road construction is being carried on.

Gold was produced only as a by product of copper sulphur ore. Strange to relate, Quebec has yet no gold mining industry, though many a prospect pleases. This is not as it should be. There are no intrinsic reasons why Quebec should not be a substantial producer of gold. Systematic prospecting is needed. Why the prospector hangs back is something that invites enquiry.

Silver also is a by product.

Titaniferous iron ore received no attention during the year. The Quebec deposits, in view of recent metallurgical developments, deserve serious examination.

Magnesite. Three companies produced magnesite, the total output being about 5,000 tons. This is one of the minerals the working of which will be most adversely affected should the proposed United States tariff be adopted.

Mica production fell to its lowest recorded figure, and no *Graphite* shipments were made.

Feldspar, as mentioned above, was produced in much larger amounts than in 1920.

A small tonnage of *Iron Ochre* was shipped.

The rumour of the discovery of rich oil shales in the Township of Port Daniel turned out to be unfounded.

Amongst building materials, sand and limestones showed increased activity.

A useful feature of the Quebec Annual Report is a list of mines and quarries.

News and Comments

BY ALEXANDER GRAY

Yea, Verily, Brother!

The Scripture moveth some of us to moralize a bit about the following leading editorial in THE MONTREAL DAILY STAR of June 23:

LOOK OUT FOR SHARKS

Important mineral discoveries in any country offer a luring temptation to adventurous exploiters to offer for public subscription all sort of properties with glowing prospectuses, often misleading, often valueless and frequently fraudulent.

The bankruptcy of a prominent brokerage firm in this city proved the concern to have been loaded with the worthless scrip of oil and gold projects. For every genuine gold mine and for every genuine oil well there are scores of fake enterprises foisted on a guileless public.

In times when ordinary business is quiet these fake enterprises are often most prosperous because many well meaning persons, seeking something to offset business losses, are more prone to speculate and all the more easily gulled.

Those subject to this kind of temptation should make no investment in such enterprises without enquiry of their bankers or other financial authorities of good repute. "*Look out for sharks*" should be posted in every man's brain.

When this appears in the newspaper with the largest circulation, a newspaper with the power to beneficially educate the public in these matters, it is fervently hoped to "have a little more of the same, thank you", from that source. Putting "sharks" where they belong is a work in which THE STAR can greatly aid, even though Business Offices do not take kindly to the refusal of display advertising. The "temptation" is not confined to the gullibles in the Street; hence the editorial quoted suggests that newspapers, too, are remiss in failing to consult "bankers or other authorities of good repute", before lending their influential advertising columns to overstatements and mis-statements. Granting the difficulty of censorships in the circumstances, knowing THE STAR Staff to have no purpose other than to conserve confidence (and cash—petty cash, if you will) it is an established fact "sharks" are not so much concerned with editorial utterances so long as they have their advertising broadcasted and "every man's brain" is in a whirl lest it be too late to get shares of problematic value.

"Snaring the Great Uncaught", has become a popular pastime—and it is worth as much space as is devoted to other amusements-de-luxe. Mining Scientists seek the co-operation of newspapers like THE STAR in order to minimize the number of "fake enterprises" foisted "on a guileless public". Every prospect deserving consideration is entitled to funds. Syndicates or small companies, perhaps, should undertake initial work, instead of the almost interminable, and certainly insufferable, issues of scrip which make of so many half-baked concerns, "steam shovel propositions"—when it comes to shift the script. Closer organization would make it possible to suitably reward the prospector who accepts shares, in whole or in part payment, when a property discloses its merits; whereas in most instances neither the public nor the prospector with Vendor Script has a chance. "Look out for sharks" ought to be repeated in THE STAR—kept standing, as it were. Brave words those:

> "*All sorts of properties with glowing prospectuses, often misleading, often valueless and frequently fraudulent*".

To illustrate: The other day I ran into a speculator from over the border, who seemed to be busy. His explanation was: "At last I have the right 'dope'. I've been playing the market, and been a buyer until they took all I had. Now I'm a seller. I came to Montreal to sell an oil stock, and we can't hardly print the certificates fast enough. I'm even on the market. Me for the selling end of it hereafter". But the pioneer invariably is sold. Public confidence is sacrificed, and Canada loses more—infinitely more—than the mere money.

My reading of THE CANADIAN MINING JOURNAL policy is that it will promote every legitimate project, and the welfare of mining scientists. Too many mountebanks ceremoniously submerge prospects or more advanced propositions in "water", to depths beyond which deep-sea divers will not penetrate, knowing they never can "come up for air". Valuing outcrops and preliminary workings by the ream is no less reprehensible than by fathoms—of "water". The public should not be asked to take all the risk, the mining professions ought not to associate with perverts. A happier medium for obtaining working capital, and a polite refusal of the lay press to allow promoters to "put it over", will clarify the atmosphere. Daily newspapers cannot claim immunity by default.

Abandon Elbow Lake

In forecasting the abandonment by individual Hollinger officials of their options on Elbow Lake properties, the intention was to prevent the distribution of shares by other interests not so well and fully advised in the premises. Possibly the decision reached by President Noah A. Timmins and General Manager A. F. Brigham, after visiting the Manitoban fields, may not mean that other portions are unattractive for large operations. The Exploration Company of London, Tonopah Mining Company, Mining Corporation of Canada, McIntyre Company of Porcupine and Nipissing Company of Cobalt, each and all are capable of deciding for themselves. They have not made any extravagant claims, such as emanated from Elbow Lake Mines Corporation selling agencies. Attempts to build a public interest on the strength of Hollinger participation were inevitable, ill-advised as it was to involve the whole situation in a condemnation by the Hollinger people alone. If, as is alleged, several interests have shared the experience of the field force representing the Timmins party, then Elbow Lake needs more than oxygen to keep it alive. To have spectacular showings, too evanescent after being moyled, and to find that the bespanglings are only "skin deep", prompted the withdrawal of the so-called Hollinger staff and crew. It was suggested that diamond drilling might be more conclusive as a means of determination. Others may resort to that method. President Timmins has shown he possessed prevision; and he may be said to have the Midas

touch; yet the Elbow Lake situation to his judgment did not offer the opportunity for all he and his colleagues were prepared to provide. However, Hollinger standards may not govern throughout. The chief owners of Porcupine mines that are unique in popular estimate are chary about lending their prestige to anything that may not be strictly "kosher".

Kirkland Lake Proprietary Clean-Up.

As no such Kirkland Lake Proprietary details have been officially communicated to Canada, this item as it appears in London, is interesting:

"First clean-up to May 24 approximately $19,000 from 2,040 tons. Main lode intersected at fifth level. Burnside Vein looking very promising. No. 11 vein cut at fourth level Tough-Oakes. Both veins now being driven on".

The date of the cable was June 6. The average of the tonnage treated, is shown to have been $9.31 per ton, which should be bettered as development proceeds. By solving the faulted section and locating the vein system to the east of the north-and-south fault, it is hoped the present capable management will have all the financial assistance necessary to prosecute the development the properties need. The cards seem to be in the deck—it is for the players to use them to the best advantage. In this connection Mr. Keegan of THE FINANCIER, London, who recently toured the Ontario North Country, and who evidently had a special commission and enjoyed special facilities for obtaining information regarding London-owned or controlled properties, had the following:

"The old owners of the Tough-Oakes and Burnside properties, after picking the mines, suspended operations. It has been left to the new proprietors to pursue, with the most encouraging results and under the direction of the most skilled advisers, an energetic programme of exploration and development.

"Crushings have just been resumed, and the company bids fair to become in the early future what it was in the past history of the camp, by far the largest producer of gold in the Kirkland Lake area".

Having "passed the buck" to those who "picked" those mines and left them speechless and unsightly, it is gratifying to have Mr. Keegan, an Eye Witness that cannot be impeached without infracting the rule of evidence—assure interested and "innocent bystanders" that all is well. To a certainty the Tough-Oakes, Burnside and Sylvanite can do team-work that should bear out Mr. Keegan's forecast. But Mr Keegan must not hold London blameless for that "picking". It was an international "mandate"

Mr Sifton Sold too Soon

The "boom" days of Montreal River areas were twenty four hour in duration altogether too short for prospectors and promoters. Senator O'Brien and the Honorable Mr. Sifton on joint account invested in Miller Lake claims, the Bousall, Gates, etc. They paid cash, and it was presumed they were well advised. Somehow they were unsuccessful. Senator O'Brien took up other ground on personal account, and the Miller Lake O'Brien has entirely justified his sporting spirit. Not so long ago, Messrs O'Brien and Sifton had a heart to heart chat, which resulted in Mr. Sifton disposing of his interest. Then (and this is the irony of it) it is understood that prospecting of what was an O'Brien Sifton area resulted in uncovering a silver vein that will be a useful adjunct to the Miller Lake O'Brien. So that section still has its story uncompleted. Elsewhere, Mr. Sifton has not fared well in his mining ventures. He and his associates also were pioneers in the Columbia oil fields. They had the rail position, as it were, in the race, and Kelly was confident Columbia had oil fields of first magnitude. Lord Murray of Elibank, representing the Cowdray interests, was not as quick as Kelly of Canada; and yet Kelly could not convince his Canadian partners that he was right. Now-a-days the International Petroleum corporation and others think so well of Colombia that they hold millions of acres, part of which was within Canada's grasp.

W. P. Alderson Of Mexico And Alaska

Senor William P. Alderson hardly arrived from the Thompson-Doheny-Nayarit mining property in Mexico than he went off in light marching order to Alaska, where the same principals have a mining and milling situation that promises more than it has performed, although current returns are not despicable. Senor Alderson has unbounded faith in Mexico and its mining fields; only it is somewhat realistic to have twelve men killed by bandits on the trail a day ahead of him and his mule. He believes the Canadian North Country has advantages surpassing others, when necessary capital is employed on the break-away basis of all things being equal. Mexico is a Miner's Land of Plenty, according to the Senor originally from the "Soo", erstwhile of Porcupine and Sheep Creek, British Columbia—and yet the taxgatherer is somewhat too vigorous with both arms, and many producing companies are not so fortunate as his, in being so close to a railway and the seaboard. To have your clean up high-graded by bandits is not at all jocular. When Mexico is at normal, there will be more mines, and more money seeking Mexico. Meanwhile Senor Alderson thinks Northern Ontario, British Columbia and Alaska will hold the stage, unless Elbow Lake and environs proves up more to the satisfaction of the large companies represented there. The Thompson Doheny-Budd Alaskan holdings are apt to obtain greater prominence. With a milling grade of $10, the matter of quantity is being determined. Power facilities are a pre-requisite, however, and either the Government or mine owners will have to provide that in order to maintain year round operations. Smaller plants are using gasoline. Hauling coal long distances in that country is far from being economical. Messrs Thompson and Doheny have done privately what more of their kind might take for example.

Dome Operating Costs

Special circumstances made for higher operating costs at the Dome Mines in 1921. They amounted to $4.558 per ton milled, as against $1.529 in 1920, which left a per ton profit of $3.246. This, says Mr. DePencier, "is more than accounted for by the increased expenditure on development work, this expenditure being $1.123 as compared with $0.925. There is also an increase of 70,000 tons in the broken ore reserve, as against a reduction of 50,000 tons in 1920. Labor was plentiful but many materials are still high, largely owing, it is stated, to high freight rates.

Mr Thomas A Edison, who is a strong advocate of Government acceptance of Mr. Henry Ford's offer to development of the Government's nitrate and paper projects at Muscle Schools, Alabama, has been invited to appear before the Senate Agricultural Committee to present his views on the subject. In an informal interview Mr. Edison said he was keenly interested in developing a domestic source of potash capable of competing with the German product. He is experimenting with a large slate deposit in Tennessee said to have a high potash content.

News of Mining

Great Britain

Ireland's annual output of coal is roughly 90,000 tons or only 149 tons per annum for each underground worker. Ireland's imports are 4,500,000 tons. Peat produced totals annually 7,000,000 tons. Peat is by far the most commonly used domestic fuel, and practically all of it is hand-cut.

The Welsh coal market is showing a pronounced depression. The stimulus expected from the effect of the United States coal strike has not materialized.

Europe

Germany's coal output for 1921 totalled 145,610,000 tons and 123,011,000 tons of lignite, the former figure including production from the Ruhr Basin. Both figures are considerably larger than the returns for the year 1920.

From 233 lignite mines in Czecho-Slovakia, the output was 21,050,712 tons and from 372 bituminous workings the output was 11,648,000 tons for 1921. For each man employed in lignite mining the yearly output was 408 tons, the bituminous output, 153 tons. The production of steel amounted to 917,662 tons.

Experiments in the production of steel by the reducing action of aluminium and carbon are being carried on at Givet, France. The process is developed in three stages, reduction of iron, manganese and silicon from their oxides; reduction of the added alumina to aluminium carrying in solution ferro alloys; and oxidization of impurities at the high temperature induced by the alumino-thermic reactions. An important phase of the process is the utilization of impure ferruginous bauxite.

January output of crude oil from the Baku fields showed an improvement of 1.6 per cent over that of December, 1921. It amounted to 15,446,000 poods, a pood being 36 pounds. The February output was slightly less, 14,423,000 poods; and the March output, 16,500,00 poods.

A conference of 1,200 leading German industrialists in Hamburg lately was decidedly pessimistic in tone. It was generally agreed that the depreciation of the mark and the scarcity of raw materials were having a bad effect on German trade, and that the German worker might soon have to forego the luxury of the eight-hour day.

Imports of coal into Germany from Great Britain during the first four months of this year amounted to 1,330,000 tons. A report from Essen states that the increasing volume of these imports is causing uneasiness.

The export of iron and manganese ores from Russia to Germany is beginning to assume noticeable proportions.

It is said that the shipments of iron ore from the port of Luleaa in Sweden will this year total 1,500,000 tons, as against 200,000 tons for last year.

Australia

Drilling for oil has brought some little encouragement at Montajap, Victoria. Here drilling has progressed to a depth of 450 feet, and evidence of the existence of oil has been encountered. So far the evidence is qualitation rather than quantitative.

Various schemes of treatment are being considered for the treatment of the lignite of the Morwell beds, close to Melbourne. At present the much-used German system of briquetting is in favour; but it seems probable that a more modern system, such as low temperature carbonization, will be eventually adopted.

United States

The United States Geological Survey is encouraging "wildcatting" for potash in Texas. The Survey urges core-drilling so that records of the occurrence of potash may be kept. Already several companies have let drilling contracts.

During the week ended June 10th United States Mint purchased 1,955,000 ounces of silver. The total purchased under the Pittman Act amounted at that date to 114,178,756 ounces.

The Interstate Commerce Commission has ordered a ten per cent. reduction in freight rates on iron ore originating in Michigan, Minnesota and Wisconsin. The new order goes into effect on July 1st.

The mining industries supplied United States railways with about 588,000,000 tons of freight during 1921. This represents about six times the amount of agricultural freight moved, and about four times the freight contributed by manufactures. A closer classification of freight would give mining an even greater advantage.

South America

Output of coal in Chile, the chief South American producer, amounted to slightly over 1,000,000 tons during 1921.

An appropriation of about $14,000,000 has been made by the Government of Brazil to finance the first stage of a general plan for the electrification of the Brazil Central Railway.

A few weeks ago the first shipment of petroleum, since the war, was made from Buenos Aires to Germany. The shipment was 7,690 metric tons. During the month of April the Argentine production of petroleum was 32,000 metric tons.

Amongst other recommendations, the President of the Uruguayan Republic, in his message to Congress, suggested the nationalization of coal and petroleum resources.

NEW METAL BROKERAGE FIRM

The announcement was made last week, of the establishment of the business of Messrs. Honston and Dutton, Metal Brokers. The new firm are quartered in the Toronto Stock Exchange Building, 84 Bay Street, Toronto. The firm will deal chiefly in the more important metals of the non-ferrous group, including copper, silver-lead, zinc and tin ores, concentrates and reductions. Later on they will be dealing in the refined products of Canadian mines. The firm are hoping to establish strong connections with large and influential firms in Europe who are engaged in the international metal trade, and will undertake forward contracts with Canadian mines. The partners in the new firm are Mr. R. S. Honston of Toronto, and Mr. S. W. Dutton, who recently arrived in Toronto from Australasia.

The Transvaal gold output for May 1922 amounted to 629,786 fine ounces, as compared with 511,338 fine ounces for April 1922 and 687,776 fine ounces for May 1921.

Notes From Nova Scotia

The Meeting at Truro

A convention of the United Mine Workers was held last week in Truro to discuss the Scott Award, but to all appearances it seems to have attended to everything else, but the business for which it had been called. Evidently all that Mr. McLachlan (who seems to have dominated the meeting) wanted, was an opportunity to show his scorn and contempt of the findings of the Scott Board. He had boasted that he had succeeded in forcing the hands of the Government to appoint a second Board, but now that it was finished and had given out an adverse decision, he stated that "the U. M. W. were through with Boards, and that all future victories would be won in another way."

The whole tone of the convention was most disappointing to those who looked for better things. Arrogance of manner and impudent language marked its attitude towards a Government that had turned an attentive ear when the cry for a second Conciliation Board went up. There was neither common civility nor respect shown, much less gratitude in recognition of the fair and generous treatment of the Federal Government. There wasn't even an attempt made to disguise the feelings of men who, however much they may have been disappointed by the Award of the Board, were in duty bound to act as respectable citizens. A studied hostility was openly manifested to all Governments, all established authority, and indeed to everything except to Soviet Russia and communistic rule.

A Soviet Rule in Fancy

For the brief span of one week while the Convention was in session, J. B. McLachlan was a real "Lenine", living in imagination the revolutionary life of a Russian Bolshevist, and revelling in dreams of a "new heaven and a new earth" under the benign influence of the Third International of Russia. And at the end of that "perfect week" he had the supreme pleasure of knowing that he was the chosen delegate to represent the deluded and reactionary miners of Nova Scotia in a supposed labour convention to be held at Moscow. No other delegate would accept the doubtful honour, and one after another turned it down, when finally it was tendered to the man who heretofore had expressed a fond wish to shake hands with Lenine and Trotsky. But before he is sure of being on the way to Russia, McLachlan has an election to run, and "there's many a slip 'twixt the cup and the lip."

For some weeks the public press, when in lighter vein, laughed at the proposal of McLachlan to give Russia a loan of fifteen million dollars in wheat. But these have suddenly awakened to the fact that they have a real Red representative among them, who would, if he could, hand over the whole country, wheat fields and all, while performing his servile obeisance to Lenine.

Nor were the majority delegates who carried the Truro convention to communistic extremes, ignorant of what they were aiming at. Openly they fanned the Russian Reds and just as openly passed a resolution that we proclaim openly to all the world that we are out for the complete overthrow of the capitalist system and the capitalist State, peacefully if we may, forcibly if we must, and we call on all workers, soldiers and minor officers in Canada to join us in liberating labour."

A Warning from Moderate Leaders

And when their frenzied oratory was at its height, such moderates as President Baxter, and International Board Member Barrett warned the members of the folly of following false gods and attempting to introduce the principles of the One Big Union, and trying to link up an industrial with a political organization; then McLachlan stood up and stated that these men knew nothing whatever of the matters under discussion.

Who did know? certainly not McLachlan, for if he had kept in touch with Trade Unionism in Russia he would not soon have forgotten the impassioned appeals of the labour organizations of that ill-fated country to the Trade Union Federations of Britain and other European countries. What force stayed the trend of the great international organizations of Europe from joining up with Russian labour unions? Was it not the statements of fact that there was no longer any labour organizations in Russia, that all of these had been wiped out and their officers and members by the thousand had been done to death by the Red communists when they stood up for the principles that govern trade organizations? And was it not the revolting story of the cruel persecution, imprisonment and death of thousand of socialists who had spent many years toiling, as they thought, for the liberation of their country? Such was the fate meted out to sincere and honest Russian workmen of all classes by intolerant, cruel, ignorant and illiterate Communists "red in tooth and claw." The Russian labour organization, as such, was swept away and a Third International, which is nothing else than a political organization, took its place. With the members of this body, the miners of Nova Scotia have decided to affiliate!

Bolshevist Delegates, but Sound Population

But why juggle with words, when the very spirit of the majority of the Truro delegates breathes out defiance to all established authority, demands the overthrow of the present industrial system and goes about to accomplish it by the treacherous seduction of the army and other guardians of law? It was an open exhibition of the Bolshevist spirit, as we have been taught to know it by its fruits, which have brought death and destruction to hundreds of thousands of patriotic Russians, and is still yielding its toll of millions by the terrible results of chaotic conditions brought about by ignorant idealists.

Men who can gloat over such horrible conditions and glorify them as idealistic, are not good citizens, but are criminal in instinct and revolutionary in name. They are dangerous enemies of the state, only awaiting an opportunity to rend the nation to pieces and fill the country with strife and bloodshed. To pervert the miners of Nova Scotia and other workers from good citizenship, by sowing the seeds of sedition and class hatred, is the avowed purpose of McLachlan and his followers; and we can depend upon it, they will be "instant in season and out of it" in carrying on their vile mission. No other country would tolerate such an outburst of rank disloyalty, and no country, not even Canada, can permit such dissemination of poisonous sentiment without a pollution of the public mind and a loss of respect for constituted authority that will finally lead to the overthrow of its moral forces and to Anarchy within.

But after all, the miners of Nova Scotia do not comprise the great bulk of the population even if they were all Reds, as they are not, and it will not be an impossible task for the rest of the population to give this class to understand that British liberty and British law still

guard the homes of the peace-loving citizens of our Province and Country

A Red Resolution

By a large majority a motion was passed to accept no reduction of wages. What this means, when it is known that a reduction has been in force since last January, is evident only to the men who find consolation in passing such a resolution. Of course, it prevents the Scott award from going before the rank and file to be voted on. But all the work of the convention was highhanded and was not in keeping with the constitution of the Mine Workers' organization. All references by the extremists to the Scott board were insolent and insulting, to say the least. Chairman Scott had shown a great deal of sympathy with the miners, had gone out of his way to please them, and did almost everything he was asked to do by them; yet he is described in the following resolution—"like a vaudeville actor, he wasn't among us with his part in the show cut out for him. Among us he went through his little stunts, made his bow and, like a vaudeville actor, left us." "The Scott Act ought to be rejected now by this convention." Clause No. 3 demonstrates the lawless feeling of the meeting and clearly points out what would happen in Nova Scotia if the extremists among the miners had their way. "No. 3 clause—Over the heads of Governments, we appeal to all soldiers and minor law officers that they join with us in our attempt to secure for our class and their class, the working class of Canada, a living, and free access to all the means of this country." Half a million citizens are threatened by a number of thoughtless firebrands whose whole stock in-trade amounts to a few catch phrases, through which they seek to call the attention of the world to the work of a convention that has been more notorious for what is failed to do than for what it has done.

"Strikes as weapons are obsolete," said Secretary McLachlan and he darkly hinted they there were others more effective and destructive. If he meant striking on the job, he was never more out in his reckoning. He declares that he is without love for all paternal governments, but he is more indebted to the Ottawa government for saving his face than he would care to admit. Had Premier MacKenzie King, in the interests of the public, not thought it wise to appoint a second Board, or had he even delayed the granting of that Board for a few weeks longer, striking on the job would be just as obsolete in the McLachlan way of thinking as strikes now are.

I do not know whether Mr. D. H. MacDongall increased in stature when he read the statement of Secretary McLachlan "that if the U. M. W. came out in the open to fight, it would be defeated." But coming from such a source it was quite an admission, and was enough to give the average man a great conceit of himself. Of course, Mr. MacDougall is above the average man in many ways, especially in common sense, and I have no doubt there was little extra chest expansion when he read the statement. But a Highlander has the quality of waiting, and a time may come, if McLachlan persists, when patience may be set aside, and "on yonder brake beneath the cliff, another Red M—will lie both stark and stiff." Metaphorically, of course, but nevertheless true. The Vice-President has ere now brought more than one proud Chieftain to his knee. He knows the game and is a seasoned veteran, and when an opponent worthy of his steel closes with him in deadly strife, he may well "look to sun, moon and stars, as what he ne'er might see again."

Mooted Improvements in Steel Plant

Much is being written about improvement to the Sydney steel plant, and no doubt there is much to be done. A new blooming mill and fifteen new open-hearth furnaces are on the program. How soon work on these will begin is yet in the lap of the gods. The expenditure will be large, but it is understood that the saving per ton of steel will be such that on an annual output of one million tons per year the whole cost would not take many years to pay off. A number of the open hearth furnaces are ready to re-light, and gradually new departments are starting up, adding to the number of men employed.

Mr. Bischoff's Appointment

Mr. W. H. Bischoff is General Superintendent at the Sydney steel plant. He is well known to the men of the plant, and his is a most popular appointment. He is a big man with a smiling face, and has a kind word for all. When on his return he passed through the works, he had a real Highland welcome and was greeted on all sides by men of all departments. He had formerly served with the Company for over three years, and during that time he had made a host of friends.

BARIUM AND STRONTIUM IN CANADA

The Mines Branch, Department of Mines, Ottawa, has just published *Barium and Strontium in Canada,* by Hugh S. Spence, a volume of 100 pages with numerous diagrams and illustrations. Herein are described all the known occurrences in the Dominion of barite and celestite, the chief minerals containing barium and strontium. Appended are sections describing the uses of each of these minerals.

The market for barite is limited. It is used principally for the production of lithopone, which is a paint for inside use composed of 70 per cent. barium sulphate and 30 per cent. zinc sulphide. It is made by reducing the ground barite (barium sulphate) to the sulphide by roasting with coal, and adding to it, hot, a solution of zinc sulphate. The resulting chemical reaction produces zinc sulphide and barium sulphate, as noted above. It is much cheaper than pigments made from lead or zinc. A long series of chemical reagents containing barium is also made from barite.

The principal deposits of barite of commercial importance are at Lake Ainslie, Cape Breton, Nova Scotia, and near Tionaga, Night Hawk River, Fort Matachewan, Mistinikon Lake, and near the Elk Lake, Gowganda road, all in Northern Ontario. The latter three, though good veins, 6 to 10 feet in width, are remote from railroad transportation. The Lake Ainslie deposits have accounted for the bulk of Canada's production to date.

The market for strontium minerals is extremely limited. It provides the "red fire" for signal flares, and is also used in one of the processes of refining beet sugar, for which latter barium compounds are likewise used. Celestite is the principal strontium mineral in Canada. There are several occurrences of possible economic importance, all in Ontario, principal among them that near Calabogie, in Renfrew County, where a small grinding mill has been erected.

Gold continues to be the principal export of the South African Union. Out of a total export of merchandise last year amounting to £62,265,363, the gold export was responsible for £34,453,586, or 55 per cent of the whole.

For the first time in several years India has been recently an importer of coal. This abnormal situation was occasioned by the serious coal strikes and railroad strikes in the country. Recently several hundred thousand tons of coal per month have been imported, chiefly from the United Kingdom, but also from Natal and Australia.

British Columbia Letter

Crow's Nest Pass Coal Company's Year

The annual report of the Crow's Nest Pass Coal Company for the year ended December 31, 1921, was presented at the annual general meeting of the shareholders, held here on June 9. The financial statement shows that the net profits from all sources amounted to $341,938.98. Four quarterly dividends of one and a half per cent. each, making six per cent. for the year, were disbursed, the total amount distributed among the shareholders being $372,690. The sum of $93,725.51 was carried forward to 1922. The two subsidiary companies, the Crow's Nest Pass Electric Light and Power Company and the Morrisey, Fernie and Michel Railway Company, showed operating profits for the year amounting to $5,008.75 and $18,245.07 respectively. Capital expenditures during the year amounted to $105,418.68, on behalf of the coal company, and $3,582.16 for extensions and equipment for the light and power company.

During the year the company mined 774,847 tons of coal and made 66,569 tons of coke; this compares with 779,942 tons of coal and 75,928 tons of coke produced in 1920. The decrease is attributed to the general depression in trade.

The following officers were elected for the ensuing year: W. R. Wilson, Fernie, president and managing director; H. B. McGivern, Montreal, first vice-president; W. H. Robinson, Granby, Que., second vice president; A. Klauer, Fernie, treasurer; and J. H. Irvine, secretary. The directors appointed were: E. P. Earle, New York; G. W. Howland, Toronto; J. F. Edgar, Toronto; A. H. MacNeill, K.C., Vancouver; J. T. Maher, St. Paul; and L. G. Gilman, Toronto.

Fluorspar in Boundary District

Work has been resumed at the Rock Candy mine and mill at Lynch Creek. In 1920 more than 7,500 tons of fluorspar concentrate was shipped from this mine, but it was closed down early in 1921, on account of the general dullness of the fluorspar market. Most of the output in the past has gone to steel works in the State of Indiana, and it is understood that the Consolidated company has negotiated a contract that will keep the mine working at capacity for the next twelve months. Between 60 and 70 men are employed in the mine and about 20 in the mill.

Barbara Mine, near Greenwood, Unwatered

Local citizens have shown a good deal of public spirit by contributing work and funds for the pumping out of the old Barbara mine, in order that it might be examined by engineers whose principals are prepared to develop the property if the report of the engineers is satisfactory. The Helen mine is now being unwatered by a similar arrangement.

Boring for Oil

Duluth and Minneapolis capitalists have formed a syndicate for the purpose of exploring for oil over a considerable area of the upper Peace River. A considerable amount of machinery has been forwarded to the property, and it is expected that seven bore holes will be sunk during the present summer. J. A. Merrill, of Superior, has located the positions for the boring operations.

Cork-Province Mine, Kootenay, now Working

Work has been resumed at the Cork Province mine under the supervision of W. Yolen Wilbur, who at one time was mine superintendent for the Granby company. The 45 foot winze on the largest, or the east, ore body is to be sunk to the 100-foot level and a drift will be driven back to the main three compartment shaft, which it is proposed to sink at the same time. A hydro electric plant will be installed during the present summer at Kaslo Creek, to replace the present water power plant, and it is expected that the mill will be put into operation some time in August. The Cork Province ore contains a considerable amount of zinc, which in the past has gone to the tailing dumps, and it is estimated that somewhere in the neighborhood of 10,000 tons of zinc concentrate has been lost during past operations. This in the future will be saved, and, under the Trail zinc schedule is expected to net the company about $15 per ton. It is expected that in future the mill will yield about 13 tons of zinc concentrate and 10 tons of lead concentrate daily.

Silversmith Progressing

John B. White passed through here recently on his way to Spokane, after making an examination of the Silversmith mine. Mr. White, who is president of the Silversmith company, spoke enthusiastically of the splendid way in which the mine is developing. New ore bunkers and a filtration plant are being added to the mill, and its capacity, which is 125 tons of ore daily, will be brought up to about 150 tons.

Activities round Nelson

Mining conditions throughout this district are improving rapidly, and it is anticipated that after the convention, which takes place during the first week of July, a good deal more money will be invested in the mines surrounding Nelson, a number of people having expressed their intention of attending the convention with that end in view. Work has been resumed at the Surprise mine at Sandon. H. H. Dimock and partners have taken a bond and lease on the Molly Hughes; and the Nugget, Queen and Emerald companies all have increased their working forces.

Thomas McAllister, pioneer mining man of the Cariboo and Kootenay districts, died at his home at Milner, on June 10, aged 72.

More Ore at Rossland

The continuity of the bonanza ore shoot at the I. X. L. mine has been established, and it is expected that another car of ore will be shipped shortly to the Bunker Hill and Sullivan smelter. Mrs. A. I. McKinnon has started a small force of men in the Golden Dip mine, which adjoins the I. X. L. and already some promising gold ore has been found.

Portland Canal District

S. G. Benson has uncovered a two foot vein on the Lucky Boy claim, and has traced it for 250 feet on the surface. An average of samples taken from different parts of the vein is said to have given an assay of $126 per ton in lead and silver. The claim is situated within a mile of the Salmon River wagon road and within 100 years of the new government trail up Eagle Creek, so there will be no difficulty about the shipment of ore should the prospect be converted into a mine.

J. J. Coughlan, president of the Silverado Mining Company, arrived from Vancouver recently to make a general survey of the conditions at the property.

Harry Howson has arrived, and will take charge of the exploration work at the Big Missouri mine for A. B. Fraser and associates, who recently took an option on the property.

Grant Mahood has returned from a trip South, where

he succeeded in floating the American Mining and Milling Company, Limited, with an authorized capital of $1,500,000, for the purpose of developing mines in this district. Operations will be started on the Betty mine, which is situated about seven miles north of the Premier, and it is said that $100,000 is available for exploration and development on the property. Some promising ore has been exposed on the surface, and an attempt will be made to develop this at depth. The company is composed of substantial business and professional men, most of whom reside in the city of Vancouver.

O. B. Bush, who has been associated with Grant Mahood in a number of mining ventures in this district, and who recently sold his interest in the B. C. Silver Mines, Limited, has formed a company to bore for oil at Huntington Beach, California. Apparently Mr. Bush has tired of the long winters and short summers of this district.

Nichol Thompson, well-known mining man of Vancouver, is in the district at the time of writing, looking over the many claims in which he and his associates are interested.

J. A. Bancroft, assistant manager for the Granby Consolidated, is looking over a number of properties for his company. Mr. Bancroft always is a popular examiner, as even when he turns a property down, often he will make suggestions as to its future development, and, if the work is carried out, it is possible that a second examination will be made.

Ore Receipts at Trail

Ore receipts at the smelter for the first week in June totalled 7,997 tons, of which 7,288 tons came from the Consolidated company's mines, practically all from the Sullivan. The other shippers were: Black Rock, Northport, 39 tons; Ottawa, Slocan City, 11 tons; Guelph, Republic, 155 tons; Rosebery Surprise, Rosebery, 61 tons; Silversmith, Sandon, 273 tons; and Surprise, Republic, 164 tons.

Dolly Varden Impasse

Mr. Debrisay, acting for George Wingfield, of Reno, Nevada, has obtained an order *nisi* from Justice Morrison for foreclosure of the Dolly Varden and Wolf mines and the Dolly Varden-Alice Arm railway and rolling stock, covered by a mortgage given to the old Dolly Varden Mines, Ltd., in 1919. The original amount of the mortgage was $150,000, but accrued interest has swelled it to $200,000. Though papers were served on the Taylor Engineering Company, Taylor Mining Company, C. M. Rolston, trustee for the bond holders, H. C. Chiene, trustee for the creditors, and Dolly Varden Mines, Ltd., no defence was entered. It is rumored that a private agreement has been reached between Mr. Wingfield and the Taylor Mining Company, whereby the latter may redeem the property within a given time by entering into certain financial conditions, but no confirmation of the rumor can be obtained. The order given by Justice Morrison calls for an accounting, and will have to be spoken to again before it becomes absolute.

New Coal Bunkers for Vancouver

New docks and coal bunkers are being erected on Vancouver harbour near the terminal of the Canadian National railway by Misak Aivazoff, for the storing and handling of Vancouver Island coal. It is stated that the whole construction will cost in the vicinity of $50,000.

To Drill for Coal in the Omineca

The Robinson Co., of Vancouver, has been awarded the contract for diamond drill work on the defunct National Finance Corporation's claims, in the Copper River district, Omineca mining division. The contract was given by the Yorkshire Trust Company, liquidators of the Finance corporation. Five seams of semi-anthracite coal have been developed near the surface, and the drilling is being undertaken with a view to attempting to prove the continuity of the seams. If successful it will demonstrate the existence of several million tons of coal. The coal property is said to be the largest single asset of the defunct company.

Canada Carbide Branch in B. C.

Among the new companies recently gazetted are the Okanagan Coal Oil and Gas Company, Limited, with a capitalization of one million dollars and headquarters at Vernon, B. C., and the Canada Carbide Company, Limited, with a capital of two million dollars and provincial office in Vancouver. The latter is a Quebec concern, that has sought and obtained extra-provincial rights in this province.

CORRESPONDENCE

MR. DENIS UPHOLDS OLD ADMINISTRATION

To the Editor,
Canadian Mining Journal.

Sir,

I have read, with mixed feelings, your editorial entitled "Aiding Prospectors in Quebec," which appeared in the "Canadian Mining Journal" of June 23rd.

I agree with the remarks that the Quebec Mining Laws, previous to 1909 were awkward and faulty, and the changes introduced in 1909, practically adopting the main principles of the Ontario Law, was a tremendous step forward. I can speak of this impartially, as I had nothing to do with the change. When I came to Quebec, in 1910, the new regulations were in force. However, I strongly and emphatically dissent from the comments regarding "the key to the backdoor of the recording office," and that "Northern Quebec was a preserve closed to all prospectors except those with influence at Quebec city", as well as "the mining law was faulty and its administration was worse." These are rash statements, probably based on the criticisms of a disgruntled prospector, which are out of place in the editorial page of a publication of the standing of the "Canadian Mining Journal", for I am convinced that they have no foundation. Our predecessors in office, technical, executive, recording and others, had quite enough of a handicap with the old mining law regulations without imputing to them such vile motives as your editorial implies. I have been twelve years in office here, and I have failed to observe, from the records or otherwise, the slightest dishonest irregularity which might have taken place before I came, and in saying this I am not at all actuated by the sentiment that "de mortuis nil nisi bonum," but merely by justice and fair play.

Yours, etc.,

THEO. C. DENIS.

Bureau of Mines, Quebec.
June 27th, 1922.

That the very same asphalt used by Christopher Columbus on his third voyage to America to caulk his ships, should be one of the chief sources of material for the manufacture of acid-proof floors for chemical plants and laboratories, will be demonstrated at the Eighth National Exposition of Chemical Industries which will be held in the Grand Central Palace, New York, during the week of September 11th-16th by the Barber Asphalt Company of Philadelphia. The romance of the Island of Trinidad with its famous asphalt lake, which has furnished more paving material for streets of the world's cities than any other source, and the numerous applications of this material and its derivatives in the chemical industry, will be shown at the Exposition this year.

Northern Ontario Letter

Hollinger Record

The dividend of 1 p.c. on shares in the Hollinger Consolidated Gold Mines, payable July 15th, to stockholders of record June 30th, will call for the distribution of $253,692.30, and makes a total of $1,775,846.10 so far this year.

Production and dividends from the property since the beginning in 1911 follow:—

Year	Production	Dividends
1911	$ 46,082.52	$ ———
1912	933,682.00	270,000
1913	2,488,022.58	1,170,000
1914	2,719,354.47	1,170,000
1915	4,205,901.69	1,720,000
1916	5,073,401.05	3,126,000
1917	4,261,938.72	738,000
1918	5,752,370.87	1,230,000
1919	7,063,099.21	1,722,000
1920	7,162,611.13	2,214,000
1921	10,314,515.31	3,198,000
*1922 (est. 1st half)	6,000,000.00	1,775,846
Totals	$56,020,979.55	$18,333,846

* Includes dividend payable July 15th.

The ore reserves on the Hollinger were estimated to contain upwards of $40,000,000 at the beginning of the current year. Since that time, a large amount of development work has been done, and, in addition, the company has purchased the adjoining 160 acres known as the Schumacher Gold Mines. There are also reports that property to the south of the Schumacher, owned by the Mining and Finance company, may be taken over by the Hollinger. This all indicates a broadened area within which to still further increase the ore reserves.

In addition to having paid $18,333,846 in dividends, the company has a surplus of approximately $5,000,000, as well as owning a plant valued at about $5,000,000.

Discovery Reported in Ossian Township

A discovery of gold has been made on mining claims located in the township of Ossian, lying to the north-east of Larder Lake, and about twenty five miles east by a little north from the producing section of the Kirkland Lake district.

No details of the find are reported, with the exception that the gold occurs in a wide body, and is a very encouraging occurrence as shown by average assays.

A feature of the discovery is that it lies directly in line with the strike of the Kirkland Lake series of rock formation and is probably a direct result of prospectors going out in search of ore deposits in this easterly continuation of the belt.

The township of Ossian is adjacent to the inter-provincial boundary of Ontario and Quebec. It is interesting to note that it is to this part of the province of Quebec that the Geological Survey, Ottawa, is directing special attention this year.

Hoist for Deep Levels at Teck Hughes

The installation of a 100 ft. hoist, electrically driven, has been completed at the 500 ft. level of the Teck-Hughes mine. This machine will enable the company to operate to a depth of 1,500 feet.

The significance of the installation of this big machine is that from this date forward the plan is to draw ore from the 605 and 730 ft. levels. As is generally known, the Teck-Hughes has not been able to draw ore from these two levels pending the installation of this big hoist, so that production since early in the current year has been from ore taken from or above 500 feet deep.

Since November last, some exceptionally rich ore has been developed at the lower levels of the Teck Hughes and the production figures in December and January showed the ore averaging around $20 per ton, or approximately double the normal average. Recent development work has proved the existence of rich ore in important quantities at these lower levels, so that drawing ore from these points will signalize a big increase in production.

Instead of treating 160 tons daily as has been the recent rate, and producing around $10 a ton, or $1,500 or $1,600 daily, it will be reasonable to look for a production of about $2,500 daily, beginning July, this coming from about 140 tons of ore yielding about $18 per ton. Indeed, the indications appear to be that the Teck-Hughes will run the Wright-Hargreaves a close race for first place in point of current production in the Kirkland Lake district.

McIntyre Results for Fiscal Year

The McIntyre Porcupine closed its fiscal year on June 30th, and will show an income of about $1,900,000. This achievement compares favorably with the preceding year, when $1,904,326 was produced.

Due to carrying on a large amount of development work, the average recovery per ton has been lower during the last half of the fiscal year than the average grade of the ore in reserve. For instance, during the third quarter of the fiscal year the mill handled an average of approximately 536 tons of ore daily or a total of 48,255 tons for the three months. This resulted in a production of $450,835, or an average of about $9.31 a ton. This compares with an average of $11.08 a ton during the fiscal year ended June 30th, 1921 and $9.58 a ton since the beginning in 1912.

Up to the end of the company's fiscal year ending June 30th, 1921, the mine had produced $11,035,561 so that (taking the indicated output of $1,900,000 for the fiscal year just ending, the total production of the McIntyre Porcupine has now reached $12,935,561.

It is too early to announce the amount of operating profit, but the indications appear to be that it will compare favorably with the preceding fiscal year, when $815,562.53 was shown.

During the period just closed the McIntyre disbursed three dividends, each being 5 p.c., making a total of $516,012.15, thereby indicating that a substantial amount was carried to surplus.

Factors of outstanding importance in connection with the new fiscal year which begins July 1st are that the McIntyre has been opened up to the great depth of 1,875 feet and that in addition to proving the downward continuation of big orebodies it has been found that one important orebody which had been expected to pass off onto the adjoining Acme property of the Hollinger has taken a turn and remained on the west claim of the McIntyre. Another important factor is that the fifty per cent. increase in milling capacity is just going into operation and the new fiscal year offers promise of far eclipsing all previous records by producing close to $3,000,000.

The Lake Shore during May

During the month of May, according to the regular monthly statement just issued by R. C. Coffey, manager, the Lake Shore mine produced $40,834.20. The mill ran 93.14 p.c. of the possible running time and handled an average of 71 tons of ore daily, this being the highest tonnage record so far in the company's history. A total of 2,212 tons were treated, the average yield being $18.46 a ton, about 25 p.c. lower than the average value heretofore. Even this temporarily reduced average leaves the Lake Shore in the position of having treated higher grade ore than any gold mine in Ontario during the month of May.

Mr. Harry Oakes, President of the Lake Shore mining company, has re-affirmed his original intention of using his present small mill until his mine shall have showed up a greater tonnage of ore in reserve.

The stock of the company was originally sold at an average of about 30 cents a share, and the regular dividends of 2 p.c. quarterly now announced, amount to over 25 p.c. annually on the original investment. As regards the clamor of more recent purchasers of the shares for a higher dividend return, that is a matter which has probably caused Mr. Oakes no particular concern. The president of the Lake Shore has shown himself to be exceedingly capable.

The work of enlarging the main shaft will proceed at once with a view to developing the downward continuation of the orebodies at a depth of 800 feet.

A dividend of 2 p.c. will be paid Aug. 15th to shareholders of record Aug. 1st.

Clifton Porcupine Development Work

Equipment for the milling plant on the Clifton-Porcupine is on the way to the property. Foundations are being placed, and the present plans are to have the plant in operation within the next ninety days.

Surface exploration is being carried on and has resulted in opening up a vein system from which high assays have been taken. Arrangements are being made to resume underground work within the next few weeks, and part of the program will be to cross-cut from No. 3 shaft to the new vein system.

It has been announced that the greater part of the 170,000 shares allotted for financing construction work have been sold at 30 cents per share, without any commission being charged. The directors of the company have shown their faith in the undertaking by personally paying for the cost of selling these shares.

Harvey-Kirkland — a New Prospect

The Harvey-Kirkland is the name of a new company which is developing mining claims in the Kirkland Lake district. The group consists of four claims lying south of Gull Lake and East of the Montreal-Ontario property. These were formerly known as the Harvey and the Simpson claims and are regarded as promising.

The Harvey-Kirkland is capitalized at $5,000,000, made up of 5,000,000 shares of the par value of $1 each. The vendors were paid 1,000,000 shares for the properties and for the money spent previously the purpose of raising money for preliminary development, and this work is now well under way. At the time of writing, the treasury contains 3,000,000 shares, besides close to $50,000 in cash. A force of men is now engaged in doing surface exploratin as well as erecting another camp for the accommodation of a larger crew.

Crown Reserve on Gillies Limit

The Crown Reserve Mining Company is carrying on some surface work on claims in the Gillies Limit section of Cobalt. Some very strong veins have been found in Keewatin formation. There are no silver values of importance at outcrop, but the Crown Reserve is considering the question of diamond drilling for the purpose of determining the thickness of the Keewatin over the underlying diabase, with a view to exploring the veins underground at a point close to the Keewatin-diabase contact.

Canada's Mineral Production

Canada's production of gold up to the middle of 1922 has reached a grand total of approximately $488,617,107. The silver output of the Dominion up to this date amounts to $265,292,685, while the value of the copper produced up to the present time has reached approximately $270,529,237. The output of nickel amnnt to $173,173,403, while $54,000,000 in lead and $20,000,000 in zinc has been produced.

The aggregate value of these metals has reached $1,271,912,432. Not only this, but the physical aspects of the mines, with the exception of silver, hold out promise of new high records being established in the future.

For a new country to have produced over a billion and a quarter from the development of only the southern fringe of its mineral-bearing area is an achievement toward which captains of finance and industry are being attracted in great numbers. The indications are that an unprecedented wave of interest and development is at hand for this country.

Thousands of men are gaining their livelihood from work at the mines, tens of thousands of people are enjoying prosperity in the mining communities, while the savings of scores of thousands of men and women are bringing a high rate of return from investment in legitimate mining stocks.

Prospect at Wig-Wam Lake

Encouragement is being met with in the surface exploration work on the Wig-Wam property at Wig-Wam Lake in the Gowganda district. This property was formerly known as the Sanderson and attracted attention last year trough the discovery of a rich vein. It is stated that one vein is from two to three inches in width and carries high-grade ore in places. Another vein is from one to two inches in width and carries encouraging mineralization. Altogether, a large number of veins are in evidence.

During the past week the O'Brien mine shipped a car containing approximately 64,000 pounds of ore. This was the only ore shipment going over the T. & N. O. Railway during the week from Cobalt.

EDITORIAL

CONFERENCE ON IRON ORE

The conference on iron ore called by the Honourable Harry Mills, Minister of Mines, in Toronto on July 5th, promises to mark an epoch in Ontario's, and Canada's, iron ore problem. Ever since Mr. Mills assumed his ministerial duties, he has evinced a special interest in this, the most serious single problem that confronts his department, as well as one of the most serious commercial problems that faces Canada. There is no need of repeating here the data that demonstrate the vast annual loss in the nation's revenue due to our present non production of iron ore; but we wish to draw attention again to the fact that the problem that Mr. Mills is now facing squarely is one worthy of the best attention he can give it, and likewise that he will need, to attain its solution, the energetic assistance of some of the best brains in our country.

That Mr. Mills is fully cognisant of the fact that voluntary effort alone will never solve the problem, is demonstrated by his having at once acceded to and seconded the request of the conference that complete data, and well considered recommendations therefrom, be gathered by a small commission of experts, the ablest that can be found, under a retainer from the Provincial government. Many have been the conferences on the question of Ontario's iron ore; but the resolutions adopted have in the main been empty verbiage, due to a lack of that concentrated and continuous human effort which alone is competent to solve the problem, and which is ordinarily not available unless it is adequately paid for.

For the first time (so far as we can learn) a prominent blast furnace manager is numbered among the practical optimists who for years have believed that the iron ore to be had in Ontario can be economically used. It is mainly due to this accession to the ranks of the believers that the conference was able to present a united front in recommending that the provincial government appropriate public funds to investigate the problem. Mr. J. D. Jones, manager of the Algoma Steel Corporation, is not only a technologist of outstanding ability, but also a hard headed business man. When, with his knowledge of the practical difficulties, he is willing to put himself publicly on record as in favour of an attempt to produce beneficiated ores in large quantity in Ontario, furnace managers with less practical knowledge and lacking his courageous pre-vision may well re-examine the situation.

This conference has been a demonstration of what can be accomplished when a keen mentality is applied with singleness of purpose to the solution of a public problem. When Mr. Mills called this conference together he must have had some misgivings lest the divergent, and possibly the selfish, interests of those present would obscure the vision of what is their common aim. Personal and sectional interests were, of course, discussed and at times threatened to monopolize the attention of the meeting. But judicial statements by several of the members were so impressive and were such outstanding features that the Minister was able, without undue effort, to direct attention to the main issues.

Mr. Mills has put his hand to the plow, and he is making a straight furrow. He is not a man whose attention will be easily diverted from his purpose. He has sought and obtained a popular mandate, voiced by the most competent leaders he could find. We hope and believe that he will have, from now on, the united and continuous support of those interested in Ontario's iron ore problem, and we are confident that this united effort will end in success.

LOW TEMPERATURE CARBONIZATION

The phrase "fuel economy" connotes to most of us practice in the ultra modern steam power plant. Since we were old enough to read we have been told that steam raising was a wasteful operation, but we were not impressed. We have remained, in effect, unimpressed.

We are quite as reconciled to wasting 50 per cent. or 80 per cent. of the utilizable energy in coal as were our fathers.

Nowhere in the civilized world is the problem of fuel supply more pressing than it is in Canada. It is well within the range of probabilities that a fuel famine will be the result, possibly the only result, of the present coal miners' strike in the United States. Being habituated to playing the part of the foolish virgin, Canada will once more find the lamp untrimmed and unfilled.

The present outlook is serious enough to all concerned, but what of the future?

Unlike Canada, Great Britain produces coal in large excess of her domestic requirements. Yet throughout the tight little island, engineers and chemists are devoting themselves to the thorough investigation of processes intended to supersede the inexcusably wasteful use of raw coal. In other words, Great Britain, although possessing more coal than she needs, is fully resolved to curb waste, and to insure her future independence as regards both solid and liquid fuels. And the Government of Great Britain is solidly behind the movement.

Present developments in the right use of coal centre round what is known as "low temperature carzonization," the practical antithesis of coke-oven and gas-retort practice. The burning of raw coal has been characterized by an English writer as a "barbarous, unscientific and uneconomical proceeding". It has been pointed out by competent authorities that the introduction of low temperature carbonization, whereby a smokeless coke is produced, and gasoline fuel oils, lubricating oils, ammonia, etc., recovered, will make Great Britain self-supporting in respect of all these products. That is, Great Britain, where about 149,500,000 tons of raw coal are now burned annually, would, by the general use of low temperature carbonization, save 75,000,000 tons of coal each year, produce about 500,000,000 gallons of motor spirit (the annual consumption is 200,000,000 gallons), create a large source of fuel oil, make all the nitrogenous fertilizers required, and incidentally, remove once and for all time the smoke nuisance.

This is the end to which hundreds of Great Britain's ablest chemical engineers are bending their energies. Their efforts have already been crowned with a measure of success. As it took one hundred years to bring the coke-oven and the gas-retort to their present state of efficiency, it is not to be expected that the new process, or processes, will be perfected without long trial and retrial. But we are inclined to agree with the engineer who expressed his conviction that the solution of the problems of this process is the most important event in the industrial world since the invention of the steam engine.

We hope that those who scoff at the work of the Canadian Research Council in this direction will at least be moved to inform themselves on a question that more widely and immediately affects our industrial future then even the development of hydroo-electric power or the utilization of our peat deposits. But in truth all three are sufficiently vital.

"THE BROKEN YEAR"

On several occasions we have quoted the utternances of Dr. George Otis Smith, Director of the United States Geological Survey. The combination of strong commonsense, clean-cut statement, and happy illustration, that marks his published comments on current affairs is as effective as it is unusual.

In a speech delivered recently before the National Conference of Social Work, Dr. Smith reviewed the coal mining situation in the United States, very crisply indicated the malady that afflicts it, and prescribed the treatment required. He spoke as a citizen rather than as the Director of the Geological Survey, but as a citizen whose special knowledge, soundly based, is at the service of the public.

Dr. Smith insists that before lasting industrial peace can be established, certain fundamental problems must be solved. These can never in this world be solved by strikes or by shut-outs, or by victory won by either employers or strikers. For the present impossible conditions, both labour and capital are to blame. "Too long" says Dr. Smith, in the exordium of his address, "have "the mine owners treated the coal business as private "privilege, and too long have the labour leaders, with "no less monopolistic attitude, obstructed every move "for underground efficiency and economy... Cheaper "coal and larger earnings will come when engineering "is emphasized more and bargaining less."

Only from the most distorted point of view can the operators be held blameless for the present *impasse*. But no unprejudiced observer would or could believe that the employers' culpability, in this instance, is at all equal to that of the labour leaders. Yet however the blame may be distributed, the effect is the same. The consumer pays the shot, a disastrously cumulative shot.

To quote Dr. Smith again: "A representative oper- "ator admits that one-third of the operating mines rep- "resent a burden on the industry, and he suggests their "elimination through bankruptcy... The United Mine "Workers' Journal admits that 150,000 miners...should "be eliminated, and he suggests that they leave the "mine for the farm."

From the fact that the average number of days that the coal miner works in the year is only 215 for the whole country, and that this average falls locally to as low as 192 days, more light is thrown on the wage rate difficulty. More continuous employment is possible only with the reduction of the number of workers and also with the reduction of wage rates. But both of these steps imply at once much larger annual earnings. The man who is employed 300 days of the year at $5 or $6 per day is in much better ease than he who works through the "broken year" at $10 per day. "It may well be questioned" says Dr. Smith "whether the pro- "ducer should be paid a wage out of all proportion "with the wage of the consumer." To clinch the point a very cogent question is asked: "Can a $5 a day work- "man afford to buy coal mined by a $10 a day mine worker?"

Coal miners' strikes have become more than a public nuisance, they are a gravely sinister menace. The savage spirit of the strike demands the spilling of blood upon its altars. The self-seeking demagogue finds it

easy to achieve popularity and leadership by inflaming the passions of the mob. The employer stands aloof. The consumer writhes at the approach of the winter of his discontent.

The lesson, and the consumer has been long learning it, is plain enough. In Dr. Smith's well-chosen words, "In bringing about the adoption of more business-like "practices in the coal business, public opinion must be "the force that refuses capital to open or operate un-"needed mines, that refuses to pay wages or profits "figured on an expectation of one-third idleness and "two-thirds work, that encourages off-season purchase "and storage of coal by consumers—and above all we "need an enlightened public opinion that puts a ban "alike upon the selfish disregard of the interests of the "producer of coal by the purchaser, and of the interests "of the consumer by both the mine operator and the "mine worker."

The ties of common interest that bind the miner, the operator, and the consumer have never been even tacitly recognized in strike settlements or in the regulation of current business. Implementing such a recognition would mean *Dividends to the employer, steady work and greater earnings to the miner, and coal at half current prices to the consumer.*

The broken year must be mended.

TRAINED PROSPECTORS

A tiny news item, tucked away in a corner of a newspaper from the prairies, has caught our attention. It is to the effect that a short course for prospectors and others interested in mining has been instituted at the University of Manitoba. This is welcome news, as it indicates that the postage-stamp portion of Manitoba, which of course controls the policies of the whole province, has awakened to the need of educating the men upon whom the development of its vast hinterland will depend.

We are, after all, far from consistent throughout our educational systems. Quite apart from the quality of what is imparted in our schools and colleges, we are very unequal in our distribution of the public benefit. One of the most obvious discrepancies, just at present, is the meagre provision made for the training of the pioneers of the mineral industry.

Of course, it is only within comparatively recent years that the training of engineers to operate mines was undertaken seriously in Canada. The fact that within a generation the direction of mining operations has fallen almost exclusively into the hands of technically trained engineers is a demonstration of what can be accomplished by means of sound education. It is true that there is still a residuum, as there always will be, of self-trained men in the profession, but these men have attained to their positions of responsibility on account of special abilities, which counterbalance the aid their confrères have had from a formal education.

It is still customary to think of the prospector as a peculiar fellow with a strange calling, and we hear from all quarters that the prospector is a type that is dying out. Some take this as an indication that prospecting is on the wane, and that our mineral industry will suffer correspondingly. Few realize the true facts.

There is at present taking place among prospectors a metamorphosis similar to that which has transformed the mining profession during the last twenty-five years. The old type of prospector is fast disappearing; but a new type is taking his place. The prospector of today grasps at every possible means of bringing to his aid the resources of modern science. He is by no means fully informed; but he knows it, and is anxious to learn. The success of the prospectors' classes conducted throughout British Columbia and Ontario during the past winter are sufficient to demonstrate a hunger for information that speaks well for the digestive capacity of the prospector's mentality.

It is more than likely that the prospector of tomorrow will be as is the mining engineer of today. It may be that education within college walls will not prove the best means for educating him, though it has demonstrated its worth, contrary to the expectation of many, in the case of the engineer. It may be that the qualities of initiative and perspicacity, which are absolutely essential to a prospector, would be unduly stunted by a formal education—a charge sometimes laid against our engineering colleges.

Whatever may be the means by which the full aid of science will be made available to the prospector, it is certain that eventually he will have it. It is incumbent upon those who are guiding the destinies of our mining industries to face this problem squarely, and then the solution will be found surprisingly close at hand.

HERE!

An over-capitalized non-producing mining company is threatened with trouble from its long-suffering shareholders. One of the insiders is supposed to give utterance to the following:

We've got to make our killing first;
And then, if there should hap the worst
Just watch our President! My eye
Just watch how we make division!
He'll name the expert to examine
And blame on them what has occurred.
He'll vow that he was quite misled
By what his engineers had said
He knows he never had a mine
But spilling beans is not his line
I guess that we can trust him now
To navigate us through the row.

So when the talk and fuss blow over,
The bunch of us will be in clover.

XNOX

Official Conference on Ontario Iron Ore

MEETING OF REPRESENTATIVE INTERESTS IN TORONTO ON JULY 5th.

When Ontario's present iron and steel industry was founded twenty five years ago, it was expected, and in fact assumed, that her iron ranges, known even then to be very large in extent, would furnish in abundance the home ore for which the blast furnaces were built. The discovery of the famous Helen iron mine seemed to confirm this opinion. Prospectors swarmed over the iron ranges, scores of miles of them were taken up, and a good deal of capital was expended in acquiring property and in exploration. The main practical result was to prove the Helen mine likely to be unique, so far as exploration went. Another result was the disclosure of very large deposits of low grade iron ore, the ore upon which our interest at present mainly hinges. So we have at present plenty of blast furnaces and steel mills in Ontario, but no available ore, with the result that many attempts have been made to solve the problem of providing our own ore for our own furnaces. The problem is still unsolved.

With a view to securing the co operation and advice of those interested in Ontario's iron ore problem, the Hon. Harry Mills, Minister of Mines for Ontario, held a conference in Toronto on July 5th, to which he invited representatives of the various interests concerned. Between thirty and forty owners of iron ore deposits, blast-furnace operators, metallurgists, geologists, and representatives of the transportation companies assembled to aid Mr. Mills in discussing ways and means of attacking the problem anew.

Agenda

To regulate the discussion and to give it a proper setting, a programme was arranged, and authorities on each subject were asked to prepare a presentation of that phase. The following are the agenda:—

(1) The extent of the iron ore deposits of Ontario. Are they sufficient to sustain a native blast furnace industry of importance?

(2) The kind and quality of the deposits:
- (a) The iron ores of Eastern Ontario.
- (b) Deposits of banded magnetic, or mixed magnetite and hematite.
- (c) Siliceous hematite.
- (d) Siderites.
- (e) Bog iron ores.

(3) (a) The applicability of magnetic concentration methods for low grade magnetites, and subsequent briquetting or nodulising.
- (b) Processes for increasing the metallic content of siliceous hematites.
- (c) The reduction and nodulising of siderites.

(4) Are all or any of the above, or other methods of beneficiation within permissible limits of cost?

(5) How far can a market be found in Ontario for beneficiated Ontario ores?

(6) Is there a market for more than the present pig iron product of Ontario? If so, where?

(7) Can the problem be attacked by adapting a method of reduction to low grade ores, rather than by treating the ores so as to make them amenable to present blast furnace practice?

(8) Any aspects of the question not enumerated above.

This arrangement proved to be well-suited to the need. By means of it and by virtue of the adroit guidance of Mr. Mills, who is an unusually capable chairman, the effort of this gathering of men representing heterogeneous interests was made to focus on the aim common to all — the use of our own iron ores.

The Extent and Nature of Ontario's Iron Ore Deposits.

The discussion of the extent of the iron ore deposits so far discovered in Ontario was merged, naturally and perhaps inevitably, with the second question, their character. Mr. C. W. Knight, Assistant Provincial Geologist, led off with a clear and concise resumé of the geological conditions under which the various deposits have been formed, dwelling mainly on those differences in their character that are due to the geological age or epoch during which they had their origin. Mr. Knight also pointed out the well-marked differences between the productive ranges of Minnesota, Wisconsin and Michigan and the unproductive ones of Ontario — differences that were, in the main, overlooked by the earlier explorers and geologists, and that were forced upon their notice chiefly on account of the otherwise inexplicable lack of merchantable ore in Ontario. It is, by the way, this lack of discernment (or perhaps it might better be called prescience) that renders so many of the pronouncements of twenty years ago on our iron ranges, of little or no value today. Their similarity to the ranges of the United States was pointed out, but not the difference.

Dr. W. H. Collins, Director of the Geological Survey, Ottawa, followed with a comprehensive outline of the province's iron ranges, with especial reference to the kinds of ore-bearing material that they contain. Dr. Collins has during recent years spent several summers in the field studying the very problem; so his judgment is well-seasoned, and he speaks with more authority or the matter than is possible to any other geologist in the Dominion. Apart from the deposits of magnetic iron, which are of igneous origin, and are rather more widely scattered and of smaller size than similar ore-deposits in use elsewhere, our iron ore all occurs in sedimentary beds, now found mostly on edge. Thus we have, in the main, the truncated edges of iron-bearing strata to explore. These beds of iron formation are of such a character as to be almost impervious to the circulation of surface waters; and this, in conjunction with their high angle of dip, militates against the enrichment that has produced the economic deposits of the United States. In certain cases the circumstances of our iron ranges are similar to the productive ranges of the United States; and Dr. Collins is confident that extensive and systematic exploration with the diamond drill on those ranges will result in the discovery of similar ore-deposits.

In this connection there was a considerable amount of discussion with regard to specific iron ranges, presented mainly by those interested in them. Mr. T. B. Caldwell, of Perth, described the conditions that at present prevent the use of ore from the iron range at Temagami. Mr. Caldwell was, by the way, one of those who effectually aided the chairman in steering the conference clear of the rocks of dissension and the whirlpools of discussion that beset its course. Mr. Dreany, of Sault Ste. Marie, gave some details of the iron range in Michipicoten District in which he is interested, and a new nodulizing process now in course of development, which he expects to be successful. Mr. H. C. Cox, of Port Arthur, who has guided the course of the Moose Mountain experiment during its latter (and most successful) period, gave very interesting and impressive data about his deposits of ore. The vast bedded deposits of the Belcher Islands, low in phosphorus and sulphur, but

comparatively high in silica, were described, and their future use discussed.

Processes for Beneficiation.

To introduce the subject of beneficiation, Mr. Mills had asked Mr. G. C. MacKenzie, Secretary-Treasurer of the Canadian Institute of Mining and Metallurgy, to prepare a statement of what has been accomplished to date. Mr. MacKenzie's resumé was both lucid and comprehensive, and forestalled a great deal of discussion that might otherwise have consumed time with no good effect. Briefly, his conclusions are that the magnetic ore deposits of Eastern Ontario are too small and too widely scattered to stand the cost of concentration, and still compete with Lake Superior ores; that sintering is preferable to nodulizing in the agglomeration of fine magnetic concentrate; and that any process of beneficiation will succeed commercially only if operated on a very large scale.

In this connection both Mr. MacKenzie and Mr. Caldwell referred to the Eustis process for the "direct" production of steel from ore. Both had had a warm recommendation of the process from Mr. Bradley Stoughton, of New York, one of the foremost authorities on iron and steel on this continent. Mr. Stoughton considers that the electrolytic [illegible] against the electrothermic reduction of iron offers an opportunity of commercial application that is particularly suited to Central Canada, with her abundance of power and scarcity of carbonaceous reducing agents.

Mr. Cox described, in brief, the latest development in the production of sponge iron, as worked out recently by two young researchers of the United States Bureau of Mines. These results have not yet been made public; but Mr. Cox is hopeful that the new discoveries will go far toward bridging the gap that now separates the experimental work on sponge iron and its commercial application. He pointed out, what is of prime importance in Ontario, that the fine magnetic concentrate from our ore would form an ideal material for such a process and that the use of raw concentrate would cut out the present high cost of agglomeration for use in the blast furnace. Mr. Cox also pointed out that the problem of producing merchantable ore at Moose Mountain has now, to all intents and purposes, been solved, and that what remains to be done is to establish such a connection with the users of ore as will warrant investment in a commercial plant.

The Cost of Beneficiation.

When it comes to a question of using ore, it is the furnace manager's dictum that rules. Consequently the account by Mr. J. D. Jones, manager of the Algoma Steel Corporation, of his recent investigations into the manufacture and use of beneficiated ores, and his conclusions, touched the heart of the discussion. The Algoma Steel Corporation has been foremost in Canada in making and using such ore, and Mr. Jones is in an exceptional position to judge of its commercial utility.

Some months ago Mr. Jones set out to determine at first hand what has been accomplished elsewhere on this continent in the concentration and agglomeration of iron ore. He visited a number of plants in the central and eastern United States, and his brief recital of what he saw was most informing. One important development that he noted is that the production of high grade concentrated ore from the low grade material available along the Atlantic coast has now excluded Lake ore from that market and promises also to exclude the cheap ore of Cuba and Brazil. Mr. Jones' conclusion in regard to Canada—and this is worthy of more serious attention than any other utterance at the conference—is that suitable processes for beneficiation can and will provide Ontario ore for Ontario's furnaces, provided the problem is attacked with energy and discretion.

The Market for Beneficiated Ores.

At various times during the conference, the quality of beneficiated ores was discussed, and their suitability for use in the blast furnace. The information elicited from those with direct evidence was that sinter, nodules or briquettes, properly made, are completely satisfactory, and a most desirable ore. Magpie Mine nodules are known to have a preferred market, due both to their useful form and their desirable chemical constitution. Sintered magnetite concentrate is now one of the standard varieties of iron ore. Gröndal briquettes, such as are turned out by the Moose Mountain experimental plant, are less firmly established in the markets of this continent; but their desirability is all [illegible]. Mr. Cox told of having during the war time shipped [illegible] briquettes (almost pure iron oxide) as far south as Tennessee, at prices that were high even for boom times. There was a shipment made to a Canadian furnace that was [illegible] briquettes insufficiently bonded; but [illegible] [illegible] to the [illegible] to which all experimental work [illegible] subject, and [illegible] which no experimenter can [illegible].

Another point of which the majority of the members of the conference were clearly informed by the explanations of [illegible] was the blending of various ores to produce the various grades of iron wanted. The [illegible], in accordance with the chemical constitution of each kind of ore [illegible], and [illegible] uniformity throughout [illegible] the [illegible]. The iron ores from all the mines [illegible] [illegible] blended to produce certain standard [illegible] [illegible] a number of [illegible] [illegible] of each of these varieties of blended ore [illegible] [illegible] for the coming year. The steel plant at Sault Ste. Marie, for instance, requires a million tons or [illegible] [illegible], which, when blended in various proportions, will give foundry iron, basic iron, and [illegible] varieties that will require during the ensuing year. It [illegible] be readily seen that to provide this million tons of any of the sorts required, from mines in Ontario [illegible] supply sufficient in quantity and uniform in quality [illegible] after year, is rather a large undertaking, and will require not only a very large outlay of capital for the application of the best brains that the province and the country can provide. But that the task can be accomplished, the sober judgment of Mr. Jones unequivocally affirms.

The Resolutions Adopted.

In order to induce an orderly consideration of resolutions, Mr. Mills suggested, quite early in the proceedings, the appointment of a resolutions committee, whose duty it would be to present the consensus of opinion in tabloid form at the end of the conference. When Mr. MacKenzie presented the resolutions that he, Mr. Caldwell and Mr. Cox had drawn up, they represented so well the principal ideas of the gathering that no change was necessary, and no discussion of consequence was provoked. The questions of the agenda were considered, in turn, with the following result:

1. The known and probably [illegible] [illegible] [illegible] can provide sufficient [illegible] for our blast furnaces, and it seems likely that intensive exploration will disclose commercial deposits of ore that will not require beneficiation.

2. Needs no answer.

3. The present methods of beneficiation are satisfactory, and both nodulizing and briquetting for sintering [illegible] are recommended.

4, 5, 6. A conclusion on these questions is beyond the scope of the present conference, and they should be considered by a special committee or commission, the appointment of which by the Government the conference recommends.

mends, the commission to be composed of a geologist, a blast furnace operator or metallurgist, and a representative of transportation interests.

It is this last recommendation that reaches the heart of the problem, as was immediately pointed out by Mr. Mills. The question of costs and of practical ways and means of applying the information now available constitutes the immediate problem, and this problem can be solved only by the intensive work of the best-informed authorities that can be had. In answer to a question, Mr. Mills said that of course the services of these authorities would not be asked for without remuneration, and that he was confident that his colleagues of the provincial administration would provide adequate means for this purpose.

An additional resolution, not brought in by the resolutions committee, was on the much-debated question of a bonus for the production of iron ore. As drafted, this resolution requested aid from the public purse for the iron ore operator in Ontario, the manner of dispensing this aid being left open.

Vote of Thanks to the Minister.

After a day fruitful of well-informed discussion and resulting in a series of well-balanced resolutions, acceptable to all and particularly suited (as it turned out) to the prime mover of the conference, Mr. Caldwell tendered to the Hon. Mr. Mills the thanks of the meeting, not only for his initiative in calling the conference, but also for his care and discretion in guiding its destinies. Mr. Mills richly deserves all the credit that can be accorded him for this forward step in Ontario's iron ore problem.

A Symposium On Low Temperature Carbonizing of Coal

ABSTRACTS FROM PROCEEDINGS OF THE SOUTH WALES INSTITUTE OF ENGINEERS, MAY 16, 1922.

OPENING STATEMENT BY DR. C. H. WANDER, REPRESENTING THE FUEL RESEARCH BOARD

The experimental work of the past two to three years has for the first time placed in our hands trustworthy data on this subject... These data will, we hope, serve to correct some of the loose and unsupported statements which have been handed on from report to report without corroboration. At H. M. Fuel Research Station we are now in a position to make tests and to pronounce with confidence as to the suitability or otherwise of any given coal for carbonization at temperatures from 500 deg. C. to 650 deg. C., and to determine the proportions in which the more and less fusible varieties of coal should be blended in order that the most satisfactory results may be obtained.

As the direct outcome of this experimental work, low temperature coke has been regularly produced on a works scale in the form of cakes which are sufficiently robust to stand the rough handling of transport. The cakes are cleanly and economical in use, are more easily kindled and kept alight than the raw coal from which they are produced, and their combustion is absolutely smokeless. This is an industrial method, and will stand or fall on a perfectly definite issue, which is whether or not it is possible to evolve an apparatus on sound engineering lines in which the capital and working costs will fall within the modest margin of working profit on which this industry must be founded...We have from the outset recognized that the solution may at any moment be reached by the genius of an outside inventor, and we have therefore devoted much time to the study of all proposals which appeared to contain the germ of possible success.

Broadly speaking, there are three distinct lines on which carbonization may be attacked:—

(1) The crushed coal is exposed in thin layers in a gas-tight chamber to the action of heat which is passed through the walls of the chamber from an outside oven or combustion chamber, and is distributed through the mass by conduction, radiation and conviction. The layer of coal is not mechanically turned over for the exposure of new surfaces to the action of heat during the period of carbonization.

(2) The crushed coal is exposed to heat in an externally heated gas-tight chamber in which it is mechanically stirred and turned over so that new surfaces are exposed to the heat conducted from the walls of the chamber.

(3) The crushed coal is exposed to the action of heat derived from the sensible heat of a large volume of producer gas which is passed over and through the mass. The gas is either generated by the combustion in a mixture of air and steam of a proportion of the coke which results from carbonization, or is generated in a gas producer fed with an independent supply of coke.

From the first and second of these methods...the quantities and qualities of the volatile products, gas, and crude oil from any given coal need not vary much from the established standards. The physical and mechanical properties of the coke, however, do vary over wide limits, and may greatly influence its suitability or otherwise as a domestic fuel.

In the third method certain entirely new considerations are introduced, the chief of which is the alteration in the quality and quantity of the resulting gas. Instead of the 3,000 to 3,500 cubic feet of gas [per ton of coal] with a calorific value of 900 to 1,000 B.T.U. per cubic feet which results from the first and second methods, the third involves the production of 20,000 to 25,000 cubic feet of gas of a calorific value of about 230 B.T.U. per cubic feet. There is a corresponding reduction in the yield of coke.

The addition of briquetting to the present preliminary preparation of grinding and blending would, we believe, go far to simplify and cheapen the subsequent operation of carbonization.

NATIONAL IMPORTANCE OF LOW TEMPERATURE CARBONIZATION.

By David Brownlee, B.Sc. Hons. (London), etc.

(Abstract)

The burning of raw coal is a barbarous, unscientific and uneconomical proceeding. During the combustion of raw coal it is almost impossible to prevent the escape of volatile products in the form of black smoke and other unburnt material.

By carbonization in closed retorts, a whole series of valuable by-products can be extracted.—motor spirit,

"Diesel" oil, lubricating oil, fuel oil, sulphate of ammonia, etc.,—which are otherwise consumed as mere fuel. In addition, the residual fuel is a much better fuel than coal, burning smokelessly and with a high emission of radiant heat.

Only 20.2 per cent. of the coal consumed in Great Britain is carbonized by the high temperature methods, the gas works and the coke oven, the other 79.8 per cent. being used as raw coal.

Taking the 149,500,000 tons of coal now used as raw fuel, the net saving by the utilization of low temperature fuel would be about 75,000,000 tons per annum. In household fuel alone, 15,000,000 tons of coal would be saved.

The universal carbonization of our raw coal by low temperature methods would wipe out once and for all the black smoke trouble, with a consequent saving to Great Britain of over £40,000,000 per annum. If fuel contains less than 12 per cent. volatile matter it is completely smokeless, because this amount has time to burn properly.

The British Empire has no oil of any importance, and we are practically dependent on other countries for motor spirit, "Diesel" oil, and lubricating oil. The world's output of oil is approximately 700,000,000 barrels of which the United States produces over 60 per cent. and controls over 80 per cent., whilst the British Empire produces about 2½ per cent. and controls about 5 per cent. We import about 200,000,000 gallons of petrol per annum, and the price is so high that the British industry is crippled.

The low temperature carbonization of the 149,500,000 tons of coal available would give over 500,000,000 gallons of motor spirit and 75,000,000 barrels of oil, which would render us independent of the rest of the world. This would also enable us to develop to the fullest extent the economical "Diesel" engine, which is infinitely more efficient than the condensing steam engine or turbine.

Finally, low temperature carbonization will give us an ample supply of fixed nitrogen (sulphate of ammonia) for the proper cultivation of the soil. We grow only about one third of the food we eat. We cannot go on forever paying millions of pounds per annum to foreign countries for food, when we have millions of men and women out of work and millions of acres of land lying uncultivated.

LOW TEMPERATURE CARBONIZATION OF COAL.

By S. Roy Illingworth, M.Sc. (London), etc.

(Abstract)

From one angle it is an altruistic conception, but unfortunately financial considerations enter into it. Does it pay? So far it does not. It is useless to think of costing a process on any other basis than the rock bottom price of its products. In this case we cannot expect more than say, 17s. 6d. per ton at the works for the fuel, and more than 4d. per gallon for the oils, since such must ultimately become the general prices of this country is to continue as a going concern.

The difficulties that have beset carbonization in the past are the long period of carbonization and the unmarketable quality of the fuel due to its friability, and of "oils" due to their mixed condition.

Coal is known to consist of four main types of substance.

The alpha compound, devoid of coking properties, gives rise in carbonization to negligible quantities of hydrocarbons. Its gaseous products are carbon monoxide and hydrogen. It does not decompose below 300 deg. C., and remains practically untouched in the general low temperature carbonization.

The gamma compound is the cementing ingredient in coal. On carbonization it gives rise to large volumes of paraffins and naphthenes. It melts and confers plasticity on a heated coal. All forms are decomposed below 500 deg. C., certain forms below 300 deg. C.

The beta compound has no cementing property; it does not melt; on carbonization it gives rise to oxides of carbon, water, phenol, but little hydrocarbon.

The ulmin compound is highly oxygenated; it gives rise mainly to oxides of carbon and water. Its occurrence in bituminous coal is negligible.

The various types of coal are conditioned by the amounts of the four ingredients and by the relative amounts of the various types of beta and gamma compound. The formation of coke structure arises by virtue of the thermal decomposition of the gamma compound.

[Increase of volatile constituents makes necessary a treatment in two or three stages. "Carbonaceous" and low volatile bituminous coals are one-stage coals.]

We have only a small stock of one-stage coals suitable for low temperature carbonization. I have converted over forty different two and three stage coals into one-stage by preliminary treatment, and have obtained sound, hard smokeless fuel. The yield of oil varied from 14 to 28 gallons per ton, according to the nature of the coal, and the gas yield amounted to from 2,500 to 3,500 cubic feet per ton. A commercial unit is now in course of construction.

NOTES ON THE MACLAURIN CARBONIZATION PROCESS

By Maclaurin Carbonization, Ltd.

(Abstract)

In general proportions the Maclaurin plant is similar to the blast furnace, but on a lesser scale.

Coking and distillation are done entirely by the hot gases formed in the lower parts of the producer, due to the combustion of a small portion of the fuel. These hot gases pass upwards, gradually heating the coal in the upper layers and carrying with them the oil vapours given off. In contact with the colder fuel being charged into the plant at the top, condensation of the oil takes place, and by an ingenious trap the oils are carried off. The fuel after being stripped of its oil passes down into higher temperature zones, and after a period of cooling is withdrawn.

The smokeless fuel produced, formed at about 700 deg. C. contains only about 4 per cent. volatile matter. The heat losses are small. The oil contains almost no light oils. It can be used direct as a fuel oil. The scrubbed gas is free from stringy tars and ready for industrial use. The yield of ammonia when running for coke is 24 lbs. per ton. On several large tests the loss on coal containing 27,552,000 B.T.U.'s was represented by only 3,104,343 B.T.U.'s or 11.3 per cent.

A reward of £10,000 was offered in January 1920 by the Australian Commonwealth Government for the discovery of oil in commercial quantities provided the applicant reported to the Government within two weeks of commencing boring. No payment was to be made until oil to the amount of 50,000 gallons was obtained, and the well was still flowing freely. In September 1920, the reward was increased to £50,000. In April 1920 the Department of Mines of South Australia offered a reward of £5,000, stipulating the production of 100,000 gallons. The Department also offer a bounty of £1 per ton on the production of graphite. (No production.) All three offers still hold.

One Of Nova Scotia's Leaders

THE HONOURABLE ROBERT DRUMMOND

The Hon. Robert Drummond, of Stellarton, spent a week in Cape Breton lately. His many friends were delighted to see him and not a few of them vied with one other in showing their liking for him. Mr. Drummond is eighty-two years old, or I should say *young*, for he will never be old. His outlook in life is that of those who believe "the best is yet to be."

A youthful, buoyant spirit, with a love of quiet fun, and a bubbling fountain of Scottish wit and humour, is just what makes Mr. Drummond the delight of his friends and the life of all company, public or private, wherever he finds himself. Of course behind all this is his sterling character, as unchangeable as the Grampian mountain range of his native land. And added to this is fifty-eight years of able public service, during which time he has been one of the greatest forces for progress, peace and sweet content in his adopted province of Nova Scotia.

Men in all walks of life and in many parts of the Dominion are proud to state that they owe their first inspiration to succeed in their various callings to Mr. Drummond. His life and example have been ever a stimulus for good, and all the more so because of his restless energy and untiring efforts in the pursuit of high ideals. His is a personality that has impressed others and spurred them on to do their best.

For the stormy life of a Labour Leader, he has been by nature pre-eminently fitted. He possesses all the necessary qualities for leadership,—courage, caution, foresight and wisdom, with a magnetism born of a large nature. And, when after nineteen successful years of such leadership, during which time he infused the mine workers of Nova Scotia with progressive ideas and led them to higher standards of living, he threw off the harness of Leader, it was only to continue, untrammeled, the work as an educator and moulder of public opinion which, as an editor, he had taken up almost simultaneously with that of General Secretary of the Provincial Workmen's Association.

For forty-eight years he has sat in the editorial chair, and has given the best of a mind clear, keen and forcible, through a pen that flowed facile over a page sparkling with wit, and playful with pawky humour, while incisive in logic and most convincing in argument. He always courted combat, and more than lucky was the antagonist who escaped unscathed from the point of his piercing rapier.

The mellowing influences of a long life and large experience coupled with unabated intellectual force, has largely added to the liquid tones of his later journalistic writing; and while these have lost nothing in force, they have greatly increased in flavour, and as the half-century mark is being approached, their captivating charm binds his readers closer and closer to him.

As a close personal friend who for upwards of forty years has had his personal guidance, I can do no better than quote our own poet Burns:

> The friend of man, the friend of truth,
> The friend of age, the guide of youth,
> Few hearts like his with virtue warmed,
> Few heads with knowledge so informed.

In the Legislative Council of Nova Scotia, of which he is an honoured and esteemed member, the advice of Mr. Drummond is eagerly sought after and willingly given. He is a keen debater and is always ready for a friendly tilt. A little over two months ago, he had the pleasure of listening to a glowing tribute by Premier Murray, in recognition of the great work accomplished on behalf of Nova Scotian miners by the moderate spirit and persistent

effort of the Provincial Workmen's Association. And he could, if he were travelling around, hear similiar plaudits almost every day, in view of what is being said and done in the colliery districts at the present time. To have lived a long, useful, helpful, wholesome life, is surely a great achievement and one that brings its own reward.

But in case some who do not know Mr. Drummond may be inclined to say that this is being "laid on with a trowel," let us look in at the Mining Society, which recently met in Sydney, and we shall see that there is here no exaggeration, and that only a small portion of the truth is being told in this short sketch.

Mr. Drummond was one of the most enthusiastic members present. Full of optimism, seeing visions as young men do, he is without that conservatism common to persons of advanced years. His speeches warmed and cheered, and while his pungent witticisms provoked much

mirth, his words of wisdom fell on retentive ears, and it was plainly seen that he was the idol of the Society's members. The genial and warm hearted mining secretary, E. C. Hanrahan, near the close of the meeting gave expression to the feelings of all present, when in a few kindly remarks he said. — "No meeting of the Mining Society would be complete without Mr. Drummond. The longer I know him, the more I love him. He grows on me as the years go by. I admire his great courage, his sterling qualities; and one of his striking characteristics, with which I have always been strongly impressed, has been his love of a fair fight and his most forgiving spirit after it is over.

I love to meet him and to hear him, and I trust he may long live to take his place at our meetings as one of the most honoured and most useful members of the Society." And we all heartily applauded these sentiments. And when that grand old Scottish, but now universal, anthem, "Auld Lang Syne," was still pouring forth from leal hearts and true, eight or nine coal and steel stalwarts could be seen silently stealing towards Mr. Drummond, and in a twinkling he was in mid air, and the song changed into prolonged cheers for one of the grand old men of Nova Scotia.

News and Comments

By ALEXANDER GRAY

Value Of Sullivan Mine

When the writer recently described his visit to the Sullivan Mine of the Canadian Consolidated Mining & Smelting Company, at Kimberley, B. C., he stated that the hypothetical quantity of ore proved and indicated was approximated at 5,000,000 tons, with the possibility of more. This off-hand estimate was that of an operating executive. It was intimated at the time by a Director that it might have been pertinent to venture a calculation as to the value of this ore in place. To have done so would have been foreign to the purpose of the visit, and would have injected a speculative factor that might be misinterpreted. However, as the Bond Brokers who arranged the financing of the East Kootenay Power Company, with a view to serving the Consolidated establishment at Kimberley, have struck an optimistic note, it is entirely fitting that the statement that the value of the Sullivan Mine "is estimated at about half a billion dollars" should be analyzed.

The writer was content to record the fact that the Sullivan certainties and probabilities were worth several times the capital liabilities and commitments of the Consolidated. Undoubtedly it was uneconomical to ship ore to Trail when a concentrator on the spot would mean a greater saving in freight. However, that is about to be remedied, and cheaper power and enough of it will be forthcoming, so the question recurs whether the Sullivan is worth half a billion dollars. To ascertain this it is necessary to consider the average of all the tonnage that has been shipped during the past two years. If the tonnage of the zinc and lead content continues to average twenty or twenty-five per cent of the grand total of the ore as estimated (roughly this is true) then five million tons of ore will represent one million-and-a-quarter tons of metals combined. Assuming it to be 2,000,000,000 lbs. of zinc and lead in place, a seventy or seventy-five per cent extraction leaves it for lightning calculators or experts with a multiplication machine to determine what those metals may bring in world markets. Every billion lbs. of the metals will make it more conclusive that the Sullivan is an asset of such dimensions that present-day truth may be much below the mark five years hence. That is why it is injudicious to indulge in ciphering concerning the Sullivan. Most published estimates can be quartered; and even then the Sullivan will have solace for shareholders, and heart burnings for other producers of lead and zinc.

Handicapping Gaspé Lead-Zinc

While on the subject of the Sullivan Mine, it is pertinent to reproduce this from the Report of the Quebec Department of Mines for 1922:

"The Federal Zinc and Lead Company, Limited, carried on further development work on their mine in Lemieux township, in the region of the headwaters of the Cascapedia river, in Gaspé, and moreover worked on the construction of the road to connect the mine with the railroad at the station of Cascapedia, near New Richmond.

"The underground development work at the end of the year stood as follows: depth of No. 1 shaft 257 feet; length of drifting 1088 feet, total crosscutting 880 feet, levels opened up at 160 feet and 250 feet. These workings have blocked out a large amount of very good ore. Two other shallow shafts have also been sunk from the surface, 64 feet and 18 feet respectively. The lack of means of communication greatly militates against the more rapid progress of this mine, and to this drawback may also be added the depression of the metal industries, which has prevailed during the past two years".

There we have official confession—but no repentance. Having done between two and three thousand feet of development, determined the presence of a large tonnage of excellent commercial ore, and endeavored to construct a road, Directors of the Federal company find themselves refused assistance in the matter of transportation. The Quebec Mines Department is alive to the needs of the situation and the disabilities of the company, but the over ruling edict is to the effect that the Federal company have to do with an abhorrent mining proposition—no matter how meritorious in the economic scale. Ontario is building roads to prospects of less consequence, and British Columbia would not and does not hesitate when road making is warranted.

To most users of coal as fuel, the question of powdered fuel is always a live one. Hence the latest catalogue (No. 1) of the Grundle Fuel Equipment Co., Harvey, Illinois, will prove of interest to many ferrous metallurgists. This illustrated brochure of 10 pages sets forth in detail the plan and construction of the equipment used to crush the coal, remove stray iron, dry the lumps, and pulverize the coal, then storage, hoppers, conveyors, feeders and burners are dealt with. In common with other pulverized fuel systems, the Grundle system claims a great economy in the use of fuel and operating cost. Its special claims to attention are demonstrated by a considerable number of successful installations.

A process for the production of potash and aluminum from feldspar by treatment with sodium carbonate has been patented by Harry P. Bassett. A very pure aluminum hydroxide is produced, according to the patentee's claim.

Preaching Without Much Practical Performance

by ALEXANDER GRAY

As an ultra-conservative newspaper — admirable, in a way, as such — *The Montreal Gazette* has conscientious scruples concerning the mining industry and maintains a policy of aloofness. Its reasons therefor, no doubt are epitomized in this extract from a leading editorial appearing in the Dominion Day issue:

"Mining schemes are a favorite device of the gamesters, and seldom fail to gather in the hard-earned dollars of the simple folk. The very fact that mines have made millionaires furnishes promoters with their strongest card, and causes perennial crops of sharks, having no other asset than a claim, and no money other than gullible people give them. Minerals, whether coal, iron, oil, precious metals or other, are a great national asset, an asset Canada possesses in abundance, but all is not gold that glitters, nor does a claim signify a mine. Mining is the most hazardous of risks. It usually means loss of the money put in, but a prize is sometimes captured, and the chance of a prize is the irresistible bait. There are sound, well-managed, profitable mining concerns in Canada, and if one desires to gamble on a chance he will find fair prospects at home without going abroad, but the sagacious person before risking his money, little though it may be, will seek advice, and in no quarter will better advice be obtained than from his banker."

In the foregoing there is considerable of fact and more that may be taken as the academic view of those who would eliminate the "mining risk", or leave it for the foolhardy to assume the hazard.

Influential newspapers lay flattering unction on themselves that they are absolved from skulduggery as practiced by "sharks", by their declining to permit a certain amount of publicity. They deem it to be a virtue to refrain also from what would be corrective and, therefore, constructive. Their generalization that "mining is the most hazardous of risks", that "it usually means loss", would not be so widespread in its application if really well-intentioned newspapers recognized that mining, no less than farming, is the conjoint basis of national wealth and progress. Too literal acceptance of the *Gazette* editorial dictum would preclude or retard the exploitation of those "assets" in "minerals, whether coal, iron, oil, precious metals, or other".

Owing as much as anything else to the hazy view obtaining with the daily press regarding mining industrialism, and since a recrudescence of over-speculation in nondescript shares was threatened, *The Canadian Mining Journal* began a crusade against what would undermine the well founded confidence there is in the very assets which the *Gazette* would promote (but is apprehensive lest it lean too far forward, whereas there is safety in leaning backward). And yet it is inadmissible that "the sagacious person" should seek immunity with and always accept the decree of "his banker." Where there is chronic antipathy toward mining, it follows, as J. Poindexter, colored, remarked, that they "look at w'ite affairs from a cullid stan'p'int".

Manifestly head-office and branch authorities are no more omniscient than those whose chosen profession it is to separate the economic wheat from the chaff. So long as mining is Gilbertian "too too", and utterly "hazardous" in the estimation of press and bankers who have no means of determining the merits or demerits of mining enterprises in any form, just so long will the real mission of our great natural assets be "mummuxed".

Making the mining sciences suspect, inevitably prevents participation in legitimate ventures of those who respect the judgment of newspapers and bankers, and places propositions all too frequently at the mercy of "sharks", who as frequently appeal to the public through the advertising columns of the otherwise well-censored press. While the *Gazette* is scrupulously careful about accepting advertisements of doubtful character, even it has fallen from grace betimes, as the pages exploiting the *"North Trail"* and space devoted to *"A Pool"* attest. However, newspapers as well as the generality of mortals are fallible, and that has a great deal to do with misadventures, unrelated to bona fide mining. Without mining, our common carries would have more steaks of rust, and the banks might have to find a way to branch out in the farm mortgages that were the vogue before the mines of the West supplemented precarious home markets for products of the soil.

Following the tenets laid down by the *Gazette* there would have to be an exodus from lunatic asylums before the sane could be convinced there are mining "hazards" worth taking. It is not the fault of mineral resources that every one of them discovered and developed in Canada was at one time or another involved in doubt, if not in discredit, inside and outside newspaper offices and banks. Begining with the Maritime iron and coal deposits, taking up the Ontario steel plants, including the Asbestos Industry, recalling what happend to the Nickel companies, going all the way to Trail, returning via that greatest of "hazards", the Transcontinental Railway, to Cobalt Porcupine and Kirkland Lake, it was derelictions on the part of humankind and the mediums of expression that created misconceptions in newspaper offices and banks.

Were it not for products of the mines—the execrated mines—there would be fewer banks and less advertising. Recurring speculative orgies are charged to mining, whereas the educational forces of the press and banks, when measured by the rule of reason, will obviate the mischief complained of. Not all the mischief. Every year there is harvested a bumper crop of "boobs", otherwise sapient unto their day and generation. As the aforesaid J. Poindexter, colored, remarked of certain New Yorkers he had met; "bright as they is in some reguards, they is the most ignorant in others ever I seen". Yet the Great Adventure, as Rickard characterized mining, will proceed, and wealth stored in the ground will be disseminated with more beneficial results than the wholly and solely admonitory seem to realize. Canadian publicists and high financiers unwittingly deny to mining its proper status. Once I asked the Laird of Skebo, Andrew Carnegie, where would be the greatest industrial center in the United States. The grizzled little genius replied:

"Wherever fabricating plants can be established closest to the essential raw materials and distribution is possible to greatest advantage".

Singularly enough, Mr. Carnegie did not consider Pittsburgh the future seat of industrial empire in the United States. What it possessed in convenient coal fields, it lacked in iron ores and cheap transportation. It is poor strategy to forego mining basic materials and have a "proxy" steel industry in central Canada. Acquiescence in the contention that Canada cannot compete with the larger steel works in the States, is a libelous confession of judgment that should not be sustained. Nor will it be. We have progress at Hamilton and the Soo, and the British Empire Steel Corporation is reported to contemplate an expendi-

ture of $19,000,000 upon additions and repairs. New open hearth furnaces and a blooming mill are to cost $10,000,000, it is said. No doubt the details of this development will be announced in the near future.

In Nova Scotia we have the greatest mining and fabricating corporation in Canada; but Canadians appear to be unaware of it, and spokesmen of banking and business interests even deny the possibility of making the iron and coal deposits of the Maritime Provinces function as Mr. Carnegie said they would, when they are in close proximity and distribution is economically attainable. Granting that those deposits have adduced commingled confidence and confusion, it is no proof that the expansion planned is not going to fortify our industrial eastern frontier and accomplish what was only feebly attempted all these years. Obscured by what is too obvious to require re-iteration, the potentialities of the basic materials on our seaboard worth the amount of our National Debt are about to provide more than mining miasma. And the irony of current events is that American banking firms are to provide the funds. Incidentally, it is no secret that it was a Canadian prominently identified with our own steel and coal industry who last month was delegated to determine exactly how to round out a steel plant in the States and at what cost.

Canada urgently needs the impetus derivable from wholesome mining. Without the $400,000,000 extracted from the Comstock Lode and its collaterals, Pacific Coast States would have had more of the *dolce far niente* than was at all delectable. Railroads were projected and completed during mining "booms", and there are no apologists for what happened. Periodically the California, Nevada, Utah and Colorado mining magnates have been accused of about every crime in the calendar; but they made something grow besides cactus and sage brush. If there was over-speculation, it was in miniature when compared with daily events in Wall street and elsewhere. Mining money gave "zip" to the colonization of the West, including British Columbia.

Enough of this, however. The daily press confuses the issues by presuming all mining in its initial stage to be excessively hazardous. The remedy for much of what obtains by way of suspicion and condemnation, rests with the press and with authorities who might deter vendors and promoters from over capitalizing the "Almost" mines, over estimating prospects, and imposing too heavy a first charge upon the public. Mineral industries must be a runner-up for agricultural industries. Embargoes upon Canadian cattle, imposts upon our wheat and the generality of products of mine and the land; so many complications confront us, it is penny wise for the platitudinous to proclaim that "the truth is not in" mining men, that all mines "usually mean" this, that or the other thing. While there is commercial activity there will be speculative activity. Canada as a whole is in the *prospect stage*. When it has more iron mines, more producers of precious and base metals (unaccompanied by furore or tol de rol if you will) it will be less of an "Almost" factor in the galaxy of nations and their metal markets. Alongside the philippines against mining is this abbreviated survey.

"Canada knew little of her rich mineral wealth in 1867. To-day production has risen to $217,000,000, including practically every known mineral except tin. Fifty three years ago there was no silver from Cobalt, the nickel of Sudbury, the coal worlds of Alberta, the gold of the Yukon and Northern Ontario had not been discovered. And yet only a fraction of the mineralized areas have even been prospected."

It is an accepted truth among the most discontent that "there are sound, well managed, profitable mining concerns". That being among the "small favors thankfully received", were they found without hazards? How long would we be in furthering mineral development if the branch manager had to pass upon prospects or "Almost" mines, and he had to await action by the head office and directors to decide? Wing the "sharks" by all means—but don't maim those whose adventuring is a prime mover.

Trained mining men and their principals, possessing or commanding capital, acknowledge Canada is the finest *prospect* before them.

There is one consolation about this discussion. *The Globe* of Toronto editorially admonished optimists not to "purchase" their gold "too high", fearing share-market inflation. *The Star* led its editorial page with a declaration of war against "Sharks". Now the *Gazette* has indulged in editorial reminder of the "most hazardous of risks". Having emphasized the precautionary aspects, what can be done to create affirmative sentiment that Canadian mineral resources are all sufficient inducement for sanely-organized enterprises? We know there is American money awaiting Canadian opportunities. The Canadian capitalist is confronted with "Beware" signs; yet we have $19,000,000 more going into British Empire Steel expansion, more millions being devoted to Consolidated Mining and Smelting expansion, and American and oversea British capital seeking Canadian precious metal areas. Our newspapers might well afford to take a positive, instead of a merely negative, stand in this important question.

THE ASBESTOS TRADE

Asbestos and Mineral Corporation, New York, have issued the following to clients:—

There has been a decided improvement in the demand and consumption of shorter grades of asbestos fibre. While the demand for longer grades is not quite as brisk, there is a perceptible improvement. All the Canadian mines, with but a few exceptions, have resumed or are about to resume operations, and prospects for the asbestos industry are much brighter for the last half of the current year.

The prosperity of the asbestos industry for the past twenty five years has gone hand in hand with steel, iron and other basic industries. The sun has evidently commenced to shine on steel and iron, and our business is also beginning to get a few rays of sunshine. We venture to predict that by the end of the year, the depression clouds will disappear entirely.

We believe that the recent downward revision of prices has about reached the lowest point commensurate with present costs of labor and supplies. Believing that there is a gradual resumption of activity in general lines and the automotive and building trades in particular, we forecast a higher scale of prices for those grades in demand for these purposes in the near future.

During the eleventh week of the coal strike, June 12-17, the production of soft coal was 1,986,000 tons (of coal and 22,000 tons of anthracite. This is about 6,000,000 tons below the weekly norm.

The United States Geological Survey estimated that the world's output of coal was 1,120,000,000 metric tons in 1921, a decrease of 200,000,000 tons as compared with 1920.

News of Mining

Great Britain

The Royal Dutch Petroleum Company and the allied Shell Transport and Trading Company have remarkable dividend records. The Royal Dutch paid 40 per cent. in 1920, the Shell Transport, 35 per cent. For 1921, the dividends total 37 per cent., and 21½ per cent. respectively. Shell Transport, since its formation in 1897, has paid dividends regularly, ranging from 2½ per cent. to 35 per cent., and totalling almost 500 per cent. on its capital.

Coal production in the United Kingdom for the week ending June 3rd, amounted to only 4,441,000 tons. For the previous week it was 4,630,000 tons. The trans-Atlantic export business is being strongly pushed to relieve the congested condition of shipping ports.

Notices of reductions of wages have been posted in British collieries in accordance with the requirements of the Industrial Disputes Prevention Act. Reductions are to take effect on and after August 1st. Employees receiving 24s. per shift will then receive 22s., and other workers' wages will be proportionately reduced.

Considerable quantities of Welsh coal have been shipped from Cardiff recently, consigned to New England ports.

Europe

Rumanian oil exports during the first three months of this year were 93,000 tons as compared with 58,250 tons for the same period in 1921.

The potash output of the German Kalisyndicat during the first quarter of this year was 3,400,000 metric quintals of pure potash.

Spanish railways that are in any way subsidised by the Government are compelled to use domestic coal to the extent of 70 per cent. of their requirements.

Italy is the largest consumer of Rumanian petroleum, France next, and Turkey and Egypt following.

Australia

Before the year 1910, silver coins for Australian currency were minted in Great Britain. Since that year arrangements were consummated whereby the Commonwealth's silver coins were minted at branches of the Royal Mint in Sydney and Melbourne. The value of the silver coins issued during 1921 was £271,000. Although the price of silver was high, the profit to the Government was £63,000. The estimated profit for the current year is £100,000.

On June 3rd the nodulizing plant of the Mount Lyell Mining Company, Tasmania, was destroyed by fire. The loss would have been serious had it not been for the fact that a new Dwight and Lloyd sintering plant was completed and put in commission during May.

The Arbitration Court's adjustment of a reduction of one shilling per day in the basis wage of West Australian mine employees, mentioned before in these columns, is to hold for three years. This is not looked upon with favour by operators, who contend that the reduction may prove quite inadequate.

Africa

The Transvaal's output of gold during May amounted to 629,786 ounces.

The present equipment of the Geduld Proprietory Mines comprises 100 heavy stamps and eight tube mills, with a capacity of about 45,000 tons per month. The plant is now to be brought up to a capacity of 65,000 tons per month. Additions will include 40 stamps; five new tube mills of dimensions 6½ feet by 20 feet, and two new Gates crushers. Instead of 55 per cent. slimes produced at present, the new plant will slime more than 70 per cent of the ore.

The rapid rate at which natives have returned to work at the Transvaal gold mines has helped production markedly.

Natives to the number of 214,000 were employed during 1921. It is improbable that as large a number will be employed at any time this year.

Asia

The production of silver in Japan during March 1922 is reported as 154,912 ounces; of gold, 25,134 ounces.

The Geological Survey of India is authority for the statement that preliminary investigations of the iron ore deposits of the states of Bonai, Keonjhar, and Singhbhum, indicate the presence of about 3,000,000,000 tons of high-grade hematite. Sampling done to date has given extraordinarily high results. Apparently the ores carry low percentages of phosphorus, sulphur, and silica. One deposit worked by the Bengal Iron Company is reported to average 64 per cent iron, 0.05 per cent. phosphorus, 3 per cent silica, and 0.06 per cent manganese.

Under a recent agreement entered into between the Premier Oil Company, Limited, and the Indo-Burma Oilfields, Limited, the geologist of the former company has authority to select well sites not closer than 300 feet from sites of producing wells or those being drilled by the Indo-Burma Company. A joint arrangement as to expenses has been made between the two companies.

United States

The Utah Copper Company, which conducted operations for only the first three months of the year 1921, reports a net loss for the year of $2,058,108.

Appearing before the House of Representatives' Committee on Mines and Mining, Mr. Horace V. Winchell expressed himself as strongly in favour of the Arentz Bill, the purpose of which is abolition of the requirement for discovery before staking. Mr. Winchell, in the course of his evidence, stated that in his opinion the day of the prospector in the United States was past and that the future of mining would depend upon the work of large corporations.

Instead of the proposed import duties on potash, a bounty on domestic production is now suggested, for a five-year period.

Joint patents have been issued to Messrs. J. J. Denny and M.F. Fairlie on a process for the treatment of manganiferous gold ores. The process is based upon the use of metallic iron and sulphuric acid followed by treatment with cyanide.

The annual report of the Nevada Consolidated Copper Company shows a distinct lessening of costs in 1921 as compared with 1920. The item of steam-shovel operation for instance was reduced from 3.04 cents, the 1920 figures, to 2.77 cents per ton in 1921. The only segregated cost item to show an increase was that of drilling and blasting—6.14 cents per ton in 1920, and 6.45 cents in 1921.

Notes From Nova Scotia

A CAMPAIGN FOR CLEANLINESS AND ORDER

A General House-Cleaning

About three years ago, the Dominion Coal Company decided that it was not incompatible to combine business with beauty, order and cleanliness at the coal mines; so a decree was sent forth for improvement of appearances in and around the collieries. It was some little time before the workmen and all the officials could be persuaded that it was really necessary to spend time and effort in trying to make a coal mine look clean and orderly, especially when frequent wind storms scattered coal dust around in great heaps, blackening and covering up everything it lighted on. But it gradually began to be understood that cleanliness meant the removal of coal dust and all other debris so that wind storms might not have the black dust clouds to play with. A storm-swept colliery was usually after this a very clean place. The general clean-up had left nothing to toss about, so the improvement at the collieries began to impress itself upon the minds of the workmen and the officials.

Here and there, previous to the order of the Company, some workman, such as a stationary engineer, had exhibited a taste for potted plants within his building, while others had shown a fondness for climbing plants without. Other men had given evidence of the love of the beautiful, by the free use of paint on the walls and floors of the houses and on the bases and other parts of their engines.

The new day came in with the vitalizing breath of a spring morning when all life is animate with the joy of quickening forces. Like Roderick Dhu's warriors, springing from "copse and heath and shingles grey", there sprang up architects and artists, landscape gardeners and painters, and a transformation was wrought at the collieries and in the feelings of the workmen that had long lain dormant awaiting the master-hand of the magician. He had come and waved his wand and immediately a new heaven, if not a new earth, appeared. Everywhere one looked, the process of change was going on. Engine houses, both inside and out, were being repaired and renovated, the oil of years was scraped from black floors; windows were washed and pure sunlight admitted; while the roofs — the overhanging canopies which in many cases had become nothing but "foul and pestilent congregations of vapors" plus cobwebs, — were brightened up and made to shed a cheering influence on all beneath.

Dark, dingy stables, badly lighted and worse ventilated, were filled and flooded with free fresh air and sunshine. Miners' bath houses were remodelled and modernized. The light of day and modern science were turned into the dark corners of cellars and all other suspicious looking buildings, and from these was disgorged the rotted and dank accumulation of years. Bon fires were lit in every mine yard and kept burning until the last vestige of refuse was destroyed. Incinerators were placed at each colliery and now these reduce daily to ashes, the waste material of the mine.

Making Lawns and Gardens

After having been well cleaned up, the grading of the surface began. Hollows were filled and leveled, under drains were put down and in many places fine coats of white dolomite from the steel crushers were spread over all, covering up the black mud, making the ground firm and clean for the feet of busy workmen. Wherever possible, squares of ground were graded and fenced in and sown with lawn grass.

Old weather-stained buildings began to take on a new appearance under the painter's brush. Black, ugly looking bankheads, glistened in the sun with their fresh coats of paint, tar or whitewash and the surrounding buildings and other objects, such as telephone poles, and pierhead pipe-lines, were touched up to suit the surroundings. And so the black colliery buildings and confused yards became things of order and of beauty.

But nowhere did the change become more apparent than in the workmen themselves. They began to vie with one another for honors in the bringing in of a new world. The men of the large power and compressor houses quickly developed a taste for painting, and each house became a picture, just as the artistic sense developed within the man. And it was wonderful to see how the strength and speed of a great engine was brought out by the colour tones of the different parts. The massive strength of the larger machines was made more impressive by choice of colours and deft application.

One old man, who for years had delighted in seeing the deep green of the morning glories mounting ever higher on the sunny side of his fan house, which itself was always a model of order and cleanliness, was delighted when the news came out that henceforth the company would be pleased to give flowers and plants and shrubs to all workmen who decided to beautify their surroundings. His eyes shone with new lustre in appreciation of the one in authority with tastes similar to his own and with a desire to develop them who had come, and he welcomed the coming of this kindred spirit. Potted plants began to fill the windows inside, and soon the fan house was fragrant with the perfumed breath of flowers in bloom. In keeping with the flowers, was a spotless floor, an engine clean and shining, cared for by a man whose work had grown lighter because of pleasant surroundings.

But all this time the mechanical superintendent who had been moving in and out inspecting the machinery and building was under the spell of the inflowing aesthetic tide. The spirit of Chloris and Flora, the Goddesses of flowers, had been brooding over and within him, and found in him an artist of exquisite tastes. He at once set himself to improve the work of his fan man. The space around the fan house was enlarged and laid out as a garden with white gravel walks winding in and out among the beautiful flower beds and grass plots. To protect these, there was built an artistic fence made of strands of worn out wire rope, elaborately wrought and beautifully painted, while what looked to be a richly carved turn stile but what in reality was only an ingenious combination of old boring augers from the mine, was placed at the entrance to this most attractive colliery garden. The fan house itself was given a fresh coat of whitewash while that part of the fan which stood outside was painted black. This black ground added to the green of the grass and the artistic design of the plot with its triangular beds and beautiful flowers now makes a most pleasing picture. This year a miniature lawn with the name and number of the colliery wrought in round white beach rocks has been added together with other improvements in the appearances of adjoining buildings. This colliery No. 10 was award

ed the first prize in the New Waterford District, last year. What it may do this year remains to be seen, as other neighbouring collieries are closely following in its wake.

Flower Garden Replaces Clinker Dump

Another mechanical Superintendent with an innate love of the beautiful saw an opportunity in the new degree for gratifying his taste, and began to look round for a place for a garden. The only suitable place was taken up by a pile of clinkers from the fire doors. The pile was removed and new soil filled in, flower beds were laid out and flowers planted; and being in a spot sheltered from the winds but accessible to sunshine, very soon a profusion of variegated flowers gladdened the eyes of men and the hearts of numerous little honey-bees. The splendour of this garden last year was far beyond any of those at the other collieries. The garden was enlarged this spring and the gravel walks re-arranged with excellent taste. The beds have been raised and re-shaped with the skill of a first class landscape gardener, and the whole presents a scene that compels passers-by to stop awhile and feast their eyes. Thus we have beauty, if not from ashes, then from the place of a former ash-pile, and a scene of loveliness where heaps of red clinkers rendered the earth barren and ugly, wounding the senses and paining the eyes.

It was this colliery with its well-graded mine yards, the neat and clean appearance of its buildings splendidly arranged, and its beautiful garden, that drew forth most favourable comments from the financiers of New York and the experts of Bethelem Steel, who lately made a visit of inspection to the property of the Empire Steel Corporation, and who expressed themselves as highly satisfied with the appearances and the condition of all the collieries.

General Manager Merrill, who never misses an opportunity to encourage his under-officers, passed on this compliment in a graceful letter to his superintendents, and through them to the mine managers, at the same time urging all to continue their efforts towards further attainment along this line. Whether we look on this as an expression of Manager Merrill's own highly cultured tastes, or an act of commercial wisdom, or both, it inspires and stimulates both officials and workmen to have kind things said when they are deserved.

Beautifying the Interiors

But the realm of nature outside with all its loveliness and its flowers arrayed in a glory greater than Solomon's was not to be permitted to go unchallanged. Indeed one or two of the stationary engineers had long before been enchancing their surroundings and beautifying their engines with paint according to their tastes. They therefore had a long handicap over their amateur brothers.

One man of gray hair who had seen long service at sea, still carried the marine atmosphere and discipline with him. On entering the engine house of which he had charge, one was struck with its resemblance to the engine room of a great ocean liner. Everything was bright and shining with paint and the place was immaculately clean. Even the wrenches were painted in different colours and hung up in such a manner as to lend beauty and harmony to the whole. One could not help feeling that here was a man deeply interested in his work, and in so far as he could, he lavished his best upon it, and one left the building with a warm feeling for one whose work was ready for the inspection of the Captain at all times.

Another is a workman, still young in years, whose building one now enters with a feeling of profound respect—so much so, that one feels like taking off hat and shoes, the hat to the man and the shoes to the floor of the building. It is a large, spacious engine house. The floor is of concrete, finished with concrete polish, and shining like a mirror. To protect it and keep it clean, long strips of rubber matting run all round, while everything within is "wondrous neat and clean." The engine has been well set up,—no vibration, noisless action, and nothing to detract from the influence of a beautiful and well-lighted building. Close by the handles stands a quiet, neatly-dressed workman. The building inside reflects his mind. It is a picture, a work of art created by him. He is by nature a painter first, an engineer second.

Who has not entered a beautiful building and felt its soft, soothing influence stealing gently over his spirit? Here was moral uplift. And what Briton ever stood on Trafalgar Square, London, under the shadow of that slender monolith,—Nelson's monument pointing skywards, surrounded by the four great stone lions guarding the corners of the square,—without being impressed with Britain's strength and Britain's courage? The whole scene grips the imagination and figures of great men of the past and present pass in panoramic vision before the mind. These are great works of art, powerful both in presentation and re-presentation.

And so, only in a less degree, with this spacious engine room, representing as it does the industrial side of life with its powerful engines pulling great loads from earth's depths, its sweet, wholesome atmosphere, its flood of light and sunshine, its mirrored floors,—the two prime elements of all works of art whether they be graphic, plastic or literary. It has impression and expression. The imagination is awakened, and while fancy's flight may not wing its way to "spacious firmaments, fretted with golden fire," or St. Paul's Cathedral, or the Nelson monument, the expression of the building is of things peaceful, pure and good. Surely, this one building alone has been worth the whole effort.

Even the Fields Improved

But improvement has been extended beyond the colliery yards and mine buildings. Around many of the collieries were fields of stumps, menacing the safety of property and giving the impression that the love of the beautiful had in these parts been long since dead. These fields were cleaned and seeded down to hay, which, besides adding to appearances, provided a new source of revenue. But a grass sward has an added value round a coal mine, especially where pillars have been drawn too close to the surface. In times of heavy rain much water is shed and run off before it has time to soak through the sod and find its way into the mine. From an economic view-point, this improvement has been sound.

But I do not wish to convey the impression that all the Dominion Colliery Buildings are King's Palaces, and all workmen have risen to the occasion and developed into great artists. There is yet room for improvement. Changes must and will be made, and when times are more favourable the finishing touches will be put to the buildings and yards of the surface plants at these collieries. Meanwhile improvement continues and the best is being made of what must remain permanently on the landscape.

According to the Annual Report of the South Australian Department of Mines, the total yield of gold during 1921 was 2,628 ounces; silver 1,449 ounces; copper, 30,640 cwt.; iron ore, 506,993 tons; manganese ore, 1,596 tons; barite 1,269 tons; gypsum, 34,383 tons; phosphate rock, 5,079 tons, and salt, 56,492 tons.

British Columbia Letter

Anyox

Bush fires have swept over a large area of this district, and, though fortunately they have caused no actual damage, they have caused a good deal of alarm, as at one time they enveloped the Granby company's powder magazine and threatened damage to the railway track. It was feared, too, that they might destroy some of the lumber for the new dam. Work on the new dam is being pushed along rapidly, and at the present time everything points to increased power being available before the end of the year. This will mean much to the Granby company, as it is estimated that between $150,000 and $200,000 will be saved annually in fuel oil alone. There is a rumor, too, that with a large supply of electricity available the electrolytic refining of blister copper may be undertaken at Anyox, instead of at the Nichols Copper Company's plant in New York state, as has been the custom in the past.

Nickel Plate Gold Mine

The Hedley Gold Mining Company's mill, which has been idle since September, 1920, has been re-started, and at the present time is crushing about 200 tons of ore daily. The Nickel Plate mine, from which the Hedley company derives its ore, has in the past been one of the best gold producers in the Province. The ore body is some 35 feet wide and runs in the vicinity of nine dollars in gold per ton. With a view to producing as much gold as possible during the war, work was concentrated on production, and development was neglected to a considerable extent. The result was that it was found to be impossible to catch up with the dead work when hostilities ceased, as was intended, owing to the high cost of labor and supplies. Consequently the mine was closed down in September, 1920, and has remained closed until the spring of the present year. A considerable amount has had to be expended in repairs to flumes and power plant after the long period of idleness, but now that the mill has been put into operation once again, it is hoped and expected that the mine will be worked for several years, as it gives employment to about 60 men, and in the past has provided about one-fifth of the gold output of the Province and from twenty to thirty thousand dollars worth of arsenic each year.

Prospects near New Hazelton

Dalby B. Morkill has made an examination of the Silver Queen group, at Owen's Lake, and of several properties on *Rocher de Boule* mountain for United States interests. There is a good deal of prospecting being done in this neighborhood, especially on Hudson's Bay mountain, where some very promising discoveries are being opened up.

Portland Canal District

C. A. Banks, consulting engineer for the British Columbia Silver Mines, Ltd., has returned from London, where he has made arrangements with the London shareholders of the company for an active campaign of development during the present season. The British Columbia Silver Mines property adjoins the Premier mine property on the north, and, it will be remembered, the Premier Gold Mining Company bought one-third of the stock of the company last fall. The remaining two-thirds is owned by the Selukwe Gold Mining Co., which is operating in the Rand fields of South Africa. It is not known what arrangement exists between the two companies that hold the stock in British Columbia Silver Mines, but if it is an amicable one, there is little doubt but that the Premier company can give some valuable hints, obtained from the development of its own property, as to the best method of developing the one to the north of it.

The Indian Mines, Ltd., is driving a tunnel to develop at depth a strong lode of ore that has been exposed at several points on the surface. The lode is 10 to 16 feet wide and is heavily mineralized with galena for two to six feet on the hanging wall side. The ore carries gold and silver values across its whole width. Two shifts are being worked in the tunnel and another shift is working on the trail, which is in bad repair. The work is being done under the superintendence of Roy Clothier.

O. McFadden has located a wide belt of ore on the Dwyer group, at the north fork of the Marmot River. The belt is 80 to 100 feet wide and has been traced for some distance on the surface.

The Premier Gold Mining Company has made its first shipment of bullion, the bullion plant for working up the cyanide precipitate recently having been completed. The shipment, which consisted of some 800 pounds of bullion, is the first bullion shipment that has been made from the Salmon River district. The Premier company is about to start work on a number of bungalows for its married employees.

George Clothier, district mining engineer, and George Young, district road superintendent, will make a reconnaissance survey for a trail to connect the Bear and Kitsault Valleys, and in this way make a trail from Stewart to Alice Arm. If such a trail can be constructed it is believed it will open up a very promissing new district, which at the present time is too inaccessible to tempt the prospector.

The town of Hyden, which is the United States gateway to the Salmon River district, evidently does not mean to allow Stewart to have all the trade of the district. The necessary appliances have been assembled, and a new wharf is to be commenced at once.

Development on a Skeena River Property

The Kitselas Mountain Copper Company held its annual meeting recently, when the retiring directors were re-elected. The general manager read his report of the year's operations which were considered to have been entirely satisfactory, and development will be pushed forward during the present year.

The Coal Strike

The Knowles Conciliation Board, appointed to investigate the dispute between the Western Canada Coal Operators' Association and the No. 18 District of the United Mine Workers of America, issued majority and minority reports. The documents are lengthy ones, dealing with intermittency of employment, and showing that from 126 to 197½ days' labor per year was all that the men worked, consequently a higher wage rate was necessary than would be the case if the men had a full year's work. Summarized, the majority report recommended a wage rate approximately 30 per cent. less than that in force for the two years prior to the cessation of work on March 31, last. The majority report was signed by W. E. Knowles, chairman of the board, and by E. Astlund, who represented the miners. The minority report suggested a reduction of between 37 and 40 per cent. of the wage rate in effect prior to March 31. It is not yet known how the reports will be received by the respective parties, but Jesse Gouge, vice-president of the Coal Operators' Association, on hearing the verdict of the Board, stated that the Alberta mines

would close within two or three weeks after opening if no greater reduction than that recommended by the majority report were made.

The reports, which affect the mines in southern Alberta and eastern British Columbia mines, will be considered by the operators and the miners during the present week. Under normal conditions the district employs about 12,000 men, but for some time prior to March 31, when the old agreement between operators and men expired, only about 7,000 men were employed. This is perhaps one of the best features of the present condition, as undoubtedly more men and more operators have been trying to make a living out of coal mining that the industry under existing conditions is able to support.

Chu Chua Coal to be Prospected

Glenville A. Collins, Engineers, Ltd., have taken a lease on 2,000 acres of coal lands at Chu Chua, near Kamloops. Mr. Collins stated that an extensive diamond drilling campaign would be started as soon as the necessary machinery could be got to the ground. Later a plant for the handling of 500 tons daily would be erected. This coal area caused an interesting dispute between some of the staff of the Geological Survey and property owners in the district at the last meeting of the local branch of the Canadian Institute of Mining and Metallurgy, a paper read by one of the staff of the Survey being unfavorable to the probability of finding coal in commercial quantities in the Chu Chua coal basin.

Power for Sullivan Mine

The East Kootenay Power Company has entered into a contract to supply the Consolidated Mining and Smelting Company with power to operate all the mining machinery at the Sullivan mine and all the power that will be required for the new concentrator, now under construction. The contract calls for the delivery of not less than 8,000 h.p. The Power Company already has an excellent plant developed on the Bull River, from which it supplies Cranbrook and Fernie, but in order to meet the increased requirements of the Consolidated company a new 20,000 h.p. plant will be developed on the Elk River, and work will be commenced on this plant immediately.

New Orebody in Boundary District

A large body of ore, well mineralized with chalcopyrite and carrying gold, has been struck at the Molly Gibson Burnt Basin Mining Company's property, at Paulson. The strike was made in the new shaft, at a depth of 75 feet, and the ore is right across the shaft, eight feet wide, and the hanging wall has not yet been reached. It is thought to be one of the most important finds that has been made in the district for some time.

Work has been started on the Enterprise group, adjoining the Molly Gibson. Ed. Terzick is superintending operations at both properties.

Results in Cariboo Placer Field

As practically everyone who knows anything about the Cariboo deposits expected, the large influx of an intelligent class of prospector into this district is bringing its reward. It is true, of course, that a good many men have "gone broke," but that, too, was to be expected. A large number came here, despite warnings to the effect that no work could be done before June, long before the snow had melted; they became discouraged and disgruntled, and some who had the necessary funds left the district before they had an opportunity to do any prospecting, and have gone away prepared to say everything that is bad about the place and the prospects for finding gold. On the other hand, a number of intelligent, hard-working prospectors have remained, and already the result of their work is being made manifest. A. Pierce, E. Gladwin, and J. Sacker, who left Quesnel six weeks ago for the Clearwater country, at the head of Quesnel Lake, returned recently, and report the discovery of really rich ground on Blue Lead Creek, at the head of Quesnel Lake. Pannings are said to show heavy gold in considerable quantities. Finds are reported from Keithley and Spanish Creeks, and, considering the earliness of the season, results that have been obtained are really most encouraging.

Messrs. Guest and Munsen, who are acting for Kelowna capitalists, and who recently purchased the Stevens and Sheridan claims, adjoining the discovery claim on Cedar Creek, have purchased four adjoining leases, the consideration paid being said to be close to $200,000. The Big Six, as the group is being called, are probably, so far as development has shown, about the best claims in the district.

R. D. Featherstonhaugh, who has been in the district for some time, left recently for Vancouver, where he will attempt to raise capital for financing the development of the group of leases in which he and his associates are interested. Mr. Featherstonhaugh considers that the properties can be operated successfully only on a large scale with expensive machinery.

Experiment in Placer Mining

A novel experiment in placer mining is being tried at the confluence of the Chilcotin and Fraser rivers. Early in the spring the water at this point was lower than it had been for many years, and some rich ground was found in the bed of the river which usually is covered by water. After the rivers rose so that the work could be no longer done, two gangs of men began mining operations in diving suits, and, it is said, are making some profitable clean-ups. There is some talk of attempting to alter the course of the river at this point, so that the ground may be worked on a large scale, as it is believed that a good stretch of rich ground is covered by water.

Drilling for Oil

The Atlas Petroleum Company has started to drill for oil on its property at Hall's Landing. The work is being watched with considerable interest, as natural gas has been escaping at this point for a number of years, and it is thought that even if oil is not found it is likely that a commercial flow of gas may be struck.

Find in Windermere.

A five-foot vein of almost clear galena has been uncovered on the Mineral King property, at Toby Creek. Assays run in the neighborhood of $200 per ton.

New Zinc Vein in Slocan

Lessees at the Whitewater mine, at Retallack, have struck what appears to be one of the most important zinc finds that has ever been found in the Slocan. The vein is seven feet wide, and assays 58 per cent of zinc.

Developments at Mayo

There is a general exodus from Dawson to the new silver-mining camp at Mayo. Not only are people going, (in fact most of them already have gone), but hotels, houses, and other buildings are being pulled down and transported to Mayo, where they are to be re-assembled.

Mayo is crowded, but there is plenty of work for everyone, and there would be work for more if there were any accomodation available. As it is, people are living in tents, in boats, and practically anywhere they can find temporary shelter. Many prospectors are in the hills, and work at the mines is developing large reserves of ore. The Yukon Gold Company and the Treadwell interests both have large reserves blocked out, and several smaller concerns have blocked out lesser amounts. Everyone speaks confidently of the future of the camp, the only thing lacking, apparently, being facilities for transporting ore to shipping points. Now that the future of the camp is assured, however, it is confidently expected that this will be provided, though by whom no one seems prepared to say.

Northern Ontario Letter

Mining Association Meeting

This week at Porcupine was marked by the holding of the annual meeting of the Ontario Mining Association at Timmins. The meeting was extremely successful, and resulted in bringing together a majority of the representatives of the operating mines in Ontario.

Balmer Neilly, secretary of the Association, presented an address which dealt with the benefit of the mining industry to every citizen of Canada. The views presented were such as should go a long way toward attracting the attention of agriculturists as well as business men in the older part of Ontario.

Rochester Property Changes Hands

Another big mining deal was closed this week in the Porcupine district when the Rochester property was taken over by the Canadian Gold Mines Company, made up of British and American financiers.

The purchase of this property involves a total of $275,000, the terms being $10,000 cash and substantial cash payments due at intervals of every three months until paid in full.

Coming so quickly on the heels of the deal whereby the Hollinger secured the Schumacher, this latest deal attracts added attention and goes to show the growing interest in properties lying adjacent to the big producers. The Rochester lies next to the Hollinger, on the north.

Mr. Theodore Gross, of New York, is one of the principal American financiers, while Mr. Sara, of Montreal, is identified with the British interests involved.

Gold Production in June

Production of gold from the Porcupine and Kirkland Lake districts was well maintained during the month of June. According to preliminary estimates, approximately 171,500 tons of ore were treated, as compared with 172,000 tons in the month preceding. At each of the mines the grade of ore varied only slightly from the preceding month and resulted in an estimated production of approximately $1,745,600 for the month. This compares with estimates of $1,755,000 in May.

At this rate of production, the aggregate output of gold from Northern Ontario for the current calendar year will approximate $21,000,000, or an increase of more than 25 p.c. over any previous record in the history of mining in Ontario.

Although these figures are imposing, yet the future outlook is still better in the knowledge that additional milling equipment has just gone into operation on the McIntyre Porcupine, while on the Hollinger another increase is pending.

The barometer indicates a steady rise in gold production from Northern Ontario over a further period of years, and the areas now under development may reasonably be counted upon to yield an average of $25,000,000 a year over a long period.

High efficiency on the part of the workmen is resulting in approximately 50 tons of ore being handled monthly by each man on the pay-roll at the producing mines.

Hollinger's Half yearly Output

During the first half of 1922 the Hollinger Consolidated enjoyed an income that is unofficially estimated at $5,700,000, the mill having handled an average of close to 4,000 tons every twenty four hours, or a total of around 700,000 for the six months. This would indicate a recovery of upwards of $8 from each ton of ore treated.

Allowing $5 to cover costs and depreciation, and taking $3 as representing the net profit on each ton of ore treated, the net return would approximate $2,100,000 or at the rate of $4,200,000 a year.

An appreciation of current achievements at the Hollinger requires the recollection that the company is capitalized at $25,000,000, made up of 5,000,000 shares of the par value of $5 each. The annual gross production is equal to between 45 and 50 p.c. of the capitalization of the company, and the net profit is equal to approximately 17 p.c. of the issued capital.

Elbow Lake

Evidently the Elbow Lake district of Northern Manitoba is to experience disappointments — in this respect being like the Porcupine and Kirkland Lake districts in Northern Ontario in their early days. Already the cat of rumor is close to the ground and is picking up "sound waves" which may spell a set back for the enthusiasts who had commenced to believe that the gold mining industry of Northern Manitoba was to be swept into world prominence on the crest of one great wave of progress.

The development of mines is usually a long and difficult task. The road from raw mineral lands to mining fields of importance is strewn with disappointments as well as gold.

Set backs have never delayed for long the development of new mining fields once important discoveries have been made. Pioneers in Northern Manitoba will do well to remember the "slump" into which Cobalt fell soon after the first boom. They would also do well to keep in mind that soon after the big discoveries of gold in the Porcupine field it became known that M. J. O'Brien had surrendered his option on the Hollinger group of claims and with that many deals that had been pending fell through.

If disappointments fall in the pathway of the present wave of interest in Northern Manitoba, this will not mean that ultimate success may not follow. Northern Manitoba has been found to have surface deposits that compare well with other mining fields, and with favorable geological conditions existing, it is reasonable to believe that the province will sooner or later contribute in an important way to the mineral production of the Dominion.

Mining Plant for Hattie Prospect

A new mining plant has been purchased for the Hattie Gold Mines and will be installed as quickly as possible. The new equipment consists of a four drill Ingersoll Rand air compressor driven by semi-diesel oil engine, air hoist and so on, the entire order to be delivered within four weeks. The purchase was made from the Canadian Ingersoll Rand, Cobalt, and the equipment is of the most modern design.

The installation of this machinery on the Hattie Gold Mines will expedite the exploration and development of this promising property.

A Ton of Silver a Day

The mines of the Cobalt district are producing approximately one ton of silver bullion every twenty four hours. This high rate of output is tangible refutation of the pessimistic views so often heard in the past year or so that the silver mining industry of Cobalt was nearing its end.

For more than a decade and a half, there has not been one single twenty four-hour period go by, but that the mines of this field have produced at least one ton of silver bullion and as much as three tons were produced daily in the banner days of the camp.

"A camp that can produce over one ton of silver bullion every twenty four hours is a long way from being dead", is a remark which was made to the representative of the Journal, by Arthur A. Cole, mining engineer for the T. & N. O. Railway.

Disputed Mining Claims

Very few mining disputes for comparatively raw mining claims have aroused more interest among prospectors than that in which C. E. Pinelle is involved, in connection with mining claims in Lebel township. The case was supposed to have been heard before Mining Commissioner Godson, K.C., several weeks ago, but was postponed. The technical points involved have a direct bearing on many claims held by men who served overseas, while the outcome of the dispute will decide whether the deal for the Moffatt Hall Gold Mines will go through or not.

Dominion Reduction Plant Resuming Operations

The Dominion Reduction plant resumes operation this week, and will gradually be brought up to full capacity. Sand tailings from Peterson Lake will be handled at the rate of approximately 350 tons daily or about, 10,000 tons a month.

The silver content of these tailings is low, but by reason of handling a large tonnage it is believed that a substantial margin of net profit will be realized. A recovery of from four to five ounces of silver from each ton would result in a production of between 40,000 and 50,000 ounces monthly, or a total of between 200,000 and 250,000 ounces of silver before being forced to temporarily suspend operations with the arrival of winter.

In the meantime, no mining operations will be attempted in the Peterson Lake mine itself, although officials of the company are confident that given the necessary finances and favorable conditions an aggressive exploration and development program might reasonably open up important deposits of ore.

Veterans' Mining Claims

By reason of the representations made by the local branch of the G. W. V. A., the promise of Hon. H. Mills, Minister of Mines for Ontario, to protect the mining claims of returned soldiers has taken concrete shape in the form of the following copy of an Order-in-Council which has been posted up in all mining recording offices in the province:—

"The Committee of the Council have had under consideration the report of the Minister of Mines, dated June 17 where he states that with the object of assisting returned veterans of the late war to retain possession of their mining claims endangered through their inability to perform the working conditions thereon within the time prescribed by the Mining Act of Ontario, or Order of the Mining Commissioner, the Minister recommends that under and by the said authority of the said Act, it shall in the case of a mining claim or of an interest therein acquired before enlisting or enrolling by anyone who enlisted or enrolled for active service against the King's enemies in the said war, be deemed to be a full compliance of the said working conditions of Mining Commissioners Order, if the first instalment of work, whether the first thirty days or any subsequent instalment, as the case may be, falling to be performed on or before the first day of July, 1922, be duly performed on or before the first of August, or on or before any extension of time expiring subsequently to said day; and if on such instalment of work being duly performed and recorded, the remainder of the work being performed at the rate per annum prescribed in the Mining Act, but so that it shall not be necessary for more than forty days' work to be done in any one year, save only in such cases, if any, where fifty days' work are required to complete the full 200 days, the date for performing such work to be computed from the said first day of August or from the expiry of any extension of time expiring subsequently to that date. In computing the time within which the work for any such claim or interest therein is required to be performed, all time necessary to give effect to this recommendation shall be excluded.

"The foregoing not to apply to any case now in dispute or pending before the Mining Commissioner or Mining Recorder."

Development of Alpine Prospect, Gowganda

Work on the Alpine Silver Mines at Gowganda is being carried on with encouraging results. Operations have centred in the diabase sill, and no attention is being given to the Keewatin contacts on either the upper or the lower side of the sill. It is understood that some attention will shortly be paid to the Keewatin in close proximity to the diabase contact as this is generally considered by geologists and successful miners in the Cobalt field to be more attractive territory than in the diabase itself.

Indian Chutes Power Plant

By the end of the current year, from the extent of the progress so far made, the hydro-electric power now in course of development at Indian Chutes on the Montreal River will probably be ready for use at Fort Matachewan. A force of between 70 and 80 men are now employed, and it is expected to generate 2,000 h. p. from the equipment now being installed.

Completion of this installtaion, it is stated, will signalize a reopening of the Canadian Matachewan Mine, formerly the Fort Matachewan Gold Mines. This property was developed previously to a considerable extent and is known to have a substantial tonnage of ore that contains about $11 in gold per ton. Given electric power and reasonable transportation, such ore would yield satisfactory profits. This work offers promise of encouraging quite general activity in the Fort Matachewan field as well as that area lying to the east, in the direction of Kirkland Lake.

EDITORIAL

By the rate we develop our natural resources, especially those of coal and iron, shall our industrial progress and our standing among the nations be measured.—A. E. Barlow, 1914.

A NATIONAL IRON AND STEEL INDUSTRY FOR SOUTH AFRICA

South Africa has decided, through her elected representatives, that she must have the iron and steel industry upon which the industrial system of any modern nation is mainly built. A cabled despatch announces that a bounty on pig-iron and a further bounty on steel has been proposed by the Government. It is asserted that what is at present lacking for the building up of a well founded steel industry is capital alone, and it is calculated that the bounty, unusually substantial at first, and diminishing to zero at the end of eight years, will be sufficient inducement for large capital expenditure. Coal, iron ore, and fluxes are available in abundance, and railway facilities are, in the main, already provided.

On another page, we review the report on South Africa's iron ore resources recently published by the Imperial Mineral Resources Bureau. This is one of a series of volumes that will describe, in a comprehensive way, the iron ore resources of the Empire and of the world. That these volumes will contain the best information obtainable, and will supersede the compendious volume on iron ore compiled in 1910 by the International Geological Congress, is evidenced by the fact that the Imperial Mineral Resources Bureau is composed of a representative gathering of the Empire's leading mineral technologists, among them our own Dr. W. G. Miller.

The domestic requirement of iron and steel products in South Africa is comparatively small. There is no doubt that the production of these materials in the interior of the African continent will expedite its development quite materially and so will help to expand the home market. But it is upon an export market that South Africa's immediate hope for an iron and steel industry commensurate with her extraordinarily favourable conjunction of resources in iron ore and coal, must depend. As the future centre of steel production is some hundreds of miles inland, it is considered that only the more valuable finished or semi-finished steel and iron products will find ready sale in the world's markets.

It is not impossible that there will be, in the future, a repetition in South Africa of the condition that has made the iron ore industry of the Lake Superior region of the United States unique. The Lake Superior ores have an exclusive market throughout the interior of the North American continent, at present based not so much upon any superior quality as upon the natural barriers that exclude competitors. Coal of the right quality and in sufficient quantity is available south of the Lakes, and as a result of the settlement of the continent and the liberal use of iron and steel products by its inhabitants, the iron and steel industry of the Great Lakes region has become the largest in the world. Little of its product reaches the Atlantic or Pacific markets, but it supplies the requirements of the larger part of the continent's hundred odd million inhabitants.

South Africa's may be a similar case, and may in time not only provide the iron and steel used in a large part of the continent, but may constitute the centre of industrial activity, which will in turn provide a ready market for agricultural products, and so stimulate a settlement of the vast vacant spaces of the southern part of that continent that now invite the white man's attention.

South Africa's present case is analogous to that in which Canada found herself twenty years ago—but quite different from Canada's case today. At the opening of the century, it seemed certain that the bonus provided for the production of iron and steel in Canada would result in what the South Africans hope for today through the same means. But the two cases differ in the fact that, whereas Canadian calculations were based upon the hope of discovering adequate deposits of iron ore, the South African ore for the purpose is already in sight, in addition to adequate coal reserves.

In this connection it is interesting to note that the Hon. F. S. Malan is South Africa's Minister of *Mines and Industries*—a conjunction of duties that is obviously appropriate, though our Canadian legislators are quite oblivious to its significance. The creation of this combined ministry and the hearty support accorded the Iron and Steel Industry Encouragement Bill by General Smuts are well worthy of that truly great leader and Imperialist.

SOLIDARITY OF THE MINING PROFESSION

The miner, from prospector to operator, is inclined to be an individualist. That is good for the profession, as mining, like farming, depends so completely upon individual enterprise and initiative for its progress and continued existence. But in this case, as is usual, one can have too much of a good thing. Co-operation has a more important part to play in the development and operation of mines than most of us realize as yet. Here and there the leading spirits among us realize the need as shown by the

recent highly successful meetings in Nelson, British Columbia, and Porcupine, Ontario.

The mining convention at Nelson is notable as an international meeting. It is the annual occasion on which the men concerned with the business of mining in British Columbia gather to review progress, discuss present conditions, and lay plans for the future. The meeting is always made the occasion of pronouncements by men in charge of public departments, and frequently the issuance of these is of prime importance. Investors, engineers and public administrators, all interested in the same broad objective, make common cause, with notable results.

It is natural and logical that the Nelson convention should include such a prominent representation of citizens of the United States. As pointed out by the Lieutenant-Governor of British Columbia, it was due principally to the initiative of American citizens that the mining industry of the province was inaugurated, and its continued progress is still dependent to a large extent upon the investment and energy of the same friendly foreigners. Such international relations as are demonstrated annually at Nelson are among those facts that cause Canadian-American amity to be an example for all the world.

The Ontario Mining Association is more exclusive in its personnel than the Nelson meeting, as it includes only the owners and operators of mines. This restriction necessarily limits the sphere of its activities, and makes the Association less representative of the mining industry of the province. Still it leaves plenty of scope for useful activity, especially in the way of keeping the mine operators of the province alive to the need of action in concert along certain lines that are essential to the progress of the mining industry.

An achievement during the past year that can be credited to the Ontario Mining Association is the express exclusion of mining engineers from the operation of the Professional Engineers Act. Our brother-engineers in other lines would have us join with them in making engineering a closed profession; but the majority of our mining engineers, though fully qualified to enter such a corporation, have a distrust of such a legalized union that prevents their participation. That this is not confined to Ontario is evident from recent action in British Columbia, where a movement is on foot to effect a belated exclusion of mining engineers from the operation of the Act recently put in effect in that province.

All these questions affect the main issue, which is the solidarity of the mining profession. The arguments for and against conventions, associations, and legal enactments bearing on the mining industry must be examined in the light of their effect on the industry as a whole. Aid to selfish or sectional interests is more than likely to impede progress in the long run. As these activities forward the legitimate objects of the industry they are good; where they run counter to the sound interests of the community, they must be opposed. The only mutable part of the industry is the fallible human beings engaged in it. Hence, upon the good judgment of the leading spirits of the industry depends, not only its solidarity, but its relation to the national community. We are confident that the spirit expressed and engendered by the conventions at Nelson and Porcupine will aid in directing the energies of Canadian mining men and the thought of the Canadian public along the right channels.

MARKETING MINERAL CLAIMS

As we have pointed out frequently, the progress of the mineral industry depends principally on the prospector. If he quits work, the whole industry will stop with the gradual exhaustion of known mineral deposits. So it is worth while to consider all means by which the work of the prospector may be made more systematic and less liable to discouragement and failure.

The examining engineer is an important factor. When a claim has been staked, the owner is naturally anxious to realize something on it as soon as possible. His discovery may have come at the end of a long period of outlay with no return. Either from pardonable haste or through ignorance, he may invite the attention of investors before the property is prepared for examination by stripping, trenching and test-pitting. When the engineer looks over a claim in this condition it is quite natural for him to feel a bit disgruntled, particularly if he has had a long, hard journey to get to it. And it is not uncommon for engineers in such cases to say something discouraging and perhaps unduly final, although there has been really no chance to examine the merits of the property.

What is the prospector to do next? Too often he does not know, and often he does nothing. His claim is like a child of his. He has faith in it, but he does not quite know what to do with it. A little wise counsel at such a crisis is what is needed, and the engineer is in a position to give such advice. It would greatly facilitate the proving of claims if all examining engineers would make it a point to indicate to prospectors in such cases what is necessary in order to put their claims in shape for examination. We know mining engineers who do this as a matter of course, and our Canadian field geologists, both provincial and Dominion, are very helpful to prospectors in this way. There are cases known where a simple hint founded on geological and mining experience has led to very important extensions of the discovery. This kind of work could be greatly extended without seriously interfering with the proper work of the geologist and the mining engineer. In fact, it perhaps should be considered part of their proper work.

It will be noted that in this discussion we have in our mind's eye the real prospector, who most usually grubstakes himself. A good many of our best prospectors belong to this class, preferring to work independently and to reap the full benefit of their discoveries. They have the self-confidence of the man that has learned to

take care of himself under all circumstances in the bush, but they also have a growing respect for the knowledge and judgment of the geologist and the mining engineer. But many of them have learned to look with suspicion on the examining engineer, and they say they prefer to take their chances with the promoter and stock-broker rather than run the risk of having their properties coldly condemned after a cursory examination. We have heard some of them even profanely eloquent over the way in which an engineer had come to look over their claims, only to complain that they could see nothing but a crack in the rocks. Doubtless in these cases that was all that could be seen, but even a crack in the rock is in some situations worth careful following up. A word to that effect, with some indication of the best direction in which to work and a suggestion of another examination later on if further exploration uncovered something more promising, would be more encouraging than a simple condemnation of the property. Our plea is for sympathetic co operation between the prospector and the examining engineer.

EDITORIAL NOTES

Mr. Scott Turner, speaking for the Mining Corporation of Canada, wishes it to be known that this company has not now, and never has had, any interest whatever in the Elbow Lake district of Northern Manitoba. The company's only holding in Northern Manitoba is in the vicinity of Flin Flon Lake, 40 miles west of Elbow Lake. The *Journal* regrets having erroneously included the Mining Corporation among those interested in Elbow Lake prospects.

A reader of the *Journal* in Toronto, who is a shareholder in the V. N. T. mine at Porcupine, Ontario, has written protesting the action recommended by the board of directors, and described by our Northern Ontario Correspondent today. If all the things this shareholder says about his board of directors, Mr. Arthur E. Moysey, Mr. Hamilton Wills and the Standard Stock Exchange are true, it is a case, as he suggests, for prompt official action, with an ultimate eye on an institution of correction on the outskirts of Kingston. There is no doubt that there is some justification for this "kicking" of minority shareholders, and we hope that there may be some prompt legal action to prevent what threatens to be a travesty of justice.

In the Toronto *Financial Post* of June 30th, there is published one of those judicial pronouncements on mining that are so rare in the public or financial press. An article by Austin R. Campbell sets forth, clearly and fairly, the fact that mining and prospecting are properly the business of trained miners and prospectors, and that in their hands the finding and developing of mines is no more hazardous a business than farming, and that it is the dabblers in mining that provide most of the failures. The same might be said of investors in mining, has been aptly pointed out lately by Mr. Alexander Gray. Intelligent investment in mining development or operation is sound and more than ordinarily remunerative in a country like Canada, whose mineral deposits are being found and put to use so rapidly.

Last autumn Mr. Ellis Thomson of Toronto University examined the Goudreau gold area on behalf of the Geological Survey, Ottawa, and an abstract of his report was printed in these pages on May 19th. Mr. Thomson is again in the field at Goudreau, and through the courtesy of the Director of the Geological Survey we are able to give today an account of present conditions in the new gold camp. Many are following with interest the events northeast of Lake Superior, which makes this account, fresh from the field, unusually timely.

Mining problems that would in other regions more favoured by nature cause the abandonment of a coal mine, stimulate the Nova Scotian engineer to renewed endeavour. The attempt to overcome "bumping" described in Mr. Nicholson's paper which we print today, is such an effort. Mr. Nicholson is one of the younger generation of engineers in Nova Scotia, and has brought energy and a vital faith to bear on his work, in addition to a well rounded experience. The recurrence of a local "bump" week before last does not necessarily indicate that Mr. Nicholson's new method of mining is unsuccessful. If as seems probable, he has solved his problem, he will deserve the thanks not only of his employers but of Nova Scotians and Canadians in general.

WELSH RABBIT

These here French cheffs I've heard about a lot,
How they can put cheese parings in a pot
And make it into a rabbit stew — My God!
I ett it wonst! Me and my pardner Rod
Got sort a soused and blowed into a place
Where none of us would, sober, show his face
The waiter ast us what we wanted first
And Rod, he looked at that there card and cursed
Sez he, sez Rod, "Say, pardner, this here rabbit
Sounds kinda good; you go outside and grab it
It wasn't what the both of us should need,
But there was nothin' else that Rod could read
The waiter fetched it after quite a spell,
And it was hot — say — it was hotter'n Hell
Rod ett his share and I got outside mine
And then the both of us just started dyin'
The way that our insides begun to burn
I knowed that rabbit's ticket was "return"

ANON

Recent Development in Goudreau District, Ontario*

By ELLIS THOMSON

During the past winter and spring considerable development work has been done on the property of the Goudreau Gold Mines, Ltd., in the vicinity of Murphy lake, Township 28, Range, 27, Michipicoten district. Comfortable log cabins have been erected and power has been brought in from Magpie Mine, which is about seven or eight miles to the west. Two double compartment shafts, some five hundred feet apart, have been sunk on the vein.

No. 1 shaft, which is close to Murphy lake, has been sunk to a depth of 136 feet, following the dip of the vein towards the south west at an angle of 65-70 deg. for the first 65 feet and 79-85 deg. for the remainder of the distance. At the foot of this shaft the vein is split up into a stock work or vein system, that extends across the width of the shaft. Most of the individual veins are small, although one near the hanging-wall side is 1-2 foot wide and carries the best gold values. The gangue in these small veins is chiefly quartz, though considerable carbonate is also present. The metalliferous minerals found at the foot of this shaft are for the most part the same as on the surface, with native gold, chalcopyrite, and pyrrhotite as the most prominent. In one part of the vein-system, near the 100 feet level, small amounts of niccolite and smaltite were encountered in a carbonate gangue.

Prospect Shaft on Murphy Claim.

No. 2 shaft has been sunk to a depth of 150 feet, vertically for the first 36 feet and at an angle of 64 deg. to the south west along the dip of the vein for the remaining distance. The gague is chiefly carbonate carrying cross-stringers of quartz and is said to carry good values although little or no gold is visible in hand-specimens. The metalliferous minerals chalcopyrite, pyrrhotite, and pyrite occur sparsely scattered through the gangue. At the bottom of this shaft the carbonate iron formation fills most of the fissure. It seems probable that the iron formation, which was deposited prior to the quartz, although appearing in places to be contemporaneous with it, acted as a good reducing agent for the formation of the metallics.

Mining Camp, Murphy Claim, Goudreau, Ontario.

Considerable development work has been done on the Bannville-Pagé claims north of Rowan lake, and native gold has been uncovered in two or three more places. The Webb claims on Godin lake have been taken over on a working option by the Algoma Development Co. and work has already commenced under the direction of Capt. Michael. The Cline claims east of Pine lake have also been optioned to a group of Montreal capitalists. In the last nine months a great many new claims have been staked in this district, and many of these as well as the older claims have been surveyed.

British Columbia's Greatest Precious Metals Mine The Premier

By ALEXANDER GRAY

Without trumpetings, and with the thoroughness characteristic of men of the large mining affairs, the Premier property of the Portland Canal district of British Columbia has been brought to the producing and dividend stage. That the Premier Mine is the largest of its kind in the Pacific province is conceded. Practically a co-partnership the Company is one of these close corporations which do not court publicity however important the information would be for the benefit of the tributary country. "Good" being "as good as it looks", whatever of speculation entered into Premier company operations has been confined to the owners of three-fifths and two fifths respectively: the American Smelting and Refining Company, Isaac Untermeyer, Guggenheim Brothers, Miner C. Keith, on the one hand, and R. K. Neill, of Spokane, W. R. Wilson, Manager Crow's Nest Coal Company and President of the Canadian Institute of Mining and Metallurgy, R. W. Wood and A. M. Trites, merchants of Fernie, on the other hand. Under such auspices it was possible to devote years to preliminary determinations, development and equipment; and if there has been reticence, it has not been due to the absence of appreciation on the part of principals or of the best technical control, H. A. Guess, Vice-President of the American Smelting and Refining Company being the Managing Director of the Premier Company and Dale L. Pitt directly in charge of the management. Explaining the general attitude of the Premier Company and staff, Mr. Guess recently wrote:

> "The mine has been extensively developed, and equipped with water power and with semi-Diesel engines as power auxiliaries in winter months; also with a mill of 100 tons' daily capacity and an aerial tramway of 11½ miles from the lower tunnel and mill direct to dock at Stewart, B.C. A dividend of $400,000 was paid at the end of December, 1921, and $500,000 at the end of March, 1922, and if no particular publicity was given to either of these dividends, it was purely because there are only a few stockholders of the Premier, which is a Canadian corporation, and its shares are not publicly dealt in. First class shipping ore goes to the American Smelting and Refining Co., Tacoma smelter; second class shipping ore to Granby smelter, Anyox, B.C., and lower grade to mill. The management is lodged with the A. S. & R. Co., with myself as Vice President and Managing Director of the Premier. The Plant Manager is Dale L. Pitt."

That is brief and to the point. Money, management and a mine that was re-discovered by Mr. Neill, as the *Northwestern Mining Truth* puts it, have made the Premier, of Premier, one of Canada's show places. Mr. Guess is altogether too modest and too pre-occupied with multifarious business to go further into particulars. His interest in Canadian mining is long standing, and his familiarity with the Premier dates back to three years ago, when the property that was abandoned twice had been proved by Mr. Neill to possess exceptional merits.

The Premier as a Prospect

Off and on for a decade or more the ground underwent sporadic prospecting and exploration. "Pat" Daly's version of what happened when Bush, a champion skater, and Mr. Neill and his associates held it or had it under option, was given last summer in *The Canadian Mining Journal*. The Canadian Mining and Exploration Company had a pre-war try with Mr. Rolfe in charge. Then the Salmon-Bear River Mining Company, organized by Col. William Boyce Thompson of New York, spent about $80,000 under the management of H. R. Plate. It is understood both Messrs. Rolfe and Plate wished to continue the work. In the case of the Canadian Exploratoin company, however, the outbreak of war suggested the stoppage of work, and the Thompson interests quit later when a noted engineer en route from Kennecut could not see eye to eye with Mr. Plate. Had either party acted on the principle laid down by the disconsolate Swede, who swore he never would abandon another property "without going four feet further", the Premier property might never have fallen into the lap of Messrs. Neill, Wilson, Wood and Trites, to say nothing of the Guggenheim Untermeyer-Keith combination. Because of the earlier misadventures and current results, the fact that "only a few" are directly concerned, rather suggests that more data at frequent intervals placed before the larger audience, now there is a Premier post-office and continuous production. Of course the owners are satisfied. Their enterprise entitles them to the privilege of looking further. They have a real mine — and there may be others. Apart from Northern Ontario, no other section, unless it be Northern Manitoba, is undergoing such extensive exploration and development.

