Canadian Mining Review.

ANNUAL SUBSCRIPTION - - - \$1.00
VERTICAL RATES—15c. per line (10 lines 3 1/2 inch).

OFFICE:

CHAMBERS, 14 Metcalfe Street.

Other
in, early, 1883, number of the
MINING REVIEW is the first
issued under a new manage-
ment. It is the intention of the
publishers to continue the publica-
tion of the REVIEW as a monthly
paper, devoted to the mining inter-
ests of the Dominion of Canada;
special attention, however, will be
given to the mining industries in
the Ottawa Valley and Manitoba, as
may be seen by the articles appear-
ing in this number. Information
concerning Canadian Mines and
Mineral Lands is respectfully solicited
by the publishers, who assure
respondents that all reliable infor-
mation of this nature will find
its way, without prejudiced comment,
into the columns of the REVIEW. This
paper has an extensive circulation
throughout the Dominion of Canada,
the United States, in Great
Britain and in Europe, and one of
its objects is to bring the owners of
mineral and other lands into closer
contact with capitalists seeking in-
vestment, with a view to the speedy
development of Canadian mines;
in order that our aim in this
direction may be attained, a liberal
amount from both parties will be
necessary. The advertising columns
of the paper are always open to
those who have properties for sale,
to intending purchasers, as well
to merchants generally; dealers
in machinery and mining supplies
will find the REVIEW a valuable ad-
vertising medium.

Address all Correspondence
to the Publishers, CANADIAN MINING
REVIEW, Ottawa.

We beg to call attention to the
advertisements, in another column,
of mineral lands for sale. True re-
sults of all properties mentioned
therein will be forwarded, on appli-
cation, by the publishers of the
REVIEW.

PHOSPHATE MINING.

This is becoming a most impor-
tant industry in the vicinity of
Ottawa, and has already developed
to such an extent that it is difficult
to say how soon it may throw the
lumber interests completely in the
shade. It is not many years ago
that this mineral was comparatively
unknown to the inhabitants of the
Ottawa Valley, while to-day there
is an activity prevailing at mines
throughout the phosphate district
that would do credit to a people
who had spent their lives in a
mining camp.

During the past winter the road
on the ice of the Rivière du Lièvre,
leading to Buckingham Station on
the line of the Canadian Pacific
Railway, presented a busy scene,
such as had never before been wit-
nessed in that locality. Hundreds
of teams were engaged in hauling
phosphate from the various mines,
and by the time the ice gave way
on the river, and hauling became
impracticable, no less than 10,000
tons of first quality ore, running as
high as 85 per cent. of phosphate
lime, besides many hundred tons of
second quality (60 per cent.) had
been delivered at the station ready
for shipping. In addition to this,
about 1,500 tons in all were deliver-
ed at the Templeton Station on the
line of the same railway. This far
exceeds in quantity the output of
any former year, and is attributed,
mainly, to the prevailing high price
offered for ore, and to the fact that
many of the most productive prop-
erties have fallen into the hands
of English, French, and American
companies.

The great drawback experienced
heretofore by those engaged in
mining was the want of capital to
prosecute operations to advantage.
Mining had to be carried on during
the whole year, while delivery of
the output could only be made in
winter, thus necessitating a con-
tinuous drain on the funds of the
miner for nearly nine months.

The promoters of the enterprise
in the County of Ottawa were not
men of means, but, for the most
part, farmers and men of limited
resources. To-day the more valu-
able developed properties are con-
trolled and worked by capitalists
who are conducting their operations
on an extensive, though economical,
scale, producing the ore at a mini-
mum of cost, employing an enor-
mous amount of local labour, cir-
culating money in the country, and

reaping the benefit of their labours
selves, so that the industry is
self-sustaining and corresponds to

the phosphate zone. The
County of Ottawa extends from the
west boundary of the Township of
Hull, about 8 miles north from the
Ottawa River, and, following a
northeasterly direction, passes
through that township and the
townships of Wakefield, Templeton,
East and West Portland, Bowman
and others north and east of those
named. This belt is from 8 to 10
miles in width, and is clearly de-
fined in the maps and on the reports
published by the Canadian Geolo-
gical Department. There is ample
field for many times the amount of
capital now employed in this dis-
trict, and virgin properties are yet
to be had that will, without doubt,
equal in richness any of those at
present in operation; all they re-
quire is developing, and, to accom-
plish this, capital alone is necessary.