The Government of British Columbia are admirably aggressive in promoting the welfare of prospectors and those with speculative capital. Base metals there are in superabundance. It was the Premier Mine that spurred the province and mining capitalists to more aggressive efforts. The British Columbia Minister of Mines in his report for the year 1921 states that "the production of the Premier Gold Mining Company, Limited, of Stewart, of over $1,500,000 this year, is indicative of the output that is to be expected from that property in the future. The great increase in gold is due to the wonderful production of the Premier Gold Mining Company amounting to 40,104 ozs., against 2,283 ozs. last year. It will be noted that the total silver output was over 1,500,000 ozs., of which the Premier Company alone produced over 1,000,000 ozs." Having whetted the appetite for further details of the Premier, and sharing in the optimism of its modest owners, the British Columbia report momentarily supplies all sufficient data, showing the situation as it was at the end of 1921.

What has been Accomplished

"The company has this year accomplished a great deal in all the departments, mining, milling, engineering, equipment, and transportation, and the property has now reached the stage where there should be no more serious handicaps to interfere with maximum production. With the completion of the tramway from the mine to the beach the greatest difficulties have been overcome. Mining for the year consists of extensive development work about 1,000 feet on all three working levels. On the No. 1 level at 3,000

feet elevation, the south vein was located by diamond drilling, crossents run from the No. 1 tunnel, and the south stope opened up. It shows a length on this level of about 200 feet of the same lenticular character as the north vein, and with like enrichments along the fault seams. The greater portion of the ore shipped last winter and this summer, amounting to over 4,000 tons, was taken from below the No. 1 level on the north vein and above the No. 1 level on the south vein. On the No. 2 level, 1,750 feet elevation, a long crossent and drift picked up the south vein and the stope is now being opened up above this level.

"The south vein on this and No. 1 level is supplying all the ore to the concentrator, over 100 tons a day, and considerable shipping ore as well, found along the cross-slips. The No. 4 level, 1,325 feet elevation, has been driven ahead from the face of the old Plate tunnel, and at the time I was at the property (January 1st, 1922) had about 200 feet to go before it was expected to encounter the south vein. When this vein is opened up it will prove the ore-shoot to a depth of about 700 feet below the surface, and should the values hold as good as the upper levels will mean several millions of dollars worth of probable ore. When both veins are raised on from the No. 4 level and the ore blocked out and 'in sight', then a fair estimate can be made of the value of the ore. It has been reported in the press that there are $80,000,000 worth of ore in sight, which may prove true, but it is an absurd statement to make at the present stage of development.

"Diamond-drilling was being done on the No. 4 level, and one or two drills have been in operation all year, totalling 6,800 feet of drilling. A raise has been put through from the fourth to the second level and equipped with a hoist and cage for a thoroughfare from the No. 4 camp to the upper camp, where the main office is located."

Character of Ore-Bodies and Equipment

As this is the official view of Premier Mine developments, and the first to appear of official record, its continuous production removes all question as to the progress made. Of the ore bodies, Mr. Schofield has stated that they follow closely the contact between the quartz porphyry and the tuffs, both of which are highly altered. Several lenses occur in the quartz porphyry, but up to the present no ore has been located entirely in the tuffs. The shoots are in lenticular veins, the ore bodies are faulted and sheared and in most places are about 10 feet in thickness. To deal with the situation, an extensive plant and housing facilities have been provided. It was the problem of transportation that gave the management most concern. To meet the difficulty, the British Columbia Department of Mines describes what was done:

"It was therefore decided to install a tramway and work was started this spring as soon as weather conditions would permit. The contract was let to the Riblet Tramway Company, Spokane, Washington, and that this company was able to complete it and have it in operation for January 1st, 1922, as a very creditable piece of work. It is 11½ miles in length, in four sections or with three angle stations, and with a tension tower on an average of about every 4,000 feet. The difference in elevation between the upper terminal at No. 4 level of the mine and the lower terminal at the dock is about 1,325 feet. The power required to operate it is a 50-horse power motor geared to the bull-wheel at the upper terminal. There are towers in the entire distance. There are 120 buckets being used at present of 800 lb. capacity each. As it takes less than two hours for a bucket to travel the 11½ miles, it means a bucket dumped every two minutes, giving a capacity, at full speed, of about 12 tons per hour, which will be cut down somewhat when hauling return freight.

"The mill was started in July and has been running continuously, except for minor close-downs for repairs and alterations. On account of the complex nature of the mill-feed, especially its variations in silver-sulphide contents, its treatment has presented many complications and necessitated some small alterations in the mill from the original flow-sheet.

"The mill was designed for treating 100 tons of feed in twenty-four hours, but has been running over capacity and producing from 20 to 30 tons of concentrates a day."

When it is understood the company has been using forty to sixty horses and two 5-ton caterpillar tractors for hauling, and handled during 1921 upwards of 6,000 tons of freight from the dock to the mine over the wagon-road, the achievements are too notable to withhold from the public. The shipments from the mine last year "amounted to 4,356 tons, from the concentrator 1,000 tons, and about 9,000 lb. of precipitates from the cyanide plant, the total production yielding 35,000 oz. gold and 1,200,000 oz. silver, valued at $1,200,000."

These figures do not tally with those given in the other portion of the British Columbia report, and already quoted. There is a seeming disparity of about 5,100 ozs. gold and 200,000 ozs. silver. However, on balance the Premier Company inaugurated its outputting on a greater scale by giving the proof of Portland Canal potentialities, —when the capital available is ample and the technical control all that Mr. Guess and his principals represent.

Mr. Neill Tells His Story

As the man who traversed the Western States and Mexico in quest of things with the ear-marks of mines, who was one of the Coeur des Alènes pioneers, has designed and built mills since 1886, who bonded the St. Eugène from James Cronin before it was sold to the Gooderham-Blackstock people, who was a party to the War Eagle, Rossland, deal with Finch, Campbell, Clark and others. Mr. Neill possessed versatility and vision. How many mining ventures he sponsored until he "made his pile", his romantically-strenuous career until then, need not be reviewed. Unfortunate investments in real estate, when he had foresworn mining, rather convinced him he had been recreant to what he was specially qualified for; so, after giving the "once over" to more country, he had his attention called to Portland Canal, which he visited. In 1916, therefore, having met Messrs. Trites and Wood, for whom he examined a property in the Cariboo, he suggested that they join him in a property offering possibilities at slight expense. This property was the Bush Mine.

How the Mine was Made

Beginning with March 7, 1917, when Mr. Neill took a bond from Bush, work began on April 7, Dan. Lindeberg being the foreman, who snowshoed his horses and packed in supplies. Five men were employed. Taking the situation as it had been left by Messrs. Rolfe and Plate, No. 1 tunnel was in about 80 feet from the portal and was in practically barren or very low-grade rock. As described in *The Canadian Mining Journal,* a crosscut was started from the tunnel working face. Two rounds brought the heading into a body of ore running $65 per ton in gold and silver. That was regarded as a fair start. Then attention was given to an abandoned crosscut. At a point 184 feet from the portal, this crossent had been run. "The first

round", says Mr. Neill, "opened up the ore-body, carrying around $60 per ton across 8 or 9 feet. So another crossent from the tunnel, that had been carried in 250 feet. At this point, with 175 feet of back, a shot or two again tapped the ore. The first 6 feet averaged $300 per ton, and the whole mass, 65 feet wide, averaged $55 per ton."

Needless to say, the section became more than interesting. Portland Canal lines of communication, though, were not conducive to large outputting. Work proceeded, but shipments were not made until the winter of 1917-18, when ore to the value of $75,000 was hauled on double-end bobsleds and rawhides, and shipped to Tacoma, which involved a freight and treatment charge of $18 per ton. The following summer, in 1918, the trail was widened and improved, and double bobsleds took out $200,000 worth of ore in the winter of 1918-19—enough to keep things going at a livelier pace. In the summer of 1919 a serviceable wagon road was completed. It reached the mine in October. By that time, it is related by Mr. Neill, "all improvements had been paid for out of profits, although the four original partners, Neill, Wilson, Trites and Wood, had each contributed $50,000 toward initial expenses and had borrowed an additional $60,000."

Their sporting bet, backed by Neill judgment, was making good so rapidly that other interests began to notice it. No doubt, Mr. Neill was not hiding his candle under a bushel. That was why two rival parties arrived on the spot about August, 1919. Mr. Guess dropped in on behalf of his principals, and Samuel L. Silverman, previously identified with the Keith-Untermeyer party, both of New York. Mr. Silverman "beat him to it". He was a lap ahead—just twenty-four hours. Mr. Guess made an examination. Of course they talked options, a probationary period for examination, reasonable payments. Mr. Neill had been there before. Neither options nor a purchase price was obtainable. Mr. Neill seemed somewhat impossible—the rivals were worse off than were Cecil Rhodes and J. B. Robinson when each eagerly sought to close the deal for the farm Langlaagte on the West Rand. Mr. Neill coyly remarked he would be just as happy "were t'other dear charmer away."

And both departed empty-handed. Shortly thereafter, Messrs. Neill, Trites, and Wood were invited to view the White Lights of New York, and they arrived there a month later. Promptly negotiations were resumed. As between the Guggenheim and Keith Untermeyer people, a compromise was effected, and terms acceptable to all partis were agreed on, on a basis of two fifths to the vendors and three fifths to the purchasers. What treasury shares were set aside, subsequently were distributed among the respective owners. Thus, it was that the Premier Company came into existence, this being the mining position at that moment:

No. 1 tunnel was in 250 ft. with backs of 175 ft.
No. 2 tunnel was in 200 ft., at a depth of 500 ft.
No. 3 tunnel was in 100 ft., at the depth of 650 ft.
No. 4 tunnel was in 570 ft., at a depth of 1,000 ft.

To-day, Mr. Neill has explained, "ore is coming from Nos. 1, 2 and 4 tunnels, although the latter is not yet in the main bonanza ore-body. The ore zone is over 100 feet wide, with the high grade anywhere from one to thirty feet wide. A combination concentrating, flotation, and cyanide mill, with a capacity of 150 tons, has been operating, power being supplied during most of the year by hydro electric plant, and by auxiliary Diesel engines during the dry seasons."

The plant is said to have cost around $300,000, according to *Northwest Mining Truth*, exclusive of the cost of the tramway, an additional $250,000. The mine is said to be now producing between 5,000 and 5,500 tons monthly, higher grade running from $75 to $350 to the ton, and shipped to Tacoma; lower grade, between $40 and $60, is going to the Granby, Hidden Creek metallurgical works. Mr. Neill vouches for it that the average of shipments has been around $100 per ton, with an average ratio of about 40 per cent. gold and 60 per cent. silver.

ONTARIO DEPARTMENT OF MINES REPORT ON SCHREIBER—DUCK LAKE AREA

There is now available at the Department of Mines, Toronto, Part IV of the Thirtieth Annual Report (1921). This contains three short reports. The second of these, by A. L. Parsons, contains a description of the minerals found in the ore of Silver Islet in Lake Superior, and demonstrates by means of micro-photographs the probable origin of the ore. The third is the report on the Gondreau gold area by A. G. Burrows, published in the *Canadian Mining Journal* in July of last year. The first report, on the Schreiber—Duck Lake Area, by P. E. Hopkins, is the one of more immediate interest. It is accompanied by a geological map of the area described, on a scale of a mile to an inch.

Though ores of zinc, lead and copper have been found within this area, it is the gold deposits that have awakened the most interest and that give most promise of economic importance,

In common with the rest of northwestern Ontario, the Schreiber area was scratched over by prospectors twenty years ago, and some ore deposits were found. Until recently the more promising of these have lain dormant, some attention having been paid to veins less worthy of it.

In the work of re-opening the deposits along the shore of Lake Superior Mr. Hopkins has been a pioneer. The fact that he re-located what is now known as the McKellar-Longworth property on Schreiber Point is somewhat obscure in his own account. This is commonly reckoned the most promising prospect in the neighborhood. Its development has been careful and consistent, as befits the work of a modern prospector such as W. L. Longworth.

The Jackson property, within a stone's throw of the railway, three miles east of Schreiber, contains some unusually rich ore; but the quantity, as described in Mr Hopkins' report, is hardly sufficient to make a mine. Exploration on both this and the Longworth properties is still proceeding.

There are gold occurrences for twenty miles along the margins of a batholithic mass of granite and syenite from Schreiber to Jackfish, and Mr. Hopkins suggests that these contact areas are worthy of careful prospecting.

At Big Duck Lake, fourteen miles north of Schreiber small amounts of rich gold ore have been found, but as yet no ore body of economic importance has been located.

After extensive experiments with the use of an Alberta coal for smithy purposes, the Industrial Research Department of the University of Alberta states that it compares very favorably with imported Pennsylvania coal for this purpose. Comparative tests were made under ordinary blacksmithy conditions, and included heating, welding and tool making. In all these tests the results obtained with the Alberta coal were equally as good, if not better than, those obtained with Pennsylvania coal.

Past and Present Methods of Mining, No 2 Mine, Springhill, Nova Scotia*

By J. C. NICHOLSON

No. 2 Mine of the Cumberland Railway and Coal Company at Springhill, N. S. is on the No. 2 seam, which is the lowest of the three principal seams in that district, the other two being respectively 100 ft. and 280 ft. above it. This slope was opened in 1871 and with the exception of several strikes — with which the people of this province are more or less familiar — has been in continuous operation since that time.

The slope is driven on the pitch of the seam which runs in a northerly direction. The average dip from the surface to the 3300 ft. level is 30 degrees with a maximum at one place of 38 degrees; from there to the bottom, which has now reached a total length of 6900 ft., it dips uniformly at 20 degrees. At 2800 ft. level a down-throw fault was encountered which necessitated driving a stone tunnel for 100 ft. This is the point of maximum grade.

The coal, which has an average thickness of 9 ft., is of excellent quality and has the reputation of being the best steam and domestic coal in Nova Scotia. The output at the present time is 1500 tons per day.

The mine is entered by three slopes — haulage slope, downcast air slope and pipe slope. At approximately 600 ft. intervals levels are broken off which are designated by their distance from the surface measured along the slope, such as: the 1300 ft. level, the 1900 ft. level, and so on.

Original Mining Method

The orignal method of working, with the exception of slight deviations due to some local condition which usually occurs in every seam, was to divide the coal into pillars in the first working. As the levels advanced, headings spaced 700 ft. apart were driven on the full pitch of the seam, coal was brought down these places on sheets, by gravity where the grade was sufficient, otherwise by boys called "shovers down". When the heading had reached the level above, sheets were taken up and replaced by track, for a back balance, using a cage. Then bords were broken off on both sides of the balance and driven 350 ft., or until they holed through on the workings coming from the next balance. This procedure was continued until the level had reached the determined boundary, and the whole lift or block of coal between the two levels had been completely

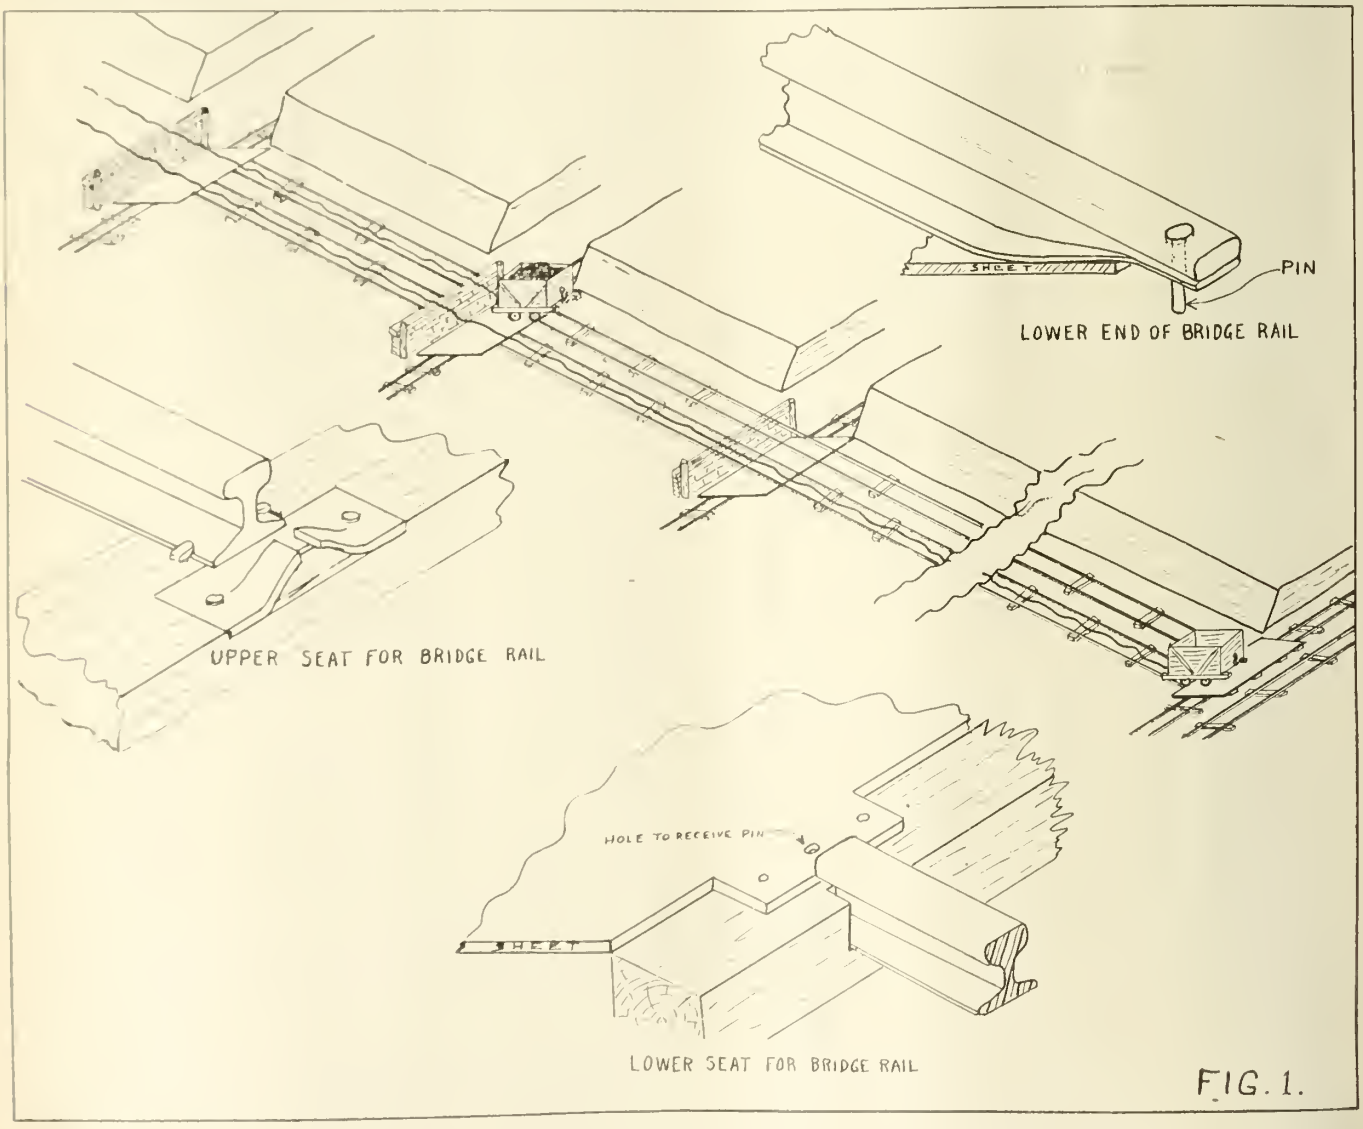

FIG. 1.

* A paper read before the Annual Meeting of the Nova Scotia Mining Society, May, 1922.

divided into bords and pillars. Then, beginning at the inside, the pillars were attacked and brought back toward the slope.

The first pillars were 30 ft. thick, with cross-cuts every fifty feet. These were increased at different times until, at the 3300 ft. level, pillars were 40 ft. by 70 ft. and the width of bords reduced from 12 ft. to 10 feet.

Troubles at Depth

This method worked satisfactorily on the upper lifts; but, as the working got deeper and the cover increased, it was found that before all the pillars could be brought back much of the first working had badly caved, thus necessitating the cleaning up of falls and in many cases the driving of entirely new bords, which were driven adjacent to and on the high side of the old ones. This operation is called locally "ribbing in". In fact, at the 3300 ft. level, where the cover increased to 1600 ft. after suspension of operations for two years due to labor troubles and a series of delays, by the time balances were found to be so badly fallen that before they could begin the pillar work, the whole lift had to be again divided up into bords and pillars.

This experience led to a material change in the method of working. On the next lift levels were shortened, the size of the pillars increased to 60 ft. by 90 ft. and no tight work above the entries (with the exception of an occasional heading to shorten the aircourse) was begun until the entries had nearly reached the boundary and they were ready to come back with the pillars.

But even this change did not have the desired effect. The cover had now reached a thickness of 2000 ft. The floor began to heave badly, with the result that even where the pillar work was begun immediately on completion of the bords, it was found impossible to remove them without much "ribbing in". Trouble from the same cause was experienced on the balances, the heaving of the pavement throwing the track out of alignment and reducing the height so that there was not sufficient head room for the cages. Moreover, the seam developed a tendency to "bumps", and these increased in frequency and severity to such an extent as to cause the management considerable anxiety. It was evident that, if the mine was to be worked at a profit, some radical change must be made in the method of working. Larger pillars could hardly be considered, as already in cross-cuts and pillar work (on account of the flat pitch) the coal had to be shovelled two or three times before it was loaded into the mine cars, and this was a source of constant complaint from the miners.

The New Method

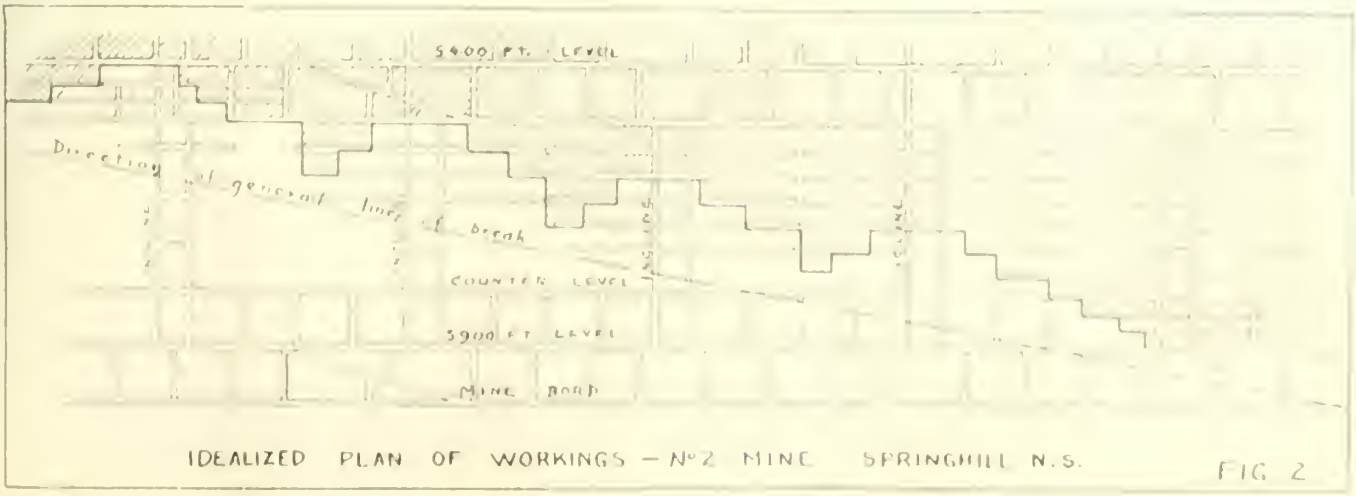
After much consideration and some experimenting the following method was adopted:

Three entries, as before haulage level, water level and counter level are driven to the boundary. Headings in pairs are laid off every 500 ft. but are only driven to the counter level, with the exception of an occasional one to shorten the air course. Between the headings and from the water level or minebord to the haulage level, cross-cuts are driven at 100 ft. centres, thus making the entry pillars 90 ft. by 90 ft. When the entries have nearly reached the boundary, the headings are continued to the level above, beginning at the innermost one and starting the others successively until four are in operation. Coal from the heading is lowered by jig wheels until the headings break through, when the wheel is replaced by a drum. Three landings, forty-five feet apart, are then cut at the top; from these, bords are driven on both sides, making the pillar between them 35 ft. The bords are driven 250 ft. or until they hole through to the working from the next inclines, when the pillars are immediately brought back. The face of the bords and the pillars are kept at least 40 ft. ahead of the bord immediately below, and not more than three landings in one incline are working at one time. As one bord is finished a new one is begun until the coal is brought back to the level.

Haulage on Inclines

The system of haulage on the inclines is known as the ent rope system. One of the ropes has two detachable sections equal in length to the distances between the landings. These are readily detached or connected as the case may require. When running from the top bord both are detached and laid aside, when running from the others one or both sections of the rope are connected according as they are running from the middle or lower landing. The landings are crossed by means of bridge rails. Perhaps this will be shown more clearly by the accompanying illustration (figure 1).

At this point it might be of interest to make a few remarks of more or less theoretical nature. Now at first glance a 35 ft. pillar under a cover of 2,500 ft. may appear contrary to the first principles of mining, but such however, is not quite the case. It is one of the fundamental principles of mining that the size of the pillars must increase with depth; but another principle, equally important but sometimes overlooked, is that the size of pillars depends on the time they are to be



IDEALIZED PLAN OF WORKINGS — N°2 MINE SPRINGHILL N.S. FIG. 2

left standing. It is to the observance of this latter principle that the present system owes its success. The pillars are removed so quickly that the bords have not time to cave.

Another feature which led to the adoption of so small a pillar was the problem of "bumps". It was early observed that these were more severe and occurred more frequently in driving the bords with a small one. As a matter of fact the first pillars were 45 ft. but the bumps were equally frequent and more severe. (See Figure 2 for plan of workings.)

Bumps

Before proceeding it might be advisable to explain just what is meant by "bumps". The terms "bump", I understand, is a more or less local term, used to describe a sudden jarring of the mine, due apparently, to a yielding to some great force in the strata. They occur unexpectedly, without giving any warning, which distinguishes them from other disturbances of a similiar nature, namely, "crushes" and "creeps". Apart from the noise, bumps consist chiefly in upheavel of the pavement and dislodgment of large quantities of coal. They are not generally accompanied by falls of roof except where the roof has been previously broken, in which case there have been falls of considerable extent.

These bumps are accompanied by some very wonderful phenomena. For instance, in one of the most severe, the jar was felt in the town as far back as three quarters of a mile behind the outcrop, and so great as to rattle the dishes on the shelves, while at the same time directly over the workings it could scarcely be detected. At another time a bump occurred in a bord where a pack or crib (7 feet high made of 4 feet sticks) had been built on the high side; after the bump this crib was found tight against the low side with not a stick displaced.

For the purpose of this paper bumps in this mine may be classified as local and general. The former, which are confined more or less to one working place, and invariably in the tight work, consist chiefly of pavement upheaval and displacement of coal. The latter extend over a considerable area, including the pillars, and are usually accompanied by falls of roof. These, as might be expected, have been the most destructive of property but the former have caused the greater number of accidents. I merely make this statement as a matter of record; it must not be construed to mean that the general bumps are inherently less dangerous, for some of the escapes in these have been little short of the miraculous.

Relation Between Pillars and Bumps

Now to return to the relation between the small pillars and bumps. When a portion of a coal seam is removed the remaining coal is subject to abnormal pressure due to the extra weight brought on by the arching of the strata over the waste. This abnormal pressure would be at a maximum at some point whence it gradually diminishes until it reaches the normal. It is evident that this point of pressure is at some point beyond the edge of the solid coal, say "B" in Figure 3, and is continually moving forward. This movement might be brought about in two ways. In the first place by the coal yielding and sinking into the pavement: secondly, assuming point of maximum pressure to be at the base of the arch and that the arch becomes wider as it becomes higher, this causes the point of maximum pressure to be moved forward.

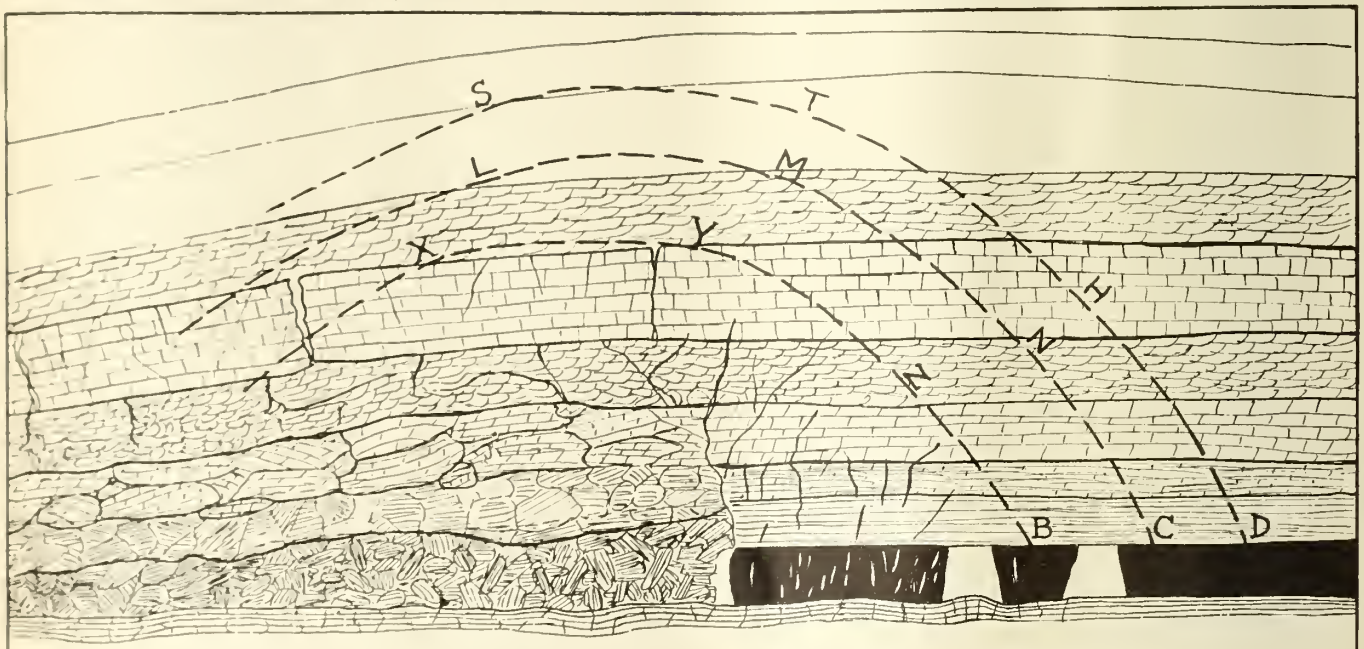


FIG. 3.

Now suppose a bord driven in the solid at, or just ahead of, the point of maximum pressure ("B" in Figure 3) where the coal and pavement have not already yielded. As the coal is removed the pavement is free to heave, but being strong, does not do so at once, perhaps not until the bord is driven some distance; then, as it is very brittle, does so suddenly, causing a bump. Had the bord been driven between "B" and the waste, the pavement and coal having already yielded, would not give way suddenly, but slowly, and there would be no bump.

Now while this supposition may be sufficient to ex-

plain small bumps we shall have to seek further to explain the larger ones.

Cause of General Bumps

So far, we have assumed the point of maximum pressure to be moving gradually and the pavement and coal to be yielding suddenly. I think it reasonable to assume that the point of pressure will change erratically. Accepting our previous assumptions, this would be the case if the falls took place in large masses, say by strata; then when a stratum falls the pressure would advance instantly, causing the coal and pavement, which are already near the breaking point, to give way with a bump, the magnitude of the disturbance depending on the thickness and extent of the stratum which falls. From this it will be noted that the prime cause of the disurbance is not necessarily a sudden increase in the pressure, but rather a sudden shifting of its point of application, thus producing a new set of forces to which the strata must adapt themselves. This explanation of the cause of bumps is but a theory, yet it seems to me, presents fewer objections than any other explanation so far offered.

As to the prevention of these troubles, what has been said already will show our method of dealing with the local bumps; but the general bumps, fortunately, have not been of very frequent occurrence and thus do not offer so much on which to base an opinion. So far it has been noticed that where they have occurred, the general line of break has had a decided bulge into the coal. If we assumed a thick stratum, strong enough to support itself and the roof above it, until the bulge has covered considerable area and then gives way suddenly, I think our explanation of these causes not unreasonable. So by keeping the line of break straight and leaving no pillars in the waste we hope to avoid, or at least decrease, their destructive effect.

This is a brief description of the present system of working in this mine and the conditions which led to its adoption. We do not claim perfection for it, since like every other method it has some undesirable features. That there are only six working places in each incline makes the output per incline much lower than if it were practical to use balances with cages; and consequently for a given output, the work is not so concentrated as is desired in good modern practice.

Also, for the same reason, the general line of break makes too small an angle with the strike. While this may not be a disadvantage in the actual working of the coal, it evidently brings too much pressure on the entries,thus making the cost of upkeep rather high.

CORRESPONDENCE

MANICOUAGAN FELDSPAR AGAIN

The Editor, Canadian Mining Journal,
Sir,

I have recently read with great interest Mr. Melkman's letter in your issue of June 2nd.

For Mr. Melkman's sake and for the sake of the feldspar industry I sincerely hope that his statements as to the Manicouagan Bay feldspar deposits are correct.

In drawing attention to our Verona deposits I had no desire at all to disparage those of Quebec. The Verona deposits must, and can, stand on their own merits.

Unfortunately my knowledge of the Manicouagan deposits was limited to the official statements of Mr. H de Schmidt in Mines Branch Publication, No. 401 "Feldspar in Canada". Referring to this deposit, Mr de Schmidt says:

"Beyond shipping a small trial consignment of about "thirty tons to the potteries at Trenton, N.J and also "to England, the owners have carried out no work ... "In 1912... three men were employed for a couple of "months in surface stripping. No machinery has ever been "employed... The deposit consists of a pegmatite body "composed of microcline feldspar and quartz; the usual "mode of occurrence is in small individuals graphically in-"tergrown with quartz; the proportion of feldspar to quartz "in the dyke is sufficiently low were it not for the presence "of too many *injurious accessory minerals* in the dyke mass "to permit of a large amount of the mineral body being "shipped crude with a minimum of hand cobbing, the "percentage of quartz in several zones in the dyke aver-"aging under 10 per cent. The amount of quartz present "in the graphic granite zones would average around twenty-"five per cent, while probably ten per cent. of the run-of-"mine would represent clean spar. Whether these condi-"tions would persist in depth can only be determined by "actual development".

It will thus be seen that I was innocent of all intention of disparaging Mr. Melkman's property.

I may add that, granting the accuracy of Mr. Melkman's claim, the Manicouagan deposit is without rival on either hemisphere.

The Verona spar bodies are known to be large and of high grade. Yet we poor operators are forced to develop them before we know what we have.

Providence seems to distribute its favors unequally.

Yours, etc.
R. F. SEGSWORTH.

103 Bay St., Toronto,
July 14th, 1922.

ONTARIO MINING ASSOCIATION

Annual Meeting at Porcupine

A correspondent gives the following account of the annual meeting of the Ontario Mining Association on July 6th and 7th at Porcupine:—

Outside of routine business and the paper presented by the secretary, which you have printed, there is very little to report concerning our meeting in Porcupine, as it was largely social in nature. The idea in view in having the Annual Meeting in different mining camps, is to draw the operators of the Province together and get them better acquainted, and in this we are meeting with wonderful success and this year was no exception. Practically every producing mine in the Province was represented at the gathering.

We held our Annual Meeting on the evening of July 6th, upon our arrival at Porcupine; on the next day (Friday) the parties visited surface and underground at the McIntyre, Dome and Hollinger mines. In the evening we were entertained at a dance given by the ladies of the Porcupine Camp, and on Saturday the party went by boat up the Mattagami from Timmins to Wawaten Falls where the larger power plant of the Northern Canada Power Co is situated, arriving back at Timmins in the evening, when a banquet was given by the Porcupine operators to the visiting members. The toastmaster at the banquet was Mr R. B. Watson and the speakers were the mayor of Timmins, Dr. McInnis, Mr. A. J. Young, Mr. A. L. Brigham, Mr. G. C. Bateman, Col. R. W. Leonard, Dr. J. Mackintosh Bell, Mr. R. J. Ennis and Mr. J. P. Bickell. The general tenor of the remarks was the necessity of closer co-operation and of educating the people of Old Ontario to the importance of the Mining Industry in the general development of Ontario. During the evening a presentation was made to the retiring President, Mr. R. B. Watson, who was referred to, and properly so, as the Dean of the Mining Profession in Northern Ontario.

BOOK REVIEW

IRON ORE.—Part 1.—United Kingdom. — Imperial Mineral Resources Bureau. 6s. 5d., post free, from H. M. Stationery office, Imperial House, Kingsway, London, W. C. 2. — 237 pp.

The sub title of this volume, "Summary of Information as to the Present and Prospective Iron-ore Supplies of the World," indicates the scope of the series of which this is Part 1. Succeeding volumes deal with British Africa, British America, British Asia, and the British Pacific regions; then foreign countries in Europe and Africa, America, and Asia and the Pacific, respectively. The total of eight volumes will form a veritable encyclopaedia of information about iron ore, with the emphasis placed upon deposits in British territory.

As explained in the introduction to this first volume, the scope of the inquiry of the Bureau has been considerably widened in the case of iron ore at the request of the National Federation of Iron and Steel Manufacturers of Britain, who have provided the additional funds required for this further inquiry. This, by the way, would seem to be a clear indication of the trend of thought of those business men of Britain who are engaged in the iron and steel business. They would hardly care to invest in the compilation of information such as this unless they wished to follow up the investment, and the logical conclusion is that they wish, not only to examine closely the relative position of Britain in world production, but to obtain reliable information as to the possibility of extending their smelting operations throughout the Empire.

The major part of the present volume is devoted to a discussion of the modes of occurrence of iron ore in the United Kingdom, and descriptions of individual beds and deposits. As a preliminary, the nature of iron ores throughout the world is briefly discussed, their geological ages, beneficiation, and the various chief factors determining their economic value.

The mainstay of the iron-ore production of Britain, as of France, is bedded deposits of Jurassic age, characteristically high in phosphorus and rather low in iron, but self fluxing either alone or in mixture. These beds outcrop near the coast and close to productive coal measures. The developed reserves, mainly comprised in the Cleveland ironstone, total 1,200 million tons, and the probable total is three times that amount.

The other important source of ore in Britain is the limestone beds of Cretaceous age, containing the hematite ores of Cumberland and Lancashire. These are non-phosphoric and higher in iron than the ironstone; but they are not so cheaply mined, nor is their extent so large. But there is still an important annual output, and the reserve determined is 45 million tons, with a probability of double that amount.

The report emphasizes the fact that the present difficulties of production of iron ore and its products in Britain are due to labour troubles and consequent high costs, and that under normal conditions Britain can hold her own, for many years to come, as one of the world's chief producers of iron ore.

IRON ORE—Part 2.—British Africa. — Imperial Mineral Resource Bureau — 3s. 3d., post free, from H. M. Stationery Office, Imperial House, Kingsway, London, W. C. 2.—76 pp.

Africa is still, in the main, *terra incognita* as regards its mineral resources, including iron ore. But in the Union of South Africa a certain amount of systematic exploratory work has been done, and this has been sufficient to demonstrate that here lies one of the principal ore-reserves of the world.

Though the deposits are known to be vast, and their quality has been determined in a fairly conclusive way, still they are not yet susceptible to definite estimates of tonnage. Probabilities only can be indicated.

Here, as elsewhere, bedded deposits provide most of the ore available. The Pretoria series of rocks is estimated to contain, in the vicinity of the capital city alone, and by open cast and adit mining, 400 million tons of ironstone ore, with an iron content of 48 per cent. Known occurrences of the same beds elsewhere bring this total to 1,000 millions.

There are numerous smaller beds and sporadic occurrences of hematite ore, all of fair grade and some of them of high grade, and it is these that are at present in use to supply the two small blast-furnaces the Union now possesses.

The great laccolith of South Africa, underlying the Bushweld, supplies one of the largest known deposits of iron ore in the world; but it is titaniferous. It occurs chiefly in flat-lying beds formed by magmatic segregation. Some of the beds are high in iron (60 per cent.), and low in phosphorus and sulphur, with about 16 per cent. titania. The quantity of this grade available has been provisionally estimated at 2,000 million tons.

It seems unlikely that any of South Africa's iron ore will be available for export as such, as its grade and the long rail hauls to the coast will prevent it. But it seems certain that, with ore, coal and fluxes conveniently available, South Africa will soon supply her domestic requirements of iron and steel, and it may be possible to build up a profitable export trade in finished and semi-finished products.

Elsewhere in British Africa the information available is incomplete and rather vague. Exploration only will improve this.

The mining Association of the interior of British Columbia is urging the provincial government to amend the act incorporating professional engineers in order that mining, milling and smelting operations will not come within its provisions. This, it is argued, will be following the precedent set by Ontario which recently exempted the mining business from a similar statute. The association also is asking the Minister of Mines to consult with it before taking action in regard to safety apparatus ordered for metalliferous mines. The Minister of Finance is to be urged to bring the provincial taxation act into harmony wth the Dominion Income Tax enactments.

The experiments of the McMurray Asphaltum and Oil Company at Waterways, Alberta, are showing good results. Tests have been made and from twenty-five pounds of tar sands, two and a half pints of lubricating oil have been obtained. The machinery is now being installed on concrete foundations.

Drilling on the Thompson Oil Company's property on the bird sanctuary near Pakowski, Southern Alberta, has commenced and it is the intention of the drillers to go to a depth of 3,500 feet.

Notes From Nova Scotia

TECHNICAL EDUCATION AT THE COLLIERIES

Mining Examinations at the Collieries

Two hundred mining and engineer students wrote for certificates at the mining examinations held a short time ago in the various mining centres of the Province. It is stated on good authority that those who went up for third class certificates showed marked proficiency, and rank well with the students of the Technical College at Halifax. This is good, considering that nearly all these men work hard all day and can apply themselves to study only in the evening.

The most encouraging feature is the large number of young men who attend the classes and are preparing themselves for their life's work in the mining profession. Another good feature is the increasing growth of the classes during the last two years. During the war period the classes shrunk greatly and the supply of certificated men began to fall below the needs of the collieries. The good attendance in the past two years has proved that we are passing through the reconstruction period, and are regaining the ambition and optimism of pre war days. The development that is bound to take place in the Nova Scotian coal industry in the near future will require men well equipped and qualified to carry on the work of mining. The technical schools of our Province are doing much to help these men and to keep up the standard of education for which Nova Scotia has long been noted.

The work of technical schools forms a large page in the history of Nova Scotia, and the industrial progress of the Province might easily be traced on the registers of these schools. It is not our purpose to do other at present than to make a short reference to the mining and engineering schools which for many years before other technical schools were opened, were of great benefit to the mining industry.

Origin of the Mining Schools of Nova Scotia

The mining schools are the off spring of the Provincial Workmen's Association, the first Miners' Union of Nova Scotia. The object of that organization, and indeed of all other trades unions in the early days, was to promote the well being of its members materially, morally and mentally. In the light of the actions of labour organizations to day in the colliery districts, which claim all these objects but fail to follow the pursuit of them, it is interesting to look back over those early days of struggle. There were giants in those days, and the first members of that association were men of clear vision, strong in intellect and intense in purpose. Their debates would do credit to any similar organization of the present day.

One of their many good mottos was "none cease to rise but those who cease to climb" and under Mr. Robert Drummond, a born leader of men, "climbing" was a very practical part of the work of the organization. The evening mining schools were recognized as a means of rising in the profession. They were introduced and kept going many years in advance of other schools. The instruction was free from the beginning and although some were slow to perceive the benefits to be derived from industrial education, there were others who were quick to grasp the opportunity afforded by the schools and gladly attended them. It would be hard to tell how many miners who were actually illiterate, entered the schools and struggled up in the classes, finally attaining to positions of responsibility at the collieries.

Part-time Schools for Boys

The opening of the mining schools in the colliery districts seemed like the renaissance of the sixteenth century, for everywhere one went mining knowledge was being diffused and mining problems wrought out. In a few years came other industrial schools until they spread all over the Province. Eventually the day schools of large mining centres took up the work of teaching mining science and carried it on with success. Dr. James H. Bingay, Superintendent of the Glace Bay schools, is a most enthusiastic advocate of technical schools, and in an address recently delivered in Truro Academy, he pointed out the necessity for half time schools in co-operation with employers. He stated that in mining centres boys dropped out of school early and in grade ten the girls outnumbered the boys at the rate of two to one. This is one of the educational problems in mining districts. The mining laws of Nova Scotia prohibit boys from entering the mine before the age of sixteen, yet there are scores of boys who do not attend school after they pass the age of thirteen of fourteen. Two of the best years of the formative period of a boy's life is thus mis-spent and by time he is old enough to enter the mine he has lost much of his early education. Surely there is food for thought here for miners and their labour organizations and other institutions interested in the development of the youth of their country and the progress of the industry in which most of these boys will labour during their life. There is certainly something to be done, whoever will do it.

Mr. Drummond the Pioneer

It was in the year 1886 that the matter of forming mining schools in the colliery districts was first discussed. The Hon. Robert Drummond, who was then Grand Secretary of the P. W. A. was instructed to interview the Nova Scotia Government on the subject of mining education. Now as the coal areas of the Province are retained by the Government and leased to operators for definite periods, and as the largest part of the provincial revenue is derived from this source, it was not difficult for a man of Mr. Drummond's ability to persuade the Government that night schools were a necessity. He was able to point out the advantages of having the mines under the control of miners well educated and trained for their positions. Safety, efficiency and sympathetic management were sure to come as a direct result of an educated class of native workers. And the long period of unbroken harmony which existed at most of the Nova Scotian collieries amply justified Mr. Drummond in his argument, and the Government in acceding to his request in opening the schools.

The Teaching Systematized

In 1888 the first mining schools were opened. To secure suitable teachers was the first difficulty to be overcome. The schools were placed under the Mines Department. For a time in some centres instruction could only be given to enable students to acquire second and third grade certificates. Those desiring first class certificates had usually to plod along alone or with such help as they could get from day school teachers and others outside the mining profession. As the first local instructors were men who had to work hard all day, their teaching efficiency was not of the highest, and the Government, after reviewing what had been accomplished since the schools were first opened, decided to establish a technical college in Halifax. The college was opened in 1907 and took over the mining schools, and in each principal mining district a full time permanent instructor was appointed to have general charge

of the work. He is responsible for the efficiency of the training in his own district and he recommends the other part time instructors. He teaches evening classes on coal mining subjects in the mining centres and gives the course in mining science in the public schools. To those who work altogether by night he gives instruction during the day. The instructors now must be men who have passed the examinations for colliery manager, have superior education, ability to impart instruction and at least ten years' practical experience underground in responsible positions.

Elementary Teaching

In conducting the mining classes it was often discovered that some of the students had not sufficient education to take up the subjects in mining and loss of time occurred through the teacher having to teach them arithmetic and English composition. To obviate this delay and to help these students, evening classes were opened where English and arithmetic were taught and mining subjects to-day are only taught to those who can give proof of their ability to enter the mining classes.

In conjunction with the mining schools the school for stationary engineers was opened. This work was carried on in a quiet way for a number of years but, with mining schools, is now under the technical college in Halifax.

The Results

With scores of students out of a working population of twelve thousand passing through the mining schools each year, it is plainly seen that great work is being accomplished. Dr. Fred. H. Sexton, Director of technical education, states that "the coal mining and engineering schools have served their purpose well. They have given the native born miner the opportunity to qualify himself for official positions without losing an hour's wages. They have helped to educate and train the whole body of coal miners into highly intelligent and skilled workmen. Practically all the colliery officials in the Province are Nova Scotians, who have passed through these schools. That the men are highly skilled and intelligent is attested by the fact that fatalities per thousand employed have been lower for many years than in any other Province in the Dominion and lower than the rate prevailing in the United States. The schools have been partly responsible for this enviable record. And when it is remembered that when these schools were first opened nearly every colliery in the Province was officered by mining men from Britain, many of them very capable men, it will be seen how far we have travelled along the way of progress. The schools are making for greater efficiency each year as the standards are gradually being raised."

An Ill-founded Charge Refuted

Some time ago a criticism of the Mine Managers of Nova Scotia appeared in one of the Montreal papers. It stated that we had no efficient Managers, and gave the impression that, such being the case, everything connected with mining was going to the eternal "bow wows". Such things usually come from those who, having acquired a little knowledge, are anxious to impress the general public with their wonderful acquirements. The mine officials of Nova Scotia are hard-working men and keen students of mining, and are as able and well-qualified to develop the coal fields of their native Province and to solve the mining problems met with as are any other mining men in any mining country, and they are doing it well.

If there is any criticism to be made, it probably arises from the method of training through which these men pass as they work their way up. Overmen and Underground Managers have strenuous work in getting large outputs of coal. They have little time to devote to the costs and other essential features of their work, and when their turn arrives to step up higher, they are sometimes without the training and experience that leads to successful management. It would pay every Coal Company to have some system by which each official would have an opportunity to serve a short course of a month or more in an office under the supervision of someone who is capable of instructing him. This is coming to be more and more clearly recognized, and when it is put into practice, the office work will not appear so formidable as it does to men whose early life has been devoted to one long round of toil underground.

The Glace Bay audit office of the Dominion Coal Company has been merged with that of the Steel Company, with headquarters in the General Office at the Sydney Steel Works.

Mr. Robert Gordon, who for many years has been Comptroller of the Coal Company, becomes Comptroller of the Steel Corporation for Nova Scotia and Newfoundland.

The Cumberland and Pictou audit offices will not now be centralized at Sydney, but later on they too will be removed from New Glasgow and all audit work will be done at Sydney.

A heavy bump occurred in No. 2 colliery at Springhill, which, besides displacing a large amount of coal and injuring three workmen, caused earth tremors to be felt all over the town. Formerly bumps were frequent in this colliery but a change in the method of mining seemed to have obviated these disturbing occurrences and it was hoped that the last of them had passed. The latest one occurred in one of the leading places, or in what is known as the solid work. It is in direct line with the bump zone in the upper lift. The roof and floor are much harder here than in most other parts of the mine, which may be a cause of the coal being thrown out when pressure was exerted. The matter may be only local as these conditions of pressure are liable to sudden change.

It seems difficult to eliminate bumps entirely. The improved method being tried out in this colliery has gone a long way towards removing the cause of bumps, and is up to the present time the nearest approach to success of any that has yet been tried.

The Mullens, one of the lowest seams of the Cape Breton coal field, is to be opened up and tested. A short slope will be driven down to ascertain the quality of the coal, and if this is found suitable, greater development may follow. The slope will be sunk in the New Waterford district, a short distance from No. 17 colliery. The coal mined will be used at the large electric power plant at New Waterford Lake. The Mullens seam was supposed to cover a large part of the New Waterford coal field, but recent borings have proved that the facts do not coincide with the glowing stories of some highly imaginative people. What we do know is that the seam is six and one-half feet thick, that it is of fair quality at the outcrop and that while there is a large amount of land-coal, yet like other seams it dips under the ocean and for aught we know may run on to Newfoundland.

The headquarters of the American Electrochemical Society have been moved from Lehigh University, Bethlehem, Pa. to Columbia University, New York.

It is reported that a United States silver export association is mooted in order to cope with the conditions which are likely to obtain when the purchases under the Pittman Act cease to give artificial support to the silver market. Of the 208,000,000 ounces to be purchased under its provisions 116,000,000 had been secured by the 22nd of June.

British Columbia Letter

THE CONVENTION AT NELSON

The Lieutenant-Governor's Address

The International Mining Convention, held at Nelson B. C. on the 3rd, 4th, 5th and 6th of July, has been the outstanding mining feature of the summer season in British Columbia. Delegates were attracted from all parts of the Northwest. There was a representative and very fine exhibition of minerals, contributions for which were sent by the Provincial Government and by many individual mine operators. The proceedings were opened by an address by Lieut.-Governor W. C. Nichol, who said that the friendly relations that had existed between the Canadian and American people since the battle of Stoney Creek had been well exemplified in the Kootenay section of the Province. The early mining development of British Columbia had come through prospectors of the Republic. Their capital had made the mineral resources of this country available. As a good Canadian he felt that perhaps it would be better for Canada if more of its mines were financed locally; but there was no doubt that the progress that had been made would not have been possible without the assistance of the enterprise of those living to the south of the line. His Honor thought that there was every indication that increases in the price of metals were permanent and not a temporary phase of economic evolution. It was his opinion that good results would accrue were the Legislature to pass laws protecting the investor in mining stock. There should be some legal assurance that the money spent in the purchase of shares would go to the development of the mining property. "We must have no more such scandalous misappropriation of funds as in the past," he declared. "There should be no possibility of a repetition of the fraud of taking millions of dollars from the people without any return and without a dollar having been spent on the property. There have been such instances and the money has gone into the pockets of the promoters. These things are criminal and the guilty parties should be punished as criminals and prevented from again fleecing the unsuspecting public." Governor Nichol counselled the encouragement of capital. He also expressed the opinion that there should be more marked evidences of friendly co-operation between the nations contributing to the world's output of metal. In most instances each country's mineral wealth varied. The United States, for instance, was the great copper producer, and Canada's chief output was in nickel and asbestos. In mining there was no room for petty jealousies. "The miners of the world," he said, "are wholesouled, genuine, good fellows. The money they make is the cleanest in the world. They take from nature and give to man. To such I give a kindly greeting and a welcome as warm as my heart can express."

The Minister of Mines Optimistic

Hon. Wm. Sloan, Minister of Mines, stated that the mining business of the Province was at the turning of the tide. There had been an abnormal "flow" during the war, bringing with it feverish activity and swollen prices. Then had come the "ebb" tide, and the drop, although in accord with nature's laws, had been unexpectedly severe. Now all signs pointed to improvement. The urge everywhere was towards intensified industrial effort. People were recognizing in all parts of war torn Europe, as in other parts of the world, that, if civilization is to stand, there must be an effort to get the right atmosphere for steady productive work, and there must be good will and place among the nations. This was what those who attended the Genoa convention had been striving for; this was what those assembled at the Hague had in mind. When Europe settled down, economic conditions would adjust themselves and once again there would be a steady demand for the products of the mine.

Statistics were quoted showing that British Columbia's decline in 1921 in point of value of mineral production was not as great as was that of the great mineral States of the Union. The decrease had amounted to about 21.06 per cent. as compared with 77 per cent. in Arizona; 75 per cent. in Montana; 55 per cent. in Utah; 70 per cent. in Washington, and so on. The returns indicated that British Columbia's mineral resources were so varied that a setback in respect of one class of metal because of world conditions was likely to be offset by a stimulus in the production of another. Production was as yet insignificant in comparison with possibilities. If the Province had an important place awaiting her in the development of the American continent it was to be found in the exploitation of her mineral wealth. Within the tremendous territory stretching from the Rockies to the Pacific and from the boundary of the United States to the Arctic there were roughly 550,000 square miles, the chief characteristic of which was mountain ranges. Any intelligent person, Mr. Sloan asserted, must see that the outstanding permanent industry of this area would be mining. Already there had been discoveries of much importance and productive mining enterprises of such volume in output and in returns as to fairly lay the foundations of what would come. There were the gold placers of the Klondike, of the Cariboo and the Omineca, copper mines, or groups of mines in which precious metals were a by-product, such as those of Anyox, Britannia, Sunloch and Rossland; a number of lead-silver mines or groups with silver as a by-product, such as the Sullivan, those found in the Slocan, the Lardeau, etc; and gold-quartz mines, of which the best known were those at Hedley and Princess Royal Island.

Encouraging the Prospector

Discussing the necessity for prospecting, Mr. Sloan said that everything possible was being done by the Government to encourage prospectors and prospecting. It was realized that hardihood and technical knowledge were required for success. As a step towards the development of this technical knowledge, winter lectures had been initiated by Government Mining Engineers in all parts of the Province. Last winter there had been a total attendance of some 3000 men at these lectures, which was considered a good start and an encouraging endorsation of the Government's policy. "British Columbia's development," he said, "depends not alone on those of the present but also on the generations to come, and I am in hopes that the practice of lectures in elementary mineralogy by Government Engineers will become a recognized part of education in this Province." He spoke of the exhibition by the Government of mine displays at different mining centres as being another effort to interest the general public in the mineral wealth of the country.

The present tendency among mining men, it was said, was to take up gold and silver properties. Prospects of this kind were in demand. The explanation was found in market conditions. This would not persist indefinitely, however. Just now there was some excitement in the Cedar Creek section of the Cariboo. This region had been worked over, as had the great central plateau, by the prospectors and miners of the middle and later periods of the past century. Gold existed in the placers of that area, and beyond question there were places where the concentration was sufficiently marked to assure profits. Some of the bench lands of Cedar Creek had yielded so well as to encourage the belief that the day of the individual miner with his pan, rocker or sluice box had not passed in the Cariboo. Here, and elsewhere in this region, a revival of interest was manifest and the least that might be expected was a considerable increase in the gold output through greater activity of the placer miner and hydraulic and dredging operations. This stimulation was evident also in the Omineca and the Peace River areas.

"The Wonder Mine"

Turning to lode mining the Minister referred to the "Wonder Mine" of the North, the Premier, which had in the past few months, paid over $900,000 in dividends. (It may be said incidentally at this point that the Premier since has declared a further dividend of $750,000). Mr. Sloan spoke also of the Princess Royal Island Mines, the Nickel Plate of Hedley, the Rossland Mines and others. As to silver properties he thought it good to be able to point to brighter conditions in the Slocan and other camps which for so long have been the backbone of the mining industry of the Province.

It was a mistake, however, to build only on precious metals and, as he had observed, the present tendency would not continue. The real permanent foundation of the industry lay in the development of the copper, lead, zinc etc. These were the industrial metals. The holder of a copper property , for the exploitation of which there might not seem to be much immediate hope, should take heart. His turn was coming. "And then there are the owners of mines in the ore of which is combined silver-lead-and zinc", Mr. Sloan continued. "For years they have been handicapped. They possessed rich ore but, in many cases, the penalties exacted because of the zinc content brought the profit to the vanishing point, if it did not wipe it out entirely. It is a great satisfaction to me to see the announcement that the Trail Smelter, through metallurgical advances, has been able to make more attractive offers to owners of such ores. It is sincerely to be hoped, not only in the interest of the Kootenays but in that of the Province, that the problem relating to the practical economic treatment of these ores has been solved. If this is so, a real service of first importance has been rendered to the mining industry of the country."

Electrolytic Iron at Trail

S. G. Blaylock, general manager of the Consolidated Mining & Smelting Co., made one of the interesting announcements of the Convention, stating that in the laboratory of his Company high grade iron had been made from pyrrhotite gangue from the roe of the Sullivan Mine. An electrolytic process had been suggested by Mr. Nichol Thompson, of Vancouver. This product, which Mr. Blaylock called a stainless iron, could be rolled cold to the thousandth part of an inch and then folded over like paper fifty times. It was the purest form known, and if the Company could develop the process commercially it would be getting out of the ore of the Sullivan mine "about everything but the squeal."

Mr. Rickard on Fraternal Relations

An address by T. A. Richard, of the "*Engineering and Mining Journal-Press*", stirred up much enthusiasm. He spoke of the building up of fraternal relations between Canada and the United States and said that if the world was to be saved from ruin it would be through the use of the English language. Mr. Rickard referred to William Randolph Hearst as a "printing pestilence", who was doing all in his power to stir up feeling against the British instead of working for world peace. He spoke of England as the mother of the commonwealths of the world.

Electric Power and Mining

"What hydro-electric development has done for Mining" was the subject of a talk by Lorne A. Campbell, of the West Kootenay Power & Light Company Ltd. and a former Minister of Mines. He said that the age of power had made possible the introduction of many new and advanced processes in mining and the future would see, through the development of electricity and its application to industry, many important improvements over the methods of today.

The Banquet

At a banquet tendered delegates to the Convention toasts were drunk to the king and President of the United States. The latter was proposed by Judge J. A. Forin and responded to by T. A. Rickard. "Canada" was offered by R. S. Ord, Spokane Wn., who referred to "Our Sister Country and the Land of Possibilities." Alderman Frank Woodside, of Vancouver, president of the British Columbia Chamber of Mines, proposed the City of Nelson in fitting terms, Mayor McHardy responding. "Mining" was offered by Nichol Thompson, M. E. Purcell, of Rossland, responding.

"Lead Smelting Practice" was the subject of an interesting paper by J. Buchanan, superintendent of the Trail Smelter.

One of the features of the Convention was a mineral exhibit which occupied the greater part of the floor space of the Nelson Armory. Each district was represented and special exhibits were contributed by the Consolidated Mining & Smelting Co. and the Provincial Government.

The Iron Ore Survey

Work has commenced by Dr. G. A. Young, of the Geological Survey of Canada, in the exploration of the iron ore deposits of British Columbia. He is assisted by Dr. Hurst, who also is specially qualified for this form of geological research. They now are examining the "Kitchener" deposits. These contain hematite iron running as high as 65 per cent and there are some sixty claims in the property. At some points the vein shows a width of twenty feet and it is quite safe to say that over the prospected area twelve miles in length the vein probably will average 12 feet in width.

New Vein on I. X. L.

The I. X. L. Mine, Rossland has been examined by A. G. Langley, resident mining engineer, recently. The property is under lease by Messrs. Shelledy and Hawkins and other local mining men, from John S. Baker, of Tacoma Wn. A vein of exceptional promise has been uncovered, Mr. Langley stating that the free gold is "standing out in chunks" and that "it is the finest quality of this class of ore I have yet seen."

Northern Ontario Letter

New Vein on Wright Hargreaves

Development work at the 700 ft. level of the Wright-Hargreaves mine has provided one of the more sensational discoveries in the Kirkland Lake field. Lateral work, which was held back for a time owing to bad ground, is now well under way and has demonstrated the fact that the ore which came into the shaft during the course of sinking is a new orebody, distinct from the main deposit heretofore worked. In other words, the Wright-Hargreaves now has two deposits instead of one.

The ultimate value of this development may not be correctly estimated until such time as more drifting can be done, but it is especially important to note that the average mineralization is high and the width compares well with what was formerly regarded as being the main deposit.

Previously, the vein being worked, which has been the source of production up to this time, was regarded as being the continuation of the rich No. 2 vein from the Lake Shore. However in the light of the latest developments on the Wright Hargreaves, it would appear possible that the vein heretofore developed may actually prove to be the continuation of the moderately rich No. 1 vein from the Lake Shore while the latest deposit discovered may prove to be the continuation of the bonanza No. 2 of the Lake Shore.

A Harricanaw Property to be Reopened

A mining plant is to be installed on the Martin Gold Mines at the Harricanaw River district. J.J. Godfrey, president of the Mother Lode Mines, Ltd., has identified himself with the project and is represented locally by Arthur W. Jeffs.

The plant is made up of steam equipment and will be in operation within the course of the next few weeks.

The Martin property is one of the more promising in the Harricanaw River district and has been explored intermittently for a number of years. Gold occurs in narrow pay streaks under favorable geological conditions.

Kirkland Lake Road Extension

An appropriation of funds has been made by the Ontario Government for the purpose of building a graded road to the Bidgood Gold Mines in the township of Lebel. The work will commence shortly and is another step toward extending the Kirkland Lake highway through the more important part of the district.

The question of continuing this work next year rests upon the degree of success achieved in the meantime on properties lying to the eastern part of Lebel and through the centre of Gauthier township to the Argonaut mine.

Reorganization Meets Opposition

The plans adopted by the directors of the Porcupine V. N. T. Mines is arousing considerable displeasure among minority stockholders in Northern Ontario. The conservative element has offered no objection to the drastic reduction in capitalization and the elimination fifty per cent. watering on a big scale. However, it is in connection with the two-year option that is proposed on the remaining 666,000 treasury that objections are being raised.

For instance, Arthur Moysey, if the directors of the Porcupine V. N. T. Mines have their way, is to be given a two year's option on these 666,000 shares at 40 cents a share. The present stockholders of the company are allowed to participate in proportion to stock now held, but all such stockholders will have to make remittance *in full* on or before August 2nd, 1922. That is to say, the shareholders of the Porcupine V. N. T. have two weeks within which to participate in the full number of shares placed in the treasury as a result of the reorganization while Mr. Moysey is given two years. Not only that, but Mr. Moysey's obligations are really optional. He may take up the shares or not, just as he wishes. That is to say, should the mine develop successfully on the money subscribed by the stockholders, it is not unreasonable to suppose that the value of the shares might increase or even multiply. In the latter event, Mr. Moysey would naturally exercise his "option".

Prospecting in Holloway Twp.

Detailed advice received from interested parties carries the information that the mining claims of W. E. Seagers, situated on the Teddy Bear river in the township of Holloway, have been optioned to the Canadian Mining Syndicate of Toronto. The claims were formerly known as The British Bluejacket and there are a number of veins opened up in which gold is visible.

It is also stated that the Manwell and the Harvey Mills groups have been optioned by the Canadian Mining Syndicate, this concern being represented by I. C. W. Holloway.

The rock formation in this district is made up of Temiskaming conglomerate, basalt, semi basalt or rhyolite. Porphyry does not occur in the immediate vicinity.

A force of 25 men are at work trenching and blasting. The work is being handled by Robt. Manwell, formerly engaged at similar work in the West Shining Tree district.

In regard to the options on the above properties the first cash payment has already been made, and the balance is spread over more than a year.

Kirkland Lake Proprietary

Although announcement was made early in June that the Kirkland Lake Proprietary had made its first clean up from the Tough Oakes mill, yet no official figures were made known. It develops, however, that the first brick contained approximately $19,000 and was the result of milling 2,010 tons of ore.

Since that time, development work has been extended from the 400 ft. level to a depth of 750 feet, at which point more ore has been opened up. From indications appear to be that although no effort will yet be made to bring the mill up to full capacity, yet the prospects are good for increasing the grade of the ore and thereby enabling the company to at least pay its way during the period of rebuilding the mine.

The high grade ore encountered on the Proprietary have been found to be quite erratic and this intensifies the problem of setting down into a uniform grade

However, the work is in good hands under the management of Mr. Thomas and time appears to be all that is required for him to establish the enterprise on a basis of substantial net profits.

Lake Shore Plans

In an interview with Harry Oakes, president of the Lake Shore Mining Company, the Journal correspondent learned that all due consideration is being given to the question of enlarging the mill. Mr. Oakes stated that the next few weeks would be occupied in enlarging the main shaft from the 400 ft. level to surface. This work will be followed with arangements to continue the shaft from the present depth of 600 feet to the 800-ft. level. In order to carry on this additional sinking and to provide for the broadened scope of operations, the mining plant itself will have to be enlarged. In the opinion of Mr. Oakes, the shaft enlargement from the surface to 400 feet deep should be completed, the mining plant enlarged and the shaft sunk to 800 feet deep before going ahead with an enlargement to the mill.

Everything considered, however, this work should be completed and the mill enlargement made by early in the coming summer. It was pointed out that up until a year ago it would have been unsound to consider mill enlargement. The development work of the past year has greatly improved the situation to the end that already the mine is assured of tonnage that will warrant the erection of a mill of at least three times the present capacity.

During the course of recent work on the rich No. 2 vein at the 600-ft. level, some faulting has occurred in the west drift. In each case, he vein has been re-located without difficulty. Somewhat similar difficulties in the east drift at the 600-ft. level may be left for solution at the 800-ft. level.

A feature of development work has been the discovery of rich ore in vein No. 1, it being noted that about the time values along No. 2 vein commence to rise, the mineralization in No. 1 decreases, with the reverse taking place at such times as values decline in vein No. 2.

Progress in Bidgood Shaft

Good headway is being made in sinking the shaft on Bidgood property from the 400 to the 600-ft. level. Already the work is below a depth of 500 feet.

With the completion of the shaft, a crossent will be driven to the vein so as to develop the downward continuation of ore as found at the preceding levels. The general interest of owners of properties throughout the township of Lebel from west to east is centred to a large extent on this operation on the Bidgood.

New plant for Canadian Kirkland Prospect

The work of developing the Canadian Kirkland property will commence within the next few days provided present financial plans materialize. An excellent plant has been assembled and is now about ready for operation.

This property lies in the southern mineralized belt of the Kirkland Lake district and is known to have good prospective merit. Previous work showed the presence of two extremely strong veins in which the gold content was encouraging.

Teck Hughes

The newly installed hoist at the 550-ft. level of the Teck-Hughes is giving excellent satisfaction and the mine is now in a position to easily keep its mill running at full capacity. It is already evident that the output for July will be highest since December and January last, at which time rich ore was being drawn from the ore-shoot at the 605-ft. level.

This new hoist is good for working to a depth of 1,000 feet and places the mine in such shape that it may be developed to a depth of 1,500 feet under the present arrangement. The decided improvement in the richness of the ore at the 605 and the 730-ft. levels form the basis of optimistic views with respect to the still deeper levels toward which the shaft is being driven.

The general impression is that the Teck-Hughes will find a place among the dividend payers of the coming year.

Another Ore-Shoot at Keeley Mine

Another discovery of silver has been made on the Keeley Silver Mines. The find was was made as a result of a continuous plan of development being carried on concurrently with the work of production.

An interesting phase of the work on the Keeley is that the silver discoveries have been made directly below oxidized sections of the vein. This condition has encouraged further drifting to points approximately at the base of the ozidized sections. Within the next month or six weeks, one of these drifts will enter into a zone where there are good prospects of another ore-shoot being found.

In the meantime, stoping on known orebodies is resulting in sustained production and withal ore reserves are being well maintained.

Nipissing's June Production

Production of silver from the Nipissing mine during June was the second highest record so far this year, being exceeded only during May. As a result of this the company produced approximately 265,000 ounces of silver, valued at $193,324 in June.

These official figures go to show a total output of approximately 1,535,000 ounces of silver during the first half of this year, valued at $1,050,201. These figures compare with the first half of 1921, during which period the production in ounces was lower and the value of the output was less than $900,000.

During June the low grade mill treated 7,244 tons. The high-grade plant treated 160 tons and the refinery shipped 303,188 fine ounces of bullion.

EDITORIAL

Those who think mining of no advantage . . . assert . . . that miners, because they entrust their certain and well established wealth to dubious and slippery fortune, generally deceive themselves . . . But persons who hold these views do not perceive how much a learned and experienced miner differs from one ignorant and unskilled in the art.—Georgius Agricola—1550. (From Hoover's Translation.)

FARMERS AND MINERS

The importance of mining to the settlement and general development of Canada is slowly—very slowly—penetrating to the consciousness of those not directly connected with the industry. The education of the public in this regard is just being commenced, and continued serious effort will be needed for a number of years to come. We of the mining profession must lose no opportunity for demonstrating to the public not only the possibilities of its development, but the actual benefits conferred today by our production of minerals. Mr. Balmer Neilly's statement to the Ontario Mining Association, which we published on July 7th, is a notable instance of how this relation between mining and the other industries can be made clear to the average man.

Next to the miner himself, the farmer probably derives the greatest benefit from mining operations. Of 73 million dollars, the gross value of mineral production in Ontario in 1920, approximately 26 millions was paid in wages. Of these wages, 9¼ millions was paid directly for farm produce—12½ per cent. of the total value of mineral production. The calculation has still to be made as to what fraction of the remaining 87½ per cent. was paid for farm produce through the medium of dividends, compensation, insurance, factories, railway workers, and so on; but the total thus returned to the farmers will certainly reach another 12½ per cent., and may materially exceed that amount. Almost the whole of this is disbursed in Ontario, and most of the small remainder in other parts of Canada. Thus the farmers of Ontario are directly the recipients of at least 18 million dollars annually from the mines of their province.

What do the farmers give in return for this 18 million dollars, won by the labour of miners from the bowels of the earth? They sell their produce, also produced by the sweat of their brows from Mother Nature's bosom, at prices notably above the average. They also buy the products of the mine, as fertilizer, farm machinery, autos, crockery, shingle-nails, or what not. Thus do farmers and miners demonstrate their inter-dependence and their common interest.

But there is a way in which farmers fail to fulfil their part of this social contract. The miners realize where their food-supply comes from, they cannot escape the monthly bills from the grocer and the butcher or direct from the farmer himself. But farmers, except those immediately adjacent to the mining community, do not give the miner due credit for the benefit he confers upon them. They do not realize to what extent the miner provides for the sale of their produce in the best of all markets, the home market. They have not accorded the miner the sympathy and hearty support that is due a fellow-worker and producer from nature's store. If a fraction of the time, energy, ingenuity and money that are now being lavished upon the attempt to remove the cattle embargo in Britain, were spent upon encouraging and stimulating mining development, the investment of effort and money would certainly be surer of profitable return to all our agriculturists, and might even in the immediate future yield a higher rate of interest than the free entry of cattle would ensure. An adequate home market will always be the most lucrative, and to the end of developing such a market our best efforts should be directed.

A direct and obvious duty rests upon the miner in this connection. He must advertise more than he has done in the past. He has been working faithfully, in silence, and without the public appreciation of his efforts that is his due. Mr. Neilly has made a good beginning. He might go farther, and many might join him in educating the public in the facts of the mining industry, which is so vital to the continued and rapid development of our country.

AID TO PROSPECTORS

The Ontario Department of Mines has recently made a move that is thoroughly in accord with its progressive policy of recent years. It announces that the Testing Laboratories of the Department at Cobalt, under the direction of Mr. A. A. Cole, are prepared to treat small lots of gold ore, and to return to the owner the value contained less treatment charges. To-day there is reported in our Northern Ontario Correspondence, an instance of the use of this privilege.

A tangible demonstration of the value of a gold vein, such as that afforded by the actual extraction of a gold brick, however small, from its ore, is one of the most effective means of attracting notice to a property. An instance of this was seen in the Schreiber district recently. A property showing unusually rich ore in small lots

whose continuity had not been demonstrated, was offered for sale, and was rejected by a number of examining engineers. The owner had not the wherewithal to open up his claim further. He made a small shipment of ore to Queen's University, Kingston, and received in return, not only the value of the gold extracted, less nominal charges, but an authentic statement of the process of extraction to which his ore had been subjected. The owner has now been able to obtain sufficient financial support to continue the prospecting of his claim.

The actual bullion return from ore treated in these experimental lots is not likely to be large, and the assistance thus rendered prospectors by the Temiskaming Testing Laboratories will neither burden the Department of Mines unduly, nor make wealthy men of mining pioneers. The effect will be principally that instanced above, and the Ontario Government will have the credit of having determined and legitimately advertised certain facts about the prospects concerned. This has been done for a number of years in Australia with marked success, and we can expect a like result in Ontario.

But there is one distinct danger in this move, wherein the public, if forewarned, may be fore-armed. It is a fact, well recognized among mining men but not generally realized by the public, that a small vein of rich ore does not constitute a mine. A recent striking example of this is at Elbow Lake, Manitoba, where Mr. N. A. Timmins, after investigating thoroughly an unusually promising surface showing, has decided that the gold ore disclosed by his work of development does not warrant the further investment stipulated in his option. It is possible that the result of a mill-run on a selected lot of rich ore in the Temiskaming Testing Laboratories might be made the basis of dishonest stock-selling operations, such as has been done in many a similar case in the past, and indeed is being continuously and flagrantly done to-day.

In the hands of competent and honest prospectors, operators, and promoters, the privilege now accorded by the Ontario Department of Mines will be a boon to the province's gold mining industry, and will aid materially in its rapid and consistent development. But we must not forget that unscrupulous persons will attempt to abuse this privilege. It will be incumbent upon those who wish to use the privilege to do all in their power to aid the Department of Mines in preventing its abuse.

THE NEED FOR SPECIALISTS IN IRON ORE

The iron-ore problem is ever with us, and at no time is its solution more pressing than now, when we can ill afford to pay out the huge sum required annually to provide ourselves with this necessity from beyond our borders. Thus every scrap of information that may help us, or any idea that may possibly point the way to a solution, is worthy of close attention.

We print to-day Mr. G. C. MacKenzie's address to the conference on iron ore, held under the auspices of the Minister of Mines in Toronto on July 5th. This is an impartial summary of the present situation, based on the outstanding facts. In common with the majority of those who have studied the question, Mr. MacKenzie finds no immediate solution in sight. However, the solution of a problem such as this is never accomplished until some one provides new information, or demonstrates the commercial feasibility of one or other of the many experimental processes; so that a successful issue rests now, as heretofore, with the experimenter, or researcher, or prospector, who is ready to risk time, labour and money by launching out into the unknown.

Meantime Mr. MacKenzie has a practical suggestion to offer, — a suggestion that is unusually opportune just at present. He points out that we have at present in Canada no geologist who has specialized in iron ore to the extent of making himself completely conversant with our resources of this prosaic but all-important mineral. The geologists in the public service have been shifted from one problem to another, periodically if not annually. If one or more of these geologists were left for a number of years to study iron ore, as has been done with such marked success in the United States, our problem might, by this means, be no problem within a short term of years. We have, up to the present, been merely dabbling in the geology of our iron ranges.

This suggestion is completely in accord with the present policy of the Dominion Geological Survey. As rapidly as it can be practically effected, Dr. Collins is allotting special fields of endeavour to his staff, which they will follow year after year, irrespective of geographic location. The present specialist on iron ore is Dr. G. A. Young, now engaged in examining the deposits of British Columbia. As iron ore is in general the most important of minerals next to coal, and as in Canada it presents by far our most important problem in the mineral industry, there will probably be scope for a number of such specialists during the next quarter-century, both in the public service and in private practice.

THE NATIONAL RESEARCH INSTITUTE

The Research Council of Canada comprises in its organization more than one hundred and twenty-five of the leading scientists of the country. For three and one-half long years the Council has been striving to induce the Dominion Government to authorize the establishment of a National Research Institute. Its efforts have been warmly seconded by practically all representative trade, scientific and technical bodies. Last year the necessary legislation was passed in the House of Commons, only to be thrown out in the Senate. Never has the Canadian Senate proved itself such a mischievous superfluity.

Only the briefest consideration of what is being done in other countries is necessary to show Canadians the fatuity of neglecting scientific and industrial research.

In Great Britain the National Physical Laboratory is equipped, at the nation's cost, to undertake all manner of

physical and engineering research. Specific aid is given in the development of technical processes. Here, and in other institutions organized by the Government, industrial processes are originated, investigated, and improved. Definite encouragement is given the inventor and the researcher. It is known that the Government wishes to stimulate and aid research — and this knowledge counts for much. Great Britain is training a generation of technical men that will, we firmly believe, bring back to the Old Country the industrial leadership that slipped through careless fingers before the cataclysm of 1914.

Far-away India, more alive to the trend of progress than are we, has established a Central Research Institute at Dehra Dun. It is also founding an institute for chemical research. Even Burmah is following suit.

The Bureau of Standards and the Industrial Research Institute at Washington constitute the very heart of scientific and practical research for the United States. Both establishments have been organized and equipped in a manner and on a scale commensurate with the importance of the work that they were designed to promote.

Australia is well to the fore in her recognition of research work. The National Research Institute of Japan is amply endowed and magnificently planned.

In short, everywhere and in all lands save a few of the most backward, governments are hastening to enlarge existing organized facilities for research, or are planning immediate steps to render such facilities available.

It is passing strange that opposition to the creation of a National Research Institute in Canada should have come from the Senate. We expect our Senate to be mildly reactionary, but not to be crossly obstructive. Senators may not be capable of rapid and clear thought, but they are at least ruminative. Perhaps light will come to them only after, and not before, their cuds have been masticated for more than one Session.

Meanwhile it should be borne in upon the Canadian public that scientific research is the only instrument that will enable us rightly to use our natural wealth. Research is not so much a means of enriching classes and individuals as it is a means—the only practical and lasting means—of promoting the general distribution of wealth and opportunity.

Mr. A. J. Balfour (we refuse to use his more decorative new appellative) speaking last year before an English audience, said: "The hope I have for the world is that by "the growth of science, invention will give comfort and "leisure where at present discomfort and labour are the "only means of producing an article, and that the people "will learn how to use their leisure. The idea of pro"gress is based on the work of men who are engaged in "probing to the bottom the secrets of nature."

An adequate Canadian National Research Institute will mean more to the poor man than to the rich man. The Dominion Government could devise no better preventive of unemployment than a handsomely endowed Department, or Bureau of Research.

Progress is possible — doubt it who may — without a Senate, but not with research.

EDITORIAL NOTES

From August 13th to 17th, Canada will entertain excursionists of the American Ceramic Society, who will visit representative feldspar quarries and a number of ceramic manufacturing plants. Technical sessions will be held in Montreal. For the occasion, the *Canadian Mining Journal* will publish, on August 11th, a special *Feldspar and Ceramic* issue, describing the principal developed feldspar and China clay deposits of eastern Canada.

As a corrective to visionary promoters, the example of the Imperial Oil Company's efforts to discover petroleum in North Western Canada is strikingly to the point. The Company has already spent some millions of dollars in geological reconnaissance and in drilling. Its surveying is done from two all-metal monoplanes. So far, in the words of vice-president A. M. McQueen, "we are disappointed but not discouraged." The directors do not for an instant hope for immediate returns, even if oil be struck in abundance. The sole object is to prove the existence of a geological reservoir of oil. Its exploitation will be deferred for many years to come. This should put a final *quietus* on all and sundry promoters of oil companies in a country where it costs as much to move a pound of freight as would move a ton in more benign latitudes.

ADIEU

[Lord Byron, in his impetuous youth, wrote a ditty on this model to the Maid of Athens. Of the two efforts we prefer the following:]

Mine Promoter, ere we part,
Let me keep enough to start
On prosaic work for pay,
By the month or by the day,
In Cathay or Timbuctoo
Where I won't see aught of you.

By those prospects always sold,
Mostly 'cause they had no gold,
By certificates I've got
Which I hoped would make my pot,
I am finished, I am through,
I have had enough of you.

Mine Promoter! if I go,
Think of me when things are slow
Though I fly to Timbuctoo
I'll be thinking still of you
Can I cease to love thee? No!
Mine Promoter! I'll not go!

VNON

Canada's Iron Ore Problem
Beneficiation of Ontario Iron Ores*

by G. C. MacKENZIE

MAGNETITE

As a general statement it may be said that the known deposits of Ontario magnetites are unfit for blast furnace use in their natural condition. There are, it is true, a few isolated and small deposits of high-grade ore, but these do not affect the main result nor are they of much importance because of the very limited available tonnage.

We have, however, a number of iron ranges containing large amounts of siliceous or sulphurous ore, such as Moose Mountain, Tomagami, Atikokan, Goulais River, Mattawin, etc., in Northern Ontario, and several smaller and relatively less objectionable deposits in Eastern Ontario, such as at Bessemer, Blairmore, Belmont, Coe Hill, Glendower, Robertsville, Calabogie, etc.

Comparing the ores of Eastern Ontario with those of the Northern portions of the Province, it may be said that the former have been found to be more readily amenable to beneficiation, while the latter are more easily mined. This is because the eastern ores are of a more coarsely crystalline type requiring less preparatory grinding, while the cost of mining has been relatively high because the deposits are not large. The Northern ores of finer crystallization require more preparatory grinding, but they have been mined more cheaply because the deposits are of considerable size.

The beneficiation of a magnetic ore is, from an engineering standpoint, a comparatively simple operation. The ore is first crushed to a size at which the objectionable gangue is freed from the particles of magnetite, and is then passed through magnetic separators which select the magnetite, allowing the gangue to pass off as waste. The concentrated magnetite is then agglomerated by means of heat to make it suitable for blast-furnace use.

If the original ore requires grinding to say 1/8 inch or finer, it will be necessary to submit the crushed ore to wet magnetic concentration; but if the ore can be freed from its gangue at say ¼ inch or larger size, dry magnetic concentration may be employed. Practically 90 per cent. of Ontario iron ores both east and north require grinding to at least 1/16 of an inch, many much finer with subsequent wet concentration.

The agglomeration of the concentrated magnetite is not as simple an operation as its concentration. The agglomerated product must be strong, porous, and not subject to weathering effects. If properly made, this artificial iron ore is an ideal raw material for the blast furnace, but if improperly made it gives rise to various kinds of furnace trouble.

The purpose of beneficiating any given ore is to make it suitable for blast furnace use, and unless the beneficiated ore can compete with natural ores in quality and price, the venture must prove unprofitable.

Operating Plants in United States

It has been proved in actual practice over a long period of years that under certain favourable conditions a lean iron ore may be mined, concentrated and agglomerated, yielding a desirable product for the blast furnace, and at a cost which enables it to compete with natural ores. The work of the Pennsylvania Steel Company, of Lebanon, Pa., and of Witherbee, Sherman & Company, Mineville, N. Y., are instances of successful operations during many years. At Babbitt, Minn., the Mesabi Iron Company are nearing the completion of a very large plant for the concentration of magnetic ores containing between 20 and 30 per cent. iron.

The favourable conditions under which the Lebanon and Mineville plants have been successfully operated are, large deposits of crude ore which admit of cheap mining, the adoption of most suitable methods of concentration, and a product which finds a steady market because of its desirability. The Mineville plants produce a coarse, crystalline product by dry magnetic cobbing, which does not require agglomeration. The Lebanon plant produces a finely divided concentrate, which is subsequently nodulized. Both the Mineville and Lebanon plants produce a concentrate containing over 60 per cent. in iron and low silica, sulphur and phosphorus.

The Blast Furnace Problem

Some few years ago blast furnace operators in Canada and the United States had no difficulty in obtaining supplies of natural hematite ores from the Lake Superior ranges, which averaged well over 60 per cent. in iron and were relatively low in slag forming elements. Many of these high grade deposits are now exhausted and while for a few years the average ore shipped from the Lake districts averaged 55 per cent. in iron, one is safe in stating that shipments of natural ore in the future will average well below 55 per cent. iron. With the decrease in the iron content there has been a corresponding increase in silica and sometimes sulphur and phosphorus, so that the furnace operator to-day has, on the average, a poorer raw material for his furnace than he had ten years ago, and much poorer than he had twenty years ago.

The decrease in average iron content and increase in average silica content has resulted in more expensive furnace operation, because the furnace-man has to contend with more slag-forming materials, and these in turn require a larger proportion of fuel per ton of ore smelted. Both charcoal and coke have greatly increased in price during the past 20 years, so that the furnace operator to-day has not only a leaner ore, yielding less pig per ton, but more slag to melt which requires a larger proportion of more costly fuel.

If the furnace operator can be supplied with an adequate quantity of beneficiated ore containing over 60 per cent. iron and low in slag-forming elements, he would be able to reduce his fuel bill, and if the beneficiated ore contained very small amounts of both sulphur and phosphorus, he could make a pig iron comparatively free from these elements and correspondingly more valuable. This principle is well recognized in the marketing of natural iron ores and a premium is always demanded and paid for those ores which are exceptionally free from silica, phosphorus and sulphur.

It would appear that all that is necessary is to produce a beneficiated ore better in all respects than the average natural ore in order to secure the highest market price for the beneficiated product. Unfortunately this accomplishment is not easy from a commercial standpoint, and the various attempts made in Canada to produce beneficiated ores have been more or less unsuccessful for many and varied reasons which need not be entered upon here.

* Part of a statement prepared for the conference on Iron Ore in Toronto on July 5th.

Conditions for Commercial Success

It is very easy to adopt a critical attitude over the unsuccessful attempts at beneficiation after the causes of failure are recognized and well known, but at the same time we learn by experience and it may not be out of place to remember a few reasons which have contributed to these failures.

It may seem unnecessary to state that unless the deposit of ore which is to be beneficiated can be mined for considerably less cost than a higher grade natural ore, there can be no profit in the undertaking. For instance, a ten foot vein of merchantable ore mined at a cost of $3.00 per ton might prove profitable, but if portions of this vein required beneficiation such portions would require to be mined at less than half the cost of the merchantable ore.

There would be nothing gained in treating this ore to produce a beneficiated ore that was no better chemically or physically than the average Lake Superior hematites, because its market value would be no higher. In order to compete with the natural ore it must be better in every way if it is to command an appreciably higher price.

The art of concentrating magnetic ores to be a high degree of purity by means of magnetic separators has made considerable advancement in the past twenty years. The process of magnetic separation is, in itself, very cheap, costing but a few cents per ton of crude ore treated, but the cost of separation by magnetic machines is only a small part of the total cost of beneficiation. The heaviest items of cost will be the mining and comminution of the crude preparatory to separation, and the final agglomeration of the concentrate.

The cost of mining depends on so many factors that it is difficult to estimate, although it may be said that unless the crude ore can be mined on a very large scale and by the most favourable methods, the mining cost will be prohibitive.

The crushing and grinding of the crude ore present no problems that cannot be overcome by standard engineering practice, but the cost of crushing and grinding will vary inversely with the magnitude of the operations.

The separation of the magnetite from its gangue by means of magnetic separators is not only cheap, but is easily controlled and is free from those factors which usually affect the mechanical separation of other minerals.

The agglomeration of the concentrate to make it suitable for blast furnace use will be the most costly item after mining. This operation may be carried out by one of three methods,—first, briquetting; second, nodulizing; and third, sintering. Each of these processes has been demonstrated to yield a product admirably suited for blast furnace smelting, and the briquettes, nodules, and sinter have received favourable comment from furnace operators both in America and in Europe.

The briquetting of the concentrate has been practised to some extent in both Canada and the United States, but because the process required a very costly installation and was difficult to control, it rapidly lost favour in America. The nodulizing process has been very successfully applied both in Canada and the United States and has been proved less costly for an equal output of tonnage to install and to operate than the briquetting process.

The advancement made in recent year with the sintering process has, in my opinion, placed this method in front of either of the other two processes. It is much less costly to install and its operation affords a large measure of positive control. The great majority of agglomerating plants in Canada and the United States now employ the sintering process, and while the sinter does not possess all of the physical advantages of the briquettes or nodules, this is more than offset by the lower cost of production.

HEMATITE

Processes for the beneficiation of hematite ore are usually based on specific gravity methods of separation. It is true that the electro-magnetic separation of hematite ores is quite possible, but only as an experimental operation, because the cost would be prohibitive of building a magnetic separator sufficiently powerful to concentrate a hematite ore.

The specific gravity separation of hematite ores depends on several factors. First, that the gangue materials in the ore considerably lower in specific gravity than the hematite; second, that the ore is not readily slimed, i.e. broken to powder; third, that the particles of hematite can be broken free from the gangue minerals in pieces not less than $\frac{1}{4}$ inch.

The general conditions governing cost of beneficiation of a magnetite apply in the case of hematites. The ore body should be extensive and very cheaply mined and the concentrated product must be better than the natural ores with which it will be in competition.

As far as we know at the present time, there is no large body of low-grade hematite in Ontario which offers a better or equal opportunity for beneficiation than any of the numerous magnetic ore bodies.

THE PROCESS OF CONVERTING HEMATITE TO MAGNETITE

There are several localities in Ontario wherein are found impure hematite ores of non-marketable value, and it has been proved that these ores may be treated by a reduction process, converting the hematite to magnetite, and subsequently concentrating the artificial magnetite oxide by means of separators.

The proposal is by no means a new one and much information regarding this process may be gained by consulting a paper by Mr. Wm. B. Phillips, published in volume XXV of the Transactions of the American institute of Mining Engineers.

Mr. Phillips has shown that, given the proper conditions of reduction, there is no difficulty in changing the hematite to magnetite, and moreover conducting the process on a considerable scale. In his article Mr. Phillips states that a ton of magnetic concentrate costing $1.25 can be produced from three tons of crude on the assumption that a ton of crude can be mined for 25c and that 50c will cover cost of reduction, crushing and magnetic separation of the three to produce a ton of concentrate.

The idea was never successfully applied even in the Southern States under the most favourable mining costs and, therefore, would hardly be applicable to our more costly operating conditions in Ontario.

THE BENEFICIATION OF SIDERITE

The Algoma Steel Corporation has conducted large scale operations for some years with the siderite ore of the Magpie Mine, and has demonstrated that it is possible to produce a roasted siderite containing approximately 50 per cent. iron and 4 per cent. silica. The

phosphorus content at 0.012 per cent. is well within the desired limit, but the sulphur content at 0.175 per cent is higher than is desirable. The roasted ore is stated to be self-fluxing because of its relatively high content of lime and magnesia. If it were possible to eliminate a larger portion of the sulphur in the roasting process, the product would be more valuable.

There is said to be a much higher tonnage of siderite ore at the old Helen Mine than has been so far proved at the Magpie, and if the expenses of mining and roasting the crude can be kept within commercial limits, the treatment of both the Magpie and the Helen siderite would mean the production of a large tonnage of Bessemer ore of fair quality.

The self-fluxing quality of these roasted ores is an advantage only under certain circumstances affecting the cost of limestone flux at the furnace. If the furnaceman can buy a hundred tons of 50 per cent. self-fluxing roasted siderite for a certain sum of money and finds that he can buy a hundred tons of 60 per cent. ore together with sufficient limestone flux for the same sum, he will naturally select the richer ore.

The Algoma Steel Corporation have made considerable progress in the beneficiation of siderite ore, and their persistence in making use of these native ores is highly commendable and should be encouraged. I am of the opinion that if the sulphur in the raw ore can be eliminated to a larger extent than they have so far succeeded in doing, either by improved methods of nodulizing or by the adoption of the sintering process, that a much larger tonnage of roasted siderite could be marketed in Ontario.

METALIZING OR PARTIAL REDUCTION OF IRON ORES

Various attempts have been made in the beneficiation of low-grade iron ores to produce what is called iron sponge or metallized ore by a process of partial reduction carried on either in a rotating tubular kiln or in a long tunnel furnace through which the ore is carried in suitable receptacles.

These processes aimed at producing a semi-metallic product which, after cooling and crushing to free the metallic particles, would be amenable to separation by magnetic machines. The separated metallic concentrate would then be available for smelting in a blast furnace.

The experimenters with these various processes have been metallurgically successful in the production of granulated or spongy iron from ores, but the commercial practicability of the undertaking has never been demonstrated. It is extremely doubtful whether these processes could be made apply with any degree of commercial success to our low-grade ores of Ontario.

Briefly summarizing the problem of beneficiation, the conditions for successful operation in competition with natural ores may be stated as follows:—

(1) The ore deposit must be of sufficient size and its location convenient to rail and water transportation to admit of very cheap mining on a considerable scale.

(2) The physical and chemical characteristics must be such that beneficiation will result in the production of a concentrate that is higher in iron and lower in slag-forming elements than the average natural ores.

(3) The agglomerated product must conform to certain physical and chemical standards required by the furnace operator, which are, strength and porosity and freedom from excess of iron silicate.

(4) The concentrated and agglomerated product must be produced at a cost that will permit of its competition with natural ores in the open market.

It is of interest to note that the Mesabi Iron Company, of Babbitt, Minn., believe that they possess all of the above favourable conditions for the production of a beneficiated ore from a crude magnetite containing between 20 and 30 per cent. of iron. The operations of this Company will, therefore, prove of considerable interest to Canadians.

SMELTING OF TITANIFEROUS MAGNETITE

A large amount of experimental work has been done on the smelting of titaniferous magnetite, and it has been shown that given proper conditions of slag composition, there is no great difficulty in manufacturing pig iron from ores containing as much as 6 per cent. titanic acid, although it has not been proved that foundry iron can be made with this amount of titania in the mixture. The pig iron produced from ores containing as much as 6 per cent. titania is usually white or low silica iron owing to the necessity for operating the furnace at a lower temperature than would be required in the manufacture of foundry iron.

Any experiments with the smelting of titanic ores must necessarily be conducted in a blast-furnace, on a large scale, if valuable deductions are to be obtained. The smelting of small amounts of titanic ore in a laboratory furnace, while undoubtedly interesting, cannot duplicate the conditions under which a blast-furnace is operated and the results obtained are apt to be misleading.

Experimental smelting of titanic ores in a modern blast-furnace is a very costly business, and I am of the opinion that this problem will receive very little serious attention from blast-furnace operators until the supplies of all other ores are not readily available.

ELECTRIC SMELTING

Some years ago the prospects appeared bright for the smelting of iron ores in Ontario by means of the electric furnace.

The early experiences at Sault Ste. Marie and at Welland lead to the belief that under certain favourable conditions we might expect the electric furnace to compete with the blast furnace. These conditions were and are:—

1st: Very cheap electric power.
2nd: Expensive coke and other fuel.
3rd: A supply of cheap and comparatively high-grade iron ore.

All of the above conditions are met with in Sweden and Norway, but up to the present time these conditions have not been duplicated in Canada or the United States.

During the war and for a short time afterwards it was found practicable to manufacture a desirable brand of low-phosphorus pig iron in the electric furnace. The melting stock consisted of low-phosphorus steel turnings and the operation consisted of simply melting these turnings and carbonizing the molten metal by the addition of coke or other carbonaceous material The process was not smelting, as we understand that term, and the amount of slag made was negligible.

The melting of steel turnings and their conversion to pig iron in the electric furnace proved commercially successful as long as the low-phosphorus pig iron commanded a price of over $60. a ton but as soon as the market price of the pig iron fell below $50. a ton the operation was not profitable.

Keeping this fact before us, it is clear that if we substitute a 65 per cent. iron ore with its slag forming constituents for the 99 per cent. steel turnings, and with

the market price for low-phosphorus pig iron at $30. a ton, there is no prospect for commercial electric smelting of iron ore *unless* electric power can be obtained for something less than $10. per h.p. year or until the blast furnace operator is forced to pay something over $15. a ton for his coke.

CONCLUSIONS

Reviewing the whole problem in the light of past experience, we can make the following general observations, which appear to be the governing factors affecting the utilization of Ontario iron ores.

Raw Material

(1) We have at present no known deposit of merchantable iron ore sufficiently attractive to induce capital to undertake its development.

(2) We have large bodies of both low-grade magnetite and siderite ores which we know can be beneficiated to a merchantable grade.

(3) The utilization of our low grade hematites and titaniferous magnetites does not look attractive because the art of beneficiation of these ores has not, as yet, reached a successful stage.

(4) Our deposits of bog ore are negligible and need not be considered from the standpoint of tonnage production.

Beneficiation

(5) Of the various processes described there are only two which merit serious attention at present, i.e. magnetic separation, and calcining of siderites.

Smelting

(6) There is no immediate prospect that the cost of electric power will be reduced low enough to admit of electric smelting, nor is there any immediate prospect that the cost of coke or other fuel will advance to a point which will admit of the electric furnace competing with the blast furnace, at the present cost of electric power. It may, therefore, be assumed that the blast furnace will remain the only practicable smelting agency for some time to come.

Government Assistance

A review of the bounties paid by the Ontario and Canadian Governments indicates that the iron industry in Ontario has received a large measure of Government assistance in the past, although not sufficient to offset the amounts that might have been expended in Canada for labour and supplies had the Ontario furnaces been supplied with domestic ores.

It is generally recognized that if the iron industries of the Dominion had not been assisted and built up by the Government bounties in the past, these industries would not have been in a position to meet the extraordinary demands for iron and steel during the war, and that Canada could not have developed as an important factor in munition supplies.

As a National Policy the old bounty systems were undoubtedly wise precautions, because the country was enabled thereby to produce its full quota of iron and steel so necessary for the successful prosecution of the war, and the business resulting from Canadian supplies of iron and steel during the war period was in amount vastly greater than the comparatively few millions expended in bounties.

The country, while not exhausted by its war effort, is nevertheless impoverished to a considerable extent, and all Canadians are demanding the practice of the strictest economy on the part of the Federal and Provincial Governments. Under these circumstances, it would be difficult for any Canadian Government, Federal or Provincial, to convince the electorate that a new system of iron bounties is necessary, even from the standpoint of a National Policy in preparation for future wars. Whether the adoption of new bounties can be urged from a strictly economic point is a debatable point, and very convincing arguments would have to be presented in justification of an iron bounty at the present time. Those who are advocating a renewal of the bounty system should, therefore, be prepared to show conclusively that under the present abnormal conditions there would be an improvement in business generally. In other words, it must be shown that our blast furnaces will use native ores to at least 75 per cent. of their capacity, and that any surplus would find a ready export market. Only in this way will a Government be convinced that stimulation of native iron mining will result in the distribution of large sums of money for both labour and supplies. There is no guarantee at present that Canadian furnaces will or can use a large tonnage of native ore, nor could that guarantee be expected until there is a decided change for the better in the iron and steel markets of the world.

A Practical Suggestion

I am of the opinion that the only logical measure of assistance to be expected of a Government at the present time is in more extensive geological exploration. Neither the Federal nor the Ontario Government have ever made a detailed study of our iron ore resources under the direction of experts specially trained as iron ore geologists. It is true that a large amount of geological work on various iron ranges has been accomplished, but this work has always been of more or less intermittent character and the geologists employed may have worked one year on the iron ranges, devoted the next year to the silver fields and the third to the nickel ranges.

The known iron ranges of Ontario cover a very large area and the unexplored regions of Northern Ontario cover a much larger area. If we cannot find merchantable ore in our known ranges, is it beyond possibility that we may discover merchantable ore in the unexplored regions? I believe that a corps of trained geologists working steadily for five or ten years over both the known and unknown areas of Ontario would would be of incalculable benefit, and if their work could be supplemented with a generous measure of diamond drilling carried out under their direction, I believe that our iron ore problem would disappear in perhaps ten years time.

I would, therefore, propose that a Committee of Geologists from both the Federal and Ontario Departments be appointed to consider the practicability of more extensive geological study of our known iron ranges, and to report on the possibility that systematic exploration over new areas might disclose valuable bodies of merchantable ore.

REVISED GYPSUM SPECIFICATIONS

A list of the specifications tentatively recommended by the American Society for Testing Materials was published some weeks ago in the *Canadian Mining Journal*. These were somewhat altered and added to by the Society's Special Committee, C-11, whose report was submitted last month at the Twenty-fifth Annual Meeting.

No material is now to be considered gypsum that contains less than 61.5 per cent. by weight of the pure mineral.

Crushed gypsum is to pass through a 2-inch ring, instead of a 4-inch ring. Not less than 10 per cent. is to be returned on a No. 3 sieve.

PORT ARTHUR NOTES

BY J. J. O'CONNOR

The old Huronian mine has been looked over recently in the interests of Pittsburg, Pa., parties. The property is located in Moss township, about 60 miles northwest of Port Arthur, and about 8 miles south of the Canadian National Railway.

The discovery was made by Indians in the employ of the Hudson's Bay Company, in the winter of 1870-71. Mr. Peter McKellar, of Fort William became interested in the lode, and through his efforts, work was started in 1872 under the direction of Captain U. B. Frue, then in charge of operations at Silver Islet. These operations continued from January to March 1872, when the hostile attitude of the Indians under Chief Blackstone drove the miners from the property. During this period about 100 tons of ore were taken out that showed an average value of $500. per ton. Later, a shaft was sunk to a depth of 150 feet and considerable lateral work done, and a ten-stamp mill erected.

There is a splendid vein system on the property, in good gold-bearing formation, that gives promise of satisfactory results on development. The well-informed have every confidence that it will give a good account of itself on intelligent development.

The Shebandowan Lake region, west of Port Arthur, is attracting considerable attention, mainly through the discoveries of large bodies of high-grade nickle ore made by Julian G. Cross, E. M. and his brother. The deposit is of great extent, and has had thorough surface exploration, with highly satisfactory results.

Prospecting in the Island Falls district is very active, several parties are in the field, and a large number of claims have been recorded. These are mainly restakings of old claims located some years ago, and abandoned by their owners on account of want of transportation facilities and other handicaps of the early days. Samples being brought in would indicate good values in large bodies, that give promise of this field developing into a prosperous mining camp in the near future.

Developments in the Schreiber field are proceeding most satisfactorily. Every day seems to add to the possibilities of active mining on a large scale being undertaken in this area at an early date.

A story sent out recently regarding an alleged find of sensational gold values northwest of the town by D. McQuaig, is wholly without foundation. Present developments in the Schreiber field are sufficient to satisfy even the sensationalist, and it is unfortunate that such stories get abroad.

MINING EXHIBIT IN NEW YORK

At the Eighth Annual Exposition of Chemical Industries, to be held at the Grand Central Palace, New York, September 11-16, there will be many exhibits of general interest, and numerous exhibits of specific interest to miners and metallurgists.

The Exposition has become a centre, on this continent, where new and improved mechanisms and processes are demonstrated to the technical public. Here there may be seen at a glance the latest developments in applied chemistry, mining and metallurgy, illustrated by full-size equipment, working models and similar facilities, under the supervision of trained attendants.

Among the 400 exhibitors, there are about one hundred whose concern is, wholly or in part, with mining. Exhibits of ores and other raw materials, water powers, etc., have been provided by governmental authorities. The recently organized Technical Photographic and Microscopical Society will present an exhibit, and Metallography will be well represented. Fuel economy, dust explosions and fire prevention will have prominent places.

Mr. Herbert H. Hoover heads a distinguished list of speakers, among them several well-known in the field of mining and metallurgy.

A notable part of the entertainment provided is the moving pictures. Asbestos, nickel and Ontario gold are prominent in the list, which contains also copper, sulphur and petroleum as subjects.

The exposition promises to be, this year more than ever, of prime interest to the miner and the metallugist, as well as to his brother engineers in other lines.

CANADIAN MEETING OF THE AMERICAN CERAMIC SOCIETY

A large number of the members of the American Society are to gather in Rochester, N.Y., on August 13th, and leaving there on the same day, visit Montreal, Ottawa, Verona, Kingston, Toronto, Hamilton, and Niagara Falls.

The official itinerary is as follows:—

Sunday, August 13th—Leave Rochester, Boat, 10.45 p.m.

Monday, August 14th.—Montreal.

Tuesday, August 15th—Montreal.

Wednesday, August 16th—Leave Montreal, 8.30 a.m., arrive Ottawa, 11.30 a.m.; inspect quarries and plants.

Thursday, August 17.—Leave Ottawa 10.40 a.m., arrive Verona 2.34 p.m., inspect Richardson Quarry. Leave Verona, 6.35 p.m.; arrive Kingston 7.35 p.m. Leave Kingston 10.30 p.m.

Friday, August 18th.—Arrive Toronto, 7.30 a.m.

Saturday, August 19th.—Leave Toronto, 9.15 a.m.; arrive Hamilton 10.15 a.m. Leave Hamilton, 2.30 p.m.; arrive Niagara Falls, 4.15 p.m.

The total transportation outlay for each individual is $36.10. The estimated expense including hotel, travelling, etc. is placed at $100.

THE USES OF LIME

A bulletin issued by the United States National Lime Association, "An Outline of the Uses of Lime," contains an unusually complete list of the purposes for which lime may be used.

Touching first on agricultural uses, it is pointed out that the use of lime enters into all phases of crop and stock production. As an essential to plant growth its functions are well enough known. It is also an important constituent of insecticides and is directly a protective. It plays an important part in animal growth, protection and sanitation, and in the composition of animal products.

In the making of mortar, plaster, concrete, stucco, brick and special paints, lime is a prime necessity.

Its chemical and chemico-industrial uses are so numerous and so important that without it our industries would be helpless. Its functions in metallurgy and electro-metallurgy are too well known to require more than mention.

News and Comments

By ALEXANDER GRAY

"WHIPPING THE DEVIL ROUND THE POST"

Associated Goldfields of Larder Lake Directors "Deny the Allegation and Defy the Alligator."

A change of heart on the part of *The Financial Post* of Toronto — due no doubt to ex-parte representations — prompted it to publish the following:

Associated Directors Answer Gray

"Direct and pointed refutation of charges and criticisms in connection with the Canadian Associated Goldfields, made by Alexander Gray, in an article in *The Canadian Mining Journal*, and referred to by *The Financial Post's* mining correspondent last week, is given by officials and directors of the company. The board includes a number of men of financial and business responsibility in Toronto and the statements they have made to *The Financial Post* carry conviction that they have honestly administered the affairs of the company in the interests of the shareholders.

"The directors declare that they parted with Geo. Gray — an engineer quoted in the article — 'because they considered him disloyal.' 'It is not to be expected,' they say, 'that Geo. Gray either had in his possession, or submitted to the other Gray such confidential information as the assay plans of the company, and even had these values been correct, such conduct would have no other effect than to disgrace the man who would betray such a trust.'

"*The Financial Post* is informed by the directors that Canadian Associated Goldfields 'has not sold a share of stock for two and a half years and has considerably over $500,000 cash on hand to-day and not a dollar of liability.' This statement is made in reply to references in the article in *The Post* to the company's stock selling campaign. Further it is stated that the company never sold a share of stock either in Pennsylvania or Massachusetts; there are comparatively few shareholders in New York and only one of those described as a farmer. The records indicate that sixty per cent of the stock of the company is held by business men in Toronto.

"It is explained that while many shareholders have visited the properties of the company, they have all done so at their own expense. As to work on the Kerr-Addison property, it is explained that operations were merely suspended to concentrate on their adjoining property which holds forth promise. In this course and in other things the company's policy has been decided by the directors in the interests of the shareholders—and the directors report no indication that this policy has met with any criticism worthy of attention."

The foregoing is one of those artifices which would make it appear that Mr. George Gray is a co-defendant, or the only culprit, or is one who ought to be excommunicated from the Profession of Mining Engineer for having maintained his own integrity and steadfastly declined to suppress the facts. It was assumed the Associated directors would do something of this sort in order to confuse the issues and becloud the record. They have attempted to calcimine themselves, whereas disinfectants would be more appropriate in view of the complete record as it exists in my possession. They may strive to discredit Mr. Gray, a reputable Mining Engineer, who had the moral courage, reinforced by ability, to adhere to his convictions, and who resigned rather than submit to wasteful operations which demonstrated an utter lack of discretion—to put it mildly.

In the conduct of Associated operations, Mr. Gray played an honorable part. He proved the properties he was chosen to manage to be so discouraging that he would not assent to the further fruitless expenditure of public money. In this he confirmed the judgment of Messrs. De Pencier and Smith, and for his complete justification I am prepared to submit to the Ontario Government or any impartial commission the assay plans of workings and drill cores, which eloquently portray the indifference with which a large sum of public money was handled.

Whether shares were sold in Pennsylvania and Massachusetts, Timbuctoo, Thibet or Slovakia, is a pettifogging diversion. The distribution was sufficiently widespread—and there still remains a supply in the treasury and in "the pool." Solicitude lest Mr. Gray be "disgraced" by the demonstration of his probity, is more humorous than convincing. His actions stamp him as the clean member of an honorable profession. Nor is it admissible that the Kerr-Addison property "operations were merely suspended to concentrate" on an "adjoining property which holds forth promise."

The detailed record shows why work was stopped (and should have been stopped long before) on the Kerr Addison. The report made by Clifford E. Smith to Director Gundy and others, was condemnatory. Undoubtedly shareholders assented to the policy of the board, but that is not a mitigating circumstance. Shareholders were led to believe the properties were disclosing great tonnage of profitable ore. The assay plans demonstrate the contrary. When Mr. Smith suggested a modest expenditure, instead of continued operations on a scale that was altogether unjustified, it was President Mackay who persisted in the plan to sink a shaft, his excuse being 'the shareholders want it." He passed the buck to shareholders—and now he would throw the responsibility upon Mining Engineers.

In refusing to draw a salary for what promised no adequate return to the company having repeatedly represented the facts of mining position, Mr. George Gray was loyal to a company that had hundreds of thousands of dollars in the treasury that could be devoted to a better cause. He was loyal to himself and to the public. He would have been recreant had he sanctioned further expenditure, where too much already had been wasted. The intimation conveyed by the directors that work may be resumed at the Kerr Addison and payable milling ore developed in quantities sufficient to feed a mill, is added proof that the sanity of someone needs expert consideration.

Will the Directors of the Canadian Associated Goldfields of Larder Lake admit their errors and abide by the decision of any impartial committee of officials or others if it is decided that their own assay plans sustain every

statement made by the writer as to the unworthiness thus far of the Kerr-Addison, Reddick and Harris-Maxwell properties for mining and milling purposes? They can make a virtue of necessity, and can manifest contrition in the disposition of the "considerably over $500,000 cash on hand to-day". Those of us who would establish standards of mining integrity, will hasten to make amends if there is any proof that the mines for which between a million and two millions was raised are economically other than a horrible example.

"Private" Mining Enterprise at Public Expense

In this connection, and owing to "explanations" emanating from another source, I am reminded that Bagstock was a Kindergartner when it comes to "slyness". He qualified in the "devilish sly" class; but he did not have the advantage of the myriad examples afforded by promoters whose formula, as George Ade puts it, is "aqua pura by the hogshead" and "created wealth by the purely lithographed Method."

In one haunt of the Cult Come On, "Slim" is deemed more expressive, and of deeper significance. At any rate "slim" is sufficiently synonymous and may as well be adopted for illustrative purposes in connection with the performances of non-casuists who have none of the qualms of those who "ne'er felt the halter draw with good opinion of the Law." They may have "erred and strayed" as "lost sheep", but they did it "privately" and are to be forgiven for taking the wrong road and what public money there was along the route.

To be explicit: There is more than *naïveté* in the contention of a North Country weekly journal, that there is no earthly reason why Attorney General Raney should intervene in the matter of the Canadian Associated Goldfields of Larder Lake; because the claims made and shares sold were entirely "private". The $30,000,000 capitalization was merely incidental — *pro forma*, as it were — a means, not an end — to "clean up" matters, as one director expressed it.

By "private" arrangement, and as a special favor, Associated shares were delivered for public cash (it is none of your business whether the capital liabilities are really nominal, or whether the reported "Fixed Assets", approximated at about $23,000,000, are rather unreal.)

Possessing a charter, an ocean of *aqua pura*, certain immovables and intangibles, Government having sanctioned the incorporation, the plea in justification entered is that it was perfectly proper and legal to ignore ordinary avenues of distribution and discreetly to dispose of shares by "private" sale, the President incidentally picturing the wealth in reserve and the 10,000 ton mill in the offing. Ore galore, a fat treasury and a fair wind, the skids for the cargo may be said to have been scientifically slickensided.

It is argued this "private" affair was a strictly "en camera" novelty—not exactly "bouffé"—and yet there are those who hold it worthy of further stage-setting. Mining Finance of the sort certainly is among *les Beaux Arts*. There is a charge for admission, and egress is unattainable "during the life of the pool". The outstanding feature of the "private" exhibit is that the public interest is locked up—"pooled" in aqua pura—and the portion of the public involved becomes somnolent under the mesmeric spell of those who serve the incense and chant the Jubilate. The public get the sockdology—the 10,000 ton mill is a castle in the air.

Manifestly the journalistic counsel for the defense makes the best of a weak case. If the demurrer is sustained by implication and there is no redress at law, there is every reason for another increase in Associated Goldfields capitalization and further "private" performances. The Government may obtain more fees.

Larder Lake "home brew" finance is apt to be popularized if this precedent is confirmed, even by acquiescence. The possibilities are tremendous—an army of canvassers can have steady employment so long as the public survives. Already solicitors are busied with shares, on salaries and commission. So long as there is no misrepresentation, no crescendos where diminuendos are in order, this phase of speculation is beyond control, once Governments license companies.

Grover Cleveland once declared, "public office is a public trust." Likewise "private" promotions can be "private snaps."

"Home brewed" script might become too plentiful. Germany has 170,000,000,000 marks. Russia's diurnal rations in rubles run into trillions. Unless printers should strike, "private" share issues can run by editions.

Somewhow, however, it seems as though the "Wildcat" was not so far off when he soliloquized: "Got me single troubles now widout hitchin' on any double extry."

Finding Canada Worth the Money

Lay newspapers, bankers and a section among Quebec politicians who decry the "mining risk," have a thought or two conveyed to them in the advent of the Anaconda Brass Company and the admirable enterprise of the Johns-Manville Asbestos people. Anaconda Brass will locate at New Toronto. The Canadian Brass Works engaged in fabricating Canadian products *non est*, as yet. Anaconda has industrial leaders *par excellence*. They have copper and zinc and lead. They are exploiting these metals and creating bulk consumption, while Canada prefers to serve them raw—a crudity that is being rectified in the Asbestos Industry.

For some time it has been keenly felt that more producers of Asbestos ought to follow the load of Keasbey & Mattison and establish Canadian fabricating plants. Certain American producers had advantages in that they sold to themselves their own crude materials at an f.o.b. valuation. Quebec authorities were rather resentful. American interests remained obdurate. Consequently complications arose and special taxation was mooted. Now, however, with Keashy & Mattison and the Johns-Manville companies prepared to meet the natural desire of Canada, it is possible the Asbestos Industry in Quebec will be a complete operation to a still greater extent.

The Johns-Manville people are about to construct a plant in which considerable of their own output will be handled. It was the intention to do so before, but conditions did not warrant it. What is more significant, is the option taken by the Johns-Manville interests on holdings of the Bennett-Martin Asbestos & Chrome Company. The option includes the two Bennett-Martin mills, the terms providing for a three-year lease with the privilege of purchasing for $2,750,000.

Obviously Johns-Manville and Keasbey & Mattison are alive to the benefits derivable from complete operations in Canada and untrammeled entrance into the markets of the Empire. There are progressive American business men who do not hesitate to take a risk in Canadian Mining Industrialism.

The Okanagan Coal, Oil and Gas Co. has recently been incorporated at $1,000,000. A number of claims have been leased and machinery ordered. Drilling is to commence immediately near Armstrong, D.C.

News of Mining

United States

From official statements issued by the U. S. Geological Survey, we learn that, due to coal miners' strikes during the year 1920, the average number of days lost per man employed throughout the year was 7.5 days. In the anthracite mines, employing relatively few men, the average loss was 12.5 days; in the bituminous mines, 6.4 days. The total man-days thus lost was 5,914,473. Loss from other causes amounted to 55,733,000 man-days, all out of 241,657,000 man-days offering. The man-days lost through strikes in 1919 numbered 15,525,857.

The existing administration of the American Smelting and Refining Company won a decision victory over the faction that proposed to replace it. The Messrs. Daniel and Simon Guggenheim remain on the board of directors, and Mr. H. A. Guess is confirmed in his position of vice-president in charge of metal mining operations.

Despite Senate opposition, the Federal appropriation of $400,000 for research work in connection with the production of helium has been made available.

Dividends paid by 13 mining and metallurgical companies in the United States during the month of June amounted to $5,519,327. Of these companies The Mother-lode Coalition contributed the largest amount, $1,250,000, American Smelting and Refining coming next with $875,000 and Utah copper with $812,245.

An employee of the United States Bureau of Mines, at the Evansville, Indiana, Safety Station, recently removed several ounces of nitroglycerine from a safe that had been drilled and made ready for blowing open by burglars. The nitro was removed by dissolving it in alcohol and ether.

The bituminous coal miners of the United States have lost, during the past 30 years, 4 days out of each 10 of possible employment.

The appropriation for the work of the United States Bureau of Mines, as from July 1st, 1922, to July 1st, 1923, is $1,580,900. The largest single item is that of the operation of mine rescue cars, $211,000. For mining experiment stations the appropriation is $170,000. The supervision of oil and gas leases is provided for with $123,490. For the economic studies of petroleum the sum of $40,842 is apportioned.

For the week ending July 1st the United States mint purchased 160,000 ounces of silver, bringing the total purchases under the Pittman Act up to 116,197,506 ounces. Less than 92,000,000 ounces are now to be bought under the Act.

The average price of silver (foreign) at New York during the month of June was 71.149 cents per ounce. The London average was 33.900 pence per ounce. Sterling exchange averaged 444.615 as compared with 377.236 during June, 1921.

New York electrolytic copper prices averaged 13.575 cents per pound during June, the highest average of this or last year. Lead averaged 5.715 cents, also the highest for the two years. Tin averaged 30.707 cents; zinc, 5.346 cents and antimony 5.143 cents.

The mines of the Lake Superior iron ore ranges are producing at about two-thirds of their normal rate. The recent fixing of prices for the year has facilitated activities.

Great Britain

The Central Association of Miners' Permanent Relief Societies reports a total membership for 1921 of 356,980. This is a falling off of 17,896 from the membership for 1920. The Societies paid out the sum of £317,041, last year in benefits. Since the year 1879, 1,937,511 non-fatal and 20,437 fatal accidents have been dealt with, representing an outlay of £9,838,276. The fatality rate for the year 1921 was 0.78 per one thousand.

Coal production in Great Britain for the week ended June 3rd was 4,441,000 tons, the previous weeks output being 4,629,000 tons.

Amongst several other Cornish tin mines that are expected to resume production shortly is the Geevor mine. On the completion of a new shaft to the seventh level it is stated that costs can be considerably reduced. This is typical of much new work being carried on with a view to the more efficient operation of the older mines.

The Anglo-Egyptian Oilfields, Limited, with which were consolidated a few years ago, the Red Sea Oilfields, Limited, the Egyptian Oil Trust, Limited, and other concerns, reports a production of 181,000 tons of petroleum for the year 1921 an amount 26,000 tons greater than the production for 1920. The net profit for the year was £374,836 11s. 6d.

A statement issued by the Mining Association of Great Britain shows that, although coal miners' wages are now at, or only slightly above, the stipulated minimum, yet they are in effect 42.97 per cent. above the 1914 level. It had been previously stated that they were but 20 per cent. above.

The Albert Medal of the Royal Society of Arts (1922) has been awarded to Sir Dugald Clerk. The award was made in recognition of Sir Dugald's work in the improvement of the internal combustion engine.

An investigation of the efficiency of domestic cooking stoves as consumers of fuel, conducted by the British Fuel Research Board, shows that the over transmission of heat falls as low as one per cent. The highest recorded efficiency was 17 per cent; the average, 2½ per cent.

In answer to questions asked in Parliament, the Hon. Mr. Bridgman recently stated that during the first five months of the current year the output of coal per man shift, on the seven-hour day, was nearly 20 cwt. This compares favorably with the output for the preceding five months, which was 19 cwt. per man shift, on a working day of eight hours.

Observations of temperatures and the rates of temperature increase in British collieries bring out some interesting facts. At one Yorkshire colliery, at a vertical depth of 2,540 feet, the strata temperature is 91.6° F., the average surface temperature being 48° F. and the "geothermic gradient," therefore, 1° F. in every 58.5 feet. In different collieries this gradient ranges from 36 feet to 106 feet. The normal gradient seems to lie between 56 feet and 70 feet. In a Lancashire colliery the strata temperature at 3,450 feet is 100° F.

Exportation of iron ores and manganese ores from Russia to Germany is now assuming substantial volume.

The French output of steel and pig iron for the quarter ended March 31st was 998,254 tons steel, and 1,914,405 tons pig iron. The Est and Alsace-Lorraine districts produced about 85 per cent. of the steel.

Workers at the Oviedo mines in Spain have absolutely refused to consider any decrease of wages. The strikers are returning to their homes.

To meet the danger of unemployment due to high cost of production, coal mine operators in the Northern France and Pas-de-Calais districts averred recently that reduction in wage rates was essential. No relief had been obtained in the matter of high freight rates, and this made wage reduction all the more imperative.

The continued shortage of coal and coke in Germany is observably affecting the iron and steel output. The situation is rendered more difficult by the temporary transference of labour to necessary summer employments.

For the 12 months ending March 31st, 1922, German production of lignite amounted to 123,000,000 tons, 9.9 per cent. more than for the preceding 12 months. Coal outputs aggregated 136,200,000 tons, an increase of 3.7 per cent. Lignite briquette production totalled 28,300,000 tons, more than half of which came from the Halle district.

Swiss aluminium producers have been almost shut out of the German market. The United States and Great Britain are now Switzerland's largest customers for products of this metal.

During the middle of June, striking iron and steel workers of Bilbao, Spain, to the number of 1,500, resumed work after consenting to a 15 per cent. reduction in wages.

Extensive deposits of gold bearing gravels and sands, on the Orbigo River, Northern Spain, are worked by the Dome Mining Corporation, of London, England. The deposits were known to, and worked by, the Romans. Prospecting shafts and boreholes now indicate, according to the Dome Mining Corporation's reports, 22,758,440 cubic yards of gravel, of a total value of £1,077,000. In addition to this, later prospecting has proven up 5,857,992 cubic yards carrying £244,000.

Africa

The total coal output of the Union of South Africa during 1921 was 13,658,922 tons. Exports amounted to 1,795,093 tons, about half of which went to India, and the bulk of the remainder to Ceylon, Aden, and Egypt. Small shipments were made to Brazil, and the Argentine Republic.

The new State Areas mine property to be worked under lease from the Government, promises to be one the Transvaal's largest producers. The Union of South Africa will get a substantial share of profits from the operating company. Plant construction will be completed early next year. The capacity will be 50,000 tons of ore per month. The ore is to be slimed, and stamps and amalgamation entirely done away with.

The plant of the Geduld mine, Transvaal, is to be enlarged to a capacity of 65,000 tons per month. Estimates of available ore are placed at 6,000,000 tons, averaging 6.6 dwt. per ton, the stoping width being 61 inches.

A United States Geological Mission is visiting South Africa and is on an extended tour of inspection. The members are Professors, Wright, Palache, Daly and Molengraaf, and Mr. L. Hall of the U. S. Geological Survey.

Evidence presented before the South African Industry Board show that whilst 25,701,954 tons of gold ore milled in 1914, at a cost of 17s. 1d. per ton, yielded £21,943,692; in 1921, 23,400,605 tons yielded £30,088,898, but at a cost of 25s. 8d. per ton.

At the settlement of Mosesberg, fifty-odd miles from Kimberley, an alluvial diamond district has been officially proclaimed. A large rush of prospectors occurred when the district was opened.

The district surrounding the village of Amsterdam, Eastern Transvaal, is the scene of gold mining activity. New and interesting developments of the banket strata have been discovered. A syncline, the axis of which passes through Amsterdam, is indicated. The trough is occupied with diabase and similar rocks, underlain in part by sandstone, quartzites and conglomerates. The stratigraphy of the region is well displayed in natural cross-sections.

Evidence taken by the South African Mining Industry Board includes cost statements from five representative gold mines. The plant of the Crown Mines, Limited, has a milling capacity of 225,000 tons per month. During 1921, 13,960 natives and 1,731 whites were employed. The average tonnage milled was 181,400 tons per month. The discrepancy between this and the rated capacity was due to shortage of native labour and to strikes of the whites. The working costs per ton milled were 16s. in 1915 and 25s. in 1921. The ore reserves at the end of 1921 were 8,511,187 tons, averaging 25.62s. The margin of profit is microscopical at present costs. At the Modderfontein East mines the reserves on December 31st, 1921, were 1,880,000 tons averaging 29s. 6d. per ton, and 2,173,000 averaging 28s. 7d. per ton. Here large sums must be expended in construction. At the Durban Roodepoort Deep, working costs have been 33s. 6d. in the past. Ore reserves are 1,092,400 tons averaging 28s. per ton. Only relatively small bodies of ore in this property will pay at the above costs. The Village Deep represents expenditure totalling £2,091,478. The working costs in 1915 were 19s. per ton, in 1921, 29s. 5d. per ton. Working costs here must be brought down to 25s. 8d. per ton. At the Nourse Mines the 1921 costs were 31s. 7d. per ton milled. Here the costs can and should be brought down to 23s. per ton. In all these cases it is urged that ample native labour and freedom from unionized labour control or interference are essential in the future.

Australasia

The management of the Junction North Mine, Broken Hill, has made representations in the Warden's Court to the effect that work cannot be continued at the present wage rates and hours per day worked. The Court consented to recommend a six-months' suspension of regulations governing labour conditions.

During the first quarter of 1922 the production of osmiridum in Tasmania came to 299.09 ounces, valued at £9,410.

Largely on account of the closing of Mount Morgan, the value of Queensland's mineral output for the first quarter of the year was only £36,908, against £122,305 for the first quarter of 121. Silver production 45,817 ounces, marked the only notable increase.

The West Australian output of gold during the month of May was 39,726 ounces, 6,668 ounces less than that of the preceding month.

Tin produced at Mount Bischoff, Tasmania, by recent London assay, is 99.9 per cent pure. Lead 0.05 per cent, is the chief impurity.

Late advices state that the coal miners' union officials of New South Wales have rejected, after joint conference, the owners' proposed wage reduction scheme.

A survey of the iron ore resources of South Australia, made by Mr. R. Lockhart Jack, Deputy Government Geologist, indicates that in the Middleback Range there is ore available to the amount of 165,000,000 tons. The deposits are controlled by the Broken Hill Proprietary Company.

Queensland's output of coal during the year 1921 was 954,763 tons.

British Columbia Letter

Blow-outs at Cassidy

Blow outs have been interfering with the working of the Cassidy, Vancouver Island, mine of the Granby Consolidated Mining & Smelting Co. These occurrences have been more or less frequent for months. Because of them the Minister of Mines some time ago prohibited the use of powder underground. Within the last few weeks they appear to have become more severe, for two miners have lost their lives at different times within this period. In each case they were buried under the fall of coal and life was extinct before the bodies could be extricated. Coroners' juries have returned verdicts of death by misadventure, no blame being attached to any officials. The situation has developed into a problem of some perplexity both for the Department of Mines and the company management. The coal in the area now being worked is soft and conditions are such that there is no assurance that blow-outs will not continue and further lives be lost unless something is done to safeguard the workers. William Sloan, the minister of mines, has interested himself in the matter personally to the extent of prohibiting the use of explosives, taking up with the U. S. Bureau of Mines the question of the explosibility of the mine dust, and now, it is understood, has instructed his officials to make full investigation to the end that effective measures may be adopted.

Coal Miners' "Meet" at Banff

Mine Rescue and First Aid contests were held at Banff Alberta, on June 30 and July 1 under the auspices of the Canadian Institute of Mining & Metallurgy. In the mine rescue event there were thirteen entries, the Fernie team winning first place, taking the championship shield, the Charbonier Cup, individual cups and medals. Their score was 480 out of a possible 500. Others finished as follows: 2nd, Michel; 3rd, Bellevue; 4th, Blairmore, (No. 2); 5th, Gibson Colliery, Drumheller. In the senior first aid contest there were eight entries and the results were: 1, Drumheller Coal & Land Co.; 2, Coleman International; 3, Canmore; 4, Lethbridge. The were seven teams of Boy Scouts in the junior first aid event, and the winners were: 1, Lethbridge (No. 1); 2, Lethbridge (No. 2); 3, Calgary. The ladies First Aid Event was won by a Calgary team. Premier Greenwood, of Alberta presented the awards.

Coal Mines Still Inactive or on Short Time

The British Columbia situation regarding coal production shows little change. In the Crow's Nest Field the mines still are closed owing to the strike. The collieries of the Nicola Princeton area are operating much as usual, although the Coalmont Collieries are doing somewhat better, their output averaging 800 tons a day, which is a considerable jump. On Vancouver Island the Canadian Collieries (D) Ltd. at Comox and Wellington have not yet been required to work full time to meet the demand. The Western Canadian Fuel Corporation, however, is reported to have signed contracts that will absorb its capacity production for a time, consequently the mines at Nanaimo and in that immediate district are active. In the north there is prospecting of the coal fields adjacent to the Grand Trunk Pacific Ry. and it is assured that mines will be operated on a small scale to meet the coal requirements of Prince Rupert and other local centres during the winter.

Shipments of Ochre

Ochrerous clay or impure bog iron ore, an extensive deposit of which exists on Demamel and Stony Creeks, Sooke, Vancouver Island, is being shipped by D. Campbell, owner, to the Seattle Gas Company. The first shipment of 225 tons left Sooke Harbor recently. It is to be used for the purification of gas.

Iron and Gold in Kamloops District

Major A. W. Davis, mining engineer for central British Columbia, states that there is a large amount of magnetite ore near Kamloops and that, cheap water power being available, the possibility of establishing a small plant for the production of pig iron is good. On the west side of Okanagan Lake there has been opened up a fine showing of high-grade gold bearing ore. It is the White Elephant Group, and sixty or seventy dollar ore is being shipped in carload lots. The ore is quartz with pyrrhotite and tellurides occurring in it.

The Portland Canal District

C. A. Mackenzie, owner of the "M.C." near the Premier Mine, Salmon River, passed through Victoria on the 17th July. Development of this property is being carried on this season. He speaks highly of the progress being made in opening up the Portland Canal District by the provincial government by means of necessary road and trail construction. Work of this kind is under way in both the Salmon and Bear River sections.

An air compressor and other plant is being installed on the property of the B. C. Silver Company, Salmon River. Messrs. C. A. Banks and H. L. Batten are supervising the work.

H. Howson has arrived at Stewart en route to the "Big Missouri" Group, recently bonded by A. B. Trites, Fernie, one of the owners of the Premier Mine. Some development work is planned.

George Clothier, government engineer, announces that the Provincial Government proposes construction of a prospectors' trail from near the head of Bear River, skirting the mountain range past Bowser Lake to the head of Unuk River. This will open up approximately 60 miles of virgin mineral bearing territory.

F. N. Cronholm, a Los Angeles Cal. civil engineer, has been looking into the practicability of furnishing an outlet for the production of the Outland Silver Bar Mine, situated on the west side of the Salmon River Glacier about seven miles up. He says that the making of a road on the glacier would be cheap and simple by filling in the cracks and staking out the route. In addition five and a half miles of new wagon road would have to be built on the ground. This would be in American territory, the ice road being on the Canadian side.

Cariboo Placers

Cedar Creek, Cariboo, has not yet proved a fabulously rich placer mining centre. It cannot be said that the excitement has petered out, but the paying ground in that locality has been occupied and returns from owners who are operating are not available. Work on the "discovery" claim has been interfered with by litigation. The Gold Commissioner has order that all leases must be surveyed. There is every probability that hydraulicking or dredging enterprises of considerable size will be initiated in this district.

The exact situation in the Whitewater District where rich discoveries were reported last year, is not known. There has been much staking on Iron and other creeks and large parties of miners and prospectors are in the country. A drill was taken in to explore the "discovery" claim, recorded in the name of Taylor, who took out a quantity of gold last year and a short time ago bonded the property for a substantial sum.

Operations have been resumed at the Rock Creek Mine and Mill of the Consolidated Mining and Smelting Co., situated near Grand Forks.

The Lardeau Valley has been swept by several forest fires this summer, the last destroying the warehouse of the Silver Cup Mining Co. and the buildings of the Big Tunnel Mining Co., both at Five Mile, above the town of Ferguson.

That a contract has been closed by the East Kootenay Power Company with the Consolidated Mining & Smelting Co. to supply power for the Sullivan Mine and the Concentrator being erected there, has been announced. Immediate requirements call for 3,000 horsepower to be delivered at Kimberley, this to be increased within the next ten years to 5,000.

Ore received at the Trail Smelter, Consolidated Mining & Smelting Co., during the first week in July totalled 4,030 tons, of which 74 tons were contributed by the Silversmith Mine, Sandon, the remainder coming from company properties. The aggregate tonnage of ore received for treatment this year so far is given as 226,734.

Some diamond drilling and other development work is being done on the Nickel Plate Mine, Hedley B. C. This mine is in operation again. The 40 stamp mill is working to full capacity and reduces over 200 tons of ore every 24 hours.

Development has been resumed on the Cork Province Mines Ltd., near Kaslo. Operations are in charge of W. Yolen Williams, formerly of the Granby Consolidated Mining & Smelting Co.

Dr. G. A. Young, of the Geological Survey of Canada, has returned to Victoria after an inspection of the hematite deposits at Sand Creek in the Cranbrook District. He has reported that some stripping will be necessary before it is possible to arrive at any sure conclusion as to the commercial possibilities of the property. It is understood that the Provincial Department of Mines has authorized the expenditure required for this purpose. Dr. Young is co-operating with the provincial authorities in the work of ascertaining British Columbia's iron ore resources.

T. E. Pooley, representing Vickers, Son & Co., British steel manufacturers, is in Victoria reporting on iron ore deposits and the economic feasibility of establishing a steel manufacturing plant in this province.

The Atlas Petroleum Co., which is drilling on property held under lease at Hall's Landing, near Revelstoke, Kootenay, has sunk some 160 feet in soft formation. W. E. Marrion, field manager, considers prospects satisfactory and new equipment is being installed to expedite the work.

EXPLORING FOR OIL IN WESTERN CANADA

In the current number of that exceedingly bright and useful monthly *Agriculture and Industrial Progress in Canada*, published by the Canadian Pacific Railway, there appears an article by Mr. A. M. McQueen, vice-president of the Imperial Oil Company.

Mr. McQueen alludes to the fact that the Imperial Oil Company "is making the first comprehensive test of the oil resources of Canada and is, of the world companies, the only one carrying on operations here. Therefore, these operations may be said to be representative of all the conditions existing. But to say this is to belittle neither the courage nor the accomplishments of many small companies which have assisted in the pioneer work, and which will some day participate in the favourable result I confidently believe there will be."

Without deprecating the work of the Geological Survey, Mr. McQueen quite rightly says that one small corner of any one of the four great provinces would have been sufficient to keep the entre survey force busy for a decade.

The reconnaissance undertaken by the geological staff of the Company between 1916 and 1919 covered much virgin territory. Altough geological information was slim and afforded little encouragement, longer chances were taken because of the demands and exigencies of war. Also, Canada produced only two per cent. of the oil she consumed. Beyond these considerations, "the search in the land of the Midnight Sun was not a wild chimera, but the natural evolution of an imperative necessity."

Because other fields are being depleted, oil simply must be found otherwhere. This is the justification for the string of drilling rigs scattered across a territory two thousand miles from the Canadian Boundary to the frozen ocean.

Amongst several possible fields selected, one was chosen near Fort Norman, at a point where oil seeps had been noted by Sir Alexander MacKenzie. By rail and water a rig was shipped over 1500 miles from Edmonton. The derrick was erected and the plant installed late in the autumn of 1919. Another drill was installed at Windy Point on Great slave Lake.

From Peace River Crossing, the end of steel, the route to these northern locations is by water for fifteen hundred miles. The season for navigation lasts for from 100 to 110 days. The Peace River is a placid stream, except for a break at the chutes, where a volume of water a mile and a half wide and a hundred feet deep falls over a fourteen-foot limestone ledge, giving promise of almost immeasurable power for the future. At the second break, down the Slave River, at Smith Rapids there is a sixteen mile haul.

The possibilities of the field can be determined only by drilling. Four drills are now in operation. The expenditure in this district has been and will be very heavy. The Co. recognizes, however, that all that can be accomplished as a result of this heavy expenditure is simply to demonstrate whether or not there exists in that country a reservoir of oil which may become available many years hence, when oil is much scarcer and its price much greater than to-day.

The future establishment of a pipe line to tide water would open up a country two thousand miles long which, together with the oil industry, would sustain a large population and extend the map of Canada north as well as east and west.

Notes From Nova Scotia

THE PICTOU COLLIERIES

The recent depressed condition of the coal trade has been hard on the Pictou colliery districts, the collieries working only two and three days per week. But the miners have borne it bravely, and while many may have been on the verge of suffering, great fortitude has been shown and very little complaint was made. The sturdy, independent spirit of the Pictou people has carried them through the hard times with smiles on their faces, whatever they may have felt within. They will enjoy the prosperity which is about to come to them all the more because they bore their trials in silence. The coal trade is picking up, and August should be for the Acadia collieries a fairly busy month. How much business will fall to the Pictou collieries will largely depend on the amount of coal the Quebec market will absorb and the duration of the coal strike in the United States. But another factor no less important will be the attitude of the men themselves to the Coal Company after the election of officers of the U. M. W. of A.

Pictou Miners are Moderates

If the Pictou miners stand firm against any hasty and ill-advised action of their leaders, as they have done in the past, then they will benefit by it; but should they permit themselves to be carried away by the violence of the Bolshevist party, they will be the losers. While there are a few extremists among them, yet by far the larger number are moderates and have no desire for revolutionary methods. If the McLachlin faction should win at the elections, it will not be by the votes of the Pictou miners. And just how long these men of the Pictou coal field will be willing to adhere to the main body in Cape Breton, will depend entirely on the policy of the leaders and how this policy will be enforced in a district which does not agree with the doctrine that making a company bankrupt is in the best interests of an industry and will eventually lead to the victory of the Proletariat.

Stellarton

One of the growing towns of Pictou County is Stellarton, the headquarters of the Acadia Coal Company. "Stellar" is the name of one of the many seams of the Pictou coal field. When this coal burns, it is covered over with bright little flame stars, and here the town found its name Stellar Town. The town has grown steadily and slowly from the beginning, but with an abundance of coal of fine quality, Stellarton has only begun its career and is yet in the early morning of life. This seems to be well understood by its citizens, many of whom own nice houses surrounded with shade trees, green lawns and beautiful flower and vegetable gardens. The miners' cottages are snug and comfortable looking and are kept just as clean outside as other houses of this well conducted town. There is a little building going on at present, in spite of the depression of the coal and steel trades.

Stellarton seems to be among the best, if not the biggest, of Nova Scotia colliery towns. The population has increased considerably during the last ten years, while coming years will no doubt continue to add to the number as the collieries are developed and enlarged.

The Coal Seams of Pictou

It has long been known that Pictou coal fields contained large bodies of coal. Early geologists had made fairly accurate statements of the number of seams to be found in this field. As far back as 1869, Logan and Hartley's report showed sixteen workable coal seams, but it was not until four or five years ago that the diamond drill proved the correctness of this statement. The following section shows the immense quantity of coal lying in this narrow field, which at present is understood to be eleven miles long by two and one-half wide.

Section of Albion and Allan Shaft Districts

McBean Seam	6 ft. - 0 in.

At first glance it might be thought that this field should be a large producer, and the output could indeed be very much enlarged. But the position of the coal seams, overlying one another with, in some cases, only thin strata between, does not lend itself to great output — that is if conservation of coal is to be observed. The seams cannot all be developed at the same time, but by careful mining methods they can be made to give much larger outputs than they are at present doing. Owing to the thickness of the seams and the amount of gas given off, they have been found difficult to operate; but as mining science has developed and men have gained experience, these difficulties are being overcome and a feeling of security established.

A Forty-Foot Coal Seam

The Allen Shafts are down on the Foord Seam which is forty feet thick. To the outside public a forty-foot seam of coal sounds good, but to mining men it presents difficult problems. The seam is too thick to be easily mined and all coal extracted. If it was broken up into four separate seams of ten feet it would be better. Five seams each eight feet thick would be ideal. Coal left in the waste workings means mine fires, for sooner or later broken or pulverized coal heats and takes fire. Under the most favorable conditions, fire in a coal mine is a terrible thing; but when large quantities of mine gas are given off, danger and disaster hover over the mine and over the workmen who risk their lives to fight it. Experience has taught that mine fires, when they cannot be controlled in the early stages, must be immediately walled off by stone or thick concrete stoppings.

The present method of mining in the Foord seam is to extract the lower part first, taking out about eight feet of the coal. The upper part is dropped in lifts until the height of twenty feet is reached. The bord is then widened and the upper layers of coal, being weakened, fall down and in many cases there is now comparatively little coal lost. The pillars are then extracted. The roof is tender and when broken runs like beans out of a hole in a bag. The panel system is used so that, should a fire break out or that section be worked out, it can be walled off, thus securing the safety of other parts of the mine. Experiments are being made in driving double bords, the one directly over the other, with the top bord advanced about forty feet. With a bord below and one in the upper layer of the seam there is still over twenty feet of coal to break down. The mine officials seem to agree that in time this method will be perfected, when a still larger percentage of coal may be won. One of the difficulties of the new method is the matter of ventilation; but this is being overcome. The advantage would be large outputs from small sections, a larger percentage of coal won, and the danger of mine fires greatly lessened.

The Albion seam is fifteen feet thick and while much thinner than the Foord, for all practical purposes it is far too thick.

The Recent Re-organization.

The Acadia Coal Company is now part of the Empire Steel Corporation. A re-organization of the management took place shortly after the Corporation took charge, and a strong and capable staff of mine officials was placed in charge. The 1918 explosion had destroyed a large part of the mine and new ground had to be attacked. This caused development work to fall behind; but the management, in spite of labour and other difficulties, persevered and are in a position today to give a good output. New sections were opened up and older ones further developed, and should a brisk season set in, the Acadia collieries will give a good account of themselves. The mine officials speak with a confidence which means much for the future welfare of the coal industry in Pictou County. They know what they have already accomplished and they believe that much more can be done. Expert mining skill and experience is being applied to discover the method of mining best suited to the coal seams, while the safety of the workmen is the first thought of all the officials. They are full of optimism and believe in themselves, their workmen and their collieries; and with all pulling together, they look for better things to come.

The manager, A. McColl, is a Pictou man, brought up in the business of coal and steel, and he knows it thoroughly. He has a University education, and added to this a long experience with the Nova Scotia Steel and Coal Company that eminently fits him for his present position as General Manager.

Asst.-Manager J. J. MacDougall has steadily climbed up from one position to another in the Cape Breton collieries. For five years he was General Superintendent at Wabana, which position he filled with ability and success. He is still a young man and while he may be overshadowed by his more brilliant brother, Vice-President D. H. MacDougall of Empire Steel fame, his genial personality, his love of a square deal to workmen, and his habit of steady working and stick-to-itiveness will carry him further along the road to success.

District Superintendent M. Blue rose from the ranks and is a remarkable man. He was one of the first miners to take advantage of the mining school. He has managed successfully different collieries in Springhill. He was appointed Deputy Inspector of mines, which position he held for two years, until he gave it up to take charge of the Drummond colliery, Westville. After thirteen successful years he went to Springhill as District Superintendent and is now back in Pictou again, being General Superintendent of the Acadia and Springhill collieries. J. B. McLachlan, in his evidence before the Conciliation Board, stated that "Government Inspectors were either old cast-off Managers of fifth-rate men"; but here is a man who has shown marked ability in all his work and gives the lie straight to "Jimmy"; and he is not the only one.

Mining Engineer T. L. McCall is a young Scot with a good training and a unique and successful experience in the mines of Malaya, where he opened and developed a colliery under conditions calculated to discourage the average man. He loves work, and golf, and if when enjoying these he remembers the Sabbath day, he will come through alright.

Drummond Colliery

Drummond colliery, Westville, three miles from Stellarton, is on broken time. Manager Maxwell hopes for a share of trade shortly. The miners of Westville are moderate in tone, although the miners' local appointed a man to oppose President Baxter. Mr. Maxwell is proud of his native town and speaks well of his workmen; and if at present Pictou County has no reason to boast of the prosperity of its coal trade, yet the whole Province feels proud that its product is not confined to coal alone, for Harvard University at the last examinations bestowed high honours on two of Mr. Maxwell's sons. This old Province by the sea is keeping up its reputation for the making of men, and Pictou County has had a large share in the making.

The steel trade is improving and shipments of iron ore from Wabana to Sydney will begin shortly. The working force at Wabana is double that of last winter and will be increased as shipping becomes more active.

Develpment work in the iron ore mines proceeds regularly, and large sections are opened ahead to meet any special demand that may be made.

Northern Ontario Letter

A Record for Dome

According to direct official advice to the representative of the Journal, the Dome Mines produced $351,531 during the month of June, thereby setting the second highest record for any one month so far in the history of the mine. The mill handled 1,036 tons of ore every twenty four hours, or an aggregate of 31,991 tons for thirty days. The grade of the ore averaged about $11.25 a ton and resulted in a recovery of $10.98 from each ton of ore treated.

For the first six months of the current year, the output has reached a total of $1,973,000. This production, along with income from interest on bonds and investments brings the income of the Dome to well over $2,000,000 for the half year.

P. N. T. Reorganization

The situation with regard to the proposed re organization of the Porcupine V. N. T. Mines is this:—At a meeting to be held next Saturday in Toronto, the shareholders will be asked to ratify a deal whereby a new company will be formed, having an authorized capital of 2,000,000. The plan is to allot 1,000,000 shares in *full payment* for the Porcupine V. N. T. The other 1,000,000 are to be treasury shares and are to be sold or optioned at 40 cents each with the intention of thereby netting the company treasury the sum of $400,000. Estimating the value of the shares allotted to the Porcupine V. N. T. to be worth 40 cents each, it does not follow that a valuation of $800,000 is placed on the mine. The fact is that it does show a valuation of $800,000 on the mine *plus* $400,000 in cash. By the time this $400,000 is all spent on the mine it will be correct to say that a valuation of $800,000 has been placed on the mine. It remains to be seen whether that value is reasonable, or not.

As to this, the property lies directly adjacent to the Porcupine Crown and Hollinger Consolidated. In fact some of the Hollinger workings are within a few feet of the boundary of the Porcupine V. N. T. Not only this, but the property is equipped with a first class mining plant which is good for carrying work to a depth of at least 1,000 feet, and with a mill which will handle 150 tons daily by making certain alterations which will cost between $40,000 and $50,000. Also, the mine has already been opened up to a depth of 775 feet, with good ore in sight at the 600 ft. level. The objective of the present work is to open up levels at 750 feet and 900 feet deep. Between the present point of operations and the boundary line of the Hollinger Consolidated are several hundred feet of ground in which a number of veins are in evidence on surface and in which gold is visible. These veins may be regarded as possible sources of ore as they are actually in that elevation which is commonly known as "Hollinger Hill", which is showing every indication of being one of the the richest pieces of gold bearing ground in the world. It was only a few days ago that A. F. Brigham, general manager of the Hollinger Consolidated, made the public declaration that for every twelve inches in depth in that part of the mine so far developed the Hollinger was assured of an output of at least $150,000. That is to say at least $150,000,000 for every 1000 feet in depth. It follows that if the deposits extend to a maximum depth of 6000 feet that a total of close to a billion dollars would be mined from the Hollinger.

It is in the belief that the Porcupine V. N. T. property will share at least some of the favorable results that are occurring on its big neighbor, that those interested in the Porcupine V. N. T. are looking to the future with optimism. A valuation of $400,000 on the mine, including a large amount of pioneer work already done, plus mining plant and mill may be regarded as possibly the lowest valuation ever placed on such a mining property. The provision of an additional $400,000 as a means of putting the mine on its feet in a big way may be regarded as the surest road to success.

The chief objection heard against the latest scheme is the terms of an option which gives Mr. Moysey a grip on the treasury and in reality makes the Hamilton B. Wills firm the clearing house for a large amount of treasury stock.

Exploration on Night Hawk Lake

According to reports reaching here from the Night Hawk Lake district, a good discovery has been made on the McLeod property, lying adjacent to the Night Hawk Peninsula property.

A syndicate of local business men acquired an option some months ago on the McLeod property and commenced exploration work recently with a diamond drill. The first hole is down 600 feet, or a vertical depth of about 400 feet, at which point a promising vein has been intersected. No statement of the gold content of the vein has been given out, but the values said to be "entirely satisfactory." A feature of the find is that the vein is believed to be a continuation of the main vein of the adjoining Night Hawk Peninsula property where outstanding success has been met with during the past year.

Shipment of Ore from Blue Quartz

Arrangements are being made to send a shipment of high grade ore from the Blue Quartz Gold Mines to Cobalt. This consignment will go forward before the end of July. Careful sampling shows an average gold content of about $394. per ton in gold and 9.7 ounces of silver per ton. This ore has been selected during the course of recent development work.

The shaft on the property is now down 200 feet and good progress is being made, the lateral work at the 100 ft. level amounting to close to 600 feet. A station is being cut at the 200 ft. level preparatory to extending lateral operations at this horizon. A number of veins were cut at the 100 ft. level.

A force of 30 men are now engaged, and three shifts with two drills are being worked. The plan consist of a 5 drill compressor, 80 h.p. and 60 h.p. boilers, together with corresponding equipment.

The Blue Quartz Gold mines is a company which has been promoted by Toronto and English interests. The Company took over mining claims from Cartwright Gold fields and La Santa Lucia. A total of eleven veins have been uncovered on surface.

Arrangements are being made for a group of those interested to leave Toronto August 4th for the purpose of visiting the mine. H. C. Crow of Toronto is president and C. H. Taylor, also of Toronto, is vice-president of the Company. J. J. Hollinger is in charge of operations.

Second Tough-Oakes Clean up

Although no official statement has been issued it is learned that the second gold brick from the Tough-Oakes mill was somewhat smaller than the first. The first clean up, made about the end of June after six weeks run, is

sulted in a production of about $19,000. The second clean-up made recently is said to have amounted to approximately $12,000.

Shaft-Sinking on King Kirkland

Sinking operations are progressing at a rate of from four to five feet daily on the King Kirkland Gold Mines. The shaft is now down about 170 feet, the plan being to cut a station at a depth of 300 feet and then continue to the 500-ft. level.

The indications appear to be that a slight dip will carry the vein out of the shaft, but only a few feet of cross-cutting will be required at the 300 and 500-ft. levels to open it up. There are also a number of parallel veins to which lateral operations will be carried as soon as sinking is complete and drifting under way on the main vein.

Good ore is showing on the King Kirkland at the 100-ft. level, and the operators of the mine are looking forward optimistically to the result of the deep mining now under way.

Optimistic View of Northern Manitoba

R. B. Watson, general Manager of the Nipissing Mining Company, is hopeful of payable ore-deposits being found in Northern Manitoba. This result may or may not be secured on properties already staked out; but, by persistent, aggressive and intelligent effort on the part of prospectors, miners and the government, it is reasonable to believe that a good reward lies in store for Northern Manitoba in the form of a substantial mining industry.

This is the gist of the views secured by the Journal during the course of an interview with Mr. Watson. To those who are acquainted with the ultra-conservative views of Mr. Watson, the optimistic reference to the possibilities of Northern Manitoba will leave the impression that although Northern Ontario is one of the greatest new mining fields in the world, yet there may come a time when Northern Manitoba will claim an important place at Ontario's side as a mineral producer.

Nipissing's Option on Elbow Lake Property

At the time of writing, the Nipissing still holds its option on the Gordon property in the Elbow Lake district of Northern Manitoba. Recent reports had it that the option had been dropped, but it has been learned officially that the ultimate outcome is still uncertain.

"It would be wrong to say that the option is being dropped," stated an official, "as one never knows what may happen at the last moment". In other words, although the result of work has been encouraging but not sufficiently so to warrant taking up the property, yet the geological structure and the nature of the mineral occurrence are such as to hold out possibilities of favorable results from additional exploration work now under way.

Debts of Montreal-Ontario Being Paid

The affairs of the Montreal-Ontario are gradually taking definite form. Of the debts of about $125,000 against the old Ontario-Kirkland, the new company has retired over fifty per cent. An extension of time has been secured on certain of the accounts, and the indications appear to be that the whole situation will be adjusted by the first half of the coming year.

In the meantime a limited amount of underground work is being done, and it is understood that no enlargement of operations is being considered for the present.

Voluntary Assistance for Road to Matachewan

A movement is on foot among mining men, prospectors and business men to encourage sufficient public spirit to have men volunteer services for a short time in cutting a road through the townships of Eby, Burt, etc., to the Fort Matachewan gold area. It is believed that if such a road could be cut, it would be only a matter of time until government assistance could be secured in making it suitable for general traffic.

The rock formations in the mineralized area of Kirkland Lake are very similar to the occurrence in the Fort Matachewan district. This has led some mining men to believe that the intervening country may be found to have deposits of value. At any rate, the proposed road upon which attention is now being centred would follow the general course of such a mineralized area.

Prospecting for Silver in Bucke Twp.

There is a possibility of the mineralized area of Cobalt being broader than has generally been supposed. There are fair possibilities of the south-eastern part of the township of Bucke turning out to be a profitable mining area.

Some months ago the Coniagas company secured a working option on the Ruby Silver Mines in south-eastern Bucke. Diamond drilling operations were commenced with a view to determining whether the conglomerate formation was merely a shell, or of substantial thickness. The result has been that the conglomerate has a known thickness of some 250 feet — actually more than the average thickness in the producing part of the Cobalt field.

As is well known to mining men, the conglomerate formation overlying diabase and Keewatin rocks has been the source of nearly ninety per cent. of the silver produced from the Cobalt mines. Over a quarter of a billion ounces of silver have been mined during the past eighteen years from veins which occur in the conglomerate formation.

This favorable geological structure on the Ruby Silver Mines does not assure success, but it does comprise sufficient encouragement to carry on aggressive exploration work. It is understood therefore, that the Coniagas will follow up this encouraging result with actual mining operations with a view to exploring known veins at points where they occur in the conglomerate in close proximity to the formation lying beneath. This will comprise one of the most interesting pieces of exploration work ever undertaken in the areas lying adjacent to the highly productive Cobalt field.

South-eastern Bucke is along the T. & N. O. Railway right at the town of North Cobalt and actually within sight of Lake Temiskaming and the town of Haileybury. Mining success of importance here would be of extreme importance to these towns, as well as to Cobalt.

During the past week the Mining Corporation and La Rose mines both shipped ore over the T. & N. O. Railway. The Mining Corporation sent out two cars containing 173,897 pounds, while La Rose sent out one car containing 65,319.

EDITORIAL

The mining men of Canada . . . have a great mineral field before them—half a continent. We are scarcely at the beginning. Let us make the best of our opportunities. Let us . . . have faith in Canada and in ourselves and a firm belief in the future of our industry.—W. G. Miller—1909.

OUR FUEL SUPPLY

It has long been recognized by well informed Canadians that our country has a fuel problem of first rate dimensions. The problem in Nova Scotia is mainly one of methods of mining, as the larger part of the coal seams are under the sea. In British Columbia and Alberta the capacity of the coal measures, and indeed of the coal mines, is far beyond any present normal demand. Saskatchewan and Manitoba have only inferior coal, whereas Ontario and Quebec have none.

It has required the heroic measure of a great coal strike throughout the United States to force on the notice of the generality of Canadians in Ontario and Quebec their present utter dependence upon imported coal. Even then the imminence of a serious coal shortage was not even deemed worthy of general public attention until Mr. S. J. Cook of the Dominion Bureau of Statistics issued his statement a few weeks ago. This statement was well timed, and eminently courageous. Its issuance at a psychological moment has had a decidedly salutary effect. It has awakened the public, as well as governmental authorities, from their usual deep sleep, induced by that potent soporific, Ignorance.

It is interesting to note the various shades of opinion induced by public spirit, on the one hand, and self interest on the other. Mr. Cook, with all the information available to a specialist, and in constant touch with the highest authorities both here and in the United States, says that we are facing a serious fuel shortage; coal dealers in numerous centres assert that Mr. Cook does not know what he is talking about, and that, as they have got their coal from Pennsylvania during October and November for years past, so they will get it this year, assuming the strike to be settled by that time. We observe this shilly-shally even in our cabinet in Ottawa if news despatches be authentic. Our federal ministers, lacking the courage of Mr. Cook, fear to offend the coal dealers and our own coal miners, and hope (in spite of warnings from Mr. Hoover in Washington) that the meagre supply available on the cessation of the strike—when it ends—will be shared with Canada. This is a fine, independent attitude for the chief executives of our Dominion! How proud we feel of the character and decision of our chosen leaders in this time of need!

A bright spot in this dark picture is the success, to date, of the attempt to make peat fuel available in Central Canada. Only a small fraction of the peat bogs of this area have been surveyed and tested, but by this means 110 million tons of potential fuel has been disclosed in Ontario, and 70 millions in Quebec. To-day we report the progress of the experimental work of the Joint Peat Committee at Alfred, Ontario. Should the experiment prove completely successful it will solve to a notable extent the fuel problem of these central provinces.

Meantime we have in Nova Scotia a recurrence of the threat to strike. In obedience to an order from the United States, Mr. Robert Baxter, leader of the moderate and saner element among the miners, has spoken for a strike, unless 1921 wages are restored. As it is utterly impossible, as well as unreasonable, that wages should be continued at the rates prevalent at the peak of the "boom", the continued production of coal in Nova Scotia is very doubtful. If the Nova Scotian miner is wise, he will refrain from "cutting off his nose to spite his face." Probably his range of vision is too short to see the unusual benefit the coal miner on Vancouver Island is just now deriving from sticking to his work.

Whatever the immediate outcome of these senseless strikes, the ultimate result will be an enormous loss of material wealth to the miner and to the world, and a hard learned lesson to all concerned. The more clearly the general public is forced to realize both the price it has to pay for these disruptions of social order, and its responsibility for their settlement, the larger will be the meagre result of good from this great evil.

CANADIAN FIELDS FOR PROSPECTORS

There has been a good deal of public discussion during recent months in the United States as to whether the day of the prospector is over. The voice of the prospector himself has been almost inaudible in these discussions, as befits one who is near his last gasp. The consensus of opinion seems to be that the mineral deposits within the bounds of the United States still undiscovered, that can be located by the means available to the prospector are few and far between that his search will, in general, be

fruitless. It has not yet been definitely disclosed wherein the future hope of the mineral industry of the United States lies; but "intensive exploration" seems to be the main recourse of our neighbours.

Fortunately for us, Canada is not in the same case as the United States. We have still on our most recent maps innumerable blank, white patches, significant as showing that nothing is known of the vast territories they represent. Only this week we have a newspaper despatch from Edmonton wherein are recounted the wonders of a valley, two hundred miles long, between the Liard and Fort Nelson rivers in northeastern British Columbia. Whether the prospector's story of what he has found there be true or not — hot springs, moose as fat as prize cattle, semi-tropical vegetation, and all manner of precious metals — the fact remains that there are in Canada plenty of valleys of this size, and innumerable smaller areas that have never yet been trodden by the white man, or where the only traverses are those made by explorers or trappers, whose meagre record is a line on the map, or a hint of geological horizons.

Thus we will require for decades to come the services of the hardy pioneer who fifty years ago was responsible for the initial development not only of the western United States, but of our own British Columbia. This man must be hardy, and imbued with the pioneer spirit; but we do not suggest that he has not advanced with advancing time. It would be lamentable if the mental equipment of the present-day prospector were not superior to that of the 'forty-niner; his physical equipment remains substantially the same, minus the load of whiskers.

The prospector is still the prime factor in the mineral development of Canada, and will remain so for at least a full generation. It is true that within the fringe of our territory that at present contains the bulk of our mines, the discovery of new mineral deposits is becoming increasingly difficult; but even here, the "new learning" gained by prospectors in recent years has brought to light many deposits heretofore effectively concealed. The prospector's increasing knowledge will extend, to a degree realized by few, his power to discover nature's secrets. Here, as elsewhere, knowledge is power.

In this connection it is interesting to note that it is only recently that the idea of technically trained mining engineers has been generally accepted. As late as 1907 there was a heated discussion at the annual meeting of the Canadian Mining Institute as to whether the technically trained or the self-trained miner could best fill a responsible position in the industry. Time has proved the point beyond peradventure. Similarly, we are confident, will the prospector benefit from the knowledge accumulated by his own predecessors as well as by geologists and the whole range of explorers in science. We must put this tool in his hands as quickly as possible, that his efforts may be still more effective.

THE NEW STUDY OF COAL

Modern methods in the study of chemistry and paleobotany of coal are so radically changed from the methods established by custom and convention that they constitute a practically new branch of science.

With the aid of the microscope and Canada balsam, the four prime constitutents of coal have been isolated, differentiated, and identified. They have also been named. It is a good sign of the spirit of the times that their names "fusian," "durain," "clarain," and "vitrain," are si sort, significant, and mnemonic.

A brilliant exponent of the new study of coal is an Englishwoman, Dr. Marie Carmichael Stopes. In this issue of the *Canadian Mining Journal* we publish an abstract of a lecture delivered by Dr. Stopes at Sheffield University, England. It will be noticed that Dr. Stopes' utterances are not lacking in positiveness. Here is no shrinking violet, no meek disciple, but a challenging personality. Dr. Stopes believes that "the chemist's knowledge of coal at the present moment is that of the Dark Ages, as mediaeval in its erudity and misleading in its apparent exactitude of percentage as was pre-atomic inorganic chemistry." She maintains that knowledge of the microscopic structure and chemical properties of the newly-identified substances that together constitute coal will soon be recognized as equal in importance to a knowledge of petrography and of Metallography in the allied sciences of geology and metallurgy.

Dr. Stopes' definition of coal as "a compact, stratified mass of dismembered 'mummified' plants" is neither elegant nor final; but it is a step in the right direction. Her flouting of the current idea that a special form of flora in the "Coal Measure epochs" was necessary to the formation of coal, is convincing. Three of the names of the integrals of coal were coined by Dr. Stopes, who has made herself not only an acknowledged authority on this phase of paleobotany, but is in demand as a forceful and remarkably lucid lecturer.

What St. Paul would feel or say were he to visit this vale of tears and see women achieving leadership, would probably not be in keeping with apostolic tradition..

For ourselves we welcome the opportunity of paying our respects to a woman scientist whose temerity is exceeded only by her positive accomplishments.

THE LATE J. D. SHARPE

On Tuesday, July 25th, John Dodds Sharpe died at his home in Thetford Mines, Quebec. He had been ill for almost a year, and his friends and family have known for some time that the end was near. He put up a good fight for life, as befitted one of his vigour and determination, and was rewarded by a peaceful end.

Mr. Sharpe was one of the few men principally responsible for the creation of the Quebec asbestos industry as it is today. As head of the Asbestos Corporation of

Canada for a decade, he controlled the policy and operation of the largest single factor in the industry. To him, more than to any other man, is due the forward position of the company whose operations he directed.

To his friends and acquantances Mr. Sharpe was known as a man of great personal charm, and possessed of those qualities that produce what we call "big" men. His outstanding executive abilities made him notable throughout the asbestos district, and indeed throughout a much wider circle. To his lieutenants he was known as a man who trusted them with the utmost confidence, once they had earned his faith. His character was impressed upon his whole organization.

Mr. Sharpe was born in Philadelphia 55 years ago. He had the advantage of a thorough technical education, and was a seasoned miner before he came to Canada, most of his experience having been gained in the Pennsylvania coal fields and in Mexico. Once in Canada, he became a whole-hearted Canadian, and always advised others in like case to do the same.

Material monuments to Mr. Sharpe's ability are plain to see in the asbestos district. The huge storage bins of unique design; the tremendous ore-reserves, developed so simply and effectively at several of the pits; the complete electrification of two of the mines, — these are typical of a man with a firm grasp of affairs, both technical and financial.

On the day of the funeral service at Thetford, the workmen of the properties in Black Lake marched "en masse" to the neighbouring town to attend the ceremony. The burial was at Sherbrooke, where a service attended by a very large number of friends and acquaintances marked the regard in which Mr. Sharpe was held. Mr Sharpe has left a widow and six children, to whom we offer our sympathy.

EDITORIAL NOTES

To day we review, on another page, Dr. H. C. Cooke's report on the geology of the Larder Lake area. This report is not concerned particularly with the economic features of the area involved, the main object of the survey having been to study the geological features and so to provide the key to an understanding of the whole district's gold occurrences. But Dr. Cooke epitomises the insuperable difficulties under which the pioneers of the Larder Lake district strove when he states that the gold "was deposited as native gold in minute fractures in the "quartz veins that cut the dolomite bodies," and that "absolutely no connection exists between the concentra- "tion of pyrite, the only sulphide in the rock, and its gold "content." It is evidence of this sort that has led the *Canadian Mining Journal* to endorse the recent unqualified condemnation of the squandering of money, obtained from the public, by the Canadian Associated Goldfields of Larder Lake, whose operations have been based upon the erroneous assumption that payable gold values exist in the dolomite, apart from the occasional minute fractures described by Dr. Cooke.

Dr. Cooke's memoir brings to mind two other points that have been noticed in these columns. His present field of investigation is Northern Quebec, in a region where he precedes the prospector in large measure, and where he hopes to make available to the searcher for gold definite information for his guidance. The Dominion Geological Survey heeds no interprovincial boundary, and will make available in Northern Quebec the fruit of four years of geological research in Northern Ontario.

The decision to train specialists within the ranks of the Geological Survey is the second point, exemplified by the fact that, since he studied the Matachewan gold area in the summer of 1918, Dr. Cooke has been studying continuously the gold fields of our northern pre-Cambrian area. It may seem a small thing that a single geologist of first-rate ability is applying his energies thus consistently; but it is principally as the result of such concentrated effort that our geological and economic problems are solved. We are well satisfied that this idea of training and employing specialists, particularly specialists in geology, is rapidly gaining ground among those interested in our mineral resources.

The coal problem of Central Canada is commencing, at last, to attract general public notice. Our present utter dependence, in this central part, upon the coal fields of our neighbour is at last obvious to the most obtuse. Consequently there is now some hope that the solution of the problem may receive the attention it deserves. Similarly, it might be a very good thing for Canada if the outside supply of iron ore upon which we now so completely depend were to be cut off for, say, a year. No argument is so convincing as necessity.

HOT AIR HISTORICALLY CONSIDERED

King David knew his brother man
About as well as mortal can
He hated, loved, and sinned a bit;
And yet was godly and a wit.
He had no patience with the fool;
His way with him was sharp and cool.
As warning to all careless buyers,
He stated flat: "All men are liars!"
We'd hardly go as far as that,
For in the fire would fall the fat;
But let us here affirm that those
Whose confidence and trust repose
In hot air artists and their gaff
Deserve to lose their hard earned stuff

L'Envoi

If illustration you requiah,
Why, pause and think of poor Uriah!

ANON

The Anrep-Moore Machine Peat Manufacturing Plant

A DESCRIPTION OF THE PLANT DEVELOPED BY THE JOINT PEAT COMMITTEE AT ALFRED, ONTARIO, AND OF ITS OPERATION

The final experimental work of the Joint Peat Committee at Alfred, Ontario, is now in progress. A visit to the scene of operations to-day is highly instructive, and gives tangible evidence of the thoroughness and consistency with which the work of this Committee has been carried on during the last four seasons. As the experimental research now gives definite evidence of a successful issue, and as the advent of peat fuel will be so highly important to coal-less Central Canada, a description of the means by which this end will be accomplished is at this time decidedly in order.

The Problem

An un-drained peat bog contains about 95 per cent. water and five per cent. carbonaceous fuel. By ditching in an approved fashion, the proportion of solids can be raised to 12½ or 15 per cent., which is about the same as the solid constituents of milk. Thus the problem that the Joint Peat Committee has tackled with such confidence, and now with such good prospect of success, is to convert this quaking bog into a fuel for our cook-stoves, fire-places and steam boilers at a cost such that it can compete successfully with imported coal.

The reason that raw peat, with no greater a proportion of solids in its make-up than milk, is of a semi-solid nature, is, of course, that its structure is cellular. The plants, mostly mosses, whose remains compose the bog have combined sunlight, air and water to build up a myriad of little cells, each of which is now full of water. The interstices are also filled with water until the bog is drained; but it is not possible to lower the water content to less than 85 to 87½ per cent. by this means.

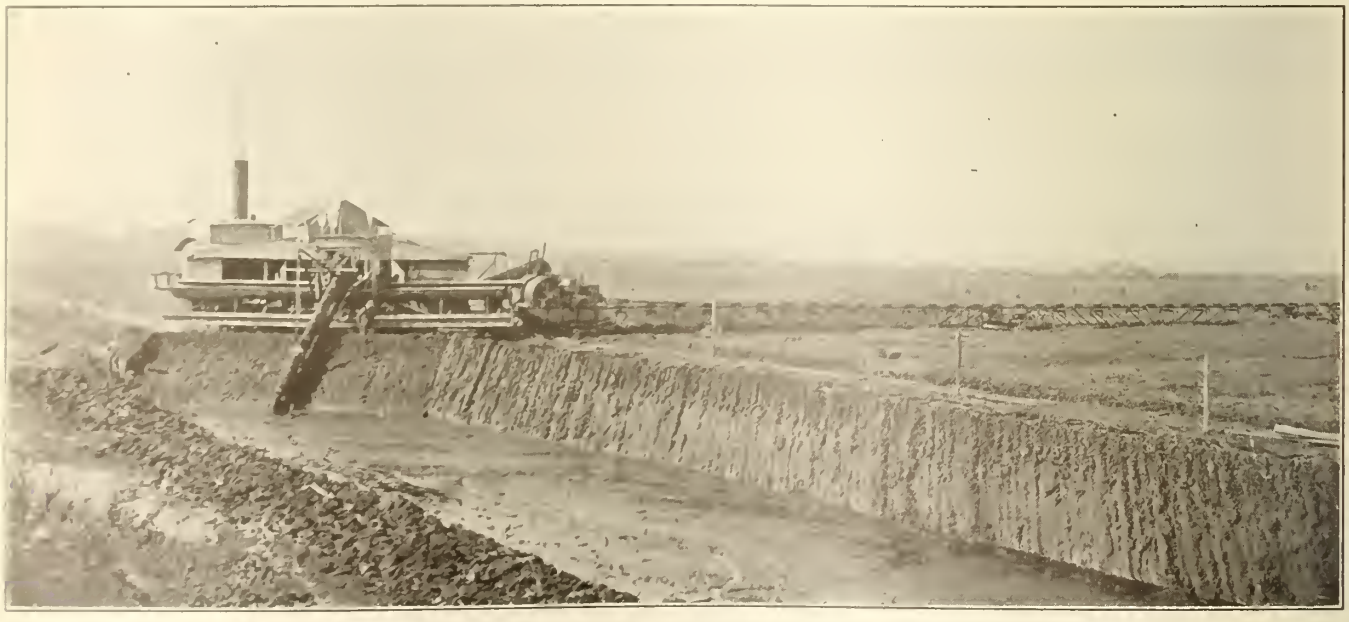
Many have been the attempts to remove the water from raw peat by squeezing or crushing it, or by artificial evaporation, followed by briquetting. A number of such processes have been devised that turn out good fuel; but invariably they have failed of commercial success, for the good and sufficient reason that more energy is consumed in the operation of producing the fuel by this means than is contained in it when finished. Thus the solution of the problem rests upon the use of energy that costs nothing—and plenty such energy is to be had from the sun.

Realizing that sun-power, free of cost, must be the principal agent in manufacturing the fuel, the problem is how to make use of this free power. This problem the Peat Committee have now solved. Their engineers have devised mechanisms that dig out the raw peat, break down the cell-walls in order that the peat pulp may condense when drying, and then spread the resulting pulp over the surface of the bog and cut it into blocks. After the sun has got in his good work, the blocks of peat are harvested by the aid of a separate "harvester" and stored in a stock-pile ready for loading into railway cars. These operations will be described consecutively after a general description of the whole scheme of operations has been given.

Plan of Operation

The general plan of operation is illustrated in the accompanying figure. The peat, which may vary from six feet up to, say, twelve or fifteen feet in depth, is dug in long strips in succession along one side and then the other of the excavation illustrated. The strip is 29 feet wide and nearly 1000 yards long, as is convenient. The "digger" moves backwards and forwards diagonally along a working face, dragging up the peat into the machine. The raw peat, a semi-fluid mass, is carried in screw conveyors to the "macerater", a hammer-mill revolving at about 1400 r.p.m., where the cell-walls are effectively broken down. This is the beginning and the end of the process of mechanical treatment, all the remaining steps being merely the conveyance of the material hither and thither.

The macerated pulp, now semi-fluid, is discharged by a screw conveyor to a belt conveyor 850 feet in length,



Anrep-Moore Peat Machine, showing Excavator, with Digger working on diagonal face, and part of Belt Conveyor.

beside which moves the "spreader." This spreader removes the pulp from the belt, spreads it evenly in a layer, 5 inches thick, on the surface of the bog, and marks it into blocks of convenient size. The sun does the rest. When the upper side is sufficiently dried, the blocks are turned over by hand with rakes. When the spreader has completed one row, 12 feet wide, conveyor and spreader both move forward to give room for the next row. These two pieces of machinery move independently of the main machine that excavates and macerates.

When the end of the cut on one side of the excavation is reached, the excavator and spreader are moved on their caterpillars to the opposite side, while the 850 foot conveyor, is moved bodily to its new position on the permanent narrow-gauge track that runs along both ends of the drying field. The whole machine now returns on its second cut, on drying field number two, which it likewise covers with its blocks of fuel.

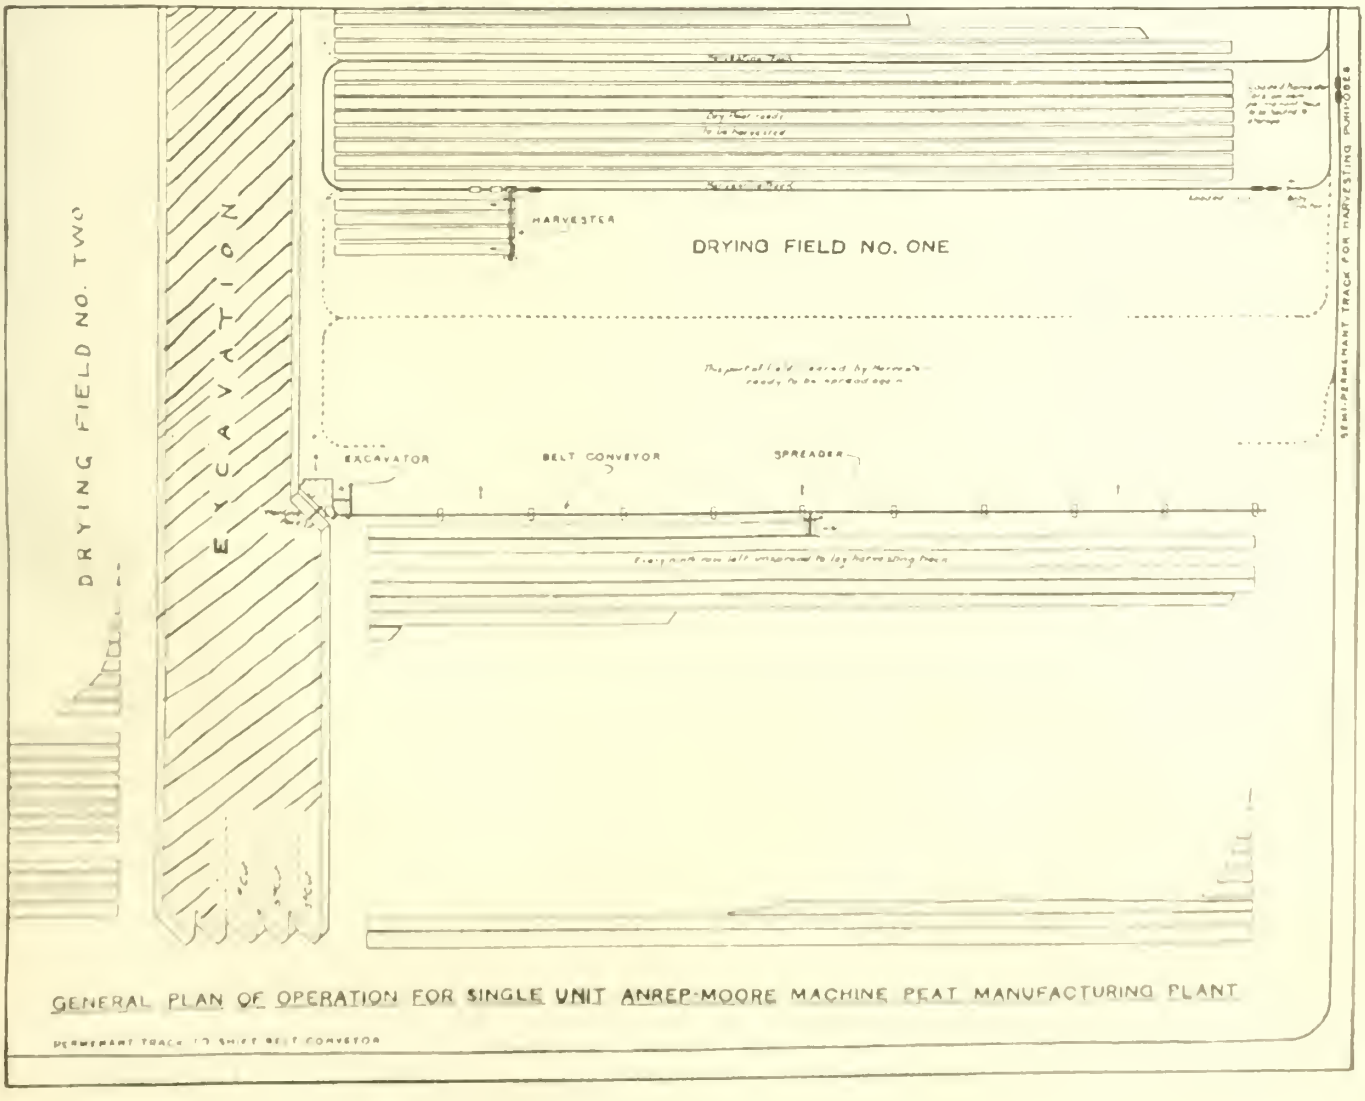
The length of the excavation is so arranged that by the time the peat machine is ready to retrace its first path, making its third cut, the first of the peat crop is ready to harvest. Our figure shows the harvester feeding the finished peat into trucks on the narrow-gauge track laid temporarily after every eighth row, where space for it has been left. Trains of these trucks are hauled off to the storage heaps at the railway.

The Excavator

A steel frame, mounted on caterpillars, carries the principal unit of the plant, consisting of digger, macerator and steam boiler and engines for motive power. The machine is of "Anrep" type. The excavating element is composed of an endless chain on which are mounted steel hoops, and occasional bottomless buckets. It moves along the working face, 40 feet, as shown in the photo and the plate. When it reaches either terminus, the whole machine moves forward automatically a distance of $5\frac{1}{2}$ inches, and the digger commences its return journey. This type of digger will take care of the small roots and stumps that occur throughout the bed of peat, and the large roots are removed by an attendant when loosened by the machine. The digger is a very effective method of delivering the raw material to the macerator, and surprisingly little delay results from interruptions in its operation.

After experiments with a number of macerating devices, an ordinary swing-hammer shredder, as used to shred wood into chips, has been found very satisfactory. Its high rate of speed effects a thorough breaking-down of cell-walls in the peat through impact, and the flexibility of the hammer arms ensures against breakage when pieces of stray iron or unusually tough roots enter the machine. The mill at present installed is being used to handle a tonnage somewhat beyond its normal capacity, and consequently its consumption of power is unduly high; but otherwise it has proved itself thoroughly satisfactory.

The peat is now "manufactured," as far as mechanical agency is covered, and it remains only to give it over to the tender mercies of "Old Sol."



GENERAL PLAN OF OPERATION FOR SINGLE UNIT ANREP-MOORE MACHINE PEAT MANUFACTURING PLANT

Belt Conveyor

As the macerated pulp must be spread fairly thin on the ground in order to dry within a reasonable length of time, it is expedient to have a wide drying field. A number of devices have been tried out to deliver the pulp throughout this field, and the final, and completely satisfactory one, is the conveyor belt shown in our plan and illustration. It is carried on a bridge composed of ten light steel trusses, which in turn rest on eleven caterpillars, driven by a single endless wire rope that engages each in turn and is actuated by a steam engine mounted on the innermost caterpillar, this same engine serving to drive the belt. The photo shows the large driving wheel of this conveyor, on its caterpillar close to the excavator, and two of the remaining caterpillars supporting the long bridge.

As the excavater moves along steadily, 5½ inches at a time, and as the belt conveyor moves ahead only when it has layed a row of peat 12 feet wide, it is obviously essential that the two should be independent in movement. A long trough fitted to the conveyor receives the pulp from the excavator, thus giving the desired flexibility of motion.

Spreader

Alongside the belt conveyor there moves slowly the spreader, driven by a gasoline motor. The pulp is continuously scraped off the travelling belt by a travelling plough, and distributed through the spreader evenly over a swath of the bog twelve feet wide to a depth of four or five inches. An arrangement like a disc harrow, with blades that also cut at right angles to the discs, marks the peat into oblong blocks. When the draining away of water underneath through the grass and moss and evaporation above cause the peat to shrink, it separates into blocks the size of common bricks along these lines.

As mentioned above, when the spreader has reached either end of the conveyor belt, the latter is stopped, and both conveyor and spreader move forward in preparation for laying another row.

Accessory Mechanisms

The efficent carrying-out of the cycle of operations necessary to win peat has involved the devising of numerous accessory machines, mainly to eleminate expensive hand labour. Prominent among these are the harvester and the combined stock-piling bridge and loader.

To devise either of these would tax the ingenuity of the average engineer; but here the problems they presented have been merely incidental to the main task. No seperate description of these will be attempted here.

Capacity of Plant

The present plant will, when operating smoothly, deliver 100 tons of dry peat per day at the railway. This excludes wastage and the amount consumed by the steam boiler to provide power. As it takes 10 cubic yards of bog to put one ton of peat at the railway, the excavator must handle 1000 cubic yards a day to attain this production.

A row of peat, as layed out by the spreader, is 12 feet wide and about 775 feet long. At present it takes 90 minutes to lay a row and move the conveyor ahead ready for the next row. This time will probably be reduced to 70 minutes eventually. A row provides 14 to 16 tons of dried peat. The capacity of the conveyor belt, the speed of the spreader and the thickness of the pulp spread on the bog can all be varied in order to provide any necessary adjustment with the capacity of the excavator.

Costs

There is at present available no detailed estimate of the cost of making peat fuel by means of the Anrep-Moore plant. Very careful and complete records are being kept, and it is expected that the results of this season's operations will provide a reliable basis for calculations of cost. In the meantime it can be assumed confidently that the cost of dry peat at the railway will be considerably below the price at which it has been sold for the past three seasons, namely $5. per ton. The various mechanisms have been designed to operate with a minimum of supervision and of hand labour, and interest and other operating charges will not be high.

The cost of the excavator, belt conveyor and spreader is estimated at about $35,000. Harvesting equipment, repair shop, track and cars, storage conveyor, power house, railway siding, etc., would nearly double this amount. With a working season of 100 days and a capacity of 100 tons per day of peat at the railway, it will produce 10,000 tons of fuel in a year.

It is clearly realized by those conversant with the problem that the production of peat fuel will never prove to be a "gold mine" to operators; but those best qualified to judge are confident that, with the apparatus now developed, a satisfactory net profit can be made.

Small Peat Machine

Along with the plant deseribed above, there has been developed a smaller plant such as would be suitable for providing a neighbourhood with fuel, without a rail haul. This machine will cost about as much as a threshing machine—say $2,000 to $3,000—and will provide a 1000 tons or more of fuel in a season. It is designed particularly to win peat from bogs that are too small for the larger machine.

Most of this smaller machine, as well as a large part of the other, have been built in the well equipped little machine shop now on the ground at Alfred.

Electric Drive

As noted above, the power used at present to drive the machine is mainly steam. This involves an inordinate weight, the boiler and accessories weighing 15 tons out of a total of 30 tons for the excavator. It is proposed to use, in future machines, electric drive, which will be both convenient and economical, whether the current is obtained from a generator at the edge of the bog or from a public supply.

* * *

In conclusion, the writer wishes to acknowledge the courtesy shown him by those in charge of the Peat Committee's experimental work. Mr. E. V. Moore is the prime mover of the undertaking, and has proved himself to be one of those ardent spirits upon whose enthusiasm, tempered with judgment, most of our technical progress depends. The amount of mechanical invention involved in developing a successful peat manufacturing plant has been huge. Part of this work of invention was already done by the late Mr. A. Anrep, Sr., of Helsingburg, Sweden, whose son, Mr. A. Anrep, Sr., of Helsingof the Dominion Geological Survey. Numerous other pioneers in the peat industry have added their quota. Mr. F. O. Orr, who is in charge of the actual operations at Alfred, is second only to Mr. Moore in his capacity for mechanical invention. To this handful of enthusiastic workers, aided by the Peat Committee and backed by the Departments of Mines of Ontario and the Dominion, is due the fact that the difficulties incidental to all experimental work have been overcome, one after another, until now a successful issue is in sight, and with it a partial solution of the fuel problem of Canada, and more particularly of Ontario and Quebec.

Metal Props for Mines

BY ROLAND H. BRIGGS

A problem of great importance in every coal mining community is the question of roof support, including the temporary methods to be followed at the coal face to ensure the safety of the miner and correct operation of the coal cutters and conveyors, the supports of a more permanent nature required in branch roadways, and the permanent structures for the support of main roadways, underground engine houses, and the like. Although timber is the matcial most largely used in all parts of the world for roof support, its greatly increased cost has led many inventors to study the possibility of the metal support, and for more than sixty years the minds of many engineers have been busy evolving props and supports designed to embody all the good features of the wooden prop, without the latter's defects.

In a very interesting paper read before the North-East Coast Institution of Mining and Mechanical Engineers, Mr. John Roberts traced the evolution of the metal prop, and described some new supports which he has invented. From the simplest tubular props of the earlier designers, progress was gradually made until props of real effectiveness were produced, some of these having various refinements, such as an electrical arrangement for indicating the movement of the mine roof. In the War period in Britain attention was necessarily paid to effecting the greatest possible saving in timber, and a considerable impetus to metal prop development was thus obtained.

The most important requirements in a metal prop for mining purposes are that it should strong, rigid, resilient, light, durable, adjustable, reliable and of simple construction. It is of great importance that it should be capable of being withdrawn with ease as the face moves forwards, and it must be sufficiently inexpensive to compete economically with timber. The miner must be able to set it up quickly in position, and when fixed it must be safe.

In a prop designed by Mr. Roberts, oval, or partly oval and partly cylindrical tubes are employed, which can be adjusted longitudinally and can be interlocked by partial rotation. The lower member is partly cylindrical and partly oval, the oval section being provided with horizontal ribs which extend over part of the inner surface. The upper member is also partly oval and partly cylindrical, but the major axis of the oval portion is slightly shorter than the minor axis of the lower member, and when the major axes of both members are parallel, the upper member is free to move vertically in the lower member. The inner tube is provided with external flanges, which engage in slots in the outer tube.

The rotation of the inner tube through a quarter turn, tightens it by friction as the flanges become engaged in the slots. A clamp collar sliding on the upper member locks the two members in position, the collar being provided with tapering slots which engage corresponding ribs on the inner tube, this arrangement facilitating the turning of the inner tube as required.

The foot of the prop rests in a metal box in which there is a spring, which takes up the pressure when the load is applied, and a similar spring is fixed at the head of the prop. The bolt which passes through the lower spring has a large head which prevents the prop being easily displaced. The cup carrying the head spring forms a support for the lid and the lower end of the inner tube is provided with cylindrical extension which acts as a false bottom, in which there are holes for the passage of sand. The sand is used solely to give a cushioning effect during withdrawal, and to prevent the sudden drop of the inner tube when disengagement takes place.

When the miner requires to set up one of these props, he makes a small hole in the floor to receive the bolt, raises the inner tube until the cup touches the roof, turns the tube through a quarter turn and locks it, lowering it an inch or so if necessary to allow the flanges to engage the slots. The clamp collar is then lowered into position and the wooden lid driven in and tightened.

When the prop is to be withdrawn, the clamp is raised and fixed to the ribs, a chain attached to the clamp, and the clamp given a part turn from a distance. The upper member will then sink gradually downwards on the sand, which is forced through the holes, and the prop is thus loosened. In a modification of this design a metal lid is used, the final adjustment and securing of the prop being obtained by means of the wedge and lid, which are contained in a box free to move vertically.

In another type of prop by the same inventor, sand is used for supporting the upper member, and the chief feature of the prop is the flat sliding plate valve. This valve is normally closed and prevents the passage of sand into the upper chamber. Means are provided to prevent it being accidentally opened or completely withdrawn from the tube. When the prop is to be placed in position, the valve is opened so that sand passes into the upper chamber. The prop is then adjusted and the sand run into the lower chamber and the valve above the middle chamber closed. Thus as the load comes on the sand, it is compressed and gradually yields. When the prop is to be withdrawn the valve is opened by means of a chain from a safe distance, the sand flows back to the upper chamber and the prop is gradually released. Facility and safety of removal and the retention of the sand within the prop are the special features of this design.

In addition to the temporary props described above, designed for use at the coal face, the more permanent types required for branch roadways were also described by Mr. Roberts, and improved designs of girder and horseshoe sets were discussed. In a modern form of steel set, the crossbar is of I section, and is supported by legs, each of which consists of two channel bars bolted together and resting on a cast-iron shoe. A number of bolt holes are provided in the legs and collars, so that the sets may be adjusted to suit various sizes of roadways. The required batter of the legs is obtained by means of the cast iron shoe, the under side of which is curved and rests on a sole piece.

The horse-shoe set is another form of support which has had considerable popularity with inventors, but to which there have been some objections. The steel arch is also popular and an improved general design is suggested. This consists of H iron supports, the webs of which are expanded at the crown, so that the two members form an interlock. At the haunches, a double flange and web provides additional support, which resists the tendency of the arch to collapse prematurely at these points. The lower ends of the sides of each unit are so formed that the advantage of the arch shaped structure is retained. The additional vertical struts provided are adapted to take most of the stresses acting on the roof of the structure, and the inwardly curved side members resist the tendency to buckle. Iron and steel is now largely used in conjunction with masonry and concrete for the permanent structure of the main roads and underground buildings, and the fact that steel and iron supports can be made of any desired shape and size is a feature which should be taken into careful consideration when roof supports are being discussed.

New Report on Kenogami, Round and Larder Lake Areas, Ontario

The Dominion Geological Survey has just published Memoir 131, *Kenogami, Round and Larder Lake Areas, Timiskaming District, Ontario, by H. C. Cooke.*

This report contains a fund of information for both the scientific and the economic geologist interested in the gold-bearing district of Northern Ontario and Quebec, as well as hints to those prospectors, ever increasing in number, who take advantage of the aid that geology can afford them.

Two of the three geological maps that accompany the report (Kenogami and Round Lakes) are of contiguous areas between Fort Matachewan and Larder Lake. The third covers the Larder Lake area. Of the first two areas, Dr. Cooke remarks that "no deposits of economic importance have been found up "to this "of economic importance have been found up to this "time (1919). Mineral indications so far have been "confined to the small areas of Keewatin rocks." After his thorough geological survey and study of the rocks, he concludes that "the geology of the area discourages "the expectation that valuable gold deposits will be "found in it."

The geological study of the Larder Lake map sheet is given in more detail, and Dr. Cooke's conclusions are of first-rate importance in the study of the rocks of the region. His summarized conclusions are as follows:

"The sedimentary rocks of Larder area, formerly considered to be a part of the Keewatin, are a series continuous with the Temiskaming of Teck, Lebel, and Gauthier townships, and correlated with the Pontiac series in Quebec to the east.

"The Keewatin was thrown into gentle folds, whose limbs had dips of 20 to 30 degrees, and was eroded, before the Timiskaming was laid down on it to a depth of as much as 1,500 feet.

"Volcanic rocks are recognized for the first time in the Timiskaming series. The most widespread of these is a soda trachyte. Extrusions of basalt or basic andesite also occur.

"The slates of the Timiskaming series, which are apparently confined to the Larder area, are fine-grained greywackes, in which ordinary clastic material is mixed with a certain amount of basalt ash.

"A rather wide variety of intrusives has been recognized, including feldspar porphyries of two different ages, a quartz porphyry, several lamprophyres, and a syenite. As gold deposition in other districts is recognized as having a genetic connexion with porphyry intrusives, it is evident that it will be of importance in the future to distinguish which porphyry has carried the gold.

"The Timiskaming series and the underlying Keewatin are folded into a series of close folds. These are secondary folds on the flanks of a large synclinorium, whose north limb has a dip of about 16 degrees south, the south limb of about 29 degrees north. The minimum thickness of the upper, closely folded strata is calculated to be 8,900 feet. The eastward pitch of the folds affords a natural explanation of the fact that the Pontiac series in Quebec is very much wider than the Timiskaming in Ontario.

"The dolomites of Larder area are shown to be secondary rocks, resulting from the alteration of slate greywacke, conglomerate, porphyry, or basalt. Some of the smaller bodies have been formed by solutions emanating from quartz porphyry dykes, pegmatite veins, or individual quartz veins, but the larger have been localized along shear zones. Partial alterations at first took place by entry of solutions along cleavage planes; the alteration was completed by fissuring and further entry of solutions through the fissures. Dolomitization was caused by juvenile solutions, probably exhaled by a large underlying body of magma which gave rise to the soda trachyte and the two porphyries.

"The gold of Larder lake was deposited as native gold in minute fractures in the quartz veins that cut the dolomite bodies. It was, therefore, probably carried by the final exhalations of the magma, the earlier solutions from which caused the alteration of the various rocks to dolomite."

Referring to the economic geology, Dr. Cooke remarks significantly, that "the same winter [1906] over forty "mining companies, with a total capitalization of nearly "$100,000,000, were organized for the purpose of carrying on development work when the snow should disappear. The natural failure of most of the claims to "produce anything, and the consequent disappointment "and loss of money to those who had invested in the "companies, gave the camp a serious set-back, and retarded the development of its more promising parts for "years."

Of the gold itself, we are told that "the gold occurring in the dolomite bodies occurs wholly in the free "state. The examination of the thousands of feet of "drill cores and of the assay values later obtain from "them which were placed at the disposal of the writer "by the Associated Goldfields, showed that absolutely "no connexion exists between the concentration of pyrite, the only sulphide in the rock, and its gold content."

* * *

A decided reaction against the editorial shears draws attention to the fact that the geological Survey has now (at last) adoped a most excellent paper for its reports. This is as it should be: for these reports constitute a large part of the foundation upon which our mineral industry is built and are consulted and thumbed not only in Canada but throughout the world, for decades after they are printed.

Six weeks from now the American Electrochemical Society will be in session in Montreal. The term "American" can here be interpreted in its proper and inclusive sense, for this society represents the electrochemical activities of the whole continent. A large part of its interest is in electro-metallurgy, which is a part of our Canadian mining industry that is now of prime importance, and that promises to become rapidly of still more consequence. A feature of the meeting is an excursion to Shawinigan Falls, where the conjunction of cheap power, good railway facilities, central location, and readily available raw materials has resulted in a truly wonderful electro-chemical and electro-metallurgical development.

The Constitution of Coal

ABSTRACT OF THE FIRST OF FIVE LECTURES DELIVERED AT SHEFFIELD UNIVERSITY, ENGLAND, BY DR. MARIE CARMICHAEL STOPES.

Common house or factory coal, generally known as ordinary bituminous coal, is banded or streaky, and appears to the naked eye to be black. In most geological text-books coal is classed as a mineral. The old name used, indeed, to be "stone coal" but this is misleading, for coal is not a mineral at all, but a mummy.

What is coal? At a meeting of the Society of Chemical Industry in 1918, I had the temerity to define coal provisionally: "Ordinary coal is a compact, stratified mass of dismembered, mummified plants free from all other matter, save for the mineral veins, partings, etc., which are local impurities". To be coal the deposit must be substantially a deposit of plants alone. Impure coals may grade into oil shales and a variety of other products.

In mummifying animals and human beings the ancient Egyptians took out the softer viscera and replaced them with resins and preservative substances. Similarly, in coal the softer parts of the plants are naturally attacked first by the bacterial action and decay, and the "resins" accumulate, tending alone to be represented after the decay of portions of the soft tissues of the plant mass.

There is no foundation to the idea that there was a special form of flora in the "Coal Measure epochs" which gave rise to the accumulations forming coal. Any portion of any plant is capable of forming coal of a sort. There is nothing in the Coal Measure flora which makes it particularly coal-producing, for given equally favourable physiographical conditions leading to accumulating deposition, any other flora of any other geological epoch would make coal.

The Locus of Coal Deposits

In some form or another, either in large lagoons or lakes, estuaries or brackish marshes, the coal forming material drifted and sank. One may classify the ways of accumulation as follows:—

In Sea Water

Drifted land material, which may travel far, settling waterlogged beyond the reach of mineral detritus.

Fucoid Algae, forming shore accumulations.

In Brackish Water

In situ material, the dropping of coastal forests.

In situ, or partly *in situ* swamp and bog plants.

In Fresh Water

In undisturbed lakes, from forest debris, or pure "plankton" or microscopic life of the lake plants growing *in situ*, or all these mingled.

In estuaries, river beds and deltas.

In large swamps interspersed with lakes.

On Land

Highland moors of various types, mosses, moor peats.

Peat and forest, mingled or alternating.

Dry forest floor accumulations.

This fundamental fact, viz. that all vascular plants share the same chief types of tissue cells is the explanation of the gross similarity between coals of very different geological ages. Any Cretaceous or Tertiary coals may be substantially identical in their response to the ordinary chemical tests with coals of the Palæozoic age, though the species of plants forming the two coals are entirely different.

The Analysis of Coal

The method of dealing with coal must be much more accurate and refined before the distinctive contributions of different plant species can be recognized. Of the various tissue substances widely scattered in all plants, such as lignin, nuclein, cellulose, "resin," and so on.

The chemist who analyses coal in bulk for the great commercial enterprises which use coal by the hundred tons, has got into the way of presenting his analysis in a form which may be of value to the commercial man, but which does not indicate in the least the real chemical composition of the substances comprising such a mixture. Indeed I consider that the chemist's knowledge of coal at the present moment is that of the Dark Ages. It is misleading in a way exactly parallel to the confusion in analysis which would be created were a mixture of say, 20 different mineral compounds pounded all together, analyzed merely for the elements. Yet in their analysis of coal chemists present but a crude tabulation of percentage of the elements contained, not in any one compound but in this mixture of compounds!

The Constitution of Coal

Realizing this very clearly a few years ago, I set to work on certain differences in coal which appeared to me to be so obvious that in a block of coal, only a few inches big, the naked eye could detect four physically different bands or zones. These microscopically recognizable portion of coal are to be found in most ordinary bituminous coal, and I named them provisionally as follows:—

1. *Fusain*—The equivalent of "mother of coal", "mineral coal" etc.

2. *Durain*—The equivalent of "dull" hard coal.

3. *Clarain* and, 4. *Vitrain*—together the equivalent of "bright" or glance coal. Sometimes the "bright" coal of an author seems to be the vitrain only. Vitrain has a conchoidal fracture.

These names do not represent chemical entities (with the possible exception of vitrain), but they do represent tangible entities of the same useful order as "jet", "granite", or "cheese".

The generally "streaky" or banded nature of a seam of coal is of varying magnitude, and as one magnifies a banded piece of coal more and more it becomes increasingly apparent how finely laminated it may be. The average "dull" band is from $\frac{1}{4}$ inch or more in thickness, and is all through visibly streaked with fine lenticles of "bright", while the "bright" portions are streaked with very variable bands of "dull" and the "bright", both the fusain and the vitrain, are all essentially lenticular masses, these are often so horizontally extended and so thin that they create the impression of being fine horizontal bands. The fusain is the least regular in its arrangement, but on the whole its more wedge-shaped portions tend to be so as to be most apparent on the surfaces which are split parallel to the bedding.

Vitrain is particularly interesting. These brilliant bands are more definitely distinguishable from the rest of the coal than are the bright clarain and the dull durain from each other. True vitrain generally forms a very definite and often sharply straight-cut band varying from 2 mm. to 6 mm. or 8 mm. in thickness. There are also brilliant streaks of smaller size down to almost hair like flecks. The larger, however, are more typical of the vitrain zones. They are notably less numerous than the zones of glossy bright clarain and are differentiated by the fact that clarain under the

gloss, will always show streakiness, whereas vitrain will not.

As observed by the naked eye, *fusain* occurs chiefly as patches and wedges, somewhat flattened parallel to the bedding plane, and often with rather square-cut ends. It consists of readily detachable, somewhat fibrous, strands. The various wedges on a bedding plane lie at various angles to each other, so that in any given light some appear dull and some glisten.

When a thick wedge of fusain is contignous to a true vitrain band, the fusain may appear as though embedded or sunk in the vitrain. The fusain can then be scooped out in short, fibrous strands and small, sharp-pointed, irregular fragments, the surface of the vitrain being left smooth and curved.

Durain is hard, with close, firm texture, which appears granular even to the naked eye. A broken face is never truly smooth. It always has a finely lumpy or matted surface. Generally a few flecks or hair-like streaks of bright coal are to be seen.

Clarain occurs as bands of very variable thickness, which are ultimately widely extended lenticular masses. Even where streaked with durain, clarain has a defined and smooth surface when broken at right angles to the bedding plane. These faces have a pronounced gloss or shine. This lustre is inherently banded and shows bands of fine durain.

Vitrain occurs in definite narrow bands, sometimes straighter and flatter than the other bands of coal, and sometimes more obviously lenticular. The limiting layer between the vitrain and the contiguous clarain or durain is generally sharply marked. There is no fine interbanding detectable, but it is a uniform, brilliantly glossy, vitreous whole in its texture. The conchoidal fracture is characteristic.

Under the microscope *fusain* is almost black, opaque, and when it shows the cellular structure of the wood from which it was formed, it reveals the walls as much thickened and the cell lumina as being generally empty.

Sections of *durain* show a granular matrix of roundish or polyhedral fragments, the majority of which are blackish or opaque. The granules are closely packed and form a coherent mass, but mixed with them are the most characteristic spore exines. The ground mass of rather opaque granules, and the large, clear macrospore exines tend to preponderate. The small, clear, lenticular bands or flecks of a more golden colour seen in the durain are streaks of clarain. Other light coloured bodies to be seen in the durain are the supposed "resin" bodies.

Clarain is essentially clear. Plant tissues preserved in it are translucent. Opaque streaks of durain should be looked upon as an impurity. Clarain is the happy hunting ground of the paleontologist in search of preserved remains of the tissue composing coal.

Vitrain is essentially uniform, structureless, and may be compared to a hardened glue or jelly.

All four substances, fusain, durain, clarain and vitrain, show sufficient variation and characteristic differences of response to chemical tests to mark these substances as being distinct from each other. The coking qualities of each are markedly different.

* * *

Both the microscopic study of the petrography of rocks and the microscopic study of the internal structures of metals at their initiation seemed researches remote from practical use. Both, however, have abundantly justified themselves, not only in the scientific world but as aids to practical men of affairs.

Similarly I maintain that knowledge of the minute structures and the chemical properties of the individual substances composing that highly complicated mixture known as "coal" will be justified in its turn.

Indeed I am bold enough to maintain that until we attain to a recognition of its differing essential compounds (which is the chemical worker's investigation of coal), the chemistry of coal will remain in the Dark Ages.

MINING AT RICE LAKE, MANITOBA

The Luleo claims, north of Hole River, are showing up well under development, according to Mr. Frank Phillips, the superintendent. The drift on the 100 foot level is in 240 feet, and sinking the main shaft to 300 feet has been started. The shaft is timbered to the 100 ft. level. The ore is running high in sulphides and in gold. Mr. Phillips is well known in Nelson and the Kootenays, and has a reputation for making conservative statements.

The history of these claims has been a chequered one. Every engineer who has examined the property was favorably impressed with the veins, which are well developed and can be traced over two full claims, with a width varying between 10 feet and 100 feet. The ore gives high assays wherever the sulphides come in, sometimes, it is believed, up to $130 a ton. There is a band of compact sulphides along each wall. The values in the intermediate region are from poor to moderate, but the average of the whole should be sufficiently high to pay if mined on the grand scale.

There is a twenty-stamp mill on the property, which was put there long before there was sufficient stoping ground to justify any such plant, simply because the then holding company acquired the whole outfit at a bargain price. They found themselves with a plant complete down to the assay balances and the fittings of a machine shop, at a price that was tempting; under the circumstances they were possibly wise to transport the mill from the Lake of the Woods to its present site north of Hole River.

The original company went into liquidation, through incompetent management, and a large sum of money was absolutely wasted; but under Mr. Phillips some excellent work is being done at a reasonable cost. Providing all goes as is hoped and expected, this property should restore confidence in the Rice Lake field — something it needs badly.

Mr. A. M. Stewart has a 2-stamp testing mill on the Kingfisher claims, and the other day took a 14-pound gold brick into Winnipeg. He is trying to make the mine pay as he goes, merely endeavoring to prospect the claims thoroughly with the money from the ore he takes out during development.

There is a rumor, which is is impossible to substantiate, that silver ore has been found near the head of the Manigotagon. If there is any truth in this report, the ore is probably on the Ontario side of the boundary, as samples of silver have come from the region just north of the English river in the latter province.

C. A. B.

The monthly report of the Department of Labour, Ottawa, on employment shows that during June there was a notable increase in the numbers employed in the mining industry, over both the preceding month and the corresponding period in 1921.

News and Comments

By ALEXANDER GRAY

Loss to Asbestos Industry

The death of General Manager J. D. Sharpe of the Asbestos Corporation, after a lingering illness, is deeply regretted by all who are familiar with his sterling service throughout ten years, for his principals and for the Asbestos Industry as a whole. The operating executive of the chief factor in the industry, Mr. Sharpe's position and diversified responsibilities made him prominent, and his personality matched the pre-eminence of his corporation. He effected many economies; saw production and prices at their peak; planned during the period of depression for the expansion he knew would follow; and, just as substantial revival is proceeding, he has succumbed. Born in Pennsylvania, eminently equipped by his experience in the coal mines of that State, he devoted himself to the Asbestos Industry with fidelity and ability, and had the satisfaction of bringing Asbestos Corporation operations to the highest efficiency.

Lake Shore Results

Official assurance by President Oakes that the $2,000,000 (approximately) yielded thus far by Lake Shore Mines represents "probably not more than 20 per cent. of the ore indicated above the 600-ft. level" convincingly offsets what would otherwise be disappointing results reported for the year ended November 30, 1921, which were neutralized somewhat by decided operating improvement in the six months ended May 31st last. As the mining position is amply protected, and since it is common knowledge that recent developments have disclosed exceptional enrichments, there is proof positive that the Lake Shore will have a prosperous outputting career from which excessively high costs alone will detract. No doubt the showing made is due to special reasons; otherwise shareholders might have more apprehension. Moreover, they are familiar with the sporting spirit of Mr. Oakes, displayed throughout the years of his activity in the Kirkland Lake gold fields. At the same time, it is due to the shareholders that the factor of costs as disclosed be elucidated.

The company will be felicitated upon the announcement that there is 28,298 tons of ore broken in the stopes, valued at $700,730, an average of about $25 per ton. This is more than a year's milling supply, on the present crushing basis. Presumably the breaking of that ore entered into the item of operating cost but, even so, the ratio of cost to profit is so abnormal as to suggest greater regard for the economies. Selective mining under the circumstances is too expensive. Only the exceptional grade saved a situation that might prejudice the Kirkland Lake fields in the public view.

"To mill 21,681 tons for a total bullion production of $460,186", as the daily newspapers express it, and to have "expenses given at $345,212", makes it appear as though the per ton milled cost was $15.92. The total income of $520,936, evidently included the premium upon gold. Anyhow the profit was $181,723, from which there was deducted $130,000 on account of Exhaustion and Dominion Taxes, leaving the net profit, $51,723. So the year ended November 30, 1921, may be considered somewhat of a hiatus—and a recurrence would not be helpful.

Fortunately, (and more to the point), the results for the six months ended May 31st, 1922, dispel doubt, taken in connection with the mining position and plans for development and milling expansion. Hereafter, with the milling policy revised, the mine should run truer to form. Bullion produced in the six months amounted to $309,637, and the total income was $323,908. The net profits, aside from allowances for Exhaustion and Dominion Taxes, were $169,167, or only $12,556 less than what they were for the whole of 1920-21. If the special reservations are taken from this, however, there still remains an incentive for increasing the production and profits in order to justify the market valuation of Lake Shore shares. Of course the profit-and-loss surplus is being handsomely conserved, and the mines are stronger than ever. Yet it is not clear why costs were so high. President Oakes promises to provide what the property needs, once the shaft is enlarged and development to the 800-ft. level is accomplished. Lake Shore is one of the strongest arguments in favor of Kirkland Lake, — but the reports just published are unattractive as window-dressing. Undoubtedly the management has a justification it might proffer.

Is the Lake Shore Over-Mined?

In commenting upon the Lake Shore reports, and doing so with a constructive purpose, it is not overlooked that the indicated ore above the 600 foot level is said to be worth four fold the capital of the company. It is the relationship of profits to production that is the question at issue; dividends have to synchronize with market valuations, and costs have their limitations where shareholders are concerned. No harm will be done, if the policy has been temporarily in the direction of over mining or over developing, and a statement to that effect is forthcoming. Undoubtedly the admission that the mines are eighty per cent. intact above the 600-foot level, and that the indicated ore in that section is valued at about $8,000,000, makes it explicable why milling has been minimized and mining magnified. But it might be that the average cost, as applied to the 1920-21 tonnage milled, was in excess of the average of the mines—and that is open to question.

Oil Shale Boom in South Africa

Resumption of work on oil shales in New Brunswick under Anglo Persian auspices has not attracted much notice. Canada is indifferent in the matter. Not so in South Africa, although what is going on there may not prove profitable. The Slangapies Oil Shales Company, having to do with a Wakkerstroom district area, in the Transvaal, is capitalized at £30,000 and holds options on 10,000 acres. That amount of money may do some drilling and make a few initial payments, but infinitely more will be needed if the promoters are in earnest. An oil shale enterprise known as the African Oil Corporation, is said to "have 7,250,000 tons of workable and highly profitable shale." Canada's Maritime Provinces have many millions of tons of high grade shales, they might be more interesting if they were further away!

The "Bickell Group"

If all goes well there will be a Bickell Group of gold, silver and coal mines. At the Rand, the Group System is in vogue. Parent organizations have proprietary privileges and subsidiaries—all the latter not always compensatory, else there would be no "mining risk". The pro-

cess is preliminary investigation by central organizations; underwriting by individuals or affiliated groups; technical control and administration by the party of the first part. Ordinarily, when the going is good, it works like a charm — and that is why the activities of the McIntyre company of Porcupine, with the McIntyre-Jupiter Pearl Lake Plenaurum gold areas and the Blue Diamond Coal commitment and slow assets, are suggestive of a larger organization, re-financing, and what not. In line with these extensions is the more recent acquisition of what is known as the "Schumacher" Veteran claim adjoining the Dome properties, the purchase price being stated at $400,000. Formerly this veteran claim (once held jointly by the Schumacher interests and Fred. Connell) was proffered to Dome Mines for $250,000. Meanwhile Dome developments undoubtedly have increased the potential value of the Veteran claim, and if the Dome company would not pay the price, McIntyre did. How the McIntyre company is going to finance all these undertakings, probably will be outlined in the near future. The American end of the Dome and McIntyre companies is somewhat inter-related, and the situation suggests a co-operative plan rather than have the McIntyre Mines carry the total liabilities. At any rate Mr. J. C. Bickell as Managing Director of a series of gold, silver and coal properties is a full-fledged magnate. The advent of subsidiaries means that the McIntyre is becoming a holding company — and as such will need more working capital.

The Irony of it

Facing a possible coal shortage, officials at the Dominion seat of Government, coal dealers and others, formally resolved to "purchase Welsh and Canadian coal, if need be." Making a virtue of necessity has its ironic aspects — and they need not be emphasized. Domestic fuel would appear to be a *dernier resort.*

"Seeing the Light"

What has the car marks of a soporific suggestion under a Dane date line, contains the statement that the Associated Goldfields of Larder Lake are looking toward Porcupine for an opportunity to employ what remains of the treasury cash. The message reads rather quaintly; it is of the "pussy-footing" variety, setting forth that "the efforts of the company in the Larder Lake district have covered quite a number of years", but "nothing of much importance has been developed on the original properties." This, it is urged, "is understood to be the reason for the present movement to secure property in the Porcupine district." But when it is claimed that "well over a million" was spent on the "originals", and that "nothing has been done toward even attempting to put the enterprise on a paying basis by way of production", we have to dissent. The trouble is that too much was done in and about properties that disclosed themselves to be hopeless. Those directly responsible fatuously persisted in expending money. To chide them for having done "nothing" toward "erecting a new mill", and to say that reports are "very conflicting" about "the possibility of dealing with the low grade material at a profit", is strictly inaccurate. There is no "conflict" as to the unprofitability of the "low grade material"; it is a clear case. Whether Porcupine or Kirkland Lake, or any other worthy area is to be the scene of Associated adventures, the sincere wish is that there will be no more tol de rol. There is a great deal more pleasure in being able to be complimentary than there is in applying the scalpel or the lancet. "Seeing the light" is in the nature of self-administered first aid to Associated Directors. They have been on the road to nowhere. We would gladly see them on the way to Somewhere.

Ancient Mariner Hikes North

Fresh and florid from Moville, the Donegal jumping-off-and-on-place for trans-Atlantic passengers, Capt. J. Iriam Jones is on his way north. He has piloted many a staunch vessel along the risky and torpedo-strewn waters of the channels. All kinds of weather were the same to him, afloat or ashore. No one suspected that he and his life partner had half-a-section of land near New Liskeard, Ontario, that had more in the locker than the average mariner really requires to keep his old tobacco box filled and provide a tot or two as stimulant. The secret was not divulged until the Captain arrived in Montreal and announced that Mrs. Jones, born at Kingston (her maiden name being Orr), inherited from her brother, some quarter of a century ago, a tract of land from which samples of silver, cobalt and niccolite were obtained. Among the captain's baggage he brought along the samples (which he will have assayed at Sudbury) and while he is building a shack, Mrs. Jones will visit friends. Just as soon as he can, the captain intends to get busy and heave a lead, as it were, to ascertain how many millions there are to be had for the taking. According to the newspaper accounts, the captain is his own plain-spoken press-agent — and an effective one. New Liskeard is famed for its garden truck — which should give the captain a deck cargo. If he has eight claims containing the minerals characteristic of Cobalt and environs, it will be in order for him to call all hands and splice the main brace, fill 'em up again, and entertain his friends with yarns infinitely more interesting than those of "Captain Marryat." Unfortunately, as the skeptics see it, the vicinity of New Liskeard has not been noted for its bonanza ores—apart from the Casey. However, the romantic tale makes Capt. Jones a welcome addition to the ranks of North Country optimists—the army of Great Expectations.

Silver Islet Re-discovered!

The Mining Journal's own Laureate has a theme worthy of his "prophetic soul" or his peripatetic muse, in the alleged re-discovery of Silver Islet,—that datum line of silver production in the bone-dry belt—between times. After being in the abandoned class for thirty-five years, it is told us by *The Globe's* Port Arthur correspondent that a Duluth syndicate went into the old workings and found a 2,000 oz. vein in a "drift, just where activities were stopped."

The announcement is the more remarkable because of the statement that work was resumed two years ago "but nothing has been found of startling magnitude until the present find". If the spectacular vein was located in the abandoned working face, it is extraordinary that the discovery was not made until July 6th of this year. "The Engineers" intended to "strip the roof of what silver could be found in order to re-imburse the syndicate for the money already expended". Lo and behold, there was "the same vein which engineers of more than a generation ago were following when work mysteriously stopped"!

So all the tales of flooding and failure were fabrications! A while back it was stated that "a delicate vein" had been found. However, now the mystery is solved. Where it was, there it is, as the "Cousin Jack" remarks. It will be better to have another look at the face.

The Southern Rhodesian gold output for May 1922 amounted to 53,920 ounces as compared with 54,318 ounces for April 1922 and 48,744 ounces for May 1921.

Investigation by the Mines Branch, Department of Mines, During the Current Year

FIELD INVESTIGATIONS OF MINERAL RESOURCES

During the current year the Mines Branch will undertake field investigations of mineral resources and their technology through nine parties. The investigation of our mineral resources and of the technology of their mining, treatment, and use provides, primarily, a national inventory of our mineral wealth. The great value and importance of such an inventory was amply demonstrated when these resources had to be called upon for their maximum contribution to the national defence. In the immediate utilization of these resources the investigations conducted furnish the interested consumer, investor, or prospector with a record of the localities where the occurrence of the economic mineral resources has already been determined, and with the available data as to the extent both of their occurrence and of their exploitation. To the owner, discoverer or expectant operator is furnished the collected and accumulated data respecting the physical and chemical characteristics of mineral products; descriptions of methods of mining and treatment commonly employed; the specifications as to the composition and character of the products required to meet market conditions, the uses to which the products are put; the industries in which they are employed, and the essential commercial data respecting markets, prices, production, consumption, etc.

A. W. G. Wilson will complete a report now under way on the development of chemical and metallurgical industries in Canada, and will spend a portion of the field season in the collection of additional information on the above industries for departmental records, and in the investigation of the technology of molybdenum and the mining industry in respect to certain metals.

A. H. A. Robinson has been investigating iron ore resources in Canada during the past eleven years, chiefly in magnetometric surveying, and will continue to study the present operating conditions in the iron mining industry.

V. L. Eardley-Wilmot is engaged in the completion of the mining sections of a report on molybdenum and its uses and will make field investigations in respect to the present condition and progress being made in non metallic industries.

Howells Frechette will continue and complete an investigation of mineral pigments in Eastern Canada, and, as Acting Chief of the Division of Ceramics and Road Materials, will, if time permits, make some field studies in respect to present conditions in the clay working industries.

Hugh S. Spence is investigating conditions in respect to the requirements of the British market for a number of non metallic products such as mica, graphite, feldspar, etc., and the progress being made in experimental work with a view to determining possible uses of bentonite. If time permits, Mr. Spence will initiate an investigation of abrasive minerals in Canada with particular reference to corundum, garnet, diatomaceous earth, etc., as well as the production of artificial abrasives including the silicon carbide products and the aluminous abrasives.

L. H. Cole assisted by Frank McNiven will continue the investigations begun last year of the saline lakes and springs of Western Canada, with a view to determining their distribution and extent, and their economic possibilities. These saline lake deposits consist of mixtures of salts of sodium, magnesium and potassium, in varying proportions.

S. C. Ells will complete the mapping of the bituminous sand area in the McMurray district, involving the surveying of the Athabaska river valley from township 88 to township 98, and the sinking of a limited number of test pits, in order to supplement the imperfect information afforded by actual outcrops of bituminous sand. It is anticipated that under favourable working conditions the work of this season will permit the completion of the detailed field investigations of the bituminous sands of the McMurray district, upon which work has been in progress for a number of years past.

H. Gauthier will continue a road material survey in the Canadian National Rocky Mountains Parks, in connection with the construction of roads undertaken under the auspices of the Parks Branch of the Department of the Interior.

R. H. Picher will continue road material surveys begun in 1920 in the Province of Nova Scotia.

The two latter investigations will be supplemented by laboratory tests, by standard methods, of numerous samples of materials collected, the purpose being to supply the engineers on public highway construction with valuable information as to the comparative road making qualities of the available supplies of material in the neighbourhood of the highways being constructed.

LABORATORY TESTING AND RESEARCH

The laboratories or experiment stations of the Mines Branch are comprehensively equipped for testing and research investigations on ore treatment, on fuels and oils, with particular reference to their physical and chemical character and their recovery and utilization, on clays or ceramic and refractory materials, on rocks, sand and gravel used for road building purposes etc. A staff of five engineers and fourteen chemists with laboratory and mechanical assistants, are engaged upon the investigations noted below.

ORE DRESSING AND METALLURGICAL DIVISION

In this division, under the direction of W. B. Timm, Messrs. C. S. Parsons and R. K. Carmodian, with the assistance of a staff of chemists, are carrying on the following investigations on ore treatment:

Copper Ores: (a) The completion of experimental work on the concentration by flotation of the low grade copper ores of Hidden Creek, Alberni, B.C. (b) A continuation of experimental work begun during 1921 to determine a metallurgical treatment of the oxidized, mixed or sulphide, ores of the Flin Flon Copper [illegible] etc. An investigation of methods for the concentration of the disseminated ores of the Flin Flon [illegible].

Copper Nickel Ores. An investigation begun during 1921 is being continued on the concentration of low grade copper nickel ores of the Sudbury district. The investigation will be extended to ores from [illegible] other localities such as [illegible]

* Published with the permission of the Director, Mines Branch, Ottawa.

Port Arthur, Ont., and the Maskwa River district, northeast of Winnipeg, Man.

Zinc-Lead-Silver Ores: (a) An investigation, which will involve extensive test and research work, is being conducted on the metallurgical treatment of the ores from the Sterling Mine, Cape Breton. (b) Lead carbonate ores from Arrowhead, B. C., carrying gold and silver values, in which the gold is the principal metal to be recovered, are being investigated with a view to determining a process adaptable to the treatment of the ore.

Gold Ores: In view of the activity in the development of gold properties, it is anticipated that a number of applications will be received for experimental test work on some typical gold ore.

The Milling of Asbestos Rock: During 1921 experimental work was conducted on the use of the conical ball mill for the cracking of asbestos rock and the liberation of the fibre. It is proposed to continue experimental test work on the application of a wet process for the crushing of the rock and recovery of the fibre.

The Concentration of Garnet From Its Rock: Investigations conducted during 1921 on shipments from three different localities will be supplemented by further experimental test work on shipments from other localities.

The Concentration And Separation of Fluorite of the Madoc District from Associated Minerals: An investigation is being undertaken to develop a process for the separation of fluorite from its associated minerals, such as barite, calcite, and silica.

Platinum Group Metals: Some experimental work already in progress will be continued on the recovery of these metals from placer concentrates. Work will also be undertaken in connection with the investigation of the presence of these metals in certain copper nickel ores.

Removal of Impurities from Coals: It is proposed to initiate an investigation on the washing and flotation of coals for removal of impurities such as slate, pyrites, etc.

The Use of Flotation Reagents Manufactured in Canada: This investigation is a continuation of one undertaken on the treatment of Cobalt ores in 1917, as a result of which valuable information was obtained in connection with the treatment of Cobalt ores. The present investigation is being carried on with all Canadian ores which are being treated by flotation, for the recovery of valuable minerals, and will not be confined to hardwood oils alone, as was the previous study, but to other reagents used, or which can be used and manufactured in Canada for this purpose. A considerable amount of data has already been collected, and with the co-operation of the mining companies using flotation a systematic investigation will be carried out in order to stimulate the use of Canadian made flotation products in place of imported oils.

Amber: An investigation is being undertaken on the concentration and separation of amber from western coals. This is being supplemented by an investigation in the chemical laboratories on the physical and chemical characteristics and possible uses of the recovered amber.

DIVISION OF FUELS AND FUEL TESTING

Under the direction of Mr. B. F. Haanel, investigations are being carried on by Mr. E. S. Malloch, Technical Engineer, and Mr. R. E. Gilmore, Chief Engineering Chemist, and a staff of engineering chemists.

Lignite Coals: (a) Investigations are now in progress on carbonization. Small scale experiments originally applied to the lignites of the Souris Valley, Saskatchewan, are being applied to the various grades of Alberta lignites. (b) Investigations are designed to be undertaken in respect to the alterations of lignites which are effected by heat and other treatments, with particular reference to (1) the character of the carbonized residue, yield of gas, tar oils and ammonia; (2) thermal reactions covering a wide temperature range to determine exothermic and endothermic points; (3) physical and chemical examination of residue with regard to briquetting qualities; (4) the effect of varying pressure and atmosphere in retort on the quality of the residue; (5) the determination of physico-chemical properties of raw lignites and their products.

Oil Shales: An investigation is in progress respecting the destructive distillation of oil shales, with particular reference to the changes which take place when oil shale is digested in a bath of oil according to the Ryan process. It is proposed also to carry on other investigations in respect to the distillation of oil shale and on the retorting of oil shales on a large experimental scale for the purpose of recovering sufficient oils to investigate their value for refining into motor spirits, lubricating oils, etc. The problem of standardization of a medium scale laboratory method for the examination of oil shale samples is also under investigation.

Peat: Research work is being continued on the heat or other treatment to which peat should be submitted for producing the largest quantity of motor spirits, lubricating and other oils, and for determining the value of peat for the manufacture of alcohol, and the treatment that may be necessary to make it suitable for briquetting.

Pulverized Fuel: Large scale tests are being undertaken on the generation of steam by the use of pulverized peat, lignite and other coals.

Domestic Heaters: Investigations are in progress with a view to determining factors and suggesting alterations in design of heaters to permit the more efficient utilization of fuels other than anthracite.

DIVISION OF CERAMICS AND ROAD MATERIALS

Laboratory tests on clays and shales are being conducted to such an extent as is possible with the available staff. The examination and testing of road materials is carried on chiefly during the winter months by the engineers who, during the field season, are engaged in the study of field conditions and in the collection of the samples. In connection with the latter work it is also proposed to carry on investigations of methods of testing. The Road Materials Division is allied with organizations of a similar character which co-operate, through the medium of the American Society for Testing Materials, to the end of advancing knowledge in the testing of road materials.

A further million pounds of gold has been retrieved from the White Star liner Laurentic which was mined off the coast of Donegal in 1917. There is a possibility that the balance of the submerged gold will be recovered within the next few months.

News of Mining

Great Britain

At a general meeting of the Gold Fields of Mysore and General Exploration, Limited, held in London recently, announcement was made to the effect that a subsidiary company was in process of formation for the purpose of investigating and acquiring mining properties in Canada. Engineers have already been engaged to conduct the work.

At Llanlarcy, near Swansea, the Anglo-Persian Oil Company, Limited, has completed a huge oil refinery. The whole plant occupies somewhat more than 600 acres. The daily capacity is 2000 tons of crude oil. It is equipped to produce every kind of petroleum product.

The annual report of the Shell Transport and Trading Company, Limited shows a net balance of £ 7,495,-010.5s. 5d. to be carried forward. The authorized capital of the company is £33,000,000.

From latest available reports it is learned that the number of unemployed mine workers in Great Britain is 97,000. Of these, 56,000 are in receipt of "benefit."

United States

All branches of metal refining are now becoming normal in Montana. The United States Geological Survey reports that last month most of the copper and zinc mines at Butte, the smelting plant at Anaconda, and the electrolytic plant at Great Falls were in full operation. Gold production fell considerably during 1921, as compared with the year 1920, silver production decreased heavily; copper outputs amounted to only 10 million pounds, as compared with the normal output of 300 million pounds; lead fell from 31,250,000 pounds (1920) to 20,275,000 pounds. It is now certain that the outputs of copper, lead, and zinc will be much enlarged during the current year. The copper output is expected to approximate 200 million pounds.

Arizona's copper output during the year 1921 was 185 million pounds. That for the year 1920 was 558 million pounds. It is probable that the figures for 1921 will be exceeded this year. The larger smelters are working steadily at moderate capacities. The State produced gold to the value of $2,930,303, silver, 2,461,393 ounces, lead 6,511,143 pounds, and no zinc.

The metal output of the State of Utah during 1921 was valued at $22,023,270, which amount was less by $49,744,331 than the value of the 1920 output. The gold and silver production of 1921 fell off only comparatively little, but copper and lead showed pronounced decreases. Copper output in 1920 was 117 million pounds; in 1921, only 31 million. There is now a very decided revival apparent in metal mining.

Gold production in Nevada has decreased steadily since 1910. The output of the State for the year 1921 was $3,312,757 which was $253,971 less than that of the previous year. Activity is now increasing materially after months of idleness. Silver mining is improving rapidly. The copper output of the State for 1921 was only 11 million pounds as compared with nearly 51 million pounds for 1920.

According to the latest reports of the United States Geological Survey the gold mining industry of the State of California is showing improvement. The output of gold for the first six months of the current year amounted to $7,721,258, or $371,140 more than that of the corresponding period of 1921, but still considerably less than that for the first six months of 1920. The increase comes most largely from the gold dredges, copper, lead, and zinc mining are not in good condition.

Coal production during the fourteenth week of the strike fell to 3,959,000 tons. It is estimated that the fifteenth week (July 10-15 — will be still lower.

The International Nickel Company's annual report of operations for the year ended March 31st, 1922, shows that the year's loss amounted to $797,746.93. Not since the year 1904 were sales so small. Nickel sales were only 40 per cent. of those of 1921 and sales of Monel metal only 66 per cent.

Exports of refined copper from the United States during the month of May totalled 58,085,033 pounds. Germany was by far the heaviest buyer, taking about 20 million pounds. France came next, purchasing somewhat less than 11 million pounds. Japan was a heavy buyer of zinc, taking seven and a quarter million pounds.

Europe

The general strike of metallurgical workers in Italy does not promise success for the strikers. Many of the employees of important plants have refused to obey the strike order. Late in June rumours of a satisfactory settlement of differences between employers and workers were current.

Certain oil wells, near Pechelbronn, Alsace, owned by the Germans before the war, were sold in March 1919 by their former German owners to a Swiss Company. The French Courts have set aside the sale for the reason that all German possessions in Alsace were sequestrated under the Treaty of Versailles.

German imports of iron and manganese ore for the first four months of 1922, amounted to 3,110,177 tons. Imports of pyrites totalled 249,180 tons.

Experimental work in the production of aluminum nitride is attracting attention in France. The action of a current of nitrogen on bauxite at 1,500 deg. in the presence of carbon, produces the nitride. The nitride is decomposed in a soda solution, forming ammonia and sodium. The major difficulty to be overcome is that of the design of plant.

Asia.

Important iron ore deposits in South Manchuria were discovered in the course of surveying the route of the South Manchurian Railway in 1909. During the war the Japanese investigated these deposits. As a result two 250 ton blast furnaces were built in 1919. The ore is stated to be low grade hematite.

The profits of the Burmah Oil Company, Limited, amounted to £3,150,000 for the year 1921.

A charcoal blast furnace has been put into [illegible] at Bhadravati, Mysore, by the Mysore Distillation and Iron Works, a subsidiary of the Tata Iron and

Steel Company, has a capacity of 60 tons of pig iron per day. The ore used is principally a high grade hematite 61 to 62 per cent. iron, carrying 0.05 per cent. phosphorus. By products from destructive distillation of wood will amount to about 200,000 gallons of crude methyl alcohol and 2,000 tons of lime acetate per annum.

The Report of the Railways Administration of India points out that India is about to undergo radical political and economic changes. Several great mining and metallurgical projects are being organized. Their success will in every case depend largely upon proper transportation facilities. Improvement in the railway management is, therefore, very strongly urged.

Figures relating to India's output of coal in 1920 are now available. The total tonnage raised was 17,962,214 tons. Exports amounted to 1,228,408 tons, imports to only 39,727 tons. Manganese ore outputs were 736,439 tons, of which 711,424 tons were exported. Tungsten ore outputs were 2,346 tons; chromite, 26,801 tons; magnesite, 14,346 tons; tin ore, 42,353 cwt., Copper ore, 28,167 tons, and bauxite, 3,931 tons.

The coal mines of China produced 18,670,000 tons of coal during 1920. Of this total, 13,900,000 tons came from North China.

During the month of May the production of crude petroleum by the British Burmah Petroleum Company and the Rangoon Oil Company was 74,434 barrels.

Africa.

The effect of the "gold premium" payments on the gold mines of South Africa is well illustrated in the case of the Crown Mines, Limited. The company's output of gold in 1921 brought £691,002 in premiums. Without this amount, with gold at its standard price, the operating loss alone would have been £19,000.

Southern Rhodesia's gold output for the month of May was 53,920 ounces; silver, 15,717 ounces. Chrome ore production amounted to 5,503 tons and asbestos to 828 tons.

Careful control of sanitation and hygiene amongst the native workers on the Rand has reduced the mortality rate to a very low figure. One company, the Rand Mines, Limited, which employs some thousands of Kaffirs, reports a mortality (not accident) rate of only 11.18 per 1000 for the year 1921. The intravenous injection of raw orange juice has been found particularly efficacious as a cure for and a preventive of scurvy.

Since the ending of the strikers' rebellion nearly 32,000 native labourers have been added to the payrolls of the Witwatersrand gold mines.

BRITISH COLUMBIA LETTER

A. M. Manson, Attorney General; Dr. W. H. Sutherland, Minister of Public Works; E. D. Barrow, Minister of Agriculture; and F. C. Wade, Agent General in London, Eng., all British Columbia officials, have returned after touring the mining sections of Portland Canal and other northern districts. Mr. Wade is collecting a new and representative exhibit of the minerals of the province for show in England. A prominent place will be given the ores of the Premier Mine.

Dr. J. A. Bancroft has resigned the position of Assistant Manager of the Granby Consolidated Mining & Smelting Co. and is being succeeded by Mr. L. R. Clapp, who is reported to have a wide experience in copper mining in America. Dr. Bancroft is returning to the faculty of McGill University as a professor of geology.

David Cole, an officer of the Cananea Copper Co., Arizona, has been visiting British Columbia.

H. Foster Bain, director of the U. S. Bureau of Mines, passed through Victoria recently after visiting Juneau and other Alaskan points. An inspection of coal deposits and examination of mining conditions generally were the chief objects of his visit to the northwest. He is en route to Washington.

Charles F. Law, a mining broker, has taken up fifteen leases on Big Valley Creek and fourteen near Antler Creek in the Cariboo District. He states that there is more valuable ground in the old channels of former drainage systems in the vicinity of Barkerville than in any other part of the Province as far as is known from present information.

The Cedar and Spanish Creek sections of the Cariboo are being made more accessible by road construction which has been initiated by the Provincial Government this year. One of the most important pieces of work is the building of a connecting link between the mouth of Spanish Creek to Duck Creek, a distance of seven miles. This will bring Quesnel Forks into touch with Keithley Creek by way of Cedar Creek. It will be appreciated by operators in the newly opened fields of Cedar and Spanish Creeks, as well as by prospectors, as a large stretch of territory will thus be made easy to reach and to explore.

Forest fires on the south fork of Kaslo Creek have destroyed the surface equipment of three mines, namely, the Gibson, Silver Bell and Silver Bear. The total loss is placed at $30,000. The Cork Province and Index Mines are in the path of the flames.

The Gamble Mining Co., hydraulic operators, Wild Horse Creek, claim to have discovered an old channel from which coarse gold is being recovered. There is 1,000 feet of this ground to be worked. New flumes have been built and other modern hydraulicking machinery installed.

Ore shipments to the Trail Smelter, Consolidated Mining & Smelting Co., for the second week of July totalled 6055 tons. Of this independent properties contributed 1242 tons, the remainder, 4813 tons, coming from Company Mines.

An aeroplane has been taken to Smithers, on the line of the G. T. P., northern B. C., to take miners and prospectors into the northern parts of the Province. A number of important mineral deposits have been reported by Indians and some white mining men in this region, and a party of explorers has arranged to inspect the discoveries. They will take the air route, covering ground in hours that ordinarily would take weeks. This will be the first occasion on record that prospectors have been transported by air.

The Transvaal gold output for June 1922 amounted to 675,697 fine ounces, as compared with 639,786 fine ounces for May 1922 and 678,490 fine ounces for June 1921.

Notes From Nova Scotia

The Demand for 1921 Wages

Since November last, the coal industry of Nova Scotia has passed through a period of depression and agitation and is still disturbed. In the early months one sensation followed another so rapidly that at the last the public was ready for almost anything. Two Conciliation Boards, both dealing with the same case, were called and two similiar awards given, only to be turned down. "Striking on the job" followed, with ill success but with much hardship to the miner and his family. This policy on the part of Secretary J. B. McLachlin led to strained feelings between himself and other executive officers and for a time it looked as if a permanent rupture in the organization had taken place. There are those who believe that this rupture does exist and may yet show itself in open division when the O. B. U. adherents see their opportunity. The Truro Convention ended in a struggle between the Reds and Moderates, with the Reds on top. Disloyalty to officers at that convention caused the resignation of the majority of them, and all the others soon followed suit. An election is now taking place and about the middle of August new officers will take their positions. But none of these things, not even the looting of the company stores nor the violent language of Secretary McLachlin towards the Prime Minister of Nova Scotia and the Minister of Labour at Ottawa, came with such a shock as the resolution passed at a mass meeting last Sunday calling on the different Locals to strike unless the Dominion Coal Company paid the 1921 wage rates. These were the peak of war-time wages, and since last November all the executive officers placed themselves on record as being favourable to the MacKinnon Award, which permits of a fairly large reduction in wages.

Strike Orders From The United States

This sudden change of front came as a result of a visit of international board member Barrett to Washington to consider the offer of President Harding to the United Mine Workers and operators. It was understood last fall that District 26 had full authority to negotiate a separate agreement and that it would not be involved in the struggle which is now taking place in the coal industry across the border. This was not a privilege granted the Nova Scotia members but was simply the fulfillment of an agreement entered into between the coal operators and the U. M. W. of A. when it was first recognized and given the check off in Nova Scotia. The text of the agreement was "that American conditions would not be permitted to influence Nova Scotia Miners in the making of wage agreements." It was then recognized that there was a great difference between the conditions of coal mining in the United States and Nova Scotia. Natural conditions were unfavourable to Nova Scotia coal mines. This agreement worked very pleasing to the public at large, who had grown tired of a long war between the miners of Nova Scotia as members of the U. M. W. A. and those who were opposed to them. But there were many who were not deluded by the settlement that had been reached and who felt that a time would come when this agreement would be torn to shreds and cast aside as worthless. That time has come and the agreement is a thing of the past. The miners of Nova Scotia are being asked to do as the miners of the United States, either to enter into an agreement or come out on strike. When the resolution to strike was passed last Sunday after a statement made by the board member Barrett, there was not one member to stand up and remind the fifteen hundred men present that they were repudiating their agreement and were running the risk of losing both recognition and the check-off.

Mr. Barrett stated that he had returned with instructions from President J. L. Lewis, that the miners of Nova Scotia would not be permitted to work without an agreement. He further stated that the coal operators of the U. S. were weakening, that a serious division in their ranks had occurred, and that the miners were winning the strike. Forty-seven per cent. of the American operators now favoured the 1921 wage scale, he stated, and others would rapidly follow. He went on to state that if the miners won out and the operators of Nova Scotia failed to come to terms, that all the resources of the International would be placed at the command of No. 2 district, and that if a strike occurred, free distribution of the funds would take place. He pointed out that in some of the larger districts ten thousand dollars per week was being distributed and other districts were receiving whatever help was necessary. Some districts had so far carried on without funds and he felt sure that the United Mine Workers were riding to victory. He declared himself in favour of a strike if the 1921 wage rates were not granted.

Baxter Changes Sides

President Baxter followed the lead of Barrett and came out on the side of an agreement or a strike. The miners, he said, had repeatedly refused to sign an agreement and there was nothing left to do but strike. This was his policy at the convention at Truro and he had not changed.

J. B. McLachlin stated that he was not so sure that the United Mine Workers could win a strike just now. He favoured strikes when many ships for coal lay at the pier, and although he did not say so, he left one to infer that men should work in the intervals, but if McLachlin's advice followed there would be no intervals and hence no work. A large number of the workmen drew the inference that he favoured the I. W. W. tactics and he was ready if the opportunity offered, to apply it through the organization of the United Mine Workers, or if that failed through the O. B. U. He said that the winning of a strike depended upon two things, the time and the spirit to win.

Vice-President Delaney was more moderate and seemed to be the only member of the executive who had not changed his views over night. He received a splendid hearing while Barrett and Baxter were often interrupted. This showed that a great many men in the meeting were moderate in their views although the majority, mostly young men, favoured a strike.

District Member L. MacCormick talked of revolution and was applauded to the echo when he referred to the refusal of President Harding's offer of a commission to the United Mine Workers as a means of settling their dispute. He evidently wanted to go one better than J. B. McLachlin, who said that every man should be withdrawn from the mine if a strike occurred. MacCormick reminded some of the audience of what they had learned at the Western front and hoped that they would profit by that experience when the time for action came. And here let me say that although quite a young man, MacCormick never saw the western nor any other front where real fighting had to be done.

Moderate Leaders Adopt Red Tactics

To say that the situation is serious is putting it mildly and although those who claim to be on the inside may try to make themselves believe that this meeting was put on for election purposes, the truth is that the former moderate leaders are now making a desperate effort to outrival the Reds, as a means to regaining the favour of the workmen. This is playing with fire, and the industry will suffer because of it. Men cannot be incited to strike and incensed to revolution without dire consequence. They cannot sow the wind without reaping the whirlwind. Nova Scotia miners are now sowing, and a reaping time may be nearer than they dream of. With over three hundred thousand tons of last winter's coal in the stock piles representing part of the wages paid out to workmen in the winter months, and with a coal output now reaching fourteen thousand tons per day with large contracts made and vessels in port to make delivery, it is not a time to make threats on life and property and to attempt to dislocate business. Cape Breton miners should not forget that winter comes to them as to no other part of the American continent. They must remember that their harvest time comes in the summer months and if these are let pass without making the most of them, a long, idle winter awaits them because they destroyed the only chance for shipping coal that comes to their Island during a few short months of the year. The American miners are not so situated. They have no such seasonal difficulties, they have no waterways like the St. Lawerence, closed by frost to navigation for five months in the year, no stocking of coal needful to facilitate shipping. Their markets are accessible all the year round and the extra expense of preparing for a summer's rush of coal delivery is entirely unknown to their trade. In their sober moments Cape Breton miners do not forget these things; but these times of quiet thinking are becoming rarer as discord is fomented and discontent encouraged with the open and avowed purpose of overthrowing the present social system.

Moderates Have Now No Leaders

Leaders like Baxter, round whom the moral forces of the Province have rallied, cannot side-step principle without loss of their following, of force and of character. Moderate men who think deeply find that they have now no leader, no one to represent their views, and are at a loss to know what to do. One thing they will not do, and that is to follow leaders who wobble. The present crisis may find these inactive and passive who otherwise might be the deciding factor in a double contest, the result of which none may foretell with certainty.

Had the International kept its hands off Nova Scotia as it had promised to do, or had the moderates stood their ground and remained true to their principles, the coal industry of the Province, which was well on the way to recovery, might have been safeguarded. The collieries have reached the highest mark since war reduced the output, and shipping last week exceeded all previous records. Miners were settling down again to do a day's work and prospects for the remainder of the year were bright. It would be deplorable that, just when coal trade and all other business throughout the Province was beginning to pick up and show signs of regaining lost markets, there should be a set-back by reason of labor disputes and threatened strikes.

There may be a way out, but "where vision is lacking the people perish." And when in place of sane leaders with a respect for law and order, we have men who can do nothing but strut across the stage and bellow like mountebanks to make the light-headed believe they are earning their salaries, there will never be anything but trouble. If organized labor expects to enjoy public confidence and have public support, it can only come through able and wise leadership and a due regard for the public welfare.

NATURAL GAS SUPPLY OF ONTARIO

During the last few weeks numerous applications have been received by Lieut-Col. R. B. Harkness, Natural Gas Commissioner under the Ontario Government, from the localities supplied by natural gas for permits to use gas as a substitute for coal under boilers and in various other ways, on the ground that coal is unobtainable, and also that its present price is prohibitive.

The Commissioner points out that the essence of the law regarding natural gas is to conserve the supply as far as possible, for domestic cooking and heating, and the same shortage of fuel is, and will be felt by the householder as by the manufacturer. In fact, householders by reason of this shortage, will undoubtedly place more dependence on natural gas for heating during the coming winter than they did last winter, and if the gas fields are taxed to their utmost during the late summer months, the gas pressure will be so lowered that it will very seriously affect the available supply during the early winter, when there is barely enough to meet the ordinary demand.

For this reason, as well as because the remaining supply will probably last only a few years longer, and it is imperative to keep it for domestic use mainly, it will be impossible to grant these requests for temporary industrial permits. Only one such permit has been granted to date, and that to a public utility that must be kept in operation.

If coal cannot be got, resort should be had to wood or oil.

Hans Renold of Canada, Limited, 11 St. Sacrament St., Montreal, manufacturers of Renold's Chain Drives, have just issued a very attractive, interesting and instructive booklet entitled, "Erection and Maintenance of Renold Chain Drives", which they advise us they will gladly send to any reader of the Journal on request.

EDITORIAL

When I had perceived the various parts of the subject, [mining], like so many members of the body, I became afraid that I might die before I should understand its full extent, much less before I could immortalize it in writing. — Georgius Agricola — 1550. (from Hoover's translation.)

GREETINGS!

Members of the American Ceramic Society will be on a tour of inspection throughout the region north of Lake Ontario and the St. Lawrence during the week of August 13th. They will be, on occasion, the guests of a number of Canadians interested in the ceramic industry, and will inspect numerous Canadian plants and feldspar quarries. The *Canadian Mining Journal* adds, to that of the official hosts, its welcome to our visitors. We leave further words of guidance and advice to the inspiration of the Journal's poet.

THE CANADIAN FELDSPAR QUARRIES

For the last quarter century there has been a consistent annual production of feldspar from Canadian quarries, fluctuating with the demand, to be sure, but sufficiently steady and of such quality as to draw the attention of users of feldspar throughout the continent. One of the original producers, the Villeneuve quarry in the Ottawa district, still furnishes annually the few tons of that exceedingly rare feldspar required by the dental trade. The Richardson quarry, which inaugurated the fame of Canadian feldspar and provided a large part of the tonnage exported until quite recently, is again being made ready to ship. Meantime "Buckingham" 'spar from the Derry quarry, near Ottawa, is upholding the reputation of Canadian 'spar by virtue of a deposit of unusual purity and fair size.

A host of small quarries throughout eastern Ontario and western Quebec have added their quota to the Canadian production, many of them maintaining the standard set by the leaders, though others (it must be confessed) have shipped material that tended to bring all but the steady producers into disrepute. Indeed, during the war time this practice of shipping an inferior grade of feldspar, useful only for the crudest varieties of pottery, became so prevalent as to make the users justly suspicious of any feldspar of Canadian origin. We are confident that now, with the consistent production of "Buckingham" 'spar, and with the promised re-opening of the Richardson quarry, "Canadian" grade will continue to signify, as heretofore, the best feldspar obtainable on the continent.

While we have stressed, above, the importance of the principal producing feldspar quarries, we do not wish to exclude the lesser producers from consideration, or to suggest that even unproved prospects are not important. Far be it from us, for even we, the editor, have a feldspar prospect about which we shall say little until we have shipped a cargo or two! Among the hundreds of feldspar-bearing dykes that have been opened up, some scores have produced a carload or two each of feldspar, good, bad or indifferent, and a few dozen have attained to the production of a few hundred or a few thousand tons; but one can count on the fingers of one hand the feldspar quarries whose size has rendered them capable of the consistent shipment of large amounts of merchantable feldspar annually. It is from this last variety of quarry that all users of feldspar wish to draw their supply; and we are confident that further exploration and careful, consistent operation of the deposits thus discovered will ensure for many a year to come a constant and large production of feldspar of "Canadian" grade.

THE GEOLOGIST AND THE PROSPECTOR

More and more are those two pioneers of the mining industry, the geologist and the prospector, coming to realize not only their common aim, but their interdependence. It is not difficult to understand that the object of both is, in essence, the same, and it is easy to see that a geological survey can aid a prospector materially in his search for ore; but it is somewhat more difficult for the geologist to realize that, as his own work is not immediately or directly productive of profit, he must justify the expenditure his work incurs by means of the aid he gives to the mineral industry, principally through the agency of the prospector.

It is fortunate that the present generation of Canadian geologists have a very clear conception of this relation. Continually we have this exemplified. The prospector has come to look upon the geologist in the field as guide and friend. There is, more than we know, a transference of information and ideas round the camp fire or on the trail between the two, and both are free to acknowledge the mutual benefit. Our geologists are, almost to a man, accomplished woodsmen and mountaineers, and this adds not a little to the regard in which they are held by their fellow pioneers.

As a means of educating the prospector in the scientific

aspects of his work, this personal contact with geologists in the field is of great value. Unfortunately, such meetings are, in the main, fortuitous and of short duration, so that the prospector can gather only fragments of geological lore. The geologist's written report is the place where the prospector must look for most of his information.

On another page we point out two instances in which the geologist has given specific information and a useful "tip" to the prospector. Dr. T. L. Tanton, in his report on a part of Thunder Bay district, Ontario, points out actual occurrences of molybdenite and galena, as well as certain geological features that are worthy of careful investigation. This area, in which he is the first official explorer, has not been prospected, and he considers it worth prospecting.

The second instance is furnished by Mr. T. T. Quirke, in his report on the Wanapitei Lake map-area. After a study of the known occurrences of gold in the vicinity, Mr. Quirke is ready to endorse the conclusion of other geologists who have examined them, and goes on to point out to the prospector a number of fault zones, close to diabase intrusions, that have not yet been explored and are worthy of close attention.

From time to time the *Canadian Mining Journal* has recorded instances where the "tip" of a geologist to a prospector has resulted in the discovery of a valuable mineral deposit. Such instances occur much oftener than they are recorded.

An unfortunate feature about the hints to prospectors given in written reports, and not spoken directly, is that they often fail to reach the men for whom they are intended. The *Canadian Mining Journal* will take occasion to transmit this information as consistently as possible, through its pages.

PURE FELDSPAR BY CONCENTRATION?

There is readily available in numerous parts of Canada a very large supply of feldspar that is at present useless on account of its being contaminated with dark minerals such as black mica, magnetite, pyrites and tourmaline. Comparatively little consideration appears to have been given to the possibility of eliminating these impurities by means other than hand cobbing.

Today we review the report on "Radium-Bearing Pegmatites in Ontario," by Mr. H. V. Ellsworth. The radium-bearing minerals occur in pegmatite dykes (the principal source of feldspar) and are objectionable impurities to the ceramic manufacturer. In the Orser and Kraft feldspar quarry, near Maberley, Ontario, there occurs, disseminated through the 'spar, the radium-bearing mineral euxenite. A hand-picked lot of feldspar, rich in euxenite, was shipped to the Mines Branch, Ottawa, where it was crushed and concentrated. From 1,593 pounds of this euxenite there was recovered over 55 pounds of euxenite concentrate.

This concentration test, made for the purpose of recovering euxenite from feldspar, suggests the possibility of treating impure feldspar after grinding, in such a way as to eliminate objectionable impurities. If such a material can be treated as above, to recover a large part of the heavy mineral, it seems quite possible that it can be successfully treated to save the bulk of the light mineral, feldspar, free from any but a trace of impurity. The means are at hand, in the laboratories of the Mines Branch, Ottawa, to conduct an investigation into such a process, provided both feldspar operators and the metallurgists of the Mines Branch consider that the chances of success warrant the experiment.

We believe that Mr. Ellsworth's suggestion is worthy of serious consideration.

A NEW USE FOR FELDSPAR

For half a century past, researchers have been attempting to find an economically feasible method of making the potash of feldspar available for human use. All the multitude of processes tried out up to the present have failed of commercial success. Nevertheless, the reward of a successful issue would be so great that attempts are still under way, and eventually a process capable of successful operation is certain to be evolved.

Most of the processes tried out are foredoomed to failure because they aim at the recovery and use only of the potash in the mineral—at best 13 or 14 per cent. of its bulk. It can be safely postulated that the successful process must provide for the use of at least the major part of the feldspar. A commercially pure potash feldspar will contain, let us say, 65 per cent. silica, 18 per cent. alumina and 13 per cent. potash, the remainder being mainly soda. If we are to make use of the major part of the 'spar we must use this silica.

A short time before he died, in 1920, J. E. Johnson, Jr., the eminent American iron metallurgist, applied for patents that described the manufacture in the electric furnace of ferro-silicon from potash feldspar and scrap iron, the potash to be volatilized by the extreme temperature of the furnace, and the fume caught and condensed. Now we hear of a similar, but simpler, process, said to be in actual operation in Sweden. Ferro-silicon is made from the same ingredients, but the potash is not volatilized and remains in the slag in combination with the alumina and other slag-making ingredients of the charge. This slag, from which the potash is readily dissolved, is ground and applied directly to the fields as fertilizer.

If a process such as this is actually feasible, it presents an excellent opportunity to Canadian manufacturers of ferro-silicon. There are very large bodies of potash feldspar readily accessible along navigable water routes as well as along existing railways. As electricity is already the source of power used, no radical change in the present method of manufacture would be necessary.

The reputed successful operation of this process in Sweden may point the way to one more Canadian industry, well founded on our mineral resources and our cheap hydro-electric power.

A STANDARD FOR FELDSPAR

For a number of years past, and more particularly since Mr. Raymond B. Ladoo made his investigation recently for the Bureau of Mines, at Washington, and pointed out certain avoidable anomalies in the feldspar mining of the United States, there has been a tendency among those interested to strive for the standardization of material that has been of such incalculable benefit in certain other of the mineral industries. The movement among Canadian feldspar producers has not as yet gathered much momentum; but it already exists, and will appeal to all rationally-minded operators if the case is presented in a proper light.

The analogy with iron ore will serve to demonstrate the benefit accruing to miner and manufacturer alike from a standardized product — a definite standard or series of standards to which the miner known he must conform if he is to continue to hold his market, and on which the buyer of ore knows he can depend. All iron ore from the great Lake Superior field is now blended to produce certain standard grades, and these grades are ordered by the blast furnace operator in the proportion in which he desires them, irrespective of the particular mines from which the ore has been derived. This simplifies the problem of both the miner and the buyer of ore, and in no way restricts the initiative or independence of either. Nor is there any monopoly in the production or handling of this ore. There is simply a set of standards, adopted by common consent as a matter of convenience and economy, to which all *bona fide* dealers in ore must conform.

A similar move can, and will, be made by those interested in feldspar. It is not likely that any blending of the products of different quarries will be needed in this case; but grades as required by the trade must be specified sufficiently clearly to prevent misunderstanding, and substantial producers must band themselves together for the purpose of forcing an adherence to these grades. This will not only react to the benefit of miners and manufacturers in general, but will aid every honest prospector, promoter and operator of feldspar properties to attain the end he desires.

EDITORIAL NOTES

A correspondent writes of a trip, just ended, through the Gondreau field as follows: "Finds are few and far between. West of the track there has been nothing more "turned up at all, the Murphy being the only property "with any kind of a showing that I have seen or heard "of. East of the track X— has been doing sampling on a "property that shows great promise. He is much pleased "with the results so far, and thinks the property has a "good chance of becoming a mine. The prospectors, of "course, think it is a mine right now." This is typical of letters and conversation among mining men, not only about the Gondreau district, but about any "rush" district. Those who know the mining business are not in danger of becoming enmeshed in the net of over-enthusiasm, or engulfed in the whirl pool of a "rush". The unsophisticated public is in need of all the guidance it can get from those who know the actual conditions of such a case. The truth cannot injure a good prospect, and it will prevent a deal of fraudulent manipulation.

Today we publish a letter from Mr. Paul Ginther of El Paso, Texas, referring to a discussion of his "Adargas" mine promotion by Mr. Alexander Gray. Mr. Gray has advised Canadian investors not to put their money into this Mexican promotion. Without entering into a discussion of the merits of Mr. Ginther's mining property, we can endorse, without qualification, Mr. Gray's advice. We have enough, and more than enough, promising prospects, near-mines and mines in Canada to engage fully the attention of Canadian investors, without recourse to speculation in far-off Mexico. Still, Mr. Ginther has a right to present his case in these pages, since his project has there been the subject of adverse criticism.

THE EXCURSIONISTS' GUIDE

(Next week Canada extends a welcome to a large number of the members of the American Ceramic Society. In their honour and for their guidance, the *Canadian Mining Journal's* unrivalled rhymester submits these limpid lucubrations. The Society's itinerary includes Montreal, Ottawa, Kingston and Toronto.)

As now you leave your own, your native strand
To travel in a strange and foreign land,
I beg to warn you that the broad St. Lawrence
Is not the only thing that flows in torrents
Within the limits of old Montreal
I hardly think so — rather — not at all!
As Montreal is your first point of visit,
It's not unfair to warn you people, is it?
And saying this, I'll now dismiss the topic,
Or else you'll fancy that my eye's myopic

* * *

Your welcome by the Province of Quebec
Will be exceeded nowhere, no, by Heck!
Yet Ottawa will do her best to show
That she is not so everlasting slow!
Kingston is Kingston, Princess of the Lakes,
Mostly asleep, but charming when she wakes —
She'll give a welcome rousing and dynamic
To one and all concerned with things ceramic
Toronto, in her conscious strength and pride
Will throw her portals hospitably wide,
And even there in that stern home of virtue,
Unhesitatingly we do assert you
Will find a true, a wondrous compensation
For Volstead's Sin against your tree-born nation!

XNON

The Richardson Feldspar Quarry

By J. C. MURRAY

About five-sixths of all the feldspar shipped from Canada to the United States during the last twenty years has come from Frontenac County, Ontario. The greater part of this five-sixths, in fact nearly all of it, has been derived from the Richardson quarry, which until recently was Canada's only consistent producer. For the last three years the quarry has not been operated, for reasons that will be mentioned hereunder.

History

The quarry was opened by the late Senator Richardson, of Kingston, in the year 1901, and was operated continuously until the year 1918, when it was acquired by its present owner, Mr. R. T. Segsworth, of Toronto, barrister, who was associated with his brother, Mr. W. E. Segsworth, M.E., in the brilliant and profitable development of the Seneca-Superior mine at Cobalt, and was then and there inoculated with the virus of mining.

In the year 1901, and throughout the succeeding decade, although feldspar prices were low, labour was exceedingly cheap. Skilled labour was not deemed necessary to the working of the quarry, and ordinary workers could be had for less than $1.50 per day, sometimes much less. The feldspar was—as it still remains—singularly pure, little cobbing was required, and both summer and winter hauls to the Kingston and Pembroke railway, though impracticable now, were then feasible, because $3, slightly more or slightly less, would pay for the day's hire of a team and driver.

In summer the 'spar was trammed a quarter of a mile to Thirteen Island Lake. Here the cars were loaded on scows and towed across the lake. Again the trams were pulley hauled across a narrow peninsula, again placed in scows, and finally unloaded at Glendower, the end of a short spur running in from Godfrey Station on the K. & P. This series of handlings would today be paralysing. In those days it left but a small margin of profit.

A brief period of activity convinced Mr. Segsworth that transportation had to be improved. Accordingly he suspended work at the quarry, confined his local efforts to sorting over the dumps and grading the 'spar in stock on the surface, and began impressing the Canadian Pacific Railway authorities with desirability of extending the spur rail line to within two miles of the quarry. This has been begun. The connecting wagon road is being finished by the Ontario Department of Highways (Public Works). As this road is remarkably well graded, transportation costs will be reduced to a fraction of what they have been. Both the Ontario Government and the Canadian Pacific Railway authorities with the desirability of extending the non-metallic mining industry. The Canadian Pacific recognizes the freight producing possibilities of the industry; the Government recognizes its duty to the community.

Geology

The geology of the region is easily understandable in principle, hence it is all the more astonishing that save in one or two instances, no attention whatever is paid to it by operators, or, for that matter, by users of feldspar.

The Richardson feldspar deposits is a uniquely large, pure, lenticular body of spar enclosed in clean well-defined granite gneiss walls. The conditions under which the intruding pegmatite filled the huge gap were, obviously, highly favourable to complete segregation of its constituents. The intergrowth of quartz and 'spar, typical of graphic granite, and naturally a limiting condition as to potash content, is here evident only in narrow isolated zones, or, rather, in streaks, near the contact with the granite; in other words, the 'spar and the quartz have separated out from the original magma as individual mineral entities, and the quartz, therefore, is only a very incidental diluent of the 'spar. Mica is found only in

Present Appearance in Richardson Quarry

rare, easily avoidable, bunches. The other accessory impurities, tourmaline, hornblende and iron pyrites, are encountered so infrequently and in such small amounts as to be practically negligible. To quote the report of the Dominion Mines Branch (1916), the Richardson spar "is probably the purest grade of commercial 'spar quarried anywhere, and has undergone only the crudest hand sorting at that."

From the evidence of surface outcrops, the recurrence of similarly large lenses of feldspar can be assumed as highly probable. In fact the geological sections at the northerly and southerly extremities of the pit and in the bottom give very strong warranty for this assumption.

The spar itself is a pinkish microcline shading to a dark buff red. It is commercially pure, and has for years been the high grade standard for the continent. No other spar has approached it in consistency of chemical and physical qualities. The dyke proper is about 150 feet wide and has been worked to a depth of about 100 ft. for the length of the pit, approximately 400 feet.

The Pit and the Stock Piles

The main pit, which is the only working from which feldspar has been quarried, is as stated above 400 feet long by about 150 feet wide, the width being fairly uniform except at the northerly and southerly extremities. From this excavation, with inadequate handling facilities, there has been taken out a total of about 500,000 tons of material, of which approximately 250,000 tons was spar, mostly of the grade that made the Richardson famous. The remaining 250,000 tons of material, disposed in stock piles on the surface, requires sorting.

The quarry bottoms in high-grade spar. An inclined shaft sunk to a depth of 40 feet below the lowest working is also wholly in spar of the best quality. The phrase "ore in sight" has little application to feldspar quarrying as heretofore carried on. Every quarry, without exception, has suffered from the most virulent form of the "hand-to-mouth" disease. The survival of the Richardson has been due wholly to its exceptional magnitude and to the purity of its spar.

Dump at Richardson Quarry, now Being Worked Over

With the guidance of past records and the results of trial shipments, the contents of the run of mine dumps and the stock piles may be estimated at 250,000 tons, consisting of spar, mixed spar and rock, and quartz. These dumps constitute a reserve of spar representing about 50 per cent of the whole. Hand sorting is practicable. The installation of simple mechanical equipment will greatly cheapen and facilitate the handling of this available reserve.

Much of the quartz quarried with the feldspar is sufficiently pure to be shipped. Some hundreds of tons are now sorted on the surface. The unsorted stock piles will yield, it is estimated, about 5,000 tons, the pit about 30,000 tons. Some years ago no less than 6,000 tons of pure material were sold to electric smelting works at Welland.

Power

Hydro-electric power will be provided for the whole of the region within a measurable time, as this is the policy to which the Ontario Government is irrevocably committed. Meanwhile the choice lies between using coal or fuel oil. At its highest cost power is not a determining factor in the situation. Transportation assuredly was operated to capacity until the inequities of the market shall have been corrected.

Market Conditions

It is Mr. Segsworth's intention so to develop and equip the property as to simplify grading and give uniformity to materials shipped. This is of as much interest to the grinders and users as to the producer himself. Heretofore the utter lack of stable market specifications has been nothing less than a blight to the feldspar producer.

Without doubt the producer of feldspar is placed in a highly disadvantageous position when he attempts to secure a steady and fair market for his output. In the first place, there is no rational selling basis whatever. Spar that one buyer may approve of may be summarily rejected by another. About the only sane basis that has been suggested is that of setting a price rate of one dollar per unit of contained potash. This is open to criticism, but so also will be all suggested scales until producer and user alike call in the man of science.

Since the Richardson, because of its magnitude, has produced uniform grades, the market irregularities have not affected it so adversely as it has the smaller producers. But it seems certain that the Richardson will not be

Section of Dyke of Feldspar - Richardson Quarry

Standardization Must Come

Feldspar producers in Frontenac and, indeed, throughout Eastern Canada, should be devoutly grateful to Mr. Ladoo, of the United States Bureau of Mines, for giving such timely publicity to the relations of producers, grinders, and users. As a direct result of his frank expression of opinion it is practically certain that Canadian shippers will hereafter be protected by independent sampling, and that they will know before shipping how closely their feldspar meets the chemical and pyrometric standards that will sooner or later be recognized by the trade. This will tend to do away with the present unsatisfactory state of affairs.

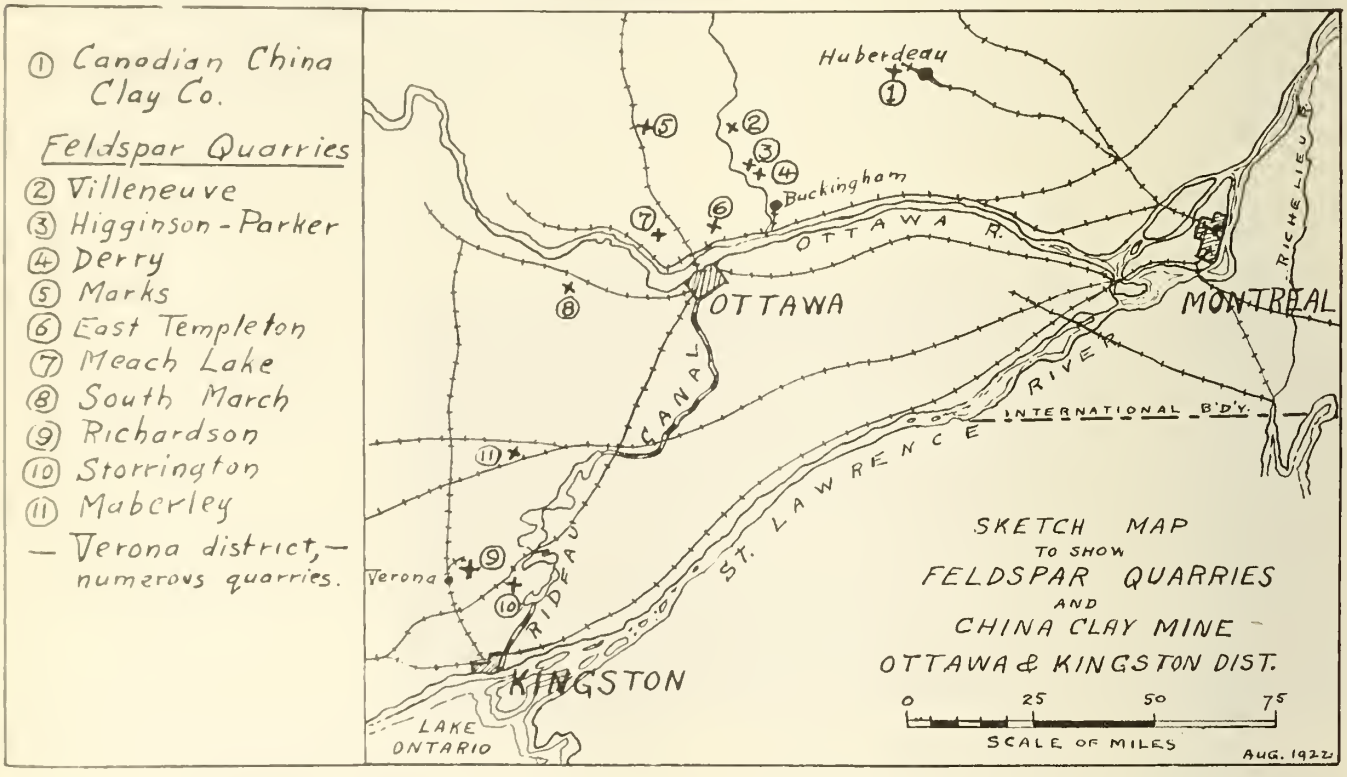
Conclusion

Postulating a sound working understanding between producers and buyers, there is no doubt that the feldspar deposits of Frontenac County, and of other accessible districts in Eastern Canada, will be worked profitably on an increasingly large scale. As in all such industries, the tendency will be towards the elimination of the small operator. Also it will be gradually borne in on the owners of grinding plants that the mining of feldspar requires specially competent and experienced men, and that it is an economic crime to attempt it without proper guidance.

A firmly established feldspar producing industry will encourage the expansion of many subsidiary industries.

Already many United States pottery manufacturers appreciate the advantages of the Verona district as a source of supply. In one or two instances manufacturers from the other side of the invisible boundary are seriously contemplating the erection of grinding plants in Kingston.

The keynote of the situation is an assured supply of good 'spar. Co-operation between all parties interested is the *sine qua non*.



VERONA DISTRICT

Throughout the territory accessible from the railway near Verona, there occur innumerable pegmatite dykes, many of them containing merchantable feldspar. During periods when there is a good demand for feldspar and when the price is correspondingly high, many of these deposits are worked, some of them consistently and economically. Some have produced feldspar of good quality in quantities measured by thousands of tons; but the characteristic deposit is rather small, with the chances against continuity of the grade that has put "Canadian" 'spar in a class by itself. Still, it is certain that the sporadic operation of such pits will continue to furnish a large tonnage of feldspar during periods of brisk demand, and it is possible at any time that the exploration incidental to such operations may disclose a deposit such as can form the basis of consistent mining operations.

Meantime it is particularly necessary in the case of these small operations that some uniform system of grading and classifying be adopted, both for the protection of buyers and for the direction of operators. Such a measure of standardization will, more than any other thing, help to make more consistent and more remunerative the production of small feldspar quarries.

FELDSPAR IN NORTH HASTINGS

About 75 miles north of Belleville, Ontario, in North Hastings county, a number of pegmatite dykes have been worked for feldspar during recent years. The principal producer among these up to the present has been the quarry of the Pennsylvania Feldspar Company, on lot 18, concession VII Monteagle township, 1½ miles east of Hybla station on the Canadian National Railway. The dyke of feldspar is 30 feet wide. During 1920 and 1921 it furnished several hundred tons a week of "Canadian" 'spar to the grinding mill of the company in Rochester, N. Y.

The search for merchantable feldspar has been inaugurated in North Hastings only comparatively recently, and the geological conditions, as well as the actual dykes, disclosed during this comparatively brief period would suggest that the district is likely to become a consistent producer of feldspar with further development.

Feldspar Deposits of the Ottawa District

By N. B. DAVIS

Historical

The first shipments of feldspar from Canada to the United States were made from quarries operated in Templeton Township, some sixteen miles to the north east of Ottawa, in Quebec Province. These quarries were operated in a small way for a few years, and then closed down because of the high freight rates then in force to East Liverpool, Ohio, and Trenton, New Jersey. For the period 1896 to 1901, the output amounted to approximately 8,000 tons.

About 1906, the Electric Reduction Company of Buckingham opened a body of pegmatite located on a ridge one mile from East Templeton station. (See Sketch Map for locations.) A small amount was ground for Montreal consumers, but the means employed were not suitable to the ceramic trade, and work was suspended. Subsequently the property was taken over by the Eureka Flint and Spar Company and several thousand tons shipped to Trenton.

About the same time a deposit of high soda 'spar, located near Meach Lake in the Township of Hull, was prospected, and a small quantity shipped to Trenton.

White feldspar was produced regularly between 1884 and 1917 from deposits about 25 miles north of the town of Buckingham, and used by the dental trade. The first deposit opened was the Villeneuve Mine, but its chief value lay in the output of white mica.

About 1896 a shipment of 250 tons of ordinary pottery 'spar was made from Lot 14 B in the twelfth Range of Buckingham Township, but the quantity developed was not sufficient to overcome the transportation difficulties.

No further work was carried on with feldspar until 1918, when O'Brien & Fowler opened a quarry near South March station in Carleton County, 16 miles west of Ottawa. Shipments were made to Langhlin, Ohio, and Wheeling, West Virginia. The car shortage, coupled with an advance in freight rates early in 1920, resulted in the closing down of this property.

About the same time a dyke of white soda 'spar was opened near Marks station on the Gatineau Branch of the C. P. R., and shipments sent forward to the Ortord Soap Company, Manchester, Conn. Changing conditions, during 1921, resulted in the closing down of this quarry.

In the autumn of 1920, O'Brien & Fowler opened the quarry now known as the Derry, located on Lot 8, Range 1, of Derry Township, and developed a remarkable body of pure 'spar, uniform in grade and analyses. As a result of this successful operation, local people in Buckingham became interested in prospecting their properties and three of these are now producing in a small way.

Character of the Spar

In the territory west of Buckingham, the feldspar is mostly pink to red in colour, and the alkalies run from 12 per cent potash and 3 per cent soda to 6 per cent potash and 5 per cent soda, the higher soda 'spars being in the Gatineau region.

The dykes in the vicinity of the Lièvre River, north of Buckingham, carry 'spar that is cream to white in colour, and distinctly higher in potash and lower in soda than that farther west. Typical analyses show 12½ per cent. to 13½ per cent potash and 1.75 per cent to 2.15 per cent soda.

INDIVIDUAL DEPOSITS

Derry Quarry

The most outstanding deposit is the "Derry" Mine, operated by O'Brien & Fowler, and this is the property to be visited by the summer gathering of the American Ceramic Society. It is located on the east side of the Lièvre River valley, about 9½ miles north of the village of Buckingham and 2 miles from the river. The deposit is part of a large intrusive mass of pegmatite that can be traced across-country for some distance, with its greatest width and development of crystallization on the south end of Lot 8 in the first range of Derry township. The dyke at this point reaches a maximum width of 150 feet. The strike is a few degrees east of north, and the dip almost vertical. The easterly part of the dyke consists of intergrown feldspar and quartz with occasional masses of very coarse 'spar. The westerly 50 feet consists of a lens-shaped body of almost pure 'spar, 300 feet long. The hanging wall is gneiss, and the foot wall a normal pegmatite.

During the past winter crystals 20 ft. to 40 ft. long and up to 15 feet in diameter were encountered. One of

Camp at Derry Quarry, and North End of Feldspar Deposit

Derry Quarry, looking North into Open Cut

the most remarkable features is the low percentage of quartz; the actual tonnage taken out to date shows only 1.5 per cent.

Iron bearing impurities, such as tourmaline, mica, etc., are confined mostly in the wall zones, associated with large crystals and the soda 'spar, albite. The present opening is in the form of an open cut driven into the hillside, and no hoisting will be necessary for several years to come.

Pedneaud Dyke in Hill, 200 feet High

Great pains are taken to maintain the original purity of the material. The surface to a depth of 6 ft. or more is quarried separately to receive special attention and insure the minimum surface contamination. The wall zones are not taken out until the central part has been quarried, so that the cobbing is also reduced to a minimum.

Holes are drilled across the face to depths of 8 to 14 ft. and spaced 4 to 6 ft. apart, depending on the nature of the ground to be broken. Both straight and ammonia dynamite is used for blasting. In the pit each man uses a stone-fork with 5/8 inch. opening to eliminate the smaller sizes of rock. As it is loaded into one-ton flat dump cars, one or two men stand at each car inspecting the material. The cars dump into a 100-ton bin built on the hillside at the mouth of the pit, and the 'spar passes by gravity, as required, into waggon boxes or sleighs. In summer waggons carry it two miles to the river bank, where a special dumping device puts it into a chute of 40-ton capacity, from which it passes, by gravity, to the scows. The scows are towed to the railway siding at Buckingham, and the 'spar placed directly in cars or in stock on a plank platform. Hence, from the time the 'spar is loaded at the quarry until it is shipped, every effort is made to keep it scrupulously clean.

Representative analyses of the shipping grade is as follows:—

	A	B
Silica	65.09	65.80
Alumina	18.85	19.74
Iron	0.029	0.031
Lime	0.21	0.11
Soda	2.11	1.74
Potash	13.42	12.32
	99.709	99.741

The fine material under ½ inch is screened for buff stucco gravel, and is being marketed under the registered trade name of "Sparstone".

Higginson-Parker Quarry

About a mile due north of the Derry Mine, on Lot 9 of

Higginson-Parker Pit

the second range of Derry, Messrs. Higginson and Parker have opened up a small body of similar 'spar. The present opening measures 25 ft. by 50 ft., and the pit is about 50 ft. deep. A boiler and hoist are installed, and sinking is carried on with one steam drill. They are now making an interesting experiment, attempting to deliver the product to the railway by means of a ten ton Holt tractor hauling three trailers over a rather hilly road, a distance of 14 miles.

Pedneaud Quarry

One mile south of the Derry Mine another dyke of the same sort outcrops on the side of a steep hill. For a number of years the lower 75 ft. of the outcrop has been worked for quartz, but, during 1920, a fair 'spar show was located near the top of the hill and the output taken by O'Brien & Fowler.

There is more massive quartz in this deposit than in any yet known in the area, but the crystallization is on the same large scale.

Cameron Quarry

Recently a small body of 'spar has been prospected on Lot 12 in the seventh concession of Buckingham. At the time of writing, work had not advanced sufficiently to gauge its size properly.

Several other small bodies of pegmatite have been opened, principally for quartz, but the presence of excessive amounts of other impurities, such as pyrite, makes them of doubtful value.

A China Clay Mine

MINE AND MILL OF THE CANADIAN CHINA CLAY COMPANY AT HUBERDEAU, QUEBEC

Until recent years there has been in Canada no economic production of China clay, and deposits of the proper quality and in sufficient quantity within reach of adequate transportation facilities have been disclosed only during the last decade. These deposits are in the vicinity of Huberdeau, Que., 85 miles north west from Montreal by railway, or 70 miles in a straight line. The property at present being developed is at the terminus of a branch line of the Canadian National Railway extending from Montfort Junction on the main line to Quebec.

The locality in which the Kaolin occurs was examined in 1916 and again in 1918 by Dr. M. E. Wilson of the Geological Survey, whose report (Memoir 113 *Geology and Mineral Deposits of a Part of Amherst Township, Quebec*) describes fully the geology of the deposits and discusses their origin.

History

Kaolin or China clay was first reported in the district in 1895, when a sample was obtained from the bottom of a well. As there are few natural outcrops of rock in the vicinity, all being covered by a thick layer of glacial drift, prospecting is expensive and development has thus been retarded.

Ten years ago the Canadian China Clay Company acquired a large acreage of the kaolin bearing ground and erected a washing plant. Several thousand tons of China clay was produced under the original management. The management was changed and the plant altered, with less satisfactory result. Eighteen months ago a third management was inaugurated and the operations since then have been consistent and effective and promise to be not only commercially successful but to lay a solid foundation for a Canadian China clay industry.

Geology

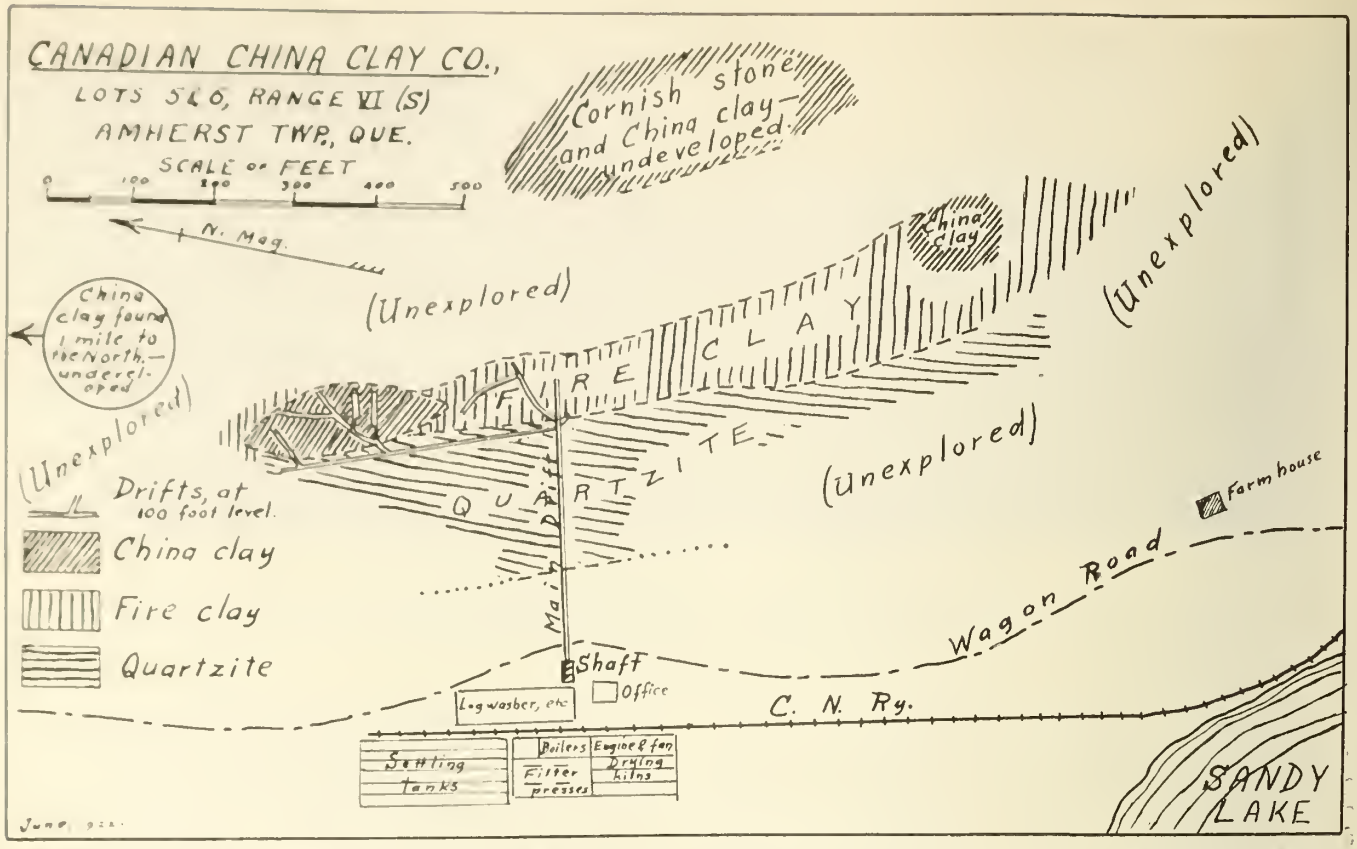
The deposits of China clay occur in a quartzite rock of the Grenville series, the oldest series of rocks known to have a sedimentary origin and consequently one of the earliest to be found on the crust of the earth. This quartzite was originally sandstone, and with it were associated beds of shale which are now changed to garnet gneiss. This garnet gneiss occurs in an irregular way throughout the quartzite, and as it is iron bearing, it introduces material that contaminates the quartzite and clay with rust. But there are zones that are free from the influence of this garnet gneiss, and consequently free from iron. The dip of the quartzite is vertical or nearly so.

The zone in which the kaolin occurs is about 1,000 feet wide, and is known to extend, north and south, for a distance of 7,000 feet. How far the zone extends beyond the limit, is not known. Comparatively little surface prospecting has been done to disclose what lies beneath the mantle of boulder clay that effectually covers the ground. The clay bearing zone is enclosed by a mass of intrusive granite, younger than the Grenville series, which provides a suggestion as to the origin of the kaolin deposits.

The Mill Buildings

Origin of the Deposits

As the China clay occurs in veins and pockets in the quartzite rock, and since in some zones it actually replaces the particles of rock, it is obvious that it could have been brought into its present position from without. The quartzite has been much folded, faulted and shattered, thus providing the interstices in which the clay has lodged. There is thus far no evidence to show conclusively whether the clay was concentrated in its present position from rock that at one time covered the present surface, whether it was leached by surface agencies, or whether it was forced up from below by means of ascending hot solutions. The



proximity of the large masses of intrusive granite tends to support the latter theory; and if so, the chances for the extension of the clay deposits to great depths are favourable. A deposit due to the action of superficial agencies would be limited in depth.

Character of the Deposits

As indicated above, the China clay is associated with much shattered vertical beds of quartzite rock. In places there are veinlets and veins of pure white clay, up to a foot or more in width; but the bulk of the clay occurs in admixture wtih particles of quartz, or filling little cavities in the quartzite. As commercial sources of clay, the veins are too small to work alone, and the quartzite rock, which contains on an average 11 per cent. of clay, is too lean, though there is a tremendous quantity of it available. Hence the commercial possibilities at present are confined to areas within the 1,000 foot zone of quartzite rock where the proportion of clay is higher than the average.

By no means all the clay present in this zone can be classed as China clay. The larger part of what has been exposed up to the present is stained with iron and must be classed as fire clay. Fortunately this fire clay has proved to be an excellent material for saggars,—a requirement rather hard to fill. When washed, it provides a buff coloured clay, suitable for certain purposes.

The accompanying plan shows the lenses of China clay and of fire clay disclosed in the small part of the zone examined up to the present. The two lenses of China clay, only one of which has as yet been delineated with any precision, are enclosed within fire clay, all of which carries about 40 per cent. clay, the remainder being quartz. This zone of clay, from 100 to 200 feet in width, is enclosed within pure, white quartzite carrying about 11 per cent. of clay, as mentioned.

Size of the Deposits

Formerly the clay was won entirely from open cuts and pits. Now, mining methods have been resorted to, and have proved completely satisfactory. One lense of China clay has been developed so far by this means, as shown on the plan. The shaft is 100 feet deep, and the drifts have disclosed a lense 200 feet by 60 feet. The lense to the south has been developed only by an open cut, and consequently is not so well defined. In the one lense there is now developed, between the surface and the first level, 25,000 tons of China clay, exclusive of the quartz with which it is mixed. The production from this lense to date has been 7,000 tons.

Of fire clay, 300,000 tons has been developed. A large quantity is still available by open cut methods. 10,000 tons of fire clay has been shipped to date.

For making saggars, the natural mixture of clay and quartz is used. Of this material there is available, above the 100 foot level, over a million tons.

What more extensive exploration will disclose it is impossible to predict. But the proved value of the small portion of the zone already examined suggests that here may lie sufficient clay of various qualities to provide not only for the needs of Eastern Canada, but for a substantial export trade.

Plant

The process of preparing the crude China clay for market is simple, as is the plant required. After being loosened with dynamite, the crude clay is trammed to the shaft and hoisted to the surface. Subsequent operations are illustrated in the accompanying flow-sheet.

The whole process of ore-dressing in this case consists in separating the clay from the grains of quartz and from stray chips. The ore is so friable that a log washer is sufficient to disintegrate it thoroughly. A large part of the quartz, as coarse sand, is shovelled out from the washer. The flow of water carries fine sand with the clay through two long series of troughs, each series being about 500 feet in length, where even the finest sand has a

Filter Presses and Filter Cakes

chance to settle out. The clay bearing water is now run through a revolving screen to remove chips, and then into large settling tanks, which are filled in succession. Here the liquid is allowed to stand for 24 hours or more, by which time the supernatant liquid is clear and is decanted to return to the circuit.

The thickened pulp in the bottom of the settling tank, called "clay slip", is now pumped at 100 pounds pressure through filter presses, the filtered water being returned to the circuit. The filter cakes, containing about 25 per cent. moisture, are placed on racks and wheeled in car loads into a drying tunnel, through which is blown a stream of air heated by steam coils. When thoroughly dry, the filter cake is broken to lumps and elevated to a large storage bin, ready for market.

The present capacity of the plant is 10 tons of washed clay per day of 18 hours.

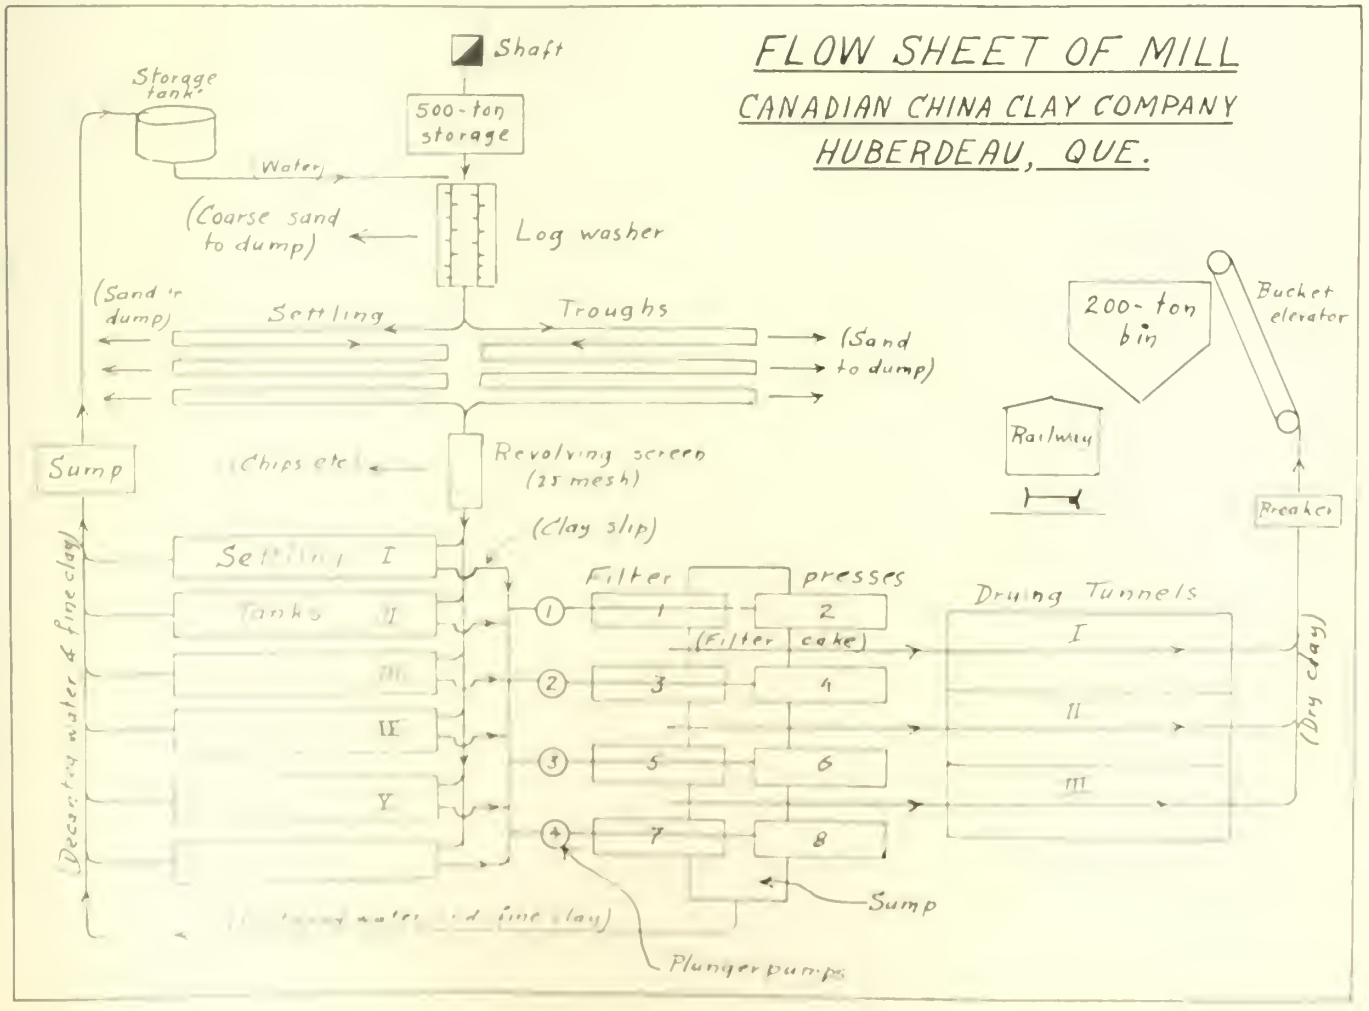
Preparation is being made to alter this flow-sheet with a view of economising labour and power and increasing the output. A sand pump will be installed at the bottom of the shaft to elevate the crude ore, with the mine water, to the surface. This will eliminate the need for the log washer. The pulp thus elevated will be passed through cone classifiers, which will eliminate not only the coarse sand now taken from the log washer, but a large part of the finer sand now caught in the settling troughs.

Quality of the China Clay

A typical analysis of the China clay is as follows:

Silica	47.50 p.c.
Iron Oxide	1.06
Alumina	36.98
Lime	0.23
Magnesia	(trace)
Loss on ignition	14.10
Potash	0.19
Soda	0.18
	100.24 p.c.

It is of a pure white colour, and its content of iron is less than that of the best Cornish clay imported into Canada. Its content of grit is unusually low, being about 0.08 per cent in the form of fine particles of quartz not over 0.05 mm. in size.



This clay is competing favourably now with some of the best imported Cornish clay, the standard in the United States as in Britain. For certain purposes the Huberdeau clay is superior to that brought from England, and it is on this account that its present ready market is available.

Fire Clay

From the parts of the deposit stained with iron oxide a buff or cream-coloured washed clay can be produced,

Filter Cake at Exit of Drying Tunnel

which has a limited use in commerce. At present none of this is separated, the natural mixture of clay and quartz being sold as saggar clay.

Saggar Clay

A notable feature of the deposits at present is the very large amount of fire clay available for making saggars and its excellent quality for this purpose. A Canadian plant has been using this material, in its natural state as shipped from the mine, for some time, and finds that its saggars last much longer than those from imported material. If, by judicious admixture with other clays, such favourable results can be generally obtained in ceramic plants using saggars, a very wide market will be opened for Huberdeau saggar clay.

Quartzite

The quanty of pure quartzite available in the Huberdeau deposits is very large. From the crude rock the China clay can be readily removed by washing and recovered. While it does not pay to treat the rock for the 11 per cent. of clay that is in it, if there were a market for the resulting pure silica as well, it might pay handsomely. In such a case, it would pay best to ship the crude rock from Huberdeau and treat it at the glass works or other point at which the silica was to be used. At present there is no such market in sight.

* * *

The writer wishes to acknowledge the courtesy to him of those in charge of the operations of the Canadian China Clay Company. The manager is Mr. Alexander H. Smith, whose experience while tunnelling in "The Bluff", Belginm, now stands him in good stead when mining the peculiar clayey ore at Huberdeau. The local superintendent is Mr. S. N. Tremblay, who is quite widely known in the bush-whacking fraternity, and has now succombed to the inducements of life as a miner. These two Canadian engineers bid fair to retrieve the fallen fortunes of the Canadian China Clay Company, and to provide in the midst of the Laurentian Highlands at Huberdeau an additional unit for the ever-expanding mining industry of Canada.

MABERLEY DISTRICT

During recent years the Maberley district, west of Perth, Ontario, has produced a considerable amount of feldspar. A great many small pegmatite dykes have been explored, a number have furnished small amounts of merchantable 'spar, and a few give promise of consistent production. The most consistent producer up to the present is the quarry of Orser and Kraft, $1\frac{1}{2}$ miles north of the Lake Shore line of the Canadian Pacific Railway, in lot 13, concession V, South Sherbrooke township.

As in the Verona district, the pegmatite dykes of the Maberley district cut granite gneiss, and contain in places many accessory minerals in addition to the feldspar and quartz of which they are essentially composed. It is in the Orser and Kraft quarry that the radium-bearing mineral euxenite was discovered in 1916. The euxenite does not occur in sufficient quantity in this dyke, where at present exposed, to warrant any attempt to recover it; but occurrences of commercial importance may yet be found in this or other dykes.

EDITORIAL NOTES (ADDITIONAL)

There has just been issued in *Summary Report*, 1921, *Part D* of the Dominion Geological Survey, Dr. F. J. Alcock's report on the zinc lead deposits of Gaspé, Quebec, which is reviewed briefly on another page. The development of these deposits has already disclosed sufficient ore to warrant the conclusion that here lies one of the important zinc-lead deposits of the continent. During the present season the Federal Zinc and Lead Company is concentrating its funds and its energies upon building a good road to connect the mine with the railway at Cascapedia, a distance of 45 miles. In this they have not received one dollar of assistance from the provincial government of Quebec, though the development of this mine and the building of the road will undoubtedly open up for prospecting, and for settlement in restricted areas, the interior of the long-neglected Gaspé peninsula. This is a strange situation and reflects little credit on the government at Quebec. Messrs. Lyall and Beidelman are to be congratulated on the energy and confidence they display in progressing, unaided, in this big undertaking.

Our Nova Scotia correspondent reports that negotiations between miners and operators have reached an impasse, and he suggests that the solution of the difficulty in Britain last year might logically be adopted here. He insists, and rightly, that the present disturbance is due principally to the recent interference by the Federal government in what was essentially a domestic disagreement. If the miners and operators had been left to compose their differences without outside interference, it is probable that there would be now no threat of a strike. Hence it is quite logical that the meddlesome Federal authorities should now bear the onus of a settlement. Unfortunately, these authorities seem to have faculty for sidestepping in such a case, plading those same rights for local autonomy that they have previously denied.

Storrington Feldspar Quarry

On lots 7 and 8 of the 13th concession of Storrington township in the county of Frontenac there are large dykes of white feldspar that have excited interest periodically for the last fifteen years. Until 1912-13 the locality was inaccessible by railway. In that year the Toronto-Ottawa line of the Canadian Northern railway was completed, running within less than a mile of the deposits. During the war nothing was done; but in 1920 some stripping and preliminary sampling led up to the shipment of a trial carload of 'spar from one of the dykes. This carload proved thoroughly satisfactory, so the property was opened up for consistent production in 1921.

Geological Occurrence

The feldspar occurs as dykes in crystalline limestone of the Grenville series. The origin of these dykes has not been definitely determined, but it can be assumed meantime that they are allied to the widespread intrusions of granite that is found extensively throughout the countryside. Dykes of feldspar in limestone are of common occurrence, but it is unusual to find them containing so little impurity as those here described.

Quarry Face Storrington Feldspar Company

Description of Dykes

The main and largest deposit of feldspar on which the present quarry is located comprises a ridge rising to a height of 75 feet above the level of Upper Rock Lake, and extending inland in a southwest direction for a distance of 800 feet. The width varies from 25 feet at the water's edge to a maximum of 100 feet at the quarry face.

Parallel to this dyke is another similar one to the north, and three more to the south. These have not been stripped or explored to the extent to which the one now opened up will provide feldspar of the quality required for the ceramic industry for some years to come.

Quality of the Feldspar

The dyke is composed almost wholly of white feldspar. In places there is a graphic intergrowth of quartz, but its quantity per cent. is not sufficient to affect appreciably the quality of the 'spar. A more serious accessory mineral is a greenish grey silicate of alumina, lime and magnesia, which occurs here and there in little bunches and must be removed by cobbing.

A representative partial analysis of the feldspar is as follows:

Potash (K_2O)	11 p.c.
Silica (SiO_2)	67 p.c.
Lime (CaO)	21/2 p.c.
Iron	(trace)

Transportation Facilities

The quarry is seven-eighths of a mile from the Canadian National Railway. As the land route is hilly, it has been found expedient to use a water route. An inclined trestle 900 feet long carries cars of feldspar on two-ton trays from the quarry to the shore of Upper Rock Lake, where they are wheeled aboard a scow of six tons net capacity. This scow is towed to the railway across two small lakes and through a channel connecting them. A siding has been constructed at the water's edge, which allows the trays, raised by a derrick, to be dumped direct into the railway cars. Thus there is only one handling of the material, that at the quarry face, and trans-shipment is effected in the simplest possible manner.

During the winter the trays of feldspar are handled from the quarry direct to the railway over the frozen lakes and loaded direct into the railway cars by means of the derrick.

The channel between the two lakes presented a serious difficulty for some weeks. It was filled with the loose, slimey material common in small lakes and bogs, bound together with roots, stumps and logs. It was finally cleared by blasting loose these obstructions and then removing the loose material to deep water by means of a drag line scraper, operating under water from a scow anchored in the lake. The spring freshet has effectually widened and deepened the artificial channel thus made.

The railway siding put in for the Storrington Feldspar Company is 3½ miles from Kingston.

The capacity of the present plant is twenty carloads (about 800 tons) of feldspar a week. As the deposit is very large and of uniform quality, and since this quality in spite of the content of lime, is suitable for quite a wide range of ceramic products, it is reasonable to expect that the Storrington Feldspar Company will develop into a large shipper of Canadian feldspar.

THE CAMPBELL FELDSPAR DEPOSIT

Since going to press, we have received from Mr. A. M. Campbell of Perth, Ontario, a description of a large dyke of feldspar that he is engaged in opening up, which can now be noted only briefly. It is on lot 20, concession IX of Bathurst township, 5 miles northwest of Glen Tay station on the Canadian Pacific Railway, with which it is connected directly by road. The dyke is 300 feet wide and has been traced for a distance of 1000 feet. The feldspar is high in potash and is said to be sufficiently free from deleterious impurities to allow of commercial use. Mr. Campbell invites an inspection of his deposit, which has been well exposed by stripping and blasting.

A Successful Flotation Mill

BY L.H. BIGGAR.

A notable address was delivered by L. H. Biggar before the recent International Mining Convention at Nelson B. C., in which he showed that the new mill, installed at the Ottawa Mine, situated on Springer Creek at an altitude of 5,333 feet and five miles from Slocan City, had already saved $25,000 from the waste dumps of the property. Mr. Biggar's description of the flotation system adopted follows:

Owing to the fact that previous to our starting milling operations there had been no attempts made in this district to concentrate this type of ore, and in view of there being several properties in the neighborhood with ore of a similar nature, this paper is submitted in the hope that some of the data contained, and an account of our milling operations, may be of interest and possibly of use to those interested in properties containing ore of a similar nature.