It has been estimated that the
cost of mining and delivering the
mineral at different points for ship-
ment varies from \$4 to \$7 per ton,
according to the location of the
mine and the nature of the deposits,
and, as the price paid for the high
grade ore is about \$21 per ton at
the railway station, it may be seen
what a handsome profit is derived
by those engaged in mining. It is
claimed for the Canadian apatite
that it is of a superior quality to
that found in any other part of the
world, on account of its purity and
for its high percentage of phosphate
of lime. Specimens of it were ex-
hibited at the Centennial Exhibition
in Philadelphia in 1876, and attract-
ed considerable attention from those
familiar with the mineral. Many
specimens were also exhibited at
the Paris Exposition in 1878, and
some phosphate crystals, sent there
by a gentleman of Ottawa, were
eagerly bought up by English and
French merchants engaged or in-
terested in the manufacture of fer-
tilizers, and preserved by them as
rare curiosities; some of these crys-
tals weighed as much as 800 lbs.

In France, Spain, Norway, the
West Indian Islands and in South
Carolina, phosphate mining has
been carried on for many years.
Canada may now be added to this
list, her output for the past 5 years
having been as follows: in 1878,
3,701 tons; 1879, 11,927 tons;
1880, 7,974 tons; 1881, 15,601
tons, and in 1882, 17,181 tons.
These figures cover the entire out-
put from all parts of Canada where

phosphate is mined. The
the Ottawa Valley, it is expected
3,500 tons will be forwarded from
the mines during the summer, the
of the mines being so situated as to
render delivery practicable at any
season of the year. This augurs
well for the future of Canada as a
phosphate producing country, and,
judging from the rapid progress
made during the past three years in
the development of the apatite de-
posits in the Ottawa Valley, there
remains little doubt that this
Dominion bids fair to become, at no
distant day, an important competi-
tor in supplying the markets of the
world with this valuable mineral.

The latest advices of the ruling
price offered for Canadian phosphate
in England quotes it at 1s. 4d. per
unit for 80 per cent. phosphate of
lime, with one-fifth of a penny rise
per unit for shipments overrunning
80 per cent. This, for 85 per cent.
mineral, would be equal to \$30 per
ton of 2,240 lbs.

The Coxheath Copper Mining
Company of Nova Scotia, composed
of Boston capitalists, has had
samples of ore assayed by two well
known assayists who report value
as follows, including a fair per cen-
tage of silver—No. 1, \$104.58, No.
2, \$106.90 per ton. It is now
stated that a regular output of ore
from the Coxheath mine has been
begun and that there will be no
difficulty in raising from fifteen to
twenty tons daily of 5 to 10 per
cent. ore.

N.B.—The Austin Mine on Echo
Lake is capable of a daily produc-
tion of from one hundred to one
hundred and fifty tons of ore, yield-
ing 10 to 12 per cent. of copper.
Surely this property should be a
mine of wealth to the stockholders
if mining operations were carried on
under proper management.

The contribution of Arizona to
the world's stock of the precious
metals from 1850 to the close of
1882 is approximately as follows:
Silver \$99,999,684, gold
\$9,566,527; making a total of \$38,266

May, 1883, no less than 100,000 visitors have been registered in the visitors' book, and those who may be seen the signatures of scientists, of men identified with mining pursuits, and of merchants and manufacturers from all parts of the globe. The average number of visitors is now about 50 daily, and during the past year there have been as many as 100, 150, and, on some special occasions, 300 names entered in the book in one day. It has been noticeable to those employed in the building, that a very large proportion of the people visiting the Museum manifest a marked preference to inspect the mineralogical collection, and to this much importance is attached, as it goes far to prove that the mineral wealth of Canada is becoming known the world over.

MINERALOGICAL NOTES.

The following is an extract from Mr. Small's pamphlet on the mineral resources of the Dominion of Canada:—

"The possession of metals is of vital importance to every country, and nature has been extremely prolific in giving Canada, in its varied geological functions, many of the ordinary metals and ores."