Description of Ore

The ore is essentially what is known as dry silver ore, this term meaning as I understand it, that it is comparatively, if not entirely, lacking in a lead or zinc content, not, as some might infer, lacking in a liquid content.

The silver occurs in the form of argentite, or silver sulphide, native silver, and grey copper, in order of their proportion, and the gangue is chiefly a hard, white quartz. An average analysis of the mill feed to date is: Silver, 9.8 ounces per ton; lead and zinc, nil; iron, 2 per cent.; lime, 2 per cent.; magnesia, 2 per cent.; barium sulphate, 2 per cent.; alumina, 2 per cent, and silica, 86 per cent.

All ore milled to date has been drawn from the old waste dumps of the property, and it was with a view to treating these and the stope fillings in the mine that the concentrator was built. The above analysis is an average of the values contained in 6,000 tons from the dumps which we have milled, and on which I have based my figures in this report.

Under the conditions existing two years ago, when the construction of the concentrator was considered, and, for that matter, under any normal conditions, it was obviously impossible to ship this grade of ore, or so-called waste, to the smelter at a profit, especially as the dumps are situated over five miles from the nearest railway and the smelter is some 80 miles distant from our shipping point.

It was in the hope of being able to concentrate the silver values mentioned which were spread throughout the large tonnage of the dumps, into a sufficiently small tonnage to be shipped at a profit, with a high recovery of the silver and at a reasonable cost, that the concentrator was built.

Cost of Mill and Tramway

For the sake of those contemplating the construction of a mill to treat ore of a similar nature and as a matter of record, it may be of interest to know the actual cost of construction of the mill, aerial tramway, etc. The capacity of the mill is 50 tons per 24 hours, and it is supplied with feed by a two-bucket jig tramway, 200 feet in length, with a capacity of 80 tons per eight hours. This tramway connects the dumps with the mill, there being, necessarily, chutes and surface tramways installed at the dumps to render all the dump material tributary to the upper terminal of the aerial tramway.

The mill complete, and on an operating basis, handling its rated tonnage, cost approximately $30,000. This does not, however, include the cost of a power installation, as we were fortunate enough to have to install only a motor-Pelton wheel and 200 feet of pipe line, as there was a flume and pipe line already in place which we utilized. With our installation and a water supply of six cubic feet per second, we have available 140 horsepower. Our horsepower consumption, running at full capacity, is approximately 110.

The aerial tramway, including the cost of clearing the right-of-way and the construction of the upper and lower terminals, cost approximately $8,000. Several local features, such as the scarcity of suitable timber for towers, and the precipitous nature of the side-hill on which the tramway is built, tended to make this, I consider, a little above the average cost. The surface tramways, chutes and equipment for handling the dumps and stope fillings, which are spread over a fairly large area, cost approximately $1,000.

The total cost of the installations, which we may say were from the "grass roots up," were roughly $39,000.

The Mill

A description of the flow sheet of the mill is as follows: The ore is delivered at the mill by the aerial tramway to a 45-ton storage bin. It is fed from here over an inch grizzly to a 7 inch by 10 inch Blake crusher, the undersize from the grizzly and the chrushed discharge passing into a 40-ton feed bin. The crusher is kept well set up, the maximum size of the ore on discharge being from one inch to one and a half inches. The ore is fed from here by an automatic feeder, direct to a five-foot by 22-foot tube mill, carrying a ball load of three-inch steel balls weighing approximately five tons. This mill serves both as a primary and secondary grinder, and has proved very satisfactory in that capacity. The tube mill discharge, a description of which follows later, is elevated by a 20 foot bucket elevator, and supplied direct to a nine-cell Minerals Separation machine. The lack of classification of the tube mill discharge may be considered as a weak spot in the flow sheet—and rightly so—but it was rendered necessary by the trouble experienced in getting this unusually coarse feed into the mill. To overcome this problem it was necessary to install a feeder consisting of a 4½-inch pipe "T", with a converging launder from the feeder and with a quarter-inch high-pressure nozzle inserted in a wooden plug at one end of the "T". The jet produced here is sufficient to carry the feed, coarse or fine, to a spiral conveyor that runs for a distance of three feet through the mill trunion and head into the body of the mill.

This jet, however, has a tendency to reduce the density of the pulp to a considerable extent, and the additional fluid necessary to convey the oversize from any method of classification of the discharge back to the feed end was found to exaggerate this to a point where it became impossible to control.

It has been found possible, however, without classification, to maintain the density of the pulp at from 60 to 65 per cent solids, and to obtain a discharge of 90 per cent through 80 mesh, which has allowed the flotation machine to maintain an excellent recovery.

The first six cells of the flotation machine deliver concentrate, which is laundered to a series of settling tanks, and dewatered. The last three cells deliver middling which is returned to the bucket elevator, and kept in closed circuit with the machine. The tailing from this machine goes direct to the creek.

The concentrate has been easily settled and dewatered, the average moisture content during the summer months being 15 per cent. The small daily tonnage of concentrate produced did not, in my mind, warrant the installation of a filter. There are three settling tanks in series and so far as can be ascertained there is but very little loss in the overflow from the last of these. The concentrate is shoveled from these tanks to a drying platform, sacked, and shipped.

Concentration by Gravity Impossible

One important feature of the treatment is, that on account of the silver values in the ore being so finely disseminated throughout the gangue rock, it was impossible to treat this ore by any method of gravity concentration, and not even a small satisfactory percentage of recovery could be obtained by this method. It was necessary, as the flow sheet shows, to grind all the mill feed to a suitable mesh for flotation treatment, and the entire recovery of the silver is obtained by this means.

The feed of the flotation machine is ground to as nearly as possible 100 per cent through 80 mesh, it having been demonstrated that at this size the silver particles are satisfactorily liberated from the gangue. The feed to the machine is maintained at from 2.5 to 3 parts of water to one of solids.

Recovery of Silver Values

The average recovery of the silver, from the 6,000 tons considered here, has been 76 per cent and of the iron only 10 per cent. The ratio of concentration has averaged 52 tons to one. In other words, of the 6,000 tons we have milled, averaging 9.8 ounces in silver per ton, we have shipped only 115.5 tons of concentrate, these few tons, however, containing on an average 390 ounces in silver per ton, and containing 76 per cent of the silver originally distributed in the 6,000 tons of dump material, the gross value of this production being over $30,000.

Another interesting feature to my mind is that the barium sulphate and alumina present in the feed have shown a tendency to concentrate to a certain extent. This may be of interest to some, as neither of these minerals are considered to be suitable for concentration by this method. It is generally considered essential that the minerals or metals be in the native form or sulphides to be easily and profitably treated by flotation. A vast amount of experimental work has been carried out, of late, along these lines, and possibly progress has already proven these other minerals amenable.

Cost of Concentration

A short summary of our operating costs, and their distribution, may also be of interest. Based on last month's operations, with a record of 1775 tons milled, our costs were as follows:

Mucking and surface Trimming, per ton of feed, 5.5 cents, aerial tramway, 10 cents, a total cost of 65 cents per ton of ore delivered at the mill.

Milling, divided as follows: Labor per ton, 63 cents; general charges, 10 cents; flotation oil, two pounds, 12 cents; steel balls, 2.2 pounds, 15 cents; depreciation and insurance, 25 cents, making a total cost of milling, which includes hauling to the railway and loading, of $1.25.

A charge of 30 cents per ton of feed covers the cost of freight to the smelter, and treatment.

The total combined cost of reclamation, tramming, milling, freight and treatment was thus $2.20 per ton of feed.

Largely on account of the simplicity of the flow sheet, we have been able to maintain the percentage of possible time run at an average of 94.7 per cent for the last six months.

In conclusion, I must apologize to some, at least, for the profusion of figures in this paper, which may make it sound like an income tax report, but in a case of this kind I think that figures speak better than words.

I wish to express apreciation for the advice and assistance I have received from numerous operators, the Consolidated Mining & Smelting Company's staff, and many others, in the technical work, and to mention my good fortune in having been able to secure from the beginning certain partners in the enterprise, and men to carry out the construction work and operating, who have shown loyal co-operation and offered much useful practical advice.

The results obtained, if they are useful to the district and the province, as I hope they may be, are largely due to the powers of assimilation and the co-ordination of the technical and practical activity of many, who have been keen to see the process prove a success.

OXYGEN PRODUCERS CONSOLIDATE

The consolidation recently of the manufacturing and distributing resources of the Dominion Oxygen Company, Limited, and the National Electro Products, Limited, gives to Canada one of the largest organizations of its kind on the continent. The business is henceforth to be conducted under the name of the Dominion Oxygen Company, Limited, now operating oxygen plants at Montreal and Toronto, and acetylene plants at Merritton, Winnipeg and Shawinigan Falls. In addition the company conducts oxygen and acetylene distributing stations at Hamilton, Windsor and Quebec.

It is claimed that the union of the two companies will be of material advantage to all Canadian oxygen users through stabilization of the product, assurance of steady supply and certain improvements in service facilities that will be made possible.

It is understood that Mr. W. J. Cluff and associates, of Toronto and Montreal, who founded the National Electro Products, Limited, several years ago, will retain their relationship with the oxygen industry through their interest in the consolidated companies.

USE OF DIAMOND DRILL IN OIL PROSPECTING

Prospecting for oil with diamond drills is being carried on extensively in Washington and Montana, according to F. A. Edson, petroleum engineer of the United States Bureau of Mines, who recently visited various centers of activity in the Northwest and Middle West. It is generally found to be less expensive to prospect with a diamond drill than by other methods. Mr. Edson has acquired much information regarding the practice of diamond drilling in oil prospecting, which will be used in the preparation of a report on the subject to be issued at a later date.

The Malagash Salt Deposits

By JOHN MOFFATT

The recent opening up of the Malagash salt bed has interested mining men all over Canada and has focused attention on Nova Scotia as a Province rich in minerals. It has also set the native Nova Scotian thinking and some are beginning to perceive that lack of early enterprise may have long delayed the beginning of an industry that bids fair to become of international importance. The work of mining salt at Malagash is in the initial stage, but has been sufficiently developed to demonstrate that great beds of salt await the pick of the miner to loosen it and send it on its way to markets that lie conveniently all around. The position of the mine is such that these markets can be easily and cheaply reached.

Early Manufacture of Salt in Nova Scotia

The finding of salt springs early attracted attention, and in different parts of Nova Scotia salt was made in quantity from the briny waters of some of the larger of these springs.

As early as 1836, large quantities of salt were made by evaporation from the salt springs at River Philip, Cumberland County. About the year 1860 the Brine Springs, Antigonish County, yielded considerable salt through the same process. Six years later operations were carried on by an incorporated company on what is now the site of Antigonish Town. Much work was done and a number of boreholes were put down, but although a fair flow of strong brine was pumped from one of these holes, after a time the strengh of the brine became very much reduced and the work was abandoned. Salt springs are found in many parts of Antigonish County.

Initiating the Present Undertaking

It remained for Mr. A. R. Chambers and Mr. G. W. McKay, two enterprising young men of New Glasgow, to make the mining of salt in Nova Scotia an industry with a steady output from a real mine. This mine is producing 40 tons of salt a day. Five years ago the attention of these men was drawn to the salt-bearing measures at Malagash, Cumberland County. After assuring themselves that salt in sufficient quantity was to be found in this district, a number of holes were put down by a diamond drill to make further tests of the salt strata, and to enable them to locate a place for a shaft. These holes ranged in depth from 85 to 113 feet. Results were so satisfactory that a shaft was sunk. The seams vary in size, in color, and in quality. There is grey, white, and red salt, dirty salt, gypsum and shale with salt; and although some of it is not white it has a high commercial value and only requires a change in choice of color to popularize it. Public taste, however, must be satisfied, and in this mine there are several seams of pure white salt, ranging all the way from four to twelve feet in thickness. The salt, when crushed and assorted, has been found fit for almost all the uses to which salt is put and a good trade is being worked up.

Outline of Operations to date

A shaft has been sunk 160 feet vertically, the lower 75 feet being in salt strata. About 600 feet of levels and cross-cuts have been driven in the salt. From July 1919 to date about 9,000 tons of salt have been mined. The full capacity of the present plant is 60 tons a day. The products at present marketed are lump, coarse, medium and fine domestic grades, and land salt (fertilising salt). The present price range from $7.50 per net ton at points of consumption for fishery salt, up to $30.00 per net ton for small lots of special grades. Present indications are that land salt will have a much larger market than the fishery and dairy grades, and the owners are at present putting into operation an effective scheme of sales which has been worked out with the grocery jobbers, to whom this scheme has appealed very strongly. It has the added advantage that it eliminates the jobbers as competitors in the selling of other salts to all trades except the fishery. The cost of production with present equipment is $5.00 per net ton on board vessel, but the owners, having been for years managing the Wabana Iron Mine (probably the largest single iron mine in the United States or Canada), know from Wabana experience that with the proper equipment a cost of $2.50 per ton could be obtained.

Up to date, energy has been devoted mainly to developing the property and proving the suitability of the product for various markets, ascertaining competition, and no attempt has yet been made to produce on an economic scale. The property is exceedingly well situated for distribution by schooner and cheap water rates can now be obtained.

Description of the Deposits

Chambers and MacKay hold 20 year leases from the Nova Scotia Government on 10 square miles of land covering practically all the Malagash Peninsula, an area 5 miles long by 2 miles wide as indicated on the map. The Government receives a royalty of 20 cents a ton for the salt as mined and will compensate the owners of the land by giving them 25 per cent. of the royalty received or 5 cents per ton.

The Malagash deposit is similar to the German deposit at Stassfurt in many respects. A potash zone has been penetrated at two points thirty feet apart, varying in thickness from a few inches to 5 feet. In one place a full shot from the face ran 8.73 per cent. potash. Chambers and MacKay have the opinion of some prominent chemists that the economic production of fertilising potash from the vein already opened up is quite possible and the prospects of richer deposits in depth very favorable.

The following table shows the analysis of Malagash salt as compared with other salts commonly used:—

	Malagash	Liverpool	Turks Is.	Mediterranean	New York
Insoluble	.50	.086	.18	.27	1.0
Iron & Alumina	Faint traces	Traces	Traces	Traces	Traces
Lime	.37	.515	.72	.35	.24
Magnesia	.01	Traces	.48	.47	.05
Sulphuric Anhydride	.46	.252	1.20	.94	.27
Sodium Chloride	98.66	98.961	97.42	97.97	98.44

A study of this table will show that Malagash salt is low in lime and magnesia, both of which impurities are detrimental in curing fish and meats, imparting a bitter taste to the food products. The sodium chloride content compares favorably with the best.

The insoluble matter in Malagash is the mineral Anhydrite or calcium sulphate. This impurity is harmless and does not affect fish or meats in any way.

The following quotation from Geological Survey Memoir No. 121 indicates the market available: "The import of salt into Canada in 1918 mounted to 165,494 tons, valued at $1,267,169. Of this amount 100,103

Lead Smelting Practice at Trail

BY J. BUCHANAN

The following paper was read by J. Buchanan, smelter superintendent at the plant of the Consolidated Mining and Smelting Co. of Canada, before the International Convention recently held at Nelson, B. C.

There have been many changes in the practice of smelting lead ores at the Trail plant since the first furnace was blown in, in 1899. Some of these have been forced on the smelter on account of the changing characteristics of the ore supply, while others have been made in efforts to improve the efficiency of the plant. An extreme example of the first kind was when the scarcity of ores high in sulphur content made it necessary to smelt a charge containing only 15 per cent. sinter, the balance consisting mainly of zinc plant residue — residue from leached zinc concentrate — with a small amount of oxidized ore and lime rock. As the zinc plant residue was all finer than 100 mesh, and the oxidized ore almost as fine, it was not a charge that one would care to smelt except under very exceptional conditions.

The outstanding examples of the second class of changes are:

(1) Double sintering by Dwight and Lloyd machines of a large percentage of the blast furnace charge and the consequent elimination of pre-roasting in Wedge roasters.

(2) The use of granulated lead blast furnace slag, which will be mentioned later.

The Evolution of Double Sintering

This double sintering has been evolved by degrees, starting from the time when the Dwight and Lloyd representatives undertook to make a first-class sinter from Sullivan ore, which assays about 28 per cent. sulphur, with a small amount of flux.

The first step was a partial double sintering, whereby the fines made by the Huntingdon-Heberlein pots were screened out and formed part of the Dwight and Lloyd charge. This was the forerunner of what afterward became the practice, as will be seen.

At this period all ores with more than 10 per cent. sulphur were roasted in Wedge multiple-hearth roasting furnaces, and then sintered with addition of flux and sintering ores in Huntingdon-Heberlein pots or Dwight and Lloyd machines.

Ores containing from 5 to 10 per cent. sulphur were known as [illegible] and were sintered but not roasted. Ores with less than 5 per cent. sulphur were classed as direct-smelting ores and went direct to the blast furnace charge bins.

Flue dust and [illegible] that were briquetted, and formed part of the blast furnace charge.

The charge to the sintering machines and Huntingdon-Heberlein pots during this time would average somewhat as follows: Calcine from roasting ore, 16.4 per cent; lime rock, 14.1 per cent; producing a sinter of the following analysis:

Lead	28.9%
Zinc	9.5
Sulphur	4 to 6
Silica	8.2
Alumina	1.6
Iron	17.8
Manganese	3.
Calcium oxide	8.6
Magnesium oxide	2.1

The charge to the blast furnace was approximately, sinter, 46 per cent; lime rock, 4 per cent; by-products, 24 per cent; briquettes, 8 per cent; direct smelting ore, 18 per cent. This produces a slag of the following composition:

Silver	0.97%
Copper	0.15
Lead	1.80
Zinc	10.30
Sulphur	4.30
Silica	22.60
Iron	22.60
Manganese	5.
Magnesium oxide	2.
Calcium oxide	11.80

During this period there was considerable blast furnace trouble, due to high zinc and high sulphur on the charge. The volatilization losses were heavy and it was apparent some radical change would have to be made in order to improve the metallurgy of the plant.

At this time the lead ore from the Sullivan mine, our largest shipper, was crushed to about one-quarter inch for treatment in the Wedge roasters, screen analysis showing about 30 per cent. on 6-mesh. Owing to the compact nature of the ore only a very thin layer on the outside of the larger particles was roasted during their passage through the Wedge roaster.

On the other hand, experiments made with various mixtures on the Dwight and Lloyd machines showed that under proper conditions a sinter, good physically, and low in sulphur content, could be made in two passes over the machine. No. D. & L. machines being available at this time for double sintering, the product of the D. & L.'s was dumped in a pile, wet down thoroughly, and returned to the H. & H. pots, where the second sintering was done so that during this period the major portion of the sintering charge was actually roasted three times.

Since 1919, conditions have been such that the Wedge roasting plant has been shut down, and all the sintered material has been twice through some combination of the D. & L.'s and H. & H. pots. In reality a considerable proportion of the final sinter is still roasted three times, as the zinc plant residue, which forms 30 per cent. of the initial sintering charge, has already been roasted prior to the leaching out of the zinc. Further experimental runs on a second sintering on the D. & L.'s were made from time to time whenever a machine was available, and it was found we could make a sinter lower in sulphur than the pot product, and although it did not stand up as well as the latter, seemed to smelt faster in the blast furnace.

This led to a request for more Dwight and Lloyds, as our plant at that time consisted of only three of these machines, and they were kept busy on pre-roast. It was finally decided to double the D. & L. sintering capacity

---

tons were [illegible] of fisheries, about 75 per cent. [illegible] the Atlantic seaboard and Gulf of [illegible] industry. If salt can be developed [illegible] output in Nova Scotia and a great [illegible] for the fishing industry, a market [illegible] valued at $750,000 should be [illegible].

Chamber [illegible] use in connection of reports and data [illegible] available, cost of production, markets, [illegible] investigations of their property.

and three more machines were added, and these were completed and put in operation in October, 1920. These new machines were put on pre roast, and the older ones on second sinter

The Sintering of Fine Materials

Up to this time we had always had a sufficient supply of coarse ore — ore crushed to one quarter inch — on the pre roast charge, and we had no difficulty in producing a satisfactory product for the second sintering machines; but with the second sintering, the gradually diminishing receipts of custom ore, and the successful concentration of the lead in the Sullivan mine (one of the Company's mines) by flotation, we were faced with the problem, new to us, of having to handle practically nothing but flotation concentrate and zinc plant residue. The zinc plant residue as delivered to the smelter contained anywhere from 18 to 22 per cent. water, and the flotation concentrate 10 per cent. water. As those two ingredients formed 75 per cent of the pre roast charge, some difficulty was at first experienced in producing a satisfactory first sinter; the charge, though "balling up" nicely in the mixer, packed tightly on the machines and made ignition and the passage of air a difficult matter. The addition of flue and Cottrell treater dust to the charge corrected this, the dust coating the outside of the granules or cohered particles of charge, and absorbing moisture very slowly, kept the charge open, and prevented the formation of an impervious mixture when delivered to the machine.

The charge to the pre-roast Dwight-Lloyds, 75 per cent. of which would pass a 200-mesh screen, was now as follows: Flotation concentrate, 44 per cent.; zinc plant residue, 32.4 per cent.; lime rock, 11.5 per cent.; silicious ore, 6.3 per cent.; flue dust, 5.8 per cent., producing a sinter of the following analysis:

Lead	36.8%
Zinc	13.3
Sulphur	10.7
Silica	3.8
Alumina	1.3
Iron	16.2
Manganese	3.
Calcium oxide	3.6
Magnesium oxide	1.5

This product on being crushed to one-half inch was re-sintered, and this second sinter, while fairly low in sulphur (usually under 3 per cent) was very friable, and broke up badly before it reached the blast furnaces. Several attempts were made to improve this condition by varying the constituents of the charge, but without much success.

Improving Friable Sinter

Finally, experiments with varying percentages of granulated lead blast-furnace slag were tried, and it was at once seen that the addition of the slag had a very beneficial effect on the physical condition of the sinter produced. With the addition of 15 per cent. of slag to the crushed pre-roast, a well fused, hard, porous sinter was produced, which stood handling well and was delivered to the blast furnaces in first-class condition. The effect of this sinter on the blast-furnaces provided a pleasant surprise, the net tonnage smelted (eliminating the slag) increasing approximately 35 per cent.

This is clearly shown by comparing the six-month period preceding the use of granulated slag in the sinter, and the first six months following the change, as follows:

Tons smelted, without slag, 51,125; furnace days, 368; average per day, 139.

Tons smelted with slag, 67,615; furnace days, 362; average per day, 188.

While the addition of slag to the sinter increased the zinc in the blast furnace charge, no bad results were experienced, as the sulphur on charge was generally under 1.5 per cent.

Blast furnace slags as high as 21 per cent. zinc have been run without the slightest trouble, an example being:

Silver	0.2%
Lead	2.4
Zinc	21.1
Silica	15.8
Iron	33.1
Calcium oxide	6.

Hood and Hanging Charges

We always experienced considerable trouble from hot tops and furnace crusts, and have tried out the various types of spreaders that have been reported as successful at other plants, sometimes even running with no spreader at all.

In an endeavor to get the advantages of the thimble type of hood, without the disadvantage of having the top of the furnace closed and inaccessible for convenient barring, the furnace was arranged for side-dump, still retaining the old smoke hoods.

An experience we had recently with a furnace that hung up, and that had to be blasted before the charge would settle, convinced us that under our conditions the open type of hood has many points in its favour. In this particular case a bridge formed across the furnace, running its full length, about six feet above the tuyers. All the usual methods failed, a two-inch pipe eight feet long and pointed at one end was driven down six feet into the charge. A stick of powder, with fuse attached, was tied to a piece of string, and suspended directly over the pipe opening, the end of the string being passed outside the hood and held there. The fuse was lit, and the man holding the string dropped the charge of powder down the pipe. A hole 18 inches in diameter was made down through the bridged charge, and the furnace being empty for six feet above the tuyeres, no difficulty was experienced in barring down the rest of the charge.

Since using the side feed we have had less trouble with crusts on the furnace sides, although crusts still form at the ends owing to a segregation there of the coarser constituents of the charge. This can be remedied by charging the furnace across the ends as well as the sides; but there are many structural difficulties in the way at present.

Various slopes were tried on the feed plates—from 22.5 degrees to 35 degrees — and we have noticed that we get the best results with an inclination of 12.5 degrees.

Recent Metallurgical Innovations

There are several features in connection with the metallurgy of the plant which may be of interest, particularly in relation to the work that is being done at present.

The percentage of lead in the charge has varied greatly in recent years, being as low as 12 per cent., while at present it is around 28 per cent.

There is very little copper in the charge, and no matte is made.

We have a chart that shows the composition of the slag, plotted from monthly averages since 1903, and it is interesting to follow the various elements through and note how the smelter has had to follow the changes in ore supply.

The silica, which used to be 30 per cent., and the iron 20 per cent., have now changed places, and a similar phenomenon can be observed with the lime and the zinc.

It will also be observed that during 1919-1920 the sulphur in the slag was high; since using granulated slag this has dropped off very considerably, in spite of the fact that the zinc has increased more than 50 per cent., in

the slag. This is due to better roasting and to the fact that there is a greater charge, which is shown clearly in another way by a study of the change in analysis of the fume caught by the lead furnace Cottrell plant.

In 1919 this fume contained about 60 per cent. lead and 9 per cent. zinc, while at present it assays less than 40 per cent. lead, and the zinc has gone up to 35 per cent., while the tonnage caught in the treater remains practically constant. Under certain conditions, this fume may be profitably treated in the zinc plant, the zinc content being entirely soluble in sulphuric acid, the residue then being returned to the smelter.

The residue received from the zinc plant contains approximately 30 per cent. excess iron over silicon dioxide, and as we have not been able up to the present to treat all this zinc plant product, we are in what most lead smeltermen would consider the happy position of having an abundance of this valuable flux. In an endeavour to increase the consumption of this material, tests covering periods of several days were made, in which the lime rock on the sinter charge was replaced by zinc plant residue, the idea being to produce a slag at the blast furnaces as high as iron and low in lime as we could with safety. The sinter produced was all that could be desired and the blast furnaces ran well with a very hot slag, the lime dropping to as low as 5.8 per cent. in some samples taken. The conclusions arrived at, however, were not too clear, and further work will have to be done in order to determine whether a minimum amount of lime is necessary in order to produce a slag reasonably free from lead. The following is an average analysis of the slag samples taken at three day run:

Silver	0.25%
Lead	2.45
Zinc	17.2
Silica	19.1
Iron	33.7
Calcium oxide	6.2

Hoffman, in his "Metallurgy of Lead," page 327, mentions several slags high in iron and zinc and low in calcium oxide, but as the lead is not reported it is not known whether these slags were clean or not.

Hollinger On "High"

By Alexander Gray

For the seventh four-weekly period ended July 7th, Hollinger Consolidated Gold Mines reported a profit of $517,895.82 at the rate of $6,732,645.66 — more than any other gold producer has ever done.

To mid-July the company had made a profit this year of $3,552,865.26, had a surplus then of $5,737,125, and the liquid assets were carried on the books at $6,764,176.99. With 515,640 tons broken in the stopes ready for loading, tramming, hoisting and milling, and the total operating cost per ton milled, $4.3699 (including allowances for taxation and workmen's compensation), it is no disparagement of others to state that Hollinger is at a peak — for the greater milling capacity about to be provided and adequately supplied with power will mean another peak at greater altitude. For the time being, the official record for the first half of this year will suffice. It is as follows:

	To June 30	All of 1921
Tons Milled	665,115	1,072,493
Average Value per ton	$8.82	$9.67
Gross Value	$5,866,902	$10,367,901
Loss In Treatment	$ 198,175	$ 336,850
Net Value Recovered	$5,669,556	$10,031,050
Average Milled per day (ton)	3,959	2,938
Profits	$3,034,960	$ 5,091,659
Surplus	$5,465,385	$ 6,596,060
Cost per ton milled	$4.42	$4.87

Monthly Millings

January	111,206 tons
February	114,731
March	110,316
April	107,834
May	101,166
June	119,855
	665,115

At the June rate of crushing, if continued throughout the latter half year the company will have milled approximately 1,400,000 tons. The June gross value was over a million, and if [illegible] this will be maintained, in which event the company will report precious metals for the year worth about $12,000,000. If the working costs are no lower than they were to June, the gross profit for the year will be about $6,200,000. No longer is there more than a nominal premium upon the gold bullion. In 1921 the premium was carried in current operations, hence the grade of $9.67, whereas it really was a dollar or so less than that.

The half yearly showing means that the company earned at the rate of almost 25 per cent. on issued capital. Two other gold mining companies have crushed more than the Hollinger company. This year the Hollinger will take priority over New Modderfontein, and here is what Hollinger operations and profits look like by comparison with the Crown Mines at the Rand:

Crown Mines

	1921.	1914.
Average strength of labour force —		
Europeans	1,753	1,576
Natives	13,109	11,826
Footage developed	44,856	32,826
Tons milled	2,177,000	2,287,000
Per White employee	1,212.6	1,451.1
Per Native employee	166.1	193.1
Gold recovered (ozs.)	643,005	707,957
Working Revenue	£3,388,718	£2,975,088
Working Costs	£2,716,718	£1,784,079
Working Profit	£672,030	£1,191,629
Dividends paid	£305,531	£700,000

The industrial outlook in Australia remains unchanged and much unemployment continues. While about a year ago nearly 6,000 men were employed in the various branches of the Newcastle, N.S.W., steel plant, now the works employ about 800 men. The directors of the company have issued a statement that there must be substantial reductions in the cost of coal and wages before operations can be resumed to enable them to meet the competitive costs of oversea mills. In the meantime many orders for iron and steel products have been placed abroad.

News and Comments

By ALEXANDER GRAY

The Golden Harvest

The proper degree of perfervidy needs a halo, else devotional speculators are prone to falterings, backslidings in their "little faith". They adore an active, advancing market as dearly as Fauntleroy loved a lord—rather as Fauntleroy's grocer did. That elucidates why everything is set fair with Domes at $32, McIntyres at $19, and Hollinger at $10.60. The quotations and news from the properties supply that aurelian atmosphere without which the picture would not be so effective. It is taken for granted those prices will not remain stationary. Nor is it prudent to conjecture, during such good growing weather. Dome is paying 20 per cent. on parity and is alleged to be finding meteoric rock (as well as its excellent milling grade) veritably as rich as that of the Croesus. At times, during its daily crushings of between 4,200 and 4,500 tons, a wad of gold has greatly inconvenienced the Mill Superintendent by clogging the Hollinger rolls. McIntyre is credited with boulevard-wide ore in its deepest workings. Lake Shore has a bonanza section. Teck-Hughes is putting through $25 ore. There is buoyancy throughout with Dome shares (momentarily) at a premium of 220 per cent. on parity; McIntyres (temporarily) at 280 per cent. premium; Hollingers in flight, the present issue selling at 112 per cent. better than parity. McIntyre is ready for larger milling. Dome is redeeming its capital and handsomely rewarding shareholders who got in early and stayed. Hollinger shareholders, it will be recalled, have four for one of the original and the 100th dividend shortly will be disbursed. Meanwhile they have a market valuation equivalent to $42.40 per share, or about 750 per cent. on parity. Another disbursement on capital account is mooted for the Dome. How soon Hollinger shareholders will be permitted to dip into their bulging treasury, is likely to be decided later. Rumor has it an increased dividend is apt to come in a month or two. Perhaps there will be a Christmas Greeting of this sort. By then it will be ascertained what new power facilities and milling extensions are going to cost, when the enlarged mill will be ready, what width the wings will have from tip to tip. It is what is being done and what is planned at Porcupine and Kirkland Lake, that stimulates those who are going strong from Lightning River and the Hurricanaw to Matachewan and Shining Tree. Who could have foreseen what it meant to have Noah Timmins break ground at the Hollinger on January 1st., 1910? And have not "Jack" Wilson and W. S. Edwards earned more than is accorded them for finding the Dome?

The Cooke Geological Report

Locking the stable door after the horse has gone is what has happened in connection with the Dominion Geological Survey Report by Dr. H. C. Cooke. The damage has been done to the public. How much of the data presented was known to Larder Lake mining directors, and how far Dr. Cooke confided in them, is subject to surmise by modern Zaccheuses, up a tree. Dr. Cooke was quoted as having advised certain work and passed upon it. His admirable summary of the geological situation at and around Larder Lake, leaves no room to doubt what he actually thought about those sedimentary rocks—which were studiously acclaimed by Associated Goldfields sponsors. Associated Directors on more than one occasion stood for utterances of the most optimistic character. They increased the capital of the company from $5,000,000 to $30,000,000. Contrary to what was urged all along, Dr. Cooke, who had access to the drilling and development results, "puts the kibosh" on them. Mr. Hopkins of the Ontario Geological department, also saw what was going on. Despite the dum-dumming about huge lenses of profitable ore, Dr. Cooke (whose report might have been issued as a bulletin before so much money had been dissipated) says there is "absolutely no connection between the concentration of pyrite, the only sulphide in the rock, and its gold content." According to Dr. Cooke, it is a matter of porphyry, porphyry, who's got the porphyry—the proper porphyry!! The Associated Goldfields have never found it, to date. But what Dr. Cooke has rendered would have been more opportune when the Associated people had a million or so in the treasury and less nominal capital.

Quebec Areas Blossoming

Examinations in progress, options being taken, and reports of promising "finds" in Lightning River, the Hurricanaw and other localities, presage an appreciation of Quebec areas.

Mr. Schumacher Has the Money

The sale of the Schumacher property on the basis of 90 cents a share, or $1,650,000 in all, and of the "Schumacher" Veteran claim adjoining the Dome Mines for $400,000 were handsome rewards for those who took over those properties when the Porcupine fields were unproved. Needless to say, Mr. Schumacher never was entitled to an allotment of Veteran claims. He and a relative became interested in Porcupine in its earliest days. The Timmins brothers were taking title to the Hollinger, Miller, Dixon, Gillies, Middleton ground, and glanced toward the so-called "Schumacher", title to which was held by a Quebec Province widow. She had been proferred $500—"for the timber on it", as the adroit would-be purchaser put it.

For a day or two it seemed as though the price was attractive to her. Then Henry Timmins tendered $10,000—and that was what the McIntyre could have been had for. The widow was favorably disposed. Mr. Schumacher not only was willing to give $10,000, but he also tendered "other good and sufficient considerations", as yet unknown. So Mr. Schumacher took the Veteran. He was prepared to sell it. As the Porcupine movement increased in momentum, Mr. Schumacher raised his price, and I have before me a telegram dated in the summer of 1911, stating:

"The Schumacher is offered us for $500,000 and twenty-five per cent. interest, Please wire your advice."

Needless to state, there was no justification for the terms. Further negotiations mollified Mr. Schumacher to the point where he would accept $500,000 and 750,000 shares. He would not take $400,000 and 750,000 shares; consequently the deal fell through.

Mr. Schumacher was approached by others. He was "gun shy", however. Some financing was done; it cannot be said that development sustained the optimism of the chief owner, and the mill that was built did not enrich him. Mr. Schumacher was unperturbed. Periodically,

dickering was mooted. More financing was contemplated. Sooner or later one corner of the property was bound to be eligible, and now it is known the Hollinger control coquetted with Schumacher for a year, before what its owners thought it was worth thirteen years ago, was more than realized. Mr. Schumacher has no reason to complain of his speculative investment of $10,000.

What the other "Schumacher" Veteran claim north of the Dome Mines cost, now would be a misdemeanor punishable with fine or imprisonment, or both. Schumacher and père-in-law bought it when the "Foolish O'Brien", Feldon, Lemberg and contiguous areas were so many suspects. Not even the Dome Extension and what became the North Dome was christened. "Ken" Rose had his notions of the Lemberg dissipated. Dr Simon shattered the tablets of Moses after coming all the way from London to inspect the Feldon on behalf of the Hamilton-Ehrlich interests.

The years have not obscured what occurred to the North Dome, fathered by the Cartwrights and foundered under Temiskaming ownership. Meanwhile Fred. Connell put some of his Connell Veterans' profits into an almost half interest in the "Schumacher" veteran claim—the other half being in the Schumacher family, where the control barely rested. That "barely" factor was enough to keep Mr. Connell upon the fence until he developed protuberances where respectable corns ought not to be. Mr. Connell's spirit was willing—but the Schumacher flesh was weak. Rather than promote a lump, Mr. Connell sold his interest for less than he paid for it—and now familie Schumacher get $400,000 from the Bickell party. Manifestly "Lady Luck" in plumage has been perching for thirteen years or so upon the Schumacher roost.

Nipissing Company in Kirkland Lake

Playing for position is becoming more than a pastime with important mining corporations. This is a phase of reproductive investment that should prolong and broaden the interest in Ontario mineral industries. Comagas spread its net. It did not gather much fish thereby, but it continues to try, and one of these days will land a large one. Nipissing bestirred itself in several directions, overlooking no points of the compass. La Rose likewise, and Kerr Lake, and the Mining Corporation. The list need not be extended. Beaver and Temiskaming might be included. All want a second helping if not a third or a fourth.

At the nascent [illegible] laid upon the advent of Nipissing which has entrenched an area immediately east of the Tough Oakes Burnside at Kirkland Lake, between those and the Gold Belt holdings. Being able to take choice of positions [illegible] of silver corporations, so far as Canada goes, like a frog where it cannot get the breast, to frog that lark must be apt to be as nourishing. If the productive [illegible] present to the west can be picked up short [illegible] people seek it, the recreative forces [illegible] will prolong their stay, and that would [illegible]

[illegible]

Mr. Paul [illegible] comment about what appeared in this department [illegible] Compania Minera San Pascual De Las Adargas [illegible] he would not enthuse over the [illegible] the character of the Adargas literature [illegible] Canada. He assures us that "Adargas [illegible] and that being so it is the wish of [illegible] both shield and armor against many [illegible] removed. Our information as to the [illegible] entered at the time specified, came from a source that will not be questioned by reputable mining people hereabouts. No one doubts the merits of some of the antiguan properties of Mexico. The Adargas aggregation is altogether too seductive for indiscriminating investors. Canada can employ its spare cash more advantageously nearer to Home. And as for previous Ginther promotions (upon which he prides himself) there is no wish to recite or recall the experience of Canadians. Admitting the adverse effects of Mexican warfare does not obscure the losses incurred. Mr. Ginther profited thereby. Very few others have done so. To the contrary. There is no need to re-open wounds. We have no quarrel with Ginther schemes so long as Canada is not exploited further. At the same time there is no disposition to detract from the professional status of Messrs. Houston and Kirby. When they formally state that there is an "inexhaustible" supply of ore in the Adargas—as the circulars set out—more credence may be given to other representations. Mr. Ginther should keep his temper—and Canada should keep its cash within its own borders, pending more authentic information.

Hollinger Production "Over the Top"

Official results of Hollinger Consolidated operations for the six months ended June 30, are as follows:

Gross Production	$5,866,902
Recovered	5,669,356
Loss in Extraction	198,175
Tons Milled	665,115
Average Value per ton milled	8.82
Profit	3,034,966
Average cost per ton milled	4.39
Average daily crushing, tons	3,959
Monthly record of tons milled:—	
January	111,206
February	114,731
March	110,316
April	107,841
May	101,166
June	119,855
Surplus	$5,165,389
Current assets over	7,000,000

The story in tabloid needs no embellishment. With a recovery of approximately $8.50 (really it is a shade better than that) and costs coming down, a profit of $4.13 per ton applied on at least 1,400,000 tons should make the whole story of 1922 operations epoch making in the annals of gold winning.

It is no breach of confidence to state that operating costs have been as low as $3.85 per ton, of late. The June average daily crushing was 4,281 tons. Throughout two weeks the daily average was 4,500 tons. It is confidently anticipated by the management that with slight modifications in the mill the daily crushing will be brought to 5,000 tons, which will be a stopping place until the new power supply is available and the ultimate objective of 7,000 tons is attained.

If the June rate of production is maintained during the second half of this year, then the 1922 production will look something like this:

Six months to June 30	$5,866,902
July 1 to December 31	6,337,435
	$12,204,337

Allowing $400,000 to cover losses in extraction, even if the final months of the year do not notify greater crushings, the company will have recovered about $11,800,000. Of that, according to first half year costs, 52 per cent would be profit, or $6,136,000. But the profit

factor will be greater, as costs are at or less than $4; so, if the grade is continued, the company may earn a profit of $6,300,000, or 25.6 per cent. on issued capital. In reality twice the present dividend requirement is being earned.

Were the policy of the company otherwise, this fact would be exploited, along with the amplitude of the surplus, for market effect. In the last week in June, the profit earned was $146,188.38, which was at the rate of $7,601,000 per annum. As it is not improbable that the final months of the year will permit of greater than June crushings, all that need be stated is that the Company will beat the New Modderfontein return and take the world record for gold outputting. Already Hollinger workings are being carried into the Schumacher property, and it is a certainty that all power difficulties will be solved. Maximum crushings cannot be accomplished until some time next year.

Meanwhile, as General Manager Brigham has shown what mining and milling efficiency means to the Hollinger, a decision will be reached in the course of a month or so regarding additional mills to supplement and eventually to eliminate the stamps. Experience has shown beyond question that stamps are relatively inefficient, all contentions to the contrary notwithstanding. And as to the mining outlook, Mr. Brigham the other night did some post-prandial word-painting. The occasion was a dinner given by the Ontario Mining Association, and there was an interchange of optimistic sentiments. Mr. Brigham, who is nothing if not enthusiastic about his mines and their possibilities, indulged in hypothesis concerning what may happen if the Hollinger sections continue as they were and are down to 3,000 feet vertical. Each one hundred feet of his mines thus far has accounted for $1,500,000. When Mr. Brigham is able to make report and to proudly remark: "Quod erat demonstrandum", it is to be hoped he will have more than laurels about his personality. For him to even hypothetically forecast a production of $450,000,000 from the properties, if the various vein series extend in widths and values to the depth stipulated, is a perfectly valid argument why the Hollinger Company must have power facilities conforming to the policy of the company. To a certainty he is aiming to get all there is in the ground, without prolonging the life of the mines by remaining content with a crushing representing $12,000,000 per annum for 37 years.

Teck-Hughes is Up-Stage

Heartiest greetings are due to Mr. Forbes on his success in staging a most auspicious come-back for the Teck-Hughes. Where there was a most disconcerting situation somewhat detrimental to the locality, there is now substantial evidence that while a good mine can make a fine manager, none the less is it trite that a good mine manager can straighten out the affairs of what looked like a doubtful mine. Mr. Forbes inherited conditions that would have deterred most managers not in need of emergency occupation. He had to re-adjust the company finances and make his mine protect new financing. That he has accomplished this, the improved mining position and the milling returns demonstrate. His July results were record-breaking so far as Teck-Hughes is concerned. The reported recovery of $25 per ton milled may not be maintained throughout a longer continuous milling period, but the grade can be accepted as proof that Mr. Forbes thinks the mine can afford it. Work on the 600 and 730-ft. levels has given the Teck-Hughes management inspiration, by reason of a supplemental ore-body. The fact that the shaft is being carried to 1,000 feet bespeaks more than Mr. Forbes cares to intimate. He rests his case upon the statement that he is "out of the woods."

Why not Canadian Coal?

An emergency exists. A greater crisis may arise. All the municipalities are clamorous for Welsh coal. Ottawa finds solace in the thought that what it can bring from Wales can be retailed at "less than $20 to ton!" Possibly the difficulty will be abated by the settlement of the strikes, and yet it might be possible to give our own western fuels more of their own markets—for a change.

Guarantees East and West

Newfoundland's Premier went off to Westminster, leaving word that he aimed to secure a guarantee from the Imperial Government of a bond issue for the benefit of those who would develop water powers and pulp areas, incidentally helping out mining interests. It is also stated that the Coast Range Steel promoters expect the British Columbia, Dominion and Imperial authorities to guarantee a $4,000,000 bond issue. In both those propositions there may be real merit, and yet there are invidious elements that suggest more mature deliberation or broader treatment. Peace River claims to have unearthed large iron deposits close to coking coal. Other districts would create iron-mining activity. The recent Ontario conference crystallized sentiment in behalf of this basic industry, but piecemeal support would be more patch-work. Nor are special privileges always permanently constructive. For their effect we need not look further than the experience of the Imperial Government in the matter of a nickel company. A modicum of protection, or a bonus for pig iron production, might be more to the national purpose than guarantees for the few—and "the devil take the hindmost."

Half-a-Year at the Dome

During the first half of the current year Dome production averaged $329,247 per month, as compared with $197,006, these being the details:

	1921
April	$153,170
May	185,551
June	198,777
July	191,678
August	210,924
September	241,935
	1922
January	$305,433
February	302,751
March	312,000
April	377,438
May	325,328
June	351,531

The respective grand totals were $1,975,481 and $1,182,035. An increase of over 67 per cent. is a producing record that will do—until there is a better one.

To this list can be added 335,754 for July.

Encore!

Pittsburgh, August 5. — A. P. Theurkaf, chief engineer of British Empire Steel Corporation, is in Pittsburgh to purchase $4,000,000 equipment for additional units and plant repairs. According to Mr. Theurkaf, British Empire Steel is operating at 75 per cent capacity. He says Canadian mills can produce steel cheaper than Pittsburgh mills.— (New item).

Some Geological Reconnaissances

The *Summary Report*, 1921, *Part D*, of the Dominion Geological Survey is now available to the public. It contains a number of reports of interest to the mining fraternity and particularly of interest to prospectors.

An Exploration of Thunder Bay, Ontario

In this report of six brief pages, Dr. T. L. Tanton tells of a reconnaissance survey into an area, quite close to Lake Superior, that has not before been mapped, and was at the time of his visit (the fall of 1921) unprospected. The rocks encountered were the basal schist complex, usually referred to as the Keewatin series, which were found developed only in small areas; granite rocks, which comprised most of the area examined; Keewenawan sediments—conglomerate, sandstone, red volcanic ash, and limestone—lying horizontally upon the former rocks; and Keewenawan irruptions—dykes and sills of diabase cutting all the above rocks.

Dr. Tanton draws the attention of prospectors specifically to certain mineral occurrences and geological features that he considers worthy of close attention. In locations that he specifies there are actual deposits of molybdenite ore, galena and argentite that have not yet been investigated. He also recommends the prospecting of faults at or near the numerous large diabase dykes, and along the course of late Keewenawan veins, a number of which were observed during the course of the survey, especially along the route between Loon and MacKenzie lakes.

Dr. Tanton is engaged in an extensive survey of the north shore of Lake Superior, and has already spent several field seasons on the work. The present report describes merely an incident.

A sketch map to illustrate Dr. Tanton's lucid text would have been a welcome and useful addition to this little report.

Investigation of Peat Bogs in Ontario

This report, by Mr. A. Anrep, peat expert for the Geological Survey, has already been summarized in the *Canadian Mining Journal* on June 9th. Mr. Anrep's surveys have delineated potential fuel reserves of a magnitude realized by few Canadians, and the next report, *Synopsis of Information Concerning the Peat Situation in Canada*, gives in five pages a resumé of results to date. The total available fuel existing in the 105 bogs surveyed is 190 million tons.

Gondreau Gold Area, Michipicoten District, Ontario

An abstract of this report appeared in the *Canadian Mining Journal* for May 19th, as well as a subsequent report from Mr. Ellis Thomson who is in the Gondreau field again this summer.

Deroche, Hodgson, Gondreau and Shields Townships, Timiskaming District, Ontario

Sir Stopford Brownfield's report on this area shows that the deposits of [illegible] in which there was so much interest shown last summer, are not at all likely to be of economic value. They are composed characteristically of pockets of [illegible] in fault zones. Three old "mines", the [illegible] and Quitabe (lead) and the Superior (copper) were examined, but no justification for the extensive [illegible] was discovered.

Wanapitei Lake Map Area

This report, by Dr. F. T. Quirke, is mainly concerned with a study of the [illegible] relations of the sedimentary rocks of the [illegible]. It extends the area studied by Dr. W. H. [illegible] and subsequent years, which led to a better understanding of the early sedimentary rocks of Ontario [illegible] much simpler classification, as well as to the solution of numerous geological puzzles. The "nickel range" extends into the western part of the map-sheet, and iron formation, previously described by Dr. W. G. Miller, occurs on the east side.

The area contains a number of gold prospects, on which exploration still continues in spite of discouragement due to erratic values. Mr. Quirke recommends intensive prospecting for gold along fault lines close to diabase intrusions, and instances a number of such faults worthy of attention.

Radium-Bearing Pegmatites of Ontario

In this report Mr. H. V. Ellsworth describes the various known occurrences of radium-bearing minerals in Ontario, all of them being in pegmatite dykes. The general conclusion is that "the pegmatites of Ontario "undoubtedly contain, in the aggregate, a relatively "enormous amount of radium and thorium minerals, "but these occur in a widely disseminated condition, "and, to the writer, it appears improbable that rich "concentrations will ever be found in commercial amount in this type of occurrence". Mr. Ellsworth adds a suggestion that, by submitting ground feldspar to a process of concentration, impurities such as magnetite, ilmenite, pyrite, tourmaline, black mica etc., might be removed, along with radium-bearing minerals, and that the last might, in certain cases, be profitably recovered.

Geology of Lemieux Township, Gaspé County, Quebec

In this report of 26 pages, including two geological maps, Dr. F. J. Alcock describes briefly a series of zinc-lead deposits that give promise of being to Eastern Canada what the famous Sullivan mine is to the West.

The Federal Zinc and Lead mine is in the heart of the Gaspé peninsula, and is reached by a wagon road, 45 miles long from Caseapedia, on the Bay Chaleur and the Quebec Oriental railway. The geology of the map area examined by Dr. Alcock shows the following succession: Shales and limestones of Lower Devonian age have been much folded and faulted and intruded by igneous rocks. Over these is Gaspé sandstone associated with basic volcanic flows, which covers most of the map area. Intruding all these rocks, probably in Middle Devonian times, are granite and syenite.

The veins occur in shale and limestone, close to intrusions of porphyry and syenite. The sedimentary rocks have been much faulted and brecciated, and there is so much sphalerite and galena in some of the brecciated zones that it can be counted as ore.

A number of the veins have been stripped for a length of 500 feet or more, and underground development has been carried to a depth of 260 feet. Outcrops on the hill side show that the veins at a vertical distance of 560 feet below the summit have the same favourable characteristics as those developed; and all evidence points to their persistence and value to a great depth.

Only a small part of the mineral-bearing area has been explored so far, but this has disclosed half a dozen veins of first rat importance, many smaller veins and brecciated zones up to 60 feet in width, much of which can be considered ore. Some time ago Dr. Walter Harvey Weed examined and sampled the deposits and reported an average content in the Federal vein, one of the principal veins developed, of 3.8 per cent. lead and 7.9 per cent. zinc.

The ore is not at all complex, and is amenable to the simplest methods of treatment. The present handicap is a lack of good means of communication.

Mr. T. O. Lyall is president of the Federal Zinc and Lead Company, and Mr. J. C. Beidelman is vice-president and general manager.

Notes From Nova Scotia

THE DEPARTMENT OF MINES AND THE COLLIERIES

It has been the opinion of local mining men for a long time that the annual report of the Mines Department at Halifax should be made more comprehensive, and should give more general information about the conditions of mining in the different districts, the difficulties encountered and overcome, and the work of meeting and solving the new problems of coal mining as they arise. The efforts of the Government Mine Inspectors in enforcing the law upon the operators and workmen alike, the new methods of mining introduced because of changed conditions, and the many other matters that are being dealt with as the mines develop and go deeper, should in some way be publicly recorded.

More Publicity Desirable

It might not be prudent to go too much into detail, but a little more information than we are now getting would be welcome. There might be some things the Mines Department would be inclined to censor from the reports of their Inspectors, but they do not need to cut them all out. The public can stand knowing a whole lot more about mining conditions without getting unduly disturbed over them. Indeed, if they knew more, there would be much less criticism by ranters and men of destructive tendency. However we may view it, there is a general lack of information in the mines report, and while we do not wish to attribute the cause to any negligence on the part of the Mines Department in gathering information, we believe there is much unwisdom and niggardliness in distributing it.

The Public, as Owners, Should Know More

It may be argued that the Government, as owners of coal areas leased to others, is not at liberty to expose information that would be inimical to the interests of those operating these properties. Nobody wants them to give away any business secrets that would jeopardise the coal industry. But coal is the property of the people, and they ought to know what means are being taken to conserve the coal fields and win the largest possible amount of coal from every working seam.

It may be further contended that all plans showing projections of new work must be approved by the Mines Department before they can be carried out. This is quite true; and while the carrying out of those plans is the only proof we now have of knowing that the Department did approve them, there is nothing in the reports to show the reason why plans were approved. For instance, a colliery is closed down, as happened at No. 9, and the men are transferred to the lower seam. If the Department follows out its usual course, no statement will would be made at the end of the year showing why this was done. At the same time it is well known that the bulk of the men in that district firmly believe that the Dominion Coal Company for sinister purposes made this change. If it were known that an explanation would be made by the Government as to why this mine was shut down, there would be less suspicion, less distrust, and less criticism.

Miners Should be Informed

Again, when new conditions arise, causing a change in the methods of working, which change is sometimes irksome to the miner, the reason for the change should be openly stated and the mining population should have confidence that the Government has full information, enabling them to determine whether or not the change is in the best interests of the industry.

Within the past ten years great changes have come over the mines of the Province. Under sea work has become so general that seventy per cent, of Nova Scotian coal is mined from this source. The Pictou coal fields have passed through an experience with spontaneous mine fires, which have been courageously met and successfully overcome. The Cumberland collieries, especially Springhill, have reached a depth at which their methods of mining have had to be changed. We do know that the Government were most deeply interested during all this time and tried to procure information from the best sources for the purpose of giving the greatest possible help. But they have failed to make this known, and in so doing have left the public to believe anything any thoughtless agitator may conjure up from the depths of his imagination.

Mine Inspection Needs More Publicity

Then again, what does the public know of the work of the Deputy Inspecters? There is nothing to show that these men visited any colliery during the year; and were it not the fact that some of us know that they do inspect the collieries of the district, we would never know it at all.. Does not much of the criticism which is levelled at thse men arise from the case just stated, viz., that there is nothing in the mines report over their signatures except a general statement showing machinery, material etc., of the coal mines? This is unfair to the Inspectors, to the Mines Department, to the miners, and to the public. Surely their work will stand scrutiny. Why, when a Deputy Inspector enters a mine and finds dangerous conditions and reports these, and makes suggestions, do they not appear in the annual report? And if on the next visit the Inspector found the danger had been removed or that it still remained and is again reported, why is this not published at the end of the year? It would show at least that the Inspector was on the job. It is the only way of seeing the Inspector at his work, and it is one of the things the miner, if not the general public looks for.

A Monthly Report Suggested

The answer may be made that mine visits of the Deputy Inspectors are so frequent that it would entail a large amount of printing and make a report too cumbersome. But a monthly statement, as now, is all that would be necessary and this could be sent out at the end of the year. We know that in the United States, Inspectors have much larger districts to cover and cannot visit them as often as is done by our own Inspectors in Nova Scotia; but their reports show their visits and what they have found and reported. Smaller districts make mine inspection in our Province all the better, but a short resumé of the work done and the collieries visited within a month would be sufficient, except in special cases such as have been referred to. This would counteract the impression that Government Inspectors are more for ornament than for use. The writer happens to know some of these men intimately, having worked with them in the mine and elsewhere, and he does not hesitate to state that they will faithfully do their duty whatever happens. They are conscientious, courageous men with long experience in coal mining. They are in sympathy

with the mining classes not anxious to do all in their power to help them. At the same time they are not blind to the weaknesses of the miner. They know that they are at times prone to take the way of least resistance, and when this course is pursued in violation of the law, then duty impels them to take action that does not tend to popularize their reputation or the Mines Department. However, it is to the credit of the miner that generally he recognizes the necessity of obeying the mining laws and in many cases gives active support to having these enforced.

The Inspector's Duties

The work of the mine Inspector is hard and dangerous, and when a mine explosion or a mine fire occurs, his task calls for the greatest courage. Indeed, men who constantly travel alone through the old waste workings of any colliery are in constant danger. This is so generally recognized that mine examiners travel these in pairs. These old ways are off the beaten track and men have been known to be injured when alone by falling rock and held under it for a long time before they were discovered. Every part of the mine must be inspected and reported to the Department and the Inspector who undertakes to travel and inspect a district of any size in Nova Scotia, is a busy man. It is part of the purpose of this article to show the Inspector in his true light, and also to help the Mines Department to see its reports as others see them.

Difficulties in Mining Nova Scotian Coal

The coal mines of Nova Scotia are difficult to operate. Nearly every problem known to coal mining has been met and either solved or is in the process of being solved. Contorted seams lie at heavy angles in Cumberland. Thick seams and spontaneous combustion are the bane of Pictou collieries. Cape Breton has been more fortunate but the process of erosion over many centuries has despoiled the Island of much of its natural wealth before cruel man discovered it, and in future he must penetrate far under the ocean bed to win a portion of what it left. The [illegible] problem is not the least of the many difficulties confronting the mining industry of Nova Scotia.

In the course of the [illegible] life of the Province its collieries have passed through [illegible] experiences of mine fires, floods and explosions. The factors that caused these [illegible] are still present and nothing but great care on the part of the companies operating and the Mines Department supervising, will prevent a [illegible]. Let us then have the work of the Department [illegible] in a way that will show what is [illegible] and the public will be less inclined to [illegible] to grow popular by criticising a [illegible] duty is being made to help the great key [illegible] of Industry.

[illegible] DISPUTE

A conference [illegible] United Mine Workers and the Dominion Coal [illegible] took place last Saturday. The result [illegible] the hope that springs eternal in the [illegible] been received, and there is a general [illegible] conclusion could come out of the conference [illegible] optimistic look for a speedy settle[illegible] of a conservative mind fail to see [illegible] among these latter are men who seem to [illegible] Coal Company has sold its output for the year at the low competitive prices of early summer. These are much below last year's prices and no increase can be granted, much less a return to the wage rates of 1921, the highest known to this Province.

If this be true, then the Coal Company is not in a position to take advantage of the rising market, due to the American strike. This may seem unfortunate, but business cannot be conducted along the lines of accident. It must have some basis of stability and the securing of coal contracts early in the year was good business. It may be difficult to persuade the workmen that increased coal prices are not being obtained. In this case, contract prices should either be made public or made known to the miners' executive. It would help the labor organizations to see just how hopeless their case is. It would also go to prove that the railways and industries of Canada were profiting by the lower prices of coal. Once the Coal Company has placed its position before the public, it will be up to the mine workers to show cause why they reject it and why they threaten to cease work.

A Suggested Way Out

To bring on a strike when the whole continent of America is facing a coal famine, in order to force the hands of the Coal Company, may seem good strategy on the part of the labor organization, but it is not calculated to win the sympathy of a public with fireless homes and idle industries. Should a deadlock occur and continue, the Government will be forced to step into the breach to try to effect a settlement. They should do this before the deadlock does occur as everything at the present time points to a cessation of work at the coal mines. Indeed, the Government is partly responsible for the present mixup, for if they had held off their hands last winter when the agitation was on for a second Conciliation Board, we believe the United Mine Workers would have discovered that they were "in wrong", to use a slang term. They would have learned their lesson. But, having succeeded in moving the powers that be to act, we may well believe another attempt of the same kind will be tried, and they will again look to the Government for aid, which will not be denied. The country cannot be left to freeze and the industries to close down without an attempt to keep the mines running. A way may be found to help out the coal industry as was done in Britain during the war. It is not necessary that the mines be taken under Government control, but a bonus could be granted during the coal famine season. But this should be done in such a way as to prevent trouble when the bonus is taken off. This seems to be only way at present of bridging the difficulty. It may well be, however, that the country will be against subsidizing any industry, nevertheless it is the duty of Governments to solve the problems arising within their country, and this seems at the present to be a practical solution, and the only possible one in sight.

When the American miners' strike is over there is little doubt that prices will become lower and competition for Canadian markets will be keener and anything that is done at the present time must have in view conditions that are sure to come. If the Company goes now to add to the miners' wages there is nothing surer than that when the coal trade returns to normal the taking this off again would be the beginning of more trouble. But if this were given by the Government then no objection against the Company could be made.

CORRESPONDENCE

A *Proponent of "Adargas"*

To the Editor, Canadian Mining Journal.

Sir,

I have just had called to my attention the article that appeared in your Journal dated June 23rd, referring to the Cia. Minera San Pascual de las Adargas S. A.

The amusing article in question was written, I understand, by Alexander Gray, but as I do not know where to reach him, and as I presume that you endorse all that is published in your paper, I am writing you on the matter of the article, in so far as it refers to me and to the Adargas mines.

With regard to the Adargas mines, I will only say that the author of the article evidently belongs to that somewhat extensive tribe of "*Know-it-alls*" that never do anything themselves except criticise others. I am surprised that he does not know sufficient Spanish to understand that "Adarga" means a shield, and the name of "Adargas" was given to the mines because Mexican Indian shields were found in the workings of these old mines years ago when they were reopened. True records exist proving that the Adargas mines were being worked long before a single pound of ore was ever mined in the whole Dominion of Canada.

The well-known integrity and professional reputations of Engineers Houston and Kirby speak for themselves, and although their experience probably does not include Africa, nothing Alexander Gray or the Canadian Mining Journal may say or insinuate can hurt them.

The Adargas mines have been worked for over two hundred years, as the vast amount of old workings, shafts, tunnels, etc., fully substantiate to any competent miner, and nothing the Canadian Mining Journal may say or insinuate can overcome the fact that these mines were always heavy producers of good ores, as all the smelters in Mexico, to which many thousands of tons of good ores were sold, can testify.

Where do you get that stuff about the Adargas Company planning a small mill?

The statement that the mines were not de-watered two months ago is a downright mis-statement (to put it mildly), and for your information I will say that the mines were de-watered over a year ago, precisely to show the people in Buffalo—Dr. Wettlaufer, Mr. Schoellkopf and "the formidable advisory Board"—that the large bodies of high-grade ores existed everywhere that the old Spaniards and Mexican miners left off working. These Buffala people were doubting Thomases like the Canadian Mining Journal and wanted to be shown before putting up their money for a railroad, 50 mile electric power transmission line and complete modern equipment in every way, which equipment is installed and in operation, ready to handle 500 tons of ore per day, as soon as the railroad is completed within a few weeks.

No Canadian mining engineer, either prominent, popular or otherwise, has visited the Adargas mines within the last six months. The only Canadian who has been at the Adargas recently is Mr. Poirier, who I have no doubt is respected and popular, and who called on Mr. Houston at the Adargas and stayed long enough to take a meal and a drink, but who saw nothing of the mines.

Either Mr. Houston or I will be pleased to show Alexander Gray or anyone else from the Canadian Mining Journal on the ground:—

First That the mines are de-watered.

Second That the large bodies of high-grade ore are visible, subject to examination and sampling.

Third That the mines are fully equipped to handle five hundred tons of ore per day, or more, as we have sufficient electric power to handle several times that tonnage.

Fourth That our standard gauge railroad is practically built and will be hauling ore shortly.

Fifth By investing one dollar in stock of Adargas, the books of the Company are open for inspection to show that the Company does not owe a single cent to anyone, nor are there any notes or bonds outstanding.

Your remarks about the seasoned promoter well known in Toronto circles is incomplete.

I have promoted two Mexican enterprises partly with Canadian capital, and am very proud of them both. The first promotion was the Mexican Northern Power Co., which constructed one of the largest dams in the world, forming the largest artificial body of water in the world, for the generation of electric power, which power is today being used in the mining camps of Parral, Minas Nuevas, Santa Barbara, San Francisco del Oro, El Rayo and Adargas, and will shortly be in Chihuahua City, Santa Eulalia and the Julieta mines. Were it not for this promotion of mine, it is probable that not a wheel would be turning today in the camps mentioned, while at present many mines are being operated, many thousands of tons of ore are being treated daily, and many thousands of miners are making a living, producing gold, silver, lead and copper.

Furthermore, the Governor of the States of Chihuahua has recently made a contract with the Mexican Northern Power Co. whereby the State acquired the water after it leaves the turbines and will irrigate something like three hundred thousand acres of land, thereby converting that much practically desert land into farms, and enabling many thousands of human beings to make a good living *for ever and ever*, much longer than the memory of Alexander Gray will last in Canada or Africa. This promotion of mine is a real benefit to mankind and I am really and truly proud to have had the vision to conceive it, promote it and carry it to a successful finish.

While the Mexican Northern Power Co. did not make any money during the several years of revolution in Mexico (not the fault of the promoter) this Company is now in first-class condition, making big money and will make more as time goes on.

Again I say I am proud of this, my first promotion with Canadian capital. Did I make any profit out of it? of course I did. Do you think I was entitled to any?

My second promotion with Canadian capital, the San Patricio Mining Co. of Parral, Chih., Mexico, owns the "San Patricio" and adjoining mines, are fully equipped with o first classs modern cyanide mill, which is running full milling capacity and earning good profits, and will do so far many years to come. I may also say here that the "San Patricio" mines were being worked long before Canada produced a single pound of ore of any kind, and probably will be producing good ore after most Canadian mines are only memories. I am also proud to have promoted this, my second promotion with Canadian capital.

With respect to the "Promoters" for whom Alexander Gray, and I presume the Canadian Mining Journal, have such contempt, I may say that if it were not for them having the courage to put in their work and money at the start to promote new enterprises, there would be very few properties operated, very little need for any mining Journal and a good deal less for any Alexander Grays.

I trust you will in justice, publish this letter, in answer to what I look upon as a very careless article published in your Journal on June 23rd.

Yours, etc.,

Paul Ginther

El Paso, Texas. July 27th, 1922.

British Columbia Letter

Collieries working at Capacity

The collieries of Vancouver Island are working to capacity. For weeks after the strike in the United States started there was little effect on the business of the operators of this section but recently the pressure has been felt and the active companies of British Columbia now are in the position of having their entire output taken up and finding it necessary to turn away buyers.

The Canadian Collieries (D) Ltd., producing 3,000 tons a day, is unable to meet the demand. Of this 1,000 tons is being taken by the Canadian Pacific and the Northern Pacific Railways. For the first time in many months the Company's coke ovens at Union Bay are in action, turning out 60 tons of coke a day for the Trail Smelter, Consolidated Mining & Smelting Company. Usually Trail is supplied from Fernie, by the Crow's Nest Pass Coal Company, but that source has dried up because of the strike extending throughout District 18 (U. M. W. of A.), which includes the eastern fields of this Province and the western parts of the Province of Alberta.

The Canadian Western Fuel Corporation, Nanaimo, is furnishing 1200 tons a day to the Great Northern, Union Pacific, and the Canadian National Railways. This and the smaller companies of the Island are turning out all the coal possible, without having difficulty in disposing of it. In Victoria, Vancouver and other Pacific Coast cities the situation is receiving much newspaper publicity and the people are being advised to lay in their winter supply, as some operators are predicting that the shortage later on will be so pronounced that the government will be forced to ration domestic fuel supplies.

The production of the Washington State mines at present is negligible.

The Coalmont Collieries, Ltd. (Coalmont (Nicola Princeton Field)) is producing about 800 tons a day and preparations are being made to bring the total to 1,000 tons. Most of this is being taken by the Great Northern, Canadian Pacific and Kettle Valley Railways. As development proceeds, it is predicted, a means will be found of doing away with the three-mile aerial tramway which provides transportation between the mine and the railway terminal. This will be done by the construction of a railway spur to the mine portal, a tipple and washery to be installed there and the coal delivered on railway cars direct. Hydroelectric power will be obtained to assist in the development and operation either by an extension of the West Kootenay Power and Light Company's transmission wire south from Princeton to Coalmont or by an independent installation on Granite Creek or the Tulameen River.

The Princeton Coal and Land Company is operating three new mines in preparation for the winter demand. One of these has been found to contain the best coal yet mined.

First Aid Contests on Labor Day

At a recent meeting of the Advisory Board of the East Kootenay Mine Safety Association plans were completed for the Mine Rescue and First Aid Contests to be held at Fernie, B. C., on Labor Day, September 4. The competitions will be in Mine Rescue Work, Senior First Aid, Ladies, and Junior First Aid.

W. R. Wilson, President and General Manager of the Crow's Nest Pass Coal Company, gave a dinner to the teams that took part in the contests held at Banff, Alta., on July 1st last. The Mine Rescue Teams of Fernie and Michel were congratulated for winning out against the best of the Province of Alberta and the Michel First Aid Team similarly felicitated on their fine showing.

New Trail in Portland Canal District

A reconnaissance trip has been completed by George Clothier, government mining engineer, over the Bear River-Naas Trail in order to obtain information as to the feasibility of constructing a prospectors' trail from Port Alice to the town of Stewart. Mr. Clothier says that work will be started this year, the route having been found practicable, and that it will be located as close to the 2,000 foot level as possible to ensure its being kept within the mineral belt. When this and other government plans are completed there will become accessible some 400 square miles of mineral-bearing territory.

Much Activity in Portland Canal District

There is more real mining activity in the Stewart District this year than ever before, states George Clothier, government engineer. The Premier is producing largely and steadily, about 200 men being on the payroll. There is development work employing from 10 to 15 men on each of several mines. These include the Divide Group, Superintendent Grant Mahood; the Big Missouri, Superintendent H. Howson; the B. C. Silver, of the Selukwe Gold Mining Co., C. A. Banks, manager, and H. Howson, superintendent; the Indian Group, of the Indian Mines, Prince Rupert, G. B. D. Turner, manager, and Roy Clothier, superintendent; the Prince John and M. C. Groups, being opened up by C. A. Mackenzie. On the Alaska side there are being developed on a similar scale the Alaska Premier, superintendent H. Tanner and the Fish Creek Mines, superintendent W. R. Forsyth. In addition probably a dozen properties are being developed with two or three men. Assessment work is being done on many prospects.

At Alice Arm there is not much movement besides at the Dolly Varden. However the Esperanza Mine is being worked while there are quite a few prospectors in the field.

Premier Producing 300 tons a day

R. W. Wood, president of the Premier Gold Mining Company, is visiting the mine. He is quoted as stating that the property now is producing about 300 tons of ore per day including mill feed. This ore is the mill production approximately 9,000 tons a month.

Silversmith Pays Dividend

The Silversmith Mines Ltd., operating the old Silver Star Mine, is back on a dividend paying basis having distributed $25,000 for the quarter ending June 30, 1922. The last previous dividend was paid on December, 1920. The mine is producing silver lead and the ore at present both mine and ore dressing plant are operated in better condition than at any time in the past. More than two million gallons of [illegible]

dends from the profits of the same property when known as Sloean Mine.

Annual Report of Howe Sound Mining Company

The Howe Sound Mining Company's Annual Report, just issued, shows an operating profit of $228,044.40 for the year 1921. This was made from the Company's Mexican properties, the Potosi Mining Company and the Calera Mining Company. The Company's British Columbia Company, Britannia Mining & Smelting Company, did not operate last year because of the destruction of the plant by fire. It is shown by the report, however, that 46,443 tons of ore were broken at the Britannia Mine during the year. This would indicate that plans are in hand for active production as soon as the 2,500 tons mill, now under construction, is completed.

To Test Placers in Bed of Tulameen River

An earnest effort is being made by Capt. Cates, a nautical man with some years of practical experience as a miner, to control the waters of the Tulameen River, sluicing the bed and recovering the riches it is supposed to contain in gold and platinum. He has constructed a dam that has stood the test of high water and, with other necessary equipment purchased and on the ground, seems on a fair way to reaching a point that will permit a thorough trying out of the theory he and many others hold regarding the wealth of this turbulent waterway. Two other companies are installing hydraulic plants. A considerable amount of platinum, derived from Olivine Mountain, it is said, has been found in the Tulameen. It has been picked up in the form of float, containing platinum, gold, copper, microscopic diamonds, and chromite, and is a thing by itself in the geology of the country. Analysis of a sample from Granite Creek shows it to carry palladium, rhodium, and osmiridium, as well as copper, chromite and iron. Nuggets of platinum have been obtanied from the Tulameen weighing half an ounce.

Progress at Britannia

Concrete work for the new mill of the Britannia Mining & Smelting Co., Howe Sound, is half completed and a start has been made on the steel erection for the fireproof mill building. Cranes, hoists, concentrating and screening machinery have arrived and the rest of the plant is expected in August. The electric railway has been extended for the transportation of supplies, and the concentrater storage bins, which will hold about 10,000 tons, are being built. Many new homes are being built for employees. Much development work has been done in the mine. The Victoria and Amy adits are now working, having been opened for the first time this year. Three levels have been driven, a shaft sunk to the 2200 level, and nine ore shoots developed by drifts, each with a good showing of ore. The ore will be raised to the Victoria level, whence it will be delivered to an ore-pocket from which it will be taken by aerial tramway to the 1600-foot or Empress Tunnel, which is provided with a 3-foot track and electric transportation. Through this tunnel the ore goes to the crushers, whence it is delivered on the 2200-foot or main haulage level and thence taken by rail to the mill. A camp is being built at the Victoria adit, one of its features being a sawmill with a capacity of 25,000 cubic feet of lumber per day.

It is reported that the Canada Copper Company, with extensive holdings at Copper Mountain and a mill at Allenby, is being re-organized.

For the three months ended March 31 last the Belmont-Surf Inlet Mine produced a net operating profit of $18,804.66.

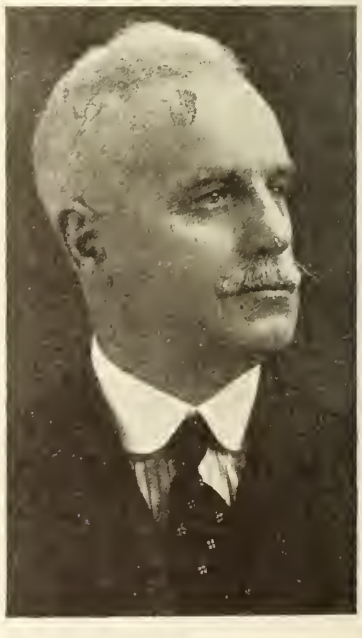
Pressure is being brought upon the British Columbia Government to back an Iron and Steel Industry. The British and Canadian Governments are said to have agreed to contribute one-third each of the capital involved, if the Province will guarantee the interest on bonds to the extent of the remaining one third. The policy of the Provincial Government has not yet been announced.

There are thirty-nine parties from the Geological Survey of Canada at work in eight Provinces and as well in the Northwest Territories and the Yukon. Ten of these are engaged on topographical mapping. In southern British Columbia a scheme of geological mapping is in progress with a view to the corrlation of the many isolated pieces of geological work already done, thus permitting the issuance of one general geological map of the area.

The Van Roi, Silverton; Gold Hill, Taghum; and Northport Smelting & Refining Company were three new shippers to the Trail Smelter, Consolidated Mining & Smelting Co., during the third week of July. Total receipts for the period were 6714 tons. Other shippers were: Sally, Beaverdell; Silversmith, Sandon; White Elephant, Ewing's Landing, and Company Mines. The latter contributed 6,272 tons.

A WELL-KNOWN EXECUTIVE

Mr. D. W. Clark, who recently became president and managing director of the Anglo-Canadian Wire Rope Company, will from now on have a more intimate con-



nection with the mining industry than in the past. He was formerly managing director of the Canadian B. K. Morton Company, manufacturers of tool steels in Sheffield. In that capacity he had already become known to many of the mining fraternity from Atlantic to Pacific.

Northern Ontario Letter

Dome

According to official figures to the Journal, the production of gold from the Dome Mines during the month of July amounted to $335,254 and was the second highest record at this time. The mill handled 31,900 tons of ore and established an average of 1,056 tons every twenty-four hours. The average gold content was a little under $11 per ton and resulted in a recovery of $10.55 from each ton of ore treated.

For the seven months ended July 31st the Dome produced approximately $2,280,000, with every indication that the income for the full calendar year will exceed $4,000,000.

Lake Shore

The annual meeting of the Lake Shore Mines was held Aug. 2nd. Plans announced for the future are that the shaft will be continued from the present 600-ft. level to a depth of 800 feet, at which point lateral work will be extended along No. 1 and No. 2 ore bodies. It has also been announced that the mining plant will be enlarged at once so as to provide facilities for taking out a larger volume of ore preparatory to enlarging the milling plant.

The net profit for the half fiscal year ended May 31st amounted to $169,167 and more than trebled that of the corresponding period a year ago when a net profit of only $51,723 was shown. Current assets amount to $449,990 as against $34,421, thereby leaving the company with net working assets of $415,569.

While the official statement showing the condition of the mine at the end of May shows 1,600 feet of drifting on No. 2 vein at the 600 ft. level and with 1,200 feet in good ore, yet it became known today that subsequent operations have extended this work to about 2,000 feet, with an even larger percentage of the drift in good ore.

The Lake Shore will pay a regular quarterly dividend of 2 p.c. on August 15th.

Goldale

The outlook on the Goldale property is gradually improving as work proceeds. The approximate point at which contact will be found between the basalt and intruding porphyry formation has been established.

The important discovery has been made that gold values are distributed through the schist in a way similar to the McIntyre Porcupine occurrence, although the extent and the consistency of this mineralization remains to be ascertained. These claims were explored in the early days of Porcupine, most effort being directed toward opening up quartz veins. Experience on other successful mines in Porcupine has shown that success or failure hinges upon the extent of mineralization in the schisted areas. It has been found that earlier work on the Goldale was so conducted as to avoid what are now proven to be the more promising sections. Some exceedingly good ore has been found at a depth of 240 feet.

Dome's Rich Ore Shoots

What constitutes good evidence that the Dome Mines will continue to produce gold at a rate of around $4,000,000 a year is to be found in the fact that there are now sixteen points in the mine from which high grade ore may be drawn. Some of the ore is as rich as that found on the Crocker in Munro township and equally as rich as that covered in the Elbow Lake district, which set all Northern Manitoba astir. The Dome management is endeavoring to discourage any tendency to place too great importance on the high-grade shoots and to keep in mind the average gold content distributed through large sections.

Another capital reduction is considered probable with the next regular quarterly dividend. This would ordinarily amount to $1 per share and would reduce the par value to $8, but it is being mooted in usually well-informed circles that the capital repayment may amount to $2 per share.

Nipissing in Kirkland Lake

The Nipissing Mining Company has secured an option on a mining claim situated on the west end of Gull Lake in the township of Lebel, adjoining the Kirkland Lake Proprietary. The claim was originally one of the Burnside group but was not included in the Burnside Company. The Nipissing will explore the property with a diamond drill.

New Find South of Tashota

According to Capt. J. Reddington, who has just returned from the Kowkash Mining Division, a discovery of gold has been made by prospectors who are engaged in carrying on exploration work in the forest reserve at a point about 12 miles south from Tashota. The gold occurs in a vein lying in greenstone formation in close proximity to a quartz porphyry intrusion.

Teck-Hughes July Production

During the month of July the Teck-Hughes mine produced more gold than during any previous month so far in its history, eclipsing any previous month in point of value recovered from each ton of ore treated.

It will be a few days before the complete official figures will be known, but it is already evident that the Teck Hughes made a close bid with the Wright Hargreaves for the position of being the largest producer in the Kirkland Lake district, each mine having produced between $75,000 and $80,000 for the period.

Favorable developments during July at the 730 ft. level caused the mill heads to rise to new high levels and resulted in a recovery of upwards of $25 per ton. It is evident from this that the achievement for the 31 day period placed the mine as the highest grade gold producer in Canada.

New Strike at Elk Lake

A rich silver strike has been made in Tisdale township on properties owned by local prospectors among whom are Fred and L. Quesnel and P. Desrosiers. The discovery was made some time ago but was not made known until negotiations for sale of the property were actually under way. Your correspondent has just been advised by Fred Quesnel that a deal has been closed, the names of the purchasers and the terms of the deal being withheld for the time being.

Queen Lebel Under Option

A. D. Miles, formerly of the International Nickel Company, has made an examination of the Queen Lebel Gold Mines and is considering the question of taking over the property on behalf of investors in England. The property lies to the east of the Burnside mine of the Kirkland Lake Proprietary and is regarded as being one of the more promising of the new properties in the development stage in this district. Prospect work to a depth of sixty feet has shown consistent gold values extending over one of the strongest veins in the district. The mine is now under option to Mr. Miles.

Gold Produced During July

During the month of July the gold mines of Northern Ontario produced approximately $1,755,000, according to preliminary estimates just made. This achievement sets a new high record so far in the history of gold mining in this province. It shows an increase of $10,000 over the June production.

The order of their production for July was: Hollinger, Dome, McIntyre, Porcupine, Wright Hargreaves, Teck Hughes, Lake Shore, Kirkland Lake and Kirkland Lake Proprietary, the first three being in the Porcupine field and the remaining five in the Kirkland Lake district.

With the exception of the Kirkland Lake and the Kirkland Lake Proprietary, all mills were operated at full capacity and handled an aggregate of approximately 175,000 tons of ore.

A reorganization of the Porcupine Crown is under way and holds out promise of renewed production, while the new financing now going on would encourage the belief that the Porcupine V. N. T. will be among the producers of the coming year.

While such substantial progress is being made at the established gold mines of Ontario, it is also true that there is a constantly rising wave of interest in new properties. British and American capital is available in substantial volume, in addition to increased amounts of Canadian capital. The net profit being realized from producing mines now amounts to over forty per cent. New properties, therefore, in these fields, are in demand and interest is spreading far and wide, embracing not only Porcupine and Kirkland Lake, but extending through Lightning River, Fort Matachewan, West Shiningtree, Larder Lake, Gondreau and Munro township gold areas.

South Lorrain

The Mining Corporation continues to meet with favorable results on its properties in South Lorrain. Four veins have been found to carry good ore-shoots and the indications are that the venture will be a profitable one. Until recently the development of ore had been confined it three veins and the prospects were favorable for these deposits being mined at a profit. More recent advice is that good ore has also been developed in Wood's vein, this being a continuation of the fracture along which such rich ore is being mined on the adjoining Keeley Silver Mines.

Thesaurus Prospect

Good ore is being developed on the Thesaurus property where drifting operations are being carried on at a depth of 100 feet. The pay-streak is from 14 to 18 inches in width and carries gold in spectacular quantities. In the wall-rock adjacent to the vein, there is also favorable mineralization and the ore over the full width of the drift may be classed as commercial.

The Thesaurus is controlled by James Nelson, a well-known prospector, and lies in the township of Baden a short distance north of Fort Matachewan. The property is equipped with a small steam-driven mining plant and the question of installing heavier mining equipment is now being considered.

Exploration on Oxford-Cobalt

Work is progressing along the vein at the 75-ft. level of the Oxford-Cobalt property, at a point in close proximity to the diabase-Keewatin contact. From a geological point of view this is regarded as being a favorable point at which to carry on exploration, and the work is occupying considerable interest among property owners in that part of the Gillies Limit.

Visitors at Lightning River

Interest is running high in the Lightning River gold area. Interest centres largely on the Lightning River Gold Mines, the property of the Canadian Finance Company, and the claims held by the Mining Corporation of Canada.

A group of investors involved in the Lightning River Gold Mining Company are leaving the railway today at LaReine, according to advice to the Journal representative. The purpose of the visit is to inspect the result of work already accomplished and to learn the extent and importance of new developments in the district. Another group of visitors will follow at an early date.

The following estimate of current gold productionhas appeared in Britain:—
(In millions of ounces).

Year.	Transvaal.	The Rest of the Empire.	British Empire.	Foreign Countries.	World.	Drop as compared with 1915 (the maximum) output. Transvaal. p. c.	British Empire. p. c.	World. p. c.

EDITORIAL

There are many mining enterprises carried on in such a way that the gambling element is almost eliminated; but these bona fide enterprises cannot operate in a fieta where properties have been given a fictitious value, due to stock promotion and manipulation. —*J. C. Gwillim*—1907.

AN OPPORTUNITY

Our quotation today is from an address to the Canadian Mining Institute by the late Professor Gwillim. There have been few men in the mining profession in Canada gifted, as was Professor Gwillim, with an all-round appreciation of the various factors that compose within, and influence from without, the activities of the mining engineer. His measured statement on this occasion is worthy of the closest attention of those who wish to penetrate to the heart of the mining business.

A large part of the news of mining that reaches the Canadian public nowadays through the daily press can be traced to one of two points of origin; it is an account of legitimate prospecting and mining operations, carried on principally by substantial corporations and private companies; or it is an attempt to interest the public in speculative ventures with a view to obtaining money. Of course, there are all varieties between these two; but the two will account for the bulk of the news items relating to mining.

The Canadian mining industry needs all the money it can get for its development just at present. A considerable fraction of the profits won from our mines is now being re-invested in the attempt to find and prove new mines. Constantly we hear of prospects optioned to one or other of the established mining companies, or to a group of successful mining investors, and occasionally we hear of the favourable result of such a venture. Fortunately such re-investment is becoming more and more the vogue. As the transaction is from start to finish in the hands of men conversant with the mining business, such investment is bound to be well-directed and economical on the whole. But the amount of capital thus available for the expansion of our mining industry is insufficient for the growth we hope and intend, it will have during the next few decades.

There is a very large amount of capital available from the public for mining development, provided the public can be assured of protection against fraud and manipulation. The amount available can be gauged roughly by the huge sums now transferred annually in the name of the mining industry. Though the "gambling" element can be eliminated from mining as completely as it can from almost any other business, still there is spice enough left in a mining venture to constitute a universal appeal. The "gambling" element in legitimate mining has been much exaggerated in the popular mind; but there is actually sufficient of it to offer an unusual attraction to the average investor.

How can we of the mining fraternity make this attractive feature accrue to the benefit of the industry and of our profession? Certainly not by standing by and smiling, in our superior wisdom, at the "lambs that are shorn," or at the "suckers that bite." We need not adopt a humanitarian point of view to see that our present complaisance is not only illogical but tends to our own destruction. Every dollar that is diverted from legitimate mining enterprise into the pocket of a fakir, is a dollar lost to the industry. The case is worse than that; for, "once bit, twice shy," the investor will not heed the call of a genuine promoter when he asks for co-operation. The old established professions have succeeded in clearing their ranks of fakirs; the quack doctor is now a rarity, and "shyster" lawyers are few and far between. The mining profession is in need of similar self regulation.

In justice to our profession, it must be made plain that our mine operators are now characteristically well trained, honest and competent men. It is another necessary part of the industry that needs attention urgently. "Mine promoter" is now a term almost on a par with the famous "mining expert," when this latter is interpreted as the superlative of "liar." To say today that a man is a mine promoter, is to place him very low in the scale of popular estimation. Yet the mine promoter is even more necessary to the industry than the mining engineer, for he is the natural and necessary medium between the prospector, who has an undeveloped "find," and the man with money to spend in opening up the prospect. Without him there would be few new mines developed.

Here we have clearly a case for organized effort. It will be useless to try to repress the activities of the present-day notorious "mine promoter" of the baser sort unless we provide an honest and reliable means of mine promotion. Here lies an opportunity for constructive effort that will furnish a rich reward to the man who devises the means for bringing the pioneer of the mining industry and the investor into harmonious and effective co-operation.

A PROMISE OF FUEL

The air seems clearer over the continent's coal fields, as we go to press. Both parties to the dispute, in both Canada and the United States, seem suddenly to have become aware of the gravity of the situation their difference has created. A compromise has been effected between the leaders on both sides, concessions being made chiefly by the operators. We (the unoffending public) may not have to chop down our shade trees for fuel next winter, after all.

The agreement reached in Nova Scotia, as well as in the United States, is in effect a reversion to the wages prevalent before the present period of acute dissension. The operators agree to a short term at the former high rate of wages, evidently in view of the greater evil that would befall both them and the whole population were a strike to endure throughout the winter. The miners have won the first round in the fight.

There is an obvious unity of action among both miners and operators that pays little heed to the international boundary. Last week this was seen particularly among the miners; now it is the operators of both Pennsylvania and Nova Scotia that have decided to yield, as gracefully as may be, to the pressure of necessity.

In the meantime we have in Nova Scotia an example of the danger of playing with fire. The refusal of the miners to disregard the well-arranged strike preparations in favour of the eleventh-hour agreement sanctioned by their leaders, is only the natural and inevitable result of the inflammatory disposition that has been assiduously cultivated among them for some time past. The extremist leaders have kindled and fanned a flame that is now, temporarily at least, beyond their control. Incendiary speech is not punishable by law, as is literal incendiarism; but it is equally as dangerous to well-ordered society. The firebrand of speech is morally just as culpable as he who fires a building, and is usually more of a coward since he is not subject to the rigours of the national law.

It is certain that coal miners, like all others in this weary old world since the Fall in Eden, will have to work for a living. It is just as sure that since competition in various guises is at present the guiding principle in the world's business, coal miners will have to fight, both hard and continuously, for their rightful share of the profits of their labour. When they do this fairly and squarely, in a spirit of justice to their employers and the community as well as to themselves, they will deserve and will obtain the hearty support of the public. We hope that the spirit of justice and fair play, observed by every honest man even in the midst of the bitterest fighting, will soon permeate their councils and inspire their leaders. We do not wish to see in Nova Scotia a reversion to the guiding principles of the Goths and Huns; we want the clean, British ideal.

THRIFTY CANADIANS

There is a belief current throughout Canada that we have now attained the state of nationhood. Canada's experience in the Great War is judged (in the main, correctly) to be to our country what the twenty-first birthday is to a young man. But like the young man, Canada has a long way to go, and a hard way at that, before we can pride ourselves on having attained the essential attributes of nationhood.

As with a young man, so with a young nation, earning power and financial solvency are the touch-stones of material well-being. In our case, no one will question Canada's ability to produce wealth beyond the average even of young countries; nor does our country's financial status alarm the well-informed, even though it may press hard upon those in authority upon whom devolves the duty of paying Canada's bills. It is the present wide-spread spendthrift habit of Canadians that is a matter of grave concern to those who take time to consider seriously the national well-being.

Nature has been so bountiful to us that the average Canadian earns a competence with comparative ease. True, we are a nation of workers, and our average production is high. But the Canadian does not have to struggle for a livelihood as does a German, a Frenchman or a Japanese. This is a fortunate circumstance that will stand us in good stead for generations to come, if we use the privilege rather than abuse it.

At present the average Canadian is inclined to waste the treasure that nature provides. It is a case of "easy come—easy go." We have still to learn the lesson that has taught every peasant in France the value of a bank-account, and that made Britain the world's creditor. Only the merest fraction of Canadians have yet learned to save and to invest. Until the lesson of thrift has been well ground into us, we will continue to be on a par with the reckless youth whose new-found freedom from parental authority results in an orgy of expenditure—with its inevitable results.

Canada is fortunate in having at present a Minister of Finance who is fully aware of our besetting sin (in the financial way), and who is determined to exert every means within his power to help his countrymen to overcome it. Mr. Fielding's announcement that the Victory Bonds issued in 1917, which mature December 1st of this year, can be converted on favourable terms into another issue of Dominion bonds, is an inducement to a host of small investors to carry on the good habit they inaugurated five years ago. The elimination of the tax-free concession will make the new loan less attractive to large investors, and that is not to be regretted.

We hope, and believe, that the growing spirit of nationalism will be sufficient at this time to induce a general response to the test now provided by our veteran Minister of Finance. We must learn to be thrifty, for our own sakes as well as for the sake of our country.

A MYTH IS EXPLODED

During the past quarter-century there have been numerous attempts to use the veins of anthraxolite that were discovered in the Sudbury district in the nineties. It is highly significant that these attempts give evidence of very little work on the veins themselves, compared with the effort made to pry loose from the investing public some of its hard-earned cash. In fact, a comparison of work accomplished in the field with the volume of propaganda based upon it makes it obvious to the initiate that here has been one of the numerous attempts to exploit the public on the basis of a fancied natural resource. Anthraxolite has been of use to the stock jobber, not to the miner.

We publish today the full text of an official statement issued from the Department of Mines, Toronto. In view of the present attempt to raise money on the strength of the alleged coal beds, the Department has evidently deemed it wise to make assurance doubly sure by having the deposits and the locality examined once more, by both a geologist and an engineer. Mr. C. W. Knight, Assistant Provincial Geologist, and Mr. James Bartlett, Inspector of Mines, have reaffirmed Dr. Coleman's conclusion of twenty-six years ago, and demonstrate once more the fact that by no conceivable means can the anthraxolite veins of the Sudbury district yield any but an insignificant amount of fuel, and poor fuel at that.

We have before us a written statement designed to convince investors that there is a possibility of finding coal beds in the rocks near Sudbury. It is a hodge-podge of fact and misstatement and was circulated quite widely in the daily press a few months ago in the form of interviews and news "stories." A few excerpts will serve to show its style.

The absence of fossils in the rocks of the Sudbury series has been questioned in this way: "Fossils have been found "by myself and my assistant, also by three independent "gentlemen who examined the district." Mr. Knight discovers that these fossils were found in a gravel bed. Enough said!

Farther on, we read that "I have indisputable proof "from the ground that the carbon in the shales at point "of contact with the earth is due to coal beneath. I have "in my possession a sample which clearly shows the coal "in contact with the shale, and the saturation of carbon "direct into the shale." These pseudo-scientific rubbish and, like most of the rest of the statements made, mere quibbling. The writer wishes to convey the impression that he believes in the presence of beds of coal, but he makes his statement ambiguous so that it may not be actionable.

The Department of Mines is to be heartily commended in taking this direct and decided action on behalf of the public. If there were a remote possibility that coal might be found in the Sudbury region, exploration would be justified. As there is no such possibility, this official report will make it plain, even to the unsophisticated, that any attempt to raise money in a search for coal there is more than likely to be a downright swindle.

EDITORIAL NOTES

Mr. Rolph's paper, on another page, is one of those pieces of research that, put together in sequence, constitute the basis of most of our technical progress. It is an item in the thorough examination now being made in the mining engineering laboratories of Toronto University with a view to determining the fundamental principles of grinding in a ball mill. Mathematical data such as those recorded by Mr. Rolph are an essential part of such a research, and we publish them here, confident that they will be of service to numerous students of the grinding problem.

It is a significant fact that the Portland Canal district, which was booming fifteen years ago, continues to disclose ore bodies that will make mines. There, as elsewhere throughout Canada, the spaces are so vast that the prospector cannot do more than skim over them in the first rush. Only the obvious outcrops are discoverable by such means, and the fact is that only a small proportion of ore bodies can be found by the means available to the prospector who travels far and fast. Detailed work will continue to disclose, in the Portland Canal district as elsewhere, new ore deposits for many a year to come.

We wish to draw attention to an item on another page, under the caption "The Spectrograph for Metallurgical Work." It is not fully realized by the generality of practical metallurgists that there is now available, in usable form, an apparatus that will dissociate, almost instantly, the ingredients of the most complicated alloy, slag, or other material. It may be that spectrum analysis will become an important aid in metallurgical works, particularly in those where smelting is practiced. If so, its trial and use by practical metallurgists will hasten the day when its further perfection will allow of its fuller use.

TENDERFEET

Twilight was dying into dusk. The moon,
Now risen, gave promise of rich radiance soon
To silver stream and forest and high hill,
Where barren boulders posed as sentinels.
The loon, unseen, poured out his harsh refrain
Harsh, yet harmonious in its dying strain.
Mystic glamour brooded o'er the scene,
All was precisely as it should have been.
Pipes lit, meal done, and flies not too malignant,
But no one volunteered to wash the dishes!

VNON

The Maple Leaf Asbestos Corporation

Among the mills that have commenced operations during the last two years in the Thetford area of the Province of Quebec, is that of the Maple Leaf Asbestos Corporation. This mill is located on Lot 29, Range A of the township of Coleraine, about half way between Thetford Mines and Black Lake, and one mile south-east of the main line of the Quebec Central Railway.

Early Development

The property operated by the Maple Leaf Asbestos Corporation consists of Lots 27, 28 and 29, Range "A", Coleraine. This property was worked in the early days of the industry by the late Dr. James Reed. The workings at that time consisted of five small pits on lot 29, and two on lot 27. The formation in the two groups of pits varies considerably. On lot 27 the asbestos is concentrated in veins of Crude varying in width from $\frac{3}{4}$ in. to 3 in. These veins are separated by masses of completely barren rock. On lot 29, however, this condition does not prevail. Here there are very few areas of barren rock, and whereas the amount of long crude is considerably less than on lot 27, still there is a very good percentage of No. 2 Crude, while most of the rock is a very good grade of mill ore.

When these claims were worked by Dr. Reed, the pits on lot 27 were worked for crude. On lot 29, a small mill was constructed. The motive power was steam. In the spring of 1920, a syndicate was formed for the purpose of operating these claims, the plan being to mill the ore from Lot 29, and to work lot 27 for Crude. The results obtained from the operation of this small mill were so good that it was decided to erect a larger plant. Accordingly, in the fall of 1920, the Maple Leaf Asbestos Corporation was formed to erect a mill of 400 tons daily capacity. The construction of the mill was put through very quickly, the clearing of the ground beginning on November 1st, and operations being under way by March 2nd, 1921. The plant constructed at that time by the Maple Leaf Asbestos Corporation is the same that is in operation to-day. Certain changes have been made in the flow-sheet and some additions have been found necessary in the storage of asbestos; but the mill is essentially the same as when it was erected.

Plant

When it was decided to go ahead with the new mill, an effort was made:

1. To keep the investment as low as possible.
2. To balance the production of rock from the pit with the capacity for milling material.
3. To secure ample dump space for tailings.
4. To provide for ease of handling material from the pit to the mill.

Though it may be said that these objects are almost invariably sought for in the construction of a new plant, it must be pointed out that the Maple Leaf Asbestos Corporation adhered to this policy strictly, and attained its end to a marked degree. The necessity for this was accentuated with this company for the reason that the engineering advice obtained by the owners of the enterprise was to the effect that prices were at a very high level, unknown until the war, and that in all probability, unless the plant could be so designed as to work under conditions of normal prices, it would prove a failure.

Crushers, Mill and Dump — Maple Leaf Asbestos Corporation

The method of mining was gone into very carefully, and though it appeared that a cable derrick is not very economical for a long haul and a deep pit, it is extremely economical for a short haul and a shallow pit. It is largely for this reason that cable derricks were installed, since the pits are comparatively shallow and within 50 yards of the crusher. As the pits become deeper, the company expects to change this form of haulage to the crusher. For the method of mining, the open pit was decided upon as being by far the most economical.

Flow Sheet

Rock from the pit is loaded into two-ton boxes, which are hoisted by cableways to a chute discharging directly into a 15 in. by 30 in. jaw crusher. Boxes with dry rock are stopped just before reaching the crusher chute and are dumped direct into a four-ton car, which runs out to the rock dump by gravity and is hauled back empty by an air hoist. It is interesting to note here that 800 tons of rock have been handled in one day by the two cable derricks, each operated by a 50 H. P. motor. But this is exceptional, and the two derricks ordinarily handle daily 350 to 375 tons each. The large tonnage and low horsepower is due partly to the fact that the pits are shallow and near the mill.

From the jaw crusher, the rock discharges into a 30 foot by 50 inch, rotary dryer, which is heated by coke burned in a specially designed fire box, calculated to give a maximum efficiency in drying per pound of fuel burned. From the dryer, the rock discharges into a No. 3 gyratory crusher from which point it is conveyed into a mill bin with arrangement so made that the crusher house may feed direct into the mill or bin, also so that it may feed partly into the bin, and partly into the mill. The crusher house is so designed that, generally speaking, a very uniform flow of rock is obtained, when feeding direct from the pit into the mill. This saves unnecessary hoisting of rock with the elevator. The ore entering the mill goes through a Torrey cyclone, or a hammer crusher, either one machine or the other being used according to the class of fibre it is desired to make. From this point the ground material passes over rock screens and the fibre is lifted off by air suction, the rock continuing to a Laurie cyclone. The discharge from this machine passes over more rock screens, and then follows on to the tailing belt. Grading is accomplished on several sets of grading screens, which are aided in certain instances by dusters.

No attempt is made here to describe the special arrangement of suctions and grading screens, as these are varied in accordance with whether it is desired to produce a fibre with a great deal of "life", as shingle stock, or soft fibre like paper stock. The finished fibre drops into bins at the opposite end of the mill from which the rock enters. These bins are within 15 feet of the bag chute, which discharges by gravity directly into the storage shed. The whole system is extremely compact and calculated carefully to pass a maximum tonnage with the minimum amount of labor.

Characteristics of the Fibre Produced

Of all the fibres produced outside the actual Thetford deposit, the Maple Leaf resembles more closely the Thetford fibre than any other. The "C" fibre is exceptionally white; paper stock is uniform and white; the "X" Fibre is tough, and at the same time not harsh; while the crude, when carded, compares exactly with carded Thetford crude. This is curious for the reason that other mines lying only a short distance nearer to Black Lake than the Maple Leaf show distinctly the characteristics of the harsher Black Lake fibres, which does not appear at all in the Maple Leaf grades. Also, although the Maple Leaf fibre is a pure white, there is no talc in it, the colour being due entirely to the intrinsic whiteness of the asbestos itself.

The first impression one receives of the plant is the absolute absence of lost motion, the rock going direct from the pit to the crusher, from there direct to the mill, and from that point direct to the sand dump. This naturally keeps the power costs for extra handling down to a minimum, and also allows the plant to be run with the least possible number of operatives. On careful inspection this proves to be the case. Aside from the regular men needed to watch the different machines, the complete number of extra men consists of two carpenters and one helper for general repair work, and one dump cart for stripping. On the night shift there are no extra men. On inspecting this plant carefully, it would seem that it is extremely well operated, considering its size, and should compare more than favorably in the matter of costs with many of the larger plants in the district.

The plant of the British America Nickel Corporation has resumed operations in a small way.

THE SPECTROGRAPH FOR METALLURGICAL WORK

During recent years, developments in the appliances and technique of spectrographic work have been marked, and have now begun to make this branch of qualitative analysis available in a practical way. Messrs. Adam Hilger, Ltd., 75a Camden Road, London, N.W.1., have recently issued a series of catalogues and folders descriptive of the advances in the art of spectrography and its uses, and the appliances they are prepared to furnish. From one of these we gather the following data.

Spectra for the accurate determination, qualitatively, and the approximate estimation, quantitatively, of the ingredients of, say, a complex high-speed steel can now be readily made with spectrum apparatus. Arc spectra obtained through the agency of poles specially prepared to suit varying circumstances are recorded in photographs, and examined at leisure. The actual taking of the photograph can be accomplished by an intelligent assistant, and the chemist himself has now the means of readily interpreting the lines recorded on the spectrogram.

"To the analyst, the complete qualitative analysis of an unknown alloy, revealed by a spectrogram, is a sure basis for the planning of the most direct and rapid method of attack. As the determination of each element proceeds, the purity of precipitates may be checked as often as desired. The spectrograph proves invaluable in the recognition of impurities, the separation of which would involve a lengthy and difficult procedure, or when the weight of an unknown is less than is necessary to complete the desired determinations. A few hundredths of a gram will usually suffice for spectrographic analysis.

"Impurities in raw material are often a source of annoyance, especially when their detection involves delay and costly analytical work. Whether low conductivity in copper is due to arsenic, nickel, or something else, may be quickly found out. Residual traces of boron, magnesium, manganese, silicon, vanadium and other deoxidising agents are easily identified where wet analysis may fail to reveal their presence, even after days of effort. Complex alloys of any kind are dissociated by the spectrograph into a spectrum, the reading of which gives the elements present, together with an idea of the relative amounts of each. The secrets of the inventors of alloys and hardened metals are no great problems when, for their solution, one can depend on the application of the microscope and the spectrograph."

This gives a suggestion of the rapidly expanding field in commercial as well as research work now open to spectrum analysis. The spectrum bids fair to become to the analyst what the X ray is now to the surgeon and dentist. The progress of the spectrograph must be followed closely by those analysts and metallurgists that wish to keep abreast of the times.

The nineteenth week of the strike in the United States, Aug. 7-12, opened with a decided increase in production. Returns so far received indicate an output of soft coal of about 1,800,000 net tons, or 500,000 tons more than the week before. The increase is due to gradual improvement in traffic conditions on the railroads serving non-union fields and also, but only in a very small way, to increased production in fields hitherto throttled by the strike. Despite this increase in bituminous coal output the nineteenth week finds production still about 550,000 tons below the level reached before the shopmen's strike.

Kick vs. Rittinger

AN INVESTIGATION OF THE LAWS GOVERNING CRUSHING IN BALL MILLS

BY E. A. ROLPH

In these days of reconstruction and desired expansion of operations in the mining world, the mill man is vitally interested in the question of capacity and efficiency. As a high percentage of milling costs is charged against crushing, it would appear to be of the utmost importance to be able to analyse crushing operations and calculate efficiencies. It is a well known fact that many of the improvements that have developed in the design and operation of mechanical engines, such as steam, electrical and oil, have been due to the ability of the engineer to measure the efficiency of each particular piece of apparatus. To explain the action of crushing, and as a means of interpretation of efficiencies, two laws have been put forth, commonly known as those of Kick and Rittinger. It is not the intention of the writer to attempt in this paper to prove or to disprove either one of these so-called laws of crushing; but rather to collect them in a form that can be quickly grasped and easily applied, as well as to give a brief description of the principles underlying each.

Kick's Law

Kick's law,* as enunciated by Stadler, who was its chief exponent, is as follows: —

"The energy required to produce analogous changes of configuration of geometrically similar bodies of equal technological state varies as the volumes or weights of these bodies."

Fig. 1 is a diagramatical representation of cubes under a crushing force to illustrate Kick's Law through the proportion of sides, work and energy on each cube.

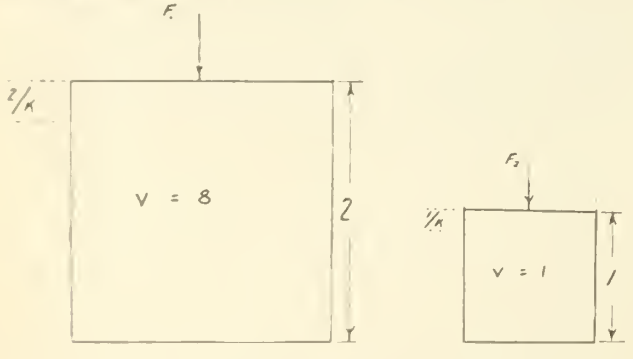

Fig. 1

Example of Proportions

Diameters, S, are in proportion of 2 : 1

Forces F_1 & F_2 are in proportion of $4 : 1$, from $2^2 : 1^2$

Work done is in proportion of $4 \times \frac{2}{K} : 1 \times \frac{1}{K} = 8 : 1$,

or as the volume.

This law seems to be based on three laws of mechanics which are now universally known and accepted. **Briefly stated, they are as follows: —

1. Within the elastic limit, the force required to produce a certain deformation is directly proportional to the area of the tranverse section.

2. The amount of deformation within the elastic limit is directly proportional to length of specimen and to force applied.

3. Work done in producing a given deformation is the product of the average force by the distance through which it acts.

These laws are certainly true in cases where change of configuration is within the elastic limit, and energy absorbed is proportional to volume. Supporters of this law claim that for perfectly elastic bodies it remains true until rupture occurs, and as they say rock is very nearly a perfectly elastic substance, the law still holds good and is a very close approximation to the truth.

The difficulty and difference arises in our not understanding just what does occur at the elastic limit. Without a doubt energy is proportional to volume up to this point. In opposition to this it has been stated * that at the point of rupture, the energy stored in the particle is released and aids in further deformation without further increase in energy absorbed.

A short mathematical expression of the above laws might prove of interest at this point.**

If W = work
- e = maximum unit stress within elastic limit
- f = deformation
- l = length of body
- A = area of transverse section
- S = any unit stress within the elastic limit of the substance
- P = Units of force
- D = edge of unit cube
- E = modulus of elasticity

Then, within the elastic limit:

$$f = \frac{PL}{AE}$$

$$W = \frac{Pf}{2} = \frac{P^2L}{2AE} \qquad S = \frac{P}{A}$$

$$W = \frac{A^2S^2L}{2AE} = \frac{S^2 \times AL}{2E}$$

If we assume the particle under load to be a cube of edge D, then $A = D^2$; $L = D$; $\frac{S^2}{E}$ is a constant.

Therefore $W = \frac{S^2 \times D^3}{2E}$ or is proportional to volume.

The above is a brief description of the basis of all arguments in favour of this law.

Application of Kick's Law.

In any regular series of sized particles, the volumes or weights of the particles decrease from grade to grade in the same ratio as the number of particles in a unit volume increases. In other words, the point is that volumes decrease as number increases. Then the product of the volume and the number of particles of that grade is a constant, for each and every grade in the scale. According to Kick the energy absorbed is proportional to the volume of the body

** See Taggart's Paper.

crushed, therefore it follows that the energy required for reducing the unit weight is constant for each grade. That is, it requires the same energy to crush from one inch cubes to half inch cubes, as from half inch. to one-quarter inch. Since this is the case, the ordinal numbers of any aritmetical progression given to these grades, represent the relative values of energy which has been spent on the unit mass to bring it to that grade. For example if to crush a unit weight of 1in. cubes to $\frac{1}{2}$in. cubes requires 1 energy unit, and to crush from $\frac{1}{2}$in. to $\frac{1}{4}$in. requires 1 unit, then to crush from 1in. cubes to $\frac{1}{4}$in. requires 1 plus 1, or 2 units, which would be the relative value for that grade. Similarly 3 would be required for $\frac{1}{8}$in. cubes, etc.

The arithmetical mean of the ordinal numbers of the two screens determining a grade represent, in accordance with Kick's Law, the energy absorbed in making that grade from the initial unit mass.

These ordinal numbers are also known as Energy Units and are the multipliers by which the percentages of each grade must be multiplied to give the energy value of that grade. The sum of these products represents the number of energy units or the ordinal number of the whole sample. If an analysis is made of the feed and discharge of any crushing device, and the energy units calculated, the difference between the two represents the work done per unit in the machine. In order to obtain total work done, multiply work per unit by the tonnage dealt with.

The relative mechanical efficiency =

$$\frac{\text{Tonnage} \times \text{Work per Unit in Energy Units}}{\text{The Horsepower}}$$

Since most industrial plants and practically all laboratories use the Tyler Standard Screen Scale, this table of E. U. for Tyler grades is given thus by Taggart:—

Aperture	Mesh	Ordinal No. or E.U.
1.050 In	1.05	0
0.742	0.742	1
0.525	0.525	2
0.371	0.371	3
0.263	3	4
0.185	4	5
0.131	6	6
0.093	8	7
0.065	10	8
0.046	14	9
0.0328	20	10
0.0232	28	11
0.0164	35	12
0.0116	48	13
0.0082	65	14
0.0058	100	15
0.0041	150	16
0.0029	200	17
0.0014 (assumed)	-200	19

In this case he assumes the average size of the -200 mesh particle to be 0.0014in. and assigns it a value of 19. Most writers prfer to use 20 or even higher as being fairer than 19. There is some question as to what the correct size of this material should be. However, any reasonable size and corresponding value adopted should be as fair to one case as to another.

Example of Calculation of Relative Effuciency in Kick's Energy Units

Case 1	Case 2
Mill — 1ft. dia., 18in. long	1ft. × 18in.
Load — .3to 1in & $\frac{3}{4}$in Balls	.6 ditto
Feed — 400 gms per min. = .634 tons per 24 hrs	400 gms. per min = .634 ton per 24 hrs.
H. P. — .2105	.3179

Case 1 and Case 2 will now be compared as to efficiencies:

CASE 2.

Mesh	E. U	Feed%	E.U. Feed	Disch.%	E.U	Disch
14	9	29.2	263.0	0.0		
20	10	50.2	502.0	0.2	2.0	
28	11	20.4	224.4	0.9	9.9	
35	12	0.2	2.4	3.0	36.0	
48	13			7.3	94.6	
65	14			12.4	174.0	
100	15			20.2	303.0	
170	16.5			16.6	274.0	
-170	20			39.4	788.0	
Totals			991.8		1681.5	
Units of Work Done			1681.5 —	991.8	= 689.7	

CASE 2

Mesh	E.U.	Feed%	E.U.Feed	Disch.%	E.U	Disch
14	9	29.2	263.0			
20	10	50.2	502.0	0.9	9.0	
28	11	20.4	224.4	2.8	30.8	
35	12	0.2	2.4	3.8	45.5	
48	13			5.9	75.6	
65	14			7.7	107.8	
100	15			14.8	222.0	
170	16.5			15.9	262.0	
-170	20			48.0	960.0	
Totals			991.8		1712.7	
Units of Work Done			1712.7 —	991.8	= 720.9	

Therefore Case 2 has the greater capacity, or more work has been done. Now, let us examine the relative mechanical efficiency, since feed or tonnage is the same in both cases.

$$\text{Case 1 Effic.} = \frac{689.7 \times .634}{.2105} = 2070$$

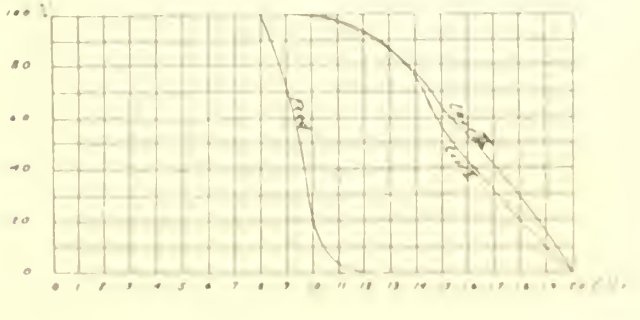
$$\text{Case 2 Effic.} = \frac{720.9 \times .634}{.3179} = 1439$$

Dividing by 100 to bring these figures to the usual expressions, the relative efficiencies are as 20.7 is to 14.4, or Case 1 is 43.7% more efficient than Case 2.

Graphical Representation of Kick's Law

The results of the application of Kick's Law for comparison can be plotted on squared paper. If mesh or ordinal numbrs are plotted equidistantly along the horizontal scale, they will represent energy according to this law. On the vertical scale are plotted weights in percentage through the screen. The space between equally spaced horizontal lins represents equal volumes or weights. The area between the curve of original material and zero coordinates represents the energy already spent upon it and the area between curves of feed and discharge represent energy absorbed in the machine according to this law.

One square on the diagram is equal to 1 × 10 E U's; so by counting the squares to the left of any curve, the total energy per unit for that sample may be computed readily, and effiency calculated as before. Comparison of curves of Case 1 and 2 shows the increase of work in Case 2 over that of Case 1



Rittinger's Law

"Work done in crushing is proportional to new surface exposed by the operation".

Figure 2 is a diagrammatical representation of cubes under force to illustrate Rittinger's Law, through the ratio of areas of section, forces, and dislocation of offset faces.

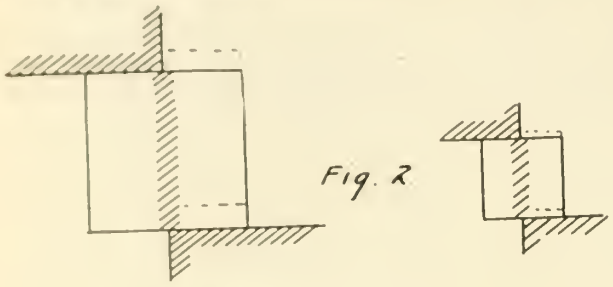


Fig. 2

Example of Proportions

$$\text{Area of Section A} : \frac{A}{4}$$

$$\text{Shearing Force F} : \frac{F}{4}$$

$$\text{Dislocation of offset faces D} : D$$

$$\text{Energy FAD} : \frac{FA}{4D}$$

1 : 4 or as the surfaces.

Gates *explains the application of the law to above figures as follows; —

Suppose forces were applied on the two offset faces until the deformation shown by the dotted lines was secured; then only the molecules along the centre vertical line will be stressed and deformed. The mass away from this line or surface will receive no pressure or deformation. In this case the assumption is that the material is perfectly rigid and inelastic. The force would then act in the fracture plane itself and the distance which the external force would have to overcome to do work would have vanished.

Rittinger stated that increase of surface is directly proportional to the force required for reducing, "and, therefore, also to work absorbed in effecting the separation". Now work is defined as the force times the distance through which it acts. Therefore if work is proportional to force, the distance factor must be ignored altogether or else taken for a constant.

This criticism of the theory is a very active one, and at the present time has not been proved one way or the other, although evidence has been offered to explain that the distance is very nearly a constant for any material.

The practical part of the application of this theory is in determining a means of measurement and designation of the surface in any particular grade of unit weight.

This relationship can be shown by an application of the laws of mechanics discussed under Kick's Law:

$$\text{We have } W = \frac{P\,f}{2} = \frac{P^2 L}{2AE} \text{ since } f = \frac{P\,L}{A\,E}$$

Now, if P and E are constant,

$$W = \frac{K\,L}{A} \text{ where } K = \frac{P^2}{2E}$$

or for a cube of diameter D,

$$W = \frac{K\,D}{D^2} = \frac{K}{D}$$,or is proportional to the reciprocal of the diameter.

Since this relationship exists, for given weights of rock the total surface of all the particles in each grade varies inversely with the diameter. Therefore the total relative surfaces exposed by each grade are obtained by dividing the weight by the average diameter of particle in that grade. Then the relative work done is found in the same manner, dividing the weight by the average size of diameter of that grade. It will then be necessary only to multiply the reciprocal of the diameter by the percentage in each grade to determine the amount of work completed. Then, knowing the amount already done befor entering the machine and that done on its discharge, we have the amount done in the machine by substraction.

To find the relative efficiency, multiply this figure by the tonnage fed, and divide by the horse-power.

Table of Reciprocals of Diameters for Tyler Standard Screen Scale

Production	Mesh	Diam. Av. Size Particle	Reciprocal
1.050		1.268	.788
0.742		.896	1.115
0.525		.6335	1.582
0.371		.4480	2.23
0.263	3	.3170	3.15
0.185	4	.2240	4.46
0.131	6	.1580	6.34
0.093	8	.1120	8.92
0.065	10	.0790	12.65
0.046	14	.0560	17.85
0.0328	20	.0395	25.1
0.0232	28	.0280	35.8
0.0164	35	.0198	50.5
0.0116	48	.0140	71.5
0.0082	65	.0099	101.0
0.0058	100	.0070	142.8
0.0041	150	.0049	204.2
0.0029	200	.0035	286.0
	— 200	.0014	715.0

The correct reciprocal to use for the -200 mesh is a much debated question. Bell* used 780 in his calculation. The concensus of opinion appears to indicate that a somewhat higher value should be used. However, for practical purposes 715 seems a fair value to use. The examples used are the same cases worked out previously according to Kick's Law. The Letters R. S. U. are used as an abbreviation for Rittinger surface Units.

CASE 1.

Mesh	Recip.	Feed p.c.	R.S.U. Feed	Disch. p.c.	Disch.
On 10	12.65				
14	17.85	29.2	521	0.0	
20	25.1	50.2	1260	0.2	5.02
28	35.8	20.4	730	0.9	32.2
35	50.5	0.2	10	3.0	151.5
48	71.5			7.3	518.0
65	101.0			12.4	1250.0
100	142.8			20.2	2880.0
170	238.0			16.6	3950.0
— 170	715.0			39.4	28200.0
Totals			2251		36986.7

Work done per unit = 36986 — 2521 = 34465 R.S.U.

*A. O. Gates E. & M. J., Vol. 97, p. 795; Vol. 95, p. 1033.

*An investigation of Rock Crushing made at McGill University.
John W. Bell, Trans. C. M. I., Vol. 19.

CASE 2.

Mesh	Recip.	Feed p.c.	R.S.U. Feed	Disch. p.c.	Disch.
10	12.65			0.0	
14	17.85	29.2	521	0.0	
20	25.1	50.2	1260	0.9	23.0
28	35.8	20.4	730	2.8	100.0
35	50.5	0.2	10	3.8	192.0
48	71.5			5.9	422.0
65	101.0			7.7	778.0
100	142.8			14.8	2110.0
170	238.0			15.9	3790.0
-170	715.0			48.0	34300.0
Totals			2521		41715.0

Work done per unit = 41715 — 2521 = 39194 R.S.U.

Indicating that Case 2 has the greater capacity.

Relative Mechanical Efficiency

$$\text{Case 1, Efficiency} = \frac{34465 \times .634}{.2105} = 103{,}700$$

$$\text{Case 2, Efficiency} = \frac{39194 \times .634}{.3179} = 78{,}200$$

Relative efficiencies are as 10.4 : 7.8, or Case 1 is 33.4% more efficient than Case 2.

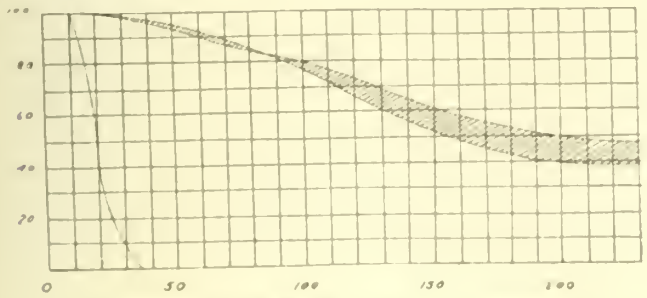
By Kick, Case 1 is 43.7% more efficient.

By Rittinger, Case 1 is 33.4% more efficient.

Graphical Representation of Rittinger

"Energy is proportional to new surface formed in the operation."

It has been shown that the relative work done is found from the product of weight and reciprocal of average size of particle according to this law. This product can be shown by an area, which forms the basis for the crushing surface diagram.



On the vertical scale are plotted weights per cent., so that the material between any two equally spaced horizontal lines has equal weight or volume.

On the horizontal scale are plotted reciprocals of diameters, so that the distances measure the differences in reciprocals between two points on the same screen analysis curve. These points are called "theoretical mesh" by Gates.

The area between the curve of the original material and the zero coordinates represents the energy absorbed in reducing the material to its present state. The area between this curve and the discharge curve is proportional to the energy absorbed in crushing in the machine. This area is then also proportional to the actual surface produced. Applying proper constants, the actual surface can be measured.

To measure the surface, a new unit was devised by Gates, which he called a "mesh gram". This unit quantity is defined as the surface produced when one gram of particles of the same size or diameter is reduced to a diameter whose reciprocal is one greater than before reduction. Similar terms as mesh tons, mesh pounds and mesh per cent. can also be used.

From the definition of a mesh gram, it is weight times difference of reciprocals, or weight divided by diameter, which is a measure of surface, so that a mesh gram is a measure of surface.

From the chart it is evident what a large part of the area extends to the right of the diagram or in the -170 mesh product.

The hatched portion shows the increase of work in Case 1 over that of Case 2.

The portion of the diagram to the left of the feed curve represents energy already spent to bring it to that condition.

One square on the diagram is equal to 10 × 10 or 100 surface units.

Conclusion

This paper has been an attempt to set forth the essential differences in the theories of Kick and Rittinger, as well as the application of each to concrete examples for the calculation of efficiencies.

Although the theory of Kick might appear the more logical, experimental work has served to show that Kick's theory is not applicable, while that of Rittinger conforms with the results of experiments.

Toronto University, July 1922.

ELECTRO-CASTINGS, LIMITED

The electric steel plant at Collingwood, Ontario, operated during the war by Wm. Kennedy and Sons and later acquired by the Baldwin Canadian Steel Corporation, has been taken over by Mr. William T. Stevens, who has organized Electro-Castings, Limited, for the production of grinding balls, liner plates, castings for pistons and piston-rings and other such material.

At present a force of twenty men are engaged in operating and re-modelling the plant. The pay roll eventually will include fifty men. In addition to the present plant, new electric furnace equipment with a large daily capacity will be installed. In the meantime a two ton Heroult electric furnace is being operated.

The site of the plant is a fine one of six acres. The foundry is 170 ft., by 162 ft., and the main building 210 ft., by 100 ft. The premises also include offices, carpenter shop, storehouses and an electric sub station.

ADVANCE SUMMARY OF COAL STATISTICS

The Mining Branch of the Dominion Bureau of Statistics has issued an advance summary of coal statistics for Canada showing the imports of anthracite and bituminous coal by grades and by provinces during the first seven months of the present calendar year with comparative figures showing the average imports during the same period in the three years 1919-20-21. Exports of Canadian coal are also shown.

Table 1. Imports of Anthracite Coal by Grades and by Provinces

Province	Total for Yr. [illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Nova Scotia	8,926	29,781	31		28
Prince Edward Island	232	1,001			6
New Brunswick	23,077	36,876			68
Quebec	216,516	681,612	191	36,134	36

(Continued on Page 559)

The Alleged Coal Beds At Sudbury

The following official statement has been issued by Mr. T. W. Gibson, Deputy Minister of Mines, Toronto. It should dispose effectively of the campaign that has been conducted for some time past to interest investors in a wild goose chase after coal.—Ed.

It is confidently asserted that anthracite exists near Sudbury and suggestions are being made to the Department of Mines that the deposits should be investigated with a view to opening up a possible supply of coal, which would undoubtedly be a boon to the public at the present time.

The existence of coaly material in the locality mentioned has long been known. In 1896 one, C.H. Collings, reported to the Bureau of Mines that he had found in the township of Balfour a seam of smokeless coal, and in view of the great importance of such a find, if authenticated, the Bureau instructed Dr. A. P. Coleman, then Professor of Geology in the University of Toronto, to visit the locality and investigate the occurrence. A Government diamond drill was also dispatched to the spot to make the requisite borings. Dr. Coleman duly examined and reported and in view of the wide-spread interest the public took in the matter his report was published by the Bureau in a special bulletin under date of November 7th, 1896. The matter was also included in a somewhat different form, but to a like effect in the Sixth Annual Report of the Bureau (1896, pages 151-169). In addition, a thorough examination of the material itself and a number of analyses were made by the late Dr. W. H. Ellis, then Professor of Applied Chemistry at the School of Practical Science, and Dr. Ellis' report follows that of Dr. Coleman's in the same volume (pages 162-166). Dr. Coleman is an acknowledged authority on geology, with a Continental reputation, and Dr. Ellis' ability and standing as a chemist and analyst was perhaps unrivalled in Canada.

Dr. Coleman's Report in 1896

Dr. Coleman states that "the coaly material occurs as an irregular vein in black fissile slate mapped by Dr. Bell as Cambrian. The vein runs about north and south up a somewhat steep rocky hill, turns a little to the east on the hill top and pinches out. Toward the south the lower end of the vein is buried under the boulder clay which covers the valley. The length of the vein exposed is about 70 feet, but further excavation may show that it continues south beneath the boulder clay. In width the coaly matter measures at its widest part 12 feet, but allowing for the dip its real thickness is probably 6 to 9 feet." The doctor emphasizes the position of the seam with relation to the surrounding rocks, stating that "the coaly material does not form a bed as in a true coal seam, but cuts across the slate, which has a strike of about 60 degrees east of north." He classed the material itself as anthraxolite, a name applied years before by Professor Chapman of Toronto University, to a similar substance found in Eastern Ontario and other parts of Canada. It closely resembles anthracite, but the latter is held to have been derived from vegetable matter and is found in beds associated with rocks containing carboniferous or later fossils, while the term anthraxolite implies a derivation from bituminous matter such was contained in the beds of slate adjoining the seam. The vein cutting very ancient slates, as Dr. Coleman points out, the inference was obvious that it must have reached its present position long after the rocks were formed, and was therefore not of contemporaneous or previous origin. Anthraxolite or anthracite, the substance burned, and gave a good heat, as appears from the statement of the Government diamond drill operator, who used it to raise steam in the boiler of the drilling plant. "The waste" however, adds the driller, " was considerable. It took close attention by the fireman to keep the ashes away and I should judge that fully one half was waste."

Dr. Coleman describes the pure mineral as black in colour, resembling anthracite or albertite, and forming small plates or irregular cubic blocks, the largest observed being three-quarters of an inch square. Between the plates or cubes there was generally more or less quartz, and in some weathered portions on the surface the quartz remains as a porous cellular mass. He noted that the quartz varied in amount, specimens from the bottom of the small pit containing less than those from the surface.

The Quality And Quantity Of Anthraxolite

As regards the probable extents of the deposits, Dr. Coleman thought there might be some thousands of tons, and expressed his conclusion as follows, "However large this vein of anthraxolite may be it is not likely that it will supply quantities of fuel comparable to those of the coal regions, where the beds often extend for many square miles." Further, "unless the percentage of ash proves less when the vein is sunk upon, the quantity of quartz mixed with the mineral will prove a serious draw-back for metallurgical purposes."

The report of Dr. Ellis showed that a selected sample contained 90.10 per cent. of carbon and 4.10 per cent. ash, while analysis of an average sample showed 74.20 per cent. of carbon 20.50 per cent. of ash. Another sample yielded 36.5 per cent. ash. It differed from anthracite in containing less volatile matter. Dr. Ellis compares this occurrence with others from the vicinity of Kingston, Lake Superior and district of Ungava, also with graphitic anthracite from Rhode Island, and assigns its origin to bituminous as distinguished from vegetable matter.

Geological conditions are not likely to change materially in 26 years, but as additional occurrences of anthracite were being alleged and large claims made as to the possible or even probable existence of an important supply of fuel in this area, the Department of Mines had another report made a few days ago by C. W. Knight, Associate Provincial Geologist of Ontario, whose professional standing is well known. Mr. Knight's report is herewith appended. It will be seen that in all important aspects it corroborates that of Dr. Coleman, and that his estimate of the quantity of fuel available is much less. The presence of fossils of carboniferous age has been adduced in support of the coal bed theory. Mr. Knight shows that these fossils instead of being in place were found in the pebbles of gravel deposits in all probability transported by glacial action, from a long distance away.

As to the name to be applied to the material, Mr. Knight prefers "anthracite", but as he states this is a minor matter. A rose by another name would smell as sweet, so also anthracite or anthraxolite by any other name would burn as well and leave the same proportion of ash. The important points are the quantity and quality of material, and the report of Mr. Knight is emphatic on both. It is addressed to Deputy Minister of Mines Gibson.

Mr. Knight's Report

Acting under instructions from you, I visited on July 19th and 20th, the anthraxolite area at Chelmsford about thirteen miles west of the town of Sudbury, Ontario. I was accompanied by Mr. James Bartlett, Inspector of Mines.

Briefly summarizing the results of our two days' examination, I may say that we found no reason to disagree with the views held by A. P. Coleman as published in the Sixth Report of the Ontario Bureau of Mines, pages 159 to 166. Dr. Coleman believed that coaly material (anthraxolite) occurred in a vein cutting the slate beds. We are in accord with this view. The occurrence thus differs in origin from true anthracite coal seams which always occur interbedded with, not cutting, shales and sandstones.

While the mode of occurrence of the anthraxolite veins at Sudbury and of the true anthracite seams is quite different, I feel, nevertheless, that the distinction given by the name anthraxolite is an artificial one, since the analysis of the pure material from the Sudbury occurrence shows it to have the composition of a very pure anthracite.

But apart from the minor question of a name for the coaly material we must remember that there are only two important points to consider: first, how much of the coaly material is in sight, and, second what is the quality of the material.

As to the first question, one may say that there are only a few hundred, or at most a thousand or two, tons in sight; I would prefer to say a few hundred tons.

Then as to quality, while the pure coaly material shows on analysis to have as high a per cent. of fixed carbon as 90 per cent and as low an ash content as 1 per cent., still the point to be remembered is that the coaly material is mixed with quartz and that this impurity brings the ash content up to as high as 36 per cent. — a very poor grade of coal.

It is hardly necessary to add that if a vein of the pure anthraxolite were discovered, giving an output of millions of tons, it would be an important event for central Canada.

Now as to details of our examination, I may give the following:

On July 19th we visited the deposit of anthraxolite, described by Coleman, in Balfour township, on lot 10 in the first concession. The vein of anthraxolite strikes north 38° east and dips to the southeast at an angle of about 50°. There is a pit about 30 feet long, about 12 ft. wide, and up to about 16 feet deep. At the bottom of the pit an inclined shaft, not timbered, follows the vein down at least 18 feet, and how much farther we could not determine owing to water in the shaft. The vein at the water level, namely 18 feet down the shaft, had pinched down to a few stringers only several inches in width. In the pit it may be seen that at the northeast end the vein pinches out completely. In the centre the vein suddenly widens out to a width of at least eight feet, and then at the southwest end almost pinches out again. This lens was worked last fall, and a shipment of 51 tons made to the Nukol Co. in Toronto. It would be well to confirm this statement through the Nukol Company.

The vein occurs on the south slope of a hill of black slate which rises above the low ground 35 feet. The southwest part of the vein is covered by the dump, and beyond that, the vein passes into the low ground and is covered with drift. At the time of Dr. Coleman's examination, many years ago, before the dump covered the southwest part of the vein, it was found that the vein had a length of seventy feet.

On the same day, July 19th, we visited another deposit of this coaly material which has been found about 4½ miles northeast of the one above described. This is a small one consisting of a few veins an inch or two wide, with larger pockets in the vein perhaps 8 or 10 inches in width. Their length was not traced. These occur on lot 4 in the 5th. concession of Balfour township, at the side of the road. A rock cut in the Chelmsford sandstone had been put through at this point to drain a swamp, and the anthraxolite veins were discovered in this rock cut. I do not think this occurrence has been described in any report.

Fossils In Gravel Pit

The next day, July 20, we were joined by Mr. C.B.W. Anderson, representing the Ontario Anthracite Mines Ltd. I want to say this for Mr. Anderson: he answered, frankly and truthfully, all questions which were asked him, and we found no intention on his part to misrepresent anything.

We asked Mr. Anderson to take us to the place where it was reported that fossils of Carboniferous age had been found. Guided by him we motored to Phelan, about 8 miles in a straight line west of Chelmsford. Here there is a great deposit of gravel which the C.P.Ry uses for ballast. Mr. Anderson told us that the fossils were found in this gravel. It is hardly necessary for me to tell you that any fossils found in this glacial deposit are of no value in determining the age of the rocks of the Sudbury basin, since any fossils in the gravel have been carried probably for hundreds of miles from the northeast.

We therefore asked Mr. Anderson if he knew of any place in the Sudbury basin, where he could show us fossils in the solid rock. He said he knew of no such place.

This disposes of the claim that fossils of carboniferous age occur in the Sudbury basin.

The same day, in company with Mr. Anderson, we visited another occurrence of anthraxolite about a mile and a half southwest of Chelmsford, on lot 4 in the second concession of Balfour. Here, in the centre of a field, there is a shaft in black slate down, it is said, 48 feet. It was full of water to within 10 feet of the surface. On the dump there are a few specimens of anthraxolite about the size of one's fist. There is also a piece of the black slate weighing 100 lbs., in which there are a few small stringers of the coaly material. Presumably, this big piece of rock has not been brought from elsewhere.

You may now see from the above descriptions that the occurrence of anthraxolite west of Sudbury is more widespread than it was originally thought to be. It is reported, indeed, that there are other occurrences of the material in the area.

KASLO CREEK PROPERTY CHANGES HANDS

The Gibson mine, South Fork Kaslo Creek, was sold at auction by the Sheriff at Nelson recently. The Company controlling this silver-lead property was forced into liquidation some two years ago. It was bought for $76,000 by mining men of Portland, Oregon, and Spokane, Washington. The deal had scarcely been completed when news was received that all surface equipment and buildings, valued at about $30,000, had been destroyed by forest fire.

British Columbia Letter

A Definite Move for a B. C. Iron and Steel Industry

Representatives of the Coast Range Steel, Ltd., have submitted proposals to the British Columbia government having in view the establishment of an iron and steel industry. They claim to have the assurance of the Trade Facilities Committee of the British Government of support to the extent of one-third of the estimated cost. This will amount to $4,000,000. They assert also that the Dominion Government has promised backing not to exceed the same figure. These agreements were conditional upon the Province guaranteeing interest and principal upon bonds up to another $4,000,000. Thus the project is expected to represent an outlay of $12,000,000. Under the circumstances the British Columbia Government undertook to support the Coast Range Steel, Ltd. Those interested in the company were told that the Government would be prepared at the next session of the Legislature to submit legislation, making the iron ore bodies of the Province available for use either on a percentage, tonnage or royalty basis; that the present legislation providing for a bounty on pig iron produced in B. C. would be repealed; that the Government would promote legislation, authorizing a guarantee of the Company bonds to the extent of one-third of the amount required to establish an iron smelting plant; and that this guarantee would be conditioned upon the Dominion Government and the Imperial Trade Facilities Committee, guaranteeing the other two-thirds of the capital required; upon a thorough investigation being undertaken covering raw material, plans, specifications, locations, contracts, conduct, management and financing of the Company and probabilities of success satisfactory to the Government; upon the Government of the Province having security for its guarantee ranking equal with the security of the Dominion Government and the Facilities Committee; and further it being understood that if the operation of the blast furnace to be established is fully satisfactory, the guarantees will be extended to include the erection of a steel-producing plant and also rolling mills. It is noted that this is not a full endorsement of the Coast Range Steel proposals. The latter contemplate a plant with a daily capacity of 1,000 tons of pig-iron together with auxiliary plant for the production of steel rods, tin plate, etc. The Government felt that this perhaps was providing too large an installation for a beginning, and therefore have gone on record as favouring a plant capable of a daily production of 400 tons of pig iron, the auxiliary plant needed for the production of steel rods and steel in other merchantable forms to be left for consideration, pending the successful inauguration of a blast-furnace industry.

The Portland Canal District

Important strikes have been reported from the Portland Canal District. One of these occurred on the Big Missouri Group and the latest information available would seem to indicate that the outlook for this property is bright. Another is on the Betty Group, near the divide on Salmon River. This is being operated by the American Mining & Milling Co. A shipment of 10 tons of the ore lately uncovered will be made shortly to the Tacoma smelter.

Pat Daly arrived in Vancouver recently from Stewart. He is of the opinion that there is to be at least one more Premier Mine developed in the Portland Canal district, and thinks that the Daly Alaska Mines Inc. has as good a chance as any of opening up such a property. This company has taken over a group of claims just across the boundary in Alaska from the Premier. Mr. Daly says that there are some high-grade showings on these properties and that the work done so far has given him confidence. He is advocating the establishment of a large smelter for the treatment of the output of the country back of Stewart, and thinks that the best site for this would be somewhere on the Skeena River.

The Esperanza Mine, Alice Arm, has been taken over by Norman Frazier and associates, who have found local capital to pay for further development. The financial consideration for the acquirement of the property was $35,000 of which $10,000 was paid in cash.

Lord Byng in Klondyke

Lord Byng, Governor-General of Canada, and party are visiting the mining camps of Mayo City and Keno Hill near Dawson City. Since reaching the Yukon, they have been touring the Klondyke gold creeks. The Governor-General inspected the hydraulic dredging operations near Dawson which now are producing upwards of $2,000,000 worth of gold annually.

Silver Find Reported in Alberta

Apparently well authenticated news has been received of an important find of silver in the barren lands northeast of Edmonton, Alberta. Mineral has been discovered which is said to be at least equal to the silver ores of Cobalt, Northern Ontario. This news is substantiated by remarkable samples of silver ore brougtht into the Northern Trading Company's post by Jack Sarcee. Hume and O'Neil, geologists, say that the find is very valuable. One asserts that the ore will run $800. a ton, while the other makes an estimate of $775.

Bayonne Group to be Developed

B. N. Sharpe, of Spokane, James Grant, of Nelson, and W. Grant, Cranbrook, have left for the Bayonne group of mineral claims, where good values were struck recently in sulphide ore. A saw-mill is being installed to cut lumber for building bunk-houses and other service buildings, and the mine is to be equipped with a compressor in order to speed up development.

B. C. Miners for Manitoba

Frank Phillips, Superintendent of the Selkirk Mining Co. Rice Lake, near Lake Winnipeg, Manitoba, has been visiting British Columbia to obtain a number of practical miners for work on this property. The Selkirk mine, he says, is being actively developed and a new mill is under construction. Its ore assays from a $130 to $175 in gold per ton. Work now is going on in a large new body of milling ore, which will average about $14 a ton. Among the latest additions to the camp is a radio apparatus, through which the miners may be kept in touch with the outside world.

New Orebody on Arrow Lake

The Monarch and Big Lead Syndicates' property on Pinxton Creek, Upper Arrow Lakes, have shown in their development a well-mineralized ore-body. It has zinc-silver-lead values and from surface indication there is a large body of it.

News and Comments

By ALEXANDER GRAY

Making Merrie Sunshine

Report has it around the King Edward lobby in Toronto that the Scottish Ontario property has been acquired by people who steadfastly hold to the belief that Northern Tisdale will not come into its own until a depth of a thousand or two feet is attained. It would be pleasant to have the ground prove its worth on which the Bannermann Brothers staked in the earliest days of Porcupine, and who kept open house for all comers some of whom staked the cream of the Pearl Lake section. A good deal of money was put into the "north end"—much of it foolishly, some of it intelligently—but Peter MacLaren was alone in his optimism, as the representative of Glasgow interests. The Hughes, Scottish-Ontario, Dobie, Crown Chartered, Davidson and Smith Veteran claim, all had an innings. If Mr. Bowman and his associates are prepared to demonstrate that they have a deep-level proposition, and have the money without asking the public to contribute what such explorations will entail, they deserve to succeed.

Hollinger to Have Power

Negotiations with the Government have resulted finally in the concession to Hollinger Consolidated Mines of a water-power that will meet the needs of the company, and to spare. It became imperative that mines that have exceeded all present power facilities should have the heartiest co-operation on the part of the Government, in order that development, production and milling capacity be increased. Three companies at Porcupine and five, for the time being, at Kirkland Lake are the mainstay of gold mining. By their standards the gold industry of Ontario will be judged. Hollinger Directors have moved deliberately. Knowing what they must have, if they could not have abundant power from one source, they knew they could have it from other sources. Whether the power development will cost two and a quarter or two-and a half millions, is a detail. The money is there, and when the amount to be set aside is established, Hollinger shareholders will learn something to their advantage. Profits are at the rate of more than twice the dividend requirements, and the surplus, apart from what the power development will cost, is sufficient to carry any increase of dividend, even though the profits are not on the ascending scale, as they will be.

Albert Freeman in Retrospect and Otherwise

From his office in Fifth Avenue, on personal letter heads which give his cable and business address, Albert Freeman, erstwhile of the McIntyre Company, and the real author of those "King Solomon's Mines" romances that landed two others in a Southern retreat, explains why he writes to Hollinger shareholders, thus:

> "I have, of course, an object in telling you this. My friends, who risked their money with me in McIntyre, joined me recently to obtain control of a large Canadian enterprise of very great promise, and I have undertaken to sell an issue of 10 per cent Ten-Year Gold Notes, with a stock bonus of 150 per cent, of which 50 per cent is 8 per cent Cumulative Preferred, and 100 per cent Common. So that, with a $1,000 *amply secured* Gold Note, $1,500 stock bonus is allotted, which is calculated to yield very handsome profits.
>
> "I recommend this investment and wish to emphasize that this is another opportunity to make a lot of money."

It is a decade or so since Albert Freeman "bought for $250,000" the McIntyre Mine, "and then financed, developed and managed" it. Undoubtedly "the financing was not easy; and when the shares went begging at 30c—the proverbial 30c—the wise prophets, mostly with elbows sticking out of their coat sleeves, proclaimed, that they wouldn't give 30c for the mine."

Crediting *The Northern Miner* with the prediction that Hollinger would produce four hundred and fifty million dollars to a depth of 3,000 feet, and stressing that the McIntyre "produced almost $12,000,000 since," Mr. Freeman returns to the bat. Recipients of his personal panegyric may regard his tale as another form of aphasia. While no one questions his identification with the McIntyre, he cannot question the discretionary right of Canadians to decline to forget what happened to the son of Nathaniel Hawthorne, and others. At least one profession, that of journalism, never can reinstate Mr. Freeman as a leader to whom they can entrust $1,000, more or less, and do it repeatedly. He is a dulcet person of undoubted ability. The difficulty he experienced in financing the McIntyre was of his own making. His literature is quite a shock, and should have been accompanied by a shock absorber.

Get the pulmotor—give the public a douche of ice water—roll them over! Mr. Freeman must understand there is a dead line at the Canadian border.

Gold by the Pound in Labrador?

It is a secret. As such it is not permissible to divulge the locality. Along the coast, up a river—and then some—a party of timber cruisers did not find what they were after. In a creek their curiosity was aroused by interesting-looking gravels. They took some and when they came out they weighed the parcel. It went 25 lbs., and when they panned the stuff they recovered ¼ lb. in nuggets and fine gold. That is good enough—$3,600 to the ton, without getting to bedrock. As a grab sample result it suggested action; so another expedition has gone thither, headed by a sourdough, well known in Rossland, Cobalt, and elsewhere in the North Country. If there is anything like that in quantity, the fortunate finders will require a belt conveyor for the nuggets. By putting the hose on a broad face, or operating a dredge, the basis for a rush might be forthcoming. The vicinity of Spanish Lake, and Keithly Lake and Cedar Creek waters in British Columbia, may not have it all their own way. The Labrador season is short, but that would not be a deterrent if the alleged find is verified. Another Klondike and Yukon on the eastern seaboard would have advantages sourdoughs would appreciate.

The presence of tourmaline in veins is recognized as evidence of former high temperature conditions. This is interesting in connection with the occurrence of tourmaline in the gold veins of the Porcupine, Kirkland Lake, and Goudreau fields. With the high temperature may be connected the idea of persistence with depth.

Notes From Nova Scotia

SAFETY WORK AT SYDNEY MINES AND MILLS

Those who have been in close touch with the work of the Safety Department at the Sydney steel plant and the Glace Bay collieries during the past two years recognize that good work has been done and much progress made in the way of prevention of accidents. Being a comparatively new department with no statistics running back over a sufficient period of time for comparison, it is difficult to give an accurate statement of each year's work showing what has been really accomplished. Common observation assures us that the work is being carried on along right lines and only requires perseverance and "push" to achieve even greater success.

Safety a Psychological Affair

The amount of literature on safety work that is being published and circulated among the workmen of all large industries in all industrial countries is enormous. Educational campaigns are being conducted on the principle that "constant dropping wears away the rock". With this in mind and with the purpose of having the workmen permeated through and through with a thought that they are their own and their brothers' keepers, safety departments labour assiduously to awaken interest, arouse attention, and cause men to think.

All accidents, whether slight or serious, are calculated to make men think. This is Nature's way of arousing attention, and when reflection is sufficiently deep and strong, action is generally taken along lines of prevention. But it is not enough that men who have been injured should think and act; supervisers of workmen must do their share of it,—indeed they must be the leaders. Their thoughts must be expressed for the benefit of others passing along the same way. Their plain duty is to warn, and sometimes to command. Their relation to the Company which they serve and the general public demands that their experience be incorporated into the sum of human knowledge, that it may be used for the benefit of the whole human race. Hence we have new departments springing up, and whether we designate these under the head of safety, welfare, social or industrial, they are all part and parcel of the one division of industry that has to do with the human side.

Safety Pays

Just as cities and towns have come to recognize that vital statistics measure a distinct financial loss or again, as well as their standing in the scale of civilization, and likewise teach them that each child born must receive the best possible care that it may live and become a useful citizen, so large industries have come to see the financial loss sustained when a workman is killed or seriously injured and the discredit that follows when the accident rate is abnormally high.

The railway, steel, and coal mining industries are hazardous occupations. The catastrophes that sometimes occur in all these callings shock us and make us wonder if man will ever be able to master thoroughly the elements of danger which at times appear with lightning rapidity, do their deadly work, and pass on, leaving us for the moment dazed and doubtful of our own ability to cope with the forces we have discovered and set in motion and which we fail at times to control. The complexity of machinery in large industries leads to accident. This is recognized and men have set themselves to reduce the danger of working around these great machines. Organization, education and mechanical safeguards are the preventives used, and they have been found most successful. In the large steel works of the United States, good results have been obtained by these means and the accident rate has been greatly reduced. This has been brought about by the hearty co-operation of the employer and employee, working together with the one thought in mind that a complex industry with its great variety of machinery presents dangers that can only be overcome by the constant care and watchfulness of every man, from the gate keeper to the General Manager.

Safety in the Steel Plant

What these large works elsewhere accomplished, we can accomplish in Nova Scotia. If they have succeeded in large measure in preventing accidents by studying the causes of accidents, so can we succeed by following their example.

The steel workers of Sydney were among the first to recognize the importance of grappling with the safety question, and when, after placing Safety Guards on dangerous parts of machinery and hazardous places, the management invited the workmen to form committees in the different departments to aid in safety work, there was a response that has brought about good results.

The steel plant can now be said to be fairly well organized, and through the system of forming committees from each department to work with the foreman and the Safety Inspectors for a period of six months, after which they retire in favour of new committees, the whole body of workmen is being gradually educated and imbued with the spirit of safety. The effect of this has been felt all over the works, and while there are still too many accidents, yet the number has been much reduced and in some departments has been reduced almost to zero.

Superintendent Bischoff, in a talk to the Safety Committee a short time ago, stated that there were three general causes of accidents; first, general conditions for which the management was largely responsible; second, the efficiency of the foreman in charge and his interest in the welfare of the men under him; third, the morale of the men themselves. The Company, he stated, must see that conditions in the works are made and kept as safe as possible; the foreman in charge of each department must see that workmen run no unnecessary risks, and must feel that he is largely responsible for accidents; while the workman who keeps continually getting hurt loses his morale and nerve and eventually becomes unfitted to carry on. Such advice as this from the General Superintendent of a large steel plant is calculated to show the workmen that the Company fully realizes their responsibility towards them.

Education the Principal Means to Safety

A few weeks ago safety organization as a whole was dealt with in these columns, showing the work from the general committee down, and it is not necessary to repeat the story. Experience has taught that lack of organization is responsible for two-thirds of the accidents that occur. This being recognized, education was at once begun, and must be continued, and it becomes as much the duty of the management to see that the means

of education is provided, as it is the duty of the workmen to be willing to acquire it and assist in spreading it among his fellow-workmen. If sixty-six out of every one hundred accidents can be averted by knowing how to prevent them, why should they occur? Knowledge in all cases means life and health and soundness of body.

Miners Prefer First-Aid Stations

It is not always easy to enlist the sympathy and secure the support of workmen, even in their own interest. There may be various reasons for this attitude. The colliery workers, while invited like the steel workers to appoint safety committees, did not respond, but on the other hand many miners attended the first-aid classes and made themselves proficient in the art of giving first aid to the injured. This led to the erection of first-aid stations at every colliery. These are well equipped and are models of cleanliness. Injured workmen are beginning more and more to find their way to these stations, and before long they will be looked upon as part of the mine equipment and no colliery will be complete without a dressing station.

Mechanical Guards a Necessity

If education can account for two-thirds of accident prevention, safety guards account for the other third. Education has to do with the human element, safety guards with the mechanical side. Where the human element fails, mechanical skill assists. Trained intelligence may greatly strengthen that first great instinct within the human breast, self-preservation; but man's courage urges him to take chances. Safety guards are erected to discourage these gambling tendencies and to hinder all foolish attemps at such. True, before safety guards came into general use, the workman had no alternative than to take chances. Now he is deterred in every way. He goes to the emery wheel to sharpen tools or grind down some piece of machinery, but he must wear goggles. In handling electric wire, he must wear rubber gloves and be thoroughly insulated. And so through the whole works, as far as possible the machinery is safeguarded and the workman himself is rendered immune from accidents by intelligence, skill and all other known protectors.

Cost no Longer the First Consideration

Cost is not considered where life is to be protected. Safety comes first, quality second, and cost last. Thus we have an entire change from twenty years ago, when output was the first consideration, quality second and safety last.