The attention of capitalists, both native and foreign, which has within the past few years been attracted thither, has had the effect of eliciting facts which prove, beyond a doubt, that Canada is destined, eventually, to rank among the finest mining districts in the world.

The impetus lately given to prospecting, by enquiries constantly being made, has caused the discovery of important deposits of economic minerals of vast extent, and of so varied and useful a character—the existence of which, in Canada, was previously unknown, or, at least, known only to the geologist and men of scientific pursuits—as in many cases, lead to

the mineral resources of this country become developed, its agricultural capabilities will be fully brought out, manufactures and commerce will increase, and a numerous and thriving population will find ready employment in the various branches of trade.

The chief minerals of economic importance enumerated in the Geological Survey Reports, as existing in Canada, may be thus classed:—

1. Metals and their ores.
2. Minerals applicable to chemical manufactures.
3. Minerals applicable to construction.
4. Minerals for grinding and polishing.
5. Minerals applicable to refraction.
6. Minerals applicable to the fine arts.
7. Minerals applicable to miscellaneous uses.

Metals and their ores.—Under this head are the following: Iron, which exists as bog ore, hematite, magnetic and specular ore, and magnetic iron sand; lead; copper, sulphurets and native; nickel and cobalt, zinc, silver, gold, platinum.

Minerals applicable to chemical manufactures.—Iron ores and chromic iron, sulphate of barytes, molybdenite, cobaltiferous and arsenical pyrites, bismuth, antimony, manganese dolomite, magnesite, phosphate of lime and calcareous tufa. Of the above, iron ores and sulphates of barytes, chromic iron, bismuth and others are used as pigments and in the manufacture of paints; molybdenite and manganese, for blacking and decolorizing; pyrites, for the manufacture of coppers, sulphur and sulphuric acid; dolomite and magnesite, for medicinal purposes; phosphate of lime and calcareous tufa, for artificial manures.

Minerals applicable to construction.—Under this head are limestones and sandstones, for building purposes, the former is also used to prepare lime and hydraulic cement; gneiss, syenite and granite, for paving purposes; marbles, found in great variety, white, black, red, veined, dark and light green, brown, grey, mottled, etc., for pillars, mantelpieces, and decorative purposes, and sculpture; slates, for

GENERAL INFORMATION

RESPECTING THE
MINES & MINING LAWS
OF THE
PROVINCE OF QUEBEC.

The chief provisions of the Quebec General Mining Act of 1880 are:

1. The declaration of ownership by the Crown and reserve of all mines not especially granted. Sec. 3.
2. For the sale of mining rights on unpatented lands acquired for agricultural purposes. Secs. 4 to 12.
3. For imposition of royalty under Order in Council, if deemed advisable. Secs. 13 and 52.
4. For granting licenses to mine for gold or silver on public lands, and on conceded portions of Seigniorie Rigaud, Vaudeuil and other private lands. Secs. 14, 50, et seq.
5. For the sale of lands as mining locations. Sec. 23, et seq.
6. For imposition of penalties for contravention of Act. Sec. 101, et seq.

Under this Act, parties holding letters patent for lands granted for agricultural purposes may acquire the right to work any mines of gold or silver thereon, without license, by paying the Commissioner of Crown Lands a sufficient sum to make up, with the amount paid before the issue of patent, the price of two dollars per acre. In the case of "free grants" the whole price of two dollars per acre must be paid. *Censitaires* in the seigniories in which the Crown holds mining rights may acquire these rights by paying one dollar and a half per acre for the whole of their land, or at least one hundred acres; and the seignior or proprietor of the unconceded portion of a seigniorie may do the same on paying two dollars per acre; the extent over which such rights can be acquired being, however, limited to four hundred acres, or in special cases, eight hundred acres.

If a mine of any kind be discovered and worked and sold for

but not patented, the duties not being payable, the sale may be cancelled and be paid for in full at the location. Sec. 12.

Locations, which may extend up to four hundred acres, or, in special cases, eight hundred acres, may be acquired by addressing a letter to the Commissioner of Crown Lands, specifying the lot or lots required, and transmitting at the same time:—

1. The full price of the location at the rate of *three dollars per acre* if it is to be mined for *phosphate lime* (this price was fixed by O. C. of 23rd of March, 1881); *two dollars per acre*, if to be mined for *asbestos or gold or silver* (price by O. C. of 7th Oct., 1881); *one dollar per acre*, if it is to be mined for *inferior metals or other minerals* or deposits of any substance of appreciable value.

2. A specimen of the mineral of which the land is to be worked with an affidavit identifying it, having been taken from the land applied for.

Mines of gold or silver on public or private lands may be worked by parties taking out licenses for themselves and employees, costing ten dollars for each person for three months, if the mining is to be done on private lands, and four dollars on public lands.

The size and position of claims on public lands worked under such licenses are regulated by the Act determined by the Mining Inspector according to circumstances.

The localities in the Province of Quebec in which minerals are chiefly found are as follows:—

GOLD.—Eastern Townships, especially the Counties of Beauce and Compton.

PHOSPHATE OF LIME.—Counties of Ottawa and Argenteuil.

ASBESTOS.—Counties of Megantic and Wolfe.

IRON.—Counties of Ottawa, Montcalm, St. Maurice, Champlain, Charlevoix and Saguenay.

COPPER.—Counties of Baguine, Megantic and Sherbrooke.

GALENA.—Counties of Ottawa (Lake Temiscamingue), Gaspé and Rimouski.

PLUMBAGO.—County of Ottawa.

MICA.—Counties of Berthier, Ottawa and Megantic.

During the past quarter of century British Columbia has been no insignificant contributor to the gold market of the world. Since 1858 up to the present time she has produced no less than \$46,000,000 worth of the precious metal. Besides this our Western Province on the Pacific Coast is conspicuous for her known natural wealth in anthracite and bituminous coal, iron and copper mines.

ING REGULATIONS.

DEPARTMENT OF THE INTERIOR,
DOMINION LANDS,

OTTAWA, 19TH APRIL, 1883.

ons to govern the disposal of Mineral
Lands other than Coal Lands.

These regulations shall be applicable to all Dominion Lands containing mines of gold, silver, bar, lead, tin, copper, iron, or mineral deposit of economic value, with the exception of coal. Any person may explore Dominion Lands not appropriated or reserved by Government for other purposes, and search therein, either by surface or subterranean prospecting, for mineral deposits, with a view to obtaining these regulations a mining location for the same.

A location for mining, except for iron, shall not exceed twenty acres in area.

Surface boundaries shall be marked by lines not more than four inches in length. Its length shall not be less than three times its breadth.

Boundaries beneath the surface shall be the vertical planes in the surface boundaries lie.

Any person having discovered a mineral deposit, and desiring to obtain a mining location, under these regulations, in order that he may work the same, shall, to entitle him to protection, proceed as follows:

1. He shall mark the location on the ground by placing at its four corners wooden posts, not less than four inches square, driven not less than eighteen inches into the ground, and showing that length above it. If the ground be too hard to admit of so driving the posts into it, he shall build about each of them to support it and keep in place, a cairn or mound of stones, at least three feet in diameter at the base, and eighteen inches high.

2. On the most north-easterly corner he must mark with a cutting of iron, or with red chalk, his name in full, the date of such marking, and the letters M.L. 1., to indicate that the post is a Mining Location, post No. 1. Proceeding to the most south-easterly post, all be marked M.L. 2., and his initials. Next, the most north-westerly post shall be marked 3., and with his initials; and the most north-westerly post shall be marked 4., with his initials and the letters M.L. 4.

Furthermore, on one of the corners of each post, which face is in the planting thereof be directed toward the post which next to it in the order in which they are here named and numbered, shall be marked in figures the number of yards distance to such following post. If means of measurements are not available, distances to be so marked on

each of the posts may be those estimated.

(In this manner any subsequent prospector, informed of these regulations, will, on meeting any one of the posts, be enabled to follow them all round, from one to another, and avoid encroachment either in search or in marking out another location in the vicinity for himself.)

5. Having so marked out on the ground the location he desires, the claimant shall next, within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration on oath according to form A in the schedule to these Regulations (which may be sworn to before the said agent, or may have been previously sworn to before a Justice of the Peace or Commissioner) setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, deposit with the agent the sum of fifty dollars to the end and for the purpose set forth in the second clause hereafter.