While there may not be accumulated data by which comparisons may be made, there are outstanding proofs that we have progressed far and are making good headway. Compensation Board records shows that septic cases are not now so numerous and so serious as formerly. This is due to the improved sanitary conditions of the works and to treatment at the first-aid stations before the workman leaves the mine or the department in the Steel plant where he was injured. In the month of May, fifty-six men were treated at the first aid stations at the collieries and in June forty-seven were attended. As blood poisoning sometimes arises from slight wounds, who can tell how many lives were saved, what suffering or financial loss was avoided by this first aid treatment?

The First-Aid Stations

At some of the larger collieries, permanent men are placed in charge of these first-aid stations. But at other collieries some trained workman gives first-aid when the injured man reaches the surface. Many severe cases are now being skillfully cared for underground. A short time ago a miner was severely injured while at work. A fellow workman nearby attended to him and although the case was one where loss of blood would have caused death in a short time, the work of bandaging was so well done that he was taken straight to the hospital from the mine. Another case two days ago aptly illustrates what our miners are doing. A large flat slab of rock fell from the roof on three miners, pinning them underneath. All were severely injured. One man by the name of Dawe, usually a quiet person, when approached by the reseuers told them to attend to the other two men first. When Dawe was examined it was found he had sustained a compound fracture of the leg above the knee. But one of the trained first-aid men was equal to the occasion and applied the splints as dexterously as if he had been an army surgeon. This case also passed on to hospital without having to be cared for at the first-aid station.

Accidents to Eyes Reduced

A class of accidents that has been greatly reduced on the steel plant is that of injury to the eyes. To-day serious cases of these rarely occur. This is largely due to the regulations of the plant that men chipping steel, breaking pig iron, or doing any other such work must have their eyes protected.

All accidents are investigated by the Inspectors and the causes ascertained. They are divided into two classes, preventable and non-preventable. The causes of preventable accidents may lie either with the manager or with the workmen. When these causes are made known, steps are taken to remove them. The safety department fills a large place in that it is free to discover and make known the cause of accident irrespective of whether the management or the employee is responsible.

Northern Ontario Letter

The Hollinger Dividend Rate

The official statement of one of the directors of the Hollinger Consolidated that the stockholders might reasonably expect an early increase in dividends has aroused widespread speculation in Porcupine. It has been intimated here that the increase will be either to five per cent. quarterly or two per cent. every four weeks.

Such an increase in dividends can be taken care of with the present mill of 4,000 tons daily capacity. Any further dividend increase would then be governed by the progress made in connection with enlarging the mill to 7,000 tons daily capacity, as officially declared to be the intention of the company.

The income of the Hollinger has been running at the rate of about one million dollars a month during the current year.

Diamond-Drilling on Newray

The work of exploring the Newray property is now well under way, and the chances of success are regarded as being favorable. Diamond drill cores will be drawn from more than a third of a mile in depth, with a view to determining the position of the intruding porphyry formation and the possible location of ore bodies. The first hole is already down about 650 feet, running at an angle of approximately 70 degrees. This is intended to encounter contact at a depth of about 1,500 feet. All holes will be driven in the basalt formation, pointing toward the intruding porphyry, and will be made to bottom in the latter formation at points a short distance past contact.

There are some high-grade patches of ore in the old workings of the Newray and there is a considerable tonnage of low-grade ore. With these facts to go on, and with favorable geological structure right on the strike of the Hollinger-McIntyre producing areas, it is generally believed that the odds are in favor of the Coniagas Mining Company meeting with success on the Newray.

Prospecting on the Kirkland Gateway

Encouragement has been met with in the new work on the old Lucky Cross property, now known as the Kirkland Gateway. Surface work has resulted in the discovery of visible gold in a promising surface vein. Effort will be directed to points in close proximity to porphyry formation, the former work having been confined almost entirely to the quartz veins lying in schist formation. This change is based on successful experience of other mines with similar geological structure.

The Reported Negotiations for Teck-Hughes

The latest unofficial reports in Kirkland Lake are that the Consolidated Goldfields of South Africa are bidding for control of the Teck-Hughes. Charles L. Denison, president of the Teck-Hughes, has just concluded a trip to the mine and has left the district greatly pleased with the situation. From the information available today it would appear as though negotiations are in an advanced stage. It is said that an endeavor is being made to secure also the Orr Gold Mines, as well as the Elliot-Kirkland, the latter lying to the west of the Kirkland Lake Gold Mines and held by former owners of the Seneca-Superior Mine of Cobalt.

The magnitude of developments in the goldmines of this country is tending to attract world-wide interest and the result is that there is probably more capital available for investment in good gold properties than ever before in the history of gold mining in Canada.

Prospecting the Brookbank Claims

The result of diamond drilling operations on the Brookbank claims in the township of Holmes has been sufficiently encouraging to lead the Coniagas to continue the work. Some wide veins are in evidence and these carry encouraging mineralization. One unfavorable geological feature is said to be the absence of porphyry intrusions.

Kirkland Lake's July Production

Official figures secured by the representative of the journal go to show what an important part the mines of the Kirkland Lake district played in causing the production of gold from Northern Ontario to reach a new high record in July.

Normal production from the Wright-Hargreaves, Lake Shore, Kirkland Lake and Kirkland Lake Proprietary, together with an increase at the Teck-Hughes, brought the aggregate yield from the Kirkland Lake gold area to approximately $250,000 for the 31-day period, or actually more than half a ton of gold bullion during the month from the mines of this comparatively new field.

About 700 men now find employment at the mines of Kirkland Lake, the monthly pay-roll exceeding $100,000 by a substantial margin. In addition to this may be included a large number of prospectors doing assessment work on outlying mining claims,—blazing the trails, as it were, to possible new producers of gold.

In the town of Kirkland Lake the sound of hammer and saw are to be heard from daylight until dark, telling a story of anticipated expansion and the necessity for more places of business and greater housing accommodation. Everywhere one goes, people are found living in rather cramped quarters, while well-situated building lots are at a premium and rentals for mere shacks are almost on a par with fine city dwellings. It is the old tale over again of enterprising pioneers making a bid for participation in the prosperity which inevitably goes hand in hand with the increasing production of gold.

Wright-Hargreaves

During the month of July the Wright-Hargreaves produced close to $80,000, the output being the second highest so far recorded at this mine, and only exceeded by the June production, which up to the middle of the current year was the largest month's production to date from any mine in the Kirkland Lake district.

Underground developments have shown that there are two important veins at the 700-ft. level, the general dip being such as to hold out prospects of the two deposits merging at greater depth. The development of these veins at the probable junction point is one of the very interesting features of future operations on this mine.

The current gross production from the Wright-Hargreaves is at the rate of approximately 33 p.c. of the total issued capital, and the net profits amount to about 15 p.c. In addition to this, a large amount of development work is being done and a big ore reserve is gradually being stored up. These operations are paving the way to an ultimate enlargement of the mill to possibly double its present capacity.

A two-story building for the accommodation of company employees is nearing completion. This building will have about 40 rooms and is one of extremely modern design. In addition to this are a number of six-room dwellings for the accommodation of members of the staff.

Achievements in the mine and mill as well as construction work on surface tend to lend an air of permanency to the Wright-Hargreaves, and it is clearly evident that the management regards the prosperity of the mine as a fixture for many years to come.

The Porcupine Gold Belt

The fact that two of the high-grade ore-bodies on the Dome Mines are running in the general direction of the Preston-East Dome Mine is arousing considerable interest in that property. This property lies adjacent to the Dome on the south-east.

The fact that the McIntyre-Porcupine has taken an option on the Schumacher Veteran claim which lies to the north of the Dome is pointed to as concrete evidence of the belief of experienced Porcupine miners that the mineralization in the Dome area may be more extensive than has heretofore been supposed.

Added to this is the fact that the consolidated properties of the old West Dome and Dome Lake are proceeding with plans to carry on deep mining operations, while farther west there is a movement on foot calculated to finance a general exploration and development campaign on the promising Gold Centre property.

Everywhere throughout the Porcupine area is a tendency among mining men to search out mining claims where porphyry formation intrudes the basalt. This is the geological structure where the vast gold-ore deposits of the proven mines have been found to lie.

While the Porcupine field has heretofore been divided into two producing sections, known respectively as the Hollinger McIntyre and the Dome areas, there is gathering evidence that work in each of these sections may extend so as ultimately to connect with one another and thereby give to the field proportions far greater than before thought possible.

The Porcupine area is now producing approximately three tons of gold bullion every thirty days. From this fact may be measured the importance of a broadened scope of operations.

The Pancake Lake Prospect

The Crown Reserve Mining Company is working away quietly on its property in the Pancake Lake section of the Larder Lake gold area. The first objective is a depth of 300 feet, at which horizon the diamond drilling operations indicated the presence of commercial ore. The shaft is already well on its way to a depth of 200 feet, and encouraging quantities of visible gold have been encountered.

Optional Route To Matachewan

Representation has been made to Hon. H. Mills, Ontario Minister of Mines, to have road work to the Fort Matachewan district directed from Elk Lake. The representation is based upon what are claimed to be natural road building advantages, that is, following the trend of rivers and valleys.

On the other hand, at Swastika there is a well organized endeavor under way with the object of constructing a road from Swastika to Fort Matachewan, this work being based upon the belief that Kirkland Lake and Fort Matachewan must eventually be connected for the reason that the strike of the gold bearing formation of Kirkland Lake is generally in the direction of Fort Matachewan.

Reported Silver Discovery

The reported discovery of silver in the district through which the James Bay extension of the T. & N. O. Railway is to pass, has been found to have originated through a prospector bringing in a sample of silver ore which had been given to him some years ago and represented to have been taken from a vein in that district. This prospector has visited the field and has made the discovery that the geology is identical with that described, but no trace of silver-bearing veins has been located. Another expedition is being planned. This is the information secured by the Journal from Arthur A. Cole, mining engineer for the T. & N. O. Railway.

Coniagas Production

Before the end of the current year the Coniagas mine at Cobalt will have yielded approximately one million tons of ore containing about 31,500,000 ounces of silver, or an average of over 31 ounces of silver from each ton of ore.

The Coniagas will close its fiscal year Oct. 31st and will show a production heavier than in either 1918, 1919 or 1920. The ore is now averaging about 10 ounces of silver per ton, despite which fact a substantial profit is being made. It has been considered wise, however, to pass up the dividend for the current quarter so as to be in a position to meet the expenditure in connection with an effort to secure a profitable gold mine. Dividends to date exceed $11,000,000.

Nipissing

Producing at the rate of close to 3,000,000 ounces of silver annually, but with its Cobalt mine growing old and with over four and a half million dollars in surplus, the Nipissing Mining Company is making a world-wide search for new mines. The company has six scouts in the field, two being in Ontario, one in Manitoba, one in British Columbia, one in Mexico and one in South America.

The Nipissing has produced approximately 64,000,000 ounces of silver from its Cobalt properties since 1904, with a value of about $43,000,000. The company has paid $24,360,000 in dividends, the current rate being 3 p.c. quarterly with a bonus of 3 p.c. in the first and the last quarters, or a total current disbursement of $1,080,000 yearly.

Find In Ossian Township

A gold discovery made some months ago in the township of Ossian in the northern part of the Larder Lake district, is attracting the attention of a number of prospectors. This discovery was made by Frank Fishley, a prospector who has been in this part of Northern Ontario for the past 15 years or more. Ossian township is in Ontario, adjacent to the inter provincial boundary. The find is in line with the probable course of the Kirkland Lake series of formation, and this fact lends interest to the discovery.

THE CONVERSION LOAN

(From *Journal of Commerce*.)

Last week the Minister of Finance issued his statement relative to the Government loan operations. As had been anticipated, the domestic loan which it is intended to launch will take the form of a conversion loan. That is to say, investors who purchased in 1917 the Dominion Government bonds that

will mature on the 1st of next December are to be given the opportunity of reinvesting their money in Dominion securities. That is right and proper. The bonds to mature on the 1st of December amount to $178,000,000, and, with such a large loan as that being repaid in Canada, Canadian investors would naturally have felt aggrieved if they had not been given the opportunity of reinvesting in Dominion Government securities. (See page 19.)

Persons who desire to reinvest thus will have issued to them new bonds bearing the same rate of interest as the old, namely 5½ per cent., and either for five years, maturing in 1927, or for ten years, maturing in 1932, as the bondholder may prefer. An advantage to the investor, as the Finance Minister points out in his announcement of the loan, will lie in the fact that, while the maturing bonds will be retired on the 1st of next December, and the interest coupon of that date will be paid, the new bonds to be delivered in exchange will be dated the 1st of November, and will thus carry one month's accrued interest.

On the other hand, the new bonds to be issued will not be exempt from taxation as were those which are to mature on the 1st of December. This we conceive to be absolutely the right course to adopt. Indeed, on general grounds of public policy, we consider that the issuance of tax-free bonds is unwarrantable, and we know that it has, within recent years, formed a much-used weapon in the rhetorical armory of those who take pleasure in grievances anent the special privileges accorded to wealth. However, the fact that the new bonds will not be tax-free, as were the old, may possibly make them less desirable in the eyes of some people. At the same time, as the Finance Minister rightly says, the bonds of the Dominion Government are the very highest class of security that can be offered to Canadian investors, and he makes a point that he is entitled to make in emphasizing the substantial nature of the concession that is being made to domestic investors in offering such liberal terms for renewal of the maturing loan, in view of the fact that the Government's recent loan was placed in New York at a figure that yielded only a little over 5 per cent.

The privilege of investment on the terms outlined above is to be confined to holders of the outstanding bonds about to mature. Arrangements are being made with the chartered banks for the carrying out of the conversion plan, and, after the latter has been completed, it may be necessary (it is stated) to arrange a further loan in which new money will be required. It will be remembered that the Loan Act, passed at the last session of Parliament, gave the Government authority to borrow $350,000,000. The present conversion plan is designed only to meet the maturities of which we have spoken. We believe, as we have indicated before today, that it is possible for the Government to raise such part of the larger sum named as it may require by means of a domestic loan open to all comers. And we shall look with confidence to those entitled to avail themselves of the conversion plan to give, by their alacrity in doing so, an indication of the readiness of the Canadian investing public generally to put their money in Dominion Government securities. — J.

EDITORIAL

The technical man that commands a good position and a high salary . . . is always the man whose profession is dearer to him than his life, who never counts his time or weighs his labour by his remuneration, but works for love. — Dr James Douglas — 1906.

PROSAIC MINERALS

To Dr Willet G Miller belongs the credit, we believe, of coining that very apt phrase, "prosaic minerals," a term meant to indicate the more common non-metallic minerals that are found in great abundance in Canada and that are the material bases of numberless industries. Of these minerals, gypsum, feldspar, barite, china clay, and quartz, or quartzite, are the most important.

Since all of these minerals are to be found in great quantity in many localities, and since, also, they are all low-priced commodities, the value of deposits of any of them is absolutely dependent upon the cost of transportation. This is axiomatic. Ignoring axiomatic truths is a specialty of the layman when he approaches mining without advice, and it is unfortunately true that most Canadian ventures in prosaic minerals have been gone into without professional guidance. Those that have succeeded, and they are few, have done so principally because failure was more difficult to achieve than success.

The scene is changing, but very slowly, lack of competent direction, absence of technical control and business acumen, is still apparent from Nova Scotia to British Columbia.

Now while it is a fact that Canada is endowed with a rich abundance of prosaic minerals, it is also true that many deposits opened in the past, or now being worked, should never have been touched at all. Neglect of preliminary prospecting has been the prime cause of these missteps. When all these shall have been eliminated there still remains a world of workable bodies of all this category of minerals. Some of these will not be valuable until years shall have elapsed, but enough are known now to satisfy a market ten times larger than that now supplied.

We believe that it would directly serve the interests of our two great railway systems were their executives to bestir themselves in examining and developing the markets for prosaic minerals. A rough idea of the deposits that might supply their lines with freight is easily obtainable. These higher officials have much better facilities for securing market information than has any individual. Indeed we can conceive of few things that would so notably help the operator and the railways themselves as a close and complete report upon the market possibilities for minerals heretofore officially overlooked.

THE STRIKE IN NOVA SCOTIA

In spite of some appearances to the contrary, the strike situation in Nova Scotia is now distinctly improved. At the time of writing, the conference of strikers and company officials is sitting. The fact that they are once more together is significant, though the personnel of the miners' representation is ominous. What we wish to draw attention to particularly is the well ordered nature of the strike —well-ordered in spite of the undoubted influence for the worse of the leaders now accredited by popular vote. It is worth some thought to discover the reason for this observance of the decencies of civilization. It is certainly not due to the presence of the soldiers.

It is not easy to discern, at this time, the influences that are holding in check the wilder and more irresponsible element among the miners. One influence is, undoubtedly, the solid character and the common sense of a large fraction of the Cape Breton colliery workers, derived from their ancestors in Scotland and fostered by the circumstances, in the main congenial to their perpetuation and growth, of life in New Scotland. The native Cape Bretoners are a hard headed, stubborn lot, difficult to rouse, but impossible to hold whenever they are roused. It is not to be wondered at that they have, temporarily, fallen under the influence of false leaders. We are confident that they will in the end see how poisonous is the doctrine that is now being fed them, and will spew it up.

As an earnest of the rational conduct that will prevail eventually among these miners, we have their response to an appeal from one of their number. D W Morrison, mayor of Glace Bay and representative of that constituency in the provincial legislature, appealed to the miners on Saturday last to go back to the pumps and fans. They have gone. Mr Morrison upheld the cause of the miners in the legislature last session when it was proposed to make it a penal offence to abandon the pumps during a strike. He instanced the traditional policy of the United Mine Workers to keep the pumps and fans running under all conditions. His constituents have vindicated this policy and have given the lie to his statement. On being reminded of this by him, they have returned to their duty.

The officials of the Company have adopted the wise principle of non-violence, whatever the provocation may be. They have set the value of human life above that of property. How hard it is for high spirited men to refrain

to the threats of the strikers, we can well imagine. That the officials have carried out this policy consistently is creditable to a degree that few will realize. By avoiding insistence upon their undoubted right to man the pumps and fans abandoned by the strikers, they have likewise made certain of avoiding a recurrence of the murders and massacres that have disgraced strikers and operators alike in the United States. Such forbearance is worthy of the widest recognition and commendation that can be given it. Also, it is so far-sighted and sound a policy that it is already bringing its reward; the pumps and fans are running again.

During this ascendency of Red leaders, the repudiation of agreements, the flooding of mines and the intimidation of those that would save the public property thus threatened, we must not forget that there is much to be said in justification of the miners. The mines are their only means to a livelihood, and a hard-won competence it is at best. The Dominion Coal Company has from the beginning been beset by difficulties, not only natural but those made by man. From time to time the coal mines have been made the subject of financial manipulation that has heaped upon them a heavy burden of debt. The miners have had to work the harder because of the creation of numerous millionaires from the spoils of this legalized robbery. The present management is under suspicion of this social crime, in large measure without warrant. The first proposals for the formation of the British Empire Steel Corporation were so outrageous that they failed of consummation. The time for such obvious and blatant robbery is, we hope, gone forever from Canadian finance. But the name of the proposed merger was retained, and we know that what other part of the original intention, and the miners are suspicious. It is unfortunate that the management of the British Empire Steel Corporation have been unable to refute in a direct, unequivocal way the charges of financial manipulation, to however small a degree, that have been directed against them by the miners. It would clear the air wonderfully were such a pronouncement made.

Meantime we are confident that, under the direction of D. H. MacDougall, himself a Cape Bretoner who has won his way up from miner to vice-president, the Company's side of the controversy will be conducted wisely and well. If only we could be sure of stability and good judgment on the part of the miners' leaders, there would be no doubt of a speedy settlement of the differences that vex miners and managers alike, and that threaten many unoffending Canadians with cold hearths during the coming winter.

GOOD NEWS FOR THE FELDSPAR INDUSTRY

Last week the American Ceramic Society conducted its annual summer excursion through Canada this year. Canada was honoured to entertain the visiting members of the Society, and we are sure that there has been mutual benefit derived from the interchange of courtesies and ideas during the week. Much of this benefit will remain always intangible, and more will become obvious only during the lapse of time. We wish to draw attention to one development that was coincident with the Society's excursion and originally inspired by its activities, though the presence of the excursionists merely afforded an appropriate occasion for its announcement.

The address of Mr. R. F. Segsworth to the excursionists on the occasion of the banquet held in their honour in Kingston last week is reproduced in full on another page. In it Mr. Segsworth announces that a decision has been made, and preliminary steps taken, to form a Bureau of Standards for Canadian feldspar. Queen's University has consented to provide certain facilities for this Bureau, and those that originated the movement have secured the active and hearty support of Mr. E. W. Beatty, who is interested both as Chancellor of the University and President of the Canadian Pacific Railway.

This is a progressive move, the influence and importance of which it is difficult to gauge at present. If pushed to its logical conclusion, it will both regulate and stimulate the production of feldspar in Ontario and Quebec to a degree that has hitherto been impossible. It will be the means of creating a steady market, such as has been available heretofore to only one or two producers of feldspar. It will, by means of a guaranteed product, ensure a much wider market than has formerly been open to Canadian feldspar. It will provide the railways serving the deposit with a steady source of income. Last, but not least, it will induce the employment of trained and competent engineers for the operation of the quarries.

Mr. Segsworth, Mr. Beatty and their associates responsible for this move are to be heartily congratulated on the step they have taken. It is a step along a way that may continue far and may lead to very important developments in Canada's mineral industry.

"WHERE THY TREASURE IS—"

It is often fruitful of result to ponder over sayings that have come down to us through the centuries from the lips of wise men. Many of these succinct philosophies have become axiomatic with us and are part and parcel of our every-day life. Others we regard with a friendly feeling, though we are not yet quite ready to adopt them into the family of our thoughts. Still others of these great and fundamental ideas we acknowledge only in a most distant way, like an acquaintance whose passing cannot be altogether ignored, but with whom we do not wish to hold converse.

It is, we are loth to confess, to the last category that belong most of those excellent injunctions that bid us direct our energies and our thoughts along lines that will bring us a permanent reward. The idea will penetrate to the consciousness of the rare man susceptible to finer influences, but the majority of us erring mortals will not be influenced by it to a measurable degree. We must devise other and perhaps cruder means to bring home to the average man the actual utility of the long-sighted view.

One of the most scandalous abuses of the privilege of democratic government is the pilfering of the public coffers that is carried on, continuously and flagrantly, under the noses of those that keep these coffers full. If an inhabitant of, say, Mars, unaccustomed to the gross selfishness that directs most of our thought and energy, were told how we free and self governing Canadians provide the funds that are, to a large extent, dissipated and wasted without good result, he would doubtless be incredulous. Many Canadians, even, would be astonished if the idea could be hammered into their heads that *they*, not that nebulous entity, the Government, are putting up the money for the sawdust wharves, the pensions that are not deserved, loafing or incompetent public employees, and overpaid railway workers.

What practical expedients can be adopted to bring home this obvious truth to *us*, the tax-payers? Moralizing is worse than useless. There are practical means, and we are gradually adopting them. First and foremost comes direct taxation, avoided just as long as possible because it is distasteful to us as a dose of medicine, and not proposed to us by our political leaders because of their knowledge of this aversion. Now we have the war debt to pay, and must swallow the dose. We know that it will help cure us of our indifference to the waste of public funds, and public resources in general; yet we hate to hand over that small bit of our income direct to the tax collector. It hurts us to do it, but it is good for us to do it.

Another influence in the right direction is the widespread ownership of Government Bonds, which Mr. Fielding seeks to perpetuate by means of his present bond conversion arrangement. It is wonderful what a strong interest the sense of ownership induces. The man who holds even a share or two of an industrial stock follows its progress in the stock market and the fortunes of the company with the utmost interest. Similarly there is induced in the owners of Government Bonds an interest that only the sense of ownership can give. This has been one of the means by which the amazing solidarity of the modern French people has been developed in spite of most potent influences toward disruption. We hope that a similar interest in public affairs and the public finances may be induced by this means in Canada.

EDITORIAL NOTES

The advance of modern metallurgy is well marked in the case of Rossland ores, whose treatment is described in these pages today by Mr. Douglas Lay. A comparatively few years ago, it was predicted that the Rossland ore-deposits were near the end of their tether. The flotation process has changed all that, and we may now confidently expect a further long life for these famous old mines.

Our contributor who suggests the advisability of starting a pottery industry in Canada is on the right track. We are not so confident that his suggestion of Government auspices is sound. We have already the beginnings of a ceramic industry, and potteries can be made to develop naturally from these going concerns.

It is most stimulating to read the reports of the field operations of our Canadian geologists. They are a carefully selected lot of men, and are actuated, almost to a man, by those generous impulses that mark the true man of science and the faithful servant of the public. If the whole of our public services were manned by men of the calibre and with the high ideals of our geologists, we would have little to complain of.

Here is a record, quoted from Lindgren's "Mineral Deposits", "At Hill End, north of Bathurst, New South "Wales, one mass of gold was mined which, with a little "quartz, weighed 630 pounds. It was valued at $60,000. "At the same place 10 tons of ore yielded 5½ tons of "solid gold, valued at $3,300,000."—Hollinger and Dome, attention, please!

It is stated, on good authority, that there are now more than 2,000 firms maintaining research laboratories in the United States. Approximately thirty million dollars were spent in research during the year 1921. Governments, State and Federal, advanced one-third of this. So far we Canadians have failed to establish a single technical research laboratory, modernly equipped on a comprehensive scale. There are a few (all too few) private laboratories working on specific problems, mainly as adjuncts to industrial establishments. We have still to see the vision that has led far-sighted industrial leaders in the United States to invest their millions in research. Our governments have still to glimpse what is now accepted as axiomatic by the political leaders of our neighbors. We wonder if the bookworm that plays havoc with our revered Senate must be referred to United States scientists? Surely we should deal with it here!

THE COMPOSITOR'S COMPLAINT

A Medley

Say, I'm sick!
I'm sick of this here copy, dammit!
The way they feed it in and jam it!
Gimme time to draw a breath,
Gimme liberty or death!
Say, I'm sick!
I'll bet the last bone in my jeans,
That editor gink don't know he means
About what it means to a guy
To be jammed up with copy then sly
It wouldn't be half so damn tough
If we got some near legible stuff,
But them verses! GOOD NIGHT!
Get them out of my sight!
Black curses upon
That blighter XNON!

XNON

Developing a Canadian Pottery Industry

A great many proposals have been advanced recently, suggesting measures to alleviate the unemployment problem. The question to be decided, apparently, is whether or not it would be advisable to continue relief by cash "doles", or if it would be more advisable to endeavour to provide work for the unemployed by promoting certain lines of industry. The writer, after making a very careful study of this question, believes that the unemployment problem could be greatly alleviated by taking one particular industry and developing it on both a technical and commercial scale. At present a great Company is engaged in developing and promoting the woollen industry in Canada, and they have met with assured success.

If it were decided to develop one great industry in Canada to alleviate the unemployment problem, it would be wise to select an industry that had not been developed to a great extent in this country; an industry from which products are produced or manufactured that are in constant great demand; an industry in which men could easily be trained in the various branches of activity.

Range of Pottery Products

A very suitable industry for this purpose would be the Pottery Clay Industry. Pottery includes many varieties of ware made from different kinds of clay. The common flowerpot of the gardener is the simplest kind of pottery made in quantity; and the unglazed pottery of the European and Asiatic peasant, and the Indian pottery, are examples of simple ware, made for every day use, very often from the commonest brick clays. Porcelain, or china, is the other extreme in the ceramic scale, and this class of pottery is made from the finest white-burning kaolin, with which other ingredients are mixed.

There are several types of pottery between these extremes, but in a general way they can be grouped into two classes—those that have a vitrified or non-absorbent body, and those having a soft body that is more or less porous. The latter require to be covered with a glaze or enamel, in order to render them watertight, but vessels of the first type may be left unglazed and still hold water. Modern pottery, however, is nearly always finished with a glaze or enamel, whether the body is porous or vitreous.

Articles for domestic use, like crocks, mixing bowls, jugs, teapots, etc., are generally made from stoneware clay. The heavier kind of tableware, known by various trade names as white earthenware, ironstone china, and white granteware, are made from mixtures of white burning clay and finely ground quartz and feldspar, burned to a fairly dense but porous body and covered with coloured glazes. There is a great variety of pottery made from natural impure clays, which burn to colours ranging from light buff to deep red.

Materials for Pottery Manufacture

Potter's clays are generally regarded as any clayey material suitable for the manufacture of pottery, though the term is mostly understood to exclude those materials that can only be used for the lower grades of ware. Good plasticity and tensile strength in the raw state is essential for making pottery on the potter's wheel, but clays that are short in texture and weak can often be cast in plaster of Paris moulds when they cannot be worked by the plastic process.

The clays commonly utilized as pottery clays are: common brick and tile clays; stoneware clays; ball clay; pipe clay; Kaolin (china clay); and shale clay. The accessory minerals used in the Pottery Industry are: flint or quartz; feldspar; fireclay and sagger clay; gypsum; and the metallic oxides. There are deposits of all these minerals in Canada.

Canada's Clay Deposits

There have not been any elaborate investigations of the clay deposits in Canada, but, as far as is known, there are deposits of the various clays throughout the Provinces. In some cases there is only one known deposit of a particular clay. For instance, the only white Kaolin so far found in Canada occurs at St. Remi d'Amherst, near Huberdeau, in Argenteuil County, Quebec. Great quantities of expensive chinaware (the product of Kaolin) are imported into Canada every year.

According to data so far available, Southern Saskatchewan is the only region in Canada where valuable pottery clays occur in abundance. However, there can be little doubt that if extensive investigations were carried on the result would be the location of a great number of deposits that now are unknown. Canada covers vast areas, and undoubtedly there are clays of every description throughout the country awaiting development.

The common kinds of tableware have hitherto been made so cheaply and so well in European countries that it was impossible for a firm in Canada to compete with them. In recent years, however, the prices for these goods have increased fourfold, so that there is now a much better opportunity for manufacturing them in Canada at a reasonable profit.

The manufacture of staple lines would be the safest kind of business to undertake at the start. These include: (1) plain white, or as it is commonly known, white graniteware; (2) gilt wares, light and heavy, these being simply decorated over the glaze with a gold line, or with a stamped device in gold, the most common on the market being the clover leaf; (the Canadian manufacturer could stamp his ware with a gold maple leaf or a beaver); (3) ware decorated with a transfer pattern in one colour, generally called printed ware; (4) water jugs, either plain white, or decorated with gilt band or printed decoration.

There is an enormous quantity of these goods sold annually in Canada, and any manufacturer producing them at, say, twenty per cent. less than the imported wares would be assured of the greater part of, if not all, the business.

The opportunities in the Pottery Industry in Canada appear to be great. There can be no doubt but that we have the resources, but capital is required to inaugurate investigational activities, as a preliminary to the development of the industry. During the time necessary to carry out the necessary investigation, a number of returned soldiers could be trained in the handicraft and commercial end of the industry. This might open an avenue to extend the vocational training of the Department of Soldiers' Civil Re-establishment.

The great obstacle to this scheme would be the securing of the capital necessary to put the industry on its feet. Possibly a Government loan might be made, as in the case of the soldiers' land grants. Irrespective of the source of capital, if it could be secured it would surely be used to advantage in developing the Pottery Industry. It would absorb a great number of the unemployed, and would place them in an occupation that could be promoted to the position of one of Canada's foremost industries.

G. W. R.

A New Colliery

No. 26 COLLIERY, GLACE BAY, NOVA SCOTIA

By JOHN MOFFATT

No. 26 colliery, Glace Bay, which when fully equipped will rival No. 2, the largest of all Canadian collieries, may be said to have been formally opened during the first week of August. This colliery is simply an extension of No. 1, taking in the lower workings and opening up seaward. It has been placed as near as possible to the seashore to win the under-sea coal. The coal shaft is not finished and a number of the large buildings on the surface are yet to be constructed. When ready, the mine will have a capacity of three thousand tons per day, so that within a half-mile of one another will be the two large coal mines, as No. 2 and 26 are sister collieries.

New Circular Shaft

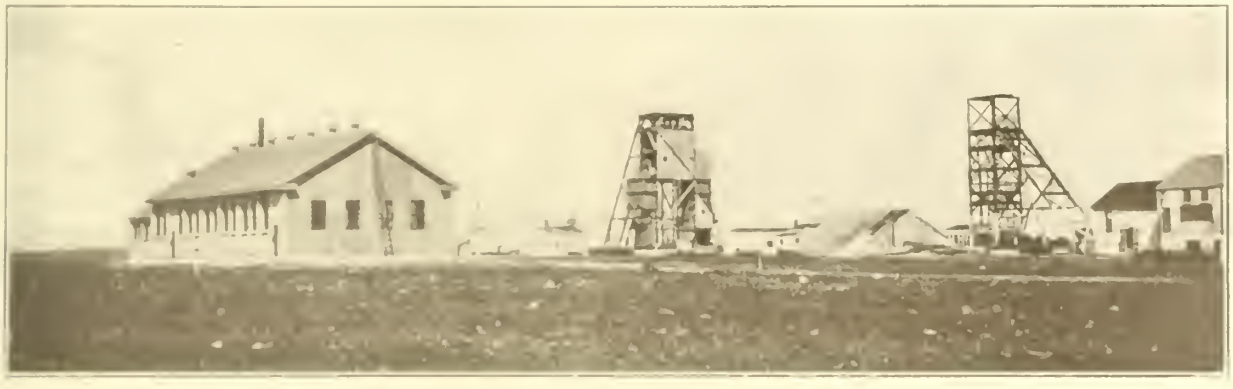
The men and material shaft was begun during the war but sinking went on slowly for a long time. Finally it was completed and is now being used by the workmen of No. 1 in going to and from their work. The shaft is circular, being the first of its kind in Nova Scotia. It is 672 feet deep and 12 ft. in diameter. The upper part is lined with brick, the lower part being of concrete. There are two cages that carry twelve men each. These move on steel guides. The pit bottom will be lighted with electricity. The surface yards are level, and though sixty feet above the cliffs, the salt spray in times of storm will be carried over the buildings. It is a beautiful, but a very exposed site for a colliery.

The new mine cuts off a walk of three miles underground. Employees' trains have been put on to carry the men to and from work and while the main haulage ways are ready below ground, riding trains will carry them to their own sections. It will be remembered that bond complaint was made before the recent Conciliation Boards about long walks underground. No. 1 colliery was among the worst. This removes the cause of complaint.

Electric Lamps for Miners

With the new means of electric power to the mine, the Edison electric lamp came into use. This is an added joy to the workmen and it is only those who have long had to use the oil safety lamps, who can fully appreciate what this light means to a miner. Light always fills the soul with gladness and as the most of the different collieries have recently received the electric light, for one whole day at least brightly filled the dark chambers of the mine. The day had come when those who sit in darkness saw a great light. And indeed those shadows had hidden from many of them the lurking spectre of death, which, if it could not be removed, then on being seen could be better avoided. Even the pit horses with their old blind eyes were dazzled with the bright lights flitting like new suns through the dense darkness of their underground home.

It has been a matter of discussion among mining men as to whether a long walk really affects outputs, and comparisons of collieries have been made with little in favour of those where miners had only a short distance to travel. It is not open to doubt that a walk of three miles against a grade, however slight, takes away from a man's strength, and that when weary and worn with hard toil, his normal working force is gradually reduced. And there is little doubt that men entering the mine and being carried to their place of work, reaching it by 7 a.m., will do better and more work than those who arrive at 8 or 9 a.m. after a long journey. The experiment at No. 26 will be watched with interest as the question is now a live one.



No. 26 Mine, O'Neill's Point, Glace Bay, Nova Scotia
General View of Mine Buildings and Shafts

Connecting two Mines

Whether right or wrong in their opinion, the miners of Nova Scotia have long believed that two separate collieries should not be connected under ground. This belief no doubt arises from the fact that many lives have been lost when an explosion occurring in one colliery broke through into the other. Springhill mines Nos. 1 and 2, or as they were better known at that time, East and West slopes, is a standing example, justifying this belief. On the other hand men have escaped death from after damp in the Pictou collieries because openings had been made from one colliery to another. On the contrary the practice of connecting collieries is common and has been found to be of great practical benefit to the coal industry. There are dangers, however, in connecting the under ground works of two large collieries. Having found it necessary to connect Nos. 1 and 2, which are on the same seam, the Dominion Coal Company made an opening through the barrier pillar, which is 400 ft. thick. This opening is only 6 ft. wide and is protected by two double three ton specially constructed steel doors. They are set in reinforced concrete, with a space between doors of fifteen feet. The thickness of the concrete on the floor, roof and sides is four feet, reinforced by four hundred pieces of steel rail or other similar material. It is not conceivable that the force of any explosion, however great, could break its way through these doors, especially when [illegible]

bered that many openings exist quite near through which the strength of an explosion would be dissipated. The Dominion Coal Company are taking no chances with either fire or flood or gas explosions, and are so arranging the underground working that they are protected against all known dangers.

Bath House

The new bath house at No. 26 colliery is a model one and, compared with some of the first erected by the Dominion Coal Company, is palatial. It is a commodious building and is intended to accommodate 600 men. At present there are only three hundred and fifty miners using it.

The introduction of wash houses in Nova Scotia has been a slow process and it has taken the miners of the province a long time to become accustomed to their use. It is doubtful yet whether the number using these wash or bath houses reaches seventy-five per cent. of the workmen. Only a short time ago it was calculated that the number did not exceed sixty per cent. There may be, and are, no doubt, good reasons for the tardiness of some workmen in using what is considered by many as a great boon.

One has not far to look back to the day when bath houses at the collieries were unknown. Such a luxury was not even dreamt of by the early miners, and when wash houses were first built workmen were generally slow to use them. The first was in most cases a rough, dirty, ill-kept wooden shack-like building, repulsive looking both within and without. Being steam heated, badly lighted, and ill ventilated with water-logged floors and stagnant water lodging underneath, the stench was often unbearable. Added to this, the early buildings were only supplied with wash basins and probably one or two bath tubs for all the men of a coal mine. It is not hard, then, to understand why workmen who lived in good homes and enjoyed pleasant surroundings were loth to go near one of these, much less use them. The more suspicious of the men looked upon them as an innovation tending to interfere with the customs and habits of their domestic life. The very fact that one had to leave his street clothes so far away from home was in itself considered a risky thing and liable to lead to loss by theft or to gain by a "breed not of noble blood." There was considerable foundation for their suspicions, and it is probably due to the experiences of those days that wash houses have not grown in favour more rapidly with workmen. But the modern houses are built for cleanliness, comfort and convenience. They are inspected every day and are under the charge of a caretaker and may now be used by the most fastidious. Since the return of the overseas soldiers, larger numbers of men are using the wash houses.

The No. 26 bath house (it has now passed away from the wash-house stage) is most attractive from the outside and is comfortable, commodious and hygenic within. It is conveniently close to the mine mouth, so that workmen in winter weather will be protected from the cold.

The lamp house is simply an extension of the bath house and here the miner gets his lamp without leaving the cover of the building. The powder house, which according to law must be a prescribed distance from the mouth of the slope or shaft, is placed as near to the wash house as possible to make it convenient for the workmen. Indeed everything was done in locating the bath house site for the convenience, the comfort and the protection of the miner, all humane considerations in themselves even in these much declaimed days of capitalism.

Design of Bath House

The design of the bath house is concrete foundation and concrete floors, with hollow walls to prevent condensation of moisture and to aid in heating. There are seven Bert ventilators in the roof. These are of the best type. The building is 100 ft. by 40 ft., the lamp house being 48 ft. by 28 ft. The floor is of concrete, sloping toward trenches designed to carry off all surplus water, whether it be from the showers or from the washing of floors and walls. The work of keeping the building clean has been made easy by the use of hangers instead of lockers. The windows are set high up and flood the building with light and sunshine, making it pleasant and cheerful, rendering it free from disease germs, which cannot live and thrive under the glare of pure sunlight. It is electrically lighted by night.

Steam heat supplied from a boiler contained within the building keeps it warm, wall radiators being used. Hot water at a maximum of 110 degrees is supplied from a large tank through which coils of steam pipe pass. The system is connected up as in an ordinary bath room with cold and warm water.

In the centre of the building stands a long row of double shower baths. These baths are large and there is ample space to enjoy the showers. Just outside are long rows of settees where men can rest or dress. On either side of the showers are large wash basins with head showers. Sanitary drinking fountains are provided. An up-to-date first-aid station occupies a well ventilated part of the building and in a suitable place are the toilets with proper ventilation and light.

Hangars for Clothes

The hanger for clothes has come into popular use in this Province as in all other countries where bath houses are used. Besides conserving space and keeping down first costs, they have been found to be more sanitary and easier to ventilate than lockers. These latter, because of being closed in and locked up sometimes fill up with old, worn-out clothes which give off vile odours, harbour vermin and breed disease. The hangers, by means of cord fastened to steel hooks, raise the clothes high in the open space overhead, which permits the sunshine and air to pass through. This is as near to outdoor treatment as can safely be given, while protecting them from the weather. This building has nearly all the conveniences of a modern hotel in the way of baths, and has a separate sewer system of its own.

OIL SHALE EXPERIMENT

Commonwealth Oil Corporation.—Mr. John Fell's experiment with burning the shale at the mine has not proved altogether satisfactory, but Mr. Fell is convinced that the process has been proved practicable, the quality of the oil and benzine recovered not being lowered. The directors have therefore decided to continue the experiment, holding that, should it result favourably, it will completely revolutionise the system of extracting oil from shale, and be of immense value to the industry by reducing the cost of production to a nominal sum, which would place the company in a strong position to meet competition.—Industrial Australian and Mining Standard.—

The Southern Rhodesian gold output for June 1922 amounted to 55,614 ounces as compared with 53,920 ounces for May 1922 and 49,466 ounces for June 1921.

Bureau of Standards for Feldspar

Speech Delivered by R. F. Sedgsworth Esq., at a Dinner given by the Corporation of the City of Kingston, Ont., to the American Ceramic Society, August 17, 1922.

Mr. Chairman and Gentlemen:—

The occasion that brings us together tonight is a notable one—the first official visit of the American Ceramic Society to Canada. I need add nothing in the way of welcome to our guests, beyond stating my opinion that in every sense the Ceramic Society is well and capably represented by the hand-picked delegates whom we now have the honour of entertaining.

What I wish to speak about very briefly tonight is the relation that should subsist between a branch of the mineral industry, a branch vitally important to the manufacture of ceramics, the City of Kingston and Queen's University. In touching on this subject I am unable to avoid references to matters in which I am materially interested. This, I am sure, will be forgiven and overlooked, as what I have to say really concerns every actual and possible shipper of feldspar in the Dominion. But tonight I speak more particularly for the district that has placed Canada on the feldspar map, a district from which more than three-quarters of all Canadian shipments have come, a district that has produced feldspar that has been taken as the standard of chemical purity and physical suitability. I speak for what is known as the Verona district.

For about a quarter of a century feldspar has been mined in a desultory fashion in this district. Only one large and regular producer has been developed. I shall not dwell upon the obvious reasons for this condition. I shall do little more than mention them.

First, the lack of good roads and reliable railway service.

Second, the ravenousness of the market and its very uncertain character.

Third, the absence of any understanding between producers and consumers as to what constitutes good feldspar, or prior fitness.

Fourth, the lack of [illegible] prospecting in selecting feldspar deposits.

Fifth, the lack of [illegible] to enable the producer to carry on over periods of depression and to equip his property so as to be able to mine his spar cheaply.

I do not think that any of these statements can be successfully controverted.

Putting it briefly, the [illegible] of mining feldspar has to do with remoteness and obscurity. Consequently the economic and the problems of feldspar have heretofore centred on the producer and the whole industry in general and the Verona district in particular have suffered [illegible]. Quite apart from any controversial political [illegible]. And I think it appropriate to mention here the name of Mr. Raymond Ladoo of the United States Bureau of Mines. Mr. Ladoo's outspoken comment [illegible] and customs that militate against [illegible] industry will do good if they are [illegible] in the spirit in which they are offered.

To resume the thread of my discourse, however, I may say that [illegible] the suggestion was made that there should be established at the School of Mining, Queen's University, a bureau of sampling and standards that would serve as a connecting link between the producer [illegible] consumer. After due discussion the proposal was approved by the authorities at Queen's. The Provincial Government, however, was not in a position to assume the whole responsibility of such an addition to its organization. It was deemed expedient, therefore, that the assistance of the Dominion Research Council be sought for the explicit purpose of carrying through an industrial and technical research as regards the question of standards and specifications of feldspar.

Accompanied by Professor MacKay, I called on Col. Gaudet, the technical headquarters of the Research Council in Ottawa. We had a sympathetic hearing—but the buck was passed on and would be still passing on, for that is the habit of Ottawa bucks, had we not resolved to face the question in another way. Briefly, with the promised financial aid of Mr. E. W. Beatty, who is not only the President of the C. P. R. but also the Chancellor of Queen's, and that of one or two others, along with the warm co-operation of Principal Taylor and Dean Clarke, it is now practically certain that a Bureau of Standards and Sampling will be established at the School of Mining early in the coming session.

Now while this step is being taken primarily to encourage and protect the producer of feldspar, particularly the small producer, it is perfectly obvious that the consumer in the United States and in Canada will be equally protected. The first object of the Bureau will be to work out standards of quality, ascertainable by chemical and physical tests, that will guide the producer and satisfy the consumer. This may be a very difficult task, but the chief difficulty I am sure will not be anything of a chemical nature; it will be, I fear, that oldest form of original sin, prejudice—the prejudice of the so-called practical man against all things scientific. Prejudice will be overcome only by actual demonstration—not by argument.

The second, and really the main object of the Bureau will be to provide facilities for the control sampling of all shipments made from the Verona district and, if occasion arises, from other districts as well. Logically this will lead to uniformity of grade, and to guaranteed composition of shipments. This will, beyond any question, enormously stimulate production and demand. The railways will benefit, communities will benefit, and Kingston, most of all, as the commercial centre of this part of Ontario will benefit. Queen's University will, to my mind, place herself in a uniquely strong position by acting the part of guide, philosopher and friend to the feldspar industry. It argues enlightenment and public spirit when we see any University so identifying itself with the industrial life of the nation. For myself I may say that it gives me a feeling of respect for [illegible] institution of learning.

I have, I know, taken up enough of your time. Before closing I wish to express my appreciation—as a Kingstonian myself—of the welcome extended by the City of Kingston to the members of the American Ceramic Society. I have the honour to be a member of the Society myself. It is not at all out of place to urge upon [illegible] all Canadian feldspar men becoming Members of the Society. With a strong international membership the Society can be made a powerful instrument for the advancement of our industry and, what is even more important, the promotion of good fellowship.

Concentration of Rossland Ores

FLOTATION SOLVES THE PROBLEM

By DOUGLAS LAY

The following paper on "Concentration of the Gold-Copper Ores at Rossland," was read before the Fourth International Mining Convention at Nelson, B. C., by Douglas Lay, manager of the Le Roi No. 2 Ltd.:

The Ore

From the milling point of view, Rossland ores may be said to consist essentially of small percentages of the mineral chalcopyrite, accompanied by a large excess of the mineral pyrrhotite, in a heavy gangue of altered country, consisting largely of augite porphyrite.

The total combined output of all Rossland mines from 1894 to 1914, a period of 20 years, amounted to 4,655,388 tons, having an average assay of 0.49 ounce gold per ton of 2,000 pounds, 0.6 ounce silver, and 1 per cent. copper.

The total sulphide content of the above would be not less than 20 per cent. With unimportant exceptions, this entire output was shipped direct to local smelters, without the intervention of any milling process; but any investigation along the lines of milling must contemplate the feasibility of treating ore as rich as the foregoing, in addition to the milling ore-reserves proper. The latter present essentially the same milling characteristics and the same relative values of precious metal to copper, and differ only in that the total values are less, ranging from about 0.15 ounce gold per ton and 0.5 per cent copper, upward.

Mine run of ore will, of course, show pieces of pyrrhotite studded with chalcopyrite, in addition to a fine dissemination of mineral throughout the country rock.

The Milling Problem

A milling scheme must therefore deal with a comparatively coarse aggregation, as well as with a fine dissemination of mineral.

Even in the case of ore of as low grade as the last mentioned (0.15 ounce gold, and 0.5 per cent copper), a considerable proportion of the mineral will be freed from gangue by crushing to say 8 mesh, or thereabouts. It must therefore be apparent that while a process of comparatively coarse water concentration will yield a considerable proportion (quite 50 per cent, as will be demonstrated) of the total values, all tailing from such a process must be finely ground in order to free the mineral from the gangue. In other words, it is possible to make a coarse concentrate, but it is impossible to leave a coarse tailing without incurring serious loss. The wisdom of a process of water concentration, in advance of and followed by the application of flotation to the finely ground tailing from water concentration, is clearly indicated.

Former Rossland Milling

The milling history of Rossland is highly interesting, and incidentally of importance as a guide. It may be summarised thus:

The pioneer milling company in the milling field was Le Roi No. 2. In 1903 this company erected an Elmore concentrator of 50 tons daily capacity.

Treatment comprised coarse crushing in Blake crushers, followed by fine crushing to 30 mesh in Chilian mills. The 30-mesh pulp, after classification, were treated on 4 Wilfley tables, and the tailings from these were treated by the Elmore oil process. The results were published in the Engineering and Mining Journal of January, 1905, as follows:

"From October 1, 1903, to September 30, 1904, Wilfley tables treated 11,601 tons feed assaying 0.191 ounces gold, 0.279 ounces silver and 0.522 per cent. copper.

"Wilfley tailing assayed 0.107 ounces gold, 0.227 ounces silver, and 0.394 per cent. copper.

"Wilfley concentrate produced 523 tons assaying 1.77 ounces gold, 1.44 ounces silver, and 1.86 per cent. copper.

"Elmore oil process treated 4578 tons of above Wilfley tailing, producing 137 tons of concentrate assaying 1.129 ounces gold, 3.244 ounces silver, and 6.532 per cent. copper.

"Elmore oil tailings assayed 0.076 ounces gold, 0.135 ounces silver, and 0.206 per cent. copper.

"The Elmore oil process proved a technical, but not a commercial success."

After treatment of the above-mentioned 4578 tons of Wilfley tailing, the Elmore process was abandoned by Le Roi No. 2, but simple concentration was followed by this company for many years, up to the most recent times, its application being, however, limited to the ore sorters' reject after culling out shipping ore, and to low-grade material resulting from development. Shipping constituted by far the major portion of ores mined.

In 1904, the Consolidated White Bear Mining company constructed an Elmore plant of larger dimensions than that of the Le Roi No. 2, the capacity being 100 tons per day. The crushing process comprised crushing by six 5-stamp batteries to 20 mesh, tabling of classified pulp by Wilfley tables, and treatment of Wilfley tailing by the Elmore oil process. No extra data as to results are available, but it is claimed that the savings effected were 80 per cent. of the values. Oil consumption was stated to be about 1½ gallons per ton. The mine closed down after the mill had been in operation for only a short time.

In 1904 the Rossland Power Company constructed a concentrator at Trail, 10 miles distant by train from Rossland, for treatment of ores from the Centre Star and War Eagle mines, the flow sheet contemplating coarse concentration by means of jigs, followed by cyanidation of tailing after fine crushing of the latter in Trent mills. The results were far from satisfactory, and the plant was only in operation for a very brief period.

In 1905 the Le Roi Mining company built an experimental mill of 45 tons daily capacity on their Black Bear property, the process followed comprising crushing by Blakes and rolls, followed by jigging at 8, 16 and 26 millimeters, the tailing from the jigs being crushed in 5-foot Huntingdon mills, classified and tabled on Wilfley tables. The following data of results have been published:

First test—695 tons treated yielded 116 tons of concentrate; saving made, 65.5 per cent. of gold content of ore and 51.4 per cent. of copper content.

Second test—Tonnage not published; concentration ratio 4.5 to 1; saving made, 62 per cent. of gold content, 64.5 per cent. of silver content, and 57.5 per cent. of copper content; tailing was stated to run about 0.3 per cent. copper.

No material tonnage was, however, treated in this mill by the Le Roi Mining company. Just about this date, the lowering of the smelter rates undoubtedly had the effect of discouraging any large scale milling operations.

Flotation Adopted

While extensive milling trials were carried out in this mill over an extended period by the Consolidated Milling and Smelting company, following upon the acquisition of the Rossland properties by this company in 1906 and subsequent years, the idea apparently was relegated to the background, and subsequent to 1905 practically the entire output of the camp was shipped direct to the smelters after sorting. It is significant that the rapid development of flotation process in quite recent years was the means of once again causing operators to seriously consider the question of milling.

The first application of the flotation process to Rossland ores on a really extensive scale is recorded in the annual report of the Consolidated Mining and Smelting company for 1918, when this company erected at their extensive smelting works at Trail, a plant employing Minerals Separation flotation process, capable of treating 1,000 tons of Rossland ore daily. No details of flow sheet or results were, however, published, it being merely stated in their annual report for this year that "headway has been made on the concentrating of low grade ores from Rossland."

The company undertook no lengthy campaign on Rossland ores, and after preliminary runs on the latter, the plant was employed in the treatment of the lead zinc ores from the great Sullivan mine owned by the same company.

Le Roi No. 2, Ltd., was once again the pioneer in installing the latest development in milling practice actually in Rossland, and last year after preliminary tests of their ore by the Minerals Separation Corporation, this company decided to embark upon flotation, the writer being commissioned, among other things, to remodel their existing plant, previously briefly described, and install a Minerals Separation flotation unit. This was done, and close upon 7,000 tons were treated during 1921.

It has been established beyond question that a large proportion of the total gold exists free even in the sulphides, apart from such as exists therein in a state of chemical combination. The existence of gold must therefore be looked for in all three ways, namely, free in the sulphides, in chemical combination in the sulphides and free in the gangue.

Owing to the fact that a considerable proportion of gold exists free in the sulphides, it will be evident that it is possible to make gold recoveries to a very considerable extent independent of sulphide recoveries.

Le Roy No. 2 Concentrator

This is an important point because while the copper sulphide is, of course, valuable at all times, pyrrhotite is only worth saving by reason of its gold metal content. For a great many years, by a comparatively crude system of tabling, Le Roi No. 2 had demonstrated that it was possible to make a gold saving of 60 per cent., although copper saving was only 20 per cent., and the saving of pyrrhotite could not have been high, although no data was to hand bearing on that point at the time of considering the application of flotation. In view of the foregoing, it was decided to pass all feed first over Wilfley tables and to send all table tailing after regrinding to flotation.

In the Le Roi No. 2 plant the treatment comprises preliminary coarse crushing in Blake crushers, a primary fine crushing to pass a 10-mesh screen followed by six foot Monadnock mill, and by a primary ball mill, five feet diameter and four feet long. Pulp is classified by a hydraulic classifier, and passed over three Wilfley tables, which yield a pyrrhotite concentrate containing about 1.5 per cent. copper and about one ounce gold per ton. All tailing from these tables, after dewatering, is re-ground in a secondary ball mill of five feet diameter by four feet long, so that not more than 5 per cent. remains on a 60 mesh screen. Again it is classified and passed over one Wilfley table, which yields a pyrrhotite concentrate lower in both gold and copper than that from the primary circuit tables.

Tailing from this table, likewise overflow from the classifier and dewater, pass to a pachuca, where they are thoroughly mixed prior to treatment in a 15-inch, 16-cell Minerals Separation, belt-driven flotation machine. The distinctive feature of the treatment is, of course, tabling in both primary and secondary circuits prior to flotation.

Both Wilfley and flotation concentrates pass in a stream of water to flat-bottom bins, situated immediately over the main concentrate bins, which are on the lowest floor of the mill. After settlement in the flat bottom bins, the concentrate is shoveled into the main bins below, and from the latter it passes to a self-dumping gravity train delivering direct into railway cars on the track about 100 yeards below the mill. It is to be noted that Wilfley and flotation concentrates are not mixed until they have first been settled.

The flotation machine is a 15-inch (diameter of cruciform impellers) sixteen-cell minerals separation machine, of the belt driven type. The original type of thrust bearing was modified by us, ball thrusts being inserted and grease lubrication substituted for oil.

Flotation Oils

Much investigation was carried out to ascertain the cheapest and most satisfactory flotation oils. The following were found most satisfactory, and were finally adopted: Water gas tar, added in the secondary ball mill, at the rate of one pound per ton of ore; heavy pine oil, added in the pachuca at the rate of $\frac{1}{4}$ pound per ton of ore. Further slight additions of the foregoing are made to the middling cells of the flotation machine, but the total quantity of reagents will not exceed $1\frac{1}{2}$ pounds per ton of ore, and the cost was between 7 and 8 cents per ton.

A Complex Ore

Before citing actual figures as to the results achieved it is well to point out that the nature of the Rossland ore is such that an obstacle is placed in the path of really high commercial gold recoveries. It is perfectly true, as has already been mentioned, that free gold values exist to a considerable extent, even in the sulphides. Nevertheless a formidable proportion of the total gold exists in chemical combination in pyrrhotite. Such gold, whether you proceed along the lines of flotation or water concentration is recoverable only along with the sulphide.

The local smelting rate, including freight to smelter, is $6.40 per ton for concentrate. It therefore follows that a concentrate totalling gross values of only $6.40 per ton must be regarded as a worthless product, unless a process of chemical dissolution can follow, and this cannot be considered. A chemical copper concentrate is valuable of itself apart altogether from its combined gold content. A pyrrhotite concentrate, on the other hand, is of little worthless apart from its combined gold content. Owing to the large excess of pyrrhotite over chalcopyrite in Rossland ores, it is manifest that flotation must follow [illegible]

times otherwise a large proportion of a product, worthless in itself, will be included.

The Results of Flotation

The following data are representative of the actual milling results obtained over an extensive period. The ore in question comprised ore sorters' reject and low grade material resulting from development.

Feed to primary table circuit, gold, 0.155 ounce; copper, 0.42 per cent., and iron, as sulphide, 8.1 per cent.

Feed to flotation machine, (this is Wilfley tailing) gold, 0.074 ounce; copper, 0.30 per cent, and iron, 6.3 per cent.

Wilfley concentrate, gold, 0.93 ounce; copper, 1.40 per cent., and iron, 28.5 per cent.

Flotation concentrate, gold, 0.91 ounce; copper, 4.66 per cent., and iron, 88.5 per cent.

Flotation tailing, gold, 0.043 ounce; copper, 0.10 per cent., and iron, 5.2 per cent.

Costs of concentration: Milling at the rate of 2,500 tons monthly, the following costs were found to result: Cost of delivery to mills, $0.40 per ton; cost of milling, $1.60 per ton.

Pyrrhotite Prevents a Clean Tailing

From what has already been said, it will be clear that the pyrrhotite content of Rossland ores is not only an obstacle of itself to a high concentration ratio being obtained and thus causes the original ore to bear a comparatively high proportion of the cost of smelting the resulting concentrate, but also by reason of its combined gold content it prevents a really low gold tailing. Actually, milling results have plainly indicated the wisdom of tabling in advance of flotation. The more pyritic the ore, the greater the possibility of increasing the saving and lowering cost by interposing jigs in advance of tables, not necessarily with a view to making any tailing from them, but simply to avoid slinning mineral already freed from gangue. Jigging at six milimeters would certainly appear sound practice, and would likely more than offset the complication of the flow-sheet thereby introduced. In the case of a small plant, simplicity of flow-sheet is the justification for direct ball milling of ore directly from the crusher.

In the case of such an intensely hard and tough material as Rossland ore, it would appear questionable even in the case of a small plant, if such a practice is really justified, and it would seem much better to interpose rolls between the Blakes and the primary ball mill purely with a view to reducing the high cost of crushing, apart altogether from any purely ore-dressing considerations. In the case of a large plant, undoubtedly, stage crushings must be followed, rolls following Blakes and gyratories, taking ore down to, say, six millimeters, at which size water concentration might well commence, all tailing therefrom passing to primary ball mills.

Heap Roasting to Aid Milling

As to the heap roasting of Rossland ores prior to milling, investigation has led us to a discovery likely to prove of great value. It is, of course, obvious that the high pyrrhotite content of Rossland ores prevents a high concentration ratio, and therefore causes a high smelting cost calculated on the original ton of ore,—a difficulty that at first sight might appear insuperable. There is, however, a way out of this difficulty, which offers great possibilities, and is incidentally of great interest. It is this:

All pyrrhotite, when piled in heaps with limited admission of air, oxides readily, and even spontaneously ignites. It is not necessary to theorize on the results likely to be yielded by flotation applied to heap-roasted Rossland ore, because actual milling results are to hand of the treatment of several hundred tons of such material. The material in question consisted of some hundreds of tons of the more pyritic ore that had accumulated on a dump. The latter when broken open showed very extensive oxidation, individual pieces were clotted together, and it exhibited all the characteristics of heap roasted ore. Copper pyrites, however, did not show much oxidation, this having evidently been mainly confined to pyrrhotite. Treatment of such material in the mill showed a very high flotation extraction of gold as well as copper, the effect of roasting evidently being to free the gold and leave it in a condition readily amenable to flotation.

Actual results of a mill run on this material are as follows: Wilfley tables, feed 0.09 ounce per ton; copper, 0.47 per cent.

Flotation feed, gold, 0.04 ounce; copper, 0.35 per cent.

Flotation tailing gold, 0.01 ounce; copper, 0.13 per cent.

Flotation concentrate, gold, 0.44 ounce; copper, 8.03 per cent.

Wilfley concentrate, gold, 0.82 ounce; copper, 1.94 per cent.

It will be noted that not only was a very high gold extraction made, but also that the lower proportion of iron sulphide rendered it possible to make a higher grade copper flotation concentrate.

There is a class of ore in Rossland consisting almost entirely of heavy sulphides with comparatively low gold values, which it has hitherto been well nigh impossible to treat profitably. In this case it seems highly probable that excellent results will be yielded by roasting to a low percentage of sulphur. Flotation of the roasted mineral should yield not only a floated product of very high grade, but also a clean tailing.

Book Review

BOILER PLANT TESTING.—By David Brownlie, B. Sc.—Price 10s. 6d. net.—Chapman & Hall, Ltd., 11, Hamilton St., London W. C. 2.

We had the pleasure a few weeks ago of reviewing a pamphlet by the same author and on a cognate subject It is appropriate to reiterate our opinion that Mr. Brownlie knows what he writes about and gives incisive and positive expression to his convictions. And nowadays there is ample cause for the advocate of reform in steam engineering to have very strong convictions.

Mr. Brownlie's thesis is, simply, that the standard code for boiler testing in Great Britain, devised by a Committee of the Institution of Civil Engineers about 20 years ago, is cumbrous, complicated, and ineffective. He emphasizes the very patent fact that a new International Code is badly needed, and that in devising this code the chemical engineer must be consulted equally with the mechanical engineer.

In Part I of the volume Mr. Brownlie exposes the fallacies and errors that underlie present methods of boiler plant testing.

In Part II he itemizes his points of criticism and in Part III suggests additions to the proposed International Code. Part IV is a constructive effort to outline a working Code, taking as a basis recent well-conducted tests.

* * *

Mr. Brownlie's book is the direct antithesis of what we habitually expect from John Bull—that conservator of tradition, that egregiously pig-headed and unquestionably successful builder of nations.

A Budget From New York

BY KIRBY THOMAS

American Silver Producers in Luck

All the silver produced by the mines in the United States is now purchased by the Government mint for $1 an ounce, notwithstanding that the price of silver abroad has been recently below 60 cents an ounce and is now slightly over 70 cents an ounce. This seeming favor to the American silver producers is due to the foresight of one of the Western senators who caused to be inserted in the law authorizing the sale of silver bullion to Great Britain and France passed during the War and as a War measure, a clause which has resulted in supporting the silver mining business materially and without cost to this country or to the American public. These countries required silver for their own money uses and to sustain credits in the Orient and the only available reserve was in Uncle Sam's capacious strong box. About 400,000,000 ounces of silver was sold to the Allies at $1 an ounce, on credit, of course. Senator Pittman of Nevada, seeing a chance to favor and protect the mining interests, caused to be enacted by Congress a provision that when the United States replenished its silver reserve, it should do so at the price of $1 an ounce, the same as was paid by the Allies. At the time and for a few months after the War silver had been selling for more than this price, but for many years before the War the price had been much less—from 56 cents to 70 cents an ounce. About half the reserve has been replaced from the American mines so far, and in the meantime the countries that purchased the silver have made substantial payments. The result has been a very great advantage for the American mine operators, which has been much needed because of the generally low prices for the other metals except gold, which have prevailed now for more than two years, and the high costs of operating. Meanwhile the American users of silver in the arts and industries have been able to purchase silver produced outside the country at the prevailing world market rate.

Oil From Shale

The government geologists, after making careful investigations, assert that the practical exhaustion of the domestic oil fields is a matter of but 15 to 20 years only. At the same time they announce that the great beds of shale in Colorado and elsewhere in the West and also in some Eastern localities can be made to yield upwards of a barrel of oil to the ton of shale and that there exist actually many billions of tons of these shales. The alarm of the near future would seem to be fully allayed by the exploitation of one other source. So far realization of the possibilities of the oil shale deposits has not been commercially undertaken in any large scale in the United States and those of the one opposing the belief that oil cannot be produced at this source from the shale at a cost to equal the normal average price of natural oil.

The production of oil from shale in Scotland has been a profitable business for more than fifty years continuously and records a $30,000,000 output of the Scotch Companies that operate. It is admitted that commercial and operating conditions affecting the Scotch operations are somewhat different and in some respects more favorable than those confronting the industry in the United States, particularly as regards market price for the oil products and the by-products, but generally the Scotch shales are not so rich in oil nor are they so cheaply mined.

The establishment on a firm basis for large development of the oil shale industry in the United States depends partly upon the assurance of fairly high average prices for oil, due to diminishing supply and world-wide demands, but chiefly upon the perfection of the somewhat complicated apparatus and equipment to make possible cheaper operations and to increase the quantity and value of the products from the shale. Already there is one commercial shale plant operating at Elko, Nevada and it is certain that others will soon be installed in Colorado and in Kentucky and Tennessee.

Recent attempts to treat the oil shale in pilot operations have been successful and have demonstrated that the methods of treating oil shale used in Scotland are not entirely applicable to American conditions. However, the difficulties which now exist are mainly technical and they surely will be overcome through the combined efforts of the large number of engineers and practical men now seriously engaged in the investigation of the problems of treating oil shale.

It is probable that extensive and successful oil shale operations will be undertaken in this country long before the supply of natural oil is exhausted and that the large and increasing needs for oil and oil products can be fully supplied from the oil shale at prices reasonably approximating those which have in recent years prevailed, under conditions of dependence on the natural oil supply, and with a good and dependable profit for the oil shale operators.

Realizing the Super-Power Project Plans

The project for the unification of the power resources of the Atlantic seaboard region from Boston to Washington, which formed the basis of the exhaustive and monumental report of a special Government commission last year, is taking on definite shape.

Now that ample time has been given to obtain the reactions of the electrical industry to the super power report, the members of the advisory board of the super power survey are to be called together in the near future for further discussion of the project.

Mr. George Otis Smith, director of the U. S. Geological Survey, under whose direction the super power report was prepared, believes that the showing of economies presented in the report has stimulated interconnection between existing systems throughout the country. The nation-wide interest that has been taken in the report is indicated by the fact that the entire edition of 10,000 copies has been exhausted. Thousands of inquiries have been received in regard to various phases of the problems involved and a large amount of discussion has been created in technical societies and the technical press.

The report has furnished essential basic data for other large power developments in other parts of the country, notably in the northwest, where the ambitious plans to harness the Colorado river have been officially sanctioned by a Government commission at the head of which was Mr Herbert Hoover. Mr. W. S. Murray, the technical director of the super-power survey, has been engaged on similar investigations for the Province of Ontario, radial power project, and the Canadian railroads are reported to be considering gigantic government developments on the lines of the plans of the super-power project. Pittsburgh, Chicago and other American industrial centres are seeking to have the Government extend the investigations to their localities.

It has estimated that the super-power project would save more than $300,000,000 yearly in the New England-Atlantic district power costs, it realized.

News and Comments

BY ALEXANDER GRAY

Industrial Disputes Travesty

When the Premier was dictating a message to Railway and Coal owners proclaiming that the Industrial Disputes Act must be held inviolate and that employees must be retained at prevailing wage schedules, regardless of all else, the miners of the Maritime Provinces, at the behest of the United Mine Workers of America, were repudiating agreements — so many "scraps of paper". It was almost ludicrous to have the edict from Ottawa after the miners had agreed to return to work — and then quit. The Eastern coal industry was tied in a knot, — but the Premier decreed that those who preferred voluntary idleness are entitled to back pay! Red tape, therefore, was ineffectual where coal production is an urgent necessity and men would rather flout the law and the sanctity of mutual stipulations. The men obeyed orders (the law is a h'ass, in their reckoning, when it is not according to their purposes). Operators are in a quandary as to where they get off or on. They cannot mine and market coal on the old basis. Conciliation Boards repeatedly have arrived at solutions, as repeatedly the men violated their obligations. Yet the men prate about unemployment, their uncertainty of tenure on the payroll and the iniquities of employers. Somehow it seems as though Ottawa had better avail itself of the Washington experience when President Harding was given to understand that interference is provocative of double trouble.

Diamond-Drilling The Vogue

From Newfoundland to Portland Canal, via the Pas, the diamond drill is puncturing the route to mineral developments. Drilling concerns have all they can do and more than they can undertake. At Sudbury, a contract for 5,000 feet near Levack is being financed by interests eager to gain a foot-hold in the Nickel Industry, the American Horse Shoe Company, it is understood, being the chief factor, with a plant recently acquired at Welland, where it is said the ore will be treated for American Horse Shoe Company purposes. The Tonopah Belmont people are sinking on the Herrick at Shining Tree, which was tested by diamond drill —at an alleged cost of $10 per foot. Messrs Carper — of Virginia and Pongola — and Carlisle know something. Of course the Tonopah technical chiefs swallowed that $10 item with a large grain of salt. Elsewhere in the Shining-Tree the drill is busy. At Kirkland Lake more drilling is contemplated. The McIntyre Company will put down two-inch holes, — seeking a core that will mean more than usual. At the same time, it is said the McIntyre will make four holes in the Schumacher Veteran Claim adjoining the Dome. In all of this the Longyear, Smith & Travers and Sudbury Diamond Drilling Company are sharing, their only regret being that they cannot accomodate all their patrons. They have first hand knowledge of the extent of these determinations, and they have the proof that the funds are available.

A Reversal in Exchange

As the premium upon New York funds no longer obtains, and exchange has no particular charms, Canadian banks are imposing a collection charge. Technically, therefore, New York funds are at a discount, which is a decided innovation and not unwelcome, after a long term of servitude that was both irksome and expensive. So, if Canadian currency or its equivalent is not tendered, American currency or its equivalent, less a nominal cost for collection, is the best obtainable. Anyhow, Canadian money is 100 per cent. good throughout the North American continent, — and that may mean Zero Hour when the restored equilibrium promotes fiscal fellowship. Without that tidy little arbitrage business in exchange, of course banks feel they have to exact a trifle of seignorage, as it were. Stamp taxes, and other taxes, the general overhead, make it incumbent upon the banker to cover himself. On the other hand, "payable in New York Funds" has lost its velvety touch. Settlements in general trade are relieved of penalty, but even the nominal charge levied for collections can be quite an item where large amounts are involved. Notwithstanding all of which, the restoration of parity of exchange is indicative of sounder commercial relationships.

Looking for More "Domes".

The rock hounds have been unleashed. Extensions of known ore-bearing structures are the objectives being sought. East and West from the Hollinger-McIntyre section, the quest proceeds apace. Dome Mines having profitably educated their owners, the Schumacher Veteran is to be tested to ascertain whether it is another Dome Extension. The same is true of the Foley-O'Brien. Preston East Dome is advanced as a possibility, on account of its shearing. To the west and southwest there is accumulating evidence that other shear zones have been misunderstood. If it took a decade to define The Dome, it is not at all surprising that the Domelets have halted or been subordinated by what was going on eslewhere. Recent developments certainly have enlarged the understanding of Southern Tisdale and Deloro shear zones, where porphyry is an antidote for ankerite, — and values compensatory for structural vagaries.

An "Artist on the Spot".

Provincial Geologist Cyril W. Knight is a prosy person when it comes to petrological affairs, but he can display the artistic temperament when called upon to express his scientific judgment upon freak depositions. He was delegated as a combined War Correspondent and "Artist On the Spot" to Report on the Sudbury District Anthraxolite,— and what he did not do to that "Anthracite" with a quartz mixture that meant 36 per cent. ash (which the high carbon content could not overcome for any economic purpose), would be unkind to emphasize. Were it not for the quartz; were there a seam and a considerable area of this Anthraxolite; were the Anthraxolite otherwise than what it is, then it would be an ideal Anthracite. Mr. Knight may have overestimated or underestimated the tonnage of Anthraxolite possible in the indicated area. He places the elastic limit at about 2,000 tons, and he did not state whether this included the quartz content. Undoubtedly a few hundred or thousand acres of Anthraxolite without impurities, — high in fixed carbon and low in ash, would silence for all time those who hold that Canada contains nothing out of the ordinary.

Shipments of coal from Lake ports to Canada have decreased more sharply than those to American destinations. Of the total dumped, only 11.7 per cent. went to Canadian ports as against 28.5 per cent. in 1920.

News of Mining

Great Britain

The number of unemployed workers connected with coal mining in Great Britain was estimated at 85,564 on May 22. This compares favourably with 92,170 on April 24.

The exports of British coal to France during the first six months of this year totalled 6,616,992 tons; to Germany the exports for the same period were 2,822,655 tons.

The amount of ammonia produced in Great Britain during 1921, expressed in terms of ammonium sulphate, was 253,253 tons. More than half of this, or 150,228 tons, was derived from gas works, and 56,427 tons from coke ovens. From oil shales the tonnage was 35,146 tons, all of which came from Scotland.

In answer to criticism of the Mines Department, Mr. Bridgeman, Secretary of Mines, pointed out that in coal mining the rate of deaths per million tons raised had fallen from 7.42 for the decade ending in 1882, to 1.60 in 1920. He stated that in that year 33 per cent. of the fatal accidents could and should have been prevented by the men and 8.43 per cent. similarly prevented by the managements. He urged strongly that "safety first" teaching be introduced into schools and colleges.

United States

The United States Bureau of the Census has published complete statistics concerning the mines and quarries of the republic. Although these figures were collected as for the year 1919, their collection has been but recently completed. Amongst other interesting facts we learn that during the year 1919, 94,876 persons were employed in gold, silver, copper, lead and zinc mining enterprises. There were 2,142 working mines, of which one quarter were unproductive. 7,285 of the employees were in receipt of salaries, totalling $16,572,917. Wages amounted to $128,466,888. Supplies and materials for the year cost $69,557,270. The value of products was $325,048,329, of which copper represents 58%. For about one-half of the average number of workers the prevailing hours of labour were 54 to 62 hours per week. The amount of power used aggregated 938,444 h.p., of which copper industries took more than half. One striking feature is the increase from 7.1 h.p. in 1909 to 11.4 h.p. in 1919 for each wage-earner employed.

The withdrawal of appropriations to enable the United States Bureau of Mines to conduct research and industrial earnings of the non-metallic mining industries has aroused a storm of protest amongst operators. It is pointed out that the non-metallic industries are represented by a very large number of small independent producers and that these are far more in need of assistance than are the large organizations that control so preponderatingly the metal mining industries.

For the week ending July 22nd the United States Bureau of the Mint purchased 500,000 ounces of silver, bringing the total purchases made under the Pittman Act to 121,648,501 ounces.

Final official returns of gold production in the Cripple Creek gold district, Teller County, Colorado, show that the total for 1920 was $1,325,988, as compared with $3,887,816 for the year 1919.

The Bureau of the Census states that of power used by metal mining in the United States, nearly three-fifths of the horse-power is generated in prime movers. Of this class of power, 54.6 per cent. is in reciprocating steam engines, 28.3 per cent. in steam turbines, 12.7 per cent. in internal combustion engines, and only 4.5 per cent. in water wheels and turbines, generating a total of 579,282 horsepower. Electric motors generate 603,815 horsepower.

According to the annual report of the United States Geological Survey the stocks of fluorspar held by users on January 1st, 1921, were the largest ever recorded. The shipments during the year were less in tonnage than those of any year since 1908. The average price per ton f.o.b. shipping points was $20.71, less by $4.55 than the price obtaining during 1920. Highest averages were reported from Illinois, lowest from Colorado. 41.57 per cent. of all production came from Illinois, 40.84 per cent. from Kentucky. The average price of ground 'spar was $40.00 per ton; of lump 'spar $21.34; and of ground 'spar $61.11. The total production was 34,960 tons, of which 25,282 tons was ground fluorspar, 3,779 tons lump, and 5,898 tons ground. The bulk of the imported 'spar came from Canada. Imports totalled 6,229 tons, of which Canada contributed 4,370 tons. 1,644 tons came from England, and 215 tons from Germany.

The average price of lead during 1921 was 4.5 cents per pound as compared with 8 cents during the year 1920. The total production was 448,589 short tons, of which 398,222 short tons was smelted from domestic ores and base bullion.

Europe

Spanish production of lead during the year 1920 amounted to 175,196 metric tons. This figure was exceeded only by the United States, which in that year produced 440,221 metric tons. Spain's closest competitor was Mexico with 81,200 metric tons.

The Spanish quicksilver market has recently been closely organized and nationalized. Uniformity of prices and terms has thus been secured. Prices are rising. Sales are largely controlled by the Almaden Council, Madrid.

The bringing in of three new wells in the Baku region has been announced by the Soviet Petroleum Department. The largest producer yields 200,000 poods daily. (A pood is 36 pounds.)

For the 12 months ending April 30, 1922, Germany imported 63 tonnes of gold and platinum including scrap, etc., 239.0 tonnes of silver; 1,855 tonnes of aluminum, 62,875 tonnes of lead; 1,920 tonnes of zinc, 207 tonnes nickel, and 6,726 tonnes of copper.

Africa

According to Mr. J. R. Thirlow, in a paper recently read before the Chemical, Metallurgical and Mining Society of South Africa, the amount of osmiridium present in ore mined on the Rand is one ounce in from 4,000 to 15,000 tons. Iridium is the most valuable constituent of the concentrate. Iridium prices, however, have fluctuated so widely as to make computations of value uncertain. The occurrences of the second other metals of the platinum group seem to be localized.

A South African Joint Council of Europeans and Natives has submitted a memorandum to the Mining Industry Board dealing with the status of native labour. The memorandum declares that the Council cannot admit that any classes of jobs should be reserved for Europeans [illegible]. It is recommended that the colour bar be removed, and that

the ratio now existing between the numbers of Europeans and native employees no longer observed. The statement is made that the European is apt to depend upon the "colour bar" for his job and not upon the quality of his own work. It is maintained that natives should be granted full opportunity for competition with whites. Four ministers of the gospel are amongst the signatories of the report.

Australia

The Government of New Zealand early in 1921 entered into a contract for supplies of Welsh coal at £4.5s per ton. The contract recently lapsed. It is now the declared policy of the government hereafter to rely wholly on domestic supplies.

A consolidation of tungsten mines in Northwestern Tasmania has been effected. Eight operating companies have joined to form a consolidated company with a capital of £500,000. A large central concentrating plant will be erected.

The government subsidy to the Mount Morgan Gold Mining Company has been extended for an indefinite period. It amounts to £1,100 per week.

15,541 bags of lead-silver ore and concentrate were recently shipped from Burnie, Tasmania, to Port Pirie, South Australia, for the Broken Hill Associated Smelters. Forty six shippers contributed to make up the lot. The ores ran as high as 103 ounces silver and 73.5 per cent. lead.

Asia

Production of salt and petroleum in China is a government monopoly. Regulations that became effective in 1914 are still in force. A movement is now on foot to induce the Government to throw open large areas for prospecting.

For the month of June the Burma Corporation reports 15,055 tons of ore milled. The product amounted to 9,600 tons of "lead" concentrate. The refinery turned out 3,-281 tons of refined lead and 379, 683 ounces of silver.

The petroleum production of the British Burmah Petroleum and the Rangoon Oil Company, affiliated enterprises, amounted to 70,590 barrels during June.

In an official statement of the Government of the Republic of China, the number of working mines is placed at 1,378. Coal mining is the most important branch of mining. In the Chikili district 5,000,000 tons were produced in 1920; in the Fengtien district 3,300,000 tons. In other districts lesser amounts were raised.

Silver coin and bullion in India, as on June 22, 1922, was estimated at 7,888 lakhs of rupees; gold coin and bullion at 2,431 lakhs of rupees.

TWO NORTHERN ONTARIO AREAS MAPPED

Part VI. of the Thirtieth Annual Report of the Ontario Department of Mines is now in circulation. It contains two reports, *Boston-Skead Gold Area, by A. G. Burrows and P. E. Hopkins,* and *Black River Area, by D. G. H. Wright.* Each of these is accompanied by a geological map.

Boston-Skead Gold Area

The map sheet covers the townships of Pacaud, Catharine and Skead, and parts of Boston and McElroy. Most of the gold discoveries are not far from the Temiskaming and Northern Ontario Railway, though there are some interesting prospects farther off, in Skead township.

The geology of the area shows Keewatin volcanic rocks and Temiskamian(?) sediments of similar great age cut by Algoman granite, the latter causing the formation of the gold deposits. On these rocks were laid the sedimentary Cobalt series of Animikean age. All the older rocks are cut by diabase dykes of Keewenawan age.

Most of the gold-bearing deposits are small veins in or near intrusions of granite, syenite or feldspar-porphyry. Throughout the area the gold is characteristically associated with tellurium, and ore-shoots are rich though small.

Up to the present, development work in the area has failed to disclose ore-bodies sufficiently large to permit of profitable mining. Exploration is being continued, on the strength of the exceedingly rich ore encountered occasionally in small shoots.

An interesting item disclosed in the report is the fact that gold occurs in the iron formation of the area. Here, as elsewhere, it has been demonstrated that the gold is contained in veins and veinlets cutting the iron formation and that the iron formation itself contains none of the precious metal.

The Black River Area

Mr. Wright considers that his report on this area is essentially a reconnaissance, as he covered over 300 square miles in a season, and so could not do detailed mapping throughout. He has delineated the geology of this area and has provided a large amount of definite topographical information, as well as detailed description of a number of the mining prospects.

The Black River area is accessible from the Temiskaming and Northern Ontario Railway, which runs through the western part, and from the Black River (a tributary of the Abitibi), which crosses the central and eastern parts.

The geology of the area is identical with that of the Boston-Skead area; but Keewatin volcanic rocks cover by far the larger part. The gold occurences are, as usual, in the vicinity of intrusions of Algoman granite, syenite or porphyry. In a number of cases tellurium has been found in association with the gold.

Referring to the vicinities of Goodfish Lake and Bourkes, Mr. Wright says: "These two localities are "still promising, and contain many prospects which "require more development before any pronouncement "can be made as to their economic value". With reference to the whole area, he says that there are "few localities where anything more than the most "superficial prospecting has been done. Therefore, the "fact that the area has not a producing mine, has little "or no bearing on its future possibilities; but the fact "that the formations are akin to those of neighbouring "camps already proven, combined with the fact that "there exists a widespread distribution of Algoman "granite, with which the deposition of gold is said to "be associated, augurs well for the future of the area". Advising the prospector, he says that "in proximity to "these acid intrusions, gold should be carefully pros-"pected for, particularly where the greenstones have "been rendered schistose."

A very interesting geological feature determined is the existance of a series of no fewer than 14 successive lava flows in Keewatin times. Bits of information from the field, such as this, are surely, if slowly, giving us the data from which to piece together a picture of this earliest period in geological history.

The Mining Districts

FROM THE JOURNAL'S CORRESPONDENTS

NOVA SCOTIA

THE STORY OF THE STRIKE

The miners of Nova Scotia are writing a pathetic page of history just now and will have ample time to regret it before many days go by. The labor storm long brewing broke at last, and, however long it may rage, it is certain that before peace returns the supercharged atmosphere of the colliery towns will have had time to cool off and all will be in a better frame of mind to get down to business. At present everything is in a state of flux; leaders have lost control of the labor situation and admit it; new leaders have been elected and old ones thrown into the discard. The mob rules and nothing but ruin faces business, the coal mines, and the colliery industry.

Events have moved with startling rapidity since last Sunday. Then the public waited with hopeful expectation the result of the conference between the Coal Company and the Mine Workers. Monday the public press hailed the new agreement reached and approved by both parties as a happy solution of a long drawn out labor dispute. At the same time groups of workmen on the street corners were swearing vengeance on their leaders who had dared to settle on any other basis than the 1921 rate. Monday afternoon a mass meeting of miners repudiated the agreement and forced the leaders to recall the telegrams calling off the strike. Monday at midnight, the strike came into effect and all miners ceased work. Pumpsmen, firemen and others in charge of property and machinery, even the stablemen, were notified to quit work at seven in the morning. Some heads, more sensible than others, left the pumpsmen and other firemen at work, but pressure from pickets and general sentiment forced these few out and the strike was finally proclaimed one hundred per cent. effective.

Intimidation and Threats of Violence

Having tied everything up the policy to keep it so was effectively followed up and the efforts of the striking miners concentrated on the central power stations.

Tuesday night (Oct. 3) a picket reached the New Waterford Power Plant which operates the collieries, and intimidated the workmen there. There spot work and a victory was claimed. Next day the power complained to the Dominion Coal Company that the town was without light and water. The Dominion Coal Company stated that the mines were filling up with water and would, in a short time, be flooded. One of the local doctors wired the Government that owing to the want of pure water, an epidemic would be liable to take place. Meantime the colliery officials had succeeded in the boilers to keep up steam long enough to keep the pumps and fans running, or if they failed to do so to get the horses out of the mine. The horses were got out but the pumps and fans were stopped and the mines filled up with water and some gas.

The largest picket station is at No. 2 Colliery. Here the pickets concentrated their forces with the determination to shut off all power. By sheer force of intimidation they successfully shut off the Mayor of Glace Bay charged there was no violence, it is learned the Dominion Coal Company had advised their officials to go about their business quietly and if they were threatened or stopped, to use their own judgment and take no chances. Threats there were, individually and in the mass, and officials were prevented from going in to the plant to help save the same property, and it was only with the aid of the soldiers on Wednesday evening that the last horses were drawn out of No. 2 colliery.

Miners' Officials Notify Loss of Control

On Tuesday morning the Dominion Coal Company was notified by the officers of the United Mine Workers that they had lost control of the workmen and the Company took immediate steps to save their property. Assistance was asked from the Local Government and on Wednesday afternoon 250 armed soldiers took up positions round No. 2 power plant. A number of volunteer workmen had arrived on the train with the soldiers, but so menacing was the mass of miners and so serious the situation that it was decided to send back the workmen and save life at the sacrifice of property. This was done and while from a distance this act may be misunderstood, yet those on the spot who are competent to judge believe the best policy was followed, for it would have been sheer madness to attempt to lead men with an inadequate force, even if armed, into a position which they could not consistently protect. If the mines of Nova Scotia are to be saved there must be sufficient force to guard the lives of all men who offer their services for this purpose. Mayor Morrison of Glace Bay and Mayor Ling of New Waterford both publicly protested against the bringing in of the soldiers on the ground that no violence had occurred and that law and order had been preserved, and that through their efforts they had largely succeeded in maintaining peace. Nero fiddled while Rome burned, and while floods, if not fire, are working destruction in the coal mines and the coal industry, the first citizens of these towns are vainly trying to deceive themselves and the public in general that there is peace where there is none. No greater tragedy has ever occurred in Canadian industry, and it is being conducted with a gallous recklessness that savors of madness and an evil intent to destroy for the mere satisfaction it brings to demoniacal natures.

The Verge of Violence

Thursday morning the regular train from Sydney was held up at the stations and pickets carrying pick handles passed through the passenger cars in search of "scab" labor. This is being repeated day after day, and no one seems to see any appearance of violence in this act. No. 2 Power House is patrolled by pickets, both black and white, some of whom carry clubs.

White officials have been openly threatened by Barbados negroes, the soldiers were stoned and workmen molested and others taken by force from their place at work, yet there is nothing but law and order as the public is told. If ever there was a policy of frightfulness conjured up by an industrial army, that policy is now being actively carried out in the coal mines of Cape Breton and Cumberland Counties. That public opinion will be embittered and inflamed goes without saying, and that labor organization will be met by the determined [illegible] distance of a public who are fast awakening to any [illegible]

Red revolutionary doctrine is now bearing fruit, and that they are face to face with the "rule or ruin" policy of the party that only a short time ago endorsed the third internationale of Russia.

Baxter's Error of Judgment

We would like to throw the veil of charity over the events that led to the defeat of President Baxter and his ticket. His policy of moderation no doubt led to violent conflict with the Reds and weakened him with the younger element who are usually drawn into the ranks of the extremists. With heroic patience he plodded on against all opposition and was no doubt in a fair way to win his election when, in a moment of weakness, he gave way to an officer less far seeing than himself and permitted himself to be committed to a policy of strike. This sounded his death knell, and two weeks ago the *Canadian Mining Journal* pointed out his great mistake when it stated that "moderate workmen had lost their leader, and rather than follow one who wobbled, they would throw in their lot with the extremists." That they did so with a vengeance is now part of the history of the United Mine Workers. For Robert Baxter the writer still retains great respect. His mistake was one of judgment, and who is not at a loss to know the right thing to do at some critical moment in his career?

A reference to the mass meeting that repudiated the agreement made by the Executive officers and the Dominion Coal Company may still be of interest. The result of the negotiations was doomed from the first—if it failed to carry the 1921 rates. The conference opened on Saturday and continued to midnight Sunday. The strike had been set for the following Tuesday. There was now only one day to work if a satisfactory settlement was not reached. All day Sunday the workmen were busy. Mass meetings were held in the larger centres where resolutions reaffirming the determination to strike were passed. Monday morning two collieries struck work. These workmen were early on the streets, and when the newspaper announced a settlement there were mutterings of hostility.

Miners' Leaders Humiliated

In the afternoon a mass meeting was called and the agreement rejected. The Executive were ordered to recall immediately all telegrams calling off the strike, and to make sure that this was done two of their number were appointed to accompany the officers to the telegraph office and read the telegrams being sent out. The Officers submitted to this humiliation and only a few hours afterwards Secretary McLachlan, at a night meeting held to appoint piekets, advised the men to go on with the strike and he would do all he could to help them, and within twelve hours after the meeting he, with other officers, declared to the Dominion Coal Company that they had lost all control of the miners.

A Page from the Collieries' Log Book

The condition of the collieries at time of writing is as follows:

Situation as Regards Fans, Pumps and Horses, 9.00 a.m. August 17, 1922

No. 1 Colliery.—Fans operating, pumps not operating, horses all out of mine, boilers under steam.

No. 2 Colliery.—Fans not operating, pumps not operating, horses all out of mine, boilers practically all dead.

No. 4 Colliery.—Fans operating, pumps not operating, horses still in mine, boilers under steam.

No. 5 Colliery.—Fans operating, pumps not operating, horses still in mine, boilers under steam.

No. 6 Colliery.—Fans operating, pumps not operating, horses all out of mine, boilers under steam.

No. 9 Colliery.—Fans not operating, pumps not operating, horses all out of mine, boilers—see No. 2.

No. 10 Colliery.—Fans operating, pumps not operating, horses now being taken out, boilers—see No. 5. Mine lost.

No. 11 Colliery.—Fans not operating, pumps not operating, horses all out of mine, boilers under steam.

No. 12 Colliery.—Fans not operating, pumps not operating, horses all out of mine, boilers dead.

No. 14 Colliery.—Fans not operating, pumps not operating, horses all out of mine, boilers none.

No. 15 Colliery.—Fans not operating, pumps not operating, horses none, boilers none.

No. 16 Colliery.—Fans not operating, pumps not operating, horses all out of mine, boilers none.

No. 21 Colliery.—Fans not operating, pumps not operating, horses all out, boilers none.

No. 22 Colliery.—Fans not operating, pumps not operating, horses all out of mine, boilers none.

No. 24 Colliery.—Fans not operating, pumps operating, horses all out of mine, boilers none.

Only sufficient boilers at No. 2 being run to operate an exciter for lighting purposes.

No. 11 boilers and compressors are being operated to supply air for pumping at No. 24.

The horses at Nos. 4 and 5 can be walked out at any time and are in no danger of being lost.

Nos. 12 and 14 collieries are now filled with gas, with the exception of the slopes.

NORTHERN ONTARIO

South Lorrain

The operations of The Mining Corporation of Canada on the Frontier property in South Lorrain, are proceeding satisfactorily. About 150 men are now employed under the supervision of Captain Faney, mine Superintendent of The Mining Corporation's properties at Cobalt. Two shipments of high grade ore have been made to the Cobalt Reduction Company from this property, which have justified the belief that South Lorrain will, in the near future, be one of Northern Ontario's important silver producing areas.

Cobalt

The Nipissing Mining Company's new vein, No. 251, is proving exceptionally rich, the Company is also doing some exploratory work near Peterson Lake.

Nipissing shipments of cobalt-silver residues to the Deloro Smelting and Refining Company continue at the rate of a car per day. The Company is also shipping a car of cobalt residues to Germany.

The Mining Corporation of Canada will continue to ship cobalt-silver residues to Deloro Smelting and Refining Company, and the Coniagas Reduction Company, Thorold, until the cold weather prevents further work.

The McKinley-Darragh-Savage continues to run on mill ore with the probability of an increased tonnage for August.

One of the most interesting recent developments in the Cobalt area, is the strike of high-grade ore in The Genesee Mine, north of the fault which was supported to terminate the high-grade deposits of the central Cobalt

area. The finding of rich silver ore on the 350-foot level of the Genesee opens up possibilities for the district included in Bucke Township, which up to the present has not produced any startling results.

The Dominion Reduction Company continue to treat tailings and are gradually increasing their tonnage as conditions improve, following their long shut-down.

The O'Brien Mine, following the decision of the Privy Council giving them control of the disputed Violet property, have started dewatering operations, and will probably take preliminary steps to collect damages from LaRose Mines, Limited, under the Privy Council decision, awarding the Violet claim to The O'Brien Mine.

Shaft sinking is proceeding on the Colonial mine under the new company controlling the property, the Menago Mines, Limited.

Fort Matachewan

The Coniagas Mines, Limited, Cobalt, have temporarily stopped work on the Brookbank claims, Holmes Township.

This company is energetically testing the Northern Ontario field for gold properties, and will explore the Hull Kipper locations in the Kowkash Mining Division, West of Cochrane.

Gowganda

The Wig Wam Silver Mines, Limited, at Wig Wam Lake in the Gowganda District, have an extremely interesting property. Some very rich silver ore has been taken out in preliminary work, and prospects are bright for another silver producer in this locality.

Porcupine

Reports current in the Porcupine area would indicate that very rich gold ore has been struck in the lower workings of the Dome, so rich, in fact, that hand cobbing is necessary.

Since the beginning of the year the Dome mill heads have averaged from $10.50 to $15.00 per ton, as compared with $9.00 for the Hollinger and $11.00 for the McIntyre.

The Preston East Dome property, owing to its proximity to the Dome Mines, is arousing renewed interest. The deep level developments in this area will undoubtedly produce interesting future developments.

Kirkland Lake

The Nipissing Mining Company is diamond drilling the Burnside Grove claim adjoining the Tough Oakes.

Work on the Beaucourt property is proceeding satisfactorily. The shaft is nearing the 600 foot mark, and development work on the veins is well under way.

The Vindicator Syndicate is drilling its second hole. The first hole to a depth of 1000 feet showed satisfactory results.

Lake Abitibi Area

The Imperium Gold Mines Ltd. continue to get encouraging results from the development of their property. Several veins have recently been encountered showing free gold. Work on the shaft and head frame is proceeding satisfactorily.

A potential source of fuel now running to waste, is the sulphite waste liquor from the manufacture of pulp. It is claimed on good authority that this fuel, if recovered, would supply the pulp and paper mills of Canada with a large proportion of outside sources of fuel, as well as providing valuable by-products.

BRITISH COLUMBIA

The Portland Canal District

Recent word from Stewart B. C. corroborates the reports of an important strike of high-grade ore having been made on the "Big Missouri" Group, now being developed by A. B. Trites, who with some associates has bonded the property.

George A. Young, government road superintendent, says that good progress is being made in opening up the mining district of Portland Canal. A branch of the Premier Mine road is being built to the Big Missouri, a distance of six miles, and will be in shape for ore haulage this year. The Bear-Naas River trail is being put in good condition. This runs into Meziaden Lake, a distance of 40 miles from Stewart and will facilitate access to many mining prospects.

The Henderson Group of Mineral Claims, situated on the southwest slope of Hudson Bay Mountain, and recently bonded by Capt. J. R. Turner, engineer for the Duthie interests of Seattle, Wn., is showing up well, some high grade galena associated with grey copper having been exposed. A quantity is being sacked ready for shipment. This is reported to assay on the average 500 ounces of silver to the ton besides considerable values in lead and gold.

Slocan Development

The Jack and King George Claims, Lemon Creek, have been bonded by Colorado interests. These are silver-gold properties on which a considerable amount of work has been done, values in the main workings averaging $18 a ton. The Chappelean Mill, three miles below, will be used for the treatment of the ore. The acquisition of the Arlington Silver Mine at Slocan City is being considered by the same people. This adjoins the Ottawa Mine.

The Ruth Hope Mine and concentrating plant, owned by George Alexander and associates of London, Eng., represented by James Anderson, of Kaslo, has been bonded to R. H. Stewart, R. S. Lennie and associates. This deal is regarded as one of the most important mining developments in the Slocan Mining District for months.

The main vein on the Golden Age claims, north of Hall's Siding, near Nelson B. C., has been proved by Terzian Brothers for 5,000 feet, the ore, it is stated, averaging $21 a ton in gold over a width of six feet. The winter will be spent tunnelling on this showing. There are nine claims and they are close to the track of the Great Northern Ry. The owners propose concentrating their energies on proving tonnage and continuity of values.

L. H. Biggar, of the Ottawa Mine, Slocan City, is endeavoring to obtain a lease for the winter on the Tamarac Mine, which recently was worked by Malcolm Cameron, who uncovered a body of good milling ore. The property is convenient to the Ottawa Mill.

About 70 tons of ore a day are being treated at the Ottawa Mill, Slocan City. Results show a concentration of 52 to 1, and a recovery of 75 to 80 per cent. on six-ounce silver ore. The July clean-up of concentrate yielded 13,200 ounces of silver from 2115 tons of ore.

The Gibson Mining Company's surface plant, buildings etc., which were destroyed recently by fire are to be restored immediately and the property soon will be on an operating basis.

A nine foot vein of gold bearing ore is reported to have been opened up on the Bayonne Group and the news has given a fillip to mining throughout the Bayonne Mining District.

Trail Ore Receipts

At the end of July records of ore receipts at the Trail Smelter, Consolidated Mining & Smelting Co., showed that the quarter million mark had been passed. In the last week of the month 10,520 tons were received, bringing the total for the year to that date to 250,023. The week's shipments included 205 tons from the Silversmith, Sandon, and 269 tons from the Standard, Silverton. There were 8,852 tons from company mines. During the first week of August 8,713 tons were received, new independent shippers including Hallett & McKellar, Beaverdell, 16 tons and the Nettie L., Garrard, 20 tons.

China Clay in the Cariboo

Messrs. A. G. Henderson, W. T. Campbell, William Hunt et al, of Vancouver B. C., are planning the exploitation of large deposits of kaolin in the Cariboo. The establishment of a fine pottery and tile industry is proposed. The clay is pure white and government analyses show it to be of excellent quality. A test made at the government laboratory, Ottawa, produced a hard, white, non-absorbent tile which takes good glaze and is pronounced equal to any imported to this country from England. With the addition of feldspar and ball clay, which are to be found in this province in large quantities, a first class china can be manufactured from Cariboo kaolin.

B. C. Spelter for the Far East

Manifests of vessels leaving Vancouver for the Orient and Europe indicate that there has been a marked growth in the movement of spelter through the Port of Vancouver in recent months. At the close of the war it was estimated that there were 20,000 tons of lead and zinc on hand in British Columbia for which there was no foreign market. Japan first and later Europe absorbed this supply and the demand has continued. Nearly every boat leaving for Japan carries a quantity of these metals, exports to that country amounting to about 1,200 tons a month. Europe takes approximately one-third of that amount a month. The production of the Trail smelter runs to about 90 tons of zinc and 150 tons of lead daily.

WIRE ROPE EXHIBIT

Wilkins Wire and Wire Ropes, Limited, Eastwood, North England, are sending out the first wire rope exhibit ever sent from England. It will be an exhibit in Machinery Hall at the Canadian National Exhibition and will include all kinds of flat, hoisting, and mining ropes, together with steel rollers for mining purposes. An interesting feature of the exhibit will be the gold-plated wire ropes used on the Royal Yacht "Victoria and Albert" in 1851. Macaulay Pope, 186 Bay Street, Toronto, is the representative for Eastern Canada for Wilkins Wire and Wire Ropes, Limited.

Final returns show production of all coal in the nineteenth week of the strike as 4,605,000 tons including 29,000 tons of anthracite. In the corresponding week of 1921 the output of bituminous was 7,770,000 tons and of anthracite 1,770,000 tons, a total for all coal raised of 9,540,000 tons, the year before that the total was 12,250,000 tons. Considering anthracite and bituminous coal as a combined source of supply, the present weekly output is over six million tons below normal.

EDITORIAL

If roguery, misrepresentation and lack of skill were eliminated from mining to the same degree as they are in the operation of railroads, manufactures and other industrial undertakings, we might deal successfully with the element of chance, and reduce speculation to investment.—J. C. Gwillim—1907.

PROSPECTING ON THE GRAND SCALE

To-day we print the announcement, from the pen of Mr. Alexander Gray, of a development in Northern Ontario that is of prime importance to the Canadian mining industry. Two outstanding groups of mining men, the Nipissing Mines and the Continental Mines, have undertaken to explore thoroughly the possibilities of an extension of the Kirkland Lake gold bearing zone, and the latter have likewise staked a substantial sum on the possibility of O'Brien silver values continuing into the adjoining Colonial property, which they now own.

These men, leaders in mining finance, have decided to do on the grand scale what every prospector does when he strips his vein. The prospector finds a good "showing", and then (if he knows his business) proceeds to uncover it throughout its length. It has taken many a year to convince the prospector that this irksome pick and shovel work is necessary if he is going to reap the full benefit of his find. The pick and shovel is now an accepted part of the prospector's equipment, and the modern prospector smiles at the "old timer" who depends altogether upon his little pick and a capacity for divination.

There is a distinct analogy between this and the present case. It is essentially the prospector's hope and faith that have led these American mining men to provide a large sum of money to follow up the gold bearing "break" of Kirkland Lake. It is probable that this investment means less to them than does the time and effort spent by the prospector in stripping his vein. They have calculated the chances, as the prospector does, and have concluded that "the game is worth the candle". The move has not been made without a very careful examination of all evidence obtainable on the ground, and the advice of masters in the science of gold mining.

This move is a most important one. For a number of years past the mining men who have thus invested have been searching systematically for a property they considered worth developing. Hundreds of prospects have been examined, and turned down as not up to the standard required. What they sought was a property whose potentialities would, if realized, place it in the front rank. Mineral deposits of such size are rare, so it is not surprising that the search was in vain. Now there has been delineated an area of great promise, and a thorough-going attempt will be made, by mining men and with their own money, to establish the feasibility of a mining operation of the first magnitude.

It is quite possible that this move will be made the basis of an attempt by unscrupulous manipulators to institute stock-jobbing operations on a large scale. They will ask why the millionaires should have the best of the Kirkland Lake field, while the small investor is left out in the cold. They will then proceed to acquire a few thousand acres of absolutely worthless ground and thereon build a house of cards in the similitude of Continental Mines, Limited. It is an old game. We hope and trust that in this case the public may become sufficiently well informed to prevent such a deplorable reaction from a development that assuredly will get out of the Kirkland Lake field all there is in it.

HIGH PRICES OF COAL TO REMAIN

It now seems to be assured that all Canada's domestic resources of coal will be available during the coming winter. The 7,000 miners of Alberta and eastern British Columbia have voted by an overwhelming majority to accept the recent offer of the operators. The leaders of the 12,000 miners of Nova Scotia have recommended their acceptance of the agreement negotiated last week, and it is confidently predicted that the vote on August 31st will show that it is approved by a large majority. Meantime the coal mines of Vancouver Island and New Brunswick's one pit are being worked to capacity.

Throughout this period of acute disagreement over wages, it has been obvious that both the operators and the miners of Alberta have been closely allied with the respective organizations across the border. Hence it was a foregone conclusion that when industrial peace was foreshadowed and finally declared in the bituminous coal fields of the United States a similar settlement would be made in Western Canada. In District No. 18, U.M.W.A. as in the United States the compromise effected is mainly in favour of the miners. The time for the reduction in the wages of coal miners, which will assuredly come eventually as must a reduction in the wages of all labour still unduly enhanced, has been postponed indefinitely.

In Nova Scotia the case has been somewhat different. Special conditions, including the old-time agreement of partial non-interference by U.M.W.A. [illegible] in local Nova Scotian affairs, postponed the final [illegible]

down". The representatives of the British Empire Steel Corporation made offers to the miners from time to time, which we believe to be as high as the conditions at those various times warranted. When the awards of the two recent arbitration boards were made, there seemed a distinct likelihood of the reduction in the cost of producing coal in the United States, with a consequent all-round reduction in selling price. Since then those hopes have gone glimmering. It is now certain that the wages of miners in the United States will remain at or near the war-time peak for some time to come. There is no doubt that this fact led the British Empire Steel Corporation to make their attractive, though belated, offer to the miners on August 18th and likewise made it possible for them to agree to the similar terms that are now before their miners. The special concession to the miners is the long-term agreement that has been effected. As it is beyond question that the company intend to live up to this agreement, we may take it to mean that in the judgment of these operators, coal prices on this continent are destined to remain at their present high level for an indefinite period.

The terms of settlement of these strikes can afford us comfort for the immediate future; we shall not go without fires or railroad service during the coming winter. But what of the more distant future? Coal is the basis of the world's industrial system, as well as the main source of our artificial light and heat. With this point in mind, British industrial leaders fought to a finish the demands of British miners for what has been determined as more than their fair share of the nation's income. The miners of Britain are now working hard for a living, as are all their fellow-citizens. The British nation judged their case and refused their demands. On this side of the water the issue has not been so clear-cut, and the decision now arrived at savours of temporising. Neither miners nor operators have been fighting on behalf of the public, and the public has not been sufficiently interested to exert its undoubted right to decide the question. Consequently the active disputants, finding that the third party to the dispute is, to all intents and purposes, blind to the issue, have agreed to close the argument, and to make the third party pay. Thus the net result of all this hubbub is that the miners will continue to receive wages out of proportion to the service they render the community, the operators will pass on the bill for this to the public, coal will remain at a high price, and the much-desired deflation in the cost of living will be prevented for we know not how long.

If we need any corroboration of the soundness of these deductions, we need only refer to the recent action of the United States Steel Corporation in increasing the wages of their employees. These wages had been reduced toward the low level it was desired to attain throughout industry. Now this low level seems impossible of attainment, and the Steel Corporation, in mere justice to their employees, have raised their wages once more.

So, as usual, the average citizen will have to foot the bill. Those whose remuneration is now at or near the pre-war level will feel this most. When a sufficient proportion of these average citizens realize clearly that the wages paid to specially privileged classes of labour are paid by themselves, then, and only then, will equality be achieved and justice meted out.

CAUSE AND EFFECT

Of the name and work of Mr. Lloyd W. Parsons, our readers will hardly need reminding. Mr. Parsons attained prominence as a member of the staff of the United States Bureau of Mines. As a writer for the *Saturday Evening Post* he has attracted an unusual amount of attention. His departmental articles, "Everybody's Business", are read throughout the English-speaking world. Mr. Parsons' specialty is fuel. His writings attest his sound grasp of the economies and technology of this all-important subject.

The other day, in an address delivered at the annual dinner of the Canadian Gas Association, Mr. Parsons expressed himself as convinced that gas will be the domestic fuel of the future, and, moreover, the chief source of industrial power. He alluded to the use of raw coal in the most strongly condemnatory terms.

Side by side with the newspaper report of Mr. Parsons' address appeared an announcement to the effect that a New York inventor has developed a method of generating gas from crude oil and dissociated water, and that revolutionary results are to be expected. The report is in typical "journalese." But this and similar announcements show how the wind blows. So far, however, no allusion has been made to the fact that coal itself can be made to yield enough oil to supply all our needs, and yet leave a valuable residual fuel.

As has recently been pointed out in these columns, the efforts of British and Continental techologists are being directed with unexampled intensity to perfecting methods for "carbonizing" lignite and bituminous coals. Success will come. That is inevitable. And success will mean extending the "life" of the world's coal deposits almost indefinitely.

One hardly recognized cause of the mighty recent advance in the science and practice of coal utilization, an unconscious and perhaps a quite unwilling contributor to the progress of nations, is the labour leader. We very much doubt if our knowledge of fuel conservation would be what it now is, had not the leader of labour seen fit to over-use that double-edged weapon, the strike.

The divine law of compensation is as immutable today as it was under the Mosaic dispensation.

ANTHRAXOLITE AGAIN

The press campaign in support of the famous "coal deposits" of Sudbury grows apace. "Canadian Press" has circulated a dispatch from Sudbury to the effect that "A. F. A. Coyne, the Toronto geologist and his gang of experts and miners" have uncovered "a seam of pure anthracite coal with slate above and below." To ensure the

quality of this material, geologist Coyne affirms his intention of sending samples of his anthracite for analysis to the leading universities of the continent. He likewise makes an offer to the Ontario Provincial Government—and through the government no doubt, to the people of Ontario. For the sum of one million dollars, to be guaranteed by the Government, our heroic friend undertakes to produce from the Sudbury district within a twelve-month, ten thousand tons of coal. On the basis of such a guarantee, he is sure that practical coal men will advance him the paltry $350,000 required to extract this coal from the bowels of the earth.

What a sporting bet! What a magnanimous offer! If only all our mine promoters would thus come up to the scratch, what a race there would be for our mineral resources!

But wait—let us look at this offer a little more closely. In the first part, what about the quantity of the anthracite, whose quality is to be attested by analyses from our leading universities? We don't find the place where Mr. Coyne mentions the amount of pure anthracite he intends to mine. Mr. Knight did better than this, for he not only estimated the amount of bituminous material in sight, but quoted an analyses of a picked specimen—such as Mr. Coyne would, no doubt, send to the various universities. And how about the quality of the ten thousand tons of coal that is to be mined for the Ontario Government? Not a word. This is strange, considering the insistence upon quality in the first instance—but not so strange, either, when we remember Mr. Knight's description of the "run of mine" material available from the anthraxolite veins. But then the risk that Mr. Coyne is taking in making this offer to the government—surely he is to be commended for this? Let us examine the figures. Ten thousand tons for $350,000—$35 a ton. Why, we might almost have made that bet ourselves for a million dollars stake, even though it would be hard to get ten thousand tons out of those dinkey little veins near Larchwood.

Seriously, it is a pity that "Canadian Press" circulates such stuff and nonsense as this dispatch from Sudbury. In this case it constitutes itself an agent in spreading a report that, though it deceives no one well versed in mining affairs, may mislead many who are less well-informed, with a consequent diminution in their bank accounts.

EDITORIAL NOTES

We are pleased to be able to publish today an appreciation of the late Gardner F. Williams, an octogenarian member of the "Old Guard" of mining engineers who died on August 24th in California. As Mr. Gray aptly points out, it is to such outstanding figures in the mining industry that a large part of its progress is due. That Mr. Williams, an American by birth, became such an important factor in the development of a British dominion, is one of those innumerable incidents that demonstrate beyond question the essential solidarity of the Anglo-Saxon peoples, including the Americans.

We wish to draw attention to the resumé, on another page, of the Standard Specifications for Wire Rope, recently published by the Canadian Engineering Standards Association. The conclusions reached by the committee of practical men who have drawn up this schedule of regulations for the guidance and aid of manufacturers and users, are simple, clear-cut and to the point. The present specification, if applied commercially, will simplify greatly both the manufacture and sale of wire rope, and will tend to protect the user from the use of shoddy material and from misunderstanding of the kind of rope he is using. The voluntary efforts of members of the Canadian Engineering Standards Association, exemplified here, will in the aggregate have a tremendous effect on Canadian engineering practice, both by inducing more economical manufacture and by inculcating rational ideas among users.

There are interesting events astir in the Quebec asbestos field. The attempt of Consolidated Asbestos Corporation to effect an intimate co-operation with buyers on a profit sharing plan may prove a good working substitute for the amalgamation of mining and manufacturing interests.

THE FLESH POTS

"Now this here question's up to you:
What can a bleedin' feller do?
A feller that has made a strike,
A feller that the boys all like?
Start mixin' up with social stuff,
And treatin' all the old gang rough?
Well, pardner, none of that for mine;
I'm still goin' to *feed*, not dine.
I'm going' to stick to draw and stud,
And not this bridge they play for blood.
I'll play the races now and then
(I've got a cheque book and a pen.)
I'll get me one plain motor car,
But I won't travel fast or far.
A decent soot of rooms I'll get,
Where I'll have shelter from the wet.
I'll go to the theayter too,
As often as I want to do.
In fact, as far as I can tell,
I'll live just average good and well
I won't put on no dog or crust,
BUT—once a year I'll have a bust,
A good old fashioned sonse like what
I had before I made my pot
Once in a while I want to wear
A shirt that's needin' soap for hair
I want to eat some chewin' plug,
And drink hard licker from a jug
I want to let my chin grow stubble,
And scrap around, and look for trouble

* * *

By cripes! this sounds so good to me
I'll telephone the doctor [illegible]

ANON.

"Big Interests" At Kirkland Lake

SQUARE MILES OF MAIN FRACTURE AREAS TO BE EXPLOITED BY NIPISSING AND CONTINENTAL MINES

By ALEXANDER GRAY

Kirkland Lake's golden two and three-quarter miles may not rival the Comstock's "richest pay streak on earth"; but that portion of Ontario situated north of Cobalt and south east of Porcupine — more east than south — is beginning to boil over. There is every indication that large capitalists now recognize the exceptional merits of these gold fields. If two-and-three-quarter miles are insufficient to make the town of Kirkland Lake another Virginia City, the three more miles now held by the Continental Mines, Limited, with an Ontario charter that has gone unnoticed, and the further extensive areas held by the Nipissing Company, of Cobalt, may be the means whereby these newer Ontario sources of the yellow metal will at least be a greater factor in that metal market.

The reason for the movement toward Kirkland Lake is contained in the producing record of its mines and the carefully-matured judgment of noted mining scientists, who have preliminary proofs of more extensive fracturing and undoubted evidence of the expanse of favorable geological conditions. Moreover, and what substantiates the expectations of those who exact more than samples, there is the concrete result achieved by the silver and gold mines. To date, Ontario has produced 330,000,000 ounces of silver, worth $203,000,000 and approximately 5,250,000 ounces of gold, estimated at $105,000,000. Confirming this is the following from official records as of January 1, 1921

	Ounces	Value
Silver	322,858,563	$198,099,336
Gold	4,276,876	87,797,553
Grand total		$285,896,889

When it is understood that this silver production relates to the period beginning with the discovery of Cobalt in 1903 by Fred. LaRose, McKinley, and Darragh, and that the greater quantity of the gold pertains to the years 1912-21, it becomes more apparent that the cumulative benefits following upon historic discoveries of precious metals accentuate the worth of Ontario's treasure-trove — no longer without ownership, other than that of Mother Earth. The dividends from gold mines, despite the handicaps due to a devastating fire and the War, to the end of 1921 had totalled $23,140,734. That, however, inadequately represents the factor of return for capital, for those mines had to be developed, and equipped out of earnings, and expanded beyond that equipment, while creating ore reserves estimated at approximately $80,000,000. As the silver mines have also distributed about $95,000,000 in dividends and bonuses, manifestly the combined precious metal output of Ontario since LaRose started the Messrs. Timmins, McMartin and Dunlap on their iridescent careers as the owners of the LaRose and Hollinger, and since Wilson and Edwards made their find at the Dome premises, corroborates the claims of Ontario to preeminence in Canada, if not universally. Ontario alone shows remarkable progressive production.

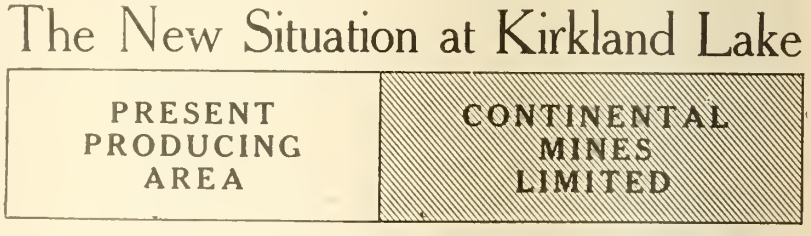
For these reasons, and because phenomenal Cobalt is nearing the finale, "Big Business" seeks Kirkland Lake gold fields and environs. So formidable is the movement based upon increasing knowledge and developments at depth, it is acknowledged that the gold lands of the Ontario northland are the most attractive awaiting the intelligent expenditure of speculative capital.

Hence the advent, with all it commands, of the Nipissing Company of Cobalt — Canada's greatest silver producer — and an impressive, if as yet inconclusive demonstration by the Continental Mines. Both of these mining corporations are of international origin. They have entered the Kirkland Lake with fore-knowledge of what they can expect and the chances they take, prepared to bring prospects to the producing stage when the "pay cracks" justify it.

For nearly twenty years the Nipissing Company has been entrenched at Cobalt. It has tried every new field seeking opportunities for reproductive investments. Nor is it going to "come out of the trenches," as Henry Ford expressed it, until Cobalt has sounded the "last post." There is further Nipissing territory at Cobalt awaiting exploration. Meanwhile the Company will prove what appears to be an extension of the fractured zone, immediately east of a portion of the Kirkland Lake (Tough Oakes) Proprietary ground, at Kirkland Lake.

Where Continental Comes In

At the same time, the Continental Mines not only have taken over a country-side, three miles in lateral extent and three-fifths of a mile transversely ("upon information and belief", as the lawyers put it) where the main fracture has been exposed; but they have acquired the Colonial Silver Mines at Cobalt, about the last of the well-placed central areas in that better-than-$200,000,000 camp.



Continental Mines field forces have been engaged for months in quietly mapping the surface of their square miles. The twenty-seven Kirkland Lake claims, and their two Colonial Silver claims, constitute a large sphere of activity. Under the direction of Mining Engineers of outstanding repute, while producing mines have been winning wealth and confidence, Continental Mines have been striving to locate those geological features and faults that made Kirkland Lake what it is.

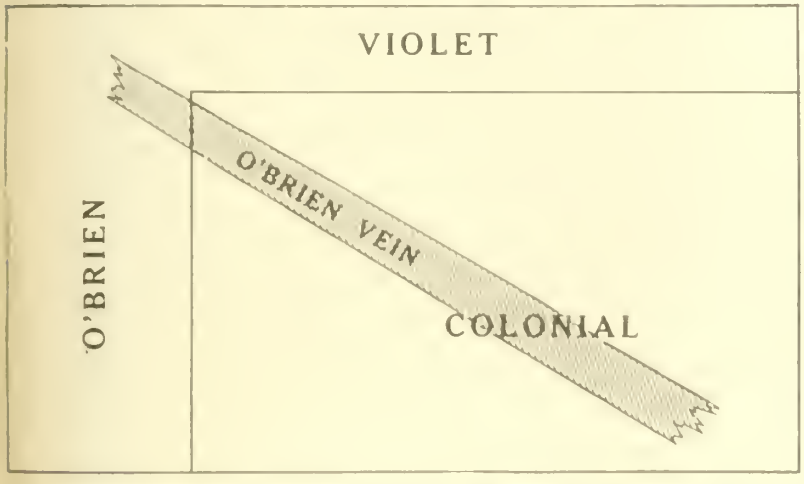
The potentialities of the Colonial Silver Mines are conceded, and will be quickly determined, shaft-sinking now being in progress. The acreage blanketed at Kirkland Lake by Continental Mines has priority in the estimates, in that it is certainly in possession of the fissuring and mineralogy of the producing two-and-three-quarter miles near-by.

Extent and Possibilities of Areas

More than presumptive evidence was necessary to persuade the technical advisers of the Nipissing nad Continental Companies to enter the Kirkland Lake gold fields, and to induce the Continental people to take over the Colonial Silver Mines. Colonial properties have the un-

questioned advantage of position and form, because the O'Brien Mine, one of the most productive, has an excellent ore-body that has been followed to within the width of a boundary pillar of the Colonial line. Kirkland Lake, though, has loomed so large owing to the expanse of gold-bearing rocks, R. B. Watson, on behalf of Nipissing, and R. C. Warriner, acting for Continental Mines, of which he has become President, decided that the facts of the gold fields amply warranted a comprehensive campaign. Mr. Watson is noted for his prudence and capabilities as a mining engineer. Mr. Warriner, originally of Pennsylvania, left an enviable record at the Witwatersrand, where he was Consulting Engineer to Crown Mines—a combination of central Rand properties controlled by the greatest factor in the gold mining world. Mr. Warriner also was General Manager of those properties, and was identified with the best mining practice. His mines hold the world's crushing record of 2,100,000 tons in a twelve month. Mr. Watson has not publicly committed himself to an opinion as to what the Nipissing is apt to have on the south line of break going east from the Tough-Oakes. Mr. Warriner is familiar in more or less detail with what Continental areas have disclosed thus far. The extension

Continental Holdings at Cobalt, Ont.



of the main fracture, in his judgment, traverses Continental claims for a mile at least. He has mapped the favorable faultings, as outlined by Geologist Goodchild of London, and Ontario provincial geologists, and the strength of the porphyries, conglomerate, syenite, lamprophyre and other features distinctive of Kirkland Lake producing section, *prima facie* proof of the potentialities of the New Situation as affecting not only Continental Mines but Nipissing as well. The accompanying sketch in simplest manner illustrates the relationship of what may be designated New Kirkland in distinction to the older, productive Kirkland.

Plans Quietly Perfected

Months ago I intimated that influential interests were overlooking nothing at Kirkland. Those interests understood that the central structures have been decoded, as it were. Prospectors having attended to necessary preliminaries, Messrs. Watson and Warriner, among others, started to "dig in." They are not given to confiding plans until they are perfected, and as the representatives of constructive mining capital, they are averse to prophecies until they know—which was Mark Twain's counsel. They think they know something, and the documents are in shape. Without trumpetings, refraining from broadcasting until static conditions were right, they made sure of their ground. Hence the significant transactions and guarded announcement that Continental Mines found the extension of the main fracture and that Nipissing is in the firing line.

Circumstantially, Continental Mines provided the more interesting development, having its beginning in the acquisition of the Colonial Silver Mines by the Menago Company. There was no thought of Kirkland at that moment. But Kirkland has been coming with a rush, and so Continental Mines Limited came into existence with a capitalization of $3,500,000. Considering the acreage holdings in the silver and gold fields, this nominal capital is a violation of North Country precedents. Sponsors seem to have been chary of numerals or of ciphers, whereas the rule is to square nominal millions to conform to combined claim areas. Besides, Continental will have $1,000,000 in the treasury to start with. Manifestly the conception and execution is epochal. To have nearly 1,200 Kirkland-Cobalt acres next to productive areas valued so lightly is unprecedented, while a million or two applied upon much smaller areas is the merest detail.

Nipissing has its own treasury to draw on. Continental has sufficient to prove the correctness of the Warriner diagnosis that the three miles secured cover one or more of the lines of fracture, the main and possibly a subsidiary fracture—enough, if good enough, to provide a Proprietary Company similar to those of the Rand, such as those that operate the State Areas, Modderfonteins, Brakpan.

Basis of the Latest Enterprises

It took about ten years to convince discriminating capital that Kirkland Lake District is second only to Porcupine, and ultimately may share the honors with the greater camp that is now producing at the rate of about $18,000,000 per annum. Thus far, Kirkland Lake has accounted for approximately $7,500,000, notwithstanding the War and reverses that might have been avoided by better management and a clearer conception of the structures. Increasing values at depth and the knowledge that gold is disseminated over a large area finally have induced influential companies and capitalists to concentrate their efforts upon these fields, more so than upon any others.

Between the Kirkland Lake Proprietary, Tough Oakes, Burnside, and Sylvanite properties, and the Kirkland Lake Gold Companies, the main fracture, therefore, is commanding greater attention. Consequently it follows that mining men of experience, if they cannot get an inviting outcrop or a producing mine at or about the price of a prospect, have a liking for dips, curves, angles and extensions. In Canada there is no Apex Law entitling discoverers to follow ore bodies into other properties regardless of ownership. Therefore, finding two and three quarter miles occupied, the determination of such combinations as the Nipissing and Continental was to secure extensions.

This has been the policy throughout mining history. Some of those who held or were content with central outcrops at the Witwatersrand doubted whether the banket beds would go down. Herman Eckstein and his contemporaries, the more far seeing of them, exercised their powers of divination when they pegged second, third, and fourth row deeps. It was their actions in this regard that established the "Corner House" as such, and made it the greatest gold mining organization in the world. Robinson forsook the richest section of the Rand and hooked on to the end of the line of reefs on the extreme western end of the Rand. Other powerful groups chose the Klandfontein, Germiston, Boksburg, Springs areas, which now include the Simmers, East Rand Proprietary, Consolidated

Van Ryns Geduld, Brakpan, and the numerous other chief sources of today's gold output.

It was the Central Rand (just as it is the Pearl Lake Section of Porcupine and the Central Kirkland Lake properties) that presented the Robinsons, Crowns, Ferreiras, May Nourses, Rose, Primrose, Goldenhuis, and the galaxy of mines that brought capital to the Rand and financed the extensions throughout forty miles of Main Reef.

The Struben's "started something" when they discovered gold bearing ores underlying the Main Reef Series. It was Bantjes who ascertained that the banket carried gold values. Comstock gave the States a "Golden West" after the California excitement, and made Bonanza Kings of Mackay, Flood, O'Brien and Fair. Stratton, Tabor, and the men of their day made a state out of a territory by what they found at Leadville, Cripple Creek, and the San Juan. Wilson and Edwards shook hands with the Fates at the Dome, and that brought Hollinger, Gillies, Dixon, Miller, Middleton and Davidson to Porcupine. Oakes, the Toughs, Wright and their fellows pioneered Kirkland Lake, exactly as LaRose, Hebert, McKinley, Darragh, Trethewey, Longwell, Leonard, and Lawson, created Cobalt. Interest broadened, and whenever areas were firmly held, recourse was had to the extensions. Now it is beyond question that the producing two-and-three-quarters miles of Kirkland Lake are apt to be merely introductory to what may result from the mapping if the main gold belt to the east of what was the Tough-Oakes. Mining at depths of from 600 to 1,000 feet, six companies are capitalized in the market much beyond their nominal capitalization.

Eastern Extension Located

No claims are made that the Nipissing-Continental lines of fracture will equal or surpass the results recorded by the producing mines of Kirkland Lake. The finding of the fissuring and confirmation of the geology for at least another mile to the east, on the Continental ground, is accepted as evidence of the lateral continuity of the gold-yielding section.

There is no intention to unduly magnify latest developments. Capable engineers are satsified that the primal conditions are present in the areas adjoining the Kirkland Lake Proprietary and Burnside. By training, manifesting their long-standing sense of responsibility in mining matters, they are disinclined to jump at conclusions. Of the twenty-seven claims held at Kirkland by the Continental Mines, all that is represented is that they are next door to the money and have the requisite geology; the drill and pick must prove the nature and character of what ore-bodies there are. Nipissing may have what it has sought and a proprietary company may be the outcome of Continental Mines' operations, somewhat similar to those at the Witwatersrand and those which have accomplished so much in the United States. Of course, all of this is prospective, and the melons to be cut are in perspective; yet the scope of Nipissing and Continental plans, carefully perfected, and following months of investigation, plainly implies that the moving spirits are favorably impressed by what they have thus far achieved since they decided to make a flying survey of an area that is accessible by automobile road, and where every operating economy is to be had without extra charge.

Continental Colonial Mines Acquisition

It is to be explained that the inception of Continental Mines is to be credited to Sudbury District principals; hence the presence of Messrs. McCrea and Buchanan, of Nickeldom, upon the Continental Board, along with President Warriner, ex-Governor Riggs of Alaska, who was a member of the Canadian-Alaskan Boundary Commission. Frederic Bull, whose family name is perpetuated because of its identification with Edward Sweet and Co., of the New York Stock Exchange, and others, including Chairman Home Smith of the Toronto Harbor Board, and William Wallace Mein, whose field representative has been Mr. Robert A. Bryce. Primarily a Copper Cliff executive decided that the Colonial Silver properties, abutting on the O'Brien and Violet (LaRose) Mines, were worthy of exploration. For years, Colonial owners had been importuned for terms. No one has doubted Colonial possibilities. They have been recognized all along and have been sought after. In the early days of Cobalt, the Colonial was capitalized at $6,000,000, produced about half a million ounces from milling rock, was litigated and has since remained idle. A small concentrator was erected and what work was done was by adit or on the surface. Milling rock then was inadequate for the Company capitalization. O'Brien and Violet operations, however, demonstrated that there is high-grade silver at depth in close proximity to the Colonial, along a contact where the diabase intruded. Since this contact proved so productive, periodic pilgrimages to Erie, where Mr. Ed. Germer resides, failed to land the Colonial on suitable terms. More success attended the efforts of the visitor from Copper Cliff, who closed a deal and turned it over to Continental Mines.

It is understood that those operating in adjoining ground were prepared to work the Colonial Mines on joint account with the holders of the rights. Both O'Brien and LaRose have first-hand knowledge of what there is underground at the O'Brien, and what is in the Violet. That is why Continental Mines have let a contract to sink a shaft to a depth of 800 feet, where it is expected to reach the contact and pick up the extension of the rich O'Brien vein.

The purpose is plain in the contract for the shaft—a three-compartment one. Ordinarily a co-operative arrangement with the O'Brien or the LaRose would be preferable. But, if the extension of the No. 6 Vein is there, it is worth going after. Never before has a shaft gone down so far at Cobalt for one purpose—and that is a real sporting chance taken by real mining men. They have an "almost" certainty, considering the O'Brien working face on No. 6 Vein is within a few rounds of their boundary, and for the further reason that the O'Brien people are sinking on this vein from the 800 to 1,000 feet. Before the existence of the O'Brien-Colonial contact was known, the Colonial properties were a great deal more problematical than they are now. Those best informed at Cobalt regard this as a venture of brightest promise.

LIQUID FUEL CONGRESS IN PARIS

The Society of Chemical Industry, 49 rue des Mathurins, Paris, will hold, on October 9th to 15th next, an International Congress for the discussion of liquid fuels. The Congress, which has been organized under the patronage of the French Ministers of Commerce, Agriculture, Colonies and Public Works, will be divided into six sections:

1 - petroleum
2 - oil shales
3 - lignite and peat
4 - tar and benzol
5 - alcohol
6 - vegetable oils

Coincident with this congress there will be held an International Exposition of liquid fuels, on the Esplanade des Invalides. This Exposition will be divided into two groups, — production and use. The first will include all the commercial sources of liquid fuels and the processes of manufacture to which they are subjected. The second will comprise exhibits demonstrating their use for motive power, industrial and domestic heating, and light.

Milling Slocan Ores

MILLS OF ROSEBERY-SURPRISE COMPANY

By J. P. Mc FADDEN

The following paper was presented by J. P. McFadden general superintendent of the Rosebery-Surprise Company, at the meeting of the International Mining Convention held recently at Nelson, B. C.

The operations of the company of which I am privileged to be superintendent, while rather small at present, have entailed the mining and milling of the ores of four widely separate Slocan mines, namely the Surprise mine on the north side of Carpenter creek, the Ivanhoe and Canadian group on the south side of Carpenter creek, both above Sandon, and at respective altitudes of 6700 and 5500 feet, and the Bosun mine at the level of Slocan lake, and halfway between New Denver and Silverton. The ores from these four mines were delivered by aerial tramway and either by rail or barge to either our concentrator at Sandon or that at Rosebery. Our efforts and results in the milling of these ores is the subject I will attempt to outline.

The Concentrating Problem

The flow sheet of both mills called for gravity concentration with the usual equipment of crusher, rolls, trommels,, jigs, tables and flotation, with machines of differing type in the two mills.

Gravity concentration in the Slocan is of course similar to the same process elsewhere in use on lead-zinc ores, but at the same time it has differences that perhaps should be mentioned. The mechanical separation of lead and zinc from one another and from the gangue material is ordinarily a simple matter, and calls for only a minimum of outlay in the way of milling equipment and construction. The fact, however, that the Slocan ores are very high in silver and often have the sulphides of lead and zinc intimately mixed through a gangue that is frequently very hard, together with the presence in the ores from some of the mines of large percentages of iron pyrites and iron carbonate, makes the problem more complex, and outlay for milling equipment and construction above the ordinary.

You will understand that the Slocan mines are primarily silver mines, and while the lead and zinc derived are, of course, necessary and acceptable products, they are, nevertheless, secondary in point of value. The difference in equipment and of construction is largely occasioned by the necessity for re-grinding a middling from all the jigs. This means additional rolls, elevators, trommels and jigs.

Character of Ore and Concentrate

The lead concentrate derived from the milling of a Slocan ore will run from 100 to 175 ounces per ton in silver. The lead is soft and very easily slimed, and it is more than advisable (in fact it is necessary to good extraction of both lead and silver) that these products be recovered in the coarsest possible state. Where the amount of lead in the mill feed will warrant it, picking belts are used. The next best device to the picking belt is the one or two compartment bull jig, where a lead concentrate only is saved as finished product, being as coarse as 3/4 inch. From a rich lead feed, a very considerable amount of the lead can be removed at this stage.

If you will size a general sample of the lead concentrate produced, you will find that the silver content of the different sizes made decreases very rapidly with the finer mesh. At every crushing of a piece of lead you produce a certain amount of very fine lead and slime which is difficult to save, some of it being impossible to save, especially in the presence of the very large volume of water needed throughout the process. Certainly so far as water concentration goes, the silver, as argentite, tetrahedrite, ruby silver or other silver compound, in the lead or zinc sulphide, must be saved while it is in association with these sulphides. The sliming of either the lead or zinc sulphide, and more especially the lead, frees a great deal of the silver and once this is accomplished, you can say "goodbye" to it. Our experience has been that it is then practically impossible to settle it from the water.

Lead Concentrate High in Zinc and Silver

A stranger, examining the assay returns of our lead shipments, might reasonably judge that we were making a very dirty or zincy product, and either wonder why this was so, or assume that the association was so complex that a better separation could not be made. With our ore, it is perfectly feasible to make a lead concentrate running 65 per cent. to 70 per cent. lead and 6 per cent. to 7 per cent. zinc; but we determined that it was greatly to our advantage to produce a finished concentrate assaying about 55 per cent. lead and 10 per cent. zinc, the whole idea of this being to recover the silver at the earliest possible stage in the operation and thereby avoid as much as possible the regrinding of a rich middling, with its consequent loss of lead, and especially silver, through sliming. The higher zinc content of course entails a higher smelting charge, but the increased extraction obtained, especially in silver, more than offsets this. This procedure would not necessarily be applicable in the production of a lead concentrate that did not carry high silver values. Just where to draw the line would depend largely on the marketing prices of the metals, smelting charges and freight.

The Equipment

With the above discussed object in view, practically all the concentrators in the Slocan have been laid out on very much the same lines. The personality and experience of different operators finds expression more in the technique of handling the equipment than in the use of widely varying styles of machines. A list of equipment of our Rosebery concentrator, with a capacity of 150 tons per day, consists of

One 20 x 30 Blake crusher
One Gates, 10-2 gyratory crusher.
One set of primary rolls.
One set of intermediate rolls
One set of fine rolls
Two 2 compartment Hartz ball jigs
One 4 compartment Hartz jig.
Five 4 compartment Hartz jigs
One 4 by 6 Chalmers & Williams ball mill
One Door duplex classifier
Eight Wilfley tables
One Deister slime table
One 8 foot Dallow cone
One 18-foot Dorr thickener for flotation feed
One 18 foot Dorr thickener for flotation concentrate
One Callow pneumatic cell
Four Hunes-Dorr flotation machines
One 4 by 6 Portland filter

The Flow Sheet

The ore is received direct from the mines in railway dump cars and is either crushed direct or dumped into storage bins of 1,400 tons capacity. When crushed direct, the car is dumped over a small bin between the railway track, under which travels an 18 inch belt con-

veyor, the bar acting as a bin until its contents have been removed by the conveyor to the Blake crusher, which is set for crushing to two inches. From the crusher the ore is carried by belt conveyor, which is also utilized as a picking belt, to the gyratory, which reduces it to one inch size. From the gyratory the ore goes to the mill feed bin by elevator.

The ore is fed to the primary rolls by means of an Allis Chalmers style "H" feeder. At this point a sample of the feed is taken every 15 minutes by catching the full discharge of the feeder in a pan through a period of 30 seconds. The large sample obtained from the accumulation of these samples through a period of 24 hours is then cut down to a 10 pound sample, as representative of the previous day's mill feed. Every alternate one of the interval samples is weighed to determine the tonnage going through the mill.

After passing through the primary rolls, the ore is raised by bucket elevator to the trommel line, which consists of four 48 by 80 inch trommels, of 12, 9, 6 and 3 millimeters. The sized products of the trommels go to jigs. All material finer than three millimeters goes to a Culver hydraulic classifier, from which the coarse sand is sent to a fine jig and the overflow to a 50-foot "V" shaped settling tank which distributes a thickened product to the Wilfley tables. The overflow of the "V" settling tank goes to the flotation feed Dorr thickener.

The middling from the bull jigs is returned to the intermediate rolls, and the middling of jigs handling material between six and 12 millimeters is returned to the fine rolls, while middling smaller than six millimeters goes direct to the ball mill to be ground for flotation. The discharge of the intermediate and fine rolls is delivered back to the head of the trommel line.

With all ores except the Bosun, lead and zinc concentrates are made on all the jigs from both cups and hutches. The Bosun ore carried too much iron to permit a jig zinc concentrate to be made, and it was necessary to send it on to flotation.

The Flotation Plants

Our flotation plants, both at the Surprise and Rosebery mills, were made necessary by the large amount of iron carbonate in the ore from the Surprise mine and the iron pyrites in the ore from the Bosun mine, which meant a very heavy zinc loss, coupled with a more serious silver loss. To this was added the incentive during the war period of the very high prices obtainable for both silver and zinc.

As an illustration of this necessity I will cite the results of the milling of 8544 tons of Surprise ore in 1915, in what was then the Ivanhoe mill, which was fully equipped with the necessary machinery for gravity concentration only. The average assay of the 8544 tons milled was 27.7 ounces of silver, 8.6 per cent. lead, and 19.2 per cent. zinc. From the milling of this lot of ore we derived 117 tons of lead concentrate with an average assay of 118 ounces of silver, 62.7 per cent. lead, and 9.7 per cent. zinc; 2456 tons of zinc concentrate assaying 23.8 ounces silver, 3.4 per cent. lead and 39 per cent. zinc. The mill feed was carefully weighed, and if we subtract the concentrate tonnage, which figures are smelter dry weights, we have remaining as tailing 4978 tons, which had an average asay of 5.6 ounces of silver, 0.3 per cent. lead and 9.1 per cent. zinc, or a total loss in tails of 27,656 ounces of silver, 14.5 tons of metallic lead, and 452 tons of metallic zinc, the 452 tons of metallic zinc being equivalent to the loss of 1130 tons of 40 per cent. zinc concentrate. From the above figures you may readily realize the incentive to undertaking the installation of flotation equipment, and the wading through that mire of experimentation which was our lot before we finally arrived at a satisfactory practice.

Our flotation work was begun in the fall of 1916 upon completion of the Surprise mill at Sandon. The flotation unit consisted essentially of a ball mill, a Dorr thickener, and a series of flotation cells manufactured by the Minerals Separation Company and sent to us in about 10,000 pieces (more or less). The Minerals Separation unit consisted of four Hebbard cells for the selective flotation of lead, followed by a group of four standard cells in series with eight Hebbard cells for zinc.

The primary flotation feed was sent to the first of the Hebbard lead cells, after being oiled with cresylic acid, for the selective floating of the lead. After passing through the four lead cells, from which a lead froth was taken, the pulp was discharged from these cells, and after re-oiling for zinc with water-gas tar and hardwood creosote, was elevated for delivery to the first of the four standard cells from which a finished zinc concentrate was taken. The pulp then flowed, by gravity, through the eight Hebbard zinc cells, and thence to tails. A middling froth was taken from the eight Hebbard cells, and returned to the standard cells for cleaning.

Good Recovery of Silver

The flotation feed would run 25 to 30 ounces in silver, 1.5 to 2.5 per cent. in lead, and 10 to 15 per cent. in zinc, the high zinc feed being due to the fact that no zinc concentrate was made in the gravity end of the mill. We were able to make, by selective oiling, a flotation lead concentrate assaying 40 to 45 per cent. in lead and 25 to 30 per cent. in zinc and ranging in silver from 200 to 300 ounces per ton. About 1 pound of cresylic acid per ton of ore treated was used. The operation was, however, a very delicate one and required almost constant attention. Th reduction in the lead content of the feed through this process was not great, so that the greater part of the lead in the flotation feed went on to be collected later in the zinc concentrate. The good purpose that this operation did serve was to provide a medium, not too ziney, for collecting the silver, which had been freed through sliming and was floating free of lead or zinc sulphide. The fact that a larger percentage of the lead was not removed in this operation was due, not to the fact that lead is difficult to float, but to the necessity of restraining the zinc.

Previous laboratory experiments had given us reason to expect better results from the zinc end of the flotation unit than we were able to obtain during the first few months of its operation. No difficulty was experienced from the first in taking off a good grade of zinc concentrate from the standard cells, but the tailing results through the early period of operation were unmentionable. Weeks of experiments followed, and many kinds of oil were used in varying quantities. Various densities of pulp, combinations of cells for re-treatment, re-oiling at later stages in the flow of pulp, varying degrees of fineness of feed, and any number of what you might call "stunts", were tried.

On the Minerals Separation unit as it stood we were not able to average better than a tailing assaying six ounces of silver, a trace of lead, and zinc 5 per cent. The oils used were five pounds of water-gas tar and 0.6 pound of hard-wood creosote per ton of ore treated. Before the war and at present, such a tailing is bad enough, but during the period of war prices it was awful!

Our next move was the installation of a Hynes machine, details of which I shall describe presently, to treat the tailing of the Minerals Separation machine for the recovery of the remaining zinc and silver. This machine was oiled with 0.3 pound of water-gas tar and 0.02 pound of Pensacola No. 350 pine oil. It delivered a very light and voluminous froth of small bubbles. It lifted most of the remaining zinc from the pulp, and with it considerable gangue. The concentrate taken from this machine assayed about 10 per cent. zinc and was returned to the head of the standard cells for cleaning. The average of the tailing from this machine over a period of 30 days would be two ounces of silver and 1.7 per cent. zinc.

The Hynes Flotation Machine

The Hynes machine consists essentially of a rotor, mounted horizontally, and its containing box or tank. The construction of the tank is similar to that of the K & K. machine, the advertising cuts of which are familiar to almost everyone. A settling trough or spitzkasten is provided along the front of the tank for the collecting and cleaning of the concentrate. The dimensions of the tank of a medium sized machine are, length six feet, width five feet and a half, and depth four feet.

The rotor consists of a 3 7-16 inch shaft, upon which are mounted perforated sheet metal discs 30 inches in diameter and 1¼ inches apart. The sheet metal discs are of 12 gauge, with ½ inch perforations, spaced 7-8 inches between centers. An area 12 inches square is left blank in the center of the disc, and the center of this square is bored and notched to take the shaft and key. The interval between the discs is maintained by means of dry fir spacers 1 1-4 inches thick conforming to the pattern of the blank square in the center of the disc.

The discs and spaces are slipped on to the shaft, the notch in the center of the discs fitting over the shaft key which extends the full length of the disc line. The spacers and discs are drawn firmly together by means of four 3-4 inch tie rods running the full length of the disc line and passing through the corners of the blank square in the central portion of the disc.

The rotor shaft is supported by bearings mounted outside the tank. A rotor, operating in a tank of the size mentioned, mounts 50 discs. Our practice required a speed of 90 revolutions per minute for the rotor shaft. The pulp enters one end of the machine, and passes out at the other, with the level maintained approximately at a point just below the shaft line by a device on the discharge end. It is necessary, however, to vary the pulp level slightly from time to time in order to control the flow of froth. The chief virtue of this machine, I believe, lies in the excellent aeration of the pulp resulting from the air entrained by the rotating perforated discs.

Rosebery Mill

The flow sheet of the gravity end of our Rosebery mill has already been described. The equipment of the flotation end consists of a 4 by 6 foot ball mill, one 28-foot and one 18-foot Dorr thickener, one small Callow pneumatic cell, 4 Hynes disc flotation machines, and a 4 by 6 Portland filter.

The Dorr duplex classifier, which is in circuit with the ball mill, is adjusted to deliver a pulp for flotation, all of which will pass 60 mesh, and 75 per cent. pass 150 mesh. This pulp is elevated to the "V" shaped thickener feeding the Wilfley tables and the thickened pulp is run over Wilfley tables and one Deister slime table where most of the remaining lead and part of the iron are removed. As no zinc is made on the tables, the table tailing includes all zinc sulphide present in the primary feed to the mill except that removed on the jigs. This pulp goes to a 28-foot Dorr thickener to be thickened, before sending to the flotation machines. The thickener discharge is controlled so as to deliver a pulp carrying 30 to 35 per cent solids. The thickened pulp is then elevated by a centrifugal pump to the head of the flotation machine unit.

Rosebery Flotation Equipment

The flotation machine unit consists of two 35-disc Hynes machines, one 50-disc, and one 100-disc machine arranged in cascade so that the feed, after entering the first of the 35 disc machines, flows by gravity through each of the others in succession. The second 35-disc machine takes the tailing of the first, the 50-disc takes the tailing of the second 35, and the 100-disc machine treats the tailing of the 50. A finished concentrate is made on three smaller machines, and a middling concentrate on the large machine. The middling concentrate, assaying 10 to 12 per cent zinc, is returned to the head of the flotation unit for cleaning.

The first oil is added at the centrifugal pump, operating between the thickener discharge and the head of the flotation unit. Oil is also added at each of the machines as conditions demand.

No difficulty is had in making a 40 to 42 per cent. zinc concentrate from any of the ores treated. The last 30-day run on Bosun ore, with a flotation feed running 57.7 ounces in silver, 0.9 per cent. lead, and 12.6 per cent. zinc, yielded a zinc concentrate assaying 95 ounces in silver, 2.9 per cent. lead, and 44.0 per cent. zinc, and a final flotation tailing of 1.4 ounces in silver, lead nil, and zinc 0.6 per cent.

The last mill runs at Rosebery on Surprise ore, Ivanhoe ore, and Canadian group ore, gave the following average results from the flotation unit through a milling period: Surprise ore, with flotation feed 22.3 ounces in silver, lead, 1.2 per cent., zinc, 11.7 per cent., gave a flotation zinc concentrate assaying 94.5 ounces in silver, lead 5.0 per cent., zinc, 42.6 per cent. and tailing, 3.7 ounces in silver, lead nil, and zinc, 3.0 per cent. Ivanhoe ore, with a flotation feed running, silver, 12.0 ounces, lead, 1.1 per cent., zinc, 9.8 per cent., gave a zinc concentrate of 45.0 ounces in silver, lead and zinc, 0.8 per cent. Canadian group with a flotation feed of 12.0 ounces in silver, lead, 1 per cent., and zinc 9.6 per cent. gave a concentrate of 53 ounces in silver, lead 3.9 per cent. and zinc 11.9 per cent., the tailing running 0.6 ounce in silver, lead nil and zinc, 0.6 per cent.

The samples of the feed, concentrate and tailing, of which I have just given the assay results, are taken automatically every three minutes and are not subject to the personal equation.

The Flotation Oils

The oils used in the flotation of zinc at Rosebery are water gas tar and Cleveland Cliffs hard wood creosote, mixed for use with Surprise ore in the ratio of four water gas tar to one creosote, and for use with Bosun, Ivanhoe and Canadian ores in the ratio of three water gas tar, to one creosote. The oil consumption on the four different ores was as follows:

On Surprise ore, water gas tar, 0.81 pound and creosote 0.21 pound per ton dry ore treated.

On Bosun ore, water gas tar, 0.75 pounds and creosote, 0.25 pounds per ton dry ore treated.

On Ivanhoe ore, water gas tar, 1.50 pounds and creosote, 0.50 pounds dry ore treated.

On Canadian group ore, water gas tar, 1.05 pounds and creosote 0.35 pounds dry ore treated. [illegible] were fed hot by feeders of the wheel and [illegible] Electric heaters were used to keep the oils at the proper

temperature. I attribute the difference in the consumption of oils at the Rosebery as compared to the Sandon plant to the more perfect aeration of the pulp by the Hynes machine.

Preliminary Chemical Treatment

A flotation lead concentrate was made from Surprise ore by treating it first in a small Callow pneumatic cell before sending it to the Hynes zinc machines. Three-tenths of a pound of cresylic acid per ton treated was used in this operation. The amount of concentrate realized was not very large, and would assay about 350 ounces in silver, 23 per cent. lead, and 22 per cent. zinc. We were never successful in making a satisfactory lead concentrate in this machine from Bosun, Ivanhoe or Canadian Group ores. The product was very zincy, and also the excess cresylic acid that would be carried through into the Hynes machine would cause an uncontrollable froth when used in connection with the three ores mentioned. This uncontrollable froth, I think, was occasioned by the action of the highly aerated pulp, in conjection with the cresylic acid, upon the graphitic matter in the gangue rock of these ores, which was soft slate. This difficulty was not experienced with the Surprise ore when using similar amounts of cresylic acid under the same conditions. The gangue rock of the Surprise ore is a hard quartz porphyry.

In order to make a satisfactory zinc concentrate on the Bosun, Ivanhoe and Canadian group ores, it was necessary to add a solution of copper sulphate to the pulp. This copper sulphate was introduced at the pump between the thickener and first flotation machine, the consumption being 0.75 pounds of copper sulphate per ton of ore treated.

Tests with Copper Sulphate

Early in our practice, being in serious difficulty in the making of a satisfactory zinc concentrate on the Bosun ore, we tried the copper sulphate, as we had heard of its use elsewhere and obtained, almost immediately, satisfactory results. Later we did some experimenting to determine, if possible, the reason for the reaction. What work we did went to show that the action or re-action was not in restraining the floating of the iron pyrites nor in decreasing the zinc content of the tailing. A test was run over a period of 10 days, during which time copper sulphate was used on every alternate day. The zinc and iron content of the flotation feed, concentrate and tailing were determined each day and the results tabulated with and without the copper sulphate. The average of the feed in both cases was the same in zinc and iron percentage namely, 5.1 per cent. zinc and 6.1 per cent. iron, and it was observed that the average tailing percentage in zinc and iron was the same, being a little over 3 per cent. in zinc and 6 per cent in iron in each case. The concentrate zinc percentage, however, had increased by 10 points in the average where copper sulphate had been used. Our deduction was that the copper sulphate had a coagulating effect upon the slime, or a restraining action upon the graphitic matter, causing at least part of it to pass into the tailing instead of rising with the froth. This theory is strengthened by the fact that no copper sulphate is necessary when milling Surprise ore, which does not slime readily, and carried no graphitic matter.