6. The Agent shall give him a receipt, according to form B in the schedule to these Regulations, for such deposit. This receipt shall authorize the applicant, his legal representatives or assigns, to enter into possession of the location applied for, and during the term of one year from its date and subject to the royalty prescribed in clause 19 of these Regulations, to take therefrom and dispose of any mineral deposit contained within its boundaries.

7. The deposit of fifty dollars shall be paid into the Receiver General by the Land Agent, along with and in like manner as other revenue from Dominion Lands in his district, and in the event of the mining applicant fulfilling all the conditions prescribed by these Regulations, the said deposit shall be deemed payment by him to the Government for the survey of his location.

8. At any time before the expiry of one year from the date of his making his application and deposit as aforesaid, it shall be open to the applicant to purchase the location on filing with the Local Agent proof that he has expended not less than five hundred dollars in bona fide mining operations on the same, such proof to consist of his own sworn statement setting forth in detail the nature of such operations and the amount expended, and to be accompanied and confirmed by the affidavits of two disinterested persons.

9. Should the applicant, or his legal representatives as aforesaid, fail to prove within one year, the expenditure prescribed, or having proved such expenditure, fail within that time to pay in full, and in cash, to the Local Agent, the price hereinafter fixed for such mining loca-

tion, then any right on the part of the applicant or of his legal representatives in the location, or claim on his or their part to acquire it, shall lapse; and the location shall thereupon revert to the Government and shall be held along with any immovable improvements thereon for disposal, under these Regulations, to any other person, or as the Minister of the Interior may direct, and the deposit paid by the applicant shall be forfeited to the Crown.

10. The price to be paid for a mining location shall be at the rate of twenty-five dollars per acre.

11. If, on account of its remoteness or other cause, a mining location cannot, at the time of the payment of the deposit of fifty dollars by the applicant for the purpose, be surveyed by the Government for that sum, he shall be subject to the alternative of waiting until the employment of a surveyor by the Government on other work in the vicinity of the claim renders it possible to have the survey made at a cost not exceeding fifty dollars, or of sooner procuring at his own cost its survey by a duly commissioned surveyor of Dominion Lands, under instructions from the Surveyor General; in the latter case, on receipt of the plans and field notes of the survey, and approval thereof by the Surveyor General, the claimant shall be credited on account of royalty due, or to become due, with the fifty dollars deposited by him to defray cost of survey.

12. Where two or more persons lay claim to the same mining location, the right to acquire it shall be in him who can prove he was the first to discover the mineral deposits involved, and to take possession by demarcation, in the manner prescribed in these regulations, of the location covering it.

13. Priority of discovery alone shall not give the right to acquire; but a person subsequently and independently discovering, who has complied with the other conditions prescribed in these regulations, shall take precedence of the first discoverer if the latter has failed to comply with the said other conditions. Provided, however, that in any case where it is proved that a claimant has in bad faith used the prior discovery of another and fraudulently affirms that he made independent discovery and demarcation, he shall, apart from any other legal consequences, have no claim, and shall forfeit the deposit made with his application.

14. Not more than one mining location shall be granted to any individual applicant.

15. The Minister of the Interior may grant a location for the mining of iron not exceeding 160 acres in area. Provided that, should any person making an application purporting to be for the purpose of mining iron, and thus obtain, whether in good faith or fraudulently, possession of a valuable

mineral deposit other than iron, his right in such deposit shall be restricted to the area hereinbefore prescribed for other minerals, and the rest of the location shall thereupon revert to the Government for such disposition as the Minister of the Interior may direct.

16. When there are two or more applicants for any mining location, no one of whom is the original discoverer, nor his assignee, the Minister of the Interior, if he sees fit to dispose of the location, shall invite their competitive tender, or shall put it up to public tender or auction, as he may deem expedient.

17. An assignment of the right of an original discoverer to purchase a mining location shall be endorsed on the back of the receipt or certificate of assignment (Forms B and C in the schedule hereto), and the execution thereof shall be attested by two disinterested witnesses; upon the deposit of the receipt or certificate with such assignment executed and attested as herein provided, in the office of the Local Agent, accompanied by a registration fee of two dollars, the Local Agent shall give to the assignee a receipt in the form C in the schedule hereto, which certificate shall entitle the assignee to all the rights and privileges of the original discoverer in respect of the claim assigned; and the said assignment, with the registration fee of two dollars, shall be forwarded to the Minister of the Interior by the Local Agent, at the same time and in like manner as his other returns respecting Dominion Lands, and shall be registered in the Department of the Interior; and no assignment of the right of an original discoverer to purchase a mining location which is not unconditional and in all respects in accordance with the provisions of this clause, and accompanied by the registration fee herein provided for, shall be recognized by the Local Agent or registered in the Department of the Interior.

18. If application be made under the next preceding clause, by the assignee of an original discoverer, to purchase a mining location, and such claim is duly recognized and registered, as hereinbefore provided, such assignee shall, by complying with all the provisions of clause 8, become entitled to purchase the location for the price and on the terms prescribed in these regulations, whether or not his assignor may have previously acquired a mining location under them.

19. The patent for a mining location shall reserve to the Crown, for ever, a royalty of five per cent. on the sales of the products of all mines therein; and also on the sales of any timber or wood that may be on the location.

20. Returns shall be made by the grantee sworn to by him, or by his agent or other employee in charge of the mine, at monthly or such other intervals as may be re-

(Continued on 6th Page.)

MINERALS IN CANADA.

An article has appeared in the *Liverpool Journal of Commerce* commenting on the mineral wealth of Canada as follows:—"Much interest has of late been created amongst capitalists in consequence of the extraordinary development of mining in Canada: and, in connection therewith, it may be well to observe that in the neighbourhood of Ottawa, the Capital of the Dominion, the amount of enterprise displayed, especially in the Laurentian range of mountains, is something enormous. For the past two or three years parties of workmen have been engaged in removing phosphates from what are known as "surface pockets," the prevailing opinion amongst geologists having been that this valuable mineral was only to be found under certain conditions. The experience of those engaged in the operations referred to throws fresh light on the entire subject, and, in contra-distinction to the learned *dicta* of men of science, it is found that the mineral is obtainable under conditions which present no appearance whatever of animal organization. Further, it is obtainable in such quantities, and of so high a quality—the latter giving 85 per cent. of phosphate of lime—as to yield a large revenue. It has been ascertained, likewise, that these "pockets," when blasted, expose extensive and unexpected deposits of phosphate beneath. The consequence of these disclosures has been much excitement, not only in Ottawa, but throughout the Dominion, and phosphate lands have experienced a rise in value. It is noteworthy, too, that not only American, but English, French and Belgian capitalists are investing largely in these lands, a strong testimony to the value in which they are held beyond Canada itself.

In further illustration of the mineral wealth of the country, we may mention that on the Island of Michipacotin there has been disclosed an enormous deposit of copper, which far exceeds the deposits of the Calumet and Acla Mining Company, so well known in the United States. Specimens of the newly-discovered ore have been forwarded to the laboratory of the School of Mines in London, and the analysis has proved, in connection with the known extent of the deposit, that a valuable industry of unheard of dimensions is about to be opened up. A large capitalist from London has sailed in one of the Allan steamships, with a view of testing the accuracy of the reports that have reached this country as to mining development in Canada—a practical method of going to work, which should tend to foster legitimate trade and nip any bogus experiments in the bud. Assuming these reports to be, in the main, correct, Canada is certain, as regards the mining industry, to have a bright future; and, with the in-

terest manifested in all Canadian matters by the Marquis of Lorne, should have the effect of promoting still further commercial intercourse between it and the Mother Country."

It cannot fail to please the people of Canada, more particularly those interested in mining enterprises, to read such flattering articles in the foreign press on the vast natural wealth this country possesses.

Manitoba Mines.

It must be encouraging to those directly interested in the welfare of Manitoba to notice how rapidly the mineral wealth of that province is being developed. Not a day passes that we do not see leading articles in the Canadian and American press commenting on the gold mines of Manitoba, and all testifying in unqualified terms to the richness of the mines at present in operation. Prominently among these is the well-known Keewatin Mine, situated near the Lake of the Woods, about 500 feet from its shore. The shaft has been opened on the crest of a ridge, about 80 feet above the lake level, and is being sunk in a true fissure vein, with most encouraging results, the quartz increasing in richness as mining progresses, until the company has now the satisfaction of claiming, and justly so, that the ore taken from its mine gives a larger percentage of the precious metal than any other yet discovered in the district; and, compared with the principal gold mines of the United States, its yield is far in excess, as the following figures will show:—

Manitoba Mines.