Graphic Curves to Aid Operators

For the use of the flotation operators, curves for determining the percentage of solids in the flotation feed and for determining the flotation tonnage going through the machines were kept posted in the mill. I will not go into the matter of the derivation of the formulas upon which these curves are based. For their use, the operator catches a sample of the pulp coming from the thickener in a container holding 750 cubic centimeters and weighs this sample. Having the weight, he can find the percentage of solids by reference to one of the curves. He then turns the feed nozzle into a box measuring 12 by 15 by 20 1-3 inches and observes the time in seconds required to fill it. Knowing the percentage of solids and the time required to fill the box, reference to a second curve gives the tonnage per hour passing through the machines. This information is recorded every 30 minutes.

For what results we have been able to obtain I wish to give great credit to F. J. Murphy, who was with us as mill superintendent for three years, when he was transferred to Mexico to take charge of larger milling operations there. During the last year of milling operations J. Reid, of Rosebery, was actively in charge of the Rosebery mill as foreman.

STANDARD SPECIFICATIONS FOR WIRE ROPE

The Canadian Engineering Standards Association has recently completed and published a Standard General Specification for Wire Rope for mining, dredging and steam shovel purposes. Copies of this publication may be obtained from the Secretary of the Canadian Engineering Standards Association, Room 112, West Block, Ottawa, Ontario. As stated in the preface, the Specification is intended to embody those requirements for standard grades of wire rope for mining, dredging and similar purposes that are regarded as essential in order to protect the purchaser against an inferior and defective product and to guide the manufacturer or importer as to standard practice in Canada.

The Sectional Committee on Wire Rope was appointed in 1919 by the Main Committee of the Canadian Engineering Standards Association. The members were: chairman, Prof. H. M. MacKay, McGill University; K. M. Cameron, Dept. of Public Works, Ottawa; H. B. Greening, B. Greening Wire Co., Hamilton; F. H. Hopkins, Dominion Wire Rope Co.; A. W. Robinson, Consulting Engineer; T. F. Sutherland, Ontario Dept. of Mines; J. S. White, Acadia Coal Company. Two subcommittees were appointed one on wire rope for dredging and steam shovel purposes and one on wire rope for mining purposes.

Wire ropes made in accordance with these specifications shall be known as C. E. S. A. Standard Hoisting or Haulage Rope and may bear the distinguishing mark of the Association.

After considerable study of the subject it was decided to classify the material for wires under three grades only: Crucible Cast Steel, Plough Steel and Special Plough Steel. Crucible Cast Steel is an acid or basic open-hearth or Bessemer steel of medium carbon content with a tensile strength of 160,000 to 210,000 pounds per square inch. Plough Steel and Special Plough Steel are high-grade acid open-hearth steels with a carbon content of 0.50 and upwards, Plough Steel having a tensile strength of from 200,000 to 230,000 pounds per square inch, and Special Plough Steel from 220,000 to 270,000 pounds per square inch. In each case the lower figure is the minimum requirement of the ultimate tensile strength of the wire. The permissible variation allowed in the diameter of wire is 0.005 inch for wire 0.064 inch and larger and +0.003 inch for wire below 0.064 inch.

Institution of Mining Engineers

ANNUAL SUMMER MEETING AT SHEFFIELD

By ROLAND H. BRIGGS

The Annual Meetings of the Institution of Mining Engineers have this year been held in Sheffield, England, and a large number of members were present. Several interesting papers were read at these meetings, amongst which were included a report on "*Rock Temperatures in the Coal Measures in Great Britain*," by Mr. J. Ivon Graham, M. A., M. Sc., Assistant Director of the Mining Research Laboratory of the University of Birmingham, a paper on the "*Rate of Absorption of Poisonous Amounts of Carbon Monoxide by the Blood*", by Mr. A. P. Veale of the same Laboratory, a description of "*Methods of Working the Barnsley Seam of the South Yorkshire Coalfield*", by Messrs. H. and M. Rhodes, and some details with regard to the "*Air Cooling Plant at the Morro Velho Mine of the St. John Del Rey Mining Company Limited, Brazil*," by Mr. Eric Davies, B. Sc., A. M. Inst. C. E.

A Brazil Plant for Cooling Air

The installation of this mine cooling plant in Brazil, the whole of which was manufactured in Britain, has been attended with most satisfactory results, some of the most important of which were quite unexpected. For instance, since the installation of the plant, a great reduction in accidents to the miners has taken place, so that the percentage of accidents is now satisfactorily low, instead of being so high as to give the mine a bad name. This remarkable result is accounted for by the fact that, owing to the more bracing condition of the mine atmosphere, the men are more alert and can perceive and avoid danger with greater celerity.

Owing to the variations of air temperature caused by the seasons and the time of day, the plant is divided into six stages, so that any number of the stages can be shut down as the outside atmosphere cools, so as to maintain a constant temperature in the mine. The air is drawn through the air coolers by two 60 inch single inlet Sirocco fans, belt driven at about 105 r.p.m. by 50 h.p. electric variable speed motors, delivering into a common duct which communicates with the downcast shaft through a tunnel 850 feet long. The air coolers are of the "Heenan" type, and consist of a number of cylinders 10 ft. 10 ins. in diameter by 8 ins. wide, weighing three tons each, and built up of galvanized steel plates arranged in a long spiral, so that the radial gap between the outside of one plate and the inside of the next (through which the air passes) is about ⅛ inch. The total length of plate per cylinder comes to about 5,400 feet. Each air cooler has nine cylinders which are arranged on a common shaft rotated at about 3 revolutions per minute. The lower parts of the cylinders are immersed in cold water.

There are two water tanks and one evaporator to each stage, each evaporator containing from 11,980 to 6,960 feet of ammonia pipe coils, or 10½ miles of pipe in all. Circulation of the water is obtained by means of a motor-driven centrifugal pump, of 400 gallons capacity against a 20-foot head. There are six ammonia compressors, one for each stage, these being single cylinder, double acting machines 11 5/8in. diameter and 21 in. stroke, belt driven at 81 r.p.m. by 120 h.p. motor. The condensers are of the double pipe type, and there is a small vertical compressor for pumping-out purposes. Messrs. J. and E. Hall Ltd. of Dartford were the main contractors, while the air coolers were manufactured by Messrs. Heeman & Froude, Ltd. of Worcester, and the electrical plant by the General Electric Company, Ltd. of Witton.

The Barnsley Coal Seam

The paper read by Messrs. H. & M. Rhodes dealt with methods of working the famous Barnsley coal seam in South Yorkshire, which underlies an area of at least 1000 square miles, and which has been proved along the outcrop for sixty miles, from Leeds to Nottingham, and has been met with as far east as Southsear near Doncaster, at a depth of 3,180 feet. Fifteen million tons per annum are now raised in the South Yorkshire Coalfield from the Barnsley seam alone. The seam varies considerably in thickness, but at most points lies between the limits of 4½ and 10 feet.

The great value of this seam is due to the fact that a portion of the seam is semi-anthracite, particularly suited for locomotive and marine use, and for iron-smelting. There are alternating beds of semi-anthracite and a more bituminous coal. The "hards" usually are about three feet thick throughout the whole area. In addition to the general use of all classes of fuel produced from this seam for steam, house and gas making purposes respectively, over the greater part of the district the small coal makes excellent coke, and is now exclusively coked in by product ovens after having been washed in Baum, Coppée and Humboldt washers.

The seam has been worked for centuries and is mentioned in the time of Henry the Eighth. About a century ago the method adopted was to form the coal into large pillars by narrow drivings and work the pillars off by lifts about 20 yards wide. About 1840 this method was given up, and the coal worked by banks or stalls about thirty yards wide with pillars of about the same width. Between the years 1847 and 1857 four serious explosions took place, accompanied by much loss of life: Oaks (73 lives lost), Darley Main (75 lost), Warren Vale, (52 lost) and Lundhill, (189 men and boys lost). Lundhill was considered to be a model colliery and the explosion drew the attention of mining engineers to the methods of working in the South Yorkshire district.

The requirements for the methods of manufacture of the wire itself, the use of filler wires, joints in wires, lubrication of hempen core and laying up of rope are simply these. Followed by reputable wire rope manufacturers.

The torsion test required that the wires shall not break, split or show any defect on 25 complete turns per length of 100 diameters.

Three standard constructions are recognized for hoisting ropes, 6 by 19, 6 by 19 Seale type, and 6 by 37.

Appendix I. gives the information that is to be furnished to the vendor by the purchaser and includes the following data, which are extremely important and yet are often overlooked when ordering hoisting ropes: purpose for which the rope is required, maximum running speed, maximum working load, diameter of sheave and diameter of drum.

Appendix II. gives the information that the manufacturer is to supply the purchaser and includes particulars as to the construction of the rope, the grade of material of wires, the tensile strength of wire and the guaranteed ultimate tensile strength of the completed rope.

T. E. S.

After the Lundhill explosion the bank system of working the Barnsley seam was practically abandoned, and the wide bank and pillar system or the bord and pillar system took its place. The longwall system of working was gradually introduced between 1866 and 1879, and with the exception of one or two of the oldest collieries, which are working out a few pillars, the longwall method of working the Barnsley seam is now universal.

Mining Method

Except in the district south of the Don Faults, it is customary to timber under a greater or less thickness of the Top Softs, the bulk of which are recovered in the gates and behind the timber in the wastes. The seam is thus worked in two operations, the thickness of the first working varying from 1½ to 7 feet. The width of the stalls varies from 22 to 50 yards, and from 2 to 8 men per shift are employed in each stall according to its length. The use of the shorter stalls is confined to those collieries that have gradually evolved their longwall from some earlier method, and also to those pits where ripping the Top Softs in the gates provides sufficient height without cutting into the roof in the ordinary stall roads, the pack material being supplied from back-ripping the main roads and cross-gates, the packs in some cases being put on under separate contract.

At the more modern and deeper collieries wider stalls are used, and the increased depth makes it necessary not only to take down top coal in the gates but also to rip from 1 to 3 feet of stone down as well. The distance between the crossgates varies from 80 to 120 yards, and they are generally packed out as the face advances without disturbing the general line on which the faces work, the men employed in each stall being responsible for carrying the cross gate across their face. The gate and crossgate packs are usually from 6 to 9 feet thick, and are in some cases strengthened by chocks, 2 ft. square, made of old timber, set about every six feet. These chocks may be dispensed with in pits liable to gob-fires, and the gate packs are then made considerably wider.

Good Production per Man

It is the usual practice for the men employed in each stall to do all the timbering and packing and to be responsible for the first ripping, and the average output per man in these circumstances is about 4 to 5 tons per shift. Since the introduction of the Seven Hours Act, about 40 per cent. of the total number of men employed, both surface and underground, work at the coal face, and where the output is as high as 5 tons per man per shift employed at the face, the average production per man employed both surface underground, is about 2 tons per shift, with a proportionate reduction where the face worker produces less coal. It is estimated that at the moment the average production per man and boy employed in the Barnsley Seam collieries is not far short of 400 tons per year, which is considerably higher than the average in Britain.

In some of the older pits it is the practice to tram the coal from the face to the pass-by, the tonnage rates in such cases including tramming for a distance up to say 80 yards. In other collieries tubs are taken from the face by ponies, but the use of small compressed air or electric hauling engines for hauling direct from the face is increasing very rapidly, some collieries having dispensed with the use of ponies altogether. In the more easterly pits, where the full dip does not exceed 1 in 25 or 1 in 30, the force of gravity is used for pulling in the empties. The main haulage is usually on the endless rope system, but the direct and head- rope and main-and-tail systems are still extensively used.

Selective Mining of the Coal

Whatever system of working is adopted, it is the practice to fill the Hards and Softs separately, and a typical example of the operations is as follows. The Softs are first kirved or holed out and filled separately. The Hards are then dropped, the lower portion of the Top Softs being supported temporarily. The Top Softs are then taken down and permanent props set to support the bags and day-bed. As the faces advance, the latter props are drawn out, and the bags and day bed immediately fall and are filled out.

Tests with Carbon Monoxide

In the paper on the rate of absorption of poisonous amounts of carbon monoxide by the blood, Mr. A. P. Veale described experiments which he himself undertook, both in a state of rest and when undergoing exertion, while breathing air containing measured quantities carbon monoxide.

It is satisfactory to be able to record that while the experiments produced headaches and weakness of greater or less severity, they did not result in permanent injury to the health of the experimenter; indeed, he proposes to carry out further tests.

The tests were eight in number and they showed that where no work is undertaken in atmospheres containing carbon monoxide up to 0.114 per cent., a maximum of 40 per cent. of the amount inhaled will be absorbed. In cases where work is undertaken under similar circumstances as the above a lower percentage is absorbed, but the greatly increased rate of breathing and consequently the volume breathed, far more than makes up for this. In actual work underground, four times the absorption of that of a person at rest should be allowed. Thus a man would only have one-fourth of the time at which he would otherwise have at his disposal in which to escape to safety. The absorption rate will also vary with the physical fitness of the subject.

The conclusion drawn from these experiments is that no one should ever go into a suspected atmosphere unless accompanied by a small warm blooded animal, which should be a linnet for preference. A mouse or bird will, during rest, absorb carbon monoxide at a rate approximately fifteen times faster than a man who is also resting. But as the man will be walking and the bird or animal resting in a cage, he will be absorbing much more carbon monoxide, and this reduces the factor of safety to about four. Thus the moment the bird collapses or falls off its perch the explorer should return at once, as there is very little time to lose. In addition, a man is rather more sensitive to carbon monoxide than a mouse or bird, which further reduces the factor of safety.

Temperature in Mines

A long report containing a very great deal of valuable data was presented by Mr. Ivon Graham, M. A., M. Sc., this being a report to the "Committee on the Control of Atmospheric Conditions in Hot and Deep Mines." Large numbers of tests have been made in different coal mines and different coalfields, by means of a special apparatus that gave the temperature at the bottom of special boreholes drilled sufficiently deep into the rock or coal to give the true rock temperature, instead of the temperature at the face, which may be lowered by the ventilating air current or by the giving off of gas.

The results obtained from these tests show that in different parts of Britain there is considerable variation

in the Geothermic Gradient. In the Stalybridge area figures of 1 deg. Fah. in 72 feet were obtained, while near Wigan, also in Lancashire, it is 1 deg. Fah. in 56 feet. There may frequently also be a change of gradient with change in depth, as for example at Brodsworth in South Yorkshire, where the gradient was 1 deg. in 60 ft. at 1800 feet; 1 deg. in 56 ft. at 2300 feet; and then reverted to 1 deg. in 59 ft. at 2500 feet. A similar change was obtained at Hatfield and other figures confirmed these results. In Fifeshire figures in the carboniferous limestone series have given variations of 1 deg. in 70 ft. to 1 deg. in 94 ft. reverting to 1 deg. in 80 ft. with increase in depth.

The point of special interest in this connection is how far the strata temperature influences that of the air in the underground workings. Temperature can be controlled by efficient ventilation so as to be well below the strata temperature. This is usually shown in the main intakes of well ventilated pits. In one case in deep workings the strata temperature was 105.5 deg. F. while the air temperature was only 87 or less, and this at a distance of three-quarters of a mile from the pit bottom. As the quantity and velocity of the air are diminished in the workings the influence of the temperature of the surrounding strata increases.

In many cases the air temperature at the coal face is actually higher than that of the strata. This is due to compression of the air, oxidation of the coal, timber or other material, and heat conducted from the strata, the latter being out-balanced by the former. It has been shown that heat due to compression amounts to 1 deg. F. in 182 feet, so that in Britain, whenever the strata are found to be at a lower temperature than the air, it is due to the heat from oxidation being excessively high. As the surrounding strata are such poor conductors of heat, the only practical means of lowering the temperature is by increased ventilation or by bringing the fresh air to the working place at a lower temperature. This production of heat usually arises from the oxidation of coal, or sometimes of pyrites, and in the case of damp working the decay of timber may be a contributory factor of considerable importance.

Geological Reports on Yukon and British Columbia

In *Summary Report*, 1921 *Part A*, of the Geological Survey, Ottawa, just issued, there are contained seven reports dealing with field work in British Columbia and the Yukon during the season of 1921.

Silver-Lead Deposits of Davidson Mountains, Mayo District, Yukon

W. E. Cockfield's report on this area is accompanied by three maps, of Stand-to Hill, Rambler Hill and Mount Cameron districts, respectively. These areas are five to ten miles north of Keno Hill and 45 miles northeast of Mayo.

On these three hills there have been discovered veins in fault-fissures in schists, gneisses, quarzites and limestones of Pre-Cambrian age. These rocks have been intruded by granite. In the veins there occur, in zones parallel to the walls, argentiferous galena in a gangue of siderite and quartz. The veins have not been sufficiently developed to demonstrate their value; but meantime it has been determined that the ratio of silver to lead in the galena is only about one-third that of Keno Hill. The present expense of transportation prohibits the exploiting of the veins thus far discovered.

Upper Kitsault Valley, British Columbia

During the field season of 1921, George Hanson mapped an area of 50 square miles, north of Alice Arm, containing the famous Dolly Varden mine and a number of silver and copper prospects. The veins occur in volcanic and sedimentary rocks of Jurassic (?) age, and are due no doubt to the presence of the great Coast Batholith, a few miles to the West.

The value of the ore deposits is due to secondary enrichment that took place in pre-glacial times. By this means parts of the Dolly Varden vein, in the upper levels, were made exceedingly rich in silver. Comparatively little intensive prospecting or development work has been done, apart from restricted areas on a few of the more prominent properties. Mr. Hanson stresses the need for surface prospecting, and adds:

"The volcanic fragmental rocks of the Dolly Varden formation are worth prospecting for silver bearing veins. The purple and red members of this formation do not appear to contain any silver veins, the grey or green members containing all the known silver veins in the district.

"Secondary enrichment has not proceeded at a uniform rate throughout any area, nor even in any particular vein. Consequently, if a vein is stripped in a few isolated places and found to be too low grade, for mining in these places, it does not follow that the intervening parts of the vein are also of low grade, and vice versa. In prospecting the silver-bearing veins in the district, thorough surface examination is of the greatest value.

"Surface prospecting would probably be of value along the Dolly Varden mineral zone, the North Star-Torie-Ruby mineral zone, and the extension of the Ruby zone.

"If the values are contained in a native silver, ruby silver ore, it is probable the silver content will decrease in depth. Where the silver is contained in a grey copper-galena ore, the values will probably be more persistent in depth.

"Where surface ores contain thick plates and leaves of silver and similar seams of ruby silver, and where fracturing has been extensive, high values can be expected to continue to greater depth than where surface ores contain very thin flakes of native silver, etc.

"It is worthy of note that the high grade silver values are obtained from a siliceous ore. In barite veins, the higher grade vein matter is found in quartzose shoots."

Coast and Islands of British Columbia between Burke and Douglas Channels

This report describes the geology and mineral deposits of a portion of the coast 120 miles long, including Princess Royal Island. Mr. V. Dolmage is the first geologist to make a detailed examination of this part of the coast.

The coastal area of British Columbia is a partially submerged mountain range, the valleys having become fiords and the hills islands. The area described is composed mainly of quartz-diorite of the Coast Batholith, of Upper Jurassic age. Included in this are areas, comparatively small, of pre-existing schist and gneiss of Upper Triassic (?) age, and cutting it there are dykes (Bella Bella formation) of late Tertiary age. In one place volcanic rocks of post Pleistocene time were found lying on glaciated surfaces, evidence of very recent eruptive activity.

The ore deposits of the district are in shear zones in the quartz diorite, with the exception of the Drum Lummon deposits, which are in acid pegmatite dykes representing an end phase of the Coast Batholith intrusion. The Surf Inlet Mine, an important producer of gold and silver, with some copper, derives its ore from quartz veins in a shear zone, the gold being exclusively associated with irregular veins of iron pyrite within the quartz. An excellent concentrator of 300 tons daily capacity prepares this material for shipment to the smelter. There are a number of promising prospects noted, some of them being near the producing stage. A vein of unusually pure magnetite on Dean channel is described. Hot springs throughout the district were examined. Some of these are already in use for bathing purposes.

Copper Deposits on Lasqueti Island

A brief examination of this island, which lies between Texada and Vancouver islands, was made by Dr. J. D. MacKenzie. A small intrusion of quartz diorite from the Coast Batholith cuts volcanic rocks of Lower Jurassic age. In sheared and altered zones in the quartz diorite there have been formed, by replacement, shoots of chalcopyrite and pyrite carrying good values in gold and silver. Only one of these zones, on the Venus group of mineral claims, has so far furnished ore in economic quantities. The properties are in the initial stages of development.

Placer Mining in Barkerville Area

A digest of this report was given by W. H. Johnston at the annual meeting of the Canadian Institute of Mining and Metallurgy last March, and was published in the Monthly Bulletin. The possibilities of further gold production from this part of the Cariboo are clearly delineated, and there appears to be no doubt of the economic value of the gravel available there for gold dredging.

Geology of the North Thompson Valley Map Area

In this report W. L. Uglow describes the geology and economic development of a strip of land ten miles wide and 50 miles long along the Canadian National Railway north of Kamloops. The valley of the North Thompson river is cut through series of sedimentary rocks ranging from Palezoic or Pre-Cambrian age to Miocene in the Tertiary period. These rocks are flanked, both east and west, by large areas of intrusive granite, mostly beyond the limit of the map-area.

After discussing in detail the geology of the various formations, Mr. Uglow gives a vivid picture of the geological history of the North Thompson Valley. This valley dates back at least as far as the beginning of Tertiary times, when the region, after the disturbances coincident with the building of the Cordilleran range and the intrusions of the Coast Range granite, had been reduced to a peneplain. By Cretaceous times this peneplain had been elevated and the valley was eroded to a further depth of 2,000 feet. During Eocene times a depressing of the land surface signalized the deposition of the rocks of the Chu Chua series, including coal beds. Then came volcanic flows, flooding the whole valley. In Pliocene times erosion began again, resulting substantially in the present topography, which has since been altered only by the glacial scouring of the Pleistocene period and by lava flows in recent times.

The Chu Chua coal is in thin beds and the content of ash is high. It is being worked in a small way.

In the northern part of the area, there are a number of promising gold and silver-lead-zinc prospects. Comparatively little systematic prospecting or development work has been done. In conclusion, Mr. Uglow offers the following advice to prospectors:

"The southern part of the North Thompson map-area seems unfavourable for the discovery of valuable metalliferous deposits. It is too far from the seat of igneous intrusion. The northern part of the area, especially beyond the limits of the map, seems more favourable, however, and the country within a couple of miles of the contact of the Baldie batholith should be carefully prospected. A thick covering of glacial drift and a dense forest mantle very greatly enhance the difficulties of the prospector."

Lardeau Map-Area

In this brief report M. F. Bancroft tells of progress made during the season of 1921 in his mapping of the Lardeau map-area, the season's work extending southward and eastward from Revelstoke.

Sedimentary series of rock, most of these Carboniferous or pre-Carboniferous in age, have been folded and faulted, and then cut by intrusions, first basic dykes and then the same granodiorite that appears to the westward in the North Thompson Valley map-area described above.

Of the possibilities for mineral development, Mr. Bancroft says:

"The mineral deposits in Lardeau area are closely associated with igneous intrusives. Wherever there are mineral indications there are at least minor igneous bodies outcropping in the same locality. The principal intrusive contacts bordering the granodiorite areas in Lardeau are similar to contacts southward in the Selkirk region and are probably well mineralized, but for the most part these contacts cross the mountains in the remoter parts of the area and have been little prospected. Few substantial efforts have been, or are being, made to prove the value of the mineral resources of this area. At the time the Slocan area was being prospected many claims were staked at widely scattered points, and some along well-defined mineral zones in this part of the Selkirk region, yet only very limited mining developments materialized. The majority of the mineral claims are in the Slocan formation, extending diagnonally across the area between the head of Kootenay lake and Revelstoke. Some properties were located in the early days east of Albert canyon near Illecillewaet and on Incomappleux river, south of Flat creek. No important mineral discoveries have yet been made in the mountains along the south watershed of Illecillewaet river, though there are places where the rocks are impregnated with rusty-weathering sulphides, containing pyrite, pyrrhotite, and some chalcopyrite...

"...The gold quartz veins found in the central mineral belt from Cascade creek on Lardeau river through to Camborne on Incomappleux river merit investigation."

An interesting recent development is the discovery of promising deposits of crysotile asbestos near Sidmouth, on the Canadian Pacific Railway branch line to Arrow Lake. Cross fibre, rather harsh and brittle, and a good quality of slip fibre are considered to warrant serious investigation. It is suggested that talc associated with the asbestos-bearing serpentine might be of economic value.

An arrangement between the Tasmanian Government and Tasmanian producers of osmiridium was renewed on June 30th for one year. A Melbourne firm is authorized to dispose of the metal. All production is pooled. Sixty per cent. of parity price is paid when the metal is received by the agents, the balance when sales are completed.

The Late Gardner F. Williams

DEAN OF THE DIAMOND FACULTY

By ALEXANDER GRAY

Gardner F. Wiliams was a kindly autocrat. During his regime he ruled Diamondom with that rare discretion and ability which made him guide, philosopher and friend to the Rothschilds, Cecil John Rhodes, Alfred Beit, Julius Wernher, C. D. Rudd, Barnato, the Joels, and all of those under whose aegis diamonds and gold to the value of billions were produced.

"The Chief" was Kimberley, and Kimberley was "the Chief"; the average resident of Diamondopolis never regretted the fact unless there was cause for it. Then there was either geniality or inflexibility.

With or without the counsel or concurrence of his Directorate, the word of Mr. Williams was the Law. That was how DeBeers Consolidated operations attained to a degree of perfection that carried its own commendation, and that is why his son, Alpheus F. Williams, came to succeed him as General Manager of the greatest factor in the Diamond World. In the Williams' lexicon "dud" was eliminated. He drafted youth and brains for DeBeers—and when his staff invariably was given preferment by other Mining Masters he recruited other virile aids with more gray matter.

To have served under him was a Degree. From his Technical School graduated many of those who won distinction throughout the Mineral Industries. If Kimberley was *imperium in imperio*, Mr. Williams was the same within that organization which ramified throughout the Diamond and Gold Fields. He preceded Hammond, the Jennings, Webb, Yeatman, Webber, the elder Mein, Clement and their contemporaries. Even after all these had withdrawn from South Africa, he continued to execute the policies of Rhodes, Rudd, Beit, Porges, Jameson and Barnato until crowding years and a tragedy suggested the surrender of his baton to his son.

From the "most splendid winding engine", which Rhodes wrote he had shipped, to power plants designed and fabricated on the spot or modelled elsewhere after the most efficient, Mr. Williams was the Executive throughout. Mining practice was revolutionized. Whatever Mechanical Sciences could devise was adopted. At surface and underground the Diamond Industry was filmed daily while Diamond Markets and the Cutting Trades catered to the fancies of the fair sex.

Perhaps the greatest tribute that could be paid to Mr. Williams was that things moved almost automatically. That was the consummation of the efforts of Gardner Williams, which the hearty co-operation of his Board, notably Colonel Harris, after Rhodes and Jameson were gathered to their fathers. Before DeBeers could move with this rhythm many millions of loads of blue ground and of money had come from mines that have made prosaic the fables of the Arabian Nights. Williams' method, as adhered to from working face to the first valuator, left nothing exposed to the off chance of losses in recovery.

Not only Diamond Mines, new diamond discoveries, coal mines, power developments, explosive works, came within the Williams purview. DeBeers also administered Kimberley as a municipality, and there again there was system; for business rivalries were obviated by the limited number of licenses obtainable from the local Chamber of Commerce. Yet the Diamond Metropolis is a large trade center, with all the attributes of such. Preventive within and without DeBeers, the necessity for compounding natives and for imposing every possible safeguard against the theft of diamonds, made imperative a close corporation. Withal, Mr. Williams was as firm and as lenient as varying conditions warranted.

A propos of the assumption that DeBeers could run by itself, while this was complimentary to the Wiliamses, the uninformed will not appreciate that it hardly conveys an adequate idea of how operations were conducted from the almost chaotic stage to what was urged as an ideal situation. Every advance in the scientific mining and recovery of diamonds for forty years bore the sign manual of that veteran graduate of Ann Arbor who guided the evolution of Kimberley from the paroxysms of individual diggers deluged with caving rock in millions of tons from the rims of the craters, to the pulsator that mechanically caught the gems upon greased terraces, thereby terminating the cumbrous and inefficient practice of hand-sorting the concentrates. Aerial gears and rawhide buckets were wondrous in their way. Batteries of rotating washing machines superseded the whim and the horse-propelled pan.

In the glamorous diffused lights, however radiant, revealing those Diamond Mines as they are, few survive who can focus the initial tribulations that confronted Mr. Williams and his principals. Forty years ago, when the Kimberley Mine open workings were at a depth of four hundred feet, in order to haul out one million loads of blue ground during the year, three million loads of reef fallen in from the terraced rims had to be raised. Two years later 250,000 cubic yards of shale slid across half the Kimberley Mine. After about four million cubic yards of reef had been removed from buried claims, at a cost of £2,000,000, it became obvious to Rhodes and his associates, and to Mr. Williams as their Engineer, that engineering science and capital in combination must be applied, not alone at the Kimberley Mine, but at all the other mines. At the DeBeers Mine smaller rock slides culminated when nearly five million cubic feet tumbled onto claims.

For seven years, ending with 1887, Messrs. Rhodes and Rudd vainly endeavored to purchase control of the DeBeers Mine. They decided at one period they could not raise £6,000 to accomplish that. When conflicting interests there and elsewhere were adjusted, the Rothschilds, on the say-so of Mr. Williams and Hamilton Smith, let Mr. Rhodes have £1,000,000 to assist him in financing the consolidation which now dominates the Diamond industry.

Prior to the Consolidation, 911,706 loads of blue ground had been washed and the production therefrom was valued at £901,818,013. To 1901, 50,811,311 loads of blue ground, debris, tailings and old concentrates had been washed, and the value of the diamonds so produced was fixed at £50,148,759.

In the years intervening and until now DeBeers has become mightier.

The record, though incomplete, may well serve as an epitaph.

The Chairman of the Zinc Corporation, Mr. E. V. Corbett, has stated that Broken Hill (New South Wales) lead must hereafter be produced at less than £20 per ton if the industry is to be successfully maintained.

News of Mining

Great Britain

A typical instance of the increase of railway freight rates in coal in Great Britain was given recently in the House of Commons. In 1914 the rate per ton from Rotherham to London was 6s. 11d. It is now 10s. 5d. per ton.

The British Mines Department has issued a statement showing that for the first quarter of the current calendar year the total coal raised was 57,633,631 tons. Of this amount there was used at the mines 3,957,505 tons, and 1,462,795 tons provided for the use of miners. The commercially disposable balance was 52,213,331 tons. The total cost per ton was 19s. 9.66d. Wages make up 13s. 4.08d. of this. The output per man shift worked, was 18.23 cwt. the earnings per man-shift worked, 11s. 0.18d.

By a new order issued by the Secretary of Mines, the ingredients of the permitted explosive Ammonite No. 1., are to be used in the following parts by weight:—Nitrate of ammonium, not more than 77, nor less than 73; trinitro-napthaline, not more than 6, nor less than 4; chloride of sodium, not more than 21.5, nor less than 19.5; moisture, not more than one. The container required is a lead and tin alloy waterproofed with pure paraffin wax.

Great Britain's exports of coal for the month of June totalled 4,793,648 tons, as against 5,057,237 tons during May. France was the largest buyer, taking 982,071 tons; Germany next with 889,644 tons.

The eighth annual general meeting of the Mond Nickel Company, Limited, was held recently in London, England. Announcement was made by the Chairman, Mr. Robert Mond, J.P., that the Company had acquired control of Henry Wiggin and Co., Limited, in order to develop new markets for nickel and nickel products. The Company has also interested itself in the organization of the American Nickel Corporation of Clearfield, Pa., for the manufacture of malleable nickel. The Corporation will also handle sales of the Mond Company's raw nickel in the United States. The market for copper sulphate was reported as excellent in tonnage but hardly up to the mark in prices current.

United States

The Bureau of the Census has issued its report on "Iron ore," as part of the Fourteenth Census of the United States (1919). From this publication it appears that the per capita output of iron ore in the year 1879 was 0.13 ton for a population of 50 millions. This went up to 0.56 ton for a population of 92 millions in the 1909, and to 0.58 ton for a population of 106 millions in the year 1919. Minnesota and Michigan are the leading producers among the different states. In the year 1901 Minnesota attained pre-eminence over Michigan and has held it by large margins ever since. Alabama comes third, with New York fourth. Pennsylvania lost the leadership to Michigan early in the eighties.

The annual report of the Alaska Treadwell and its associated enterprises, the Alaska United and Alaska Mexican gold mining companies, for the year 1921, shows receipts of $217,495.85 and expenditures of $240,039.79.

The construction of a branch railway to the Healey Coal fields of Alaska has been sanctioned by the United States Secretary of the Interior.

The managing director of the American Gold and Silver Institute estimates that silver purchases under the Pittman Act will last for about fifteen months from the present.

Europe

French collieries wrecked during the war produced 1,348,913 tons of coal during 1921. The 1913 output was 2,512,340 tons; and for 1920, 586,005 tons. About 13,000 men are now employed as compared with 10,179 in 1913.

Low-temperature carbonization processes are now playing an important part in German industry. The meagre supplies of gasoline and lubricating oils have been greatly augmented by the treatment of lignites, shales and in lesser degree, bituminous coals.

According to the conjoint report of two mining engineers employed by the Spanish Government, there are at least seven deposits of iron ore in the province of Granada that can be profitably worked. The tonnage presently available at each property ranges from 9,000 tons to 125,000 tons. Costs of production are estimated at from 2.50 pes. to 3.25 pes. per ton; transportation costs at from 12 pes. to 15.25 pes. per ton; average iron content from 51 per cent to 66.8 per cent.

South Africa

In the year 1913, coal mining costs in South Africa, including only the three major items of white wages, native wages and stores, averaged 2s. 11.74d. per ton. In 1920 this average went up to 4s. 10.24d. per ton, and in 1921 to 5s. 10.40d. per ton. Only 13 companies out of a total of 39 paid dividends in 1921. The sales of coal are controlled and allocated by the Transvaal Coal Owners' Association, the cost of selling and administration being only ¾d. per ton.

Before the recent strike, mining and milling costs at the Robinson Deep stood at 26s. 6d. per ton. Costs are now being satisfactorily reduced. The loss for the first quarter of the current year was £47,000, due to suspension of work. It is expected that the rate of crushing will shortly be brought up to 700,000 tons per annum. As the gold recovery will average 26 shillings per ton, profits will absolutely depend upon cost reduction. 20 shillings per ton is the figure aimed at.

Rhodesia's gold output for the month of June was 55,614 ounces; silver, 14,745 ounces; chrome ore, 300 tons; asbestos, 1,069 tons, and diamonds, 16 carats. The outptut of coal exceeded 39,000 tons.

Working costs at the Modder "B" were reduced by 10d. per ton during April. They stood at 25s. 2d. per ton, as against 26s. for the year 1921.

The Director of Native Labour, Colonel S. M. Pritchard, has suggested that mining work be classified as skilled, semi-skilled, and unskilled. The category of skilled would embrace all occupations for which apprenticeships had been served, and all requiring special intelligence or training. Semi-skilled occupations would be merely a lower class of the former. He contended that native wages could not possibly be increased unless their wage-earning capacity were increased.

Out of 35 leading Rand gold mines, 15 showed lowered working costs for the month of June.

Australasia

The reorganized Broken Hill Junction Lead Mining Company's first annual report—February 1921 to the end of March 1922,—shows that maintenance of the mine and plant through the long periods of idleness cost the company £10,908. Considerable additions, however, were made to the ore reserves, which will partly compensate the Company for this loss.

The Mining Districts

FROM THE JOURNAL'S CORRESPONDENTS

BRITISH COLUMBIA

To Discuss the B. C. Iron and Steel Industry

The arrangement of finances in connection with the establishment of an Iron and Steel Industry in British Columbia is to be discussed, according to report, in London. Hon W. S. Fielding, Minister of Finance, has left for the Old Country and is said to be prepared to take up this question. The Imperial Trade Facilities Committee is quoted as saying that four million dollars of its funds is available for the western Canadian enterprise. There is a possibility that a member of the British Columbia Government will go to England in connection with this matter.

Premier Offer to B. C. Silver

An offer was made by the Premier Gold Mining Co. last June of $1,000,000 for the option to purchase within a two year period the 60% interest held by the Selukwe Gold Mining & Finance Co. of London in the B. C. Silver Mines, Ltd. The Premier Company submitted also that if the Selukwe people would extend the time of the proposed option the bond price would be increased. In reply the Selukwe representatives suggested a price of $5,000,000 to be paid over a period of four years. Mr. Guess, acting for the Premier Company, declined to consider this proposal. It will be recalled that the Premier Company some months ago paid $100,000 for the 40% interest now held by them in the B. C. Silver Mines, Ltd. which property is believed to contain a continuance of the Premier lead.

High Grade Ore at Fish Creek, Alaska

The property of the Fish Creek Mining Co., recently reported to have been absorbed by the American Mining & Milling Co. consists of some 19 claims situated on the Alaskan side of the line close to the Portland Canal Mining Division of British Columbia. It is about one mile by air line from the Salmon River wagon road, and within five miles of tidewater at Hyder, Alaska. Owing to its low elevation, ample timber and water power are available. There has been considerable development work done in the way of tunnelling, stripping, etc. From what sampling has been carried out, the ore would seem to run consistently high gold and silver. One return gives gold $28., silver 493.6 ozs., or a total value per ton with silver at American prices of about $521.60.

Custom Office for Portland Canal

Indicative of the growing importance of the Portland Canal Mining section, B.C., is the announcement that a Canadian Customs office is to be established at the International boundary opposite the U. S. Customs office already established there. This is for the purpose of facilitating the transport of supplies and material for Canadian mines in the district, as practically all this material must cross Alaskan territory. It is considered likely too, that an aerial station will be installed at the town of Stewart.

Prospectors' Supplies by Hydroplane to Prospective Placer Field

Some excitement was occasioned recently at Hazelton, B. C., Grand Trunk Pacific Railway, by the departure of an hydroplane carrying 1500 lbs. of supplies for prospectors in the field in a little-traversed section of northern British Columbia. The plane reached Thindade Lake without mishap and made connection with the party. An hour was spent in scouting over new country and the crew of the plane report having seen large herds of caribou and goat and some moose. Thindade Lake is at the head of Finlay River and in the past has been reached by pack train, the round trip taking from 5 to 6 weeks. It is reported that a new mining field of importance is likely to be staked as a result of these activities.

Ore Receipts at Trail

Ore receipts at the Trail Smelter, Canadian Consolidated Mining & Smelting Co. for the week ending August 14th, aggregated 6,936 tons, of which 6,324 tons were from Company mines. Of the balance, apart from Washington State mine, the largest shippers were Roseberry Surprise, 84 tons; Whitewater, 70 tons; and Paradise, 54 tons.

Engineer Mine Still in the Courts

The ownership of the Engineer mine, Atlin, B. C., upon which has been placed a valuation of $3,000,000, is to be decided by the Privy Council. The issue is between the executors of the estate of the late Capt. Alexander and the Engineer Mining Co. Members of the latter Company claim that they were the original locators and improvers of the property, and that while their application for a certificate of improvements was held up in the registers, Captain Alexander staked over their property. Both before the Supreme Court and the Court of Appeal the Engineer Mining Co. have lost their suit, but they are making an appeal to the highest Court in the Empire. Meanwhile the further development of this well known and rich gold property is held in abeyance.

Canada Copper Reorganization

Apropos of the reorganization of the Canada Copper Co. Ltd., it is understood that shareholders and bond holders have received circulars outlining the plan decided upon. This contemplates the foreclosure of the first mortgage and the forming of a new company to acquire the properties covered by the mortgage. The monies raised by the new company will be used to begin operation and for working capital, such monies to be raised by the sale of stock at $5.00 per share. For each 11 shares of stock owned the holders must subscribe to 1 share of stock of the new company at $5.00 per share, and shareholders owning less than 11 shares of stock of the new company. Stockholders who do not subscribe receive nothing.

Coal Strike Settlement

The coal miners' strike in District 18, U. M. W. of A. (which includes eastern British Columbia and the Province of Alberta) is likely to be settled immediately. The prospects of an adjustment that will result in the miners returning to work after having been idle practically all summer were bright at the time of writing (August 22nd). It is suggested that the mines will be re-opened in the Crow's Nest Pass next week. The miners recently made an offer to restart on the basis of a 20% reduction, provided that other conditions remain as at 31st March last. The

operators then refused to consider this, but it now is believed that they have agreed to such a settlement the same to obtain until the 31st of March, 1923. There is a general feeling that the proposal will meet with the approval of the men, and that all that stands in the way of a settlement is the necessity of obtaining the endorsement of the men through the ballot.

Vancouver Island Coal Seam on Mainland?

There have been reports recently that the coal seams outcropping on Vancouver Island in the Nanaimo district extend under the Gulf of Georgia to the mainland, and may be located under English Bay near Vancouver, B. C. and at different points in that section. As a result the Provincial Government is receiving applications for coal rights on lands, surface and subterranean, extending over a considerable part of the southern mainland coast of the Province.

Chu Chua Coal

The Wiggan Collieries at Chu Chua, near Kamloops, B. C. expect to be producing 500 tons of bituminous coal a day by the first of next year. Development by means of diamond drilling now is in progress.

Coal Mine for Okanagan

The White Lake Collieries near Okanagan Falls are planning the production of 100 tons a day of semi-anthracite coal. A ready market for this will be found in the well settled agricultural area of the Okanagan Valley.

The Vancouver Island Coal Mines

The coal mines of Vancouver Island continue to be exceptionally active. Not only is the domestic demand heavy, but foreign trade has improved and the operators' only problem is to mine sufficient coal to supply the trade offering.

The production of the Western Fuel Corporation, Nanaimo for the month of July broke all records. The total of 76,395 tons being the largest in the history of the company. The closest approach to this figure was 69,500 tons in March, 1918. Not only is the output for July a record for Nanaimo mines, but it is the greatest production for a month of any Island colliery. As there were 25 working days in that period the average daily output was over 3000 tons.

The Western Fuel Corporation of Canada now has in its employ 1675 men, and while conditions at the present time are abnormally good, the management does not anticipate any decided slump in the future. It is likely that the scope of its activities will be enlarged, and with this in view new fields in the vicinity of Departure Bay are being explored. It is probable that at least one new shaft will be sunk before long.

What has been said regarding the Nanaimo Company applies also to the Canadian Collieries (D) Ltd., whose production for the month of July runs very close to 68,000 tons. The Granby Consolidated Mining & Smelting Co. has been speeding up the output of its collieries at Cassidy, a total of over 20,000 tons for the month of July marking a substantial increase.

Canadian Collieries (D) Ltd. is encouraging its employees to lay out gardens and otherwise beautify the surroundings of their homes at Comox, South Wellington and Extension. Prizes have been offered of $25 for each best garden in each town a further prize of $75 for the best garden of all. The judges will not only take into account the matter of floral beauty but will be required to give proper consideration to those who go in more for the utility end of cultivation by the production of vegetables, etc.

SPECIAL DISPATCH FROM SUDBURY!

Sudbury Citizen: Well, I guess we can't have a coal field here. Too bad you haven't any fossils.

Bill McVittie: I've seen fossils out at my mine.

Sudbury Citizen: The hell you have! What fossils did you see?

Bill McVittie: I saw the Palaeozoic millerite, the Pleistocene colemanite, the Pre-Cambrian nightite and some vermiform varieties which are now in the Geological Museum at Ottawa.

Sudbury Citizen: That takes the coyne!

A GREAT INVESTMENT OFFER

(From *Journal of Commerce*)

Last issue we referred to the statement issued by the Minister of Finance relative to the Government loan operations, and, in commenting editorially thereon, we expressed unqualified approval of the conversion scheme announced therein. Elsewhere in this issue will be found the official advertisement of the scheme in question, and, from a perusal of this, it must be apparent to all that the holders of the Canadian Government war loan bonds, about to mature on the 1st of December next, have a splendid opportunity for reinvestment open to them.

For the ordinary investor, the first thing to be sought in an investment is that it should be absolutely safe. The only people who, without an uneasy mind, can afford to go in for speculation and take the risks attendant on speculative enterprises, are the really rich, and the really rich are relatively few in number. The rest of us—the great majority—whose means are moderate, must, if we are wise, make it a *sine qua non* of our investments that they be absolutely secure. And it would be difficult, anywhere in the world today, to find more absolute security than that offered by the bonds of the Dominion of Canada.

Further, in addition to the absolute security they offer, the bonds which the holders of those about to mature can exchange for the latter carry the same high rate of interest, namely 5½ per cent., and are either for five years, maturing in 1927, or for ten years, maturing in 1932, as the bondholder may prefer. Without hesitation, we say that we know of no other investment, taking so high a rank, that combines, to the same extent, unimpeachable security with liberal interest. Moreover, as we pointed out last week, a further substantial advantage to the bondholder who takes advantage of this conversion scheme is that he will receive a bonus of one month's interest.

The present offer is not made to investors generally, but only to the holders of the bonds about to mature. Holders who do not wish to reinvest in the manner open to them through the conversion scheme will be paid in cash on the 1st of December. But the security offered to them is so gilt edged and the rate of interest so generous that we shall be very greatly surprised if the great bulk of the maturing loan is not eagerly renewed by those who have the chance offered to them.

EDITORIAL

We hear a great deal of what heated waters and volcanic action have accomplished in the formation of ore deposits; but no one has yet come forward to champion the glaciers, to whose action in many parts of the world the mineral industry is much indebted. — W. G. Miller. — 1904.

A CENTURY MARK IN ASBESTOS

During this year the production of asbestos from the Thetford region of Quebec will reach and pass the hundred million dollar mark. From a very small beginning in 1878, when asbestos was first shipped out on the brand-new railway, the industry has grown slowly and steadily until today it constitutes the major part of Quebec's mining industry and one of the most important units in the mineral production of our Dominion.

At what stage in its development our asbestos industry now stands, it is difficult to judge. As pointed out recently in these columns the reserve of ore definitely determined at least equals the total extracted to this date. On some properties no attempt has been made to block out ore reserves and on none of them have the limits of the productive ground been reached. Consequently it can be concluded safely that the present century mark will be more than doubled before there is the slightest danger of exhausting the deposits. How many times this will be repeated is pure conjecture.

Another satisfactory feature of the present asbestos production of Quebec is the high price the mineral brings. A great deal of what was sold to make up the present total of one hundred millions brought only a mere fraction of the present prices per pound or ton. It seems likely that the unique quality of Quebec asbestos will cause it to continue at the present enhanced value as compared with the more brittle fibres from other countries.

The Quebec asbestos industry now has what very few mining camps possess—the dignity of years, combined with an unabated production and the promise of an indefinitely long life of usefulness. Its present age can be aptly gauged by a personal experience that befell one of our veteran Canadian geologists, Mr. R. G. McConnell, the recently retired director of the Geological Survey. In the summer of 1877 Mr. McConnell then a young student assistant on the survey party that was pushing through the location of the Quebec Central Railway was camped on the shore of Black Lake. Then, as now, that hilly region was subject to sudden and violent storms. The young McConnell was flooded out of his tent and doubtless marked the district unfavorably on that score. Since then the country-side has, no doubt, redeemed itself even in the eyes of Mr. McConnell.

During the course of the asbestos industry's long life in this country, little has been done to ensure its manufacture within our borders. This anomalous condition is now rapidly being changed, mainly on account of the high tariff in operation, and the still higher tariff pending, in the United States as well as by virtue of preferential tariffs within the British Empire. How far these conditions and the natural ambition of Canadians to make the most of this natural resource will carry the movement, it is impossible to say. Meantime we may be well satisfied with the steady annual creation of wealth by the mines, and the good beginning that has been made in the domestic manufacture of asbestos products.

OUR MAPS

During the past year there has been concluded in Ottawa a measure of inter-departmental co-operation that has passed unnoticed by the public. It is of interest to the mining industry, and deserves mention here.

There are three departments of our Federal Government that have to do with map-making—the Geological Survey, the Militia Department and the Topographical Surveys Branch of the Department of the Interior. All three of these have field parties at work each season, and all publish maps that are widely used not only in Canada but abroad. Until this year each of these departments followed its own sweet will in map making, with only the vaguest reference to its two sister departments. The result was a great deal of unnecessary duplication both in field work and in the compilation and printing of maps, as well as a lack of uniformity in methods both of recording information and of printing maps that made inter-departmental co-operation extremely difficult, even had it been desired. Happily this anomalous state of affairs has come to an end. The three departments concerned have agreed upon a common course of action that will avoid duplication of effort and will ensure a far better return for the total annual sum spent on map-making.

The geodetic survey provides, of course, the basis for all permanent mapping. The settled portions of the country are now fairly well provided with accurately determined points of reference, but in our outposts of the art of precise surveying. In the [illegible] of the various provinces control surveys of a temporary nature—

are now provided well ahead of the detailed exploration that depends to such an extent upon a reliable framework of surveyed points. Northern Quebec alone is, we are sorry to say, deficient in these control surveys, with the consequence that the existing maps are mainly of that very sketchy sort that aggravate the explorer and prospector more than they assist him.

Filling in the space between the high spots touched by the geodetic survey, we have maps made by all three departments. The Militia Department, with an eye to national defence, makes the ordnance maps that are a necessity for systematic military operations. Their detail and accuracy, though not yet comparable with those of maps in older countries, are notable in Canadian map making. These maps cover as yet only part of the settled fringes of our country, and the work proceeds but slowly. The Department of the Interior publishes useful maps on various scales, notable among these the standard geographic sheets on a scale of 1 500,000 and 1 250,000, (approximately eight and four miles to the inch, respectively). The information for these is gathered principally from the records of land surveys, provincial and federal. The Geological Survey's maps vary from the mere sketches provided by pioneer explorers to the extremely accurate contoured maps made of important mining regions. The standard map, though, is on a scale of a mile to the inch, giving accurate topographic as well as geological data. It is from a series of contiguous map sheets of the last variety that the final and complete geological maps of Canada will be compiled —a compilation that is as yet only a vision in the future, but toward which our far-seeing geologists are already beginning to shape their course.

Map-making is a science, as well as an art. Only the initiate can realize fully the wealth of information recorded on even a simple map-sheet. Particularly does the geological map deceive one by its apparent simplicity of construction. A life-time of well-spent geological effort can be recorded in the few colours and symbols of a comparatively small geological sheet. Happy is the man who is thus privileged to make and leave a record for the guidance, not only of contemporary co-workers, but of Canadians of future generations. To those with eyes to see, there is no record that demonstrates faithful and discerning human effort more clearly than a well-made map.

THE MINE EXPLOSION ON VANCOUVER ISLAND

We have received from our British Columbia correspondent the following telegram—"Explosion in number "4 Mine, Cumberland, Canadian Collieries (D), Ltd. "Fifteen fatalities, three white men and remainder "Orientals. Special investigation ordered by Minister "of Mines. Cause of ignition unknown. Electric lamps "were in use in affected area, and no blasting was per-"mitted."

Thus there is recorded briefly one of those accidents for which the coal miner always be prepared, for the prevention of which all the resources at his command at times prove unavailing. The coal miner in Canada is now protected about as securely as can be by a well-framed law and a conscientious enforcement of its provisions. In spite of this, accidents occur periodically to remind us of the danger of working in a gas-or dust-laden atmosphere in a chamber in the bowels of the earth.

In this case, the effect of the explosion has apparently been localised by means of the precautions that are now exercised in every well-managed coal mine. The loss of 15 human lives is to be deeply regretted, and all means must, and will, be exerted to prevent a recurrence of the tragedy; but advances in the science of coal mining have prevented the holocaust that used to mark an explosion in a gassy mine.

FURTHER EXPLORATION AT ELBOW LAKE

It is satisfactory to note that exploration work is to be resumed on the Elbow Lake claims in Northern Manitoba, formerly under option to Mr. Noah Timmins and some associates. The spectacular surface showing of gold that first attracted the attention of the Murray brothers failed of its promise, as most spectacular showings do. Mr. Timmins dropped his option on the claims, not necessarily because he considered that there was insufficient ore available there to form a basis for profitable mining operations, but because the ore his work of exploration disclosed was insufficient to warrant the payment of the further sums specified in his option. It is reasonable to suppose that Mr. Timmins is searching for a second Hollinger, and is interested neither in a little mine nor in a long chance on a big one.

The terms under which the further exploration on the Elbow Lake claims is to be conducted are radically different from those recently terminated. The terms accorded to Mr. Timmins assumed the possibility of a large ore-body, unusually rich in gold, and specified cash payments of very large dimensions. The new agreement, as reported, provides plenty of money for development work, but restricts the reward of the owners of the claims to a participation in whatever net proceeds there may be eventually from the operation of the property. This is a very reasonable basis of agreement in such a case, and if it were adopted by more prospectors, it would be much easier to find investors to open up mining claims. We hope that in this case the Messrs. Murray have already received payments on their claims sufficient to reimburse them for the expenditure of time and energy that resulted in their discovery. This much cash at least is due the prospector as a reward for locating a good "showing", and is pre-requisite to further prospecting.

Whether or not Elbow Lake will have producing mines, is still undetermined. The rational means now adopted to determine the point are worthy of remark. The operators have our best wishes for success.

EDITORIAL NOTES

In his addresses to the electors of The Pas district in Northern Manitoba, previous to the by-election there in which he is a candidate, Premier Bracken has stressed the importance to the farmers of the province of a well-developed mineral region in their hinterland. He is evidently one among the very few practical politicians who are well seized of this intimate relation between the two great prime producers of our country. We shall follow with interest the practical means that Mr. Bracken and his Government will adopt to put his promises into effect.

The largest of our Canadian mining and metallurgical corporations has at last resumed operations on a comprehensive scale. The International Nickel Company has re-opened its smelting plant at Copper Cliff, and will operate at one-third total capacity for the time being. This foreshadows also the resumption of mining operations at an early date. Meantime the refinery at Port Colborne has been operating steadily for some time. That the peace-time market for nickel, not yet returned to its full dimensions, already warrants the resumption of activities at Copper Cliff, speaks well for the future of the nickel industry. It has passed through dark days, but the future is bright with promise, already partly fulfilled.

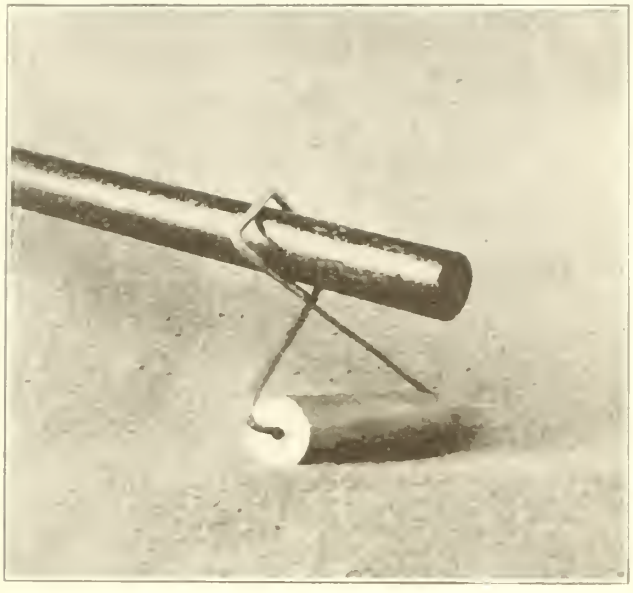
This week's budget from our Nova Scotia correspondent, who is a keen student of labour affairs in Cape Breton, is full of hope for the future. As has been pointed out repeatedly in these pages, the responsible officials of the Dominion Coal Company have displayed throughout the long period of dispute a toleration and a respect for the undoubted rights of their miners that are well worthy of remark. That they adopted this attitude of regard for justice and recognized throughout the practical necessity for compromise was all the more commendable because of the provocative attitude of the ill advised miners' leaders of radical tendency. It says much for the essential soundness of the miners themselves that the power of these false leaders is now distinctly on the wane. Once more it has been clearly demonstrated that "red" tactics are not acceptable to Canadians and that Sovietism will not become part of our political organization.

In response to our editorial of June 20th, entitled "Newspapers and Mining News," we have received a communication from "Science Service," in Washington. This is an organization for the collection of news of scientific interest and its supply to the public press. Its board of trustees is graced by a long list of scientific men in prominent positions, who are available for consultation. The motto of Science Service is "Not *Interesting, If True*, but *Interesting And True*." This is a move in the right direction. Truth is stranger than fiction, and far more interesting. Let us have the truth.

A ROLLER FOR LONG BARS

(Harry Moore, Montreal)

Where no proper facilities are provided, it is a common sight to see men dragging long bars of steel over the shop floor, cutting ugly grooves in the latter and incidentally giving themselves much needless exertion. One man who had work of this kind to do from time to time, made the simple little roller shown in the photo. The roller itself is a piece of scrap steel with a hole in the center, through which passes a length of quarter inch wire bent to form a Vee square as it were. The end of the round bar is inserted in this, and when the



workman pulls at the other end, the wire grips the bar tightly between the Vees, thus holding it to the roller and keeping it square at the same time. Various size bars can be handled with this device, those that are too big to go through the wire requiring the service of more than one man to transport them successfully.

REQUIEM

And the strong man wept, wept sore,
As he gazed upon the floor;
And his tongue was mute and tied,
He exuded shattered pride
But at length his speech returned,
Whilst his eyes with anger burned;
And he said, with gesture fistic
"Do you call this job artistic"
"This prospectus is a frost;
"Fifty bucks is all it cost;
"This will put us on the blink!
"What will other people think"

So from a treasury, wasted and depleted,
They got a grand super prospectus completed
(You *may* think it odd, or you *may* think it not,
But that's everything that the shareholders got.)

ANON.

An Apparatus for Magnetic Assays

By F. C. DYER

The determination of the amount of magnetic material (magnetite or pyrrhotite) in an ore is frequently required. With coarse magnetic particles the determination is simple, but when, as is often the case, the ore requires to be ground very fine (below 200 mesh) to liberate the magnetic particles, then the determination is more difficult. It is almost impossible to make a determination dry, and to make it wet, by hand, is a slow and tedious process.

To render the wet determination of the magnetic portion of an ore both easy and expeditious the machine described below was designed and built, and has proved very satisfactory.

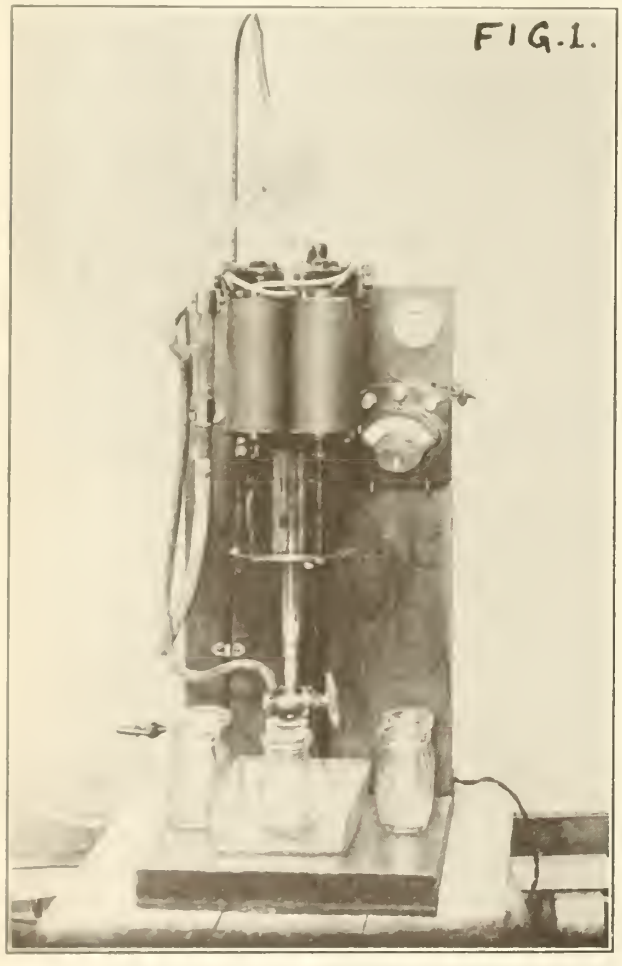


FIG. 1.

The principle employed is to suspend the magnetic particles in an alternating and rotating magnetic field through which flows a stream of water.

The washing chamber is a glass tube about 3-4 inch in diameter, with a receiving funnel and water overflow at the top, and a glass stopcock at the bottom. It is fitted into a small flask with an overflow sufficiently high to keep the water level in the tube near the top.

Around the tube is an iron ring from which are hung four electro-magnets wound with 3500 turns of No. 14 D. C. C. wire. The magnets are coupled in pairs alternately so that the magnetic field of each pair is along a diameter of the tube. The pole pieces are 4 in. by 2 in. by 1 in., bolted to the magnet cores and slotted at the back for adjustment, and are wedge-shaped toward the central tube. Two notches 3-4 in. by ½ in. are cut in the wedge of each pole piece. Without these notches or with notches too small the magnetic particles will slide down through the field, overload the end and drop off. The remaining parts of the poles, about 1 inch long, have a capacity of over one gram of magnetite each, making a capacity of more than three grams of magnetite for the machine, which is ample for any ordinary determination.

The electro magnets are operated by a rotating commutator which alternates the fields of the magnets and also their polarity, causing vigorous stirring of the magnetic particles suspended in the field. There is a slight lap in the commutator so that the current is turned on one pair of magnets before it is shut off the other pair. The magnetic field is therefore not lost during the change.

The commutator is revolved at from 50 to 100 r.p.m. by a gear and worm operated by a small series-wound motor with a suitable resistance for connection to a 110 volt circuit. By means of the resistance the speed of the motor may be changed if desired.

The magnets are coupled in parallel with a 50-ohm rheostat by means of which the currents to the magnets are controlled, and varied from 1 amp. to nothing. As the magnet coils become warm their resistance increases with decrease of strength. At the same time the rheostat also is becoming warm, tending to increase the current to the magnets. These changes are partially compensatory. By means of an ammeter and a slide on the

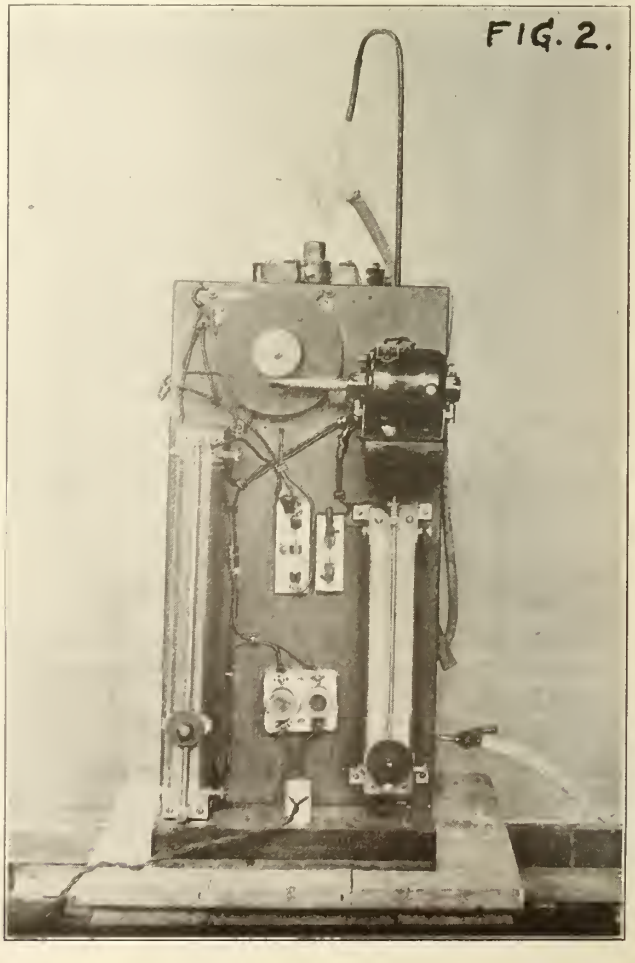

FIG. 2.

rheostat, current strengths can be controlled, so that conditions can be duplicated and the amount of middling retained in the field controlled to some predetermined degree. A double-throw switch permits the ammeter to be short circuited when it is not required. A switch is provided to stop the motor when readings are required, otherwise the needle oscillations may be so violent as to make meter readings impossible.

Except for reading the ammeter, these switches are not used, but a master switch, placed on the front of the machine throws in or out both motor and magnets together; thus there is little danger of trying to operate the machine without the magnet current being on.

The machine is provided with an adjustable water jet serving to wash the ore into the machine and also to provide a constant stream of washing water through the tube.

In operation the stopcock is opened, the machine filled with water, and the wash water and current turned on. The weighed and wetted ore is washed into the funnel and tube. In a minute or two the magnetite is washed, the water in the tube becoming clear. The stopcock is then closed, the bottom flask removed and replaced by a beaker. The current is shut off and the stopcock opened, the magnetite washing into the beaker. A fresh flask of water is placed in position and the machine is ready for another round of operations.

As a matter of precaution it may be advisable to return the material in the flask to the machine. Any fine particles of magnetite that escaped will be agglomerated and caught in the flask, and it is only a minute's work to re-treat the small amount of material caught in the flask. The time taken to do the whole operation, except the drying and weighing, is only three or four minutes.

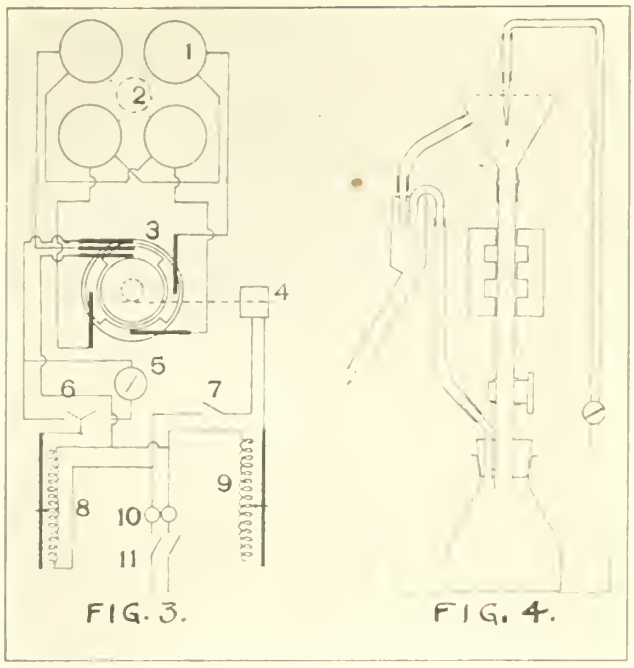

FIG. 3.

FIG. 4.

Figure 1 is the machine from the front, Figure 2 is the back of the machine. Figure 3 is a wiring diagram, in which 1 is the electro magnets, 2, the magnetic field, 3, rotating commutator, 4, motor, 5, ammeter 6, ammeter switch, 7 motor switch, 8, magnet resistance 9, motor resistance, 10, fuses, and 11, the main working switch. Figure 4 is a diagram of the water circuit.

University of Toronto, July, 1922.

AMERICAN ELECTROCHEMICAL SOCIETY

Meeting in Montreal, September 21, 22 and 23, 1922

Final arrangements for the Forty Second General Meeting of the American Electrochemical Society, at Montreal, Que., are being made which will make this meeting one of the best in the history of the Society.

The meeting will be opened by President Schlueder berg on Thursday morning (September 21) and the Technical program will proceed with the presentation and discussion of papers on Electrolysis and Electroplating. The recently organized Division on Electrodeposition (G. B. Hogaboom, Chairman; Wm. Blum, Secretary) will be well represented and take an active part in the discussion of these papers.

One of the papers of the Thursday morning session will deal with the physical properties of electrolytic iron—a product which is being turned out commercially, contrary to all predictions of ten years ago. There will also be papers on zinc, brass, and other electrodeposited metals.

On Thursday afternoon and Friday morning, a very interesting symposium on "Industrial Heating" will be in progress. The Electrothermic Division (Bradley Stoughton, Chairman; Colin G. Fink, Secretary) which held a most successful symposium on "Electric Cast Iron" at the Baltimore Meeting, in April last, will again be in charge. Twelve papers especially prepared for this session and dwelling on industrial heating in electric furnaces, other than fusion and melting furnaces, will be placed open to discussion.

There will be papers on

a. History of Industrial Heating.
b. Principles of Design of Furnaces.
c. Comparison of Fuel Costs in Different Types of Electric Furnaces, and with Combustion Furnaces. (In this connection, Electric Energy would be estimated as a "fuel cost.")
d. Resistor Materials.
e. Specific Heats.
f. Electric Conductivity of Insulating Materials at Industrial Furnace Temperatures.
g. Heat Emissivity.
h. Heat Transfer.

There will be an excursion to Shawinigan Falls, affording members a rare opportunity to inspect the various industrial plants of one of the most progressive centres on the continent. It is planned to have a special train for this all day trip from Montreal.

A popular lecture on the Progress in Physical Science is scheduled for Thursday evening. Section Q will be in charge of old fashioned Smoker on Friday evening.

The headquarters for this Meeting will be the Hotel Windsor. Members and guests are urged to make their hotel reservation immediately.

MAP OF MACKENZIE RIVER BASIN

The Geological Survey, Ottawa, has issued a new edition with revisions and corrections up to 1922, of Map No. 1580, *Mackenzie River Basin*, scale 50 miles to the inch. It shows the geology along the main water route from Edmonton to the Arctic. It can be obtained by those interested from the Director, Geological Survey, Ottawa.

The Glacier as an Aid to the Prospector

By MILNOR ROBERTS *

When a man is travelling over the range and finds a glacier blocking his route, he discusses the situation with his packhorse and wonders what useful purpose a glacier serves in the scheme of natural affairs. As a highway it is a failure; usually the edges are steep walls of glare ice, difficult to climb or descend, and separated from the adjacent mountainside by a deep chasm. Its surface is hummocky and pitted, or else littered with broken rock of all sizes lying so loosely as to slide or roll at the lightest touch. Here and there are crevices just too wide to jump and long enough to cause much delay if repeated detours are necessary. Only in winter does a glacier offer an easy route; at that season the snow has filled in the gulch along the side and built up an approach, and the drifts have arched over the fissures, leaving a glossy surface that makes fine going for the skiis and web-shoes. But in winter the prospector usually is holed up as snug as a coney.

Mark Twain's Journey

Mark Twain, in "A Tramp Abroad," narrates how he proved the worthlessness of a glacier as a means of rapid transport. Being aware that glaciers actually do move, he "resolved to take passage for Zermatt on the great Gorner glacier." Thereupon, he says, "I took up as good a position as I could upon the middle of the glacier — because Baedeker said the middle part travels the fastest. As a measure of economy, however, I put some of the heavier baggage on the shoreward parts, to go as slow freight." After watching to see the scenery go by and camping with his expedition for a night on the ice, he learned that the Gorner moves a little less than an inch a day, or say, 30 feet a year. The distance to Zermatt being three miles, a little over 500 years would have been required for the journey. Mark Twain concludes that "the passenger-part of this glacier — the central part — the lightning express part, so to speak — was not due in Zermatt till the summer of 2387, and that the baggage, coming along the slow edge, would not arrive until some generations later."

From a mining viewpoint, the most useful labor that the glaciers have accomplished has been the deep scoring of the earth's surface, with a resulting clean exposure of ore bodies. Illustrations of this operation are common in many places, especially in Alaska and at the higher altitudes in the western mountain ranges of Canada and the United States. To the eastward, where the topography and the glacial conditions are different, comparable if not quite similar action took place, but the illustrations are less numerous there because drift now covers a great proportion of the land area.

Canada's Iron Ore Removed

Regarding a part of the eastern territory, Capt. H. C. Dudley, a mining engineer, of Duluth, who for the past 20 years has been exploring and operating iron mines in the lake region, writes me informally on this subject as follows:

"As you probably know, the remnants of what must have been several good iron ranges are left in Canada, having been so deeply eroded by glacial action that only a few pockets remain, although the indications are quite remarkable, and the trail of ore leading up to the deposits sometimes covers several miles, strewn thickly with boulders of iron ore. The iron ranges of Minnesota and Michigan have also been greatly eroded, but in less degree. The pyrrhotite deposits, carrying copper and nickel, in Sudbury, have been exposed by glaciation, and probably ore bodies quite as large as those of the Creighton mine have been entirely swept away in the process which exposed the present hills of sulphide in the norite."

Here in the western mountains are numerous examples of ore deposits that were formed at moderate or great depths, and that have since been laid bare through the agencies of erosion, the latest of which was glaciation. Perhaps erosion had been going on for a very long time, even through several of the great geologic periods, and thousands of feet of rock had thus been removed before the ice began its shift with pick and scraper. Without comparing the relative degrees of strength of the several agencies that cause the breaking down of rocks, such as frost, meteoric waters, and stream erosion, it was the glacier that performed the last great stage and put on the final polish in the region described.

Veins Exposed by Glacial Erosion

Striking features of ice carving are its smoothness, sharpness and speed. So swiftly did the cutting proceed that it kept ahead of weathering processes, and performed its work in ore and country rock little changed by superficial agencies. Since the retreat of the ice so little time has elapsed that no great amount of alteration has taken place, and in consequence we find sulphides and other ore minerals that originated at depths of hundreds or even thousands of feet, appearing today at the immediate surface, and yet not showing the effects that usually accompany such a position in many other regions. For example, the ore bodies of the Kennecott mine in the Copper River region of Alaska occur in a ridge carved by glaciers which still exist, although shrunken in size; in fact, the mine buildings at the Jumbo stand on dead glacial ice. Solid masses of chalcocite, forming the highest grade copper ore bodies of large size that have ever been known, outcrop at the actual surface. Oxidation has attacked only the loosened material of the lode. The mines of British Columbia offer many instances of ores formed at depth, but now appearing unweathered at the surface, their relative change of position having been brought about through the agencies of erosion, including a final sweep by the ice.

The Glacier as Steam-Shovel

It is hardly necessary to point out to members of this convention the numerous cases of prominent ore bodies exposed in places where the results of ice action are evident. One has only to glance at the symmetrical, U-shaped valleys of this region to recognize the trail of the ice, and the local members may be depended upon to describe or show us their famous mines.

The characteristic of ice carving that is of greatest value to the miner is the cleanness with which the cuttings have been removed. Except for debris caught in pockets in the rock and in hollows protected by projecting ribs and bosses, the bedrock has been swept clean. The cuttings have been carried either to the nearby valleys, or

* (Written by Milnor Roberts, dean of the Washington School of Mines, Seattle, for the fourth International Mining Convention, at Nelson.)

through them and on to the distant lowlands, where they have accumulated as glacial drift or perhaps in mixed form as alluvium. Since the drift masks the rocks beneath it, what has been the mountain's gain in the way of exposing its mineral wealth has been the valley's loss through a corresponding concealment of its veins.

Last week, while standing on a rock-rib jutting up through the snow that still covers the ridges north of Mount Baker, I was gazing across a valley head to the glaciers two miles distant, perched on the shoulders and crown of the great cone. The ice, massive as it is, and showing a tremendous depth where even a part of it appears on the cliffs, is but a small remnant of the steely river that some thousands of years ago trailed down the valley. To go back a little farther in time, when a great sheet of ice covered nearly all parts of the range (excepting a few high peaks), makes the comparison of today still sharper, for then the valleys were filled from wall to wall and throughout their length from the summit of the range to the lowlands. As the area of the ice has diminished and its depth has shrunk, so has its power decreased. When it stood thousands of feet deep in the valleys, its movement must have exerted tremendous force. The harder blocks of stone imbedded in the bottom of the ice, backed by the great weight above them, must have gouged into the bedrock as sharply as the steel tool in a lathe chisels a casting.

Fresh Ore at Surface

A prospector who has known these mountains well for many years stood beside me, and pointed to a lead outcropping on the far wall of the valley 1,000 feet or more lower than our position, and again at points farther up the slope and just below the melting ends of the glaciers. On the near wall below us he has found a similar showing. On the other side of the ridge on which we stand are other showings of like nature. The ore is zinc blende, of a reddish brown hue; it occurs directly at the surface, and when touched with a pick, or even scratched by the nail in a boot, it shows the usual luster of the fresh mineral. On the steep slopes mosses and lichens alone have covered the lead, while in the hanging meadows a few feet of detritus and peaty muck conceal it; but in all cases when solid rock is exposed some sulphide particles glint brightly, although others in patches are oxidized.

Numerous other deposits in the same region present similar conditions. Leads extending through vertical ranges of many hundreds of feet show little variation in the general mode of their ore occurrence. The ore shoots may be widely scattered through the leads, but their general appearance is the same, although detailed study brings out differences. Again, separate leads found at elevations varying widely but all lying within a glacial valley, show uniform characteristics.

"Only the Surface!"

The facts in these situations seem to be clear and to fit together logically. The earth has been dissected and an ore shoot laid bare, just as one might cut away half of an apple and expose its seeds to view. Whether the cutting left the greater part of a particular seed in the apple or removed most of it would be purely a matter of accident. The proportion of an ore shoot that may yet be remaining when found in the wall of a deeply cut glacial valley is equally a matter of chance, yet the prevalent idea is that at each outcrop it will be necessary to obtain 'depth' before the true character of the body can be determined. My prospector friend explains to his backer, a prosperous physician, that these showings are merely the surface," leaving much to the imagination. It is a pity not to recognize the true situation and be thankful that the glaciers have carved the cirque so deeply and left the ore so clearly exposed. May it prove that the ice used that rare judgment so essential to a prospector and quit work when the ore shoot was widening!

It will be noticed that the useful work ascribed to glaciers is that which was done some time ago rather than quite recently. Glaciers in the north today are probably as vast and as active as they were here in glacial time, but in any case unless the ice has shrunk back and exposed the carved areas the results of its work remain unknown to man.

Glaciers Today

If any case has been made out as tending to show that the glacier by its past operations has been the prospector's friend, it must at the same time be admitted that the surviving members of the order—if such cold blooded, sluggish monsters have enough fraternal ties to form an order—have numerous acts to their discredit as well. Some years ago the western edge of the Russell glacier on the northerly shoulder of Mount Ranier rode up over a granite knob where a windlass stood over a shaft sunk on a copper-molybdenite lead, and moved the sills, posts and all to one side in a gentle way that no snowslide could have accomplished. If the ice has to support an aerial tramway, its restless habit is a source of trouble to the operators, who frequently have to straighten up loose-legged towers and adjust the tension on the ropes. Railway tracks that have been laid on ice assumed to be dead have frequently rearranged their sleepers without orders. As tailings dams, glaciers are not trustworthy. They are liable at any time to swallow the whole heap, cyanide included.

A miner on the Smattle river complains that the high-grade ore he piles each summer at the mouth of his drift has been badly scattered in the course of its transport down the valley by the ice route. A prospector near Doubtful lake used to drive through glacial ice for some distance before reaching his vein in the solid rock. By the next season his adit through the ice would have moved down the valley a little distance and he would be obliged to drive another one. Being attentive to his assessment work he soon had several of these cool tunnels lined up in a row, and would doubtless have been glad to dispose of them even at a loss. He might even have promised shipment in the bargain, to lower valley points, with date of delivery not specified.

A ROPE SEVEN MILES LONG

There was recently made by Wrights of Birmingham, England, a flattened strand wire seven miles long, without splice in either strand or rope. It is 1⅛ inches in diameter and weighs [illegible] long tons. As it was impossible to roll this rope on drums in the usual way, it was shipped in coils on specially prepared railway trucks. Flattened strand ropes are increasing rapidly in popularity among users. An objection formerly made to them was their lack of flexibility. The modern design as adopted by Wrights provides a greatly increased degree of flexibility combined with the compactness that makes the use of the flattened strand so desirable.

The [illegible] output [illegible] for July [illegible] ounces as compared with [illegible] ounces for June [illegible] and [illegible] for [illegible] 1921.

Pure and Applied Science

(Abstract of address delivered by Dr. E. H. Griffiths I. I. D., F. R. S., at a Special General Meeting of the South Wales Institute of Engineers, held at Cardiff, Wales, on March 23, 1922.)

Editor's note—Dr. Griffiths' address, the full text of which appears in the Proceedings of the South Wales Institute of Engineers, is a strikingly lucid statement of the relationship subsisting between pure and applied science. The whole address, as will be gathered from the extracts and digest presented below, is what our neighbours of the south would call "inspirational." It typifies the mode of thought, the high mental plane of the best British men of science. Scores of men like Dr. Griffiths are doing their utmost to spur the youth of Great Britain on to equip themselves for scientific research. In Canada the awakening is yet to come.

I CLOSER UNION BETWEEN PURE AND APPLIED SCIENCE

Let me call your attention to the conditions prevalent some hundred years ago, after the close of the Napoleonic wars, those conditions in certain respects largely resembled those now existing. The same want of employment prevailed, discontent evidenced by riots was prevalent throughout the country. There was, however, an essential difference. The comparative smallness of our population might have made it possible for us to have become an agricultural community and self-supporting, but no such possibility is open to us to-day. That period, however, was followed by one of unexampled prosperity, and the basis of that advance was found in the application of science to the affairs of mankind...

About 1830 we entered on a period in which the discoveries of science were utilized for the purpose of industry a period of the replacement of manual by steam power. The discovery that one engine could do the work of a hundred men, and that so far from diminishing it increased employment, altered the whole face of our civilization. If, for example, a few thousand puddlers were thrown out by our employment of the Bessemer and Thomas processes, the increase in the output of steel gave employment to twenty times that number in the engineering trade...Workingmen never make a greater mistake than when they resent the introduction of machinery...

It is but slight exaggeration to say that this country had in the middle of the last century command of the industrial markets of the world. This supremacy, however, steadily diminished during the remaining years of that century, and this was due mainly to two causes:—

(1) Our great industries were controlled by able business men, but men with no scientific knowledge and with but little respect for it, and "rule of thumb" methods were prevalent; research was ignored.

(2) Other nations felt that their existence as industrial communities was threatened, and Germany, more especially, entered into the lists and profited by our mistakes...Her industries were guided by men with both business instincts and real scientific knowledge, a combination rarely found in this country.

It was in the laboratory of an English chemist, Sir William Perkin, that the discovery of aniline dyes was made nearly seventy years ago, yet the manufacture passed into the hands of Germany, which resulted in that multiplication of her chemical resources the effect of which we discovered during the war.....Why was this all-important industry taken from us? I believe the bed-rock causes were the indifference of our business-men to the discoveries of science and the want of co-ordination between the men who apply, that is, the engineers and manufacturing chemists, and the men who work at research in the laboratory, and we have paid dearly for our indifference.

It has been well said that this country has lost its preeminence in the dyeing and coal-tar industries because "the English manufacturer considered that a knowledge of the benzol market was of greater importance than a knowledge of the benzol theory."

It would be easy to multiply examples of industries founded on discoveries made by Englishmen and applied by the Germans. Hence to-day our position is, in many respects, more difficult than that of a hundred years ago. For our competitors are beating us at our own game. Is this due to lack of brain power or intelligence on our part? I do not for a moment believe it. The names of men who have made, and are making, the basic discoveries on which industries are or can be founded are in English and French rather than in German lists. Is it that our engineers are incapable of applying the knowledge thus placed at their disposal? Again, I do not believe it. In the list of the great engineering achievements of the last century with perhaps the exception of the Suez and Panama Canals, the names of English engineers are preeminent. In a popular vote taken by an American publication named *Popular Mechanics* as to the seven most wonderful applications of science for the purpose of mankind, the achievements which obtained the highest number were wireless telegraph, the telephone, the aeroplane, radium, antiseptics, spectro-analysis and X-rays. *Each one of these had its foundation in purely scientific work, and was not the result of deliberate intention to make something of service to humanity...*

During the past hundred years all the conditions of civilization have been transformed, not by legislators, not by soldiers or sailors, but through the agency of men seeking after knowledge for its own sake...

The conversion of a laboratory process into a commercial proposition requires both faith and capital. In the past the British business man has not been prepared to supply the capital until the commercial application has been proved successful. This, however, was impossible unless the necessary capital was provided; and thus we have travelled in a vicious circle... If our technical experts in engineering and chemistry devoted more of their energies to exploring and applying the stores of knowledge freely placed at their disposal by the pioneers of science rather than in the improvements of methods already established, then I believe we could face the future with greatly increased confidence. Unfortunately, as I have already indicated, there has existed in the past, and to some extent exists in the present, a wide gap between the laboratory and the market place... This is especially noticeable in the lapse of time which seems inevitable between the discovery and its application. Let me give you a few examples:—

In 1831 Faraday...established the fact that it was possible to generate electricity by the expenditure of mechanical work, but it was nearly fifty years before the discovery was used with commercial success in the construction of the dynamo.

Aluminium was discovered by Wohler in 1827. This was simply regarded as a scientific curiosity till about 1860. The manufacture of aluminium is now an industry employing millions of capital and thousands of labourers.

Phosphorus was discovered by Brandt in 1669, and exhibited to Charles II as "A wonder of Nature." It was not until 1834 that it was first used in the manufacture of matches . . .

About 1870 Maxwell established the theory that waves of light were due to an electro-magnetic disturbance in the ether. It was not until 1896 that Marconi applied for a provisional specification of apparatus for signalling by electric waves . . .

During the past few years the works or Sir Joseph Thompson, Sir Ernest Rutherford, Dr. Ashton and many others have revealed to us the marvellous constitution of the atom, and are leading us to conceptions of the . . . nature of the chemical elements, and of the relation between what we have hitherto called matter and electricity, which are bound profoundly to influence the whole nature of future investigation . . . Our attitude of mind should be, not "Is there any possibility of utilizing a discovery?" but rather "In what way can this discovery be utilized?"...

As we look back on the last century we are driven to the conclusion that our prosperity has been chiefly due to our utilization of the energies supplied to us in centuries long past, and now available in the form of coal.

We are thus living on our capital; it is true that we are learning, but slowly, to utilize its latent energy in more economical methods than we have done in the past, but no thinking man can deny that not only is our capital diminishing, but that it is also becoming less available. The sources of energy in the densely populated regions of the globe are diminishing with increasing rapidity.

I believe the attention of our engineers must be directed to the possibility of actually transporting to our doors the energy daily showered in favoured regions of our earth rather than to the destruction of the sources supplied to us in the past.

I ask you to reflect for a moment "on our income of energy" . . . Observations by Buchanan taken in Egypt with an improved calorimeter led to the conclusion that each square metre of the earth's surface which is exposed perpendicularly to the sun's rays receives radiant energy equivalent to 1 h.p. Now the area of the great circle of the earth is roughly speaking 130 billion square metres, thus the working value of the sun's radiation to us is about 130 billion h.p.; if we deduce from this the h.p. radiation per 1 square foot of the sun's surface we obtain a value very decidedly less than that obtained by Lord Kelvin (7,000 h.p.) . . . If the radiant solar energy falling on the earth were wholly converted into mechanical energy, each individual's share (including men, women, and children) would enable him to lift a weight of 3,300 pounds through a vertical distance of nearly 20 miles every minute of his life."

It is true that by application of water power the swing of the tides, the growth of plants, the combustion of wood, etc., we do, to some slight extent, utilize our income, but the fraction thus expended is negligible.

I venture to predict that our engineers and chemists will in the future have to rely on *direct* rather than on what I may term the indirect utilization of the energies supplied us by nature . . . I may doubtless seem guilty of presumption when I suggest to our rising generation of engineers and chemists the advisability of "going back to nature", that is, to a study of natural phenomena. By the combustion of coal at a temperature of thousands of degrees we evaporate water in a boiler, and by means of ponderous and ingenious machinery transfer energy by an electric current to our incandescent lamps. The actual light energy that we thus obtain is but a tiny fraction of the energy expended in the furnace. Consider by way of contrast the glowworm; it is estimated that it utilizes as light some 95 per cent. of the energy expended, and that without any appreciable rise in temperature.

Again, consider the astonishing prospects opened out to us by the discovery of the energy within the atom . . . If we could but learn the way to persuade the atom to commit suicide, and also discover how to utilize the resulting legacy of free electrons, then we should have no need to consider other sources of energy . . . The dissolution of radium (and also some other elements) indicates the possibility of such a process, and improbable as may be the realization of such a dream, it is not for this generation to assign limits to the march of discovery . . .

There is no branch of natural science which the engineer can afford to ignore . . . His dependence on the physicist, the chemist and the geologist is obvious, but I ask you to remember that the successful construction of the Panama Canal was due to the researches of zoologists, and even the designers of our aeroplanes had to call on the botanists for advice in the selection of their wing materials . . . We must remember that all branches of science are parts of one organic whole . . . It appears to me that one of our difficulties is the tendency to over specialization. The engineer should have easy access to all chambers in the temple of science . . . I want to induce our young engineers to be both optimistic and imaginative . . .

Determine that you will become liason officers between the allied armies of pure and applied science . . . To the man of science, discoveries are an end in themselves, by the engineer they should be regarded as foundations on which he may surely build for the edification of mankind.

CORRESPONDENCE

Editor, Canadian Mining Journal

Sir,—

I desire to correct a statement in your issue of July 28th in the article of "Canada's Iron Ore Problem" by G. C. MacKenzie, which reads as follows:

> "The nodulizing process has been very successfully applied both in Canada and the United States and has been proved less costly for an equal output of furnace to install and to operate than the briquetting process."

The statement as rendered is [illegible] briquetting processes. Since the adaptation of [illegible] [illegible] practice [illegible] the contrary is true.

A plant using the [illegible] process [illegible] by the M. A. Hanna [illegible] Co. at Buffalo, N. Y., and as a result [illegible] has [illegible] made for [illegible] per cent. [illegible] for sintering and nodulizing and 25 per cent. [illegible] cost of operation. Further, the product [illegible] shaped briquettes [illegible] as a [illegible].

Yours, etc.,

A. E. Seelhorst [illegible]

General Briquetting Co.,
11 Broad St., New York.

Book Reviews

IRON ORE — Part 3 — British America. — Imperial Mineral Resources Bureau. 3s. 9½ d., post free, from H. M. Stationery Office, Imperial House, Kingsway, London, W. C. 2. — 115 pp.

As with all the outlying parts of the Empire, the mineral resources of Canada, including iron ore, are as yet only imperfectly known. Consequently the present volume must be considered suggestive rather than determinative. This is conceded in the statement in the summary that "with the data at present available, it is impossible to estimate even approximately the reserves of iron ore in Canada." The hope for the future is expressed in the closing sentence: "There are ample supplies of coal in the Dominion, and most of the other materials required by steel makers are to be found in abundance, a fact which affords a strong incentive to search for new and suitable deposits of iron ore."

The recent position is well indicated in the following sentences: "There are undoubtedly large resources of iron ore in Canada, but the majority of the deposits known at the present time consist of low-grade ores, which generally require treatment to raise them the standard of furnace requirements . . . . . By far the larger portion of the Dominion is practically unknown as regards its mineral resources, and only a very small portion in the more populated parts, along the coast and larger rivers, has been at all prospected. Sufficient evidence, however, has been obtained to indicate the great potentialities of the unprospected areas."

The reference above to coal supplies refers, of course, to the coal measures of Nova Scotia, Alberta and British Columbia. The description of individual districts and deposits, which comprises most of the volume, contains the conclusion that there still remains a good chance for locating in each of these provinces iron-ore deposits suitable for the basis of a great iron and steel industry.

One little error, either a misprint or a quotation from a report that has now been superseded, does injustice to one of our principal ore reserves. The Magpie and Helen Mines in Michipicoten District, Ontario, are credited with 2,000,000 tons of ore. Actually, the New Helen has proven ore to the extent of 100,000,000 tons at least, and probably much more.

For the rest of British America, British Guiana and Trinidad are almost completely unexplored, while nothing is known, officially, of iron ore in Jamaica or the Falkland Islands. Newfoundland, by virtue of its huge bedded deposits at Bell Island (Wabana) near St. Johns, has one of the largest known ore reserves in the world, estimated at about 3,500 million tons — sufficient to supply the demand of the whole world for a period of twenty years.

IRON ORE. — Part 4. — British Asia. Imperial Mineral Resources Bureau. 2s. 8½d. post free, from H. M. Stationery Office, Imperial House, Kingsway, London, W. C. 2. 65 pp.

British Asia is comprised mainly by British India, in which occurs one of the largest known reserves of high-grade iron ore in the world. Though a comparatively short distance to the west of Calcutta, these deposits remained unexplored until recent years. At present there is being built up, with remarkable rapidity, an iron and steel industry of world importance, firmly based upon this unsurpassed source of iron ore and a neighbouring supply of coal of good quality and of fair dimensions.

The principal ore deposits of India occur within an area of about 150 miles diameter, situated 300 miles west of Calcutta, and at an average distance of 120 miles from the coal field, which are to the north. They occur in rocks of pre Cambrian age, and are comparable with deposits of similar occurrence in the Lake Superior region, Brazil and elsewhere. Their total size is still undetermined, but one range 30 miles long in the Orissa region is estimated to contain 3,000 million tons, and the resources of the whole iron bearing area are estimated at 20,000 million tons of high grade ore, 60 per cent. or over in iron. The ore is hematite, locally altered to magnetite, and is characteristically of Bessemer grade, with only a few per cent of silica.

If only the visible supply of metallurgical coke were comparable to her known supplies of iron ore, India would be assured of an iron and steel industry of the first magnitude. But though the coal measures to the north and northwest of Calcutta are known to contain a very large supply of coal, only a small part of it is of metallurgical quality. The reserve of high-grade coking coal at present determined is 2,000 million tons, which will last only a comparatively few decades, if the present rate of increase in its use be maintained. It is suggested that the use of this high-grade coal be restricted to metallurgical purposes, and that the lower grade coal, of which there is an abundance, be used wherever possible.

Though its successful initiation is of only recent date, India's modern iron and steel industry is already of large dimensions. The principal producer at present is the Tata Iron and Steel Company, which now produces 900 tons of pig-iron a day and 17,500 tons of steel ingots a month, while additions at present nearing completion will raise these outputs an additional 1000 tons of pig-iron and 1000 tons of steel ingots a day. This company and its subsidiaries manufacture rails and miscellaneous rolled shapes, forgings, agricultural and industrial machinery, tin plate and enamelled utensils, wire products and pipe. In addition a plate mill has recently been completed. The Bengal Iron Company produces pig-iron and castings only, at the rate of 450 tons a day. The Indian Iron and Steel Company is erecting works to produce 600 tons of pig-iron a day. Two other companies, the Eastern Iron Company and the United Steel Corporation of Asia, are projected.

The rest of British Asia contains iron ore only in minor amount, and none of it is being used. Among Ceylon, the Malay States, Borneo, the mandatory states Mesopotamia and Palestine, and Hong Kong, only the last has an appreciable amount of ore. On the mainland portion of the Hong Kong colony a number of lenses of magnetite are known, containing several million tons of ore.

IRON ORE — Part 5. — Australia and New Zealand — Imperial Mineral Resources Bureau — 4s. 4d., post free, from H. M. Stationery Office, Imperial House, Kingsway, London, W. C. 2. 106 pp.

Prior to 1915, Australia possessed no iron smelting works of importance. The establishment in that year of the Broken Hill Proprietary Company's works at Newcastle, New South Wales, virtually initiated the iron and steel industry of the Commonwealth, which is now (barring incidental labour troubles) in a very sound position. The Newcastle works are capable of producing 1,500 tons of pig iron a day, and comprise as well basic open hearth steel furnaces, rolling mills, merchant mills, and foundry and forging plants. Another works at Lithgow has a capacity of 3,000 tons of pig-iron a week, and a steel works in addition. The Australian Electric Steel Company,

Limited, has been successful in producing steel in electric furnaces.

As the practical interest in Australia's iron ore deposits is of such recent date, not much is known of them, and that little mainly on the south coast, the interior and northern (tropical) parts being virtually unprospected so far as iron ore is concerned. At intervals along the coasts of each of the states (with the exception of Victoria) ore deposits of considerable magnitude and satisfactory grade have been found, the total known reserve being 345 million tons. The most important deposits up to the present are on the islands of Yampi Sound, in Western Australia, and at Iron Knob, in South Australia. The Yampi Sound deposits are huge beds of compact hematite, interbedded with highly metamorphosed sedimentary rocks. The Iron Knob deposits are large lenses averaging 68.5 per cent iron, which at present supply the iron works at Newcastle.

Coal of metallurgical grade is also readily obtainable on the south coast of Australia; so the conclusion that "the resources of Australia appear to be adequate for the establishment of an iron and steel industry capable of supplying the local demands and providing a surplus for export," would appear to be well justified.

New Zealand is not so well supplied with iron ore as is her larger neighbour. The principal deposit known is at Parapara near the northwest corner of the South Island. Here there has been determined 65 million tons of limonite of fair quality, locally called Onakaka ore. There are extensive deposits of titaniferous iron sand on the north Island, and an unsuccessful attempt has been made to smelt it by a new method. Lately the plant so used has been purchased for removal to the Onakaka ore beds where the limonite will be smelted. The lack of suitable coking coal has militated against the successful establishment of an iron smelting industry.

* * *

One small item is lacking in these reports—merely a convenience, but one that the reviewer has missed. The sketch maps accompanying all the volumes have no scale of miles. This might logically be included in future volumes.

PETROLEUM—WHERE AND HOW TO FIND IT

—By Anthony Blium—Published by the Modern Mining Books Publishing Company, 905-127 North Dearborn Street, Chicago, Illinois. Price $2.00.

Mr. Blium's name will recall many pleasant and picturesque memories to those who were in any way identified with gold mining in the Lake of the Woods region a quarter of a century ago. Even the portrait that adorns the volume under review we should judge that the years have dealt not unkindly with the author and that his virility, zest and humour are still unabated.

* * *

Books are inevitably the expression of authors' personalities. We conclude therefore that Mr. Blium does not place a very high estimate upon the acumen of the citizenry of the United States and Canada insofar as mining investment is concerned. Also we gather that he considers himself a competent guide, philosopher and friend to said citizenry. On one count Mr. Blium is perfectly right. Mining truths must, or should, be told to the populace in words of one syllable—here a little and there a little. As to Mr. Blium's fitness for the role of adviser, we think there is little room for doubt. Assuredly he knows the world and by this time he should be able to manhandle the "devil." The "flesh" has nothing to do with the matter in hand.

Some write because they wish to, some because they must. Mr. Blium is nothing if not fluent. His volume is comprehensive in title. He has tackled a large subject in a manner singularly confident, even we might venture to say *debonair*. Because of this confidence we doubt not that words of warning will do much good where and when they are read and heeded.

MINES AND QUARRIES OF CANADA

The Mines Branch, Ottawa, have just published their annual list of mines and quarries and allied industries throughout Canada. These lists are invaluable under certain circumstances, and the revised issue of this year will, no doubt, fulfil its useful purpose. The lists comprise the following:—

Metal Mines in Canada.
Coal Mines in Canada.
Non Metal Mines in Canada.
Stone Quarry Operators in Canada.
Manufacturers of Clay Products.
Operators of Sand and Gravel Pits.
Petroleum and Natural Gas Wells.
Cement Mills and Sand lime Brick Plants.
Lime Kilns in Canada.
Metallurgical Works in Canada.

Any or all these lists can be obtained by those interested from the Director, Mines Branch, Ottawa.

ENGINEERS WANTED

The Mines Branch, Department of Mines, Ottawa, have advertised positions vacant for two engineers "to make or assist in making, investigations and studies in respect to the occurrence, recovery, marketing, and utilization of Mineral Resources and Mining and Metallurgical products, to prepare reports on the results of the work and to perform other related work as required." Technical graduates with a well rounded practical experience are required. The initial salary is $2,100 per annum, with an annual increase of $120 per annum until a maximum of $2,580 has been reached. Those interested should apply immediately for blank forms for application to the Civil Service Commission, Ottawa.

Soft coal production shot upward almost as suddenly as five months ago it had plunged downward when district after district accepted the Cleveland wage agreement and resumed work. Late returns for last week, August 21-26, indicate an output of 6,700,000 tons of bituminous coal and the present week, August 28-September 2, will show 9,200,000 or possibly 9,700,000 tons. The anthracite mines, however, are still idle. The increase has come almost exclusively from mines opening under the Cleveland agreement. The non-union districts of the Middle and Southern Appalachians are still limited by railroad disability and in spite of a slight increase in car supply are producing only 60 per cent of the rate at mid-July before the shopmen's strike.

By fact-compilings of lack of cars have already again appeared in the union districts of Eastern Ohio and Northern West Virginia. The limiting factor in production of bituminous coal has thus changed over night. A week ago it was the supply of mine labor; today it is transportation. The first response of the railroads to the demand for more cars has been favorable partly because they had a surplus of [illegible] when the mines resumed work. Whether the roads can maintain the present rate of coal movement [illegible] the surplus of cars is exhausted remains to be seen.

A Budget From New York

By KIRBY THOMAS

Copper and Copper Stocks

A New York business man, whose activities for nearly a life time had necessitated the study of the markets for the basic natural resource commodities, and who had been concerned in the consideration of the securities based upon industries engaged in the production of such commodities, remarked recently at a down town luncheon club, that "copper and copper stocks seemed to be suffering from an acute case of 'statisticitis'". Pressed for an elaboration of his cryptic diagnosis of the "copper situation", he explained that for more than half a century the copper mining industry had grown, thrived and acquired a paramount position in the mining field, without the support and guidance of the tables of statistics, charts and graphs, which are now everywhere and always in evidence, whenever the subject of copper is discussed, especially by those who presume to speak as oracles. The mining companies multiplied and expanded to gigantic proportions, and many of them have prospered through many years. Fortunes have been made by mine owners and mine developers and profits and losses accrued to the participants in copper stock speculations much as they did to those who indulged in operations in other stock. All this went on without the inspired guidance of the "statistician". Since the collapse of the copper industry, following the hectic and stimulated markets of the War period, there has been an endless array and an everchanging succession of tables of statistics, all put forth in alleged answer to the question, "What is the matter with the copper industry?"

When trouble came into the copper camp, after the War, as it did into most other business, (due, as is now generally admitted, to the collapse of the business machinery of the civilized world, caused by the catastrophe of the World War), the statisticians came to the front. Their conclusions and deductions, it must now be admitted, confounded the directors of the copper companies and confused the public interested in the metal and in copper securities. The battle front swayed from "foreign markets" to "domestic consumption", and then advanced into the field of intricate details of "cost of production", based upon unilateral evidence from the companies' official statements. Recently, a new attack has been started all along the front, because of some new reported authentic data as to "secondary, or scrap copper".

Continuing, the business man said, "The trouble with the copper industry is the general problem of post-War adjustment, which has similarly affected most of the other basic industries. The industry will not be generally satisfactory until normalcy has returned throughout the world".

Whether these over-the-luncheon-table remarks may be seriously justified or not, the fact remains that the price of the metal copper has not increased as rapidly nor as much as was predicted by the market oracle, nor have the copper stocks advanced to the point promised in many of the official letters from brokers' offices. There has, however, been a substantial advance in the metal market. It is patent that the domestic demand for so essential a material as copper must be steadily increasing with the general resumption of industrial and building activities. The record of the exports furnish evidence of the increased use of the metal in Europe, and the financial authorities, in part at least, assert that the financial capacity of Europe to buy copper and other essential raw materials is slowly improving, except, of course, in Russia. The War reserve stocks in Europe and the vast amount of copper salvaged from the armament and munition depots, which, it is now belatedly discovered, were both very large, are now practically absorbed. These supplies constituted the "secondary copper" factor, now being discussed in copper circles. In addition to the gradual restoration of normal demand for copper, there has come about the new demand for radio apparatus and the prospective vastly enlarged demand which will result from the consummation of the large hydro-electric projects in every part of the world.

Most of the large producers of copper in this country are resuming production but upon a curtailed output basis. Hardy any new large copper mines in the United States or in Canada have been discovered or developed in recent years, and the prospective new productions in the next five years can hardly equal the certain exhaustion or depletion of the existing mines. The Mexican copper output is still small, due to political and economic troubles, and the South American copper companies will surely be slow in recovering from the adverse conditions, due to money exchange and high costs. It would seem, from these general factors, that for the immediate period of two or three years the demand for copper should increase faster than the supply, particularly if the few companies with large output continue the policy of curtailed operations until the surplus stocks are disposed of. Looking farther ahead, the demand for copper should increase at a greater rate than the supply if the business of the world maintains normal activity and increase. These general facts seem to point to a continued fair price for the metal and some increase on the average.

The price of copper, as with the other metals, is more directly dependent upon supply and demand than upon cost of production, for production costs vary with the different conditions of the deposit operated, and with the character of the ore, and the scale of operations.

As for the dictum of the statistician, it has just been announced that the stocks of refined copper were reduced during the first half of this year by 164,000,000 pounds. In June, the reduction in stock was 40,000,000 pounds, this being the excess of domestic consumption and export over refinery output. It is predicted that by the end of the year, the refined copper stocks will be reduced to about 365,000,000 pounds.

In connection with the general subject, it is interesting to note that the copper mines in this country are today producing 60 per cent. of the world's supply, and that 80 per cent. of the world's copper is refined in the American refineries.

Trade reports show an improvement in domestic demand and a continuation of exports, which is considered remarkable, in view of the still unsettled conditions in Europe.

As to the copper stocks, these are not directly dependent upon the price or statistical position of the metal, for each individual company has its own factor determining cost of production and product, and there

(Continued on next page)

News of Mining

United States

The quantity of gypsum produced in the United States during the year 1921 was 3,051,000 tons. Of this amount, 526,042 tons went to cement makers. The gross estimated value of crude and calcined gypsum was $23,700,290. More than 50 per cent. of all the gypsum was calcined before marketing. Imports amounted to 271,291 tons of which amount was responsible for the greater part, 267,045 tons. Canada's total production was 357,183 tons.

Production, imports, and consumption of bauxite in the United States were markedly less during 1921 than in the previous year. The total tonnage produced was 139,550 tons, almost all of which came from Arkansas. The gross value was $889,800. Imports were 27,587 tons, valued at $164,589.

Revision and passing of the McCumber Tariff Bill by the United States Senate was finished last month. The Bill now provides, amongst many other items, a tariff of 3 cents per lb. on nickel; 2½ cents on copper; 1½ cent on lead-bearing ore; 35 cents per pound on the metallic contents of molybdenum ore; 1 cent per pound on the metallic contents of manganese ore; 10 per cent. on amorphous graphite; crude gypsum, free; talc, if ground, 1 cent per pound, up to 25 per cent. ad valorem; and five sixteenth of one cent per pound on crude magnesite.

Current coal mining wage rats in northern West Virginia include the following:— Pick mining, seams five feet or over, open lights, $0.876 for room and pillar, $0.936 for entries; closed lights, room and pillar, $0.890, entries, 0.950. For seams under five feet the corresponding rates are, open lights, $0.95 and $1.065; closed lights, $0.964 and $1.079.

Great Britain

A comparison of returns in the coal mining industry for the three quarters ending, respectively, September 1921, December 1921, and March 1922, shows that, with successive lessenings of average earnings, the output of coal per miner display corresponding increases.

In a recently published article, Sir John Cadman, K. C. M. G., new chief technical adviser to the Anglo Persian Oil Company, expressed his belief that the chemist would in the near future find some method of liquifying coal and thus rendering it as mobile and economical in use as is petroleum.

Europe

The English firm of Stanley Sugden and Fisher controls the Roudny gold mine in Bohemia. For the first five months of 1922 the yield of gold from 13,000 tons of ore milled was 111.5 kilos. Great increases in wage rates and in the price of timber have now compelled the operators to seek government subvention.

The growth of lignite mining in Germany is indicated by the fact that, whereas the output in 1913 was about 87,000,000 tons, it now approximates an annual total of 130,000,000 tons. In the Cologne and Halle districts there are six large distillation and chemical plants. One company now produces 10,000,000 tons annually and generates 150,000 h. p. at a central power station.

Payments for Wabana iron ore, now being shipped to Rotterdam, are being made in British currency. It is thought that, with twelve steamers commissioned for this trade, the total shipments will amount to about 750,000 tons before the beginning of 1923.

The production of crude petroleum in Roumania during the first six months of the current year was 662,000 tons. Three leading companies, the Astra Romana, Romana America and Steaa Romana, produced about two thirds of the total.

Africa

Egypt does not yet produce sufficient petroleum to meet her own needs. Other Egyptian mineral production is relatively unimportant. The Sinai Mining Company produced 55,000 tons of manganese ore during 1921 and phosphate rock to the amount of 122,000 metric tons was mined.

The greatest tonnage of ore milled during the month of July on the Witwatersrand was that of the Crown Mines, 201,000 tons, on which the profit was £80,933. Government Areas, with a smaller tonnage, 140,000 tons, showed a profit of £149,156. The costs per ton at the Crown Mines was 24.s. 2d. per ton at the Government Areas 21.s 2d. per ton.

Mr. Malan, Minister of mines, South Africa, recently predicted a revival in the diamond market. A statement made in Parliament by Mr. Henderson, member for Bakersburg, to the effect that depressions in the diamond trade are brought about by inside influences every seven years, was deeply resented by other members.

The ore reserves of 39 Rand mining companies aggregate 80,000,000 tons. The highest average gold content is reported for the Meyer and Charlton. On this property the reserves are estimated at 396,000 tons, averaging 1.58 dwt per ton.

The coal output of the Transvaal during May was 491,740 tons. The output for the whole Union was 911,262 tons.

Among the most successful of the Rand mines so far as cost reduction goes is the Robinson Deep. Costs there were 5.s less in June than in November, 1921. The Modder B shows a reduction of 3.s. 9d. for the same period, and the Wolhuter, 4.s. 9d.

For the year ending 31st March, 1922, the Rhodesian Copper and General Exploration and Finance Company reports a balance of £22,259. A dividend of 10 per cent. was announced.

Shipments of low grade asbestos fibre have been resumed by Rhodesian producers.

The Belgian Congo produced more than 30,000 metric tons of copper during 1921. The output for 1920 was 15,500 metric tons. It is stated that Swedish capitalists are investigating the feasibility of hydro-electric plants for the further development of the Congo deposits. The plants are to be situated near the falls at Pondi.

Australasia

Boring for oil on Kangaroo Island, South Australia, has brought in a considerable flow of gas.

1073 men were employed in alluvial gold mining in the State of Victoria during 1921, and 1977 men in quartz gold mining. The total yield for the year was [illegible] Gold mining companies paid dividends [illegible] £80 during the year.

---

is to be considered always the question of the depletion and exhaustion of the reserve. However there are several large companies, whose stocks are on the market, which have such large reserves, and whose operations are so organized and on such a scale that they may be considered as manufacturing undertakings. These stocks, of course, should directly respond to the improvement in demand and to any regular increase in price for copper.

News and Comments

By ALEXANDER GRAY

"Read the Answer in the Stars"

A humorous light opera artist used to strike the risibilities of his audiences by singing this laughable thing. As a piece of prose the following may not be quite so ludicrous in one sense, but it will serve to remind President MacKay of the Associated Goldfields of Larder Lake that his shareholders have not as yet received any authentic report in detail as to what happened to the prodigious ore bodies, and on what basis the "assets" were valued:

Dr. MacKay's Statement

"The directors have pleasure in submitting the balance sheet of your company as at October 31st, 1921, showing cash and Victory bonds on hand, $614,630, development and office expenses $140,177.

"Mr. George Gray, our engineer on the property, who has been in charge since January last, will not have his report on the properties ready for about three months, after which time a meeting of the shareholders will be called and a full report presented.

"A financial statement will be presented today which will show assets of $21,953,603, the outstanding item of which is $20,985,398, which appears under the heading of Mining Properties, including development, timber limits and power rights at Raven Falls and Windego, at value at which acquired from vendors (satisfied in part by the issue of capital stock.)

"The other big item is cash and bonds as referred to by the president.

"The company is capitalized at $30,000,000 made up of 30,000,000 shares of the par value of $1 each, and the liability column shows issued trust receipts for 21,934,096 shares of $1 each, fully paid, $21,934,096."

Seven months have elapsed since that was administered to Associated shareholders. Mr. Gray, months before, had summarized the results of the work. Is Silence more golden than the ore bodies?

Aluminum Products Boosted

When the Senators at Washington were about it, they might as well have made it a penal office, punishable without regard to international rights, as to impose an impost of 60 per cent. ad valorem upon aluminum kitchen and household utensils. The intention was to make the duty 28 per cent. As an afterthought, 60 per cent. was inserted. It remains to be seen how this is going to popularize aluminum ware. Messina Springs aluminum works find Canadian hydro electric power acceptable; but Canada no doubt will be obliged to pay the extra charge on aluminum products—unless we compromise by making our own kitchenware. Washington is banning so much that the international jury may render an adverse verdict when it comes to the point of "take it or leave it."

Canada's Climatic and Mineralogical Elysium

Never—well hardly ever—was there a Mining Engineer who would allow his imagination free rein to the point of being riotous. Promoters and speculators make up for his deficiencies in this respect. That is why we have implicit confidence in the picturesque experiences graphically related by Frank Perry. Ordinarily the lay press might lapse from the veracious and leave a lingering doubt in the minds of the reader. But Mr. Perry being a Mining Engineer, formerly of Idaho and Montana, is to be accepted as the embodiment of truth when he describes the wonders and wealth of a British Columbia Valley—a Paradise so Arcadian and yet so materially transcendant that the Yellowstone and Yosemite fade into the commonplace by comparison. It is a coincidenced that when the splendors of the Yellowstone country were revealed by the adventurous, incredulity was displayed. Arboreal beauties, glories of geysers, the pellucid lakes set amid incomparable stage effects, were greeted by the skeptical as the conjurings of a lineal descendant of Munchausen.

Mining Engineer Perry, being a Mining Engineer and constitutionally conservative, will entrust no one with more than his glowing generalization. It is his own secret. For fourteen years he roamed over British Columbia. Presumably they were unprofitable years, since he admits his belongings consisted of four pack dogs, the usual prospector's outfit, the help of Providence and a toothbrush. Of course he had a rifle and, perhaps, a shot gun, otherwise he could not have varied his regimen with the essence of moose meat—the "concentrated extracts" of moose meat,—to be strictly correct. Seemingly he would have had less of that nutritive emergency ration were it not that fortune favoured him during a sub-Arctic blizzard. He was footsore and heart-weary as he stumbled up a hill along with two dogs—somewhere in latitude 57-63, longitude 122-131—deliberately vague, and advisedly so, because Perry on reaching the summit was regaled by a panorama of surpassing grandeur. Below him was a valley, enchanted, haloed in vapors, tropical, populated with game. Descending and in due course extending his explorations, there were rose bushes luxuriant beyond previous human ken, as large as trees. Apart from trappers, no human foot had tainted this Arcadia. Vapors emanating from hot springs and "almost boiling lakes" shielded from frost the foliage of the valley. Even Indians would not go there believing the enchanted valley was haunted or an inferno, canopied with smoke. Perry had the Eden all to himself.

The soil is estimated at 100 feet deep. Perry, by education and engineering instinct was unconcerned about soil. He observed the volcanic action, took note of the igneous rocks, and he brought out samples containing a "high percentage of gold, silver and copper", as well as coal and iron ore. One iron ore body is 800 feet wide and 200 feet thick.

The cap sheaf of the whole natural situation is the fertilization of the soil by the springs. A valley such as this, twenty miles long and between 25 and 40 miles wide, rich in all the attributes making for human content and wealth awaiting the taking of it, entitles Perry to a pedestal and appropriate decorations. British Columbia, predestined to become a world mining center, now should appreciate this Perryhelion (if a pun be permissible) upon its Ossa of multiform native wealth. The essence of moose meat hereafter will be regarded as an exhilirant as well as invigorant. Perry no doubt will become an F. G. S., F. R. G. S., Speaker of the Veritas Society, etc. May be he is not too preoccupied to associate himself with a few mining enterprises nearer to our own Home and Fireside.

The Mining Districts

FROM THE JOURNAL'S CORRESPONDENTS

BRITISH COLUMBIA

Esperanzo Now a Shipper

The Esperanzo Mine, Alice Arm, has commenced shipping ore. Approximately 750 sacks of high grade has been sent to the smelter for treatment and about 40 tons of lower grade ore is ready for shipment.

Promising showings are reported to have been found on the Alice and Lone Miad properties to the Esperanzo, Alice Arm.

Record Output at Anyox

Announcement is made that all records for production were broken in July by the Granby Consolidated Mining & Smelting Co's Anyox plant. Over 3,000,000 lbs. of copper matte were turned out. The smelter has frequently reached an output of 2,700,000 to 2,800,000 lbs. in a month, but never before exceeded 3,000,000 lbs. The local press carry photographs showing 7,800 bars of matte lying on the C. P. R. docks at Vancouver pending shipment to the New Jersey refinery. These bars contain values in copper, gold and silver and are estimated to have a total value of $568,282.97.

It is reported that this Company now is making its copper for around 9½c a lb. This is cheaper than at any time of the Company's history comparing with 11.63c last year, and 15.95c in 1920. Production in the first half of 1922 was at the annual rate of 25,000,000 lbs. Production during the latter half of this year is expected to total 15,000,000 lbs. as the Company, it is said, does not intend to increase its output before the new rise in the price of copper. It is figured that the Granby Company is equipped to produce about 50,000,000 lbs. of copper annually.

Lode Gold Reported in Cariboo

A discovery has been made on Lowee Mountain in the Barkerville section of Cariboo District which seems to be important. A vein approximately 11 ft. wide of gold-bearing quartz has been opened up and A. Sanders, a prospector and the [illegible] of the property, claims to be getting large returns [illegible] little development already done.

News of another find has reached Barkerville. The record was made by a prospector named E. Moore and is situated in the watershed between Upper Cunningham and Harvey Creeks. It is an immense body of quartz apparently about 60 ft. wide and highly mineralized.

The Britannia Mining Company has been released of all further liability in connection [illegible] out of the [illegible] flood of last fall at Britannia Beach. The Company has paid claims amounting to approximately $[illegible].

There was only [illegible] shipped to the Trail Smelter, Consolidated Mining & Smelting Co., during the week August 15th to 21st [illegible] Aldermac. Considerable shipments were made by the Emerald at Salmo and the Silversmith, Sandon. The Company mines shipped [illegible] tons.

Ralph W. Stubbs of Seattle, Wash., has been inspecting a number of mining properties in the Greenwood District, B. C.

The Revenge mine, adjoining the Bell at Beaverdell, and owned by George Barrett, has been leased and bonded by Louis Cory, John Bergman and Ernest Granberg. The consideration was $35,000, a small part being in cash and 50 per cent. net of the smelter returns to be applied to the principal until the whole is paid.

Clarence Cunningham is running one shift at the Mamo mill, and treating ore from the Wonderful mine.

Kaslo Creek Property to be Re-equipped

Joseph C. Roberts, one of the purchasers of the Gibson group of mines on the south fork of Kaslo Creek, recently made a thorough examination of the property in company with W. T. Dumbleton, a consulting engineer of Tacoma, Washington. They made a special examination of the effects of forest fires which have almost entirely wiped out the surface equipment. This is to be replaced without loss of time in order to permit an early start on development work.

Zinc Lead in Wymer Property

Recent work on the May Blossom group, Quartz Creek, Wymer District, have shown up 30 inches of fine zinc together with some galena and lead carbonates. J. F. Harbeth of Waverley, Washington, the owner, has driven along this ore body for 1500 feet. He is convinced that he has a large body of first class ore and proposes to develop it on a considerable scale.

Developments at Sheep Creek

The Sheep Creek Mining syndicate of Vancouver has bonded the Kootenay Bell, Sheep Creek, and preparations are being made for development work.

The McAllister mine, Sandon, should be a steady shipper early next year. R. A. Gibbs, the manager, says that a 1600 ft. tunnel now being driven to tap the lead at a lower depth will be completed by next March.

The vertical shaft on the Queen Mine, Sheep Creek, which is 600 feet in depth and partly filled with water, is being unwatered. William Dewar is [illegible] the work. As soon as the pumping has been completed further development will be undertaken.

Investigating China Clay in Cariboo

Deposits of kaolin, [illegible] for the production of first class porcelain, have been found not far from Williams Lake on the Pacific Great Eastern Railway, according to information received by [illegible] [illegible]. Investigation work is being made as to the extent and commercial possibilities of the material.

Site for [illegible] Plant at [illegible]

J. D. [illegible] and A. W. Noble [illegible] reported to be negotiating with the [illegible] Chilliwack for a site on which [illegible] and steel plant to be capitalized at $[illegible]. Mr. Noble states that capital has been already secured [illegible] and that [illegible] in that [illegible] district.

Geologists Examine Kispiox Valley for Oil

A special investigation will be made this summer of the possibilities of the Kispiox Valley, Northern British Columbia from the standpoint of oil production. Reports have been received from time to time of the discovery of seepages and oil shale in this section. Competent geologist therefore, are being instructed to visit the field and submit reports.

No Shortage of Coal in B. C.

J. M. Savage, Manager of the Canadian Collieries (D) Ltd. is authority for the statement that there will be no shortage of coal in British Columbia this winter. He says that the only effect of the strikes that have depressed the industry in United States and other parts of Canada has been to promote activity in the coal-fields of Vancouver Island and other parts of the Province. He observes that difficulty in obtaining coal along the Coast of British Columbia is not caused by lack of the fuel, but by interference through severe weather with deliveries. The strike, however, has had one result in the northwest which is being felt by coal operators. Fuel oil is being used to a larger extent than in the past. This movement has been encouraged by the drop in the price of oil, which is being quoted in Seattle, Washington, at $1.10 a barrel, as compared with $2.50 a barrel a year or so ago. Oil now is being used extensively by industrial plants which had been converted into users of coal or coal dust.

Fewer Coal Mine Fatalities in United States

George S. Rice, of the United States Bureau of Mines, is visiting British Columbia and has been in conference with the Hon. Wm. Sloan, Minister of Mines, with reference to various matters effecting the operation of coal mines on Vancouver Island. He declares that accidents in the coal mines of America have decreased 25 per cent. in the last few years. This has been brought about by greater care in the inspection of coal mine workings. The value of the coal miner, he states, has been raised since the coming into effect of Workmen's Compensation Acts. Before a funeral perhaps $500 was all that a worker's family could expect from the average employer. Today a man's death means the paying out of several thousand dollars compensation. Mr. Rice asserts that largely through the technical services of the Bureau of Mines, explosions, once the most frequent cause of death and injury, have been almost entirely eliminated. Individual accidents from falling roofs and cave-ins are the most general cause of trouble today. He concluded: "The number of individual accidents is being lessened all the time. Up to date the American system of coal mine operation has been to wait until signs of trouble appear before taking steps to meet it. In Britain and the rest of Europe precautions to avoid accident are taken all the time, whether trouble appears imminent or not. We are gradually coming to that system in the United States."

Wider Use for Alberta Coal

Coal mine operators and business men generally in the Province of Alberta are looking forward to the time when the coal of Alberta will be exported to a much larger extent to the eastern Canadian market. With the settlement of the strike it is thought likely that a start in this direction will be possible. A material reduction in freight rate is being sought, and influential western men are agitating at Ottawa for the granting of a subsidy on Alberta coal bound to eastern markets. What is wanted now, they state, is not just something that will fill the gap in the East, caused by the American shortage, but action that will assure a permanent market for the product of the Province of Alberta.

Crow's Nest Coal Mines Now Producing

The miners are back at work in the Crow's Nest coal-field, Eastern British Columbia. Already the mines are on a production basis. Strikers who have found temporary employment in logging camps and elsewhere have dropped their stop-gap jobs and gone back to their working places underground. This will mean that the coking ovens at Michel soon will be in full blast, manufacturing for the Trail Smelter and other markets. It is possible that the ovens at Union Bay, Canadian Collieries (D) Ltd. deprived of this outlet will again be closed down. Certainly the pressure on the Vancouver Island Colleries, which has caused remarkable activity during the past few months and abnormal production, will be relieved.

NOVA SCOTIA

Struggle for Cheap Fuel is Ended

The whole American continent has been demanding cheap fuel for both business and domestic purposes since the cessation of war. It is commonly stated that the high cost of coal increases the railway rates and these two factors, including wages, are the chief cause of the present high cost of living.

To satisfy the demands of the public, efforts have been made by nearly all the coal mining concerns of North America to reduce the cost of mining coal that it might be sold at lower prices. To do this, miners' wages had to be reduced; but it now seems that the result of attempting to force a reduction of wages had the opposite effect and raised the selling price of coal through the scarcity caused by strikes of almost continental dimensions. While the short struggle between the miners and their employers in Nova Scotia was taking place, the public had an opportunity of learning some things about coal mining that are not generally known. There is a body of opinion which believes that every coal mine is a bonanza and the owners become wealthy in a very short time. Even the miners themselves, who know better, are in the habit of giving out statements which they know are most misleading; but because they want to throw dust in the eyes of the general public and in a small way help their own cause, they become the ready propagators of these dangerous half-truths. When contending in a wage dispute the price per ton paid to the miner is usually compared with the price paid by the consumer, and as this rate may run from 75c. to $1.00 per ton or perhaps more, the public get it into their minds that they are being fleeced by the Coal Companies. They forget, or rather they do not know, the great expense attached to coal mining. If what has lately occurred at Nova Scotian collieries has enabled us to understand more clearly how much we are controlled by outside influence, the short struggle has not been in vain. American competition fixes the coal and steel prices of Canada and controls the labor, and whether we like it or not, when the economic conditions of the United States improve and wages move up, wages in Canada must follow or our industries will be affected by the migration of workmen to more prosperous parts. This is going on in a marked degree at the present time and there is only one way to meet it.

Progress to Accompany Peace

The industrial life of Nova Scotia, especially the mining side of it, may now proceed along the way of progress without let or hindrance. The vote taken on the Agreement offered by the Dominion Coal Company was large and favored its acceptance. Springhill was the only mining town that went against it, but they must yield to the majority. For many years Springhill was an eyesore to the whole Province, and Springhill strikes became proverbial. It is to be hoped that this is but a lapse rather than a reversion to type on their part.

With the Steel workers satisfied by a wage increase and the big industries of the Province in tune, we may expect a revival of business along all lines. It is much needed and all are looking forward with expectant eyes to better days to come.

The Coal Company is now free to carry out the large programme of development which they intended to begin last spring. Work on the new collieries will be immediately begun; outputs will be increased; large numbers of men will be employed and business generally will be benefited. Let us hope that with a new beginning there will be an effort on the part of all toward effective co-operation. We hope we shall have no more of the abusive, insulting language of labor leaders, which is strongly resented by all sensible citizens of the Province, and leads nowhere.

Early Co-operation of Miners

The new agreement between the Dominion Coal Company and the United Mine Workers has been accepted and business can now settle down for the coming eighteen months. If it is found that the coal industry can do a profitable business at the present wage rates, then these may become the basis for all future negotiations on wage questions. No base wages rates were ever laid down in making agreements in Nova Scotia. The contract and datal rates were simply taken as they were and increased as trade permitted and as the cost of living demanded. Apart from minor adjustments, this is the first wage reduction by agreement in mining rates in our province. Wages during the last forty years have been advancing. The upward trend has been slow at times, but nevertheless sure. The early days of the coal industry were marked by fierce conflict and the trade advanced or receded just as the trade policy of the United States permitted. In years of internal warfare in that country, the coal trade prospered in Nova Scotia, only to become depressed after peace was proclaimed. It remained for the Dominion Coal Company to put the business on a stable basis and to give it an impetus that enabled it to surmount all obstacles and to finally attain its greatest success. The company was most fortunate at the beginning in its workmen. They had passed through times of deep depression in the coal trade and when they fully realized the import of the "Whitney Monopoly", as the politician styled it, they made up their minds to co-operate with it and they did so. This co-operation gave the Coal Company confidence and they reached out to new markets both in the United States and in Canada. The net result of this trade was to give steady employment at the collieries and to stimulate business all over the Province. It had been a common custom each fall when the contracts were filled to close down the collieries for five or six months, and if by chance some colliery did work, it was at what was known as the banking rates, usually eight cents per ton below the summer rate, and miners counted themselves lucky if they were permitted to fill their coal without having to riddle it. With the inception of the Dominion Coal Company, winter rates were abolished and away went the riddle forever from the coal mine, and for years the collieries worked just as steadily in winter as in summer.

Those were prosperous, happy days at the collieries, and but for them the coal trade could never have been sufficiently established to give industrial leaders confidence to go further and create allied industries, which would help to develop further the coal industry and give a market in the heart of the mining district. The Steel Workers at Sydney, when in full operation, use 4000 tons of coal per day — an amount greater than the output of the New Waterford collieries. What this means in the winter months when shipping has ceased is best understood by those dependent on the trade for their livelihood.

Miners Adopt Antagonistic Attitude

It appears, however, that we have passed away from the days when every workman felt it to be his duty to foster the coal trade. The Dominion Government was then helping the steel industry to its feet. The time came when it was believed that this industry could stand alone on its feet, and the bonus on steel was withdrawn. Whether with the withdrawal of Government aid went the desire of the miners to fully co-operate with the Coal Company, or wether they began to believe that working together was no longer necessary, it is very evident today that there is but one thought in their mind, and that is that the coal industry owes them a living wage. Steady employment must now take a secondary place and miners are ready to take their chances with the amount of employment they will have so long as the daily wage they receive is commensurate with their ideas of a living wage rather than what the industry can afford to pay, or even with high yearly earnings. It is quite possible to force wages to a high level, but to keep them there and do business is another thing. Of one thing we are certain, and that is that the growing time of Nova Scotia's coal industry was when all worked together with one aim, that aim being to make the industry a success. Wages were not high, but the concensus of opinion today is that men then had more money to lay by than they have now, and miners were more contented. They were relatively better off, because they labored to improve their own industry and to give the large buyers of coal the impression that a contract for coal once made was as good as filled. To get back to that position should now be the aim of every miner.

The Strike in Retrospect

Looking back to the beginning of the dispute, now settled, we see a very heavy reduction in wages imposed when work was broken. Weekly earnings were very much reduced. Coming so suddenly after a prolonged period of high wages, the workmen were not in a mood to accept it. Their leaders added to the fire by using insulting and abusive language towards the Company, and by leading the men to adopt tactics that recoiled on them. Although provoked by the offensive methods of the Mine Workers, at a time when business was bad, the Dominion Coal Company took every opportunity to show the public that they were ready to adopt any rational means to settle the dispute, hence they willingly agreed to the decisions of two Arbitration Boards, and met the Executive of the United Mine Workers whenever requested. This won public sympathy for the Company, and when the call to save the collieries came the whole country responded. The defiant attitude of the miners met with a definite opposition from public opinion, which has gone a long way to demonstrate that so far as Canada is concerned the Red revolution so much desired by some is not yet feasible. The most re-

result of the dispute to propagate labor politics, and before it ended workmen began to see clearly that they were being used for other purposes than to settle a wage dispute. Once these points were seen, things began moving on the labor camps, and it is the fray the elaborate [illegible] in the U. M. W. contest, we are now confident that the moderates control the situation, in Glace Bay at least. Neither the men nor their leaders are seeing as red as they did, and when the reaction towards sanity is over, it may be possible to see both the miners and their leaders "sitting clothed and in their right minds."

Company Wishes to Co-operate With Union

There is one feature of the dispute that should appeal to all workmen at this time, and that is the patience the Dominion Coal Company showed with the Mine Workers' Organization during the last eight months, when unfair tactics were used and when the threat of bankruptcy was held, like the sword of Damocles, suspended over their heads, unlike the Coal Operators of the United States, they did not repudiate the check-off. They might have done so, for they had just cause. "Striking on the job" and pulling the pumpsmen and other maintenance men out were never tried in the United States, and yet the operators of that country are striking at the vital part of the trades union organization when they refuse the check-off. But the Dominion Coal Company does not wish to retaliate. They desire to have the goodwill of their workmen and prefer to do business with them in the organization they have adopted.

There is now a strong suspicion in the minds of many miners of Nova Scotia. They believe that if agreements making and keeping them poor, but that it cost them the wages that might have been granted under such retroactive agreement. They preached "no profits" and they practised it, and this blindness reacted against themselves, so that when the time to settle up came, they could not in all fairness ask for something they had destroyed.

Long-Term Agreement Satisfactory

Another phase of the agreement is pleasing, and that is the period of time over which it extends:—eighteen months. This gives stability to business and tends towards peace and progress. But the time of the expiry of an agreement has always been a sore spot with the miners of the Nova Scotia. They believe that if agreements were made in May or June they would fare better. There is little to this argument. The geographical position of Cape Breton in relation to the coal market is favorable in the summer season when shipping is unimpeded and unfavorable in winter when shipping has ceased. In order to know how much coal is to be placed on the coal heaps and what organization it is necessary to carry, the Company must make their large contracts before the end of February. They must therefore have their agreements made at the latest in January. If not, then the workmen stand to suffer by short work at a season of the year when it is hardest to live, and the Company has less coal to put on the market when seasonal conditions permit free transportation. A coal pile means wages paid out to workmen without return, and the company is going to pay out two million dollars in wages and take the risk of loss by fire if there is not some market for the coal when it can be moved. Neither the Coal Company nor the workmen of Cape Breton can alter these conditions, and there is nothing about them that is hidden. We have stated before the fact that Nova Scotian coal is competing against coal mined in the United States under entirely different conditions. Besides having many advantages such as thick seams lying level and under thin cover, they have no stocking of coal to do, for they are not ice-bound three months in the year, and can fill their orders as they come in. Cape Breton Collieries are mining coal at a tremendous natural disadvantage and to add others artificially—like making summer agreements—would lead to disaster.

Dr. McKinnon's Good Offices

The new agreement was reached by compromise. The miners insisted on the 1921 rates and the Company refused. The McKinnon Award of 1920 had always been popular with the workmen because the principle of the Award recognized the necessity of helping the lower paid workman. So when Dr. McKinnon, in whom the miners placed implicit confidence, was drawn into the dispute, it was felt that it was as good as settled. He insisted on the spirit of compromise, and with both sides yielding, a compromise was effected. Should this spirit continue to govern the miners of Nova Scotia, it will be most fortunate and the long drawn-out struggle will not have been in vain. Why such fierce hostility should be manifested towards the Dominion Coal Company, which on every occasion has been ready to meet the Mine Workers, is hard to understand. Both the workmen and the Company stand to lose heavily by a continuation of such tactics. Having met each other half way, why, should not this way of doing business continue?

A TALK ON THRIFT

By S. W. STRAUS
President American Society for Thrift

"The greatest of faults," says Carlyle, "is to be conscious of none." No man who has made progress in the world has done so without making mistakes. Errors of judgment and faulty decisions are bound to occur. But progress and success come through learning the lessons that our mistakes teach us. Failure, on the other hand, comes through the repetition of one's errors.

To eliminate mistakes, as the result of the close study of one's personal problems, is efficiency. It is this quality that distinguishes the thrifty man from the man who is thriftless. The latter continues the mistakes of wasting money, time, energies and opportunities. The thrifty man learns in the school of experience that these things mean retrogression. While he makes mistakes, he is personally organized along such lines of efficiency that he is not likely to repeat them. His practices of thrift and self-denial have developed will power and character. Therefore, his mistakes become sources of strength. Instead of millstones about his neck he makes them stepping stones to greater accomplishments.

Do not bemoan your mistakes. If you are a young man or young woman standing today on the threshold of life, do not imagine that you will go through the journey without making mistakes or displaying short-comings. The question of your success or failure in life will not depend on whether you make errors. For you are sure to do this. It will depend on your ability to take advantage of them, to avoid their repetition and utilize them as necessary lessons in the development of character and judgment.

EDITORIAL

The time has gone for running through the woods with a canoe and a pick. We have found our iron ranges, and in large numbers and great size. The question now is: What is in the bottom of them? —*A. B. Willmott*—1904.

THE LABOUR PROBLEM

The various strikes that have interrupted coal mining operations in Canada during recent months have all been settled. Each of the settlements is a compromise, to which numerous factors have contributed. The conflicting interests of miners who want more wages, investors who want higher dividends, and the public who want cheaper and better coal, have been brought into temporary adjustment. It would seem that, of the three parties interested, the public has had by far the worst of the bargain. The public has had no effective protagonist in the struggle, and no advocate in the settlement. Our government departments, who should represent the cause of the public in such a case, are mere administrative organizations, without a public mandate for a purpose such as this. Our political representatives, elected nominally to safe-guard the public interest, are in the main far too busily engaged in grinding axes or in balancing on a fence to serve the true interests of their constituents.

This being the imperfect state of our political and administrative departments, what can be done to effect a settlement of the various conflicting interests that will be a little better than the present temporary measure of compromise? To answer this question would be to solve one of the riddles of modern industrial life. Here we can merely refer to some of the means of alleviating the evil of continuous disagreement that will be applicable to the case in point.

The recent findings of the Scott Conciliation Board in Nova Scotia have brought to the fore once again the importance of proper housing and general living conditions in a mining community. If the miner's wife is comfortable and contented the miners is likely to follow suit. Our correspondent for Nova Scotia has described from time to time a number of movements that tend toward the contentment, as well as the efficiency and prosperity of the miner. The improvement (and even beautifying) of the appearance of buildings, equipment and grounds has a value as yet recognized only by a few discerning ones. Those twin accomplishments, order and thoroughness, can be applied to all work both above and underground with a vast resultant economy, in the long run, of both human labor and material. The miner can by various means be made virtually a partner in the company, sharing in the profits of his labour with the investor, as does the British coal miner today. A dozen other such expedients could be cited; but all lead to the one conclusion.

When all is said and done, so far as we erring mortals can glimpse and then achieve the ideal, *education* sums up the total of our effort. As our expedients conform to the ideal of a sound and lasting scheme of education, they are effective; if they are merely stop-gap compromises, confusion worse confounded is bound to follow. Our problem, then, is to obtain a clear vision of the ideal toward which we must aim, and to formulate a comprehensive and well-founded plan of action that will result in so educating our workers that they likewise will glimpse the ideal and work with us toward it. This may be considered rather a lofty view to direct the settlement of ever-recurrent labour disputes; but we are convinced that any practical ideal less lofty will lead to no good and permanent solution of our problem.

We are glad to hear that Mr. D. H. McDougall is to bend his energies to a study of the labour problem in Cape Breton. Mr. McDougall is a rational human being, as well as an accomplished executive and a gentleman. We are satisfied that if he applies his talents to this, the most serious problem that confronts his Company, as it does our whole Dominion, the result will show time and energy well invested.

THE USE OF ALBERTA'S COAL

It is estimated that one sixth of the world's available coal is to be found in the province of Alberta. How easily some, at least, of this is available, we illustrate today on another page. Just at present the chief trouble with Alberta's coal is that there is too much of it—it is so easily and cheaply developed that it is hardly worth the miner's trouble to put it on the cars. The population of Alberta is sparse and scattered, and the mountains, themselves well provided with coal beds, on one side, and the vast extent of plain on the other prevent the shipment of fuel to distant markets that would readily take it at anywhere near the pit mouth price.

These vast deposits of coal have for a generation past been the subject of vague speculation usually projected into the centuries to come. It has been predicted that in the years to come the prairie lands will become thickly populated, and will even grow to be the centre of popu-

lation for Canada. With this there will come naturally an industrial growth, based mainly upon the supply of coal.

These conjectures seem logical enough; but we should like to evolve some ideas of more immediate and more practical interest. How can the coal operators of the province of Alberta find a more extended market for their product? How can they change the present seasonal demand for coal as fuel into a demand that will keep their miners and plants busy all the year round? This problem has been faced at one time or another by almost every coal field, and in many instances the solution has been found in the establishment of a metallurgical industry, more particularly of an iron industry.

Of merchantable iron ore, Alberta has at present none discovered. This is not to say that none will be discovered as the search proceeds. But even if iron ore of the proper grade and in sufficient quantity were now available, it is a question whether an iron smelting and steel works could be worked profitably under the present conditions. This is a matter that must be left to the decision of those well versed in the commercial aspects of the case. Meantime we can look at some of the outstanding facts.

Alberta is far removed from any centre of production of iron and steel, and pays dearly for both semi-manufactured and manufactured iron products by reason of these great distances. Conversely, the expense of transporting her own products, almost exclusively agricultural, to these distant markets is so great that the profit is correspondingly small. It seems probable that, were commercial iron ore found in a suitable location in Alberta, this very fact of comparative isolation and the enhanced value of imported materials would provide a chance for successful operation. Even a small plant with a diversified production might succeed under these favourable circumstances. Once established, such a plant would create the conditions essential to its further progress, as has been demonstrated so clearly in the great and growing central industrial area of the United States. Even a small industrial population would provide a more lucrative market for agricultural products, which would induce more intensive cultivation and thicker settlement, which would again provide a better market for the smelter and mills; and so on for generations to come. The problem is how to initiate this cycle of progress.

The only iron-ore deposit of any dimensions known at present in Alberta is in the form of beds of titaniferous ore extending northward from the railway at Burmis, near Blairmore. These are, apparently, rather extensive, though their content of that bug-bear, titanium, has prevented their thorough exploration. It is possible that advances in ferrous metallurgy may bring such ore into the market, when the proximity of these deposits to first-class coal may make them of commercial significance.

Elsewhere in Alberta, the chief chances for finding iron ore would appear to be in the long strip of Palaeozoic and late pre-Cambrian rocks that compose and fringe the Rocky Mountains on their eastern side. All this area is within easy reach of good coal, though all of it is not yet within reach of a railway. It is in these early geological horizons that iron-ore deposits are most likely to be found. There has not yet been discovered in Alberta the association or iron-ore with the coal measures that has proved of such utility in Britain.

We believe that this iron-ore question, and its concomitant, the question of an iron industry, is well worth the close attention of Albertans, particularly of those Albertans interested in coal mines. The time may be ripe now for a thorough investigation, if not for the establishment of a commercial plant.

AMERICAN INVESTMENT IN CANADIAN MINES

From the beginning, the mineral industry of Canada has been indebted in large degree to the good offices of neighbours from the United States, both investors and technical men. On the whole, the operations of these friendly neighbours have been successful, and have benefitted both themselves and Canada. This is attested by the present mineral industry of British Columbia, initiated almost completely by Americans, and by the success in Ontario of such concerns as the International Nickel Company, Nipissing Mines, the Dome, and in Quebec, of a number of the Asbestos quarries.

At the beginning, however, the attempts of Americans to develop our mineral resources, particularly in Ontario, were just a crude and failed of success just as frequently as have those of a certain part of the succeeding generation of Canadians, whose futile efforts still continue. The gold boom of Ontario, twenty to twenty-five years ago, left a hole in many an American pocket-book, and blasted the hopes of many a would-be miner from across the border. What we wish to emphasize now, by contrast, is the rational basis for mining investment now adopted by those of our neighbours that are still actively interested in Canada—and interested to a growing extent.

Of late years, and particularly quite recently, the flow of money northward across the border for the purpose of developing Canadian mineral areas has been directed principally by men well experienced in mining. The consequence has been that, in due time, the tide has turned, and the in-flow of money accruing from these investments has yielded a very handsome return. In fact this return has proved to be so satisfactory that these same mining investors are searching, consistently and continuously, for opportunities of re-investment in Canadian mines, and their numbers are being augmented by many investors new to Canada. This speaks well, not only for our mineral resources, but for the discretion with which these investors have applied their money.

We Canadians may well study the methods by which our neighbours have built up this remunerative mining business in our midst. We are, roughly, about a generation behind them in mining experience and can profit not

only by their mistakes, to avoid them, but by the sound methods they have worked out, to emulate them.

The first and obvious point about these operations is that stock-jobbing has no part in them. The initial risk is assumed altogether by men that can afford to lose all they have invested, and as they are usually men of considerable means, a syndicate of workable dimensions can provide a very large sum for development work. Once a paying mineral deposit of large dimensions is proved, then it is sound policy to let the public participate in the venture, even if only to a small extent. This is the principal reason that so many sound mining concerns that began as syndicates are now public companies, with stock listed on the exchanges. A lesser use may be made of a profitable mine, through the stock exchanges, but with that we have no concern just here.

Another prominent feature of this well organized work of exploration and development is that only well trained and competent engineers are entrusted with the expenditure of the large sums of money available. It is evidently a hard lesson to learn that a miner, just as a doctor or a lawyer, must be not only carefully trained, but well-seasoned by experience before he can be entrusted safely with the administration of a responsible position. We Canadians still employ far too many misfits, irresponsible enthusiasts, and demonstrable fakers in our mining industry.

Gradually the efficient type of mining investor is coming to the fore in Canada. We have a number of men who have made fortunes in mining, and are reinvesting in the same and well ordered way that is bound to bring a good return. But these men cannot by any means grasp all the opportunities offered on the mining lands of our broad Dominion. We need the aid of outside investors of the right stamp. It is a great satisfaction to find that the mining investors of the United States who are seeking opportunities in Canada are overwhelming numbers are of the genuine sort that will assist in establishing and retaining the high ideals of our mining profession.

A POLITICAL EXECUTIVE

Shortly after the members of the new cabinet gathered in Ottawa last winter, one of the associates of the Honourable Charles Stewart, Minister of Mines and various other natural resources, remarked that he was "the pick of the bunch". This was after the two had had a month's hard work together. Mr. Stewart's subsequent activities have done much to justify this conclusion.

It is positively a treat to have in charge of the Department of Mines in Ottawa a man who not only is thoroughly interested in the administration of his Department's affairs, but is taking an active part in examining the natural resources for which he is responsible to his country and is likewise working out sound and practical expedients to direct and control their use. Mr. Stewart brings to this task the wide vision, the sound judgment and the energy of a business executive of first rate capacity. We see no evidence that he allows political tinkering or trimming to interfere with the prompt and business-like discharge of the duties he has assumed at the behest of his countrymen.

It is high time that we Canadians showed a more definite and decided appreciation of public service such as that now being rendered by Mr. Stewart. We have become so inured to the false coin of talking, trimming and political tattle that we are almost ready to let it pass current for gold. Here we have a man, high in our public service, who values the truth, and is not ashamed to own it; who is ready to make a decision, and then to act upon it; who puts the public interest above private gain. We of the mining industry may well be proud to have such a man representing our interests in Ottawa. Let us, individually and collectively, make it known that his are the qualities that the men of the mining industry require of a political administrator.

EDITORIAL NOTE

Today we quote the conclusion of a practical field geologist about the iron ranges of central Canada. Though Mr Willmott made this statement eighteen years ago, it applies almost with equal force today. Since that time a good deal of money has been spent on the exploration of the iron ranges, but the sum is not at all commensurate with their extent. It is easy to be wise after the event; but a good deal of the money and time was spent injudiciously, where there was little or no hope of finding commercial ore bodies. There still remains, as we are told on most competent authority on another page, a chance of finding such ore bodies in ranges and parts of ranges still unexplored. This merits the serious attention of those interested in iron ore, and especially of those in Canada who are now drawing their supply of ore from the United States. The advances in geological science make it possible to explore for such ore-bodies in a much more rational and economical way today than was the case even a few years ago.

PASSIONATE PLAINT OF THE PUBLICITY SHUNNING MINING ENGINEER

I've seen his name in print
Id nauseam and *ad infin*
That I'm as good as he,
Don't matter one small pin
He gets the early worm,
The late one, too, I ween,
And I would judge he gets
Most those that come between
How does he turn the trick?
How does he bag the prize?
The answer simply is
The blighter advertises!"

ANON

Ring The Bell

Twenty-odd years ago gold mining in Nova Scotia had fallen into a state of innocuous desuetude. There were those who still believed in its possibilities; there were also those who were willing to implement that belief by spending money, and there were, as always, those who were more than willing to spend other people's money. Yet there was then, and I believe there is yet, a sturdy, practical, minority holding fast the conviction based on hard experience, that certain areas in Nova Scotia's gold fields would respond to the right kind of development. This small minority was made up of workers who rarely, if ever, blossomed into print, and who, indeed, for the most part preserved a silence induced by disappointment and disgust.

When, in the year 1904, Mr. T. A. Rickard made his report on the industry for the Provincial government and when that report was—well—not exactly suppressed, but certainly not given publicity to any large or varied extent, Nova Scotian gold mining received what is known amongst Mr. Dempsey's friends as a "technical knockout." Its supporters, however, did not throw the sponge in the ring. Unfortunately, also they didn't do anything else. Hence a once possible contender is still weaving round the squared circle in a lamentably groggy condition, with no referee on hand to prevent further punishment. It is high time that someone interfered.

* * *

The present writer firmly believes that, were Mr. Rickard to report on Nova Scotia's gold mines to-day, his conclusions and recommendations would be different in tone and, perhaps, more encouraging than those of his former report.

The last eighteen years have brought phenomenal and radical improvements in mining and milling practice. During this period also, the mining geologist has sprung into existence. And it is an acknowledged fact that Mr. Rickard did not pretend to make an exhaustive investigation of the whole field, nor, indeed, was he asked or expected to do so. It is not logical, therefore, to accept his diagnosis as the final word. Mr. Rickard himself would be the first to concur in the statement that no responsible engineer could formally and finally damn Nova Scotia's gold districts unless he had spent years in each of them.

The present Provincial government has held the reins for many, many years. Unlike the average long-lived government, its tenure of power seems ever firmer now than it did in its youth and middle age. Its revenue is very largely derived from mining (not gold mining). The areal and general geology of the province has been well attended to by the Dominion Geological Survey. With ample material at hand and the world hungry for gold, Premier Murray and his colleagues have much reason to do their best to galvanize into life an industry that, though now pernicious-anaemic, may need only an infusion of the same life-giving current that it once supplied in plenty to the Provincial coffers.

Whatever one's point of view may be, a 90 per cent. disability member of the industrial household is no blooming asset. Hook-worm, sleeping sickness, low vitality, incipient t. b., are all amenable to proper treatment.

The compiler of the Annual Report of the Nova Scotia Department of Mines is hard put to it to fill a few tenuous pages with notes concerning gold mining.

It would be a bold and telling stroke for the essentially paternal Murray government to remove the semi-unconscious fighter, have a searching medical examination followed by a modern course of training, and then place him in the ring to meet his fate with some little chance of breaking even. This fighting at "catch" weights isn't all its cracked up to be. One of the contenders in the encounter of 1904 hadn't a look-in from the first.

The moral is plain, in spite of very badly mixed metaphors. Death and burial are more to be desired than vacillating doubt. The present state of affairs is tantamount to lingering homicide. Anything else were better!

CAPRICORN

COAL PRODUCTION IN UNITED STATES

The United States Geological Survey reports that, instead of the 9,400,000 tons suggested by the first reports, final returns on soft coal production show only 9,142,000 tons in the week ended September 2. The record of the week was awaited with interest as an indication of the supply to be expected after general resumption of mining under the Cleveland agreement. In the present week (September 4-9), because of the Labor Day holiday, the output can hardly exceed 8,700,000 tons.

Production of anthracite, though expected shortly, has not yet been resumed.

The limiting factor in the supply of soft coal has now become transportation. It is true that some thousands of miners are still on strike, notably in the Connelsville and Kanawha districts, but the tonnage offered for shipment by the other mines at work will absorb the available transportation facilities. The demand for coal is active and prices are high. Under such conditions coal is offered for shipment up to the limit of the ability of the railroads to transport it.

The present rate of production is 9,600,000 tons a week. In the corresponding period of 1920 the average was 11,750,000 tons; in 1919, 11,340,000 tons; and in 1918, about 12,800,000 tons. The present rate of soft coal movement, even with priority in use of open-top cars, is therefore 25 per cent. below 1918, 15 per cent below 1919, and 18 per cent below 1920.

The value of the silver mined in Mexico from the first years of the Spanish conquest — 1521 — to January 1922, reached the enormous total of 6,000,000,000 pesos, or $3,000,000,000 in American currency, according to figures made public by the Mexican Embassy, London, state Samuel Montagu & Co., in their weekly letter on bullion. Considered by weight, Mexico has produced somewhat more than 155,000 tons of silver. Over the four-century period the annual production has averaged 40,000,000 pesos; since 1900 the average has been 74,000,000 pesos; this includes the ten year revolutionary period of 1911-21, when silver mining activities were greatly hampered, and in some instances entirely arrested. Now that the country is in a more peaceful state, it is expected that production will mount to new high figures.