Keewatin Mine, per ton of 2,000 lbs. . .	\$171 50
Lake Winnipeg " " 	124 00
Hay Island " " 	151 00
North American " " 	81 25

United States Mines.

	Per ton
Bodie Consolidated Mine..California...	\$74 78
Keystone Mine.....Georgia.....	36 00
Moneton ".....Montana.....	40 00
Penobscot ".....Dakota.....	5 to 6
Robinson ".....Colorado.....	50 00
Silver Bond ".....Montana.....	40 00
Tecumseh ".....Utah.....	30 00
The West ".....S. Carolina.....	10 00

From this it will be seen that the flattering reports published regarding the value of the "Keewatin," have not been without substantial foundation, and taking into account the many important advantages this mine possesses, such as being easy of access, the cheapness of fuel and the richness of its ore, it may safely be predicted that the company has in store a brilliant and a prosperous future.

Some gentlemen from the United States who have a large amount of capital invested in mines in New Mexico and Nevada, accompanied by mining experts from New York, recently visited the property of the Keewatin Mining Company, and were unanimous in the opinion that the lode was much richer and promised a larger yield than anything they had seen in Colorado or Nevada. To the opinions of these practical and, in such matters, well informed men, should be attached much importance; time, however,

will prove the correctness or incorrectness of their reports. If mining operations are prosecuted with the same energy in the future, and with the same encouraging results as have been shown in the past, this company will realize such prosperity as will exceed the most sanguine anticipations of those who are interested in its welfare. If, when the output of ore has been crushed, the result bears out the tests already made on a small scale, and there is little doubt but it will, then, it is safe to say, success will have been assured for the Keewatin Mining Company and a lively "boom" will thus be created in Manitoba mining stocks. There will be no further necessity for applying to men of capital for assistance—on the contrary, capitalists will anxiously seek investment for their money in what promises to return such handsome profits.

A Gold Brick.

A despatch recently received from Winnipeg announces the arrival in that city of a gold brick weighing 3 lbs. It was brought from the Winnipeg Consolidated Mine, and has created intense excitement among those interested in Manitoba gold mines. Another brick is looked for, and should have reached Winnipeg ere this, from the Argyle Mine. The mills at both these mines are said to be doing excellent work, and the value of the properties is established beyond a peradventure.

Keewatin Mine.

A telegram was received from New York a short time since by a gentleman in Winnipeg, asking him if the Keewatin Mining Company would be disposed to sell 5,000 shares of its stock at \$8 per share. If this offer be accepted, it will be the largest sale of Keewatin stock yet effected; its par value is \$10 per share.

**Incorporated Mining Companies
in Manitoba.**

The following is a list of the Gold Mining Companies owning properties on the Lake of the Woods, the capital stock of each, and the par value of their shares :

	Capital Stock.	Shares par value
Argyle Mining Co., limited. . .	\$1,000,000	\$100
Winnipeg Consolidated Gold Mining Co., limited.	1,020,000	50
Keewatin Mining Co., limited. .	1,000,000	10
Lake of the Woods Gold Min- ing Co.	2,000,000	20
George Heenan Mining Co. . . .	500,000	10
Lake Winnipeg Mining Co. . . .	2,000,000	10
Mining Investment Co.	300,000	
Canada Gold Mining Co., limited.	1,000,000	20
British American Gold Min- ing Co.	500,000	10

The greater number of the above named companies are already engaged in active operations, and mining is being vigorously pushed ahead.

A careful estimate, by States, of the silver product of Mexico, shows an annual yield of \$22,000,000.

Manitoba Lands.

We beg to direct the attention of our readers to the list of Birtle Lands in Manitoba, published in another column for The selection of these land made by an old resident of the country, who reports rich black soil with gravel sub-soil, and plenty of water. The Portage and Huron Railway—now in construction—will run through the heart of the Birtle district. More beautiful country exists in the British possessions than the Red and Bird Tail Section of Manitoba, and we venture to say that, in the next five years, lands of this quality offered for sale will be difficult to obtain at \$50 to \$100 per acre.

ASBESTOS.