Hollinger A Golden Machine Gun

Commanding the Position and Making its own Precious Ammunition

By ALEXANDER GRAY

Having been accorded access to current operating results of the Hollinger Consolidated Gold Mines, with the figures before me, I am reminded of the not always sage counsel: "Git a' plenty whin y'ir git in"

That sort of a thing can be done—and overdone—but with Hollinger it almost seems as though it is being undertaken according to the plans for larger milling capacity. This fact, together with the production at the Dome and McIntyre, as well as the no less satisfactory developments throughout the Kirkland Lake areas, where "big" money is busy, make the Gold Fields of Northern Ontario more than ever magnetic.

Porcupine's three milling companies are making wealth at the rate of over $1,500,000 per month and Kirkland Lake's five producers are of increasing interest, not only by reason of their advancing output but because of the positive proofs that values are improving with depth.

As results and the 4000ft quantities are the basis of credit it is to be expected, therefore, that the advent of Nipissing and Continental Mines at Kirkland will lead to more rapid development. Nor are the areas adjacent to Porcupine being overlooked particularly those of the Pearl Lake section and wherever the shear zones are prominent, east and southwest of The Dome.

Kirkland Lake, owing to the decision of Nipissing to investigate other areas further east from Gull Lake and of Continental Mines to hasten their exploratory work, has all the incentive required in such a demonstration as the following affords:

Hollinger July-August Figures

	Four Weeks To July 15	Four Weeks To August 12
Tons Milled	120,095	119,672
Gross Value	$992,949.43	$1,058,812.33
Value Recovered	954,677.71	1,018,200.97
Average per ton	$8.26	$8.85
Profit	$517,895.82	$ 536,122.02
Average tons milled per day	1,289	4,274

Taking the gross value of the 239,767 tons milled in those two four-weekly periods, it is evident the Hollinger company has been mechanically shooting golden bullets at the rate of $21.52 per minute. The results illustrate the significance of the homely aphorism, "Git a' plenty whin y'ir gittin' ".

This left the Hollinger Company with this exhibit for the eight four-weekly periods beginning January 1st and ending August 12:

The Year to August 12

Tons Milled	120,095	119,672
Gross Value		$7,918,694.67
Value Recovered		7,642,433.80
Average Value		$8.75
Profit		$4,089,287.28
Surplus		$6,027,297.02
Tons Milled per day		4,040
Average Cost per ton		$4.37

As the profit earned in the eight periods was over 16 per cent. on issued capital, it remains to forcast the outlook for the year as a whole. Assuming the tonnage milled during the remaining five periods will equal that of the four weeks of August, then the total crushing for 1921 will be 1,503,257 tons. If the same average grade is milled, then the gross production should be $13,112,904, and the total recovery $12,733,115.

Significance of Larger Operations

Hollinger operations provide their own dispensary. When the greater mill is ready, relative economies will be in effect and the entire North Country will have the benefit of its influence. It has been foreseen that larger areas will protect milling requirements for many years. Dome Mines adopted early the policy of merging and its acreage is all sufficient. McIntyre is a group. It is no disparagement to say so, and perhaps it could not have been done otherwise. But Kirkland Lake's producing properties might have prospered more quickly had there been combination and centralized milling. In a sense, the smaller companies

"The Golden Stairway"

Since the exciting days of Cobalt, there has been no picturesque talk of sidewalks. "Silver Sidewalks"—probably they proved slippery. Momentarily there was a "Golden Sidewalk" at the Dome. Perhaps, therefore, this Golden Stairway is in order in view of what is transpiring at Porcupine, Kirkland Lake and elsewhere.

1911	$ 5,414,486
1912	4,558,518
1913	5,059,767
1914	8,501,393
1915	10,839,254
1916	5,695,748
1917	8,209,489
1918	10,451,700
1919	13,836,913
1920	14,934,082
1921 (estimated)	12,000,000
Total	$107,606,673

While 53¼ per cent. of that has been produced by the Hollinger Company, 11¼ per cent. has come from Dome Mines, and nearly 13 per cent. from McIntyre. The showing made by Kirkland Lake does not measure up to that of the older Porcupine Camp but its mines were caught in War-time cross-currents and the mishaps attending initial operations in most fields were here discouraging to capital until the real potentialities of the producing and prospective sections became apparent. It is pertinent to emphasize in this connection that Kirkland Lake to the end of 1922, notwithstanding delays in development and the small mills, will have produced three times as much gold as was reported for the whole Province of Ontario prior to 1911.

the more popular and no less beneficial; yet the tendency is toward the elimination of duplications. Therein is the future assured, for if lean sections do not suffice, combined sections are more apt to make up for the deficiencies.

Kirkland Lake, therefore, is likely to be the scene of greater milling plants, such producers as the Wright-Hargreaves, Lake Shore, and now the Teck-Hughes, having indicated the possibilities of those fields. Should the Nipissing Company find what it is after (and it is sincerely hoped it will) friendly rivalry between it and the Continental Mines for milling supremacy would be worth more than "big days" on Mining Stock Exchanges. Were Custom Mills the vogue in the North Country, there could be a chain of producers. Failing that, the presence of Nipissing and the Continental people in Kirkland Lake may balance the odds now in favor of the senior camp, with its Hollinger, Dome and McIntyre.

There is pollen for a good many ventures in the producing areas. Competition such as now is being displayed, reinforced with capital provided by those who can afford to play with it, is making the Porcupine and Kirkland Lake fields more than light-weight speculators comprehend.

Along with this is the unique record of Hollinger. If the prevailing market price of Hollinger is availed of, each 100 shares purchased at $5 has enabled the owner to pocket $1,850 in dividends and $5,000 in the market.

However, that is dangerous ground — and only "the rich — they ride in chaises".

Dome's Record to Date

While commenting on Hollinger's record it is interesting to note what Dome has done to date. The Dome Mines have paid $2,844,259. in dividends and $473,431 return of capital — $3,317,690 in all. This is 97.6 per cent. of the original capital issued.

Some Mines and Prospects of the Coast Range

In the course of his summer's field work, Wm. M. Brewer, Resident Mining Engineer with headquarters at Nanaimo, B. C., has made an inspection of parts of the Coast Range region on the southern mainland coast of the Province. He paid particular attention to ore occurrences and is of the opinion that this section offers considerable opportunity to the prospector and mine operator. In a brief and interesting account of the Coast Range Mr. Brewer says:

Reginald Aldworth Daly in Memoir 38, *Geology of North American Cordillera at the Forty-ninth Parallel*, states: "In British Columbia the late Dr. Dawson adopted the name of "Coast Range" to enforce the view that the granitic schist of British Columbia Mountains on the seaboard should be distinguished from the lava-built Cascades as originally named at the Columbia River, and that name, "Coast Range," has survived and is in fact the only name officially approved by the Geographical Board of Canada for any principal division of the Cordillera."

Geological Reports

Practically the only work reported on the Coast Range by the Geological Survey is in Memoir 23, *Geology of the Coast and Islands between the Strait of Georgia and Queen Charlotte Sound, B. C.*, by J. Austen Bancroft, Canadian Department of Mines, Geological Survey, 1913, and the report of Dr Charles Camsell on his reconnaissance along the line of the P. G. E. Ry. published in the Geological Survey Summary, 1917. In describing the extent of the Coast Range, Mr. Bancroft says as follows:

"West of the Interior Plateau the rugged Coast Range borders the Pacific Ocean for a distance of 900 miles, extending in a N. N. W. direction from the Fraser River valley on the south to the head of Lynn Canal. It continues northward, passing behind the St. Elias Range of Alaska, where it gradually blends with the Interior Plateau at Lake Kluane in longitude 138° 30′ near the boundary line between the Yukon Territory and Alaska. In southern British Columbia these mountains maintain a width of about 100 miles, which diminishes to about 50 miles at the Lynn canal. It is not, however, easy to assign definite boundary lines to them, for they shade off into Interior Plateau conditions on the east, and are closely related in their geological and physiographic developments to many of the Islands on the Pacific Coast. The length and breadth of this range is coincident with the main portion of the great series of batholiths, composed of granites, diorites, gabbros, etc., of remarkably uniform texture, which were intruded probably during late Jurassic time."

It has only been within the last few years that the Coast Range has been visited to any extent by prospectors. This is accounted for by the fact that geological maps of the western part of British Columbia show the Coast Range to be made up of a great mass of eruptive rock, mainly granodiorite, forming a belt from 60 to 100 miles wide, which gave prospectors the idea that there was little to be gained by attempting to explore the Granite Mountains.

Dr. Camsell "Discovers" Coast Range

However in 1917 Dr. Charles Camsell, the present Deputy Minister of Mines at Ottawa, made a reconnaissance along the line of the Pacific Great Eastern Railway, which practically cross-cuts the mountain range. He described the conditions there as follows:

"In the section across the Coast mountains along the Pacific Great Eastern railway such a simple condition does not exist, but instead there are several broad bands of stratified rocks—schists, quartzites, argilites and limestones,—which lie in the granodiorite and are intruded by it. These bands are remnants of the old cover of the granodiorite batholith, which were not destroyed at the time of intrusion nor removed by later erosions. They all strike parallel with the trend of the range, and, consequently their greatest dimension is in a northwesterly direction and their shortest along the line of railway. The contacts of these bands of stratified rocks with the granodiorite are all more or less mineralized. The lateral contracts are mineralized mainly by copper ores, and on the roof contacts, that is where the batholith plunges northwesterly or southeasterly under a roof of stratified rocks, the mineralization is often by the more precious metals.

"The significance of the discovery that large bands of sedimentary and other stratified rocks lie in what was formerly supposed to be nothing but a mass of granodiorite in the Coast mountains is far-reaching, and it is only fair to assume that the other sections through these mountains northward to the Yukon boundary will reveal the same conditions to a greater or less extent. The conditions are most favorable for the occurrence of

metallic deposits of copper, lead, zinc, gold and silver and the whole interior of the Coast mountains of British Columbia therefore becomes an excellent field for prospecting, and not only the eastern and western borders as was formerly believed to be the case."

The First Prospects

The earliest prospecting work recorded in the Coast Range is near the head of Salmon Arm of Seechelt Inlet, where copper ore of bornite variety was discovered in the early seventies, the prospects were known as the "Howe Sound" mine and worked for a time, the ore being brought down the mountains by Indians and some of it shipped to Swansea. The next prospect recorded was on the easterly boundary of the granodiorite batholith near the town of Hope at an elevation of about forty-five hundred feet, where the ore carries principally silver values and occurs very near the contact between the granite rock of the Coast Range and the older sedimentaries of the Interior Plateau. Ore from this prospect, know as the "Eureka" mine, was also carried down the mountain and some of it shipped to Swansea. Both the groups of mineral claims mentioned were owned by Victoria syndicates.

As far as the records show, prospecting on the Coast Range was practically abandoned after the location of the two properties referred to, until 1897, when a party of trappers discovered copper ore on Britannia Mountain about three miles from Howe Sound. Another party discovered copper ore on Hidden Creek, which empties into Observatory Inlet, an arm of the Portland Canal, about six hundred miles in a northwesterly direction from Howe Sound. Both these occurrences of copper ore occur in schist country rock of the type described by Camsell as the remnant of roof pendants.

The next prospecting operations to be carried on in the Coast Range were in the vicinity of Shoal Bay, Phillip's Arm and Frederick Arm, distant about 130 miles northwesterly from Vancouver. It was in this section that gold-bearing quartz veins were discovered, occurring in bands of highly altered stratified rocks.

The "Dorothy Morton", "Douglas Pine," "Alexandra", and "Blue Bell" groups of mineral claims represent some of the prospects on which considerable development work was done, and from the "Dorothy Morton" some ninety thousand dollars in gold and silver bullion was extracted in about eleven months, between December, 1898 and November 1899, when the property was closed down. Work has never been resumed.

Recent Prospecting

In the southerly portion of the Coast Range that is between the Fraser River on the south and Seymour Inlet, opposite the north end of Vancouver Island, a few prospectors have been continuing work diligently during recent years. The result of their work is the discovery of a number of bodies, such as the "Lucky Four" in the Choam Range just south of the Fraser River and about twenty miles east of the Town of Chilliwack. In the "Lucky Four" group the country rock formation is very similar to that of the Britannia mine, but the ore is high-grade chalcopyrite. In addition to the mineralized zone known as the Britannia belt, copper sulphide ores have been discovered on the following groups of mineral claims north of the Fraser River. The "Attorney," "Opporgol" on the easterly side of Howe Sound near Whytecliffe, "Horseshoe" on the westerly side of Howe Sound nearly opposite the Britannia mine, "Brue", "Contact", "McKinnon", and "Radiant" on Ray Creek, a tributary of the Stawamus river near Squamish, "Bowen" on Bowen Island.

From Ray Creek a band of altered stratified rocks consisting of schists, andesites, argillites and some limestone extends more or less continuously in a south easterly direction to the valley of the Indian River, which stream empties into the head of the north arm of Burrard Inlet. In these stratified rocks there are several occurrences of copper ore. The mineral claims on which all these prospects occur have been acquired by the Britannia Mining Company, except the "Bullion-dale" and "Belle" groups near the head of Indian River.

Numerous Copper Prospects Located

Along the line of the Pacific Great Eastern Railway in the vicinity of Brew and Mons Stations there are several chalcopyrite deposits, the most prominent of these being the "Fitzsimmons", "Summit", "Green Tree" and the "Alpha" groups. There is also a deposit of bog iron ore or limonite which occurs near the north end of Alta Lake.

Travelling up the Coast to Jarvis Inlet, copper sulphide ore occurs near Egmont Point, also at the head of Narrows Arm on the Zyoone River, as well as near the head of Salmon Arm, the last having been already referred to as the result of the first prospecting in that section.

On Treasure Mountain, near Vancouver Bay on Jarvis Inlet there are extensive deposits of low-grade copper sulphide ores associated with magnetite, while on the opposite side of Jarvis Inlet about six miles from the mouth of Britain River, outcroppings of high-grade chalcopyrite occur and several mineral claims have been located, known as the "Little" group. At the head of Hotham Sound, an arm of Jarvis Inlet, on the easterly side near its entrance, there are several outcroppings of copper sulphide ores on some of which considerable development work has been done.

In the mountainous country between Powell Lake and Theodosia Arm bands of altered sedimentaries occur in which are found copper sulphide ores carrying low values in gold and silver. On Goat Island in Powell Lake outcroppings of ore of the same character also occur, and similar conditions exist in the mountains adjacent to the Olsen River, as well as near the foot of Powell Lake.

Between Powell River and Lund, deposits of ore in which the chief mineral is zinc occur and have been developed to some extent.

Magnetite, Limestone and Gold

On the northerly part of Redondo Island facing Pryce Channel, there are deposits of magnetic iron ore and limestone of considerable extent, the limestone being quarried for use at the pulp mill at Mill Creek at the head of Howe Sound. On Fanny Bay, Ramsay Arm, there is a deposit of galena and zinc blend. In the vicinity of Frederick and Phillip's Arms, off Cardero Channel, occur the gold bearing quartz veins already referred to, while on Thurlow Island south from Phillip's Arm the "Dawn" group of mineral claims is located, the ore carrying gold and silver values in quartz gangue. Portions of this ore-body carry about 1 oz. in gold and 8 oz. in silver to the ton. Northerly from the last mentioned occurrences near the head of Knight Inlet there are bands of altered sedimentary rocks which have been intruded by the Coast Range granite and in these sedimentaries are found ore bodies carrying chiefly copper sulphide ores.

Between Knight Inlet and Seymour Inlet the entrance of which is on the southerly side at Queen Charlotte Sound there has been but little prospecting done to the present time.

At the head of Seymour Inlet there occur deposits of magnetite of considerable extent.

Coal by Steam-Shovel

We are now well accustomed to the idea of winning iron ore by steam-shovel from open pits; operations on the Mesabi Range of Minnesota have demonstrated its feasibility for two decades. To mine coal by the same up-to-date method is an occurrence well worthy of remark. Dr. D. B. Dowling, of the Dominion Geological Survey, has recently inspected such a coal quarry, and from him the following data have been obtained. Dr. Dowling has spent half a lifetime in studying the geology of the plains and hills of Alberta, and is Canada's specialist in the economic problems of the mineral industry pertaining to that area.

Discovered in Railway Cutting

Bassing, Alberta, 150 miles west of Edmonton on a branch line of the Canadian National Railways, is near the western edge of the huge area of coal-bearing rocks that underlies such a large part of the province. Along the outcrops of the coal-bearing strata there are a number of coal mines. One of the latest there is the Sterling Mine, here described. The coal was discovered accidentally during the construction of the railway, having been exposed in a cutting. It has now been exposed over a considerable area and is being operated consistently.

The coal seam occurs in rocks of Upper Cretaceous, or possibly Tertiary, age. It is a fairly good bituminous coal, being graded as a light steam coal. Essentially it is of the grade best suited to domestic use, but it has been used successfully on the railways during the past summer. No miners are required to win it—only steam-shovellers—so that its operation was not affected by the recent strike of coal miners.

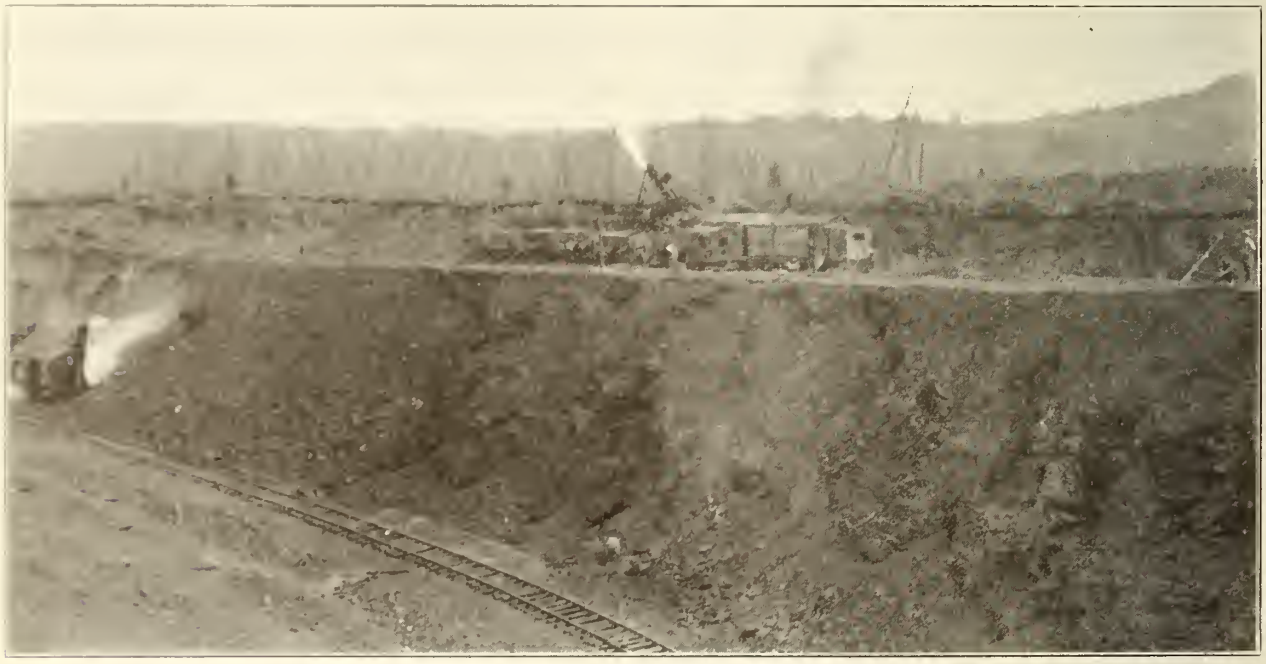
Geological Occurrence

As at present exposed, the bed of coal has an unusual thickness, illustrated in the accompanying sketch. It is covered by a mantle of glacial drift (boulderclay) to a thickness of 15 to 20 feet. This has been stripped sufficiently to disclose a large area of the deposit. A number of bore-holes have been put down to determine the size and limits of the seam, with a result approximately as shown in the sketch. The 90 feet of coal measured vertically beneath the railway track is a maximum it is not expected will be attained elsewhere.

This great thickness of coal is obviously not due to a natural deposition of coal-forming materials. Its origin is suggested by the nearness of the foot-hill of the Rocky Mountains, and a brief geological reconnaissance has confirmed the view that a crustal movement has caused a lateral compression of the original coal bed, with a consequent increase in thickness. It seems likely that a thrust fault at or near the present land surface has caused an overlapping of the hard strata that lie beneath the coal. As coal is much more fluid under pressure than is the rock, instead of being faulted it yielded to the force by flowing, thus assuming its present shape. Numerous well-determined examples of an increment in thickness by this means are available to support this idea.

Twenty-foot Bench of Coal

The coal is being won at present by means of two steamshovels, one to remove the overburden and the other to load railway cars on the level below. A bench of coal twenty feet in depth is now being worked. As shown in the accompanying photo, the coal, after being loosened with explosive, is simply shovelled into dump cars, hauled to the tipple and, after being screened, loaded into cars on the railway siding.



Steam Shovel Above, Removing Overburden; Below, Loading Coal.

The Geology Of Ontario's Iron Ores

DISCUSSION AT CONFERENCE ON IRON ORE IN TORONTO

By C. W. KNIGHT and W. H. COLLINS

At the conference on Ontario's iron ore problem, convened on July 5th last in Toronto by Hon. Harry Mills, Minister of Mines, the geology of the Province's iron ore deposits was discussed briefly, first by Mr. C. W. Knight, Assistant Provincial Geologist, and then by Dr. W. H. Collins, Director of the Geological Survey, Ottawa. Their remarks follow:

Mr. Knight's Address

This is rather a large question. I understood from Mr. Gibson he wanted me to say something about the geology of the iron ores in our Province, but this would be like bringing coals to Newcastle. In Ontario we have what is known as the Keewatin series. Unfortunately, the Keewatin series in the United States has not been attractive. The Animike is the main series in the United States, and in it is found the great Mesabi range which has produced about 73 per cent. of the ore of that country. This series in this Province is only two hundred feet thick, and strikes from Loon Lake to the American boundary. In the United States this series is from seven hundred to one thousand feet thick.

Just a word as to the character of the Keewatin ores and the Animike ores. The Keewatin ores are very much altered. They are practically all magnetite, but some are hematite, and they are found largely standing in vertical positions. The Animike rocks are flat lying. It has often been asked why it is that we have so many ores in Ontario which have not been concentrated, while across the line we have these valuable ranges. I think the two men who know more about this than anyone have probably given some of the best reasons. They think the glaciers must have scooped away these ores except in certain spots, the Helen Mine being an instance of the places that escaped the glaciers. That seems to be one of the main reasons why we have not got these ores. Another reason probably is that the structure of the iron formation in this Province has not been the same as in the United States, and also the rich character of the ores themselves is different. The richer ores are found by exploration under the drift and also through the rock, and in this regard our iron formations have not been properly prospected.

Dr. Collins' Address

It seems to me that the question of an adequate iron ore supply for the upkeep of Ontario's iron and steel industry should be considered under two heads: ores that may be considered as primary, that is, ores that were formed in their present state at the time they were laid down; and the concentrated and enriched ores that have formed from these primary ores at some later time. It is to this second class that attention should particularly be directed by the prospector if a supply of ore is to be obtained without resorting to beneficiation. I am perfectly in accord with what Mr. Knight has said about the desirability of further prospecting certain of our primary iron formations for secondary enrichments.

We may group all our known iron ores into six types. The oldest, the Keewatin, is very widespread. We find it all over Northern Ontario, from the extreme west to the east, and as far south as Georgian Bay. This Keewatin iron formation might again be divided into two types, the banded silica and magnetite type, and the second one, really very closely related to it, the carbonate type, which is particularly characteristic of the Michipicoten District. The banded silica and magnetite type is of widespread occurrence. One finds a fairly good inventory of these deposits in the publication known as "Iron Ores of Canada" issued by the Mines Branch of the Federal Department of Mines. It is perhaps sufficient here to say that a good many of these deposits are so extensive that you can conservatively estimate their available contents in tens or hundreds of millions of tons. The only trouble is that they seldom run over thirty-five per cent in iron content and the silica content is too large for satisfactory blast furnace treatment.

Carbonate Ranges Insufficiently Explored

Carbonate formations are more promising sources for secondary concentrations. They consist on one side of banded silica and either carbonate or some form of iron oxide, and on the other side of a carbonate which is really a mixture of iron, lime, magnesia and manganese, scattered through which is a small percentage of pyrite and pyrrhotite. The pyrite, in the presence of oxygen and moisture, forms sulphuric acid. The acid drives off the carbon di-oxide and transforms the carbonate into iron sulphate. This sulphate when carried below ground water level reduces to oxide and becomes thus converted into hematite. The Helen iron ore is a sample of this secondary type of concentration, as are also the Josephine and the Frances. Now I might say that these carbonate formation ranges extend for many miles in the Michipicoten district, and also east of Lake Nipigon. Only a very small percentage, perhaps not more than ten per cent. of the linear extent of these ranges has been adequately prospected for secondary concentrations of the Helen type, which is an excellent ore, running about 55 per cent iron. The primary carbonate, or siderite, was itself mined at the Magpie mine and roasted to drive off the carbon di-oxide and sulphur. The roasted product constituted an excellent ore carrying about fifty per cent iron, no moisture and lime magnesia and silica in proportions that required very little additional fluxing materials.

There is a third type of iron ore deposit, in one of which Mr. Leitch is interested. Iron formation of this type occurs east of Lake Nipigon, and in the Lake Savant district in the northwest corner of Thunder Bay district. This type of deposit consists of a greywacke or hardened mud interbedded with layers of iron ore, in the form of hematite and magnetite. Iron formations of this type do not ordinarily contain more than forty per cent of iron, and they are highly siliceous and do not furnish in the natural state an ore suited for smelting. In their present state the iron oxides are not in suitable mineralogical form for natural concentration. If natural concentration has taken place, it was a long time ago, and the search for concentrations is going to be a difficult matter that will require all our available resources for examination.

Iron Ore in Animike Formation

The next type is the Animike formation, which in the United States has produced the great Mesabi deposits. We have this Mesabi type of iron formation, although

thinly, in two places. One of these has just been mentioned by Mr Knight, in the Port Arthur district. Another one not belonging to Ontario is in the Belcher Islands, Hudson Bay. If, however, the Belcher Islands iron deposits are ever developed, it is quite possible that Ontario will benefit. These Belcher Islands deposits were examined last summer by a Government survey party, and they have been examined several times before, in the interests of Sir William Mackenzie and others. The results of last year's examination, which was confined to the eastern part of the Islands, indicate that there are 158 square miles underlain by the iron formation. The formation has a linear outcrop of 110 miles, and the ore itself ranges from a content of metallic iron of 52 per cent. down to about 35 per cent. Some of the analyses may be of interest to the meeting. The first one is from a bed two feet thick only, largely of magnetite, the metallic content of which is from 52 to 40 per cent, virtually no lime, magnesia or manganese, sulphur 0.1 and phosphorous 0.09. Unfortunately silica is about 24 per cent. The second bed, immediately underlying, and 11 feet thick, contains 45 per cent. of metallic iron, but 32½ per cent. of silica. The third bed, 12 feet thick, carries 39 per cent. of metallic iron, and 28½ per cent. of silica. The fourth band, fifteen feet thick, contains 35½ per cent. of iron and 46½ of silica. These ores are magnetite and the silica is interbanded in such a way that mechanical separation would be rather difficult. These are believed to be largely primary ores. The original ores were iron silicate and not very suitable for natural concentration and there is not much evidence that concentration has taken place. These ores are, however, of enormous extent, and there is a possibility of there being concentrations, although how these concentrations are to be located is no easy problem. The formations lie flat.

Minor Occurrences

A fourth type of iron ore deposit is that which occurs interbedded in the Lorrain quartzite and Gowganda formations along the north shore of Lake Huron. These are comparatively small deposits of hematite not capable of yielding any important tonnages of ore.

The fifth type is likewise of little commercial importance, so far as yet known. It comprises hematite deposits, both specular and massive varieties, which was apparently deposited along with the first sand and gravel of the St. Mary's sandstone which occurs near Sault Ste. Marie, and along the north shore and islands of Lake Huron. In some cases the iron oxide is a part of the St. Mary's sandstone and too impure to be an ore. In a few cases it appears to have accumulated in a purer state in crevices in the underlying floor of Huronian formations. The old Stobie mine near Gordon Lake is an example of these fissure fillings from which ore was formerly mined.

The iron ore deposits of eastern Ontario include various deposits of high iron content but, generally speaking, of small dimensions. These deposits, however, are too complex, geologically, to be described with any degree of success in the short time at my present disposal.

News of Mining

Great Britain

The former secretary of the Sankey Commission, Mr. A. D. McNair, some weeks ago read a paper at Oxford on the "Problem of the minets". Mr. McNair strongly urged the acquisition of all mining royalties by the State. This he considered a pre-essential to adequate state supervision. There should be, he believed, a national mining board, empowered to grant leases. Consolidation of collieries is also, in his opinion, a crying need, as is also complete publicity as to the financial management of individual collieries.

The result of the conference of representatives of the Patent Offices of the Dominions, held at the Patent Office, London, is the unanimous decision that a British Empire patent is desirable and practicable. A central office for the examination and granting of British Empire patents is to be established provisionally. It was agreed that uniform practice should obtain throughout the Empire.

Although the calculated total loss to Scottish coal mine operators, under the minimum Wage Agreement, amounted to £44,493 during last May, they were permitted to carry forward a deficiency of only £16,919. The latter sum is taken as representing the irrecoverable loss.

Production of pig-iron in great Britain amounted to 399,100 tons during July, an increase of 30,000 tons over the output for June. The monthly average during the year 1913 was 855,000 tons.

For the quarter ending July 1st, 1922, coal production in Great Britain amounted to 57,552,000 tons, as compared with 62,202,000 tons for the immediately preceding quarter. The output of coal per man-shift worked, was about 19.5 cwt. for each quarter. The average declared f.o.b. price per ton of export coal was 22s. 11d. during June. 232 persons were killed during the second quarter of 1922 and 1,097 seriously injured 1,089,700 wage earners were employed.

During the last 12 months no less than four successive reductions in the prices of explosives have been announced in Great Britain. The aggregate reduction represents about 20 per cent. on the price current a year ago.

United States

According to figures recently made public by the United States Bureau of the Census, there were, in the year 1919, 21,280 producing mining enterprises in the United States. The number of wage-earners was 981,500. The power equipment in use represented 6,750,000 h.p. The invested capital approximated $7,000,000,000. Working and other expenses aggregated about $2,500,000 during the year. Of this sum, $311,000,000, or 12.44 per cent., went into development work. In the total number of wage earners employed, those working for non-producing enterprises represent only six-tenths of one per cent. of the whole. Wages totalled $1,300,000,000; salaries, $152,000,000. The value of products was $3,175,000,000. This is an increase of 150 per cent. over the value estimated for products in 1909.

Europe

Figures of Germany coal, lignite, and coke for the first half of 1922 are now available. They are as follows:—Coal, 67,220,982 tons; lignite, 54,051,229 tons; coke, 14,404,406 tons. All three returns are considerably higher than those for the corresponding period of 1921.

The Asturian (Spain) coal miners' strike has been arbitrated by the Minister of Mines. The minister's chief stipulations are, first, that work must be resumed without compensation for losses; second, that wages be reduced 5 per cent.; third, that if the output be increased

by 20 per cent. before November 1st the reduction in wages will be no longer effective. The miners had previously offered to bring the output up by 10 per cent.

The annual report of the Luxemburg Chamber of Commerce, in reviewing the Luxemburg iron industry, complains that it "has been forced into a subordinate position in the world's markets in relation to those countries which are favorably situated financially, and which receive subsidies from wealthy governments and give orders in return". It is pointed out that the government of Luxemburg is quite unable to help the struggling industry.

The Belgian coal producers profited greatly during the continuance of the United States coal strike. The fuel briquette trade was also much stimulated.

According to an official statement issued by the French Minister of Public Works, the hydro-electric plants of the country now represent a power capacity of 2,100,000 h.p., an increase of 40 per cent. as compared with last year. Electro-metallurgical and electro-chemical plants absorb 1,300,000 h.p. of this total. Within the next two years additional power, about 300,000 h.p., will be available.

The exports of refined petroleum from Roumania during the first half of 1922 were 102,180 tonnes.

Production of petroleum from the three large fields in Russia, namely, Ural Duba, Baku, and Grozny, during the first six months of the current year amounted to 141,796,000 poods, an increase of 17 per cent. over the production for the corresponding period of 1921.

Announcement is made that the Reichskabinet has authorized the raising of German potash prices by an average of 30 per cent.

Asia

Reports from Bombay bring the information that the Tata Iron and Steel Company's annual statement for the year ending March 31 1922, shows a profit of £588,333 (1881/2 lakhs). On account of trade difficulties encountered during the past 12 months, no dividends are to be paid on the common shares, as it is thought advisable to strengthen the Company's standing by establishing a working reserve.

Australia

The Queensland Department of Mines is equipping a new colliery near the Styx River. Production on a large scale from already opened seams and from four newly discovered seams, will be commenced as soon as railway connection shall have been completed. It is the Government's intention to develop trade with the Far East and the United States. The coal is reported to be excellent in quality.

Africa

During the year ending March 31st, 1922, the Central Mining and Investment Corporation, Limited, reports 186,630 tons of ore milled averaging 6.19 dwt. Costs were 30.s. 10d. per ton, as against 29.s. 1d. per ton during the previous year. The tenor of the ore dropped from 6.74 dwt. to the figure mentioned above. Working profits amounted to £17,251, as compared with £77,700 for the preceding 12 months.

Representations made by the Transvaal Chamber of Mines in the interests of gold mining, and submitted to the Mining Industry Board, reiterate the pressing need of economic reform. Costs, it is stated, must be lowered before the maximum remunerative tonnage can be treated, and before employment can be given to the maximum number of whites and natives. The tremendous importance of the low-grade reserves, at present economically untreatable, was emphatically brought out. It was claimed that these reserves could be made payable if, first, all restrictions were to be removed from the recruiting of native labour, and second, if the efficiency of both white and native labour were brought up to a higher standard. The present reserves of producing mines are estimated at 316 millions of tons, averaging over 6 dwt. per ton. These reserves could be doubled in quantity and profits in the aggregate hugely increased, were costs reduced to a reasonable and possible figure.

For the quarter ending June 30, 1922, silver lead ore milled by Transvaal Silver and Base Metals amounted to 11,866 tons, yielding bullion valued at £46,264. The working profit on this tonnage was £5,362, or 9.03.s. per ton treated.

Owing largely to damage resulting from difficulty of proper mine maintenance during the late strike the Simmer and Jack reports a loss of £7,006 for the quarter ended June 30, 1922.

News and Comments

Encouraging Oil Developments

It is a positive treat to have Minister Stewart at Ottawa publicly proclaim that it is the policy of the Government to assist every legitimate effort to find oil in our West. He deprecates printing press prospecting and over speculation, but that is a concomitant of all adventuring, and the chief thing is to see to it that people with capital are given the helping hand. If influential interests are co-operating in the Lake Pakowki development, so much the better. Heretofore, the impression created was that officials were afraid someone would make some money, and the Government would not get the lion's share. Assuming that Montana operations will lead to success on this side of the line, Minister Stewart is very much to the point — and not leaning barkwards.

The McIntyre Report

It would be trifling with the verities were it to go uncontested that, as sections of the daily press profess, the McIntyre Porcupine Mines report for the fiscal year ended June 30, is "a highly satisfactory document", apart from "a slight reduction" in the profits. Considering the speculative position in the company's shares, and contrasting it with the ore reserve position, there is a hiatus suggesting admonition.

The total of the ore reserve is 718,198 tons averaging $10.37 per ton, amounting to $7,452,467. At $18.50, the market price of the shares, the market value of the 800,000 shares is $14,800,000. While not losing sight of the statement of the very highly thought of General Manager, who is always scrupulously exact, that "Veins Nos. 8, 9 ad 10 have not been developed to a point where we could include them in this year's ore reserves", and conceding the importance of recent deeper developments, the fact remains that the Mc-

hetyre shadow is removed somewhat from the substance.

Without detracting an iota from the optimism regarding McIntyre properties, and reiterating that the management is distinctive in its probity and capability, the speculative aspect on the outside is not quite as pleasant as the showing made on the inside by mines that gained $1,060,073 in the gross value of the ore reserves after contributing 193,971 tons worth $2,074,088.81 in the year on review.

McIntyre Mines now have a producing record of $13,091,717.20, and there is evidence of more to follow, not only throughout the determined vein-systems, but in the particular section held in non-committal reserve by General Manager Ennis, of which he writes:—

"No. 8 Vein System lies 120 feet south of No. 7 Vein and was cut by 13 B crossent on the 1375 foot-level directly under the quartz prophyry. Fifty-four feet of drifting has been done on this vein showing 8 feet of ore assaying $6. On the 1,500-foot level 15 B crossent intersected the vein, showing ore 5 feet wide assaying $6. The following diamond drill holes have intersected No. 8 Vein System:

Hole No	Horizon	Width	Assay
274	1400	10 ft.	$6.40
190	1475	10 ft.	6.90
266	1550	30 ft.	12.40

"No. 9 Vein System lies 350 feet south of No. 7 and has been intersected by 13 B and 15 B crosscuts. On the 1375 foot level a well-defined vein 10 feet wide was exposed but being in the quartz prophyry contained low values. On the 1560-foot level 7 feet of ore was exposed assaying $6. The following diamond drill holes have intersected No. 9 Vein System.

Hole No.	Horizon	Width	Assay
246	1400	8 ft.	$20.40
281	1575	6 ft.	16.20
266	1650	10 ft.	37.60

"No. 10 Vein System lies 500 feet south of No. 7 Vein System and has been exposed by 13 B crosscut on the 1375-foot level, showing ore 7 feet wid assaying $3.60. 15 B crossent is not advanced far enough to intersect this vein and the territory is now being drilled

Estimated Ore Reserves

	Tons	Assays	Amount
McIntyre Claims	305,257	$10.61	$3,237,496
McIntyre Ext. Cl.	203,764	11.27	2,297,689
Jupiter Claims	79,041	8.29	655,337
Broken in Stopes	130,136	9.69	1,261,945
	718,198	$10.37	$7,452,467

The usual allowances have been made for dilutions due to the inclusion of barren schists and wall-rock. The general Manager knows his mines and has stated his case with commendable conservatism. Vein Systems 8, 9 and 10 are being relied on to maintain the larger production with the greater mill, which should reduce operating costs.

The average cost as given, $6.42, is no more than was expected, in view of the extensive development. It is respectfully to be noted, though, that the item of "administrative and general expenses, Head Office, $85,989.84", equal to 44 cents per ton milled, or 12.3 per cent of operating earnings, exceed the cost of "management and general expenses, Mine Office $68,619.88".

Of the indicated ore, and the potential value of the properties, General Manager Ennis, holds these optimistic views:

"Development work has confirmed the statement made in last year's report that the contact between the basalt and porphyry flattened out and that the area of favorable ore-bearing formation would increase with depth. Vein Systems Nos. 8, 9 and 10 on the 1500 horizon are passing out of the porphyry into underlying basic schists and like No. 7 Vein are expected to increase in values and continuity. It is also probable that as the porphyry recedes eastward other vein systems will be found in this area on lower horizons".

Those opinions are shared by noted scientists who have examined the McIntyre properties on behalf of New York interests. The diamond drilling end work done sustain the assumptions entertained.

Elbow Lake Developments

Options held by individual Hollinger Directors and officials upon the Murray claims at Elbow Lake, Northern Manitoba, having been abandoned others have been acquired by Elbow Lake Mines Corporation — mostly made up of Quebec men, Frederick G. Corning, of New York, Director of The Dome Mines, Vice President Parker of the Canadian Mining Corporation, Robert Sweeny, and others. This arrangement was effected after considerable negotiation. It is undestood the Messrs. Cohen, Mining Engineers, felt that the Murray ground had not been thoroughly tested and so urged further work. An extensive distribution of shares having taken place, and more of it being in progress, anything that will restore confidence in the district will be welcomed. Apart from the surrender of the Murray options, there has been no recent authoritative report on developments. Samuel W. Cohen and Julius Cohen, having actively espoused Elbow Lake, are leaving nothing undone to at least establish the merits or demerits of the zones in which spectacular showings were found. Preliminary disappointments may not be permanently so. The McCuaig, Turner, Rogers, Corning, Parker combination should give the section what it needs, in the opinion of the Messrs. Cohen.

Nipissing Also Quits

The intimation conveyed some time ago that the Nipissing Company of Cobalt was dissatisfied with the results being obtained at their Gordon property, in the Elbow Lake district, was indignantly resented by the over-enthusiastic. The statements made in *The Canadian Mining Journal* that the so-called Hollinger interests had withdrawn their field force, also was denied. When two such combinations of capital and technical abililty spend their own money and retire, it is manifest that this Journal would not have stated the facts unless it was in the interests of the public to make the announcements. There was too much circusing of those interests, by those who had shares to sell. Not that shares do not have to be sold, but simply that it is unwise to ride into popularity upon the shoulders of men who are not ossified from the shoulders up. All of us would be only too delighted to have Elbow Lake more than fulfil the representations made in "bull-bull" advertisements. But alas and alack! Nipissing Engineers and Hollinger Engineers have made a "strategic retreat"!

The Mining Districts

BY THE JOURNAL'S CORRESPONDENTS

NOVA SCOTIA

Mr. McDougall's Timely Compromise

Dr. McKinnon, who mediated the miners' agreement, has paid a glowing tribute to D. H. McDougall. He pointed to the fine spirit shown during the negotiations by the Vice-President, and eulogised him for giving the workmen more than they expected to get. The learned divine means well but he failed to see that his way of putting it might be construed to read that Mr. McDougall gave way more than was necessary. Fine spirit and all that he has, the Vice-President is not noted for giving away his company's money, especially in a time of stringency. What really did happen was that he gave way just in time to save his company from being confronted with other impossible wage rates or a strike over an indefinite period. It is doubtful whether the making of such an agreement could have been accomplished one week later.

Bolshevist Utterances

"He needs must go that the devil drives." President Lavingstone of the United Mine Workers, at a labor demonstration in Sydney on Labor Day, declared that he was a Red Revolutionary; yet to us there is no terror in his threat of Red Russian rule. We have heard such ranting many times before and lived to see the barristers "peep about to find dishonorable graves," when the seed they had sown bore fruit.

Miners Hard at Work Again

With the exception of Sydney Mines, which took an extra day off in sympathy with the striking railway men in the Steel Department, all the collieries of Nova Scotia got away to a good start. Cape Breton and Pictou miners went away with a swing and got into their stride in three or four days, while Springhill miners had the satisfaction of seeing all three collieries open up in full blast. For a long time there was only one colliery working in Springhill and that only a few days per week. There are several months of the open season left during which coal can be poured into the Montreal and other markets to meet the demand, great as it is, and some of the leeway lost can yet be made up.

A few "sorehead" are trying to cause trouble and stir up strife over the 1921 rates. These agitators claim that Nova Scotia miners, in order to remain on a level with the American miners, should have retained the 1921 rates. They are, however, weak in logic, for the Americans came out on strike to hold the 1920 rates. Nova Scotia miners at the same time received an increase in 1920 and the granting of the Montreal pact, in 1921, was additional, against which the American miners received no equivalent.

Fire in Inverness Colliery

Inverness sent out a call to the Draeger corps of Glace Bay and Stellarton to help them in an attempt to put out a mine fire. The leaders and their men got ready to depart with their equipment when news came that the fire was under control. It seems that the fire occurred at No. 10 Level East and was simply an old fire broken out again. Stoppings were built and the fire section walled off, and other sections of the mine worked as usual the following day.

Handling the Underground Floods

When on August 15th the firemen, pumpsmen and engineers quit work, the Coal Company made a mighty effort to do the work of these men, but in spite of all they were able to do the collieries began to fill up with water. It was here that the public began to realize what there was and always is to contend with in operating the Nova Scotia collieries. And it was here that the efficient management of the collieries and their far-sighted policy showed at its best. Every mine as far as it was possible was equipped for emergencies, and when the pumps ceased the great underground lodgments began to take care of the fast accumulating waters. These lodgments, which are simply concrete dams, built into the solid coal, are made to contain all the way from two to eight million gallons of water. Some of them may hold a week's water, others more and others less. Usually in the summer season the mine makes little water, but this summer was unusually wet and the inflow of water was very heavy. To those who understand what this meant, the case looked most serious, and there was grave concern about losing the lower workings of some collieries. The reports sent out every day aroused the Provincial Government and forced it to act, but they were none too soon, for some lodgments were running over when the regular pumpsmen returned to work at the end of six days, and in some of the collieries a number of the lower places will be under water for some time to come.

Clearing the Mines of Gas

The pumping capacity of each mine is more than adequate to handle the daily inflow and well equipped pumping stations are properly placed to handle the large bodies of water. Most of the collieries were ready in a few days to resume operations, having been cleared from both mine gas and water. When the management realized that the collieries might be permitted to fill up with water and gas, arrangements were immediately made looking to the time when both of these elements would have to be removed, and when the time came to clear away the gas, it was a comparatively easy matter, although some collieries were filled almost to the mouths of the slopes. As soon as possible afterwards the mines were inspected and reports made.

The inspection of a coal mine is an all important matter and mining laws lay such emphasis on mine inspection that examination is going on all the time, both day and night. The examination for mine gas is most interesting at any time, but more so after one knows that for a time the mine has been simply one large gasometer with enough explosive mixture to "blow the roof off," to use a common mining expression. So the greatest care was taken in entering and in making the examinations of the Nova Scotia Collieries when the recent strike was declared off. Samples of the mine gas were taken from different sections of the different collieries, and samples of the mine atmosphere were gathered after the gas had been carried off in the air currents. Temperature readings were made

and much data gathered that under ordinary work day conditions could not be obtained. An analysis of these samples may later on furnish interesting and instructive information to students of mining.

The Safety Lamps

In preparing to enter a mine the safety lamp is first examined and thoroughly tested. Recent experiences in Cape Breton collieries have placed the safety lamp under careful observation. It is fully realized that defective lamps are all the more dangerous because they are known as safety lamps. One week of damp weather during the strike had left a little rust on the gauze. This had to be removed and other parts thoroughly cleaned. For that wonderful principle, discovered by Humphrey Davy, over one hundred years ago, on which he constructed the safety lamp is never for one moment forgotten by the careful miner. It is a remarkable fact that while safety lamps have undergone many changes in construction since the first one was made, which have made them more efficient, yet so thoroughly did that painstaking scientist of the past do his work that the principle has never been improved upon. The electric light is an improvement in giving better light, but it is not a gas detector and can only be used after the safety lamp has proved conditions suitable for working.

The Mine Examiners

The examination of a coal mine can only be made by certificated examiners. These are usually men of wide experience selected for that purpose. The Mines Regulation Act states the qualification of the examiners and the duties they are to perform. They are "to have the general charge of the safety of the mine; to make such inspection and carry out such other duties as to the presence of gas, ventilation, state of roof and sides, as required by the act and by any special rules."

Primarily the duty of the mine examiner was to examine the mine for gas. The examination of the roof was later on linked up as a natural result of inspection, but the fact that examiners must carry safety detectors, such as the Keohler or some other reliable lamp attests that their first duty is to search for gas. In the early days when miners were merely learning by the hard experience of gas explosions, both on a small and large scale, that the examiner must be thorough in his work, the same emphasis was not laid on careful examination as is done today, although there were then faithful men who did their duty. The writer remembers an instance of one examiner who had a considerable time to wait before he could make his examination. His shift was up and the miner who delayed him told him to go home and after he finished he would make the examination. Quick as lightning came the reply that he could not do so, for he would have to write a report, and when he wrote it he wanted to be in a position to say that it was true. In the same mine was another examiner, who, when he passed up through the section of a miner whom he knew to be careful, said, "Well, I am glad to see you, for while you are here—I won't have to come through your section." But within two months several miners were burnt by gas explosion in this man's section, and he lost his job, while the other examiner rose to be mine manager and is today just as loyal and faithful to duty as ever.

225,000 Tons in One Shot

One of the largest shots in mining operations in this part of the world was fired at Port Au Port, Newfoundland on the tenth of last month, in the Limestone quarry of the Dominion Iron and Steel Company. The quarry face varies from ninety to one hundred feet in height and it was planned to shoot down a section thirty feet wide for a distance of seven hundred feet.

Churn drill holes five and five-eights inches in diameter were placed thirty feet back from the face and to a depth varying from one hundred to one hundred and ten feet. These holes were placed at thirty-foot centres and a charge of eight and one-quarter tons of dynamite distributed among them, twenty-seven in number. The lower part of the holes was charged with sixty per cent dynamite and the balance with forty per cent. Each hole was primed with three number eight detonators, each on an independent parallel circuit, and the entire charge was exploded by firing from the main power line carrying two hundred and fifty volts.

The break along the line of holes was almost perfect, one-half the hole being plainly seen in the face after the shot was fired. The lower or shore part of the face, however, came away with the shot and caused a run of stone that brought the total quantity up to two hundred and twenty-five thousand tons.

This quarry was opened up in 1912, but little was done until the present year. The rock is a close-grained, compact crystalline limestone, and is hard to drill; but the close texture makes almost perfect blasting possible. Of the rock shot down seventy per cent. will be handled by the steam shovel without further blasting.

Wabana Iron Ore Exports

Iron ore to the amount of two hundred and ten thousand tons was shipped from Wabana during the month of August to European ports. This was the largest quantity shipped in any one month to foreign countries. The mines are in excellent condition and are producing at the rate of from three to four thousand tons per day. There are seventeen hundred men employed, which is a normal summer force. Shipments to Sydney have so far continued uninterrupted and by the end of the shipping season stock piles will be large.

NORTHERN ONTARIO

The O'Brien Mill Lost

On Labor Day, September 4th, the O'Brien Mill, motor shop and No. 1 shaft house were completed destroyed by fire, with an estimated loss of approximately a quarter of a million dollars. Fire broke out in an electric drier and rapidly spread through the whole plant. As it was Labor holiday there were very few men around the plant, and when the fire department did get into action it was found that the valve inside the mill had been left open and very little pressure could be obtained. It is understood that in addition to the solutions in the mill, there was a considerable quantity of concentrate on hand, and no doubt a large part of this will be a total loss. No announcement has been made as to whether or not the company will re-build. There are two customs plants in the camp, and it is believed that other mills as well would be glad to obtain additional tonnage. It is understood that the mine shows three years demonstrated ore reserves.

Peterson Lake

Nothing further has developed regarding the proposed deal for the Peterson Lake, although the stock market seems to indicate that there was some definite basis for the rumors. The names of the Nipissing and O'Brien have both been mentioned as possible purchasers, but officials of both companies deny any interest.

Activities of Coniagas

The Coniagas has started underground work on the Ruby property. The diamond drilling campaign, in addition to giving some evidence regarding values, demonstrated a thickness of approximately 200 feet of slates and conglomerate. This company is also understood to be negotiating for the control of the Beaver. The latter property has been closed for the last two years, and has the deepest shaft in the camp, which was put down to 1,400 feet with the idea of exploring the lower diabase-Keewatin contact. At this depth a very strong and well-mineralized vein was found, and some development work was done on it at the 1,200 foot level. It was demonstrated, however, that the contact took a considerable roll and that this level was too far below the contact to obtain favorable results. The property was closed before further exploration work was undertaken, and has not since been re-opened.

Argonaut to Complete Mill

Officials of the Argonaut Mine in Larder Lake state that the company has sufficient finances to complete the mill construction, which requires an additional $50,000. Work on the mill was stopped for a time until it had been demonstrated that some of the richer ores encountered in the upper levels existed at the 500 foot level. To date approximately $750,000 has been spent on this property.

Boom in Gold Stocks

Porcupine is enjoying a running boom, and stock market quotations are rapidly discounting future developments. Results, however, at the leading mines have been exceptionally good, and new records for production continue to be set.

Dome's August Production

During August the Dome mill treated 35,000 tons and recovered $352,774, an average of $10.08 per ton. This is the best month of the year, and compares with $335,254 in July and $351,531 in June.

McIntyre Production Increases

The McIntyre mill extension is now in operation, and the output from that property is showing substantial increases. The annual report of the McIntyre for the year ending June 30th, shows that gold to the value of $1,937,105 was recovered from 193,971 tons of ore, an average of $9.99 a ton. Costs per ton were $6.12, but during the year a good deal of shaft sinking was accomplished at a total cost of $120,000, and this was charged against operating. The net profit was $552,716, which is $260,000 less than for the preceeding year. This is due, in part, to the expense for shaft sinking, charged against operating, and to a drop of $100,000 in non-operating revenue, which presumably represents exchange. Ore reserves are placed at 718,198 tons, averaging $10.37 per ton, an increase of over $1,000,000 as compared with that for the previous year. The report states that three new vein systems were discovered on the 1,375 foot level, which promise to be of great importance. The balance sheet shows an investment of $280,000 in the stock of the Blue Diamond Coal Company, and a further $290,000 loaned to the same company.

Water in Vipond Shaft

The sinking of the Vipond shaft to the 1,000 foot level was stopped at 900 feet on account of encountering an exceptionally heavy flow of water. Orders have been placed for heavier pumps and when these are installed sinking will be resumed.

1000-foot Shaft for Davidson

It is announced that the Davidson has been financed to the extent of $900,000, and that work will be resumed in the immediate future. The first work, to be undertaken will be the sinking of the shaft to the 1000-foot level. Mine reports show ore reserves of approximately $3,500,000.

Profitable Operation of Blue Diamond

The Blue Diamond Coal Company in Alberta is owned jointly by the McIntyre and Temiskaming Companies, and its report for the year ending June 30th shows net profits of $55,498, as compared with a deficit of $157,127 in the preceeding eighteen months. This company holds an option on the Canadian Coal Fields, Limited, at a purchase price of $1,000,000, payable any time before 1935. In the meantime, however, net profits from operations have to be paid on account of the purchase price. The business of the company is understood to be very satisfactory, and substantial profits are now being realized.

The Porcupine Mutual will do 5000 feet of diamond drilling.

BRITISH COLUMBIA

Developments in Portland Canal District

A. B. Trites, of the Trites-Wood Company, has bonded the Unicorn Group of Mineral Claims, Portland Canal District. He will proceed with development. He is one of those responsible for opening up the Premier Mine. At present he has men working on the Big Missouri Group in the same district. The new strike on the latter property is reported to be a quartz vein, samples from which give assay returns of around $800 per ton in gold.

The Fish Creek Mining Company, besides carrying on active development, is taking out ore by pack train, high grades being sacked and prepared for return trips as supplies are brought into the camp. Thus a valuable smelter shipment is being accumulated at Hyder. A good sleigh road will be available this winter over which it is proposed taking a compressor. This will permit the raising greater quantities of ore.

The Silverado Mining Co. Ltd., Vancouver, B.C., are actively putting their claims, situated on the east side of the mouth of Bear River, in shape for shipping. There are two camps, one at 3850 foot elevation and the other at 1700 foot elevation. These are terminals for a two-bucket tramway, nearly a mile long, which has been installed. A single cable tram, 1,000 feet long, connects the upper camp with the tunnel. The ore is lowered to the lower camp, thence rawhided to sea level. Ultimately a complete tramway from the mine to tidewater will be installed.

The Rutus Group, on the north side of upper Bear River, has been bonded by Gustave Seiffert, an operator of Stewart. An expenditure of $70,000 on development is planned. It is proposed to drive a 500 foot tunnel from which the entire mineralized zone will be crossed. A compressor is to be taken into the camp.

Stewart Welcomes Governor Bone

Citizens of the Canadian mining community of Stewart, B.C. had the pleasure recently of welcoming Scott C. Bone, Governor of Alberta, who was accompanied by Thomas M. Reed, judge of the first division, and Arthur Shomp, district attorney for the first division. They arrived on the U. S. revenue cutter, Unalga. They were re-

ceived by Dale L. Pitt, manager of the Premier Mine, Pat Daly, veteran mine operator, and other prominent Canadian residents.

Dolly Varden Operations Still in Abeyance

Alice Arm has received, with disappointment, the news that the Taylor Mining Company has been given six months to redeem its obligations to George Wingfield, the Colorado mining man. Miners interested in the district feel that this means that the Dolly Varden and the railway up the Kitsault Valley will remain idle until next year.

Lack of Water in Cariboo

J. D. Galloway, provincial mining engineer, has returned from a tour of the Cariboo District where he found hydraulic operations interfered with to some extent by lack of water. For that reason the gold output of that section will not be as large as has been expected.

Ottawa Mill Burned

The Ottawa Mill, Springer Creek, near Slocan City, has been almost totally destroyed by fire, the damage being estimated at $40,000. The plant had been shut down for one day for minor repairs and L. H. Biggar, one of the owners, was on watch when the outbreak occurred. Reconstruction, it is stated, will be undertaken without delay. Within recent months 11,000 tons of ore from the dump had been run through the Mill. Since December 1st last a production of $40,000 in silver has been made.

Promising Gold Veins in Bayonne District

Michael Sullivan, Spokane mining man, who has been inspecting properties of the Bayonne District, B.C., states that on the Bayonne Group a large tonnage has been uncovered along the main vein, which has been proved for 3,500 feet. Mr. Sullivan is interested in the gold claims of W. McCreath and associates in the Bayonne.

Copper in Portland Canal District

The development of large copper deposits on the Portland Canal, six miles from Stewart, B.C., is promised by Hugh B. McGuire, who has returned from eastern Canada and the United States where he has been interesting capitalists on the enterprise. Mr. McGuire states that no difficulty is experienced in securing money for the development of legitimate northern British Columbia mining projects.

Western Meeting, C. I. M. and M.

The annual western meeting of the Canadian Institute of Mining and Metallurgy will be held at Vancouver on November 15 and 16. There also will be a session at Nanaimo, B.C., on the 17th when the coal mines of Nanaimo, Ladysmith and Cassidy will be visited.

PORT ARTHUR NOTES

By J. J. O'CONNOR

A reorganization is taking place in the affairs of the Jackson Development Company, Ltd. of Port Arthur, Ontario. A new charter has been applied for under the name of the Jackson Gold Mines, Ltd. The Head Office will continue to remain at Port Arthur.

This company's property is located two and one-half miles east of Schreiber, Ontario, and adjoins the right-of-way of the Canadian Pacific Railway. It consists of eight mining claims in one group, aggregating 324 acres, lying along the strike of the mineralized zone for a distance of over three-quarters of a mile.

This area has been mapped by Mr. P. E. Hopkins, geologist, of the Ontario Department of Mines, Toronto, and has been found to be highly favourable for the occurence of gold in economic quantity. This conclusion is concurred in by many geologists, experience mining operations, and mining engineers who have visited and examined the geological structure of the Jackson area.

The Jackson is traversed by several narrow veins which outcrop on the side of Gold Range mountain. These veins, while narrow, carried extremely high values in gold. Late in the year 1920 Mr. Jackson sent a ton of ore from one of these veins to the School of Mines, at Kingston, Ontario, resulting in a return of $115.90 per ton. About 62 per cent was extracted as bullion and 24 per cent as concentrate, the balance being in the tailing. Both concentrate and tailing were found to be readily amenable to cyaniding.

This ore was extracted by means of a tunnel driven into the mountain. It was found that this tunnel on the series of veins did not give sufficient back to warrant further work at this point, and the management decided to sink a shaft on a mineralized outcropping in the low ground. On being stripped, this outcropping was found to be a fractured zone of over ten feet in thickness, carrying low values on the surface.

The shaft was commenced in June of this year, the work being done by hand. At a depth of 7 feet the ore averaged $3.51 per ton. At 12 feet a considerable amount visible gold came in, and continues to 16-ft., where the shaft is bottomed in an ore-body 5 feet in width, carrying good payable ore. Though the shaft is only 16 feet in depth, the management are confident they have discovered a commercially important ore body. It is planned to continue the shaft to the 100-ft. level before beginning lateral operations on the development of this fractured zone, and the cutting of the vein system on Gold Range hill at depth.

During the current year two tunnels, one of 59 feet and the other of 100 feet, were driven into the hillside to cut the veins, revealing ore that assayed from a few dollars to over one thousand dollars per ton on selected samples. These results were most encouraging, and the management believe that from what they have found at this point, it will be found that at depth the whole ground between the veins will be workable for a width of from 12 to 16 feet.

EDITORIAL

There is no question in my mind that we are on the eve of great achievements as regards the application of electric energy to the extraction of metals from their ores, and that the energy of the splendid, abundant, and as yet undeveloped water-powers of Canada will ere long be employed for metallurgical purposes.—Eugene Haanel — 1905.

AN IMPORTANT ELECTROCHEMICAL CENTRE

This week Canada welcomes as her guests in her chief city the members of the American Electrochemical Society. The gathering in Montreal is not an excursion to a foreign land; for the Society is virtually an international organization embracing all the electrochemical and electrometallurgical interests of the continent without regard to international boundary lines. As an exemplification of international comity between the adjacent countries, and the spirit of co-operation that pervades so much of our common endeavor, particularly within the sphere of scientific research, the organization and work of this Society is outstanding. We have here exemplified in the realm of practical science and (partly) of active business that oneness of aim, that mutual understanding and that common endeavour that characterise the co-operative efforts of the members of the British Empire. That the politically separate, and now the largest, member of the Anglo Saxon nations should be so ready for practical co-operation with us in such a way as this augurs well for a continued mutual understanding, and hence points the way toward the time when the world shall have the full benefit of the lofty Anglo-Saxon ideal, directed by the united moral force of all the Anglo-Saxon peoples.

It is entirely fitting that the American Electrochemical Society should choose Canada, and Montreal, as its annual place of meeting. We have in Canada more than our share of available hydro-electric energy, the principal basis of electrochemical manufacture, and close to Montreal is one of the principal, though one of the latest, electrochemical centres of the continent. Few Canadians realize as yet the present importance and the future promise of the valley of the St. Maurice River as a centre of chemical industry. Pulp and paper mills still consume the larger part of the power developed, but the metallurgical and chemical manufactories at Shawinigan Falls use a large part, and eventually will use much the larger part, of the power available. On the lower part of the river, within easy reach of Three Rivers, the St. Maurice is capable of furnishing one million horsepower at a cost less than almost any other water power of large size on the continent. It has been stated on good authority that the major part of, if not all, this million horsepower will be made available during the next few years. What this signifies in the development of the electrochemical industry of the locality, we can only suggest.

The principal electrochemical products at Shawinigan Falls are calcium carbide and aluminium. The establishments that make these two products, of growing importance in commerce, bid fair to become the most important of their sort in the world. Particularly is this the case of the carbide works, which provides the raw material for a synthetic chemical manufacture whose scope, though still undefined, fires the imagination with its possibilities. The original purpose of establishing the plant of the Canadian Electro Products was to provide acetone for the manufacture of cordite. Its war service in this respect was notable. Its subsequent peace-time activities have been no less notable. Synthetic acetic acid can now be produced there in quantities that will fill a very large part of the world's needs. Researches, carried on continuously since the inauguration of the process, have resulted in so improving and simplifying the methods that the manufacturing cost of Canadian synthetic acetic acid is now without compare in the world. As acetic acid is the raw material for numerous important chemical industries, the importance to Canada of a cheap supply in unlimited quantities need only be suggested.

While the chief raw materials for the manufacture of calcium carbide, limestone and electric power, are available to us within our borders in abundance, the bauxite from which aluminium is reduced must be imported. There seems only a remote possibility that bauxite will be found in eastern Canada. However, we have in abundance another mineral high in alumina, feldspar. If advances in metallurgical science should make possible the treatment of potash feldspar for the recovery of both the potash and the alumina it contains, then we shall have made possible a completely indigenous aluminium industry.

We have drawn attention in these columns on different occasions to the possibility of producing pure iron commercially by means of electrolysis. The success recently of the experimental production of electrolytic iron at Trail, British Columbia, by means of one of the several processes now available, suggests the possibility of

inaugurating such a process for the use of St. Maurice power. Important deposits of iron sulphide are available in the Eastern Townships, while the hinterland, still unexplored, offers opportunities for the discovery of other deposits.

The members of the American Electrochemical Society will visit the plants at Shawinigan Falls as a part of their Montreal meeting. There is no doubt that this excursion will not only result in stimulating the interest of many of those not already conversant with the scope of the electrochemical industries already in operation there, but will also be prolific of discussion that will provide many a good idea. It is such ideas, and the mental effort expended in adapting them to commercial use, that ultimately will result in making Canada pre-eminent for the wealth and variety of her electrochemical products.

PREVENTION OF FIRES

The Dominion Fire Commissioner has, by warrant of the Governor General-in-Council, proclaimed October 2nd, to 9th, as "Fire Prevention Week". Those interested plan to conduct a public campaign, especially among school children, with a view to educating all in the essentials of the seemingly simple precautions against fire. The annual loss in Canada is $45,000,000 in money, and over 350 human lives. We have seen no mention in the plans of the Fire Commissioner of miners—not that they do not need instruction and exhortation, we are sure.

The first structures at a Canadian mine are characteristically makeshift wooden affairs, with little attention paid to anything but matters of expediency. Often the first buildings are of logs, the head-frame of tree-trunks, and the pit timbers of logs on the hog-pen style. These are set in a tiny clearing, and are subject to all the dangers of a forest filled with prospectors, some of them careless and all of them subject to the accidents that sometimes result in forest fires. We shall remember long the disastrous experiences of 1911 in Northern Ontario; and the losses to British Columbia mines during the present season impress us once again with the necessity for adequate clearing and fire-breaks round a mine.

As transportation becomes improved and a saw-mill is brought in, the community centred round the shaft assumes the semi-civilized appearance accorded by rough sawed lumber and clap-boards. Stumps, and even standing timber, are interspersed among the buildings. The sunlight has been let in sufficiently to make tinder of every thing from the moss upwards. This stage of development presents his best opportunity to the fire fiend, and preventive measures adequate to the need have seldom been taken.

As the little community becomes better ordered, the fire risk usually is lessened by more thorough clearing of the ground and more thorough building construction. But all too much of the temporary fire-trap construction that was necessarily characteristic of the building before the value of the mine was proved, is fairly sure to survive this uncertainty. Hence conflagrations in a mining community are looked upon as a variety of necessary evil,—the accepted, through drastic, preliminary to a thorough straightening-away and cleaning-up.

We would judge that the miner needs, more than the average citizen, education in fire prevention. From his circumstances he is necessarily more exposed to fire risk. Let us, then, take note of Fire Prevention Week, and do our bit to see that that good servant, fire, is kept strictly in his place.

A SUGGESTED USE FOR FELDSPAR

A few weeks ago we suggested, in these columns, that our abundant supplies of potash feldspar might be made useful by means of a process for the manufacture of ferro-silicon, reputed to be in successful operation in Sweden. In this process the potash becomes available for fertilizer by grinding the slag. The alumina is lost.

We wish now to make a further suggestion—a suggestion not backed by any experimental work, and therefore certainly of less value than the former one, though it may possibly hit the mark and so stimulate some determinative experimental work. Why not recover the alumina from such a slag, instead of putting it on the fields, where there is already sufficient clay?

The chief difficulty in using feldspar as a source of potash is the 65 per cent. of silica present with the 15 to 18 per cent. of alumina and the 12 per cent. of potash. If the silica were removed, as suggested, the slag would consist principally of alumina and potash. It might well be that the separation of these two ingredients and the necessary purification of the alumina for the manufacture of aluminium could be effected as economically as the present treatment of bauxite. Here is the suggestion, for what it may be worth!

A GRATIFYING RESPONSE THUS FAR

It is satisfactory to learn that returns received to date by the Department of Finance indicate a very general acceptance of the Minister's offer to convert 1922 Victory Bonds, maturing the 1st December next, into new bonds bearing 5½ per cent. interest and running for a further period of five or ten years as desired. In fact, many holders of these 1922 Victory Bonds would like to take up considerably more of the new bonds than they hold of the maturing issue. This, however, is not permitted, as cash subscriptions are not being invited at this time. But it may be pointed out that it is, of course, open for such persons to add to their holdings of 1922 bonds by purchasing them in the market, or from other holders who require the cash, and then to surrender them for new bonds. As a fact, it is known that this course is being followed.

The present holders of the 1922 issue have until the 30th instant to decide their course of action. But it would be well for those who wish to avail themselves of the offer of the Minister of Finance to surrender their bonds

at once rather than to delay doing so until nearly the last moment. For the 1922 maturity, when it was issued in 1917, proved a prime favorite with small investors, many of whom were buying bonds for the first time. In consequence of this fact, there are very many thousands of individual holders of these bonds. Hence it would not only be a great help to the bonds and to the Department of Finance, in carrying through the conversion expeditiously, but also a great convenience to the holders themselves, if they would turn their bonds into the banks as speedily as possible. As it is, there are now only eight days remaining in which to do so.

As we said, just now, this 1922 maturity, when it was issued in 1917, was a prime favorite with small investors. It was of the utmost importance to the country and to the country's *morale* that, in the grim days of war, the high patriotic fervor, which literally swept the Dominion, from the Atlantic to the Pacific, should have resulted in hundreds of thousands of Canadians becoming, for the first time, investors in these Dominion securities. And just as it was of the utmost importance to Canada that these hundreds of thousands of small investors should have subscribed in the first instance, so it is profoundly desirable now — and desirable from a national, not less than from the individual, viewpoint—that their investment should be continued in the way that the Government's conversion offer admits. On all grounds, it would be little short of lamentable if any considerable number of the holders of these maturing bonds should pass over the Minister's offer, with the idea of using the money at maturity either for less sound investments—when there is no sounder security in the world today than that offered by the Dominion Government—or for unnecessary expenditures—at this time when economy is the plain duty of us all, alike as a nation and as individuals.

EDITORIAL NOTES

The preliminary signal to a possible call to arms discloses throughout our Dominion an enthusiasm well tempered by experience. If enlistment should become necessary, there is absolutely no question of the response that will be made. We sincerely hope it will be unnecessary. Meantime it is disturbing, as well as rather humiliating, to have our chief executive at Ottawa reported, principally by means of his own words, as doing the usual skilful feat of balancing on the fence. Surely we Canadians are worthy of a less equivocal representation than this in what may prove to be a moment of crisis.

Mr. Charles Camsell, Deputy Minister of Mines at Ottawa, has made himself actively interested in Canada's "prosaic minerals". His trip to the Old Country was primarily to receive the Murchison Award of the Royal Geographical Society and to attend the International Geological Congress in Brussels as one of Canada's delegates. His efforts on behalf of our minor minerals have had wide-spread publicity in Canada, and we hope the same is true of Britain. Now comes an opportunity for taking a further step in the right direction. It is announced that the Canadian Chamber of Commerce in London has decided to organize a section at the British Industries Fair, to be held at Birmingham next March. This may provide a first-rate chance for making British manufacturers acquainted with Canadian mineral products.

Mr. Kipling, if he has been correctly reported by the newspapers, reminds one of that most fearsome of all nuisances, the man who conducts a postmortem over a game of cards. There are many live issues to which the brilliant poet could more decorously divert his energies. Scolding the United States about the part is played in the war is not sporting. We should like to have the author of so much that has given us joy write a ballad on the fuel situation, or on mine labour, or on any of a dozen live topics. Mr. Kipling needs exercise.

That we are as yet but skirting the edge of the science of the proper use of coal is not to be denied. The leaders of British and Continental research admit frankly that they are only on the threshold of a right comprehension of the composition of coal. The anomaly here is that the carbonization of coal has been a commercial process for at least 150 years.

Startling as are the press announcements concerning the claims of the new Elmore Process, there is reason to believe, or to hope, that they are well founded. At Broken Hill, New South Wales, the Zinc Corporation is installing a 25-ton unit. It is stated that, at low cost, the Elmore plant will turn out pure metallic silver and lead and a clean, residual, zinc concentrate, the recovery in each case being over 95 per cent. of the original metal content of the ore. Whilst this sounds too good to be true, yet the undertaking is sponsored by responsible technical and business men.

CIRCUMLOCUTION

He brought me a specimen lousy with gold,
And he said that it came from a *locus*
Where the shores of Lake Larder are frowning and bold
Oh! he vowed there was no hocus pocus

He gave me that specimen lousy with gold;
And I gave him a cheque to his order,
But something went wrong and I knew I was sold,
For he lit out that night for the border

I still have that specimen lousy with gold;
But I now have a very firm notion
(A notion on which you can't loosen my hold)
That it came from a mine Nova Scotian!

ANON

Exploiting The Prospector

(Written specially for the "Canadian Mining Journal")

In former articles the prospector's work was traced up to the point where he had a property to dispose of in part or in its entirety. This stage of the game, which is ever beset with guns and snares and pitfalls, deserves separate treatment. It is the stage at which the prospector, as a vendor, is most shockingly prone to errors of judgment. On the one hand, he may sacrifice his perfectly good bone for an illusory and unsubstantial shadow, (the ducking that the dog got is never mentioned), and on the other hand he may do too much watchful waiting at precisely the time when action is most needed.

Now to my mind the three positive dangers that threaten the prospector who is trying to dispose of a property, are the broker, the willing intermediary, and the unattached promoter. Of these three, each is less to be desired than the other two if you happen to be doing business with him.

The Broker

In my day I have met a genteel sufficiency of brokers—mining brokers. From the very nature of their calling it is not praticable to classify them as "good" or "bad". They may be pleasant or unpleasant. But no one who knows them would dream of measuring them by moral standards. In a sense, a colloquial sense, they are ethical, because they will play each other's game, but always at your expense.

All mining brokers seem to have been sophisticated at birth. Their air of sophistication is greatly enhanced by the use of large, horn-rimmed spectacles. All of them have certain set formulae whereby they can put your property on the market, and, in effect, put you out of the property.

An instance from real life: A few years ago, not very many, a prospector arranged that a Toronto (or Montreal) mining broker should handle his property for him. The broker agreed to do it on condition that he, the broker, should have the entire "say" as to capitalization, marketing of shares, etc. The broker organized a company. He named it the "Johnny Smith", which, for illustration's sake, we will take as the prospector's name. I may say here that the prospector's real name was widely known and that he was deservedly liked and respected.

The company was capitalized at $3,000,000, of which $1,000,000, represented by shares, remained in the treasury. A terrific advertizing campaign, exploiting the "Johnny Smith" mine (which was not a mine) was inaugurated. At first, I think, Johnny Smith was rather tickled with the publicity, but not for long. He was a simple, but really honest, soul. A flashy prospectus was issued, full of standardized dope about the fortunes made in Treadwell, Homestake, and Hollinger. Then the time came when Johnny wanted money for himself and for work on the property. None was forthcoming. Without going into painful details, the net result was that Johnny found that he owned only one-fifth of the issued shares, that there was no money in the treasury, and that only the broker's own shares had been sold.

Out of about $65,000 raised, $18,500 had been spent in advertizing, $2,500 on the prospectus and circulars, and $2,000 on "organizing expenses." The balance went into the broker's pocket. The property was never developed. There remains to-day, a melancholy monument, the small head-frame of the shaft, visible near a Northern Ontario railway siding.

This may be an extreme instance. Yet it is typical enough of the broker's tendency to exploit.

It is my deliberate opinion that the broker serves a useful purpose only when he handles shares on a commission basis. As an organizer and promoter his services are too costly for any small enterprise to have a chance of life.

The Intermediary

In the lobby of any large hotel the questing prospector can find any number of men willing and anxious to introduce him to someone through whom he will meet some one else, who is "in touch" with some person possessing capital. This leads to a sad and confusing succession of "touches", and is a fruitful source of lawsuits for commission. Some of these suits are excusable, some are unadulterated blackmail.

The only advice that is worth giving here is "don't". Don't do business in a hotel lobby. Hotel lobbies are the general offices of the parasitic hanger-on, some of them well-meaning enough, but all of them incapable of doing anything that the prospector cannot do better for himself. Their very willingness and eagerness to take up a proposition is *prima facie* evidence of their lack of responsibility.

The Unattached Promoter

Of this person it is not easy to give a fair description. He is a chameleon. He assumes a myriad form. But he, like the intermediary, is found mostly in hotels. Rarely has he a fixed abode, a local habitation and a name. The decimal point for him is removed far to the right. He has numberless moneyed friends and associates. He specializes in long telegrams, costly long-distance telephone calls, good clothes, protestations of integrity, and is strong on documents. He will probably explain to you how much his drafting of certain legal documents has been admired by prominent lawyers. He has ready money and he spends it. But who the men behind him are, you never learn. If you get any money at all out of him, you or somebody else pays a very full price for it.

I need not elaborate. Leave him alone. He is not for you.

* * *

To sum it all up, any self-respecting prospector is well-advised to eschew all three of the superfluities mentioned above, and to go direct to some active mining investor, preferably one identified with a large mining company, who will drive a hard bargain, but whose cheque is handled with reverence by the cold-blooded banker who, after all, is the channel of your happiness and of mine.

CAPRICORN.

A CORRECTION

On page 609 of the issue of September 8th, under the caption "Mines and Quarries of Canada", it was inadvertently stated that the lists had been issued recently. This is decidedly in error, as these lists were issued during the latter half of last year. No lists more recent than these are at present available.

The topographic Survey, Ottawa, has in progress a survey of Great Slave Lake, which is larger than Lake Ontario, and is dotted with islands that have never yet been mapped, many of them having been discovered only during the course of the survey. On one of the islands, Caribou island, gold claims have been staked recently. There has been gold reported also on the north shore, in the vicinity of Yellowknife River.

The Mount Mulligan Colliery Explosion In Queensland

By JAMES ASHWORTH

Although this explosion only occurred on the 19th of September 1921, the Mines Department of the Government took up the matter of enquiry with such energy that by the 23rd day of the same month a Commission consisting of R. A. Dunlap Esq. Police Magistrate and Warden, the Hon. Charles Fitzpatrick, M. L. C. President and Inspector for Queensland Coal Mines, and William Want Esq., Manager of the Queens Collieries, Bundamba, was appointed to make a full enquiry and report. The Commission began work on the evening of the same day.

Mr. Dunlop was already at the mine, and on being joined by the other members commenced personal inspection of the mine on the 29th of September; by the 25th of November, they handed in their report, accompanied with the notes of evidence in extenso, exhibits, plans, photographs, and suggestions, to render the mines safer during their future working.

The Commissioners found, "after making a minute examination of the mine workings, and considering the oral and written evidence of all available witnesses,":

(1) That an explosion of coal dust originated at the face of No. 11 gateway, Fitzpatrick's machine wall, south side of No. 2 seam, and travelled the working faces and roads of the mine and passed out of the entrance of both intake and return tunnels.

The Cause of the Ignition

(2) Three possible sources of origination have been suggested by the evidence.

First, the discovery of the top half of an acetylene hand lamp which was made in two sections, the bottom being made to clamp to the top, created an inference that the contents had exploded in the lamp and ignited the coal dust. An examination of the parts found showed no damage. The thin rubber washer between the two parts was adhering to the top part of the lamp, and had not been scorched. In view of the fact that more tangible evidence of other sources of ignition is available in this place, and that this theory was set up tentatively, we have discarded it.

Second, the theory set up by Mr. J. T. Watson (the colliery company's superintending engineer) supported by Mr. James Harris, engineer, that the charge had been exploded in contact with an open light in Morgan's hand when he was in the act of carrying it to charge a hole, is discussed at length under the heading of "Consideration of Evidence."

As the weight of evidence is against this theory, and the evidence advanced in its support conflicts with other evidence, and takes no account of certain singular results observed in that place by witnesses, we find that this theory is untenable.

Having considered from every point of view the several theories advanced, including the possibility of an ignition of methane or other inflammable gas, having made minute examinations of mine workings, and carefully investigated the depositions of witnesses, we are unanimously agreed

Third, the cause of ignition was the firing of an explosive, either accidentally or otherwise, on the top of a large block of fallen machine cut coal, such explosive not having been placed in a shot hole.

It is difficult to understand how explosives, being used in the ordinary way, could be fired at this spot. Alternately the conclusion that obtrudes itself is that a plaster shot was placed on this block of coal to break it so as to facilitate handling, and it exploded prematurely, either because of defect in the fuse or from some other cause, such as a fall of roof stone.

Propagation

Explosion effects were not immediately violent, propagation proceeding with various degrees of velocity and intensity throughout the mine.

Explosives were distributed, carried, used, and stored underground in a careless manner, without regard to the regulations.

Condition of the Mine

The mine was dusty and extremely dry, and no adequate means were adopted to render dust innocuous, as prescribed by regulation.

The Commissioners conclude their report with eleven Recommendations which include an Act for collieries separate and distinct from the Mines Regulation Act for 1910—Inspectors, Record Books, Explosives, Safety lamps, Stone Dusting, Special Rules, Rescue Stations, Reversal of Air Current, Shot Firing and Experimental Station.

The evidence showed quite clearly that the observers outside saw the display of distinct forces from the explosion, the first being from the fan tunnel and the second one from the main tunnel, with an interval of about one second. The noise was heard at least 15 miles away. The fan was destroyed and rendered useless, and at the main tunnel the jig drums and a blacksmith's shop were carried away and grass set on fire for a considerable distance. As the explosion produced two separate reports outside, it gave rise to the impression that there were two points of initiation and a great deal of evidence was given with that supposition in view. Eventually, however, the Commissioners decided that the "focus" of the explosion was on Fitzpatrick's longwall face, where there was a Sullivan Bar coal cutter. It was evident, however, that the explosion had not originated at the coal cutter, as the machine had not been at work that morning. In another stall on the outbye side of the coal cutter, some of the explorers noticed a large piece of fallen coal, but it does not appear to have attracted any particular notice until Mr. Want, one of the Commissioners took note of its surroundings. It was observed that a large piece of machine cut coal along with a band of fireclay had fallen so as to almost block the stall on its right hand side, that in the roof behind the coal there was the bottom part of an unfired shot hole, that the miner's tools were all close to the miner's body, and that the wooden tamping bar was close to his body, which was found in a sitting position at the end of the skip. This skip had been thrown off the rails, supposedly by the force of the miner's body striking it. The skip was half full of hand loaded coal, and the skin of the man's back remained attached to the skip when the body was removed. The men all worked without shirts. The evidence of force at this gate end

showed that it went outwards down the gateroad and also both inbye and outbye along the coal face. The focus of the explosion was at first assumed to be the Sullivan coal cutter, which was in the next gate road inbye, but as part of it, weighing upwards of one cwt, was also carried in the same direction, and the trailing cable, etc. were jammed underneath the coal-cutter. it was demonstrated that the theory of the origin of the explosion in No. 11 stall was strengthened. However, the witnesses were not agreed as to the origin of the flame or of the explosion which originated the disaster. The Commissioners seemed to think that it had originated from a charge of explosive placed on the top of the block of coal because in one place there was a slight depression on the top of it, with some comminuted coal also around. This reckless mode of blasting was called "plastering," or as named in other places "bull dosing". This would have been considered reckless at any other coal mine, but it was no more reckless than the general treatment of explosives inside this mine; in fact, the working places were actually found strewed over with cartridges and detonators after the explosion; some of the cartridges were found charred outside and some had coked dust on them. However, the plastering argument could not be supported by the surrounding conditions, and thus it was one point which was not decided by the Commissioners and is open for a more practical theory. Other factors need to be taken into account; for instance, the miner Morgan had just completed drilling a hole to shoot down the coal, and had his wooden tamping bar and presumably his explosives also at hand. Apparently unknown to the miner, there was a slip in the coal seam parallel to the face, which eventually caused the coal to fall without shooting. Probably the miner heard the coal cracking and stepped back with the tamping bar still in his hand. Meanwhile the falling coal raised the dust from the floor and carried it in the ventilating air current inbye into No. 12 gateroad, whilst the mass of falling coal on its impact with the floor naturally detonated the explosive charge with which the miner was preparing to charge the shot hole. In confirmation of this it is very noticeable that the remains of Morgan's store of explosives were found in this stall gateroad, viz., 50 detonators in an open tin with only 1½ plugs of monobel and a coil of fuse. In further confirmation of this supposition the miner had had no time to move any of his tools, and his body was blown backwards by the force of the resulting explosion, against the end of the partly loaded skip, thus throwing it off the rails and leaving his body in the position in which it was found. This supposition is again further confirmed by the very great force exerted, which although it only crossed one stall was sufficient to lift the loose cover of the coal cutter and carry it (one cwt.), no less than 30 yards inbye. The miner's mate was found 142 feet down the gate road, and there was a deposit of coke on the inbye side of the props in the gate road. The fall of coal was about 5 yards in length, with the machine cuttings as well as the trailing cable underneath. In the next stall, No. 12, one hundred detonators and a packet of monobel were found laying near the rails. The "slip" in No. 10 was well defined and extended from roof to floor. There was slight evidence of coking both inside and outside the partly loaded skip in No. 11. The evidence in No. 10 stall showed that the blast came from No. 11, and a full skip of coal was thrown off the roadway. The Commissioners when making their first inspection found in No. 7 stall one plug of Australian made gelignite, 25 plugs of monobel, and one coil of fuse, lying beside the road without a container. The monobel showed distinct evidences of coking. Three plugs of monobel were found outbye, the lid of the box being open and paper scorched. The blast was traced down the wheeling road on to No. 11 level and most of the distance outbye. Loose explosives were found in all parts of the mine, where at work, but no secondary explosion was found to have occurred, due to the careless abuse of the storage and use of the explosives, detonators and fuse.

It was thought that there had been two distinct explosions, with about one second's interval between, but the examinations of the mines did not confirm this; in fact, when the evidence is carefully sifted it is evident that the "contrary" effects were due to the fact that the return air way provided the shortest distance for the expansion of the heated gases from the point of origin; hence the first outside evidence of the explosion was seen at the fan, which was blown away and destroyed, whilst the force which travelled outbye and came to the open air through the main tunnel had the longest distance to travel, but had the best supply of coal dust to carry it along. Thus there were "contrary" effects clearly demonstrated at the junction of both No. 11 and No. 12 south levels and the Middle Slit with the main slope.

Humidity

It would appear that this feature of what we might call "Safety" precautions received some respect; thus the mine was provided with a hygrometer, and it was used at times, with the net result that the mine was considered "dry" and dusty. The results of any examinations were reported in percentage of humidity. Thus, every time that the dry-bulb thermometer showed either an increase or a decrease in heat, the scale of actual dampness was altered and there was no basis of comparison. One would naturally assume that as most people used to regard and many de so still a wet or saturated condition of the atmosphere of the mine as a point of excellence to aim at; but taking the the figures from Mr. Watson's evidence as the superintending engineer at Mt. Mulligan, the dry bulb ranged from 80 to 84 degrees, and the wet bulb from 66 to 70 degrees thes, if both bulbs registered 84 degrees of saturation, it was evident that each cubic foot of air was carrying 12.4 grains of water vapour, and if both bulbs registered 76 degrees, then we again had saturation but with a reduction in the weight of water vapour carried, viz, 9.7 grains or a difference of 2.7 grains per cubic foot. The next question is naturally what is the object to be attained: Is it the health of the of the miners and their comfort whilst at work, or is it the imaginary safety of the mine against explosions? To answer the last query first, it is absolutely useless for the latter purpose and more than useless, as even more moisture is required to give the high explosive effects; in fact, at least thirty per cent. is necessary to exert any restraining effect. It is therefore made plain that for restrictive or safety purposes water is practically useless.

Now, as to the health of the miner, which ought to be the first consideration. If he must have a cool ventilating air current to work in, how is this to be accomplished? The cure is quite simple: you must make the current as *DRY* as possible and with a velocity which will not stir up the dust too much. Then the air not being saturated with moisture will carry off the perspira-

tion from a man's skin, and the velocity gives him a feeling of coolness and he might work with his shirt on his back even in Mount Mulligan coal mine.

Just as a matter of comparison and if possible to exemplify the ridiculous use made of humidity tests, we can refer to the 1921 Annual report of the Minister of Mines for British Columbia. There will be found the readings of the hygrometer in the most gassy mines in the world and where watering is considered a "Safety" provision: the quotations are given in percentages of humidity. Thus at 52 degrees in the return air the weight of vapour carried is 4.4 grains only, and this is 100 per cent. humidity saturation for 52 degrees. In the same table is a case where the heats are 67-66 and the vapour carried is 6.8 grains for 93 per cent. humidity. Which then is the safest atmosphere: the one with the highest percentage of humidity or the one with a lower percentage of humidity but a greater weight of water vapour?

Safety first is a universal cry all over the world, especially in connection with coal mines, and with such carefully prepared reports as the one made on Mount Mullingan to stir up a willing Government a vast increase in safety may and will undoubtedly result

The Commissioners devoted a section of their report to a "Review Leading to Recommendations," and subdivided this again under the heads of (1) Explosion Effects, (2) Department Inspections, (3) Prevention, (4) Dust Treatment, (5) Proposed Reduction of Oxygen, (6) Explosives, and Shotfiring (7) Lights, (8) Experimental Station, (9) Rescue Work.

The very first paragraph under the heading of Explosion Effects needs some further explanation. The Commissioners say "the dust in the whole of the return air was raised by concussion and subsequently detonated by the flame or explosion wave". This would seem to imply that the speed of the effect which raised up a universal dust cloud was only that of the sound wave, viz., about 1100 feet per second, which appears to be far too slow to precede the explosion wave, which the Commissioners say was subsequently "detonated". This is a most important statement, as so far as the writer knows no scientist has yet described how it is possible to detonate a mixture of coal dust and air, nor yet what is the meaning of the word detonation when used in connection with colliery explosions. Thus, if we assume that detonation took place at the point of origin, in No. 11 stall, at Mount Mulligan, then we should have to conclude that it was consummated when the detonator and charge of monobel was fired by the lump of coal, in which case it would mean instantaneous death to the whole of the men in the mine. Some of the men were, however, assumed to have moved during the development of the explosion, and this would therefore suggest that the explosion was a violent inflammation of the mixture of coal dust and air, and no admixture whatever of methane. It is quite true, as stated by the late John Gerard of H. M's Inspectorate staff, in England, that very few people appreciate how very small a proportion of coal dust makes an explosive atmosphere, although some authorities insist that a pioneering cloud is necessary.

The most modern research by physicists has introduced the Electron theory and the ionization of gases as factors which may have to be taken into account when considering the safeguards necessary in dusty coal-mines, especially that part of the subject which has to raise a "cloud" or a "pioneering" dust in front of a flame which may be travelling at a speed of from say 3,000 to 5,000 feet per second. The Commissioners very strongly and very properly recommend the establishment of an experimental station and there is no greater or more important research which can be undertaken than that connected with the safeguarding a coal mine from coal-dust dangers. A coal-dust explosion in a torrid zone seems possible, but why should a coal mine (Longyear, Spitzbergen) be equally dangerous when exposed to similar conditions although frozen stiff both inside and outside?

THE MINERAL PRODUCTION OF CANADA

During the six months ending June 30, 1922

According to a survey made by the Dominion Bureau of Statistics the total estimated value of the mineral production during the first six months of 1922 was $57,682,944 in which $26,475,544 represented the value of the metal production and $31,207,400 the nonmetals. As compared with the same period in 1921 the value of the metals is seen to have increased about two million dollars or 9.1 per cent.

The standing of the different provinces in the Dominion according to the returns for the half-year was as follows: Ontario, $18,833,577; British Columbia, $16,153,307; Alberta $10,062,318; Nova Scotia, $8,792,-799; Quebec, $2,051,455; Yukon, $714,652; New Brunswick, $590,456; Saskatchewan, $266,041; Manitoba, $215,339.

The ten principal products of the mineral industry in Canada during the period in order of the values assigned where, coal, $24,346,959; gold; $12,110,242; silver, $5,997,199; lead, $2,882,047; natural gas, $2,-418,829; copper, $2,337,093; asbestos, $1,894,232; nickel $1,401,820; zinc $1,370,460; and salt, $849,133.

Excluding the value of natural gas, the total value of the production of these commodities during the period was $52,340,052, as against $59,615,309 during the first six months of 1921. The decrease amounted to 12.2 per cent. and was due largely to the slackness in shipments of coal and the weakness of the nickel and copper production.

The outstanding feature of the metal production was the excellent gains made in the output of gold by the two important producing provinces, Ontario and British Columbia. The total for Canada during the period amounted to about 63 per cent. of the whole 1921 production, an increase of 12 per cent. over the production during the six months of that year. The increased prices and the lively markets for silver and lead were reflected in excellent gains in production over the half year of 1921. The zinc production remained about the same, cobalt increased slightly, while copper and nickel, as might have been expected, fell off considerably.

The pegmatites are essentially coarsely crystalline rocks. Under some circumstances the dimensions of the crystals may be enormous. In the Ural Mountains a quarry was opened in a single orthoclase crystal, in India muscovite plates 10 feet in diameter have been found; at the Etta Mine, in the Black Hills of South Dakota, spodumene occurs in crystals resembling tree trunks and as much as 42 feet in length.—[illegible] Mineral Deposits

Report on Bridge River Area, British Columbia

MOST PROMISING PART OF THE LILLOOET DISTRICT

There has now been issued by the Geological Survey, Ottawa, W. S. McCann's Memoir 130, *Geology and Mineral Deposits of the Bridge River Map-Area, British Columbia*. This report of 100 pages describes the geology and minerals of an area 25 miles square, the south-eastern corner of which touches Marne station on the Pacific Great Eastern Railway. The Bridge River, and a wagon road along it, cross the centre of the area and both extend 20 miles farther eastward to Lillooet, on the railway.

Rocks of the Area

The rocks of this map-area are similar to those of some other areas recently described in these columns. Sedimentary rocks of Carboniferous age, interbedded with volcanic flows, were folded into mountain ridges, and then deeply eroded (Bridge River Series). In early Mesozoic times there were small intrusions of olivine rocks, and then a subsidence of the land surface, followed by the deposition, under water, of a series of sedimentary rocks and volcanic flows (Cadwallader series). Later in the Mesozoic era (Jurassic period) there came the vast intrusions that formed the Coast Batholith and that brought such a widespread distribution of mineral deposits throughout western British Columbia. Since this intrusion there have been other series of sedimentary rocks laid down and other intrusions of igneous rock, which have provided no minerals of economic importance up to the present.

Minerals of the Area

Of the area in general, Dr. McCann says: "The Bridge River map-area owes its present status as the most important district in the Lillooet mining division to the gold-quartz veins contained in the augite-diorite stock near Cadwallader creek. The silver-copper of McGillivray mountain, the antimony deposits and the gold placers are of minor importance.

"The mining properties of the district are still in the prospect stage of development with the exception of a few of the properties on Cadwallader creek. The difficulties of transportation, combined with the lack of capital required for exploitation, have accounted for the slow development of the region. Moreover the district has never been affected by a boom which would serve to attract outside interest.

"... Considerable tracts of promising territory still remain unprospected for gold, and certain belts, as indicated on the geological map, might advantageously be searched for platinum, diamonds, cinnabar, antimony, and possibly some of the higher priced non-metalliferous deposits such as magnesite, talc and asbestos."

Possibilities of the Gold Properties

The only properties of the district that have produced values are a few of the gold deposits along Cadwallader Creek, namely, the Coronation, Lorne, Pioneer and Wayside mines, in which a considerable amount of work has been done. All other of the numerous deposits discovered are in the prospect stage of development. The extreme difficulties of transportation, even since the Pacific Great Eastern Railway was pushed through to Lillooet, have militated against an active and thorough development. In spite of this, $350,000 in gold has been won from the ore, principally by means of treatment in the primitive arrastra. As this ancient metallurgical device, and even the stamp mills installed subsequently, can recover gold only when it is "free", and as a large part of the gold in the ore is securely locked up in arsenopyrite, only a fraction of the gold available has been recovered. This report suggests that, with the aid of the present improved transportation facilities and modern metallurgical treatment, the camp might develop into a consistent and important producer of gold. It is also suggested that an amalgamation of the various small properties would be conducive to economy of operation and would stimulate a rapid and consistent development.

Producing Properties

The gold deposits of Cadwallader creek are, in the main, of one sort. They occur in well-defined veins, mainly of quartz, filling fault fissures of irregular width in the augite-diorite intrusive rocks. They have characteristically a ribboned structure where the values are best. The gold occurs mainly in irregular shoots, and usually in wide parts of the veins, in association with sulphides, arsenopyrite and tellurides. Values are erratic, and there has not been sufficient development work done to study effectively the trend of values. The wall-rock does not contain workable values, so far as determined.

The Lorne deposits were located between 1897 and 1899, and arrastras and, later, a five-stamp mill, have produced $100,000 from its ore. The veins are narrow, and pay ore is in shoots. It is said that the ore treated has yielded about $17 per ton, this representing a 60 per cent. recovery.

The McGillivray mine, equipped with a 10-stamp mill, has produced $35,000 in gold, the yield per ton on the plates being $25. The main vein has been developed for a length of 600 feet, and is of unusual width—up to 20 feet. The average values are low. No work has been done on the property since 1910.

The Pioneer mine is equipped with a five-foot Chilian mill and concentrating tables. The veins are narrow, averaging two feet, and the ore is said to average $13.50 per ton. Some ore-shoots have yielded $60.00 per ton by amalgamation.

To gauge the value of these gold deposits, Dr. McCann examined the gold mines of Grass Valley, California, which are similar to those of Bridge River and have been operated successfully. That he is optimistic as to the possibilities of successful mining at Bridge River speaks well for its future as a gold producer.

Other Minerals

Silver-copper ore has been developed at the Wayside mine, but the values so far determined are not promising.

Antimony ore has been found in various places, notably on the Stibnite claims. The deposits so far located are not of economic importance.

Associated with the serpentine rocks are found chromite, minute diamonds, magnesite and asbestos. These have been so little investigated that their value is still undetermined.

As regards further development, Dr. McCann gives this sound advice: "The Coast mountains and the Interior "plateau of British Columbia afford a promising field for "systematic prospecting and mine development. But many "difficulties will have to be overcome, close attention will "have to be paid to the structure and origin of the de-"posits, and operating companies will do well to employ "mining engineers who have gained experience in the "opening up of similar deposits elsewhere."

Mineral Production of Ontario

FIRST SIX MONTHS OF 1922

Returns received by the Ontario Department of Mines from the metalliferous mines, smelters and refining works of the Province for the six months ending June 30th, 1922, are tabulated below. For purposes of comparison the quantities and value are given for the corresponding period in 1921. Tons throughout are net tons of 2,000 pounds.

Summary of Metalliferous Production
—First Half of 1922

Product		Quantity (6 mos.)		Value $ (6 mos.)	
METALLIC		1922	1921	1922	1921
Gold	ounces	476,338	286,018	9,845,910	5,761,504
Silver	ounces	4,774,666	1,277,762	3,273,247	2,552,125
Platinum metals	ounces	151	941	9,421	26,317
Copper sulphate	lbs.	22,553	87,382	1,310	3,495
Copper metallic	lbs.	495,899	2,297,732	57,603	272,132
Copper in matte exported (*)	tons	505	314	101,000	55,040
Nickel in matte exported (*)	tons	425	811	212,500	407,000
Iron ore (**)	tons	1,004	22	14,472	99
Iron, pig (**)	tons	10,517	27,117	258,953	733,568
Iron Arsenate	lbs.	75,000	.....	938	.....
Cobalt, metallic	lbs.	2,111	30,423	7,246	91,355
Cobalt oxide	lbs.	153,510	99,533	315,284	201,853
Nickle oxide	lbs.	137,258	331,078	75,002	65,652
Nickel Cobalt oxides, [unseparated]	lbs.	(¢) 647,254	26,592	(¢) 131,525	29,720
Nickel, metallic	lbs.	102,200	3,121,773	29,466	1,071,479
Other Nickel compounds	lbs.	27,270	111,279	2,231	9,991
Lead, pig	lbs.	1,993,880	1,504,830	112,604	79,322
TOTAL				11,418,312	11,363,652

* Copper in matte was valued at 8 cents per pound in 1921 and 10 cents in 1922, while nickel in matte was valued at 25 cents per pound for both years.

** Iron ore figures include only exported product or ore shipped to point other than Ontario blast furnaces.

Total output of pig iron was 178,863 tons worth $4,463,547.

Figures in the table represent proportional contained value of product from Ontario ore.

¢ Includes residues marketed.

Gold

Gold production for the first half of 1922 shows a marked increase over any similar period and gives promise of an output exceeding $20,000,000 for the full year as compared with $11,624,085 in 1921.

Porcupine, Kirkland Lake and newer gold areas are attracting the attention of the mining and investing public not only in Canada but throughout America and Great Britain. The Hollinger Consolidated has established its reputation as one of the greatest gold mines of the world. At present the milling capacity is 4300 tons daily. When additional hydro-electric power is available the ore treated will be increased from 4300 to 7000 tons daily. The McIntyre mine has increased its milling capacity 500 tons per day beginning this month, and is sinking the central shaft to a depth of 2500 feet. The Dome shaft has been stopped temporarily at a depth of 1,634 feet and a crusher station is being placed on the 12th level (1150 feet). Producing mines at Porcupine and Kirkland Lake have a combined daily milling capacity at present of 7,000 tons approximately.

For 1921 the exchange premium averaged 11.61 per cent. By the end of August 1922 Canada's currency had reached par. The exchange really amounted to a bonus for the gold mining industry. Canada is the first combatant country suffering currency depreciation as a result of the Great War to get back to normal.

Details of production are given in the following table:

Source	Ore milled tons	Gold Output ounces	Gold Output Value $	Silver Output ounces	Silver Output Value $
PORCUPINE					
Dome	173,050	94,761.10	1,958,712	13,912.13	9,518

Silver

Silver production shows an increase over the corresponding period in 1921. Since the end of June the McKinley Darragh and Dominion Reduction Company have been operating their mills. South Lorrain is attracting attention owing to the satisfactory developments on the Keeley and Frontier properties. Some very fine slow samples of leaf silver have been found recently on the Frontier. The Castle mine at Gowganda is also meeting with encouraging results.

The average New York price for the period was 67.34 cents per ounce as compared with 59.9 cents in 1921 and $1.17 in 1920. Shipments over the T. & N. O. Railway from Cobalt of ore and concentrates totalled 474 tons to Ontario and 385 tons to points in the United States. Mines shipping over 200,000 ounces are given in order: Nipissing, 2,167,265; Mining Corporation of Canada, 701,891; Coniagas, 647,544; O'Brien, 539,768; Keeley, 298,806; La Rose, 244,221. A summary of output is given hereunder:

Shipments from Cobalt, South Lorrain and Gowganda,	Ounces 4,697,335	Value $3,219,326
Recovery from gold ores,	76,405	53,284
Recovery from nickel-copper refining,	926	637
	4,774,666	$3,273,247

Refineries: The coniagas plant at Thorold has been overhauled, the process changed and the company reorganized under the name of The Coniagas Alkali and Reduction Company, Limited. The new company did not receive any shipments for treatment during the period but marketed materials on hand. No residues were received by Southern Ontario Smelters during the half year, but subsequently, owing to reduced freight rates, shipments have been made both to Thorold and to the Deloro Smelting and Refining Company, Limited, at Deloro. Ontario Smelters and Refiners, Limited, with plant at Welland went into the receivership of the Trusts and Guarantee Company of Toronto on May 30th.

Nickel-Copper

Owing to the continued overstocked condition of the copper and nickel markets mining, smelting and refining operations have been greatly curtailed. The Mond Nickel Company was the only smelter operated, treating 93,148 tons of ore and producing 4,535 tons of nickel-copper matte, the two other smelters remaining closed. The International Nickel Company of Canada reopened its Port Colborne refinery on May 1st and treated 1,269 tons of matte. Nickel-copper matte on hand at Bayonne, N. J. (1,094 tons) was reshipped to Port Colborne, where all refining operations will be conducted hereafter. The Bayonne plant has been scrapped, and some of the equipment shipped to Port Colborne. During the dull period new uses and new markets have been found for nickel, and as a result the Copper Cliff smelter was restarted on September 1st, two converters being placed in commission. The Creighton mine was reopened a week previously. All mining and smelting operations by this company were suspended in August, 1921. The average price of electrolytic copper for the period was 13.02 cents per pound.

* Estimated.

Iron Ore and Pig Iron

Moose Mountain, Limited, shipped beneficiated magnetite in the form of briquettes to Electro-Metals, Limited at Welland, makers of ferro-silicon.

Only three iron furnaces were in blast during the period, two operated by the Algoma Steel Corporation and one by the Steel Company of Canada. Of a total of 337,637 tons of ore smelted only 19,843 tons or 5.88 per cent. was of Ontario origin. In addition to the pig iron product mentioned in the table 164,616 tons of steel worth $5,567,256 were produced.

Lead

Ontario's only operating lead mine and smelter, situated at Galetta on the Ottawa river, are operated by the Kingdon Mining, Smelting and Manufacturing Company. The recovery noted in the table was made from 22,770 tons of ore. A blast furnace is being installed to treat the slag and flue dust which have accumulated from the Scotch hearth. A small recovery of lead is made from Cobalt silver ores by certain refineries in the United States, returns of which are received at the end of the calendar year. The average New York price of lead for the half year was 5.07 cents per pound.

Non-Metallic Minerals

Heretofore data have been compiled annually for non-metallic minerals, hence the returns of output for the first six months of 1922 cannot be compared with a similar period in 1921 and for that reason the figures for the full year 1921 are given. It will be noted that in 1922 arsenic, graphite, gypsum, mica, peat, salt and talc show an increase in output over half the total figures for 1921. Arsenic is in good demand and an insecticide plant is in operation at Deloro to use part of the product there recovered from the refining of silver-cobalt-nickel arsenides. There is little activity in mica mining except in scrap mica, the prices for thumb-trimmed not being sufficiently high for profitable operation.

Structural Materials

No statistics were received from producers, the estimate being based on the relative activity in construction in 25 Ontario cities as revealed by a comparison of the value of building permits issued for corresponding half-yearly periods in 1921 and 1922. The figures respectively are $24,421,333 and $34,685,905 or an increase in value of 42 per cent. in 1922.

News and Comments

by ALEXANDER GRAY

Abestos Manufacturing Company of Canada

So long as there is a "fair field and no favour," whatever will promote the fabrication of Canadian raw materials—"prosaic minerals" if you will, metallic and non-metallic—it is the bounden duty of Canadians to rise up and call those who undertake bona fide enterprises, "blessed—thrice blessed." That is why the activity of the Hon. P. J. Paradis, M. L. C. Quebec, President of the Asbestos Manufacturing Company, Limited, is hailed with satisfaction by the Montreal and Quebec press. Mr. Paradis proposes to interest British capital already invested in asbestos products, in his manufacturing company, whose plant is at Lachine, and was operated by the Keasbey & Mattison people. The intention is to increase the capital of the Asbestos Manufacturing Company from $1,000,000 to $2,500,000, and by enlarging the Lachine works and effecting close co-operation with the British interests, to materially increase the production of fireproofing, textiles, packing, shingles, etc.

"A world-wide business that will be one of the main distributors of asbestos," is the general objective of the contemplated merger, the accompanying assurance being that "the British firm referred to is one of the largest in England," probably of Manchester and of "Everight" reputation. The assumption that it is Messrs. Felber & Jucker who are joining with Mr. Paradis may not be accurate; but the Turner interests are not in the deal and other asbestos manufacturing concerns in Great Britain have their own plants. The Bell people are not involved. The Johns-Manville are to have their own Canadian factory. That is why the names of Messers. Felber & Jucker are associated with the mooted merger.

At any rate, the matter will be settled in London. That it should be injected into the announcements, that "reports circulated at the last session of the Quebec Legislature to the effect that the Provincial Government was studying the advisability of levying a special tax on raw asbestos exported to other countries, have already brought results," is not conducive to the harmonies, since Mr. Paradis is Government Whip. However desirable it is to have a complete performance within Canada it is more desirable to maintain the welfare of the Industry as a whole. While Washington is not very considerate where Canadian mineral industries are concerned, it has made certain exemptions in the pending Tariff Bill. The greatest factors in the Asbestos Industry now are ready to conform to Canadian ideals in every way possible; but the situation is a delicate one, and it might be prejudicial to use the bludgeon where moral suasion will more than suffice. Moreover, the "Manchester" policy of buying in the cheapest market—the free trade principle—might present Quebec with a reaction.

South Tisdale Northern Deloro Shearing

Newspaper announcements that a discovery has been made on the Ritchie "Vet," west of the Dome and that the Paymaster property in Deloro is exploiting a porphyry section, has the same relative importance to the Porcupine fields as the developments on the Rochester "Vet," the Goldale, and elsewhere in the Pearl Lake area. Every shear zone may not be "another Dome," and every contact may not disclose "another Hollinger" or McIntyre; yet experience has shown that those structural conditions are very promising. Dome Extension, though not "unwept," certainly was "unhonored and unsung," despite Capt. Anchor's persistent optimism. Dome shearing did not stop at the Dome boundary. West Dome was [illegible] handled. Dome Lake was "married in haste [illegible]

mill and "reported at leisure" The Preston East Dome was named after one of the Dome discoverers, but it had more water in its capital than exaggerated prospects could de-water. Preston East Dome, without adequate working capital and the necessary supreme management, had to await the fuller appreciation of the Dome Mines structure. And now the Paymaster, formerly the Standard, of "salted" core (unsavory memory) is said to have more than a chance along a porphyry intrusion. Of course it will take more than can be winnowed from small-fry speculations to prove the shearings, whether they have more of shadow than of substance. Nevertheless those zones are benefiting from Dome and Dome Extension results, the acquisition of the Schumacher "Vet" by the McIntyre Company, and the general statements about those properties, including the Ritchie "Vet."

Ankerite became anathema at Dome Mines and the adjoining areas. The "Foster Vein" at the West Dome, looked as comfortable as a church warden before a cheery fire, but it really was as hungry as the proverbial church mouse. Porphyry contacts, however when financed by those in a position to take a loss or raise more money, may make Deloro what its name implies. It is nearly twelve years since I heard a wiseacre proffer $300,000 for the Ankerite Company's outcrops—as spectacular almost as that of the Paymaster, or Standard. Well, the Ankerite property was developed to some extent, as were Dome Extension, and West Dome and Dome Lake and the Edwards ground. Ankerite without porphyry contacts "gave the dog a bad name," as it were, until Dome Mines provided an agreeable surprise. Likewise the porphyry contacts around Pearl Lake have moved back the horizons until the mining area is larger and the outlook wider. To ascertain when a shear zone is not a sheer waste of country, though, will take a sporting scientific spirit and many simoleons.

An Objective Worth Keeping In View

Those who rail at 'Rand Engineers and foresee the rapid decline of the unparalled gold fields of the Transvaal, have a suggestion conveyed to them in that for the first time in the history of the 'Rand, the gold output has exceeded half the world's production. Statistics just published by the Transvaal Chamber of Mines show that the output equal 52½% of the world's total. Since the commencement of operations, the 'Rand production has reached £666,000,000—roughly three-and-a-third billion dollars. The July production was equal to $12,700,000-for the whole of South Africa, apart from Rhodesia. So, those who graduated at, or took a post-graduate course at those fields have something in retrospect that others can place in perspective.

Business Men Appreciate Northern Ontario

It is refreshing to have the Toronto Board of Trade, after an official tour of the mining and agricultural areas of the North Country formally recommend that the Provincial Government enter upon a policy involving the annual expenditure of $10,000,000 in that section. The otherwise efficient Quebec Government, although unprecedentedly prosperous, concede a pittance toward providing transportation facilities for the mining sections of that Province. No greater inducement could be offered at this time, to capital and its representatives, than the assurance that Quebec is no less enterprising than British Columbia in the matter of roads to aid mining. To be specific: The Gaspé Peninsula (to say nothing of Western Quebec) has very great possibilities, and not a few certainties, but individual operating companies find themselves compelled to devote large sums to roads, whereas their working capital ought to go into their mines and equipment. The Ontario Northland may not get $10,000,000 year, but it is pleasant to have business men on record that the money should go there.

R. P. Doucet, General Manager, Sante!

Holding a record as a business go-getter and rapid fire conversationalist, Mr. R. P. Doucet will not be an experiment as the operating chief of the Asbestos Corporation. Mine Accounting is his other name. He is a polyglot personage, and under stress has been known to develop great lingnistic artistry. Always immaculately groomed, Mr. Doucet will fix the styles at Thetford. His intimate knowledge of the markets for every grade and familiarity with the men and affairs of the asbestos trade, does not imply that his middle initial means Powder; but he will find those who will do the shooting most economically, and if there is any below-the-belt work among produeers he will be his own referee. Every nook and cranny of the international fields has been personally scanned by Mr. Doucet. His assumption of the duties of General Manager of the largest producer no doubt will carry with it more than supervision of the operating department.

Coynite

If Mr. Coyne delivers the goods in quantities to meet a long felt want, and the "coal measures" of Larchwood present Canada with anthracite, he will be entitled to have his product indexed as Coynite. Otherwise—well, it will be Mr. Cyril Knight's privilege to find a suitable name for it. Failing this, Professor Haultain has a periodically demonstrated vocabulary outside the lecture-room.

Balfour Syndicate's Sporting Bet

Coal or no coal, anthraxolite or anthracite, the Balfour Syndicate of Toronto took the plunge by letting a contract to diamond drill the controversial Balfour Township area. Private money is doing it, there has been no special pleading, the hole is going down where the section seems to be least disturbed, and if there is coal "as is coal"—why the gamble will, or may, reward the gamboliers. They know exactly what to expect in either event. A coal seam—of coal—when proven over a sufficient area—would be a veritable Coyne of vantage. Reports on what has been done at surface by others, are not flattering to the promoters. The Balfour Syndicate, not having strained the "pregnant hinges" of their knees to enlist the public in a venture so largely speculative, all the more credit will accrue if coal is there in quantity and quality.

Johns-Manville-Bennett-Martin Deal

Drilling on an extensive scale is proceeding at the Bennett Asbestos properties at Coleraine, Quebec. The understanding is the deal with the Johns-Manville people is contingent upon the drilling results.

W. G. Trethewey Still Scouting

A report is current that an important find of high-grade silver ore has been made in Ontario near the Manitoba border. As W. G. Trethewey is interested and optimistic concerning it, he must have had a recurrence of those thrills when he received his first shipping returns on his Cobalt ores—and of those chills when he recalls how near he came to selling the Trethewey to that keenest of business men, Ellis P. Earle.

The Mining Districts

BY THE JOURNAL'S CORRESPONDENTS

SILVER STRIKE IN PATRICIA

There is no longer a doubt that some extremely rich silver ore has been discovered near Red Lake, in the district of Patricia, west of Lac Seul and toward the Manitoba boundary. The discoverers are H. W. Cann, G. E. Hoyt and R. G. Johnston. The last named has been hunting for silver for the past three summers, and according to one report found an old abandoned claim with the remains of a camp by the shore of Red Lake, and this led to the finding of a vein of silver lead ore, which the old timer had evidently discovered previously. Many years ago, just before the Klondike excitement, there were prospectors all through this part of Ontario, and they made a lot of finds, but generally could do nothing with them because of the entire absence of convenient transportation. When the tales of gold came from the Yukon they dropped their pans and picks and left for the newest El Dorado. None ever came back.

The present find is said to have yielded very high assays, and the ore evidently contains other silver-bearing minerals than galena such as for instance, native silver and stephanite. The country rock is said to be schist with diorite and porphyritic granite intrusions. The belt of silver bearing rock does not seem to be extensive, though it may be so. The richest ore comes from a streak a foot and a half in width, but according to some, values are found over fifteen feet.

Six claims have been recorded up to the time of writing, but a lot of men are expected to record within the next fortnight. About a hundred mining licenses have been taken out. There are indications of a rush—also, possibly, a raid on the crop money now coming into the hands of the farmers. Probably all our old friends of the Rice Lake boom of a few years back will turn up again, eager for more of the same "pap".—Chas. A. Bramble.

NORTHWESTERN ONTARIO NOTES

Northwestern Ontario is again coming to the fore as a mineral field of great potential wealth. Recent discoveries of silver deposits at Red Lake, in the Lac Seul country, are said to be of great richness. These deposits have been known in a more or less hazy way by prospectors for some years, and that territory has been commented upon as the scene of coming developments, by men who had some knowledge of it. W. G. Trethewey, a prominent and successful pioneer in the Cobalt field, has just returned after making an examination of the find, and pronounces it as being a likely rival to Cobalt in the future production of silver. The lateness of the season, and the difficulties of transport (it being a five day trip by the water route from the Canadian National Railways) will prevent any considerable exploration or development this season. Details of the discovery are lacking, but sufficient is known to ensure the attention of prospectors and investors.

Operations have been resumed at the Mikado Gold Mines in the Lake of the Woods district. Lt.-Col. H. A. C. Machin, of Kenora, recently reorganized this company under the name of the Mikado Consolidated Gold Mines, Limited, with an Ontario charter. The work of dewatering the mine is now underway. An inclined shaft is down about 600 feet, with rather extensive lateral development work performed. The property is equipped with a mill and the necessary mining machinery. Though somewhat out of date, these will be altered to suit modern requirements in the recovery of values. There are three thousand tons of broken ore in the mine, ready for the mill, and thirty thousand tons of commercial ore ready for stoping. When the unwatering process reaches the known ore body, milling tests will begin for the purpose of determining the best method of treating the ore.

Development work on the property of the Contact Bay Mines, Limited, situated about seven miles south of Dryden, on the C. P. R. west of Port Arthur, is proceeding satisfactorily. The property equipped with a ten-stamp mill, and test runs are constantly being made as development proceeds. These tests have been of the most encouraging kind, showing values of from $12 to $20 per ton in gold. Recently there was made a shipment of $3,000 in bullion to the Mint at Ottawa, being the result of the test runs. This company has recently purchased the Redeemer mine, situated about two miles west on the same vein system. The purchase price is said to be $150,000.

Prospecting is very active in the Sabawe Lake district. A large number of claims have been staked and recorded. The formation in this field is most favourable for gold occurrences, and many promising finds are reported. This territory is in the Fort Frances Mining Division, and as there is no Mining Recorder resident in the Division, all claims have to be recorded at Toronto, resulting in much loss of time, and causing stakers great inconvenience. This could be avoided by having these claims recorded at Port Arthur.—J. J. O'Connor.

NORTHERN ONTARIO

Toronto Men Visit Northern Ontario

A group of seventy business men, members of the Toronto Board of Trade have just returned from a visit to the different camps, agricultural sections and pulp mills of Northern Ontario. A day was spent in Cobalt and the adjoining towns and in the evening a banquet was tendered the visitors by the local boards of trade. On occasions such as this it seems to be an unfortunate habit for local speakers to make a specialty of airing grievances. Northern Ontario has a number of grievances against the southern part of the province, some of which are very well founded, but little good can result from bringing forward a large number of criticisms on only a few of which visiting associations can act.

Many of the visiting business men were making their first visit to the north and they were greatly impressed with what they saw. There is no doubt that trade relationships will be strengthened and also that the visitors will be more alive to the needs of this fast growing country. Mining is, of course, the great industry of the country and one of the Cobalt speakers pointed out that to date the mines of this province have paid out for

labor, supplies and equipment practically one billion dollars, a large part of which, either directly or indirectly, has gone to the farmers and business men of Old Ontario.

Residues Shipped from Cobalt

Heavy shipments of residues continue to be made from Cobalt and for the week ending September 8th, the Nipissing and the Mining Corporation shipped a total of 844,000 pounds to Deloro. La Rose was also a shipper with one car of 80,000 pounds of high grade concentrate. No decision has yet been made as to milling arrangements for the O'Brown, but it is understood that they are negotiating for the purchase of the Bailey Mill.

Mr. A. A. Cole, mining engineer for the T. and N. O. Railway recently made a visit to Moose Factory on James Bay, by airplane. The visit was made with an idea of getting a general view of the country in anticipation of the possible extension of the T. and N. O. The return trip used to be a matter of weeks, but it can now be accomplished in a few hours.

The Nipissing is preparing to reopen shaft No. 26 with the idea of getting some high grade mill rock and also exploring the lower Keewatin-diabase contact, on which the company has already done some diamond drilling. The work at the Colonial has no doubt stimulated the Nipissing in this direction.

Colonial Shaft

Rapid progress is being made in the sinking of the Colonial shaft to 900 feet, and this work promises to establish a shaft sinking record for Northern Ontario. The work is in charge of J. Hussey, who at one time held the shaft sinking record for South Africa. Six machines are used and the three compartment shaft is drilled off in one shift. A new head-frame is being installed and a two-ton sinking skip will be used. A great deal of time is gained by having separate timbering crews, who do the timbering while drilling is in progress.

Several veins have been encountered in the 450-foot level crosscut of the Victory.

More Ore at Castle Property

High grade ore has recently been struck on the 160 and 325-foot levels of the Castle property in Gowganda which is rapidly developing into an important mine. The directors are considering the installation of a 50-ton mill.

Wright-Hargreaves Dividend

The Wright-Hargreaves property at Kirkland Lake, which started production only sixteen months ago, has declared a 5 per cent. dividend payable October 1st, to shareholders of record September 17th. This makes the third dividend for the present year and puts the company in the position of being the second largest dividend payer in the camp. The total disbursements of the Lake Shore are slightly ahead of the Wright-Hargreaves, but the latter company will soon take the leadership.

Dividend for Teck-Hughes

It is quite possible that the Teck-Hughes may soon enter the ranks of the dividend payers, as it is understood that some of the heavy bond holders are anxious to see dividend payments started before all the bonds are paid off. There is no reason why this could not be done as the company is making very substantial profits. There have been various rumors from time to time of an amalgamation of the Teck-Hughes and the Orr. As the properties adjoin and the same vein runs thru both this would seem to be the logical thing; but officials of the Orr state that there is "nothing doing", although the property is open for sale.

Porcupine Prospects

Crosscutting has been started on the 125-foot level of the Rochester property in Porcupine, which adjoins the Hollinger, and it is expected that several veins will be intercepted.

The Paymaster reports the discovery of rich ore on the 300-foot level. Officials state that there is sufficient ore developed in the mine to justify the erection of a mill.

The Bison Gold Mines, Limited, has been formed to take over a group of properties lying between the Paymaster and the Clifton.

Skead Property Optioned

A. D. Miles, on behalf of English capital, has taken an option for $250,000 on the property of the Skead Gold Mines.

Shaft on Hurricana Property

Preparations are being made to sink a 500-foot shaft on the Martin property in the Hurricana district Quebec, which is under option to J. J. Godfrey and associates of New York.

NOVA SCOTIA

THE MINE EXAMINER'S WORK

To examine a mine in the dead of night when men are out of it and everything is still except the falling of a piece of rock or coal is responsible and weird work. Accompanied by his boy (for in Nova Scotia the Mining Act gives every examiner a companion to give warning in case of accident and help in other ways), the preliminary walk of two or three miles is hastily made and the examination begun. The work must be finished within the prescribed time of three hours, if gas has been found in the mine within three months.

Gas Detected by Safety Lamps

If the walk has been along the return airway, care has been taken to make frequent tests of the mine atmosphere to find out what percentage of mine gas (CH_4) it contains. When the working sections are reached the examination of the working faces begins. Here the flame of the safety lamp, which at best gives only a dim light, is lowered to a length of, say ¼ inch. Care must be taken in walking, for the slightest mis-step or stumble puts the tiny light out, and the floor of the working face of a coal mine where coal in blasting has been thrown out in all directions is not as smooth or clean as that of a house.

The lamp is now held is a position where the trained eye of the examiner can note the slightest change, either in the length or the color of the flame. Gently the lamp is raised towards the roof. If gas is present, it burns with a blue cap directly above the flame. Before this occurs, however, the flame may become slightly elongated or it may be seen to jump as if jerked upward by some unseen force. This is the effect of mine gas and if the examiner keeps pushing his lamp into the gas instead of slowly withdrawing it, the lamp fills and an explosion takes place within that puts the light out. It is only the inexperienced workman who bungles at such a critical time and place.

In former days, before self-lighting lamps were made and examiners did their work alone, to get "into the dark," as miners say, meant a walk of possibly a mile or more through the dark chambers of the mine to a re-lighting

station; so examiners had to be very careful to keep their lights. Sometimes the mine laws or rules permitted the examiners to carry a lamp key and matches, but there came to be a strong suspicion that more than one explosion was caused by examiners opening and lighting their lamps while in the gas zone, although they evidently believed they had crawled far enough out of it to be safe. Mine explosions in such cases leave little evidence of the cause except an open safety lamp, and these have been found.

Black Damp to Extinguish Mine Fires

Black damp (CO_2) is another gas common to Nova Scotian coal mines. Its effect on a light is to extinguish it; but men can live where a light dies out so there is ample time to retrace one's steps should the light be seen to grow dim and slowly go out. Great bodies of this gas gathered during the days of the strike, but as its only danger is from suffocation it is not feared as is the more inflammable methane (CH_4), which haunts the higher places and is always found there. Indeed, black damp is rather welcomed in a mine subject to spontaneous combustion, and there are mine managers in Nova Scotia who are experts in damping out mine fires by means of using carbon dioxide. As the specific gravity of this gas is much greater than firedamp, a change in the atmospheric pressure is immediately felt.

Oil Used is Important

When gas is found it is reported in the day book, the place, kind and quantity being noted. This requires experience and a thorough knowledge of the type of safety lamp and the kind of oil used. The lighter oils such as kerosene, gasolene, and naptha, while detecting lower percentages of gas in the mine atmosphere are, because of their high temperature flame and the inflammable vapour or gas given off within the lamp, less reliable and more confusing to the examiner than the heavier oils, such as sperm and vegetable. The trained examiner, given any type of lamp or any oil or compound, quickly becomes accustomed to them and can within a very short time give a report correct enough for all practical purposes of the gas found in the place examined.

The reporting of the examiner has undergone changes like many other things, and more up to date methods of reporting are being worked out. With a standardised safety lamp examiners will be expected to give the exact quantity in feet of gas found in any one place while conducting their examinations. This is a long departure from the daily report of former days, in which the examiners stated that indications of gas had been found. One day a mine manager, puzzled by the vagueness of one of these reports, placed a footnote on it asking what an indication of gas was. Since then, gas, or no gas, has been reported.

Low atmospheric pressure permits of an outrush of gas from the gobs and a greater diffusion of gas from the coal face. Nova Scotia mine examiners know this and have been taught to take the barometer readings and to search for gas in unexpected places during times of low pressure. This is an extra precaution found necessary by practice, although theory is far from unanimous that atmospheric pressure makes much difference at the mine face. It does make a difference, however small it may be, and that is the reason why a greater amount of gas is actually found at such times.

Precautions for Safety

The word "Danger" written on a Board or any other plane surface underground, especially near the working faces, has a most startling and arresting effect. There is no miner so reckless as to try to pass this warning, for lurking unseen is his subtle enemy, mine gas. He fears it, and not without reason. If large bodies of gas are present he prefers to be out of the mine when they are being removed. He knows that a slight injury to a safety lamp may cause an explosion and he prefers to take no chances except when necessary. Millions of feet of gas were safely removed from Cape Breton collieries when the great fans were got going lately, and in a day or two the reports of the examiners showed all clear. The dangerous practice of walling off large bodies of gas is not permitted in Nova Scotia collieries.

In addition to the regular examiners there are the Company inspectors and the government inspectors. These latter have large powers. They supervise everything and everyone, from the trapper to the manager, and from the surface to the farthest recesses of the mine.

Sometimes the miners of a colliery become doubtful about the condition of their colliery. They believe it to be dangerous. Provision has been made by which a committee of workmen may enter and inspect the mine and report to their fellow workmen. This gives confidence and men become satisfied and work without fear.

Some one once said that no coal mine is ever absolutely safe, and no mining men will deny this. Acting on this assumption, every known precaution is taken to make them safe, and if at times workmen voice any suspicion of unsafe conditions, they are welcome to make inspection. For no matter how much men and management may differ on other matters, safety is the first consideration for all.

Bunker Trade Active

When the strike ended, a large number of vessels were in Sydney harbour, waiting for coal. With the steam shovels going in the coal heaps and the output of the collieries becoming normal in the first few days, these were quickly loaded. In their absence coal was placed on the coal heaps. At it appears at present, both the Company and the miners are going to make up some of the losses due to the strike, and by the end of the year the Eastern coal market should be fairly well filled.

Short Strike at Toronto Mine

Considerable agitation took place at one of the smaller collieries, the Toronto mine, over the placing of men, and a short strike ensued. But when matters were explained by the Executive, work was resumed.

To Regain Montreal and St. Lawrence Market

The agreement between the Empire Steel Corporation and its employees has not yet been signed, although it is in the hands of the Executives of the men. It takes some time to discuss the large number of class rates and to consider the changing conditions at the different collieries. There is, however, no apprehension in the minds of those directly interested as to its final ratification by both parties. What some are asking is how far it will permit of steady employment in certain districts. Cape Breton, especially the Glace Bay district, is the one where conditions are most favorable and where the outputs are large. Here at least all expect more continuous work. The renewed activity at the steel plant will do doubt give more employment at the collieries. But all eyes are looking to the Montreal market to greatly increase its buying of Nova Scotia Coal, and there will be considerable disappointment if at the end of the year a large trade has not again been found in the Province of Quebec.

BRITISH COLUMBIA

Important Copper Deposit at Sidney Inlet

Important developments are reported from the Tidewater Copper Co. Ltd., Sidney Inlet, Vancouver Island. There is a large body of ore, assaying 2 per cent. copper and carrying a little gold and silver, blocked out on the Indian Chief Claims that will keep the concentrator in feed for at least two years. As soon as sufficient water is available, and this should be the case within two weeks, the mill will be put in operation. A crew of miners is being engaged and will be put to work immediately.

About a year and a half ago a new body of ore, locally known as the "Price" deposit, was opened up on the Indian Chief by diamond drill. This was discovered on No. 2 tunnel level at an elevation of 1550 feet and about 800 feet nothwesterly from the portal. This was in virgin ground and since then it has been developed by opening drifts and crosscuts and an upraise and is proved for a length of 230 feet on No. 2 level and to a heighth of 170 feet. Between March and May last some 6,000 tons of ore from this body have been mined and concentrated. In May the mill was closed down owing to dry weather and since then the ore body has been developed for an additional depth of 890 feet below No. 2 level and for a length of 200 feet.

With this ore in sight and fall rains supplying water, the management are looking forward to the immediate future with satisfaction.

Reported Sale of Engineer Mine

It is reported from Atlin, B.C. that the Engineer Gold Mine has been sold to the Timmins interest of Ontario. This information appears to be based on the fact that some representatives of Timmins Brothers were on the property this summer. No figure is mentioned. It is clear, of course, that any sale would be contingent on the outcome of the present lawsuit between the heirs of Captain James Alexander and the old Engineer Mining Co.

Trail Ore Receipts

Ore receipts at the Trail Smelter, Canadian Consolidated Mining and Smelting Co. for the week ending August 31st totalled 12,131 tons. Twelve mines contributed, in addition to the mines of the Company. The Monarch of Field, made its first shipment this year. Shipments were made by four Slocan mines, the Silversmith contributing 191 tons of lead and 178 tons of zinc concentrate. The Company mines shipped 10,988 tons.

Strike near Grand Forks

An important strike is reported to have been made on the Maple Leaf mine, in the Franklin Camp near Grand Forks. It is the intention to sink 50 ft. and to drift to determine the size of the lead. Assays are most encouraging.

Asbestos near Yale

Two deposits of asbestos are reported in British Columbia. One of these is located in the Yale District about 80 miles from Vancouver. The owners says that his development and investigation has convinced him that his property can be made of commercial importance. Another body much similar in character also has been reported to officials of the Vancouver Chamber of Mines.

Kitsault Valley Trail

Considerable work in trail construction has been done in the Upper Kitsault Valley, Alice Arm, this summer. The most important undertaking is an extension of some length beyond the inland terminal of the Dolly Varden Railway. This, it is hoped, will be completed before the snow flies. It will furnish means of transportation to a number of promising prospects.

Railway for Portland Canal District?

Charles F. Caldwell, well-known mining operator and a prominent Zionite, has returned after an inspection of some Portland Canal prospects. He holds a charter for a railway up the Salmon Valley and states that he may have some interesting announcement to make soon relative to the construction of the road.

2,000-foot Tunnel in Portland Canal District

J. C. Weir of Weir Brothers & Co., New York, and R. I. Claus, also of New York, recently returned after inspecting the Daly-Alaska group, Portland Canal, now under bond to Pat Daly. Mr. Weir states that a 2,000-ft. tunnel will be driven and other important development undertaken. Mr. Weir spoke highly of the mining possibilities of the district and commended the Governments of British Columbia and Alaska for their enterprise in road building.

Synthetic Nitrate Plant

Plans are being formulated for the development on a large scale in British Columbia of nitrogen products by the synthetic method that will make Canada independent of outside sources for its supply of nitrates. C. F. Graff, President and General Manager of the American Nitrogen Products Co. states that the Company's plant at Buntzen Lake is only a beginning. The concern has in view the establishment of a plant with its own water power and has secured deposits of natural soda and limestone in different parts of the Province. There are deposits of this nature of considerable size near the town of Clinton on the P. G. E. Railway. Others exist on Texada Island in the Gulf of Georgia.

Three-year Agreement by Negotiation

Underground employees of the Western Fuel Corporation Ltd., Nanaimo, B.C., are preparing the basis for a new agreement with their employers which, it is the intention, shall subsist for three years on and from the 1st of October next. Their desires have been placed in the form of a Report which will be submitted to representatives of the management and are interesting, not alone because of the several demands made, but as well as illustrating the amicable and even friendly relations that appear to exist, at present at least, between the men and the company.

As to the matter of wages, and the payment rates on rock work, timbering etc., the men, of course, are asking for increases. These phases of the Report are open to negotiation and there is every reason to believe that on such points an understanding, satisfactory to both sides, will be reached. One of the gratifying features to those desirous of seeing the industry maintained on a productive footing is to find that provision is made for the permanent establishment of an Agreement Committee which, it is proposed, shall hold monthly meeting with a similar body to whom the management delegates authority. Before these two Committees, or rather this joint Agreement Committee, will come everything of a contentious nature

for settlement and, in this connection, the following striking phraseology is used:

"—it being distinctly understood that there shall not be any stoppage of work by employees, individually or collectively, pending the hearing of and adjusting of any dispute or grievance during the term of this Agreement."

The men ask that they be paid a standing bonus of $1.25 a shift per man in place of the present bonus of 88 cents granted by the Cost of Living Commission. If this cannot be done they want a 10 per cent advance on the base rate together with the present bonus. The Company is requested to agree to a minimum rate of $4.25 and bonus per shift for miners in all mines covered by the proposed Agreement, the Agreement Committee of Miners to be judges as to the ability of the miner to earn such minimum. Schedules of rates of pay for rock and timber work are detailed. A six hour day for Saturday is sought and it is provided that employees shall be able to buy the best quality of domestic coal for $2.50 a ton. To those living outside of coal mining centres, who have to pay from $12.00 to $14.00 per ton for their coal, it would seem that there are some compensations to place against the hazards of a miner's life.

Old time Coal Mining

Conditions have vastly changed in the last half to three quarters of a century for those engaged in coal mining on the Pacific Coast. Memoirs of ex Mayor Mark Bate, of Nanaimo, B.C., show that old timers of that town received seventeen pounds sterling per year and rations for coal mining. They were imported from England by the Hudson's Bay Company. The twelve hour a day working schedule prevailed.

Mr. Graham Thanks Coal Miners

Mr. Thomas Graham, general superintendent of the Canadian Collieries (D) Ltd., has published the following statement, which explains itself.

"Kindly give me a small portion of your space to convey to the injured and the relatives of the dead in our recent deplorable accident (the explosion at No. 4 Mine, Cumberland is referred to) the sincere sympathy of the President, Directors and Management of the Canadian Collieries (D) Ltd.

"To express the appreciation and thanks of the Company and its Official Staff to all who in any way rendered assistance and sympathy.

"To those who volunteered their services, whether outsiders or employees, we feel deeply indebted.

"To mention any one in particular, where so many responded and did so well, would be invidious, yet we cannot refrain from special reference to Miss Ballati, of the local Hospital Staff, who in keeping with the best traditions of her profession, forgot self and entered the mine immediately following the disaster, and with the Medical Staff rendered such timely and signal First Aid to the suffering injured.

"To our employees we also desire to express our sincere appreciation of the hearty and almost unanimous response to the call for work on Labour Day.

"Realizing that of all days in the year Labour Day is specially your day it was with deep regret and only under most urgent circumstances that the call was made.

"Your hearty response was another tribute to that spirit of toleration and co-operation that has dominated all of your relations with the Company during the past five years."

Boring in Copper River Coal Field

Exploration of the Copper River Coal Fields, northern British Columbia, is proceeding with satisfactory results. The first bore struck the seam at between 600 and 700 feet. Two more test bores are to be sunk. These fields are situated in the vicinity of the Grand Trunk Pacific Ry.

Disagreements all Settled

All union coal miners are back at work in District 18 (Eastern B. C. and Province of Alberta). The last dispute in this section was between the men and the management of the Big Horn and Saunders Creek Collieries. An agreement, however, now has been reached as to the "check off" and the mines of the district all are producing again.

Mine Accidents

A small cave-in at No. 1 South Mine, Crow's Nest Pass Collieries, recently killed a miner named Dan Bodak. George McAndrew, his partner, was injured.

A fire Boss and a miner were killed at No. 5 Mine, Middlesboro Collieries, Nicola-Princeton District, by a cave in on September 13th.

Investigation of Mine Explosion

While the results of the inquiry into the cause of the disaster of August 30th, which occurred in the longwall workings off the slope of No. 20 East Level, No. 4 mine of the Canadian Collieries (D) Ltd. near Cumberland, B.C., have not been announced, the opinion is generally held that the explosion had its source in the ignition of gas in a cavity on the side of the roadway. It is known that the electric wiring connecting the coal cutter was dislocated, and whether there was a flame at this time that was responsible, or whether there was a shot fired that ignited the gas, are points that are expected to be cleared up. Three white men and fifteen Oriental underground workmen lost their lives in the outbreak and, at the Coroner's Inquest held on Friday, September 8, a verdict was brought in that the deaths were the result of "suffocation and burns." Examination of the workings has been made both by George McGregor, Chief Inspector of Mines, and George Wilkinson, mining engineer and former Chief Inspector for British Columbia. Their reports, it is understood, are in course of preparation. The mine has been repaired and the colliery is again on a production basis.

Outbursts of Mine Gas at Cassidy

George S. Rice, of the United States Bureau of Mines, who has been in British Columbia on unofficial business relative to gas outbursts in the Cassidy (Vancouver Island) coal mines, Granby Consolidated Mining and Smelting Co. Ltd., has left for the East. It is understood that Mr. Rice was engaged by the Company to make an examination of underground conditions at Cassidy and submit recommendations as to how best to deal with serious operation problems with which the management has been faced of late. The outbursts referred to have been occurring with more or less frequency of late. They give little warning and dislodge considerable amounts of coal. Although the measures taken have protected the men, as a rule, there have been fatalities. The British Columbia Department of Mines has been investigating the problem, and the Company, appreciating the necessity for action, has called in Mr. Rice, one of America's acknowledged authorities.

The Dominion Bureau of Statistics states, in its advance summary of coal imports for the first eight months of 1922, that for anthracite coal, a total of a little over a million tons has been imported as against three million average during a like period in 1919-1920-1921. Bituminous coal totalling three and one-half million tons has been imported, which is half the average for the former years. Exports total a million tons, which is three-quarters of the normal amount exported.

To Holders of Five Year 5½ per cent Canada's Victory Bonds

Issued in 1917 and Maturing 1st December, 1922.

CONVERSION PROPOSALS

THE MINISTER OF FINANCE offers to holders of these bonds who desire to continue their investment in Dominion of Canada securities the privilege of exchanging the maturing bonds for new bonds bearing 5½ per cent interest, payable half yearly, of either of the following classes:—

(a) Five year bonds, dated 1st November, 1922, to mature 1st November, 1927.

(b) Ten year bonds, dated 1st November, 1922, to mature 1st November, 1932.

While the maturing bonds will carry interest to 1st December, 1922, the new bonds will commence to earn interest from 1st November, 1922, GIVING A BONUS OF A FULL MONTH'S INTEREST TO THOSE AVAILING THEMSELVES OF THE CONVERSION PRIVILEGE.

This offer is made to holders of the maturing bonds and is not open to other investors. The bonds to be issued under this proposal will be substantially of the same character as those which are maturing, except that the exemption from taxation does not apply to the new issue.

Holders of the maturing bonds who wish to avail themselves of this conversion privilege should take their bonds AS EARLY AS POSSIBLE, BUT NOT LATER THAN SEPTEMBER 30th, to a Branch of any Chartered Bank in Canada and receive in exchange an official receipt for the bonds surrendered, containing an undertaking to deliver the corresponding bonds of the new issue.

Holders of maturing fully registered bonds, interest payable by cheque from Ottawa, will receive their December 1 interest cheque as usual. Holders of coupon bonds will detach and retain the last unmatured coupon before surrendering the bond itself for conversion purposes.

The surrendered bonds will be forwarded by banks to the Minister of Finance at Ottawa, where they will be exchanged for bonds of the new issue, in fully registered, or coupon registered or coupon bearer form carrying interest payable 1st May and 1st November of each year of the duration of the loan, the first interest payment accruing and payable 1st May, 1923. Bonds of the new issue will be sent to the banks for delivery immediately after the receipt of the surrendered bonds.

The bonds of the maturing issue which are not converted under this proposal will be paid off in cash on the 1st December, 1922.

W. S. FIELDING,
Minister of Finance.

Dated at Ottawa, 8th August, 1922.

EDITORIAL

So let the farmers have for themselves the fruitful fields and cultivate the fertile hills for the sake of their produce; but let them leave to miners the gloomy valleys and sterile mountains, that they may draw forth from these, gems and metals which can buy, not only the crops, but all things that are sold.—Georgius Agricola—1550. (Hoover's Translation.)

A FORECAST

The results of long-continued and systematic research into the possibilities of the low temperature carbonization of coals and lignites are dispassionately reviewed in the Report of the Fuel Research Board (Great Britain) for the years 1920-1921. *Inter alia*, it is apparent that the public claims of enthusiasts and promoters of special processes must be seriously discounted. The Board's Report serves a good purpose in stripping away all fancies and placing facts, and facts alone, before us.

So far as present knowledge goes, the standard yield of one ton of bituminous coal, under low temperature (600 deg. C.) treatment is approximately as follows:

Yield of coke, pounds	1,500
Yield of crude oil, gallons	15
Yield of "liquor", gallons	11
Yield of ammonium sulphate, pounds	6.5
Yield of gas, cubic feet	3,250

These figures, of course, will vary within fairly wide limits; but they may be taken as typical of the larger range of coals that are now amenable to low temperature carbonization. This range has been made much wider by the discovery that the admixture of "non-caking" and "caking" coals gives good results and tends to facilitate the control of operations.

In Canada we continue, despite shortages and all the dictates of common sense, calmly to waste irreplaceable fuel by direct firing. No refinements of practice can make this method economical for it is in essence an extravagance. Can any consideration palliate the stupidity of being content with one fifth of the potential energy that we *can* get out of coal?

The industrial centres of Canada at which domestic fuel suitable for low temperature carbonization is available are Halifax, St. John, and the smaller cities of the Maritime Provinces, Quebec, Montreal, Edmonton, Calgary, Regina, Saskatoon, Vancouver and Victoria, with the possible inclusion of Winnipeg. In other words all of Canada, excepting Ontario, can within ten years, be made self sustaining in the items of industrial fuels, including gas, fuel oil and gasoline. In addition, enough lubricating oil could be produced to supply the whole country's needs, and sufficient coke for all purposes.

Let the reader pause here and digest the fact that this is not a dream. It is the goal that leaders of technical thought in Great Britain are yearly and daily approaching.

Also it is the goal that we Canadians must win to, if we have any trace of ambition and self respect.

THE PROVINCIAL GEOLOGICAL SURVEYS

The Provinces of our Dominion gradually are becoming equipped throughout with organized geological surveys. Ontario's department of Mines, now in its thirty-first year, has conducted geological investigations since its earliest years. At first the geologists retained for this work were borrowed for the summer season from the colleges. With the appointment of Dr. W. G. Miller as Provincial Geologist in 1902, a permanent geological staff was commenced that now has grown considerably. With the aid of those of the Department's staff whose duties are principally with the mines themselves, and with their members supplemented temporarily during the summer months, the geologists of Ontario now cover effectively the mining districts of the province. Their numbers could be increased materially with great benefit to the Province's mining industry; but meantime their aid is most effective, and is much appreciated.

In British Columbia, the local Department of Mines confines its activities to the aiding and regulating of actual works of prospecting, development and mining. Geological survey work is delegated to the federal Survey. The establishment of a local branch of the Geological Survey in British Columbia, with resident staff, and all but autonomous in its operation, has had virtually the same practical result as is attained in Ontario. Productive mineral areas are mapped in detail and their geological problems studied and solved, with the result that the miner has the advantage of whatever direction can be afforded him by geological science in opening up and following his ore bodies.

Alberta has now a well established geological survey through its activities are somewhat shrouded in mystery under the name of its executive body, the Scientific and Industrial Research Council of Alberta. What we would judge to be a systematic and [illegible]

commenced by officers of this department with the object of making immediately available the aid of geological science in the commercial development of the province's minerals.

The Government of Saskatchewan has shown as yet no intention of appointing a permanent geologist to its staff. Its mining industry is still embryonic, or rather, it is still in the germ stage. Still, it is more than likely that its growth would be stimulated, immediately and to a notable degree, were a competent geologist retained to enquire carefully into the resources available and to point out to prospective operators and investors the proper way of utilizing this potential wealth. There is plenty of precedent for expecting a successful result from such an appointment.

The recent mineral development in Northern Manitoba has resulted in a considerable amount of geological surveying on the part of the government in Winnipeg. There still remains to be effected, however, that formality of organization that will put this work on a basis of permanency and thus give its officers that opportunity for uninterrupted and consistent effort which alone will bring the best results.

Quebec was the first part of Canada to yield a treasure of minerals to the early settler, and still its mineral production ranks high among the provinces. But its early promise has not been fulfilled as yet. Perhaps as a result of this, or perhaps as one of the causes of this, the province has no geological survey. For many years geologists have been retained for a season's work; but this work has no permanency, and as far as one can see, leads to no definite goal. The potential value of Quebec's mineral industry is now, as always, very great. We are confident that the day of its realization would be materially hastened by the efforts of a competent geological staff whose exclusive concern was the development of Quebec's mineral riches.

New Brunswick is almost "terra incognita" to the miner. Areal surveys have determined sufficient of the stratigraphy and of the principal igneous intrusions to present a plausible appearance on the geological map. So little interest is shown in mineral possibilities by the resident population that there is little incentive for even that small share of attention due the province from the Geological Survey at Ottawa. We have had recently a pronouncement from the Director of that Survey as to some of the possibilities of New Brunswick as a mineral producer. This may help to stimulate an interest that has never yet been commensurate with the opportunity.

At one time Nova Scotia ranked as the most promising mineral area of its size in Canada. Today its mineral production consists of little other than coal. True, private initiative, principally transferred from the coal and iron-ore operations, is slowly becoming apparent here and there, but on the whole, the province is doing little to work out the salvation of its promising mineral areas. We need not repeat the suggestions made so recently in these columns.

Until the inhabitants of "The Island" succeed in proving either a coal seam or an oil pool beneath their fertile soil, their nearest approach to the subterranean excavations of the miner will be digging their famous potatoes. We do not believe that the supervision of these operations will require a large staff of geologists.

Throughout all the provinces, and supplementing and co-ordinating the work of all the provincial bureaux and surveys, are the Geological Survey and the Mines Branch at Ottawa. Their range of vision must cover the broad expanse from Atlantic to Pacific. Only they can study and work out Dominion-wide problems, and there are plenty of these to occupy the attention of their staffs. To the provinces must fall the task of solving provincial problems, particularly those directly concerned with the local mineral industry. To this end each province must, and will in time, provide a local geological staff commensurate with its needs.

RESULTS BY CO-OPERATION

Among the numerous interesting papers at the meeting last week in Montreal of the American Electro-chemical Society, none was more suggestive of live ideas or more fruitful of animated discussion than that of Mr. E. F. Collins on *Electric Heat: Its Generation, Propagation and Application to Industrial Processes.* After delineating briefly the scope and the means of applying electric heat industrially, Mr. Collins stressed the point that engineers skilled in the design and construction of electric heating devices have now such a firm grasp of the fundamental principle involved and of the practical requirements to be met that they can conduct their work with the utmost precision. This is a long advance from the electric furnace design and construction of even a very few years ago, when trial and error guided most of the effort, and when error followed trial much oftener than did success. The electric furnace is a comparatively new heating device, and it is highly satisfactory to know that the principles of its construction and operation have been mastered at so early a period in its career. This career is, we are confident, at present merely beginning, and will be, in Canada particularly, long and useful.

Mr. Collins' remarks on the present perfection of electric furnace design and control at once brought a rejoinder from a number of practical users of such furnaces. Their point was clearly put when it was remarked that their work in the plants required a dray horse, capable of long-continued and strenuous exertion, while they were furnished with a blood horse, sensitive, quick to learn, and capable of wonderful exhibitions, yet useless, for their purpose. This divergence between the man of science, even of applied science, working in a laboratory or under ideal conditions, and his fellow scientist in the commercial works, is typical and is a fruitful source not only of argument but of serious disagreement. Those that arranged this discussion in open meeting of the American Electrochemical Society, where good fellowship and mutual understanding are bound to prevail over the feelings that

would lead to serious disagreement and misunderstanding, have employed wisely the old-age British principle of free speech and open debate.

If there is one means more prominent than any other for promoting the modern spirit of co-operation in industry, it is the periodical meetings of technical societies. Their name is legion. No industry of any consequence now lacks this evidence of cohesion. Some people think there are too many societies; perhaps there are in some spheres of life. But in the realm of scientific and industrial endeavor, these societies are primarily a means of "getting together," and the more we get together, the better it is for us, individually and collectively.

One of the potent agencies in promoting this "get together" spirit in modern industry, particularly on this continent, is the growing proportion of college-trained men in the ranks of industry. With the ranks of pure science completely filled with men permeated with the fraternal spirit acquired in college, and with the forces of industry guided by an ever-increasing proportion of leaders trained in the same halls of learning, the old-style exclusiveness and secrecy that has hampered the progress of industry for so long is becoming rapidly a thing of the past.

Our own Canadian Institute of Mining and Metallurgy may well take a leaf out of the book of the American Electrochemical Society. We have, possibly, in the past been accustomed to proceedings that are principally of technical and academic interest, or that lead to controversy that is more interesting and amusing than of national importance or of prime interest to the mining industry, or that are disjointed and without the force resulting from concerted, constructive thought. Our industry, like our Dominion, is young and unformed, and is growing by leaps and bounds. There are many live questions that confront us. Let us search out the more important of these, and apply ourselves vigorously to their solution. A well organized symposium is one of the most effective means to this end. Our Institute has the power, if it will, of regulating and directing wisely and well the whole course of our mining industry.

THE SILVER DISCOVERY IN THE DISTRICT OF PATRICIA

When the phenomenal silver veins of Cobalt were disclosed, eighteen years ago, it was freely predicted that they would not prove unique, and that the broad expanse of similar rocks in Ontario and Quebec would be found to contain other such deposits. The occurrence of somewhat similar ore at Silver Islet in Lake Superior and on the mainland adjacent and of numerous other deposits of merely scientific interest in widely separated localities gave a good basis for this belief. Up to the present the promise has been fulfilled only in the case of the few operating properties of the Gowganda district, though "indications" of similar ore have been found in many places.

Still the search for a second Cobalt goes on. The latest reported discovery, at Red Lake, west of Lac Seul in the District of Patricia, north of Kenora, Ontario, may or may not be the long-sought prize. Though native silver is not reported as present in abundance in the veins, it is possible that the sulphides of lead and zinc, and the higher-grade ores of silver reported, may carry enough silver to make the narrow veins workable even in that distant locality.

A disturbing feature of the case is that a competent observer who has examined recently the veins so far discovered is not able to corroborate by any means all the statements that have been made about them by the prospectors. It is the easiest thing in the world to become over-enthusiastic about a new and promising "find". It is the judgment of a capable and disinterested observer that must be given most weight in such a case. We have had the conclusion of such an one and now must "wait and see", until more prospecting and development have been done and more of mother nature's secret disclosed.

EDITORIAL NOTE

Today we print, once again, an appeal for a more effective organization of scientific research throughout our Dominion. This might seem to be unnecessary, in view of the belief, now wide-spread, of the efficacy of research in stimulating and aiding profitable industrial enterprises, as well as in helping the prime producer, be he farmer, miner, lumberman or fisherman. The sad fact is that, though there is a vague idea of the value of research it is applied as yet in concrete instances to such a small extent that Canada tends to lag behind the rest of the world by reason of not seizing her opportunities promptly and with intelligence. Research is the intelligence service of the advancing army of industry, as well as its engineer corps to clear the roads and build bridges. We make no apology for harping constantly on our need for more, and better, facilities for research.

TO THE LUSTY LEGUME

I sing the Bean, the lowly, wholly Bean!
Not the emasculated legumine
One sees in cities on the pantry shelf,
But that whose virtue speaks for its own self.

O, Blessed Bean! How often have I ate
Whole plates of Thee, my hunger to abate!
And Thou abatedst it, Thou didst indeed,
Thou ever over-satisfying feed!

How oft have I devoured Thee, piping hot,
From out deep beds of ashes, in a pot
That had been buried there the live long night!
That, that's the way you taste exactly right

And I have had you bitter, bitter cold,
When boreal breezes blew o'er weald and wold
In fact, although your qualities are such,
I've had you, Bean, a trifle too darn much!

ANON.

Oil and Water

ARTESIAN WELLS AID IN LOCATING OIL "STRUCTURES" IN SOUTHERN ALBERTA

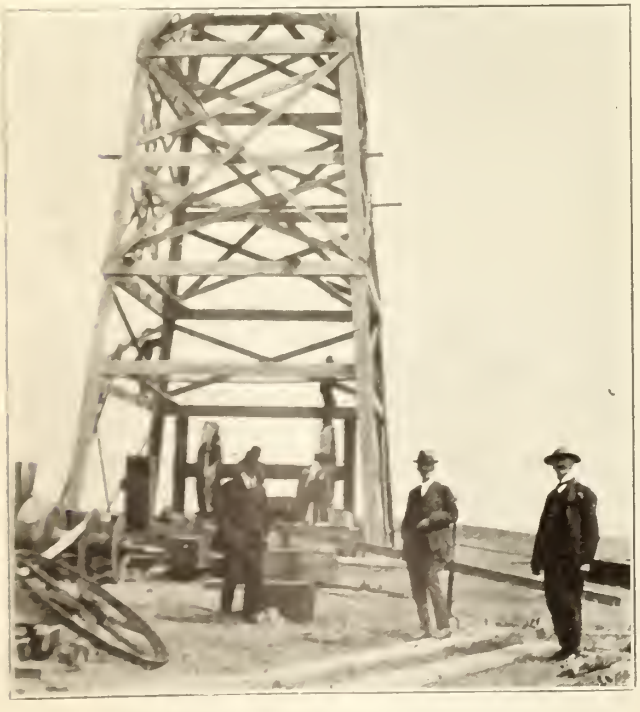
The field staff of our Geological Survey are the source of a vast amount of original information, useful particularly to those of the mineral industry, but likewise to the public at large. Seldom, though, does it fall to the lot of a geologist to perform a direct and indubitable public service of large monetary value, such as that done by Dr. D. B. Dowling recently for the farmers on two million acres southwest of Lethbridge, Alberta. That this service was purely incidental to Dr. Dowling's prime motive in examining the district makes it none the less notable; in fact it demonstrates once more the value of general scientific research, whether conducted in the field or in the laboratory.

Geological Reconnaissance

It was in 1915 that the oil boom, centred in Calgary, spread as far southward as the international boundary. In that year Dr. Dowling examined on behalf of the Geological Survey the area south and southeast of Lethbridge, with a view to possible oil production. The principal data required for such a purpose are the age and character of the rock strata within reach of the welldriller's tools, and "structures" such as might collect and confine the minute particles of oil, moving slowly through a porous stratum, in "pools" of commercial importance.

During this stratigraphic study, Dr. Dowling determined that a stratum of soft, porous sandstone that outcropped in the valley of Mill river, just north of the international boundary, dipped at a low angle beneath the plain to the north, reaching a depth of 600 to 900 feet as it approached the railway, 60 miles northward. The prairie in this part is devoid of streams or lakes that could be used for a domestic supply of water, and the rainfall during the summer season is so uncertain that it cannot be depended upon to fill reservoirs. All attempts to get water by means of ordinary wells had failed, and the settlers of the area had a very precarious existence.

THE INTAKE — Remnants of Bed of Soft, Porous Sandstone in the Valley of Milk River



The McLean Outfit Under Construction

The First Artesian Wells

The geological reconnaissance did not mark the commencement of an oil boom in the district; but it did provide water. Dr. Dowling reported officially to the Geological Survey that artesian wells would, in all probability, be found if bore-holes were put down to the Milk-river sandstone, a distance of 600 to 900 feet below the surface of the prairie throughout an area of a million acres, which he delineated. Some unbelievers in Lethbridge publicly derided this prediction, classing it almost with the notorious hazel switch divination of water "doctors". Then came a pretty little show-down. Our geologist undertook to find the water if his detractors would assure the goverment of the need for water and the importances of demonstrating by actual drilling the soundness of his theoretical deductions. Money was voted forthwith, and as quickly as holes could be bored, three first-class artesian wells, at widely separated points within the million acres specified, were providing the lifegiving fluid as predicted.

The Present Oil Boom

So much for the water. Now we shall return to oil. The next boom was staged in Montana, south of the artesian area. A year ago the Campbell well near Kevin, a wild-cat, found at 1770 feet depth. Mr. Campbell was such an effective promoter that the excitement waxed and a number of other wild-cats were

put down. The first of the lot proved to be a gas well but in June, another, only eight miles from the Campbell well, really found oil. Since then five good wells have been found, within ten miles of the international boundary. This is such recent history that the sequence of events is still in mind.

At present there are a number of new wells being put down on the Montana side. Some are likely to bring gas only, as they are near the top of the dome that is providing oil for the producing wells. On the Canadian side, excitement grows apace. At present there are eight outfits drilling near the boundary, as follows:
Livingston-Mc Lean—Section 1, township 1, range XV
Somerville—Section 2, township 1, range XV
Baalim—Section 2, township 1, range XV
Mc Lean—Section 10, township 1, range XV
Bow Island—Section 15, township 1, range XV
Philips—Section 24 township 1, range XV
Imperial Oil—Section 5, township 1, range XVI
Border Oil Co.—section 6, township 1, range XV

All these wells are on an anticline dipping gently northward from near Kevin, where its top is. This anticlinal area underlies the Sweet Grass Hills of Montana, just south of the border. To the east of this are East Butte and West Butte, igneous intrusions that appear on the surface as conical mountains. A well put down just north of the West Butte in 1911 brought in "vaseline"—it was too close to the intrusive rock for oil. An American company is now preparing to test the ground north of East Butte, which is adjacent to the border south of Lake Pakowki. However, it is considered at present that the main chance for oil is in the principal anticline, stretching northward from Kevin in Montana toward Taber, on the Canadian Pacific Railway in Alberta.

Artesian Wells And The Geologist

In order to study in some detail the geology of this anticlinal are, Dr. Dowling had recourse to the artesian wells. He travelled the artesian area systematically, and located 115 wells. From the farmers and from the records of the well drillers he obtained the depth at which water had been struck. This marked, of course, the depth at 115 points of the water-bearing Milk River sandstone. The elevation of these wells was determined by reference to bench marks in the township surveys, and thus the contour of the strata, hundreds of feet underground and invisible at the surface, was worked out. Of course the data obtainable from these drill holes is fragmentary, and some of the conclusions are merely tentative. Still, there have been determined within the area of the major anticline a number of minor "structures" favourable to the accumulation of oil, and the work of exploration for oil can now be conducted wth considerably more precision then heretofore. The more promising locations delineated are all within this anticlinal area. The Lake Pakowki area, where some work of exploration is in progress, is on the flank of this anticline and its chances for production are less. A deep well drilled just west of the lake showed only tar sand,—a mere residuum of the oil that filled the porous rock before its migration.

Thus we have a complete demonstration of the utility of the man of science, even of pure science, to the workaday world. The geologist in this instance predicted a great extension of the gas field and nearly hinted the possibility of oil; but he demonstrated the feasibility of providing water for the homes, the cattle and the gardens over an area of two millions acres. Without these artesian wells, those acres would revert again to open pasture land. The drilling of the wells has provided our man of science with a further opportunity for forwarding the interests of the district. He is not able to predict the future of oil production so positively as he was able to do in the case of the artesian wells. If the hoped-for flow of oil from the deep strata beneath should be even the merest fraction of the present flow of water from the Milk River sandstone, then Canada will have taken a long step forward in the direction of adequate domestic oil production.

THE OUTFLOW — Artesian Well, 35 miles North of Milk River, Tapping the Same Bed of Sandstone

THE OVERFLOW — Artesian Well, Irrigating a Garden in the Dry Belt

CORRECTION

On page 621 of the issue of Sept. 15th, there is an obvious mis-print that makes confusing one of the tables demonstrating the Hollinger record of production. The first line of the table, *Hollinger July August Figures*, is repeated in the succeeding table *The Year to August* 12. In the latter table the figure of *tons milled* is actually 904,882.

Research in Canada

MORE SYSTEMATIC AND MORE INTENSIVE RESEARCH WORK NEEDED

by GARNETT W. RICHARDSON

"Original Research is in itself the most powerful weapon that ever has been or ever can be wielded by mankind, in struggling with the great problems which Nature offers on all sides for solution".

Prof. Meldola

During the latter part of the late war, and since that time, the part that scientific research and discovery have played in the intense international industrial competition has had a marked effect in helping to bring prosperity again to the world. European countries have probably been foremost in this research seconded possibly by the United States. Sad to relate Canada has been somewhat backward in her research activities.

Research Officially Recognized in Canada

In 1916, by Order-in-Council, the Government of Canada established an Honorary Advisory Council for Scientific and Industrial Research. The Council was authorized to make an investigation into the various agencies conducting research in the universities, and especially, to quote from the Order-inCouncil, "to become acquainted with the problems of a technical and scientific nature that are met with by our productive and industrial intersts, and to bring them into contact with the proper research agencies for solving these problems, and thus link up the resources of science with the labour and capital employed in production, so as to bring about the best possible economic results".

When the Council commenced their investigations, they found "that scientific research in Canada was practically confined to the laboratories of two or three of our universities, and one or two departments of the Government." They also found the absence of any scientific control in the industries. Consequently the waste in our industries was tremendous, and we can easily understand the difficult task that confronted the Council. However they succeeded in directing attention to the value of scientific research by lectures, bulletins, and addresses.

A series of studentships and fellowships was established to encourage university graduates to enter the field of research, and substantial assistance was given to research, both academic and industrial. The relationship between science and industry was fully recognized by the Council, and they set about to bring "an intimate co-operation between those who could set the industrial problems, and those whose knowledge and training would aid in their solution."

In 1917 it was proposed that a Central Research Institute be established at Ottawa, to develop both scientific and industrial research in Canada. A Bill to this effect was brought before the House of Commons, and was carried almost unanimously. However, the Bill was turned down by the Senate on the grounds of economy, and has not as yet been re-introduced. As a matter of fact, though, a small grant has been given each year since that time by the Government to enable the Council to carry on a limited amount of work. It may be stated without prejudice to the Government, that every moment lost in inaugurating an adequate Research Institute means a tremendous loss in our industries, and the falling behind of our country in the ever-increasing international industrial competition. The Administrative chairman of Advisory Research Council in his report for the year ending March 31, 1920, states that "the urgency of the establishment of this Institute is of the first order of importance, and every year lost in effecting this establishment will increase the difficulties which Canadian industry will face in competition with industry abroad, aided by all the resources that scientific research will place at its command."

To Hamper Research is False Economy

Economy is no argument against the establishment of a Canadian Research Institute. Anyone using this argument shows lack of information on the real value of research. A few results of scientific research in some other countries may be given here appropriately. In the United States at the Mellon Institute in Pittsburg, a few years ago a research into improved methods of bread making was undertaken, at the instance of an association of bakers. With the expenditure of some $5,000, certain discoveries were made almost immediately that enabled the bakers to affect a saving of $500,000 annually. Needles to say, the bakers paid the investigator a very generous bonus. A few other cases relating to the financial returns from research in the United States may be cited. In one case an industry, founded with a capital of $25,000, had accumulated $200,000 of assets at the end of two years, and was doing a busines of $1,000,000 annually. In another case an industry started in a small way was making a monthly profit of $50,000 at the end of eighteen months, during the first six months of which the business was in the experimental stage. It has been stated authoritatively that over fifty industrial concerns in the United states have established research laboratories on an extensive scale and many of these expend from $100,000 to $300,000 on research work alone. The most prominent Government research agency in the United States is the Bureau of Standards, at Washington, D. C. This establishment employs about three hundred scientific workers, and handles the greatest diversity of problems. It tests and conducts original researches on papers, textiles, structural and other steels, building and roofing materials, cements, paints, inks, chronometers, thermometers, barometers, electrical apparatus of all sorts, radio-active preparations, and in fact anything and everything to which a mechanical, physical, or chemical test can be applied.

Official Aid to Research in Britain and Elsewhere

In England, during the course of the war, a State Department of Scientific and Industrial Research was organized, and a fund of a million pounds was placed at the disposal of the Department of research work. One of the foremost activities of this Department has been in getting together manufacturers in the same industry for the founding of research laboratories on a co-operative basis. In connection with the mining industry, studies have been made of the carbonization of coal, light alloys, refractories, concrete, the corrosion of non-ferrous metals, insulating oils, and many other such problems. Great economies have been effected in the recovery of tin from the mines in Cornwall. Porcelains imported in considerable quantity from Germany before the war have been replaced by very satisfactory substi-

tutes made from British clays. Also, for the furtherance of research in the mining industry the British Non-Ferrous Metals Research Association has been formed and is doing very valuable work.

An instance in England of the value of authoritative scientific counsel in its relation to industry may be instanced. One of the largest steel corporations in England had, until 1914, been importing from Austria through a German agency, a certain material for lining its converters. When war was declared they had a two years' supply on hand. As time wore on and the supply diminished, the directors were obliged to call for scientific advice. They were referred to the geologists, who informed them that a bountiful supply of the material in question was available in the immediate vicinity of their plant. This information was acted on, with the result that the company is now mining in sufficient quatity on its own account the material formerly imported from Austria at many times the present cost.

France has kept pace with other countries, and has an Academy of Science to her credit. In Japan an Institute for Physical and Chemical Research has been established, at a cost of over two million dollars, this expenditure being shared equally by the Government and the manufacturers. These are only a few instances of the research work being done in other countries; innumerable other instances might be given. It is apparent that if Canada is even to keep her present status in the present international industrial competition, greater attention must be given to the fostering of scientific institutions. It should be the duty of the Government to grant a liberal sum for the establishment of research laboratories, and for their maintenance for a limited period of time, until the industries concerned could take them over. Then the prosecution of industrial research on a co-operative basis could be delegated to the intersts themselves, an association of manufacturers in each branch operating the laboratories for the common benefit.

What is Research?

Occasionally we find persons having only a vague idea of which "research" really means. The right Hon. Lord Moulton, K. C. B., F. R. S., in his introduction to the volume published by the Cambridge Press entitled "Science and the Nation", says, "the word 'research' has of late years been used too frequently as little more than a cant phrase, dear to educationalists, but carrying with it no clear or definite meaning, and if there is any patent or latent hostility to research it is mainly due to the way in which the word has thus been treated by its self styled champions. But (as I am glad to say is frequently the case even in the arena of legal conflicts) the blunders of the advocate have not been sufficient to hide the merits of the case. Not only thoughtful educated men but even numbers of the general public are beginning to realise that it is to research in its proper signification that we owe the knowledge of the wealth of the world in which we are placed —of the power that is within our grasp. The man engaged in research is like the mining prospector who may discover that rocks, which seem to the ordinary eye indistinguishable from the barren masses that surround them, are in reality teeming with riches. But for research one would never have known that the coal tar oils which resemble so closely in their general characteristics the Paraffins or Petroleums are capable of entering into combinations of such novelty and complexity that they now furnish the whole world with dyes and chemical products of priceless value. It is the application of research to the problems of metallurgy that has caused the additions to our knowledge of metals during the last 50 years to be greater than all that has been learnt in the ages that had elapsed since man first began to work metals. And what is most remarkable of all, we find that through the introduction of research the empirical handling of the problems of organic life is being step by step replaced by an assured treatment based on a conscious and realised connection between cause and effect. All these changes are due to Research. Scientific research has removed our previous ignorance of the properties and powers of the things around us and has taught us what they are and how they can be used. It is not too strong a simile to say that without the teaching of Science man blunders through life much as a card player would blunder through a game of cards if the did not take the trouble to look at the cards in his hand and learn their value."

Canada's Opportunity

The opportunities for research in the mining industry—probably the largest of all the world's industries—appear unlimited. In Canada we have the mineral resources and the young industries, and the right type of young men to make a vocation of research work. I am not overlooking the older men, the trained scientists of to-day. No doubt we have in Canada at the present time as able scientists as there are in any other country in the world; but we must look to the young men to take their place and advance the field of Science. It may be safely said, that any young man entering the field of Science will be entering a field full of the finest fruits of nature.

We have the material in Canada, and if this fair Dominion is going to keep pace with other countries, we must have a strong, intelligent Government lead in the field of Scientific and industrial research, and hearty co-operation among our industries for the furtherance of the interests of each and all.

I.-R. GENERAL CATALOGUE

The Canadian Ingersoll-Rand Company have just issued a new condensed General Products catalogue. This is an unusually attractive volume of 230 pages, fully illustrated, composed of fifteen sections with thumb index, bound in loose-leaf style. As a general volume of reference for the Company's numerous products, this should prove very useful to Canadian mine managers and others interested in equipping mining properties, to whom it will be sent upon request. The fifteen sections are as follows:

Compressors and Accessories
Air, Steam and Electric Hoists
Vacuum Pumps
Condensers
Oil and Steam Engines
Steam and Centrifugal Pumps
Air Lift Pumps
Rock Drills and Accessories
Drill Sharpeners and Accessories
Rock Crushers
Pneumatic Tools
Tie Tampers and Accessories
Pulp and Paper Machinery
Rubber Machinery
Engineering Data

The last section gives tables and charts dealing particularly with air compression.

Review of Progress in the Conditions of Coal Mining

By JOHN MOFFATT

Initiative brings Progress and Safety

When in the year 1815 Humphrey Davy discovered the principle of cooling a flame that led to the invention of the safety lamp, a great step forward was taken in coal mining. Ever since then mining men have been slowly toiling upwards, and today we can look down from heights we have reached, and are able to trace distinctly every step taken on the rugged ascent. For progress has been slow and painful at times, and the whole price has not yet been paid. The too frequent news flashed across the world of mine explosions, mine fires, and sometimes mine floods, are stubborn witnesses that we are still far from the goal where we can pause and rest for a while with the peaceful assurance that we have reached the top of the hill. But unhindered by obstacles and undismayed by disaster, the eyes of mining men have been steadily fixed on the prize that comes to those that press forward manfully. So they have travelled far on the way to success. Much has been accomplished, but much more remains to be done. Real progress began with the safety lamp. With the means of getting to know mine gas, (CH_4), its nature and its habits, miners began to study it and to try to cope with it. It is stated that previous to 1815 mining in gaseous districts was much retarded and many collieries, because of gas and other difficulties, were considered unworkable. But it was only man's initiative that was for the moment arrested, and when the "Davy," the safety lamp, was invented, man's inventive genius received an impetus that has carried him forward with an ever increasing momentum, and if today the very gaseous mines of Belgium and other countries can be safely operated under cover of over 4,000 feet, it is because mining science has made the most of its discoveries and kept steadily marching on. Progress has been made all along the line in the methods of working in mine gases, in ventilation, timbering, and pumping, in transportation, and in cleaning and assorting coal for the market.

The safety lamp has been much improved and almost perfected as a gas detector since its first appearance. Miners thoroughly understand it and value it, and it is the use of the safety lamp that has made mining in a gaseous atmosphere possible. For every day work, lamps of a strong make are used, but for the work of examination of mine gas (CH_4), some well known, standardised lamp is selected and placed in the hands of the expert miners. For the minute examination of the mine atmosphere, by mine examiners, lamps specially designed for the purpose are used. In addition, samples of the mine air are taken in air-tight vessels and where there is any suspicion that the atmosphere of any mine is approaching the danger state through mixture with mine gas, an analysis is made daily.

Knowledge means Safety

The many regulations that came in with the use of the safety lamp have all had a disciplinary effect and tend to make miners more careful. The testing of the lamp by the foreman of the lamp house and then by the miner himself, its further testing underground at the lamp station by the examiner, who gives the miner his report, the locked lamp, and the relighting stations, with their powerful magnetic unlockers placed at special places in the mine, the exclusion of tobacco, pipes and matches from the mine where these lamps are used, are in themselves eloquent every-day reminders that the utmost care must be exercised in a safety lamp colliery. It is a long step from the time when the miner set fire to mine gas in his place as the quickest way of getting rid of it, or brushed it out with his coat only to have it return, up to the present, when with a closed instead of an open light, he is not permitted to go near his place until he gets a clear report from the examiner. These and other dangerous practices of the past are well within the memory of many miners today. The dropping of them marks certain stages in the progress of mining; but these early practice cost many lives and left many maimed and disfigured miners. Progress exacts payment in the highest values, and this step forward exacted its full toll.

The electric light is rapidly taking the place of the flame safety lamp, but it cannot be used to detect mine gas.

Inauguration of Ventilation

The nature of the different gases met in the mine having become well known, mine ventilation was improved to meet conditions, and no mine of any size and depth is found today without some well defined system of ventilation. In early days a furnace usually was placed at the bottom of the return air shaft, with the return air passing directly over the fire; or, if the air was supposed to be heavily charged with methane (CH_4), then a "dumb" drift driven to a higher point in the shaft and the steam jet were used among the first aids to natural ventilation.

As the mines went to greater depths, fans were used. One type followed another until today we have powerful machines forcing or pumping air out of or into our collieries in any volume desired. As a further aid in the long airways, booster fans are being used to supplement and to lighten the load of the surface fan, and in case of breakdown there is at most collieries an auxiliary fan ready to start up at once.

A sufficient quantity of air to keep the mine clear and the miner healthy is specified by law in most mining countries. The condition of the air entering and leaving the mine is constantly registered. Instruments for measuring its velocity, humidity and temperature are all part of the mine manager's equipment. If the air in the mine is too dry, it must be moistened. Various processes such as the spray and the steam jet on the intake are used. If too hot, it must be cooled. This condition is seldom met with in the northern part of this continent with our comparatively shallow mines and equitable climate; but in Brazil and other warm countries, cooling plants, to cool the mine atmosphere and reduce the temperature of the strata and keep the workmen energetic and alert and less liable to accident, have been constructed at great cost.

Controlling the Mine Atmosphere

In all large colliery districts ventilation is usually under the direct supervision of a mining engineer, who confers with the manager in charge. This greatly helps the manager and usually gives satisfactory results in the matter of ventilation. So again, looking back to the days when, using natural ventilation a charge of wind set us to or stopped us from working, or while at work we suffered all the ill effects of an impure atmosphere,—comparing this with present day conditions, we can gauge the progress made.

Good ventilation implies ample airways, well planned and constructed, and whatever system is chosen, whether

it be the ascensional or any other, nothing is left to chance. A well conducted colliery must have its main and its secondary airways with their various stoppings built as necessity dictates, and whether there are overcasts and mine doors or some other device, the system must be simple and suited to the conditions of the mine.

If the mine is dusty and dry, the dust is loaded out and the section watered, or a wet or stone dust zone created, heavy stone dust being used to cover up the coal dust, or water applied in quantity to produce super-saturation. Such methods were unthought of a few years ago, although they were just as necessary then as now.

Safe Explosives

As the blasting of coal loads the air currents of the mine with smoke fumes and with coal dust, and in this way is often the cause of mine fires and explosions, great changes in the use and the composition of the explosives used have been brought about. The use of black blasting powder is no longer thought of. Though the ideal explosive for breaking down coal with the least shattering effect, it flames invariably when exploded and is now considered unsafe and in most places is debarred from the coal mine. Permissible explosives have taken its place, with greater safety to the mine and miners, although with more breakage to the coal. This latter result has, however, been offset by the advanced knowledge of the use of fine coal. If it could be sold on the B. T. U. plan, sizing would almost be eliminated. The principal factor, safety, has been extended, and as far as possible blasting in a coal mine has been rendered safe.

Economical Mining Methods

It is not long since investigations were carried on in the United States to ascertain the percentages of coal won and lost in coal mining. The information gathered was most startling and showed that little over half was taken from some coalfields. It was found that many of the methods of mining were faulty or that in the desire for cheap coal the methods employed were not followed as planned. Immediate steps were taken to correct this cause of loss, and methods of mining all over the continent came under the searchlight. The Canadian mining industry profited by the investigation and loss in mining coal was much reduced. Methods in vogue were scrutinized and improved. Some, owing to greater depth and pressure, were changed. There is no doubt that in the methods of mining the skill of the mining engineer is most tested and he becomes a success or a failure just as he is able to improve or change the method to meet the changing conditions of the mine. A colliery that for years has been a success under the bord and pillar system may, under thick cover and greater pressure, be forced to modify its system or change to some other system. Long wall retreating, may in practice prove to be a failure, while advancing it may be a success. The panel system, because of spontaneous combustion or other causes, may be the only available system for other seams. Collieries reaching great depths usually have either to modify or change their methods of mining.

Failure to follow out faithfully the method employed is usually just as disastrous to coal winning as it is to refuse to change to another and more suitable system when every indication points that way. Squeezes, creeps, bumps, etc., are nature's ways of protesting; but the alert mining engineer usually avoids these costly errors and plans to extract his coal with the least possible disturbance. Conditions will and do arise over which the engineer has no control, however, well adapted his plans. Mining scientists in different countries are slowly coming to the conclusion that many of the "bumps" in a coal mine are due to earth movements and cannot be avoided. Nevertheless we do know that faulty methods often have been the cause of very serious bumps, but the great amount of knowledge that has accumulated by research and experience and the interchange of ideas has led us to a better understanding, and we are beginning to learn that there is more motion in our earth than we usually think of. Whether with our advanced knowledge we will be able to plan against seismatic tremors as some of the builders have undertaken to do in cities visited by earthquakes, we do not know; but to be able even to discern the cause of certain mine disturbances is a step forward and leads on to the next step. The fact that the Nova Scotia coal operators have brought in for consultation expert mining men from Great Britain and our Western mining Provinces, as well as from the United States, is in itself a proof of progress, in that we have learned to seek knowledge where we know it is to be found.

Underground Transportation

It was a long step forward from the pushing of pit boxes by man-power, to the pit pony. None of these have, however, been altogether displaced. The work of each has merely been lessened to the extent that the use of rope, compressed air, and electric motor haulage have been adaptable to the various haulage problems. Both men and horses are yet the feeders of many of the different mine haulage systems. This is especially true of low seams. The extended use of mine haulage has made possible the enormous daily outputs common to the more favored collieries. In looking back over a period of fifty years, I am inclined to think that the gravity system of haulage was just as thoroughly understood then, and more utilized than it is today. Some new form of motive power is in common use today where formerly the jug wheel on the gravity incline was the only practical means of lifting and lowering raikes of boxes.

The tracks and roadways of the present time are improved beyond all comparison with other things. From planks laid on edge, to the flat one-sided rail, and from that to the flat rail, placed on its edge on notched wooden ties, we have progressed to the common T rail of all weights. With these came improvement in the design of the mine-car axle and the wheels. Thus transportation has forged ahead.

The Mine Water Problem

Mine water is a problem that has stubbornly resisted solution. The acidity of the water and its effect on pump valves and pipes has constituted the more serious part of the problem. Efforts to overcome the bad effects of mine water on parts of machinery have taxed the ingenuity of the engineer. Some have tried to change the water in the mine by the use of alkaline salts, while others have sought to discover metals or alloys that will withstand the corrosion of the water. Among these acid resisting materials are duriron, stainless steel, aterite, porcelain, glass and compressed rubber. While all of these have been found good, yet they are far from perfect in use.

Pumping stations, to which all mine water is conducted in drains, and the use of the electric pump have simplified pumping. The diamond drill has come to its assistance by boring from the surface directly over mine lodgements, thus cutting off long pipe lines through the entries and reducing losses of power due to friction.

Timbering

Timbering has become a fine art, and in all well regulated collieries the system of timbering is standardized. How it shall be placed, the distance apart, the kind of timber to be used, are all a part of the mine rules. Exper-

iments tending to discover just how long mine timber will last after treatment by salt, creosote or other solutions have advanced mining knowledge. The use of steel supports is in many cases displacing timber, which marks another stage in progress.

The increased use of mining and boring machines has greatly helped to expand the coal industry and to allow of large outputs with a minimum number of men. The saving to a coal company that has to provide houses for its workmen is large. Development is more rapid and larger outputs per pit are obtained. When the mechanical loader becomes a success, one of the hardest problems in mining will have been mastered. The hammer drill has made shaft sinking and rock tunnelling comparatively easy.

The Miner Himself

There remains the "welfare" side, which while it may not be looked upon as part of the science, is nevertheless most essential to success in mining. The relief societies, compensation board, the housing conditions, the bath houses at the collieries, the employees' trains, and mine riding raikes, the first-aid station and the rescue corps are all milestones marking the onward way. They could now be no more dispensed with in the life of the miner than the use of safe explosives in breaking down coal.

THREE GENERATIONS IN THE MANUFACTURE OF MINING MACHINERY

On the front cover page of this issue will be found the announcement by Chalmers & Williams, Inc., Chicago Heights, Illinois, of the fact that they have made arrangements to manufacture their well known line of mining machinery including Symons disc crushers, with the John Inglis & Co., Limited, Toronto, Canada. While this action marks a forward step for Chalmers & Williams, it works an even greater advance in Canadian industrial affairs. By their affiliation, the John Inglis Co. are now able to offer a complete line of crushing and grinding machinery for mines and quarries, manufactured in Canada but proved by years of experience.

The original Company was established in 1849 by Mr. Thomas Chalmers, Sr., and in 1861 became known as the Eagle Works Manufacturing Co. and was incorporated in the State of Illinois. It was re-organized in 1870 and became known as the Liberty Iron Works, and subsequently was known under the name of Fraser & Chalmers. Under this organization, Mr. Thomas Chalmers, Sr. was in charge of shop management and factory output and with Mr. Fraser, both of them skilled mechanics, the Company prospered.

The force of men employed in 1872 was sixty men and under the guidance of Mr. Chalmers and his son, Mr. W. J. Chalmers, who took active charge of the business on the retirement of Norman B. Fraser, the business grew until in 1900 they employed a working force of 1800 men. Their machinery was known throughout the world, and it was as common an occurrence to ship machinery to Africa, India, China, Japan, Australia or South America, as it was to ship to Colorado or California. The equipment produced by this Company came to be known as the highest grade of mining machinery manufactured and very few important mines came into existence that had not at least some part of their machinery manufactured by this Company.

In 1905, on the retirement of Mr. W. J. Chalmers from active interest in the manufacture of mining machinery, the co-partnership of Chalmers & Williams was organized, composed of the son of Mr. W. J. Chalmers, Mr. Thomas Chalmers and Norman Williams, the son-inlaw of Mr. W. J. Chalmers. This co-paternship was subsequently incorporated in 1908. This Company started out in the manufacture of the same class and grade of mining machinery formerly manufactured by the parent company and some years ago took over the manufacturing rights of the Symons vertical and horizontal disc crushers. They, like the parent company, are making their product known throughout the world.

Thus it will be seen that there generations of the Chalmers' family have been engaged in the manufacture of mining machinery since 1849. The manufacture of their line of mining machinery in Canada will enable them to serve better their customers in the Dominion.

COAL SUPPLY

The United States Geological Survey reports that normal production at the anthracite mines during the present week (September 18-23) has brought the total output of all coal, anthracite and bituminous, up to about 11,650,000 net tons. This is still somewhat below the amount required to meet current consumption and Lake shipments and at the same time to rebuild consumers' stocks.

The total output of anthracite during the first week after the strike was 1,064,000 net tons and during the present week (the second following the strike) it was about 1,850,000 net tons. The cumulative production to September 16 this year is 23,325,000 tons; with an estimated production of 1,850,000 tons this week the total output to date is approximately 25,175,000 tons as against 67,759,000 tons in 1921. The present year is therefore about 42,584,000 tons behind last year.

Production of bituminous coal in the present week is estimated at from 9,600,000 to 9,900,000 tons, a slight increase over the week preceding. The present output is above that of the corresponding period of the year of depression, 1921, but is below that of the other years shown.

The present condition of the coal market resembles the three years 1918 to 1920, more than 1921. In those three years, as now demand for soft coal was active enough to absorb all the coal that could be transported.

Hans Renold of Canada Limited, 11 St. Sacrement Street, Montreal, advise that their parent company have been successful in securing the contract for all the Chain Drives in connection with the South African Government scheme for handling, storage and shipment of South African grain. In addition to the terminal elevators at Capetown and Durban, this order includes thirty-four Country Station Elevators which will be built by Messrs. A. W. Menkins Company of New York City. This contract totals 272 Renold Silent and Bush Roller Chain Drives, which is said to be one of the largest, if not the largest single contracts ever given for Power Transmission Chain Drives in grain elevators.

The Department of the Interior, Ottawa, estimate that the 2,700,000 h.p. of hydro-electric energy developed in Canada saves us 27,000,000 tons of coal annually. Of course, its chief use is as energy, not as heat, though in special case it can be used economically for heating purposes.

News and Comments

By ALEXANDER GRAY

The "Secret" is out

In a stage whisper the firm of Minyard & Company, of Toronto, is circularizing the populace about "one of the Ontario gold stocks", of which it professes to be reliably informed, to this effect:

> "The property in question has long been believed to possess ore reserves equal to ten years' requirements. Recent explorations, *secretly* conducted, have developed at least five times the previously estimated ore reserves. In addition these explorations have uncovered veins of such *tremendous* richness as to be *almost unbelievable*."

Minyard & Company said it. "Almost unbelievable" expresses it to a nicety. It is consoling to have the "secret" imparted in this public manner—in an Irishman's whisper, as it were. Somehow, fifty years' requirements rather accentuate the "unbelievable" element in the "come on" circular. However, as Minyard & Company are "anticipating" an "early reply", there it is. Minyard & Company are.

Will They Get Together?

Success at the Lake Shore and Wright Hargreaves, and the advent of large interests at Kirkland Lake, may bring about at least one amalgamation that might not be amiss. The subject is a delicate one; for the Lake Shore and the Wright-Hargreaves have been the mainstay of the Kirkland Fields while other producers rounded to. Being so intimately related and having their areas in an excellent stage of development, if the principals should decide to join hands and go in for a greater milling program Kirkland Lake should be benefitted. A year ago Kirkland Lake Proprietary interests were understood to be casting longing eyes at the ground acquired by Continental Mines and the Nipissing Company. Options were under negotiation. But "the bones" were not rolling right in London, so Continental and Nipissing absorbed the country. Kirkland Lake consolidations, if sanely arranged, could be made very helpful. Will Al. Wende and Harry Oakes divide the pot?

Rather Purblind View of Mining

As he arose to leave the street car, compressing his lips, the somewhat taciturn ex-President of a Canadian Stock Exchange truculently remarked "Well, so far as I'm concerned, I never owned a share of mining stock. I think one mine in ten thousand may be a good one."

He is a conservator of credit—a shrewd seller—has entrenched himself against the allurements of shares in mining ventures—keeps the pledge that he will refrain from personal participation in any of them no matter what his clients do at their own risk. Mining! Perish the thought! Better, a thousand times better, to take the quarter and an eighth commission on listed and unlisted stocks.

The speaker is obsessed with the nitwit notion that all Mining should be taboo, to all but the sulphate of calcium minded. He is prominent dealer in what has ruefully been described as the "unbeatable game". Respected by his fellows for "holding them close to his chest" and keeping the other players from knowing what he has in his hand, his acumen hardly exculpates him from what amounts to an offense against that industrialism without which his avocation would be less profitable. He regards his aloofness as a redeeming trait, whereas it is such as he who should co-operate in the intelligent exploitation of those natural resources which are the basis of permanent investments.

Declining to be educated, lacking sporting spirit, possessing irremovable prejudices against vital economic factors, his convictions have nothing but back action that gets us nowhere. It is this attitude on the part of self-centered, sapient mediums of investment and speculation, that leaves bona fide prospects and meritorious mines to the too frequently unmerciful manipulators of 'the telephone "ticker" miners—jugglers of the tape. Like the ornamental citizen who will not go to the polls to vote because he has no choice of parties or candidates, he withholds his influence from what would preclude a great deal of the deviltry he misconstrues as mining. So he would make mining an infringement upon the prerogatives of stock exchanges, and leave all who think otherwise to take the consequences. Of such are the Kingdom of Hip-pocket Holiness, who really believe they are conserving sumptuary sanctity.

After all, it is not the "tight-wads" who matter, however salutary may be their example. Their precepts are distorted. Mining has enriched the sciences and the spheres. Without mining whole States and Provinces would be so many prairie dogs' Paradises; other regions would not be so remarkable for the varieties of cacti and the coyote. Railheads would not be so numerous. More "terra incognita" would be shown upon the maps, real estate "miners" would be unemployed. When all the so-called granger and trans-prairie railways were built, they "came up for air" in the mining highlands of the Far West, long before California, Oregon, Washington and British Columbia became notable for their soil and climatic effects. "The Golden State" had precedence in the whole of the development of the Western United States.

Admitting it was the gold of California that put the Pacific section "on the map," we do not deny it was the San Francisco Stock Exchange that brought tragedies to the Bank of California, and others. It was not the mines or the placers that drove men to distraction. Without Sacramento, Grass Valley, the Motherlode and the Comstock, engineers in mining would be among the casuals or casualties; the production of wealth would not have given impetus to diversified enterprise in and out of trade marts. Granting individual judgment will err, that cupidity and crookedness have beclouded the benefits derived and derivable from mining industrialism, this cannot imply that the gains on balance are not greater than the losses.

To illustrate this: The other day there was laid away a towering personality, a patriarch in his profession; very prosaic, but the most romantic, melo-dramatic actor on the modern mining stage. His mistakes were on the side of conservatism—another phase of what the ex-president of the Stock Exchange manifested. Sent by his principals (who had reason to impose implicit confidence in his professional opinion, and were willing to abide by what he thought); he wrote of the discoveries of banket at the 'Rand:

"It is not worth coming off your horse to look at."

According to all precedents this representative of Cecil Rhodes and others was perfectly right. The emphatic decision of that "prenez garde" exponent kept Rhodes and his colleagues away from the 'Rand, for a while, although

Hamilton Smith was favorably impressed. Ordinarily the big mistake of the biggest of men in his profession, would have excommunicated him. But he simply had voiced his sense of duty to his principals; what he considered a freakish occurrence was not good enough. Shortly before he had condemned the Barberton Gold Fields of the Eastern Transvaal, and brought down upon himself the execration of all concerned. He was as right in this respect as he was wrong at the Rand. A quarter of a century later, he was retiring from his unique position at the Kimberley Diamond Fields. When he hesitated about commending his capable son as his successor, Rhodes, with that characteristically democratic spirit for which he was noted, replied

"What in earth does it matter if he is your son?"

This man was the confidant of Rhodes, Wernher, Beit, Smith, Rothschild, Carl Meyer and Barnato; yet he flouted the greatest of gold fields and coincided in the rejection of the Premier Diamond Mine, the largest of its kind ever discovered. He was a scientific investor — strictly so.

So, why charge it against mining and mining men, that they proffer unnecessary risks! Essentially speculative, as a rule, bona fide adventuring is what makes the world wag. Rhodes, Rudd and Beit were not so sure they were doing the safest thing when they amalgamated the Kimberley Diamond Mines. Before the Consolidation the gross capitalization of the four Kimberley mines was £23,434,250. Rhodes, counselled by Gardner Williams and Smith, wrote that down to £3,950,000, included two leaseholds, and made the fixed charges £320,000 per annum. Perhaps, nowadays, such a merger would have brought about a duplication or triplication of capital commitments. But there were (and there are) conservative mining financiers and engineers who are as chary of their reputations as the authority quoted at the beginning of this dissertation. Standards of valuation, unfortunately, are not always governed by the Golden Rule. We have seen Nipissing shares go to $34 and drop below parity, and yet Nipissing has distributed more in dividends than it was ever valued at in the market when "49" blew off the lid. Some of us suggested to wizards of finance that they invest in Hollinger shares at $3.75 and $5. The rebuff was, "You're crazy!"

Coniagas when capitalized at $4,000,000 was a sort of "air pocket", but we know what happened.

Nickel-copper ores were a liability, and "broke" Col. R. M. Thompson, and we have seen the aftermath.

Quick firing fiscal agents like the ex-President of the Stock Exchange do well to be admonitory. They would be more to the purpose were they to ascertain the true relationship of real mining to what transpires on 'Change.

Mr. Rickard's Sullivan Mine Projection

A hurried apology is necessary; because, a while ago, this department ventured to state that as the Sullivan Mine present ore reserves were estimated at 5,000,000 tons, a hypothetical valuation of the gross metallic content of that tonnage might be around $500,000,000. Now, along comes the circumspect, always erudite, and authoritative, Thomas A. Rickard, who writes in *The Engineering and Mining Journal-Press*:

"This mine has enormous reserves of a complex silver-lead-zinc ore, the estimates of tonnage being well above 25,000,000."

Simple arithmetic could make that worth "well above" $2,500,000,000 gross. Of course there are "ifs" in the argument; yet Mr. Rickard gives the estimate publicity over his signature. According to all accounts, the "new 1,500-ton mill, with an expected working capacity of 2,000 tons," will have sufficient feed for "well above" 40 years.

Incidentally and in the interim, there ought to be linings for the pockets of shareholders. Differential flotation of coin of the realm in their direction is something to which they are not averse.

Canada's Red and White Metals

The statistical position of copper is a disputed point. It is liable to continue so until the industrial front is broader and international trade has the hobbles off. United States production of copper in the first seven months of this year is placed at more than 500,000,000 pounds, while consumption is not what producers wish it. No doubt a general resumption of trade is impending. Meanwhile Canadian nickel-copper corporations are begirding themselves and hope to get off to a running start. One statement is to the effect that International Nickel operating chiefs expect to smelt in each furnace at the rate of 100,000 tons of ore per month. That would mean the highest state of efficiency. It was never done in the past—but Copper Cliff should put the past in eclipse with its completed plants, improved practice and that Creighton grade of ore. If need be, the Creighton could draw on its broken ore and make competitors very uncomfortable.

British-America operations also are to be resumed—to what extent naturally will depend upon circumstances. The Mond people, like the International, have arranged for larger markets, to which their new mill in Pennsylvania will be an important addition.

In the West, the Canada Copper Company is undergoing another of those periodic reorganizations, which are not helpful in the furtherance of Canadian copper enterprises. It has been decided to incorporate a new company with 700,000 shares of $10 per value. There are to be no bonds or preferred stock. Present holders of the securities of all kinds alone will be allowed to participate. Holders of first mortgage 6 per cent bonds, $2,500,000 principal amount, which are in default $300,000 interest since July 1, 1920, may exchange their bonds par against par for stock in the new company to be formed, receiving 250,000 shares. They may also subscribe for 200,000 additional shares pro rata at $5.

Holders of 5 year 6 per cent debentures in the original company, $710,000 principal amount, must subscribe at $5 a share for new stock, in the proportion of 20 shares for each $100 face value of debentures. This should account for 71,000 new shares. Subscriptions at the same rate for the 200,000-share block are also acceptable.

Stockowners of the first reorganized company may subscribe at $5 a share for stock in the second reorganized company, in the proportion of 1 for 11. Those who do not subscribe for new stock, receive nothing at all. This item calls for 100,000 shares of the forthcoming issue. An additional 49,000 shares are reserved to cover reorganization expenses.

Stock of the new company has not been underwritten, and the plan will not become effective unless 160,000 shares or $800,000 are subscribed. In event of failure the properties are to be foreclosed for benefit of first mortgage bondholders and subsequent formation of another company in which present security owners would receive no equity.

Unfortunate as it is to have Canada Copper affairs involved in what is obvious, it is gratifying to have Granby Consolidated report progress and profit. This company in June produced 2,450,477 pounds of copper, compared with 2,522,000 pounds in May, and with 1,974,162 pounds in January. The outlook for the company, according to an official, is very favorable. The company's costs at present are, approximately, 9.7 cents a pound, which permits a profit of, approximately, 4 cents a pound on operations. Earnings for the current year, it is estimated, will amount to better than $7 a share on the outstanding capital stock.

The Mining Districts

BY THE JOURNAL'S CORRESPONDENTS

NORTHERN ONTARIO

South Lorrain

Due to very favorable results at the Frontier and Keely properties in South Lorrain, claims in that district are looking up, and it would not be surprising to see some deals negotiated in the near future. Among others the Belle Ellen shareholders have authorized the president to negotiate with a view to selling or refinancing.

The results being met with at the Keeley are exceptionally favorable and the mine has a large number of faces in high-grade ore. August production was 80,000 ounces, a record for the property since being reopened, and it is anticipated that monthly production for some time to come will average about this figure.

The Mining Corporation, which is operating the Frontier, will soon have to decide what to do with the mill rock. Before deciding to build a small mill, which would run into a good deal of money, the company will investigate the question of hauling the ore to Cobalt for treatment in the company's mill. It is believed that tractors, particularly in the winter time, could haul the 20 miles at a cost sufficiently low to make this proposition attractive.

Gowganda

Recent developments at the Castle property in Gowganda have also been very favorable and properties in the Miller Lake-O'Brien-Castle area are attracting attention. The Castle is investigating possible sources of hydro-electric power, and is also considering the installation of a 50 ton mill.

Work is under way at the Miller Lake-Everett property adjoining the Castle. Development will be carried on from the No. 1 shaft of the Castle, which was sunk close to the boundary.

Production at Cobalt

The August report of the Nipissing shows that during the month the company mined ore of an estimated net value of $189,258 and shipped bullion and residues from Nipissing and customs ore of an estimated net value of $394,406. The low grade mill treated 7,558 tons and the high-grade plant, 205 tons, while the refinery shipped 352,883 ounces of bullion. There were no new developments of importance underground, during the month.

The McKinley is producing at the rate of 45,000 ounces a month, largely from mill rock and is understood to be making a fair profit.

For the week ending Sept. 15th, three companies shipped ore from Cobalt. The Nipissing and Mining Corporation shipped a total of 900,000 pounds of residues and the Dominion Reduction shipped 85,000 pounds of flotation concentrate from Peterson Lake tailing. During August there was shipped a total of 2,332 tons by six companies. Of this amount 2,144 tons were residues shipped by the Nipissing and Mining Corporation. Of the total tonnage shipped, 1,910 tons went to the Deloro Smelting Co., 265 tons to the Conagas Reduction Co., 73 tons to Perth Amboy and 84 tons to Carnegie.

Continental to Offer Stock for Sale

It is understood that the Continental Mines, Limited, will shortly make a public stock offering. This company is the holding company for the Menago which has the Colonial property in Cobalt; and also the Norlanda company, which owns a large acreage in Kirkland. The Continental has a capital of $3,500,000 in shares of $5 par, of which the promotors have the larger part.

Sinking Resumed at V. N. T.

Water troubles have been overcome at the Vipond in Porcupine and sinking to the 1,000-foot level has again been started. It is expected that this depth will be reached in December.

Goldale

Negotiations have been opened for the purchase of a number of claims belonging to the Goldale company. Of these, 120 acres are in the vicinity of the Dome and two groups of claims north of the McIntyre.

Dome Lake

Preparations are being made to dewater the West Dome Lake properties preparatory to sinking the shaft from 600 to 1,000 feet.

McIntyre

Big things are being predicted for the McIntyre and in a few weeks the mill will be treating 1,000 tons a day. Since the new mill unit started the opportunity is being taken to overhaul the old part of the mill. The ground between the 1875 and 2500 foot levels will be opened up as soon as possible.

Lightning River

Operations have been suspended at the Lightning River Gold Mines, but it is expected that work will be resumed during the winter when necessary machinery can be hauled to better advantage.

Thesaurus

Good results were encountered on the 100 foot level of the Thesaurus property in Matachewan and the shaft is now being deepened to 200 feet. It is expected that hydro-electric power will be available from the Indian Chutes development about the first of the year.

High-Graders Arrested

Recent arrests in connection with the high grading of gold precipitate from the Hollinger indicate a widespread organization extending into Porcupine and Kirkland, with operation covering a considerable period of time. A small furnace and over $1,000 worth of precipitate was located in Toronto.

A BUDGET FROM THE NORTHLAND

Lightning River

The recent discovery of rich gold ore in Holloway township is drawing considerable attention to the Lightning River area southeast of Lake Abitibi. The summer's prospecting campaign of the Canadian Syndicate has given results that should bring about extensive prospecting of the neighbouring claims. There is considerable overburden in the area and it will take work and time to demonstrate the value of the properties. Sufficient has been learned already to indicate that the chances of further noteworthy gold discoveries being made are good. Prospectors and engineers are busily at work trying to discover more ore, and camps are being built with a view to

on prospecting during the coming year. The discovery vein shows abundant grains of gold and is very rich. Neighboring outcrops are now being stripped and some pronounced shear zones have been found. On another property a mineralized red porphyry in basalt has been stripped for several hundred feet. A number of outcrops are of conglomerate and greywacke with slaty bands. The area is, in fact, made up of formations usually found in Northern Ontario gold areas and the recent discovery of rich ore, together with the earlier discovery on the Cochenour property a few miles south, will warrant intensive prospecting.

Goldale

At the Goldale the shaft has reached a depth of 540 feet, and a loading pocket has been cut for handling ore and rock from the work at the 500-foot level. The development of the ore zone is now beginning and in view of what is already known about it, the work of the coming months should result in important orebodies being opened up. Additional plant is being installed, an 80 h.p. tubular boiler having recently been added. The shaft and station are timbered and sumps cut for collection of water. The shaft has been unusually well constructed and its use as a main orehoisting shaft is evidently contemplated.

Rochester

Shaft sinking at the Rochester has been recently delayed by a heavy flow of water. A steam plant has been installed to keep the workings clear in case of a shortage of power. The work already done in the shaft has resulted in the discovery of a new vein.

Newray

At the Newray two diamond drills are in operation and the locating of the ore zones is under way. Mr. John Redington is in charge of operations, which are being carried on by Coniagas Mines Ltd., under an option agreement.

Shining Tree

Development is proceeding steadily at the Ribble-Wasapika property, drifts being run at the 100-foot and 200-foot levels. Additional houses are being erected to take care of a larger number of workmen.

Shaft sinking at the Herrick is well under way. The shaft is down about two hundred feet. The Tonapah Mining Company is operating the Herrick.

Blue Quartz Mines

At the Blue Quartz mine, east of Matheson, the development work continues to give encouraging results. Drifting is in progress at the 200-foot level and some good ore has been encountered.

Experiments at Hollinger

There is considerable interest being taken in the crushing experiments being carried on at the Hollinger. The rod-mill, which is new to the district, is evidently giving good results and some account of its performance is awaited with interest. That it is giving satisfactory results is evidenced by the dismantling of its competitors in he trial runs.—R. E. Hore.

NORTHWESTERN ONTARIO

The Red Lake Silver Strike

Interest is being aroused by further reports coming in from the Red Lake district. Miners are coming into Kenora in considerable numbers, and have recorded many claims. They report 15 miles of the "silver belt" staked solid. The silver bearing formation is reported to be five miles long and of undetermined width. It is not thought that the full length of the belt has yet been determined, and there is hope that further extensions will be located. The lateness of the season and the difficulties of transport have not deterred a movement in the direction of Red Lake. Already parties are being organized in Northwestern Ontario preparatory to a prospecting campaign in that field this Fall. One party headed by Don. Gibson and Mr. Greenley, recently in charge of mining operations at Silver Islet, left Port Arthur yesterday for Red Lake, and other syndicates are being organized that will be under the direction of competent prospectors and engineers.

Silver at Schreiber

An interesting discovery of silver has been made by William Longworth, on claim TB.3850, in the Schreiber area. The vein outcrops on the shore of Lake Superior, on Location 2, and strikes inland, east of north, forming a distinct break in the rock, to where the find was made, about a mile from the shore, the intervening portion being mostly covered with drift. At the point of discovery both the vein and country rock show good silver values. Until further work has been done, no definite statements can be made regarding this find, beyond the fact the few shots that have been put in have disclosed unusual values that warrant more prospecting.

Atikokan Mine Leased

The well known Atikokan iron mine has been leased to Clement K. Quinn & Co. of Duluth, Minn., one of the largest independent iron ore operators in the Lake Superior region. The lease is for thirty years, at fifty cents per ton royalty, on a minimum basis of 100,000 tons per year, for the four year period from 1923 to 1926, both years inclusive, and 200,000 tons per year for the remaining twenty-six years. The royalty is payable quarterly and the first payment becomes due April 1st. 1923. Mayor I. L. Matthews of Fort Arthur, representing the city as one of the bondholders of the Atikokan Iron Company, signed the lease of the 18th. instant. The closing of this transaction means that active mining operations will be carried on at this property in the near future. Clement K. Quinn & Co. formerly held a lease on this property, but dropped it without carrying on any mining or other work, by mutual agreement, during the severe depression in the iron and steel trade in 1921.

In addition to the Atikokan Mine, Messrs Quinn & Co. have taken over under lease all the iron lands held by Maskensie, Man & Company on the Atikokan and Mattawin iron ranges, together with the iron land holdings of Gano & Shepherd on the Atikokan range. These lands cover many thousands of acres, and represent immense tonnages of ore, that under responsible and capable operators, should give an impetus to industry that will be felt all over the province.

Dwight E. Woodbridge, E. M. of Duluth, Minn. is examining iron deposits this week in the Whitefish Lake area, west of Port Arthur.—J. J. O'Connor

NOVA SCOTIA

Labor College Mooted at Glace Bay

The leaders of labor round Glace Bay are discussing the opening up of a labor college. To gain information Dr. Clarence McKinnon of Halifax was asked to address a meeting of all interested in the project. He appeared before them and told how the project could be realized and what the benefit a study of economics should be

to the working classes. After the speaker left the room it was agreed that an effort should be made to begin the work of education among the miners. If sufficient money could be had it was thought that a series of lectures could be conducted during the winter months. Prominet labor men are to be approached to support the cause by giving a small monthly contribution, while it is understood that the different locals of the United Mine Workers are to be asked to contribute as they can.

If the proposal has for its object the teaching of economics it will be welcomed by all who know the leavening influence education has on the public mind. It will have the support of all sound thinking men and its work will be eagerly followed. But if its object is to spread more "Red" propaganda, then it were better that the scheme were still-born. Institutions for the education of workmen in Britain have been of great benefit, and where these have been conducted with no other propose than to inform the mind and fit the workers for the full responsibility of citizenship they have had a wonderful effect in sobering and steadying the masses and their leaders in the troublous days through which they have been and are still passing. Britains labor forces have been and are still passing. Britain's labor forces have shown remarkable wisdom as their responsibilities increased, and to the educational effort of the labor party is largely due the success obtained. On the other hand there have been certain groups that aimed at perverting the laws of the nation and the institutions of these anarchists have been forcibly closed. If it should happen that thoughts of a school of this kind are entertained by those who, while sincere in their desire to ameliorate the ills of the working classes, are nevertheless going the wrong way about it, then a new weapon will be placed in the hands of men whose only attitude up to the present time has been to try to shock the public mind into thinking along communistic lines. The spirit of ideal communism and that shown by the labor leaders and their public meeting at Glace Bay are as far apart as the poles.

The system of education most needed among the miners of many parts of Nova Scotia is one that will teach men to respect one another sufficiently to show civility at their meetings, to tolerate of the opinions of others, to forget their differences for a short time at least, and try to fall into line with other public spirited men who also are laboring for the common interests of our whole people.

BRITISH COLUMBIA

Mineral Exhibit at Prince Rupert

Some fine specimens of the ore of Hudson's Mountain, Hazelton District, B. C., were on exhibition at Prince Rupert recently. A sample from the Mamie Mine assaying 5,000 ounces to the ton high-grade gold-silver copper ore from the Venus, Victory and Shamrock Groups, and high-class samples of gold-silver-lead ore from the White Swan were included in the display. There was also some fine bituminous coal from Lake Kathlyn, B. C., low-grade lead and copper-gold ore a high place was given the exhibits of the Kleanza Co., Ltd., of Usk. The Granby Consolidated M. S. & P. Co. was represented by an interesting collection of its ores and concentrates.

Winter Shipping of Mayo Ore

The Treadwell Mining Company proposes using caterpillar tractors in the haulage of ore from the Mayo Camp this winter. They have found this method of transportation successful during the summer and are convinced that it can been adapted to the snow roads of the north. The Company has 2500 tons of silver ore in sight for shipment. Keno Hill, Ltd., will use horses and sleighs after the close of the river for the transportation of between 3,500 and 4,000 tons of ore. This winter's shipments are expected to be double those of last year in volume and most of it already has been mined and stacked.

It is reported that the Treadwell Company has made another strike of silver ore at the 200-ft. level, the vein being from eight to twelve feet in width. Assays are said to show 300 ounces of silver to the ton. A shaft is to be sunk to the 400-ft. level and, if the values are maintained at that depth, it is the intention to instal a 50 ton concentrator.

Telluride Ore in Chilcotin District

An important strike of telluride ore is said to have been made in the Whitewater section of the Chilcotin District, British Columbia. Veins are reported to have been uncovered from which rich samples have been taken, the covering being no more than from two to three feet. J. Russell and H. Schwartz are named as the two prospectors who have staked the most promising claims. There has been many claims taken up in the district during the season.

The Jack Paul Mining Co., of Spokane Wn., has taken up some prospects in the vicinity of Rock Creek, Grand Forks District B. C. F. Keller, a mining engineer well-known in western Canada, is associated with the enterprise.

Ore for Shipment from Esperanza Mine

Some beautiful specimens of ruby silver crystals have been taken from the Esperanza Mine, Alice Arm, and are on exhibition in the town. They were found in the high grade vein from which considerable rich ore has been shipped. This vein is said to be increasing in width, varying now from 18 to 24 inches. The main ore-body is about 6 feet in width. There will be considerable ore shipped from the property next winter, as the government has widened the trail and snow will help transportation.

Hon. J. H. King Discusses Iron and Steel Project

Hon. J. H. King, Minister of Public Works for Canada, who has been touring British Columbia, conferred with the members of the Provincial Government with regard to the iron and steel plant it is proposed establishing under the joint guarantees of the Provincial, Dominion, and Imperial Governments.

Another Mining Plant Burned

The main plant of the Red Mountain Mine has been destroyed by fire. The mine is situated in Washington State, Mount Baker District, but is accessible only from the Canadian side. The compressor room and the ore bins are completely wiped out and, in order that operations may continue unhampered, rebuilding must be undertaken. The property changed hands recently for a sum approximating $800,000, according to report.

Col. Oscar Butler Perry, mining engineer with the Guggenheim Exploration Company, passed through Vancouver B. C. recently from the Orient. He has circled the globe, his last stop of importance being at the tin fields of the Malay Straits where his principals are developing an industry.

Trans-Continental Highway Runs Through Mineral Areas

A trans-continental highway is being built in Canada by the Dominion Government with the assistance in each province of the provincial governments. In British Columbia the work is well in hand and the roadway will serve, not only for tourist travel, but to open country rich in mineral as well as in other resources. This is especially true of the Rossland Cascade Section, now in hand. The road will give connection between the historic and still productive Rossland District and the Boundary Country. About a year ago Rossland lost its railway service when the Great Northern branch was closed down. Since that time mining there has been at a low ebb. With a good road tapping the mines and running through to a smelter or to railways having connections with a smelter, there will be many properties now dormant that again will become producers.

Trail Ore Receipts

Ore receipts at the Trail Smelter, Canadian Consolidated Mining & Smelting Co., for the week September 1 — 7 totalled 6425 tons. There were three new shippers from the Slocan District, namely, the Black Colt, Last Chance, and the Mountain Consolidated. The Lanark Mine, near Revelstoke, also made a contribution. The mines of the company shipped 5548 tons.

Two-year Agreement with Coal Miners

An Agreement has been entered into between the management and the employees of the Western Fuel Corporation of Canada, Nanaimo B. C., to take effect on the 1st of October next and to continue in force for two years from that date.

The minimum wage per day to be paid the coal miner is $4.25¼, it being understood that the Superintendent of Mines shall be the judge as to the ability of the miner to earn such minimum. In addition the Company agrees to pay all employees a bonus of $1.00 per day worked. "It is mutually understood by the Company and its Employees that any increase or decrease in the bonus herein mentioned shall be governed by competitive conditions." The former bonus was 88 cents per day worked.

The price of coal to employees is set at $3.00 per ton.

Under the schedules mining and yardage pay is given as follows:

Mining — Wakesiah and Reserve Mines, and No. 1 Upper Seam, 91¾ cts. per ton.
Upper Seam, coal under four feet in thickness, $1.08 per ton
Lower Seam, $1.08 per ton.

Yardage — Upper Seam — Level $3.37 per yard and coal
Crosscuts - $2.70 per yard and coal.
Levels - when less than one half of height is in white rock $10.12½ per yard. Coal to Company.
Levels - when more than one half of height is in white rock, $10.80 per yard. Coal to Company.
Turning Stalls - Five yards long by twelve feet wide, $13.50 and coal.
Brushing rock - One foot thick, $1.35 per lin. yard.

The day rates range from $3.71¼ for muckers to $4.99½ to machine foremen. To these, of course, must be added the bonus already referred to.

At the miners' mass meeting it also was decided that Hon. Wm. Sloan, Minister of Mines, would be asked to exclude Orientals from the mines and that the appointment of boards for the administration of the Widows' Pension Act be better acquainted with the needs of beneficiaries.

New Colliery on Vancouver Island

That there will be another producing coal mine on Vancouver Island soon, would seem assured, as J. J. Grant, former manager of the Nanoose-Wellington Collieries, has secured a considerable acreage of coal-bearing land adjacent to the old "Jingle Pot" holdings, near Nanaimo, and is authentically reported to have pushed development close to the shipping point already. Mr. Grant has a first-class colliery equipment, complete in every respect, according to report, and the new mine should materially add to the annual coal output of the Vancouver Island fields.

Fatal Accidents at Working Face

There have been four fatal accidents in the coal mine of British Columbia within the past few weeks, caused by falls of coal or of rock, all of which, with one exception, occurred at the working face. One took place at Nanaimo, another at Fernie, a third at Merritt, and the last at Cassidy.

Hon. Wm. Sloan, Minister of Mines, has noted the recent increase of these fatalities with concern. He has stated that falls of rock and coal are a constant menace to the coal miner and that in late years the majority of the fatal accidents in the coal mines of the Province has been caused by such falls. Undoubtedly, he stated, many are unavoidable accidents, occurring after every known precaution has been taken; but a proportion are preventable. More especially is this so if timbering regulations are complied with.

At present, the Minister pointed out, the demand for coal on the Pacific Coast is urgent. The collieries are working at capacity. It is possible that, under these circumstances, chances are being taken that, under normal conditions, would be avoided. Holding this view, he is determined to obtain all possible information regarding the recent accidents mentioned and, accordingly, has given George Wilkinson, former Chief Inspector of Mines, a special commission to make a thorough inquiry into each case. Mr. Wilkinson will undertake the work immediately and submit his report as soon as possible.

Mr. Sloan states that, if there has been any laxity in the observance of the regulations under the Coal Mines Regulation Act, especially as to timbering and the special rules applicable to the operating companies, he wants to know it. Similarly, if there is anything that can be done to further improve conditions as to safety at the working face, he wants to be informed of it without delay

Too Many Coal Mines, Increases Cost of Coal

George S. Rice, chief of the mining division of the United States Bureau of Mines, who has been in British Columbia investigating the "blow-outs" in the Cassidy Mine, V. I., Granby Consolidated M. S. P. Co., made a statement before leaving the Province touching on a few poins of the present position in America with regard to coal production and supply.

"Indiscriminate competition" has been the cause of the high cost of production. The theory that the more coal mines then are the lower will be the cost, is unsound. Output might be so great that the mines could work only part time. Thus overhead expense is increased and the public has to pay the bill.

Some of the United States mines work only half of each year, the average being about 210 days. The railway mines and those supplying the steel industry work

without cessation, while those supplying the general public often do not operate more than 180 or 190 days in a year.

Mr. Rice would remedy the evil through federal government regulation. He would have the Inter-State Commerce Commission refuse trackage rights to any company wishing to open a new mine until it had proved in open court that the mine was needed. In this way the number of mines would be kept to the point where they would all be able to operate at full time. This, it is thought, would result in a drop in coal production costs of perhaps twenty-five per cent. The existence of too many mines would be quickly remedied through the annual increase in the consumption and the working out of mines.

Government ownership of coal mines is not favoured by Mr. Rice, who claims that experience has proved its unsoundness. Even in Germany where, in pre-war days the best form of government for the carrying out of such a policy existed, it was not a success.

The statement of Henry Ford that there was no shortage was said to be incorrect. The scarcity of coal has been real and the situation in the north central and north Atlantic states, as well as in parts of eastern Canada, might be expected to be serious this winter. A shortage of anthracite was probable in some of the big cities such as New York and Philadelphia, and soft coal would have to be used by people not accustomed to it nor prepared for it.

PROGRESS IN THE CARIBOO

Cariboo, in sympathy with mining generally, is receiving a fair share of attention this season. Although the unprecedented drought has to a considerable extent impeded hydraulic mining, the chief source of gold production in the district, some attention is being directed toward other sources of gold mining, particularly dredging and quartz mining.

While the district was first made famous by the rich placer areas in Williams Creek, Grouse Creek, Lowhee Creek, and a number of other creeks, new discoveries on shallow diggings in recent years have been rare. Still, the recent discoveries in the Cedar Creek district has created a renewed interest in "poor man's diggings," especially on higher levels. According to old timers, exploration or prospecting of the higher benches has been practically nil. The chief hope of the placer miner has been the number of deep unprospected creeks and valleys of the gold zone, a large extent of possible dredging ground, or small or big hydraulic areas.

There are several boulton drills operating in the district testing dredging areas, and a fair proportion of them are finding gold in commercial values.

The hydraulic plant on Lowhee Creek operated by John Hopp has cracked within a short distance of their reservoir, making it necessary to abandon it and construct a new one a mile further up the gulch. They have now a gang of men extending their ditch and building a new dam. It is also the intention of the Company to move their large hydraulic plant from Stout's Gulch to Konkline's Gulch. Konkline's Gulch is a tributary of Williams Creek and one of the rich drifted creeks of the "forties" and like Stout's Gulch now worked out. It is said to contain some very rich yardage values.

John McDougall has struck some rich pay in the deep ground of the unworked part of Jack O' Clubs Creek. The Homer Bell operating at the mouth of the Devil's Canyon has struck rich pay gravel, believed to be from an unworked channel in Grouse Creek. If this proves to be the case, it will develop into an extensive hydraulic property.

In view of the number of quartz discoveries in the district, local attention is being diverted from placer to quartz mining. These new discoveries make it more obvious that the gold zone strikes in a north westerly and south easterly direction and cuts the heads of the rich creeks in the district. Two outstanding gold quartz discoveries have been made this season, the first during May, by Al. Sanders, an old experienced prospector, whose find was in the north westerly slope of Lowhee Mountain, although there is as yet insufficient work done to determine the importance of this discovery. The outcrop indicates a vein from six to twelve feet wide. The vein strikes N. W. with the formation and like most veins in the district dips nearly vertically, while the prevailing dip of the country rock is to the north. While Mr. Sanders' object is primarily to strip the vein, he does a considerable amount of panning in order to keep posted as to values, and his daily pan washup amounts to approximately an ounce a day, which indicates that at least the part of the vein he has uncovered is high grade. This is the second discovery made by Mr. Sanders in a year, the other one being on the Williams Creek slope of Proser Pine Mountain. The distance between these two discoveries is approximately 2½ miles. The vein in the latter discovery is considerably broken over, and it will require considerable development to determine its size and regularity.

Another strike that is attracting considerable attention was made recently by Ernie Moore in the same mineral zone but about fifteen miles south easterly, between the headwaters of Cunningham and Harvey Creeks. Here Mr. Moore has uncovered a vein about sixty feet wide highly impregnated with iron and galena. Where oxidized it shows free gold. These two strikes have caused a certain local excitement and as a result quite a number of claims have been staked.

Dr. W. L. Uglow, in charge of the Dominion Geological Survey party working in this district, has been making a painstaking examination of the geology in the district, including the new discoveries, as well as the discoveries made a few years ago in Proser Pine Mountain. Joe Errington, an easterner representing Porcupine interests has been examining properties on Proser Pine Mountain with a view to purchase. He is expected to return to the district shortly.

To Holders of Five Year 5½ per cent Canada's Victory Bonds

Issued in 1917 and Maturing 1st December, 1922.

CONVERSION PROPOSALS

THE MINISTER OF FINANCE offers to holders of these bonds who desire to continue their investment in Dominion of Canada securities the privilege of exchanging the maturing bonds for new bonds bearing 5½ per cent interest, payable half yearly, of either of the following classes:—

(a) Five year bonds, dated 1st November, 1922, to mature 1st November, 1927.

(b) Ten year bonds, dated 1st November, 1922, to mature 1st November, 1932.

While the maturing bonds will carry interest to 1st December, 1922, the new bonds will commence to earn interest from 1st November, 1922, GIVING A BONUS OF A FULL MONTH'S INTEREST TO THOSE AVAILING THEMSELVES OF THE CONVERSION PRIVILEGE.

This offer is made to holders of the maturing bonds and is not open to other investors. The bonds to be issued under this proposal will be substantially of the same character as those which are maturing, except that the exemption from taxation does not apply to the new issue.

Holders of the maturing bonds who wish to avail themselves of this conversion privilege should take their bonds AS EARLY AS POSSIBLE, BUT NOT LATER THAN SEPTEMBER 30th, to a Branch of any Chartered Bank in Canada and receive in exchange an official receipt for the bonds surrendered, containing an undertaking to deliver the corresponding bonds of the new issue.

Holders of maturing fully registered bonds, interest payable by cheque from Ottawa, will receive their December 1 interest cheque as usual. Holders of coupon bonds will detach and retain the last unmatured coupon before surrendering the bond itself for conversion purposes.

The surrendered bonds will be forwarded by banks to the Minister of Finance at Ottawa, where they will be exchanged for bonds of the new issue, in fully registered, or coupon registered or coupon bearer form carrying interest payable 1st May and 1st November of each year of the duration of the loan, the first interest payment accruing and payable 1st May, 1923. Bonds of the new issue will be sent to the banks for delivery immediately after the receipt of the surrendered bonds.

The bonds of the maturing issue which are not converted under this proposal will be paid off in cash on the 1st December, 1922.

W. S. FIELDING,
Minister of Finance.

Dated at Ottawa, 8th August, 1922.

EDITORIAL

The geologist will be of even greater service in northern Canada than he has been in the south, for he has now the accumulated experience of years in Canadian geology on which to base his opinions.—F. D. Adams—1912.

IRON BY ELECTROLYSIS

Since the successful commercial establishment, recently, of an electrolytic iron industry at Grenoble, France, there has been a marked revival of interest in this simple and effective means of procuring pure iron from its ores. The direct production of iron, chemically pure, by means of an electric process that uses without waste almost the sum total of the energy supplied, has features that commend it not only at this time, when pure iron and its derivatives are of increasing use and value, but in this country, where there is super-abundant electric power, abundant iron ore, and a general industrial development that is merely in its infancy and that gives promise of remarkable expansion during the next few decades.

It would appear that, of all the countries where electrolytic iron might be made commercially, Canada is the most favoured of nature. In both the east and the west, hydro-electric power can be developed in colossal amounts at a cost that allows of its application to electro-metallurgical processes. In both the east and the west, most of the power thus available is remote from large agricultural areas and general industrial communities whose competition for the power might raise its price. It is probable that the use of this power will depend largely upon the development of electro chemical and electro metallurgical industries.

Though Canada is, so far as is known at present, poor in iron ore suitable for direct use in the blast-furnace, she has an abundance, both in the east and the west of other ores of iron, both sulphide and oxide. The present attempt at Trail, British Columbia, to make use of the pyrrhotite gangue from the huge ore deposits of the Sullivan mine illustrates the direction in which an indigenous Canadian iron industry may be developed. If the metallurgists at Trail should succeed in separating economically the iron and sulphur from the Sullivan ore, as already they have done the silver, zinc and lead, British Columbia's long desired iron and steel industry may become established without more ado.

We print to-day an account by Mr. Axel Estelle of two processes for the production of electrolytic iron, with by-products, that he has worked out recently. The practical details that elucidate and amplify his chemical equations show that his processes are based, not merely upon ideas transferred to paper, but upon practical experimenting. A considerable part of the data he gives and the conclusions he draws is common to other similar processes; but he has new data and new conclusions that make his paper worthy of close study.

The possibility of producing iron from its compounds with sulphur seems rather remote, to those of us accustomed to rely upon the blast-furnace with its cheap raw materials and its unrivalled economy of operation. Many an attempt has been made to use pyrrhotite or pyrite as an ore of iron by means of putting the sulphur into saleable form, generally in the form of sulphuric acid. In Canada, this use of the iron sulphides has been unprofitable because of the limited market for sulphuric acid. If, however, the sulphur could be recovered in its native form, a new field would be opened which would bear close examination. The Estelle process for sulphide ores of iron proposes the recovery of pure iron and sulphur, with any precious or semi-precious metals concentrated in a small residue.

Ordinarily we consider the oxygen of oxide ores of iron as something merely to be got rid of at the least possible expense. The Estelle process proposes to catch and use this oxygen after it has been separated from the metal. The use of oxygen in modern industry is increasing very rapidly. It is possible that here lies an opportunity for producers of oxygen to manufacture the gas in a way that will aid materially in promoting our production of iron from Canadian ores. The magnetic concentrate from our low grade ores would be especially suitable for this purpose.

IRON ORE DEPOSITS IN NORTHWESTERN ONTARIO TO BE OPERATED

It would appear that at last the more promising of the iron ore deposits of northwestern Ontario have fallen into the hands of operators who will really operate. Clement K. Quinn and Company are one of the most substantial and most progressive firms among the independent iron ore miners and dealers of the United States. Since so many Canadians (most of them amateurs in the iron ore business, to be sure) have failed to make a commercial success of opening up these ore deposits, and since British iron and steel men are not interested in stimulating and

ating the development of a Canadian iron ore industry, it is satisfactory to have a competent American firm undertake to make use of these resources.

As yet it has not been disclosed what direction the projected attempt will take. Mr. Quinn is said to have taken over not only the Atikokan deposits but a part of the Mattawin iron range as well. The beneficiation of the ores of these two ranges presents separate problems, as sulphur is the deleterious element in the case of Atikokan ore, while the Mattawin ore is high in silica. It is significant that there is available on the Mattawin range, close to the railway, a very large amount of banded magnetic iron formation, available by quarrying and higher in iron than is that now being treated at Babbitt, Minnesota. If the treatment at Babbitt should prove to be commercially feasible, then it goes without saying that the ore of the Mattawin range, higher in iron and similar in other respects, will be amenable to the same or similar treatment.

Should the enterprise of this American firm result in the successful establishment of a Canadian iron ore industry, it is to be hoped that Canadians will follow suit in some of the remaining localities where low-grade iron ore is available in abundance. Our best efforts up to the present have fallen short of complete success; but that is not sufficient reason for abandoning the attempt to put our Canadian iron and steel industry on an independent and secure footing.

CAPITAL FOR MINING DEVELOPMENT

It is a truism that Canada, in common with all new and growing countries, has not adequate facilities for developing her natural resources at the rate she wishes. Particularly does she lack capital sufficient to take advantage of all the opportunities her resources offer. In no part of her industrial organization is this more apparent than in her mining industry.

If we look over the mining fields of Canada, we will find that the larger part of them, as well as the more successful part, has been developed by means of capital obtained from the United States. Canadian and British capital have, in places, been very successfully applied; but the lion's share of the work has been done by the eagle on the American dollar. We allow this metaphor to stand, badly involved as it is, since it suggests the undoubted fact that Britons, as well as Canadians, have been slow to take advantage of opportunities that have been grasped promptly by our American neighbours.

What do we pay for the use of this capital from abroad, and what benefit do we derive from it? This is rather an involved question; but a partial answer to it can be given simply. If the capital investment results successfully, we have the benefit of added employment and an increase of taxable property within our borders. The profits go abroad. The more profitable the venture, the larger is the fraction of the proceeds paid by Canada for the use of the borrowed money. Meantime the direction and control of the mining operations is in the hands of the investors, though in the last resort, of course, the state is the final authority.

There is, fortunately, an increasingly large amount of Canadian capital available annually for investment in Canadian mines. A fraction (much too large a fraction) of this capital falls into the hands of unscrupulous promoters and stock-jobbers, and thus does not become actually available for the legitimate purposes of the industry. Nevertheless Canadian investment in Canadian mines has now reached measurable proportions. Gradually, as the investing public is educated to the opportunity and becomes capable of discriminating between the genuine investment and the wild gamble or sheer shell-game, Canada will conserve the profit from her mineral resources by providing her own capital for their development.

While a large part of the general investing public remains, as at present, supremely ignorant of the basic facts of our mining industry and thus subject to the wiles of the ever-present member of the light-fingered fraternity, our main source of Canadian capital must be successful mining operators and investors who are ready to re-invest in the industry. These men know all the rules of the mining "game", and their money is spent to the best advantage in the exploring and prospecting, examination of prospects, preliminary development and mine development that they undertake. They are, of course, subject to error as all of us are; and many a prospector whose find has been turned down by their examining engineers will tell you that, each and all, they are looking for ready-made mines at bargain-counter prices. Nevertheless the fact is that professional mining investors are the soundest and surest means of developing our mining industry rapidly and economically. We hope that the numbers and the resources of Canadians thus interested in the mining industry of our Dominion will continue rapidly to increase, in order that they may hold for Canada, as well as for themselves, the full benefit of the riches with which nature has endowed us.

EDITORIAL NOTES

Through the courtesy of the Geological Survey, Ottawa, we are able to print today a full description of the geology of the Red Lake area, District of Patricia, where a silver find has created such interest. The report of Dr. Dowling's survey, made twenty-nine years ago, would have remained as little known to us as it is to the mining community at large, had not the Chief of the Division of Geological Information, Mr. Wyatt Malcolm, drawn our attention to it. We have here an instance of the practical utility of this Division of the Geological Survey, whose chief function it is to help make available to the public the vast store of useful information contained in the Survey's records,—much of it securely hidden there, but for the attentions of Mr. Malcolm and his staff.

It is interesting to note that in Toronto, civic spirit, making use of the powers of the fuel controller, has at last

succeeded in reducing the price of coal somewhat below the exorbitant level at which it has been for many years past. It is a fact well-known to those who wish to inquire even casually, that the coal trade of Ontario and Quebec is a monopoly, in the hands of a few wholesale dealers who are in complete agreement in their determination to keep prices at an artificially high level. The retailers must accede to this, whether they will or no. The wholesalers obviously do their scheming in collusion with the "coal barons" of the United States, from whom they draw their supply. This deliberate scheming virtually to rob the public is done by men who are otherwise high in the esteem of their fellows. It is looked upon as "good business." Actually it is one of the blots upon our civilization, and illustrates the fundamental cause of a vast deal of labour discontent and unrest. It is a flagrant violation of the principles we call Christian. We are pleased to note that a missionary, in the shape of a fuel controller, has made bold to penetrate the heathendom heretofore reserved to coal dealers.

Now that the situation in the near East has become less threatening, our precious cabinet in Ottawa has commenced to take it more seriously, presumably because the case now involves for them more definitely domestic political problems. The shame we felt first at being exposed by the action of our accredited representatives to the ridicule of the Empire and of the world, still persists; but now it is mixed with contempt for the bare faced juggling that tries to make political capital out of a national, and international, crisis.

When Samuel Champlain was organizing his expedition to Canada, in the year 1618, his letters of authorization contained some singularly interesting provisions. Amongst other things, he was instructed to take with him ten tons of lime. The presence of limestone round Quebec and Montreal was not then known. Two mill stones were also part of his cargo. This was carrying coals to Newcastle with a vengeance.

TOOL FOR GRIPPING SHEET METAL

Wherever sheet metal is used in a continuous manner some protection is usually provided to prevent the metal from cutting the operator's hands; but where this material is only handled occasionally, as, for instance, in a storeroom, no protective device is deemed worth the trouble and cost. Consequently, many badly cut hands often result. Illustrated in the accompanying photograph is a tool which has been used effectively for the purpose of handling sheet metal in a storeroom. With this device one man can pull out a sheet from a number of others and transport it with ease and safety. For wide sheets, two of these tools are used, one in either hand.

Materials for the tool are inexpensive and there is nothing complicated in the construction of it, the main part consisting of a short length of 2 in. by $\frac{1}{4}$ in. strap iron. This has a slot $\frac{1}{4}$ in. wide sawed out at right angles to the length, near the end, and near the other end a hole is drilled to clear a stud which is threaded tightly into a file handle, the whole being held together by a nut on the under side of the iron. A glance at the photo will explain to the reader how the construction of the tool permits it to grip the metal as soon as the handle is pulled and why

the tightness of the grip increases in proportion to the pull. It will be as well to add that no attempt should be made to smooth the edges of the slot; the rougher these are left the quicker the tool will grip. The device can, of course, be used in an opposite direction to that shown, i.e. upside down, and this position is preferable where the stock is some distance from the floor.

Harry Moore, Montreal.

NIGHT-WATCH

I rolled me in my blankets snug and tight,
And settled down all fixed to sleep all night
My pardner was a fat chap from the East,
Who didn't know my habits in the least
I hadn't been asleep an hour, no more,
When that there feller started for to snore!
Say, I have heard some snoring in my time,
But what he did was just one jeesly crime!
He trumpeted and gurgled like a whale,
And then he'd choke—I thought his heart would fail;
And then he'd start again, the sinned dunned loon
I'd rather have a kyoot or a loon!
While he was bubblin' there like merry hell,
I wouldn killed him had I knew him well
I wouldn made him go outside and die,
And stop his bloody noise and let me lie
But as he was a stranger all I did
Was lie awake and never bat a lid

J. C. M.

The Estelle Process

ELECTROLYTIC REDUCTION OF IRON FROM ITS ORES

By AXEL ESTELLE

"Mining and Metallurgy" published in its number of December last year an article on "Commercial Production of Electrolytic Iron," describing the so-called "Eustis Process." This process, which produces electrolytically iron tubes from sulphide ores, is in the article said to be "unique in iron metallurgy." As the electrolytic production of iron tubes is already well known, the uniqueness of the process can only refer to the electrolytic reduction of iron from its sulphide ores.

This reduction as indicated by Mr. Eustis, however, is by no means new; the present writer gave long ago (especially in the American Letters-Patent 1,162,150 of November 30th 1915, and Canadian Patent 157,266 of Aug. 4, 1914) an exact description of it, far more detailed than has been done in the above mentioned paper. Besides, the invention was made in 1912, and the inventor filed an application for letters-patent for it in his native country, Sweden. He then, it is true, withdrew the application before it was submitted to public inspection, on account of his not meeting with a sufficient interest in his invention. The fact is that important deposits of sulphide iron ores are not found in Sweden; therefore the inventor was not inclined to protect a process that could be of advantage only to foreign countries and that, in fact, would be prejudicial to the export of high-class iron from Sweden.

The writer, having meanwhile taken up residence in Germany, then stated that certainly Canada, where, as well known, immense quantities of sulphide iron-ores are found, might have an interest in the process. For this reason he filed again applications, almost simultaneously, in Canada, the United States and Germany.

As a result of the war, the inventor was informed, only after the lapse of a number of years, that Canada and the United States had granted him the patents. An invitation to come to Canada in order to discuss the utilization of the invention never reached him until after the war.

Dissolving the Iron

In the above-mentioned article in "Mining and Metallurgy", to which the attention of the writer was drawn a short time ago, he sees that his idea has been taken up by other people.

The Chemistry of the Eustis Process is described in the article by the two equations

$$3\ FeCl_2 = Fe + 2FeCl_3 \text{ and}$$

$$2\ FeCl_3 + FeS = 3FeCl_2 + S$$

The first equation is identical with that of No. (2) of the above-mentioned American patent. What the second equation, in which the sulphide ore is represented by the mono-sulphide, FeS, signifies is contained in the lines 89-96 on Page 2 of the patent. The equation itself, however, has intentionally not been included, as the solution of the problem is not so simple as this equation would lead us to assume.

First it is to be observed that most of the sulphur compounds of iron are not soluble, or else rather difficult to dissolve, in dilute acids and in solutions of ferric salts. This is specially the case with iron pyrites, but also with magnetic pyrites or pyrrhotite, which, though it contains more sulphur than the monosulphide, is generally not much better for use. Therefore it is proposed in the patent to remove first this additional sulphur in any of the ways already known.

Difficulties of Using a Ferric Solvent

But, even when the mineral has been turned into monosulphide, a direct leaching with only a ferric salt solution is, for different reasons, hard to accomplish. The elementary sulphur, which precipitates as shown in the second equation above, has a very disturbing influence, especially as relatively hot solutions are necessary for the treatment. This sulphur, which coagulates in chloride solutions and does not remain suspended in a colloidal, finely divided condition, soon forms an impervious covering round the mineral grains and stops in this way the further reaction of the ferric solution. Moreover, we must remember that a ferric salt in aqueous solution is always partly dissociated hydrolytically into hydroxide of iron and hydrochloric acid, as this equation shows:

The degree of dissociation of the hydrocloric acid, however, is very high and for this reason the concentration

$$FeCl_3 + 3H_2O \rightleftharpoons Fe(OH)_3 + 3HCl$$

of the H-ions will surpass the ferric-ions. The chloride of iron accordingly does not react with the iron sulphide in the simple way that the second equation indicates in the article mentioned.

The hydrochloric acid formed by hydrolysis reacts on the iron sulphide and releases an equivalent quantity of hydroxide of iron, by which reaction sulphuretted hydrogen at first is formed. All the latter, or at least the larger part of it, reduces unaltered chloride of iron and precipitates sulphur. The hydroxide of iron at first set free is turned by the surplus of chloride into soluble oxychlorides, which however, as fast as the chloride becomes reduced change into soluble basic combinations as, for example, $Fe_2\ Cl\ (OH)_5$. Finally, when the greater part of the chloride has been reduced, sulphureted hydrogen escapes and the reaction might be the following:

$$5FeS + 4FeCl_3 + nH_2O = 5\ FeCl_2 + 2Fe_2Cl\ (OH)_5 + 5H_2S + (n\text{-}10)\ H_2O$$

The consequence of the hydrolytic dissociation of the chloride of iron is that when leaching, if there is no free acid, besides sulphur, all kinds of insoluble basic ferric compounds are formed, which also work disturbingly in many regards, and part of the sulphur escapes as sulphuretted hydrogen.

Another disadvantage connected with the leaching of the ore with chloride of iron is that part of the sulphur, although but a small part, oxidizes to sulphuric acid and that the solution is getting more and more sulphate-containing, which should be avoided when reducing pure iron.

Should the ore, together with iron, contain any other sulphides of metals that might be of use, then the direct leaching with chloride of iron is still more unsuitable, as these foreign metals are dissolved, although not quantitatively. There is obtained not only a solution of ferrous chloride containing compounds of other metals, which solution must be specially treated before electrolysing in order to utilise these metals and get the purest iron possible, but also a residue of gangue, sulphur and sulphides of metal that remain undissolved and that cannot always be economically treated.

The Estelle Process

All the above mentioned disadvantages and difficulties are avoided by the invention of the author. The process according to this invention consists essentially in first leaching the raw material with weak non-oxidizing acid and in then separating the iron electrolytically with insoluble electrodes from the solution of the salt of iron so formed, a suitable method being employed for continuously regenerating the solution as diagrammatically shown in the drawings filed with the patents.

One of the figures illustrates the various steps by which the iron and sulphur are separated from each other and from the residue of the ore, the leaching being done simply by a dilute non oxidizing acid. The other figure illustrates the same when a part of the ferric solution produced by electrolysis is used with the same dilute non oxidizing acid as leaching fluid. The process is the same, step for step, the difference being the addition of supplemental leaching liquid at one stage, to the main leaching liquid first mentioned above. Of course the material produced or separated by the various steps of the process may be collected, washed and used continuously where made available.

After the sulphide iron ore has been converted into the readily soluble form as more particularly explained in the patent the above described leaching and electrolytic treatment can be carried out. It has already been frequently proposed to treat copper and zinc ores or their smelted products in a similar manner. The known processes involving this treatment are, however, totally unsuitable for the present purpose, because, when extracting iron, quite other conditions exist, which render necessary a treatment essentially different from these processes.

In the Patent the method is described in the following manner:

"For carrying the new process into practice, two cases must be considered: (1) When the raw material contains valuable metals which it is desired to extract as by-products. This case is to be regarded as the normal one. (2) When the raw material contains no such metals.

Separation of Iron and Other Metals

"The following is an example of the manner in which the present invention may be carried into effect. The raw material, reduced to a suitable size, is treated at a temperature of about 40 deg. to 80 deg. C. with a dilute, non-oxidizing acid, preferably hydrochloric acid. Assuming that the latter acid be employed, the result of the reaction is the formation of ferrous chloride and sulphuretted hydrogen, in accordance with the well known equation:

$$FeS + 2HCl = FeCl_2 + H_2S \quad (1)$$

"Other sulphur containing metals possibly present, as well as a small residue of gangue, remain behind in the lixiviating apparatus. These particular metals, being in this highly concentrated form, can subsequently be very advantageously treated. The solution of ferrous chloride is electrolyzed in suitable decomposition or electrolytic cells with insoluble anodes, these cells being however of extremely simple construction because the solution contains only one single metal. A portion of the iron is now deposited, while twice this amount of iron is converted into the corresponding ferric compound, as the following equation shows:

$$3FeCl_2 = Fe + 2FeCl_3 \quad (2)$$

Separation of Sulphur and Regeneration of Acid

"The ferric chloride obtained is now passed, together with the equivalent quantity of sulphuretted hydrogen evolved in accordance with equation (1), into an absorption tower or other suitable, similar apparatus, the following known reaction then occurring:

$$2FeCl_3 + H_2S = 2FeCl_2 + 2HCl + S \quad (3)$$

"The acid previously combined with the electrolytically deposited iron is in this manner again liberated in order to be available for further use, while the corresponding quantity of sulphur, simultaneously separated, needs only to be removed and converted by known methods into one of the commercial forms.

"By this process there are therefore extracted in a simple manner not only the electrolytically deposited iron but also the corresponding quantity of sulphur. The valuable metals remain behind as compounds with sulphur and can be recovered by a separate process. The acid employed as solvent is continually regenerated, and then re-employed.

"A special advantage of this process is that sulphur is eliminated in a separate apparatus and is not rendered impure by the residues when the raw material is dissolved. An added advantage is that the electrolyzing devices can be of extremely simple construction, as it is a question of keeping several different metals separate from one another.

"In the above-stated second case, viz. when the sulphide of iron contains no other valuable metals or at least no sufficient quantities to warrant recovery, the above described process may obviously be also employed. Under some circumstances it is, however, preferable somewhat to modify the process, for, since no valuable attendant metals need to be taken into consideration, *it would be possible directly to lixiviate the sulphide of iron with the ferric solution directly obtained from the electrolytic or decomposition cells* (*) For this purpose, however, a certain quantity of free acid must be present, and as the solution to be electrolyzed should contain no free acid, or at least no material quantity, the acid must be neutralized or saturated before the solution is subjected to electrolysis. This again would mean a continual increase of the quantity of solution and a corresponding loss of acid and iron. This disadvantage can, however, be obviated by supplying only a portion of the ferric solution directly to the lixiviating apparatus, while the remainder is passed through the absorption tower provided in case No. 1, in order to reach the lixiviating apparatus only at some later time. In this manner the necessary quantity of free acid is supplied and as this should be neutralized, the quantity of sulphuretted hydrogen necessary to furnish this acid is produced.

"By the process described in this invention it is therefore made possible to produce electrolytic iron from ores and smelted products which have hitherto been regarded as almost worthless. Moreover, the new process is applicable to any sulphide containing smelter product, provided that the percentage of soluble sulphide of iron is sufficiently high.

"As this invention is not limited in its application to one product only, it is of no consequence that the iron is obtained in a crude form as "electrolytic crude iron." The decomposition cells can on that account be of very simple construction. As no free acid is present, and no destructive gas is evolved at the anodes, the cells are well preserved.

"The separated iron is preferably melted in an electric furnace, this iron being alloyed simultaneously if desired with other metals for special purposes."

(*) The italics show the words in the Estelle patent that correspond with the second equation of the "Estelle Process" mention above.

Electrolytic Reduction of Iron Oxides

The above described invention relates to the utilization of sulphide iron ores. The author also carried out another electrolytic treatment for reducing iron from its ordinary oxide ores. This invention was made a short time before the war and an application for letters-patent was filed for it in November 1914. The American Patent, published on August 6th, 1918, has the number 1,275,161. The Canadian Patent is No. 188,462, Jan. 28th, 1918.

The invention proposes the production of iron by the electrolytic dissociation of a hot slimy precipitate of iron hydroxide suspended in an electrolyte of caustic alkali, comprising for example 35 per cent water, 35 per cent caustic soda and 30 per cent ferric hydrate, the electrodes being of iron, nickel or any other suitable material that resists the effect of the current and of the hot electrolyte. By the action of the electric current metallic iron is precipitated on the cathode in form of a smooth layer, and oxygen is evolved near the anode, while the iron hydroxide is gradually decomposed. In order to render the process continuous, iron hydroxide may be added to the electrolyte in the electrolyzing tank in proportion as metallic iron is precipitated.

Under the influence of the current two events occur. By the action of so-called electrophoresis the hydroxide of iron comes up near the cathode and would firmly adhere to it in this chemical state, if the electrolyte were not simultaneously decomposed. On the other hand the electrolysis would end in a simple decomposition of water, if the hydroxide of iron were not reaching the cathode. The sodium ions arriving at the cathode immediately reduce the ferric oxide and insure that only metallic iron is deposited at the cathode, whereas the hydroxyl-ions deposited at the anode dissociate into elementary oxygen and water.

The electro-chemistry of the process may be shown by the following equations:

$$6NaOH + 6(F) = 6Na' + 6OH'$$
$$6\ Na' + 2Fe(OH)_3 = 2Fe + 6NaOH + 6(+)$$
$$6OH' = 3O + 3H_2O + 6(-)$$

$$6NaOH + 2Fe(OH)_3 + 6(F) = 2Fe + 3O + 3H_2O + 6NaOH$$

From the final equation it is clearly seen that, by the action of the current—6 valence charges (F) for 2 Mol. $Fe(OH)_3$—the electrolyte, the caustic soda, remains unchanged in its chemical state and only the ferric oxide is decomposed into its elements, iron and oxygen, whereas the water of hydration separates unchanged. By the latter, it is true, the electrolyte becomes diluted, but, the electrolysis occurring at about 100 deg. C., a temperature far below the boiling point (140 deg.) of the electrolyte, there is so much water evaporating as steam with the oxygen that commonly an equalization is obtained by this means.

Process Electrolytic, not Galvanic

With regard to the above description, the reduction of iron is not to be looked upon as the result of a common, galvanic process, but as that of an electrolytic reduction. To prove this statement, an experiment may serve, in which the cathode was separated from the hydroxide of iron by a porous cell. In that case no iron was deposited and the result of the electrolyzing was only a decomposition of water. The process is therefore to be considered as unique in electro-chemistry in this regard also, that a molecule by aid of electrical energy is separated into its constituents parts in such a way that neither of them has an opportunity of forming new combinations and both therefore can be utilized in their unchanged state.

The fact that the electrolyte consists of a strong solution of a caustic alkali has the great advantage of permitting metallic iron to be used as the material of construction, not only for the decomposition-cells themselves, but also for piping, heating apparatus, devices for moving the slimey mixture and for other parts coming into contact with the hot electrolyte. The decomposition-cells therefore can be made air-tight, and for that reason the oxygen also can be caught and utilized. For one metric ton of iron obtained not less than about 300 cubic meters of oxygen are produced.

No Diaphragms Required

The electrolysis occurs without making use of diaphragms. The electric current required is 1.6 to 1.8 Volt at a current density of 3 Amp. per sq. dm. At an efficiency of current of about 90 per cent, the consumption of energy is about 2,800 K.W.H. per metric ton of iron.

The deposited metal does not incline to a lumpy formation as is the case with the ordinary galvanic process. However, it is a little more porous than ordinary electrolytic iron.

Molding, Rolling and Forging Electrolytic Iron Without Fusion

It is simple to provide for an easy separation of the metal form the cathode sheets, if it is to be utilized as "electrolytic crude iron" or as powdery iron. Having not been red hot, the iron may in a simple way be ground to a fine powder. This peculiarity of his iron suggested to the author the idea of a process for the production of objects of pure iron, iron alloys, simple and alloyed steel by making use of powdery materials, by making at first in quite a special way, a solid compressed mass, free from oxygen, which can be worked up by common, well-known methods either cold or red-hot. The objects made in such a way, such as hollow cylinders, which are to be slit and rolled, may accordingly be finished without any melting of the material. This is of great importance, specially for products of excellent magnetic qualities, as the iron, as is known, tends to absorb gases when fused, but not when only red hot. The possibility of giving a certain shape during the compressing of the powdery materials has in itself an importance that is not to be undervalued.

As mentioned, the oxide of iron that is to be electrolyzed must be in a hydrated form. Anhydrides, as hematite and magnetite, may therefore be hydrated by a suitable treatment with ordinary or caustic soda, by which means a ferrite of sodium is first produced, which is then decomposed by the addition of water into hydroxide of iron and caustic soda. So the soda is not consumed; at best it is causticised in accordance with the following equations:

$$Fe_2O_3 + 2NaOH = Na_2Fe_2O_4 + H_2O$$
$$Fe_2O_3 + Na_2CO_3 = Na_2Fe_2O_4 + CO_2$$
$$Na_2Fe_2O_4 + 3H_2O = 2Fe(OH)_3 + 2NaOH$$

Sources of Raw Material for Estelle Process

In many factories by-products are formed, which if not made impure by carelessness may be directly utilized for the present purpose, such as iron hydrates obtained in factories for aniline and for compounds of bromine. Turnings also may serve as raw material for the production of electrolytic iron by this method, after a preliminary washing and conversion into hydrates.

Whether natural products as common iron ores, residues from the purification of bauxite in the alumina factories, and sulphide iron ores (pyrite and pyrrhotite), should be used as raw material, is in any single case a question only

of separation or concentration. With magnetite as raw material an oxygen compound of iron, practically free from gangue, may be obtained economically as is well known. Sulphide of iron can be freed from the gangue by a variety of pyritic smelting, and from sulphur to a sufficient extent by roasting and in other ways. For the treatment of pyrite and pyrrhotite, containing besides iron other useful metals such as copper, nickel and cobalt, and also precious metals (Canadian ores especially), the method opens up new ways, which may lead to the ultilization not alone of the above-mentioned metals but also of the iron, as well as of the sulphur. Non-magnetic iron ores, in the first place the hydrated ones (brown hematite, bog ore, etc.) are hard to concentrate, so that they are less suitable raw materials for the electrolytic reduction of iron than the above mentioned ores. In the treatment in question it is most important that no considerable quantity of gangue should enter the apparatus. Lately, the author has succeeded in finding out a treatment for bringing such ores in a way other than roasting to a very strong magnetic state. This gives him promise of making also of these non-magnetic ores suitable raw materials for his process.

Suggested Uses for Oxygen

Regarding the utilization of the oxygen produced as a by-product in the alkaline process of electrolytically reducing iron, we must mention some special uses. In smelting works the oxygen is not only highly serviceable for autogenous welding and cutting, but also for purely metallurgical purposes. If, for example, in the Siemens-Martin process it were possible to increase the content of oxygen in the compressed air by about 2 per cent., a temperature could be reached, that would permit refining processes that otherwise can be carried on only in the electric furnace. It is only during short periods, that the air must be thus rich in oxygen.

For the utilization of the nitrogen of the air, as in the process with electric arcs, cheap oxygen is of importance as has been shown, since the yield is improved by using the so-called ideal gas mixture, consisting of equal volumes of oxygen and nitrogen, instead of the air. It may also be an advantage to have cheap oxygen at one's disposal, when oxidizing ammonia to nitric acid.

Finally the writer wishes to draw attention to the fact that in the supply of electric current, large fluctuations have no significant influence on the quality of the iron separated. For this reason an industry based on the alkaline process of reducing iron electrically seems to be suited to serve as a consumption-regulator for electric central stations.

This electrolytic iron industry undoubtedly would be able to fulfil the principal conditions of commercial success without any difficulty, the raw material, as a rule, being nearly everywhere obtainable. The finished product, if cheap enough, would find an unlimited sale, and the plant itself would need relatively few hands.

Recent Development in Lightning River Gold Area

By R. E. HORE

The Lightning River gold area is in Ontario close to the Quebec boundary. It lies immediately south of Lake Abitibi and is most easily reached from La Reine station on the main line of the Transcontinental Railway east of Cochrane. La Reine is on a river running into Lake Abitibi from the north east.

The Canadian Mining Syndicate, which is developing claims in the area, has provided a motor boat service to Lightning River landing. From La Reine to the landing is a journey of three and a half hours by motor boat. A very reasonable charge is made for passengers and freight. The present center of activity is about three miles from the landing. A roadway has been cut out to the Syndicate's camp which is on the Meridian line in Holloway township. From this camp trails lead to the other parts of the area. At the landing there is accommodation for travellers at the "Ghost Range Inn".

In crossing Lake Abitibi there is in plain view a number of prominent hills south of the lake. The most conspicuous of these is the Ghost Range. The recent discoveries are just south of this range of hills. The road from the landing avoids the hills and can be made a good one at reasonable cost.

The show place is the Seagar claim, where some very rich ore has been taken out from a quartz vein. The enclosing rock is a gray carbonated mass which is in many places heavily impregnated with iron pyrites. For a considerable distance from this rich vein there is mineralized rock in which ore bodies may be found by stripping and sampling of the undecomposed rock. This is a big task and will take some time, but the chances of finding something of first rate value are good and well worth the effort. Strippings in the vicinity of the vein all show gold in the decomposed rock when tested by panning.

In the neighborhood there are outcrops that show there are wide and strong schist zones running across several claims. The rocks of the area are of types prominent in other Ontario gold areas. Systematic and thorough prospecting is quite likely to give good results and it is pleasing to note that preparations are being made by several groups of claim owners for intensive prospecting. Already a lot of good work has been done and the encouraging results have resulted in the erection of permanent camps for the continuation of the work.

A few miles south of the Seager claim is the Willans-Howie-Cochenour property, a description of which was published some time ago in the reports of the Ontario Department of Mines. Mr. Cyril W. Knight described in some detail the formation there and called attention to the number of lava flows that occur. In the vicinity of the new discovery outcrops of sedimentary rocks—greywacke and conglomerate—are more prominent than the volcanic rocks. At the O'Neil claim there has been stripped for several hundred feet a mineralized red porphyry dyke which is in basalt. The rock enclosing the rich ore on the Seager property appears to be largely composed of secondary minerals. It has been formed probably by alteration of a mass of igneous rock; but microscopic examination will be required to determine its exact composition and probable origin. Mr. Knight has recently visited the new discoveries and his report will probably include some detailed description of the rocks. A geological map of the area would be of considerable assistance to prospectors.

As the season for water transportation is drawing to a close, the provision of a winter route is now occupying the attention of the operators in the area. It is probably that roads leading out from the T. & N. O. Ry. at Matheson or Ramore will be extended to serve as winter roads. Camps for winter use have been erected on the Seager, O'Neil and Cryderman claims and it is evidently the intention to proceed with exploration without delay. Prospectors have recently staked out a number of claims and there will doubtless be a great deal more staking during the next few months.

Red Lake District of Patricia

SURVEY MADE IN 1893 BY DR. DOWLING

Much interest is being taken in the recently reported discovery of silver on Red lake, Patricia district, Ontario. A geological survey of Red lake was made by D. B. Dowling of the Geological Survey of Canada, in 1893. The following notes are taken from Mr Dowling's report.

Red lake is a long narrow body of water dotted with innumerable islands and branching into a great number of elongated bays. Its greatest length measured in a west south-west direction is 27 miles, and its greatest breadth at right angles to this is 7 miles.

The geological formations exposed on the shores of Red lake are Precambrian in age. They consist of a series of schists, limestones and bedded volcanics, designated at that time as Huronian in age. These were intruded by later granites.

Pipestone bay, the most westerly bay of the lake, affords the best opportunity of studying an almost continuous exposure of the older schists, limestones and volcanics, across the strike. "It was found to present, with Front Bay to the south, a series of highly inclined beds representing possibly many folds which have assumed the general form of an anticline, the axis running east-and-west occupying the area of Pipestone Bay. The beds on the north, in contact with the gneiss, dip northward at angles varying from 60 deg. to 80 deg. At the centre and near the south side they are nearly vertical. Southward through the narrows, the inclination is south varying from 50 deg. to 80 deg. from the horizontal. A synclinal fold with its axis running north-west brings the beds up again on the south shore of Front Bay, where they strike along the general direction of the south shore of this arm. The continuation of this to the south-east probably form a narrow belt passing near Medicine Stone Lake and joining the same rocks at Gull Rock Lake.

"The composition of the series in these folds appears to be as follows, in ascending order:—

1. Dark green schists, probably squeezed volcanic material, together with a more crystalline hornblende-rock which appears to be eruptive.

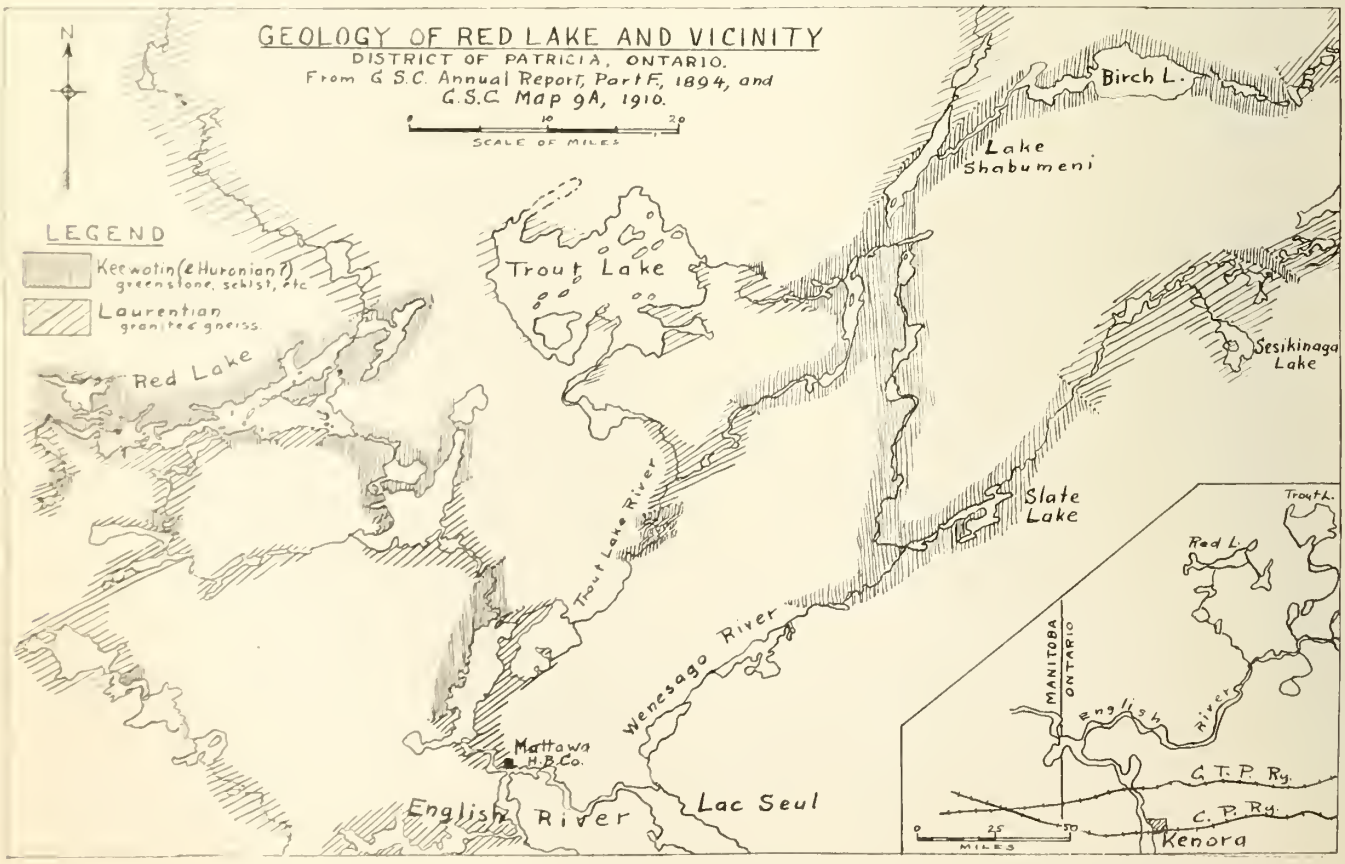
2. Yellowish-white, rusty-weathering, dolomitic limestone, holding irregular nodules of a cherty nature. These beds in some places are more or less quartzose owing to the greater or less prevalence of the cherty masses. Alternating with them are greenstones which are occasionally altered to a soft chlorite or pot-stone, the pipe-stone of the Indians. In this form, an example is found in the narrows leading to Pipestone Bay, where a bed of one foot in thickness lies between beds of rusty dolomite.

3. Beds of slate and schist, mostly black and dark-green, are found to intervene between the first rusty beds and a second series above.

4. The second series of rusty-weathering dolomites is preceded by a bed of squeezed and altered quartz-porphry of ten feet in thickness. The dolomite is in a thicker bed, and, like the first, very much spotted with dark-weathering irregular masses of cherty or quartzose material.

"Above this is another band of altered quartz-porphry, which is in the form of a gray hornstone with numerous blebs of quartz.

"In other parts of the section, these beds can be with difficulty followed, but may become altered to varieties of slates, schists and quartzites, while layers of greenstone, perhaps of volcanic origin, are found interstratified or



forming lenticular masses between the beds, often seemingly occupying the place of other members of the section.

"The beds crossing the central portion of Pipestone Bay, possibly representing the lower members of the series, are nearly altogether of alternate layers of greenstone and green schists, often becoming a chlorite schist. Succeeding them to the north, a series of highly quartzose felsites, occupying probably a similar position to the lower dolomites of the south side, weather to light colours and assume the appearance of quartzites.

"In the northward extension, which should represent the upper part of the section, the first band of altered quartz-porphyries and cherty dolomites only, are found in contact with a band of dark diorites and hornblende-rocks, which extends to the contact with the Laurentian.

"In a bay just north of the Wolf Narrows, a band having the appearance of a conglomerate is found, with occasional pebbles of red banded jasper and others of a light-yellowish quartzite, but the majority of the pebbles are of a dark purplish gray to green with a matrix of the same colour. The thickness of the band is about ten feet, and the associated rock is of a greenish to gray colour in rather thin beds. The position of this bed is probably represented by a band of conglomerate, which follows north of the slates exposed on the north side of Slate Bay. These slates, a fine grained argillite in composition, are generally black and thin bedded, with many jointage planes dividing them into small pieces less than a foot in length.

"At the eastern end of the lake, dark blue limestones are found associated with these beds, but as the strata there are apparently much folded, the relations of the two classes of rock could not be ascertained.

"The rocks on the south shore of Granite Bay, as well as the points on the north, are all of a light reddish granite in which the foliation is very slight. Wherever noted, this is nearly parallel to the general line of the northern border, dipping towards it at a low angle.

"The line of contact of the Huronian schists is seen in many places, beginning on the west at the narrows from Trout Bay, where it cuts off two small islands lying in front of the opening. Thence it crosses Marble Bay, and the beds on the point to the east are cut at an angle of 45 deg. by the granite, which occupies the point and also the western face of a small round island where the schists abont directly on it. The large island to the south is mainly granite, with only the slender point at the east end, of Huronian. At the Wolf Narrows, both shores are granite, the line of contact following nearly the line of bedding of the schists, and cuts off the northern point. In the bay to the east the granite has been eroded to the contact line, and along the shore small patches of it are found clinging to the face of a high cliff, while seams of the same material occur, running north into the mass of the darker rocks. This shore is thus chiefly composed of Huronian rocks, but generally represented by a dark crystalline rock which looks somewhat like a diorite squeezed in some places to a crystalline schist.

"The granite of the south shore is replaced at the Middle Narrows by black schists and dark green rocks which strike south by east, apparently the same beds which border the north shore of the bay to the east. The contact line bends around from the north shore, touching the islands, and strikes the south shore just south of the narrows. There the contact is a sharp line running with the strike, but having a few parallel dykes of granite, apparently filling breaks made along the bedding near the contact. A few scattered dark angular fragments are seen in the granite.

"The rocks of Marble Bay, on the north, are continuations of the altered quartz-porphyry and rusty cherty bed which is seen directly to the west. These are followed to the north-east by fine-grained light-green altered rocks and by a small area of white calcite with many dark irregular markings which are very similar to those in the yellow beds before mentioned. This area of white marble-like rock does not seem to form a well defined bed, but looks rather like an irregular mass. At the end of the bay, dark crystalline rock is seen, altered to a serpentine or something of that nature.

"The eastern part of the lake is divided into two parts by a string of islands, with a large one, Mackenzie Island, at the north end. The northern part forms a long narrow arm running to the north-east and is named Slate Bay, from the many exposures of this rock running parallel to the north shore, and also exposed on the north shore of Mackenzie Island. The slate band of the north shore is found to be flanked on both sides by agglomerate. That on the south side is a dark-green mass, in which large lumps of slightly harder rock are cemented together by material similar in colour, but weathering somewhat more readily. Fractures along the bedding show a very lumpy surface. This bed may prove to be of volcanic origin, and it was recognized in two places, on a point at the west end of the bay and on another opposite Mackenzie Island.

"On the northern edge of the slate band, a narrow strip of lighter coloured slate, holding lumps or grains of quartz, was found. The possibility that this is a much squeezed and altered quartz-porphyry, is suggested not only by its appearance, but from the position it seems to occupy in the section, where it is apparently a continuation of the bed seen on Marble Bay. This is followed northward by a bed of argillaceous slate, making a total breadth for the slate bands of nearly a quarter of a mile.

"A band of cherty rocks, holding pebbles of much the same nature, occurs at the north side of a bay near the west end, and again appears north of the slates, in a deep bay northward from the centre of Mackenzie Island. Still farther north, after passing some dykes of fine grained diorite, similar pebbly rocks are cut by granite dykes, which are apparently offshoots from a mass that seems to compose the hills at a short distance north of this arm.

"On the north end of Mackenzie Island and on the mainland to the east, dark blue limestones are found associated with dark schists. These rocks strike to the south of east on Mackenzie Island, but northwest this changes gradually, till in the narrows leading to Whitefish Bay, they are running north east and parallel to those on the north side. They seem to form a broad curved band coming from East Bay and abutting on the schists and slates of Slate Bay. In the narrows above, the rocks are fine grained, black schists, and in East Bay the principal rock seems to be a dark green schist, which maintains a nearly uniform strike of south east by south. On the west shore are dark greenish blue limestones, followed by yellow rusty weathering cherty dolomites or limestones, which are probable continuations of some of the limestone beds of Mackenzie Island. The attitude of these is generally vertical, but occasionally they dip to the west. On the eastern shore of East Bay several large dyke like masses of granite, generally light-gray, cut the beds, and probably indicate the proximity of the granite which occupies the shores of Trout Lake to the east.

"The northern point of Mackenzie Island shows beds evidently very much disturbed. Their strikes converge on a point just west of the island, dipping on the north at a high angle to the north, to the south of this point toward

the south, and lastly, along the western shore, they dip to the west, apparently passing under the slates exposed on the west side of the island. The position of the dark-blue limestones would appear to be lower in the series than the slates though as there is possibly a great dislocation as well as folding, this is uncertain.

"The bay to the south, or near the outlet of the lakes, is found to have been eroded through the centre of an oval area of intrusive granite, which occupies a part of the south shore, several small islands in the middle, parts of islands near the outlet and the southern part of Mackenzie Island. The contact with the Huronian on all sides shows the intrusive nature of this granite mass.

"The schists on the south strike approximately parallel to the contact, following around the granite, while on the east and north the beds are more broken up and have been replaced by the granite. Part of the beds which pass to the south do not reappear on the west, and are evidently broken off. The main mass of the rocks of the south shore, west of the granite, are black hornblende-schists and eruptives, and these beds are seen again at the outlet and thence at Keg Lake, but a series of fine-grained greenish-gray, thinly laminated, chlorite schists, with lenticular patches and thin partings of calcite, lie to the north. These end at the granite, appearing only on its eastern side."

News of Mining

Great Britain

Labour conditions in the coal mining industry showed some improvement during July as compared with the month of June. The average number of days worked was larger and the coal production greater. The total output for the four weeks ending June 24th was 15,826,800 tons; whilst that for the four weeks ended July 22nd was 18,145,300 tons.

The Report of the Fuel Research Board for the year 1920-1921, contains the statement that fuel oil derived from the low temperature carbonization of coal is completely immiscible with ordinary fuel oils. So far as is now known, Trinidad oil is the only one with which it will mix freely.

From the famous "Blue John" mine, near Buxton, from a depth of 300 feet, wireless messages were recently sent to the village of Hope, some miles distant. This is the first recorded trial of the wireless underground.

United States

In a paper read before the Lake Superior Mining Institute, Mr. F. W. Denton adduced some extremely interesting and encouraging facts. Certain changes in mining and milling methods at the mines of the Copper Range Company, and the results of these changes, are presented and discussed. The most salient points are:—The general introduction of the one man drill. The completion of the plant for regrinding the coarse sands. The introduction of waste sand for stope filling. A much closer study of underground conditions. —Comparison of the two periods, 1908-1914 (inclusive), and 1915-1921 (inclusive), shows that the effect of these changes was marked. The improvement is best seen in the increase of extraction of copper from 24.8 lb. per ton in the former period, to an extraction of 37.2 lb. per ton during the second period. The tons stamped per shift per head for all employees was 2.01 tons and the yield of copper 48 lb. during the former period; during the latter, the corresponding figures were, 1.91 tons and 71 lb. copper. Extraction is now above 85 per cent. and the concentrating ratio 30 to 1.

Feldspar mined and sold in the United States during 1921 fell off 32 per cent. in tonnage and 27 per cent. in value as compared with the output of the year 1920. The average value of all crude feldspar sold was $6.62 per long ton. Ground feldspar sold at an average price of $17.91 per ton. Prices for the ground ranged as high as $26 per ton. The total tonnage produced was (crude) 91,865 tons. North Carolina was the largest producer, the output of that State being 40,712 tons.

On the 30th of August a labour union official named Otis Clark was indicted and immediately arrested on the order of the Grand Jury now sitting at Marison, Ill., investigating the Herrin massacre. Clark is charged with complicity in the Herrin murders. The State authorities have refused to release him under bond, Illinois miners' unions are strenuously attempting to spread the idea that the move was inspired by "capital". The Illinois Chamber of Commerce has been actively engaged in raising funds to meet the expenses of the investigation.

Europe

At Noeux-les-Mines, France, a demonstration plant erected by the Minerals Separation, Limited, has successfully treated shales, low grade anthracites, and *schlamms* from various parts of the country for the reduction of ash content. A plant with a capacity of 1000 tons per day is now projected to treat the Noeux shales.

Late in June the German Reichstag passed an Act regulating the hours of mine labourers. The Act now covers all kinds of mining. Measurement of underground shifts is made uniform. Maximum hours are fixed as indicted in this column recently. Shifts are shortened in mines where the temperature exceeds 82 degrees Fah.

Both pig iron and steel production increased in Belgium during the month of July as compared with June. July's production or pig iron was 127,220 tons, of steel 111,040 tons. The figures for June were 114,910 tons of pig iron, and 108,870 tons of steel.

The historic Przibram silver mines, Bohemia, have been shut down. About 600 miners will be thrown out of employment.

For the first seven months of the current year Sweden's exports of iron ore amounted to 3,100,000 tons. This compares favorably with the exports for the corresponding period of 1921, when exports were only 2,100,000.

Exports of iron ore from the Lorrain Basin, France, were 4,328,500 tons during the first six months of the year. During the same period of the year 1921 they totalled 2,666,428 tons.

July's production of crude petroleum in Roumania was 140,000 tons.

Africa

The projected blast furnaces and steel plant, to be erected near Pretoria, will be situated on one of the three known large iron ore deposits of South Africa. Another

large body of ore lies within a short distance of the proposed plant. The dolomite to be used as flux will be obtained from huge deposits in the neighbourhood, and the coal from the Witbank seams about 70 miles away.

The net operating profits of the Cape Asbestos Company, Limited, for the year 1921 were £26,532. A dividend of 10 per cent. was recommended by the directors.

The gold mining companies of the Transvaal milled 6,856,647 tons of ore during the first half of 1922. The yield was 2,456,549 ounces of gold, an average of 6.95 dwt to the ton. The working costs aggregated £9,840,345; or 23s. 1d. per ton. Working profits totalled £916,440, or 8s, 6d. per ton.

Australia

A recovery of 95 per cent. of the silver and lead contents in the form of pure merchantable metals, and a complete recovery of zinc in the form of a pure concentrate, is promised to the Zinc Corporation (Broken Hill) by the manufacturers of the new Elmore process plant. A 25-ton trial plant has been shipped from England and will shortly be installed at Broken Hill. If success crowns this trial the effect will be to render available for treatment hundreds of thousands of tons of old dump material not now commercially treatable. It is claimed that Elmore process costs are remarkably low.

The resumption of work at Mount Morgan has brought about a marked increase in the mineral output of the State of Queensland for the second quarter of 1922. Official returns give the value as £129,844. In 1921 the output was valued at only £53,985. Copper produced at Mount Margan during the Quarter was valued at £92,595.

The ore treated during 1921 at the plant of the Great Boulder Proprietary Gold Mines, Limited, totalled 94,051 tons, yielding 90,131 ounces of gold. The ore averaged 15.08 dwt. per ton. Mining and milling costs averaged 45s. 11d. per ton, an increase of 4s. 2d. per ton as compared with the costs for 1921.

News and Comments

By ALEXANDER GRAY

The Engineer Mine

The speed with which rumor becomes positive statement is illustrated in the matter of the examination of the Engineer Mine, in British Columbia on behalf of Messrs. Timmins. As originally announced in *The Canadian Mining Journal*, the Messrs. Timmins took an option, knowing the property is involved in litigation. All negotiations were subject to the examination of the mine and a clear title. Mr. Alphonse Paré, as stated at the time, is familiar with the White Horse Pass and tributary country. He was delegated to make the examination. While en route, however, he became ill, dangerously so. Notwithstanding this, he reached the mine, and that is about all. He could not do more than make a hurried inspection, and even that accentuated his ailment. So he was hurried out to a steamer, brought south and to Montreal, was operated on, and is rapidly convalescing. Meanwhile, W. P. Alderson, who happened to be in Alaska for Thomson-Doheny interests, was requisitioned. Mr. Alderson, therefore, has been making the examination. No doubt conditional terms have been arranged, but everything depends upon the Alderson report and the final decision by the Privy Council.

Quick Work at Continental

For the August 15 September 15 period, Manager Hussey reports progress amounting to 150 feet. According to this, the three compartment shaft on the Colonial property at Cobalt is going down at a rate approaching the record Mr. Hussey holds one record for shaft sinking at the Witwatersrand, and it seems he is craving others in the Northland. Moreover, the aggressiveness with which the work is proceeding bespeaks more than need be conveyed in words as to the earnestness of the Continental Mines management. On September 23 the Continental Colonial shaft was down 20 feet. At that rate, if it is maintained, the contact sought may be reached early in February.

Nipissing Makes Hay and Sunshine

Another three per cent. regular and three extra from the Nipissing softens the asperities of other share markets. So there are mines giving dividend performances for almost two decades. Besides, the Nipissing Company has a liquid treasury position, in cash and bullion, representing most of its capital liabilities. Yet the ore reserves are perennially valued on a nominal basis—just enough to make it look pleasant before the camera.

Give "High-Graders" the Longest "Holiday"

The arrest of gold "high-graders" and the recovery of a McIntyre gold ingot in Italy, should be followed by the punishment of the thieves. No light sentences will suffice. The limit of the law is necessary, and then there will have to be renewed vigilance in order to minimize thefts of this sort. How much silver was purloined from shipping silver mines (so easy was it to grab what really was bullion) is beyond conjecture. Change houses and close supervision did not prevent thievery, and thievery that was organized. Rarely have the culprits been brought to book. Crooks there always will be. Ontario silver ores aroused cupidity. Thieves are resourceful, nor are they confined to Ontario. It was the stealing of diamonds that resulted in the perfection of legislation to make it punishable to have an uncut stone in your possession without a Magistrate's permit setting forth the source of the diamond. Even then it was known that thefts were numerous, but five years on the Breakwater with hard labor was a deterrent, and "I. D. B." —Illicit Diamond Buying—became less of a commercial proposition. So much gold in the form of amalgam was stolen at the Rand, off the plates, or wherever it could be obtained, that it became a felony to have unwrought gold that could not be explained away. Five years for "I. G. B." Illicit Gold Buying had remedial effects. Of course screens on the plates and various other devices prevented thievery to some extent, but we have just seen the evidence that illicit traffic has been continuous and extensive. Porcupine and Kirkland Lake companies were victimized, and the Government should give the crooks the limit.

Premier Mine a Star Performer

There must be heart burnings among those who were faint hearted about what now is known as the Premier Gold Mining Company of the Portland Canal District. Another dividend has been declared, the latest being for

1½ per cent. As this is the fourth dividend since the tramway to the property was completed, bringing the total of distributions within a year to $2,400,000, the private owners are to be felicited upon having been repaid nearly one-half of their investment. Production is going on at about $400,000 per month and the rate of dividend emphasizes what the grade of ore must be. Evidently the results are sufficient incentive for the broader activities of the chief owners, who have been acquiring other properties.

"Ontario's Gold Output"

Under this caption *The Globe* of Toronto, editorially rises to the occasion and vigorously remarks:

> "Pressing world conditions should stimulate the owners of Ontario gold mines to develop every prospect that looks as if it might become a mine, and to expand the production from every profitable producer."

Incidentally *The Globe* discussed at length the disadvantage under which debtor, war-stricken, impoverished nations are laboring, because they are unable to attract gold, which they need for the purposes of international commerce. As the United States has 40 per cent. of the world's gold lying inactive, "useless", in the Washington vaults, and as gold production is waning everywhere but in Canada, *The Globe* would have Ontario mineowners do more than seems to be possible unless the obligation to do this very thing is shared by the more influential Canadians who have the necessary funds. To "develop every prospect" with the surplus monies earned by producing companies, might not be the most practical and remunerative method of accomplishing what *The Globe* so forcefully advocates.

That *The Globe* has always exercised a wholesome influence upon the Ontario mining situation, cannot be questioned. It has not seen eye-to-eye with mineowners at all times. Perhaps it could have been more constructively critical betimes, and thereby further the cause of Mining Industrialism; yet the spirit has been willing if the flesh was weak, and the very fact that it now urges a broader forward movement is a most auspicious event. "Every prospect" to which the term "prospect" can be justly applied, it would have entertained by owners of producing mines, and by having "production from every profitable producer" expanded, a larger measure of relief for the world's needs would be assured. Gold, Ontario Gold, *The Globe* would have us believe, can be distributed in volume —$20,000,000 this year; $30,000,000 next year, and $50,000,000 in due course.

Gratifying as it is to have this editorial optimism, and reassuring as it is to have so much confidence displayed by an influential daily newspaper, the proposal is susceptible of abuse; for it would be injudicious to impose upon the directorates of "profitable producers" the risks involved in the way suggested. Reproductive speculative investments in the manner proposed might have an effect contrary to that intended by *The Globe*. There are multiplying indications that Directors of dividend-earning mines are most enterprising in endeavoring to prolong the lives of their mines. Hollinger Consolidated has acquired the Schumacher; the Dome Mines took over Dome Extension and may not stop at that; McIntyre added the Pearl Lake, Jupiter and others, including the so-called "Schumacher Veteran" Claim. Thus we have the three leading Porcupine producers practically demonstrating their readiness to carry on. Several "Domelets" were merged. Porcupine Crown and Vipond-North Thompson-Krist plans are in the melting pot.

Eligible "prospects that look as if," are not confined to those herein named; but the average owner of undeveloped ground looks rather askance when he considers the possibility of his precious parcel of land being subordinated to anything else. Invariably the vendor's stipulation is for independent organization—part cash and a large helping of script. Except in special circumstances no "profitable producer" cares to dilute his solids with "prospects" too fluid for other than water ballast.

Frequently, unproductive, somewhat unproved areas, are not beyond the scope of what *The Globe* has in mind; but to amalgamate them with other non-producers and make it a patriotic duty for profit-winners to finance such ventures, might lead to a kind of dissipation certain to result in the alienation of popular interest and the diversion of funds that belong by right to those for whom directors are trustees.

No doubt *The Globe* intended to have the prosperous miner succor the deserving prospector. That is as it should be, if the drain upon trust funds is not too great. The safer, saner policy is to have such journals as *The Globe,* appreciating the potentialities of the Ontario gold fields, point out that "prospects" that are merely presumptive mines and are capitalized as full-fledged mines are thus made unavailable for the purposes of "profitable producers" who must not scatter their surpluses indiscriminately. Regardless of well-grounded optimism actual producers are too few. Were there co-operation rather than the lack of it, combined areas might be explored and proved, but not altogether by those who are outputting and making profits—profits that belong to shareholders in the respective companies.

The practice recommended by *The Globe,* and practised at other fields, inevitably is toward the acquisition of the more desirable areas by the successful mining corporations. If daily journals will do as *The Globe* does to some extent, that is to discriminate and educate, and thereby enlist outside capital otherwise than through the medium of share-selling agencies then production will reflect the real merits of the North Country, where gold occurrences are so widespread that they require more capital than mining exchanges can provide. The larger stock exchanges and men of affairs, even the bankers, will have to abandon their policy of aloofness before all that *The Globe* portrays is given effect and Ontario is established as Canada's golden province. Meanwhile "profitable producers" are the standards of credit.

Never losing sight of all *The Globe* has done for the welfare of the Ontario mining industry, it is in order for that journal to render the "profitable producers" a distinct service by inducing the Government at Ottawa to take the hobbles off by permitting urgently needed metal mining labor to enter Canada. Of late there has been a noticeable slackening of efficiency and there is somewhat of a shortage of unskilled labor. Ottawa has drawn the line on immigration and failed to understand the difference between essential and non-essential labor. If production is to expand and if plans to that end are to be consummated, there will have to be a slight relaxation of labor regulations. Gold miners are getting a good wage. There are not quite enough of them. *The Globe,* having stated the case for production, can do more by exerting its excellent offices with Ottawa.

Optimism Pervades McIntyre

Being the deepest mine at the moment in the Porcupine Field, and confidently assuming that it will "be able to operate at the lowest level of any property", as the daily press quote President Bickell, there is substantial basis for the optimism voiced by General Manager R. J. Ennis at the annual meeting. According to Mr. Ennis, not only

have the net profits for the first quarter of the current fiscal year been at the rate of approximately $100,000 per month, which compares with an average of $70,000 throughout 1921-22, but the new ore bodies located in the lower section "pointed to the possibility and even likelihood of continued values at increasing depth."

"All the characteristics" of these veins, Mr. Ennis declared, are favorable to vertical continuity and sustained values, hence the deduction registered by Mr. Bickell that "we believe the ore on this property is very deep-seated and will give greater permanence to our mine." Of course that is obvious, and the fact that ore opened up on "the 1875-ft. level for a distance of 800 feet" has "averaged $20 a ton", with every prospect of further lateral extent, provides an indicated factor warranting the belief that development "will put a great deal of ore of fine grade in sight."

With one shaft at 2,100 feet and lateral work proceeding at depths only slightly less, the diamond drill and detailed development no doubt have pointed the way toward operations at greater depth. President Bickell stated that "the head of the main shaft is being prepared and strengthened to enable sinking to proceed to a depth of 5,000 feet if deemed advisable. To a certainty "the outlook for the company is more encouraging than ever before."

Immediate plans involve modification of milling and metallurgical practice, by which it is expected to increase production to 1,000 tons a day, or double last year's tonnage capacity. Like other producers, McIntyre has to make dividends more in keeping with market capitalizations; therefore it is intended to put through more ore from the lower levels "rather than treat the carbonaceous ore in the upper levels." Moreover, the lower levels' grade is better. So with it and the larger tonnage to be treated, earnings will be in closer harmony with the market position. "To this end," said Mr. Bickell, "new equipment is being installed and will be ready in 60 days, when it is expected to increase the average daily tons milled from 750 to 1,000."

To have the President of the Company supported by his General Manager, and both of them "on their toes", so to speak, regarding the McIntyre structure, should give courage to the camp as a whole. Preparing to go to 5,000 feet, "if advisable", opens a new chapter. That is a matter to be dealt with as the years go by. Meanwhile the Schumacher Veteran Claim is to be tested by diamond drill. Already $25,000 has been paid for a six months option that is renewable for a further three months on payment of $25,000 more. In the event of the results being favorable, the purchase price all told is to be $400,000, spread over four years. Those terms appear to be reasonable enough and the acreage is a consideration, if ore bearing.

With reference to the Blue Diamond Coal Company subsidiary, the prospects are represented to be "distinctly promising". Amicable adjustment of labor difficulties permit of production at from 10 to 12 cents per ton less than heretofore. "The company's labor is now unionized and production is gradually being restored to normal. Output at the present time is approximately 1,500 tons a day, and it is anticipated that within three months' production will have been extended to 2,000 tons. All through the coal strike when the majority of United States plants were closed down tight, this company operated at fifty per cent capacity."

The story as told at the McIntyre meeting is complimentary to the men who made it possible to tell it. Competent management and properties that survived their original mismanagement, have given the company a deservedly prominent place in the ranks of producing gold mines. Most of the shares are held in the United States, and shareholders can be assured of the good-will interest of all Canadians.

Economic Position of The Metals

Lead at a better price than it has brought in two years; zinc "imperceptibly higher," as the chroniclers of the press put it, accompanied by heavy trading, makes producers of those metals fairly contented. Copper at 14 cents, and the disconcerting element injected into the labor market by increases in the wage of steel-workers, leaves the red metal somewhat stormbound. Were international metal markets broad and active and exchange nearer to normal, the action of steel corporations in advancing wages might be less bothersome. Unfortunately there is a shortage of unskilled labor, and the skilled has not quite completed its lesson; so steel makers had no other recourse. The copper producers are not complacent. The tendency toward inflation before international business is possible, has its admonitory aspect.

MORE SAFETY WORK

That we shall see in the immediate future a greater development of public safety work together with a campaign against industrial accidents carried on with even greater activity through organized effort, is the statement of Marens A. Dow, General Safety Agent of the New York Central Lines, newly elected president of the National Safety Council at the eleventh annual congress held at Detroit August 28 September 1.

In accepting the leadership of the Council for the new year Mr. Dow said further that every effort would be made in the forthcoming year to reduce the national loss of life from industrial and public accidents which last year totaled approximately 80,000 deaths.

"The saftey movement has long since passed the reform stage," said Mr. Dow. "It is now a practical, constructive movement. While much has been accomplished in lessening accident casualties in industry, much still remains to be done. We are cutting down industrial accidents and now must work for a great development of public safety without neglecting industrial safety work. The right to work and mingle in public places without injury is the right of every citizen of this country. The National Safety Council is pledged to promote a national spirit which will make the recognition of that right paramount in the minds of the people."

Practical application of a process for extracting oil from the tar sand deposits of Fort McMurray, has now been made, it is said, with a plant, installed by a company operating in that vicinity. The bed being worked is 150 feet thick.

The diamond is one of the most enduring of minerals. In washing for gold, it may turn up with such hard, heavy minerals as garnet, zircon, and magnetite. Valuable diamonds have been found in this way by the watchful prospector and miner. It is not enough to find a mineral that will scratch glass; quartz will do that. But the diamond easily cuts into quartz. There is a mistaken notion that it cannot be broken with a hammer, and several large diamonds have been destroyed by that test. The diamond passes through an ordinary fire unharmed

The Mining Districts

BY THE JOURNAL'S CORRESPONDENTS

MAKING NEW MINES AT PORCUPINE

By R. E. HORE

During the past few months there has been a marked increase in mining activity in the Porcupine gold area. The success being met with at the Hollinger, McIntyre and Dome has resulted in determined efforts being made to locate similar ore deposits on the neighboring properties, which for some years have remained undeveloped because their value has been more difficult to determine. Early efforts at exploration of these properties did not give satisfactory results. Now, however, the attack is being vigorously renewed. With the added knowledge gained by several years of work on the producing properties, the operators now have much greater chances of success. Important results may confidently be expected from some of the work now under way. The probability of extending the producing gold area has already been greatly strengthened by the results of work done during the past few months.

Goldale

A Porcupine gold mining operation that is likely to attract much attention from now on is that of Goldale Mines Ltd. This Company recently began underground work on one of its several properties in the gold area and having sunk a shaft to a depth of 500 ft. is now ready for a thorough testing of the ore-zone at that depth. The ore-zone has been delimited by surface work and diamond drilling and is known to have most promising possibilities. The actual opening up of the ground is likely to give momentous results. Systematic drifting and crosscutting will be carried on rapidly and there is good reason to expect that a large body of ore will be opened up at this level during the next few months.

The work at the Goldale mine is being carried on by the Kerr Lake Mining Co., Ltd., which has acquired a large interest in Goldale Mines Ltd. Exceptionally good progress has been made in sinking the shaft and the work has been done well and in a way that will facilitate the operations now beginning at the 500-ft. level. There is every evidence of intention to proceed rapidly with the development. There is evidence also of confidence in the outcome, for the shaft work obviously has been done with a view to use for production as well as for exploration. Mr. Harry Kee, who is in charge of operations at the Goldale, evidently expects to hoist a lot of ore out of this shaft. The chances are good that he will.

There is exposed on the Goldale property a very promising ore-zone. This zone is made up of mineralized schisted rocks enclosing gold-bearing quartz veins. Along the zone are small outcrops of quartz porphyry. This ore-zone crosses diagonally through the Goldale property and is of such length and width as to make Goldale a large mine if any appreciable part of it is of payable grade.

Newray

Northeast of the Goldale is the Newray property, which is now being explored by Coniagas Mines, Ltd. The Newray has been idle for some time, but in the early days of Porcupine it was regarded as a valuable property. From the discovery vein about a quarter of a million dollars in gold was recovered. Comparatively little exploration of the vein was carried on after the outcropping ore-shoot was mined out. It is quite reasonable to expect that there are other ore-shoots in the same zone. Coniagas is now exploring the property with diamond drills. At present one hole is being driven in the southwestern claim and another has been started from close to the south boundary east of the Newray road. This new hole dips to the north under some promising surface showings. The other hole now being drilled dips to the south. The Newray has great possibilities and the tracing of the ore-zone across the property by diamond drilling will doubtless be followed by underground operations as soon as power is available.

Holtyrex

West of the Newray is the Holtyrex property on which important work has been done this summer. Trenching in the south-eastern part of the Holtyrex resulted in the discovery of some rich ore in rocks typical of the ore-zones of the area. A considerable amount of stripping has been done and the ground is now being cleared for shaft sinking and for construction of buildings.

Rochester

Close to the Hollinger an interesting development is under way at the Rochester property. This Company is sinking a shaft close to the railway. A good start has been made, but progress has been slow recently owing to the large amount of water encountered. An unsatisfactory supply of power also has handicapped the operators.

NORTHWESTERN ONTARIO

The Longworth Silver Strike

As the recent discovery of silver near Schreiber, by William Longworth, becomes opened up, its interest increases. The vein is two feet in width at surface, and is traceable for one and one-half miles. It has been uncovered by stripping and trenching for a distance of 12 chains from the point of discovery. The silver is in the felsite on the east wall of the vein, and occurs native, in leaf and nugget form, in quantity that runs into high values. There is a three-inch streak of massive galena in the centre of the vein that assays from 34 to 70 ounces of silver per ton, and from $2.70 to $4.60 per ton in gold. Visible gold occurs in an eight-inch vein of quartz on the west, or hanging wall.

Development work is proceeding by way of an open cut along the vein. This cut is now in 24 feet, and is 15 feet deep. The vein is well defined between good walls, and has widened at the north end, at the bottom of the cut, to three and one-half feet.

Mr. P. E. Hopkins, geologist, of the Department of Mines, Toronto, writes that he will be up next week to make an examination of this property.

C. E. Kingsley, E.M., of Toronto, examined this find during the past week. While there he put in some shots and took away several pounds of samples carrying native silver.

Humphrey W. Chadbourne, E.M., of New York, representing the Gould interests, is due in Schreiber on Oc-

tober 8th, to make an examination of the McKellar-Longworth property, with a view to becoming interested with the present holders of the option.

The Jackson Gold Mines, Limited, are engaged in erecting a complete set of working camps, preparatory to carrying out extensive development work at an early date.

Option on Claim near Schreiber

Lewis Fenning, of New York, representing New York interests closed an option today, on fourteen claims in the Schreiber area lying between the McKellar-Longworth property on the south, and the Jackson Gold Mines, Limited, on the north, for an unstated figure. The option involves working conditions, that, if carried out, will result in the development of these properties in the immediate future.

Mr. Fenning is a mining engineer, and is just back from the Schreiber field after examining the claims included in the option.

The Re-open Silver Mines

The Islet Exploration Company, Limited, have taken a working option on a number of the old silver mines located south-west of Port Arthur, along the Duluth extension of the Canadian National Railway. These include the East End Silver Mountain, West End Silver Mountain, Badger, Porcupine, and others all famous in their day as producers of the white metal. It is the intention to thoroughly open up and explore these properties for further silver deposits, more than one of which is already known to exist. It is confidently believed that the application of modern methods of recovery will enable the operators to again place these mines on the map as producers.—J. J. O'Connor.

BRITISH COLUMBIA

Cassiar Properties Involved in Lawsuit

The gold-silver properties of the Cassiar District known as the Mad ot Erin, the Wonderful, Sonora, and others are the subject of a lawsuit in which Robert W. Wiley, of Portland Ore., is asking that Richard Kennedy of Haines, Alaska, et al be required to deliver good title or pay him $140,000. Wiley took an option to purchase in January, 1921, the amount involved being $490,000, of which $20,000 was paid at the time. He then proceeded to develop, doing work and installing mine machinery costing $120,000, according to the statement of counsel. On August 1, 1922 an additional $50,000 was to be paid by Wiley but, it is stated, when he called on the vendors to give good title they failed to do so. The documents conveying the properties to Wiley, which had been placed in the Bank of California as provided by the option agreement, were removed. Mr. Wiley now is asking that they be placed in escrow again and good title assured or his investment returned. The difficulties the defendants find themselves in, it is said, is that the heirs to the estate of Patrick Kennedy cannot be found and as their interest in the properties would be approximately $125,000 there at present are obstacles preventing the immediate delivery of good title.

Lardeau Properties being Developed

Michael Sullivan, in co-operation with New York interests, is reported to be opening up the Wagoner and other gold-silver properties of the Lardeau. Hugh McKay is developing the Red Elephant, of the same district, while a twenty-foot vein, carrying gold-silver-copper, has been opened up between the Red Elephant and the Bannockburn Groups.

Slocan Mines

The Silversmith Mines Ltd. are preparing to instal a 200 h.p. Diesel engine as an auxiliary at their compressor plant in order to meet such a possible emergency as a shortage of water or a break in the pipe. In the Ruth Mine, also of the Slocan, a five-inch vein of clean silver-lead ore has been uncovered. The Rambler-Cariboo is making regular shipments again. There are between 150 and 175 men engaged in mining operations in the vicinity of the town of Sandon. Over four hundred now are said to be similarly employed in the whole of the Slocan District.

Silver-lead Ore at Windermere

The Windermere, East Kootenay, is the scene of renewed mining activity, largely due to the work being done on the Steele Group of Mineral Claims, situated between 18 and 19 miles from Brisco. This property carries a fine-grained galena ore which, when sorted for shipment, will run between 30 and 40 ounces in silver and from 65 to 75 per cent. lead. These are conservative estimates. The owners are the Alice Arm Holdings Co., of Vancouver. An aerial tramway, 1,500 feet long, is being installed and A. J. Hughes, the superintendent, expects to continue shipments all winter. Near this mine are two other mineral groups, viz., the Lead Queen and the Isaac, both of which are promising, the ore being of much the same character as that of the Steele. Development is in progress in both instances. The Paradise Mine at Lake Windermere and the Monarch at Field are the only other mines shipping from this district.

Cedar Creek

While the Cedar Creek excitement of six months ago has petered out to a large extent, there still are many prospectors in that part of the Cariboo. The latest report is that rich ground has been found at Quesnel Dam. This is one of the centres at which miners outfitted en route to the interior. The story is that good pay was discovered in excavating behind the hotel. As a result all the ground in this locality now is staked. Some difficulty is being experienced because of the lack of water, but good returns are said to have been obtained. Messrs. King and Ramser, who are hydraulicking, state that their ground is on the old Cedar Creek Channel and that bedrock has been reached with every indication of satisfactory clean-ups.

Gold Quartz in Fraser Valley near Hope

A. S. Williamson reports that three quartz vein outcroppings have been located on Hills Bar Creek, near Hope. Some samples have been taken running high in gold. The property has been examined by representatives of three of the largest mining corporations of United States, including the U. S. Smelting and Refining Co., and the Anaconda Copper Co. Where Hills Bar Creek flows into the Fraser River, large amounts of gold were mined by the old timers during the excitement of over sixty years ago. That rich quartz veins existed has been a legend of the district for years. They are supposed to have been discovered first by a Chinaman, who passed the information on to prospectors. They searched without success, but the quest has never been entirely abandoned, and the recent find is said to be the legendary deposits.

Geological Parties Returning

The field work of parties of the Canadian Geological Survey in British Columbia is drawing to a close. Dr. G. A. Young, who was engaged in a survey of iron deposits, has left for Ottawa. After some months in the Cariboo where he has been collecting data on the placer fields, Dr. W. F. Uglow has returned to take up his duties as professor of mineralogy at the British Columbia University. A. C. F. Shepherd, D.L.S. who has been in charge of a party on Vancouver Island working under the topographical division of the Surveys Branch, is expected back shortly. Dr. Victor Dolmage and party are on their way south after mapping near the Alaskan boundary. Mr. J. F. Walker has returned east after spending the season in the Cranbrook District on geological work. Dr. George Hanson will be back from the Northern Interior very soon, and Dr. J. D. MacKenzie is expected to complete his work on Vancouver Island in a few days. He has been engaged on an investigation of the coalfields of the Island.

Gold Quartz Find in Windermere

Larrabee Brothers are reported to have opened up some rich quartz claims on McDonald Creek, Windermere District. The showings are being developed and the owners are confident that their find will prove important.

Ore Receipts at Trail

Ore receipts at the Trail Smelter for the second week of September, amount to 6,268 tons, made up as follows: Alamo, Alamo, 46; Blue Bell, Riondal, 8; Noble Five, Sandon, 43; Paradise, Lake Windermere, 41; Quilp, Republic, 267; Republic, Republic, 50; Surprise, Republic, 53; Silversmith Sandon, 31; Revenge, Beaverdell, 11; Standard, Silverton, 130; Whitewater, Retallack, 34; company mines, 5554.

Business Men Visit Portland Canal

Grant Mahood, President of the American Mining and Milling Co. has taken a party of Vancouver business men on an excursion to Stewart, B.C., the object of which is an inspection of the Company's property, the Fish Creek mine. The excursionists will also visit the Premier Mine while in the North.

Granby Company Bond Copper Property near Stewart

The Granby Consolidated Mining and Smelting Co., it is announced, have bonded the George Copper property, which consists of 20 claims situated on the south side of the Bear River, some 20 miles from tidewater at Stewart. It is stated that extensive diamond drilling is planned for next year. Mr. George Clothier, Government Engineer, in his report of 1918 said that the "blue vein" on the George group is comprised of three veins contained in a 50-foot mineralized belt, traceable for a thousand feet or more; the veins, aggregating 10 ft. of ore, average gold $4.00, silver 30c. per ton, copper 3 per cent. After describing what are termed the "white vein" and the "green vein", he says that the property appears to improve with exploration and should receive more extensive investigation.

Records for B. C. Coal Mines

Consideration of the coal mining returns for the past few months indicates that some records have been made in production. The Western Fuel Corporation of Canada during the month of August had an output of 85,000 tons. As far as is known this is the greatest monthly output to the credit of the company since it began coal mining on the Island. The average production for a month is 56,000 tons. The Canadian Collieries (Dunsmuir) Ltd. also has improved its showing remarkably. At the beginning of the year this company's monthly figures dropped to around 26,554 tons. They have been coming back steadily, the production for August being some 48,000 tons. The Nanoose Wellington Collieries had a production in August of 10,315 tons, the best record yet made by that corporation. Leaving the Island, it is found that the same activity prevails in the Nicola-Princeton coalfield. The Coalmont Collieries, for instance, jumped their production to 18,059 tons last month, their record to date. The Middlesboro Collieries, too, had an output of 9,500 tons, which compares more than favorably with past showings.

The total production of the Province for this year to date approximates 1,600,000 tons, which is an exceptionally fine record when it is remembered that the collieries of the Crow's Nest were closed down through strike trouble from the latter part of the month of March to the 28th of August last. If production continues at the present rate for the remainder of the year there should not be much of a decline in the provincial output for 1922 as compared with that of 1921 notwithstanding the Fernie trouble, and the loss it represents in coal to British Columbia.

NOVA SCOTIA

A Resolution

"Whereas the wage rates of the Sydney agreement has ben accepted by a majority vote of the rank and file of the miners of District 26, U. M. W. of A., under the lash of hunger, military despotism, together with threats of the provincial government to man the mines with provincial constables armed with guns, clubs and full authority of the law, to intimidate, browbeat and shoot the strikers into submission; and

"Whereas the brass check press together with the entire pimp and spy army always employed by the operators, did advertise, circulate and threaten the eviction of the miners from all company houses by an army of armed provincial police, in order to further intimidate the miners to accept the poisoned starvation wage rates; and

"Whereas the international union could not or would not render us any assistance to further carry on our fight against this sort of tyranny and unmerciful onslaught on our already too low standard of living; and

"Whereas we, the members of local 4529, feel thoroughly convinced that such circumstances compelled the majority of the miners of Nova Scotia to vote for the cessation of the fight at the time of the referendum; and