This valuable mineral is found more or less in various of Canada. It occurs in the s lying north of Kingston an many sections adjacent to tawa Valley, but the deposit covered in these localities have yet been worked, and this is due to the want, on the part of the owners, of the necessary means to carry on mining operations, as to the fact that the existence of the mineral in this section of C is comparatively unknown to the lists. Yet the opinion prevails amongst geologists that the amount of asbestos in the Ottawa Valley destined to become an industry of great importance. In the El Township it has already become the most important industry, a large quantity of mineral shipped from the mines in the County of Me has been annually increasing, and it is rapidly becoming one of the most extensive asbestos producing sections of North America. In the Township of Shefford, mining operations are being actively carried on by the Boston Asbestos Paper Company, by Messrs. King and by Messrs. Johnston and Four distinct properties are now worked by these gentlemen, who employ in all 160 men, and the daily output is estimated at 7 Mr. Jeffery has for some years been engaged in mining in the Township of Danville, and has succeeded in raising a large amount of mineral all of which has been shipped by Mr. W. H. Johns, of New York, one of the largest Fire-proof Rope Paint and Packing Manufacturers in the United States. Mr. Wright's mine, in Wolfston, is said to yield 20 tons daily, and by the employment of additional force the output might be considerably increased. This, however, has, as yet, been but recently opened and it is only reasonably supposed that it will become as productive as development progresses. In the Township of Broughton, Dr. J. Reed is giving some attention to mining, and a mine now operated by him bids fair to develop into a very valuable

property. The asbestos produced from these mines in the County of Megantic, is similar to that found in the Ottawa Valley, and is pronounced by European manufacturers the finest and strongest fibre of the kind known. On Lot No. 11, in the 8th Range of the Township of Templeton, in the County of Ottawa, a valuable asbestos mine has been opened and a quantity of mineral shipped, but, owing to the owner's inability to continue mining operations, the property is offered for sale, as will be seen by an advertisement in another column. Most favourable reports have been received of this property, and there exists little doubt that it will develop into one of great value.

PERSONAL.

Mr. J. G. Miller, who has for many years been identified with phosphate mining in Canada, was in Ottawa recently. Mr. Miller has devoted a great deal of time and study to this industry, and was instrumental in attracting the attention of the outside world to the value of our Canadian apatite deposits. For the past two years he has been actively engaged in guano mining on an island near Porto Rico, and was in Ottawa *en route* to Liverpool, where he hoped to procure direct tonnage from the island for his output by effecting such arrangements with ship-owners as would allow vessels carrying cargo to American ports to return laden with guano for the English market. As the uncertainty of transportation has thus far retarded his operations, and has been a serious drawback, it is to be hoped he may accomplish the object of his mission.

Mr. W. McIntosh, Manager of the High Rock Phosphate Mine, was in the city within the past few days, and expressed himself more than satisfied with the way in which the work under his supervision is progressing. Mr. McIntosh has been engaged for some years in this business, and has forwarded many thousand tons of mineral across the Atlantic; this season he will ship more than in any previous year, and yet he speaks of phosphate mining in Canada as being in its infancy.

Captain J. E. Smith, of the "Union Phosphate Land and Mining Co.," reports that work is progressing most favourably at the mine. The property owned by this company adjoins the "High Rock Mine," in the Township of Portland, West, and is said to be very rich in mineral. The company, composed of capitalists in New York, Philadelphia, Detroit, Chicago, Cincinnati, and Kansas City, has a capital stock of \$1,000,000, divided into 10,000 shares, fully paid up and unassessable. A large force of men are employed at the mine, and the most

modern machinery has been erected to facilitate the rapid prosecution of work. Captain Smith, the company's superintendent, when last in Ottawa, is reported to have said that, since the company began operations, the immediate vicinity of the mine has undergone a great change. What was but a few months ago a wilderness, is now the scene of life and activity; and, where no habitation was visible, a village of no mean proportions has suddenly appeared. The superintendent will no doubt ship a large quantity of high-grade phosphate from the mine this year.

Mr. Weston, of the firm of Van Rensselaer, Falding & Co., of New York, was in Ottawa a few days ago. This firm has entered into contract with the Dominion Phosphate Company to raise a large amount of first quality phosphate from a property purchased last year by the said company from Mr. W. A. Allan, of this city. The mine is one of great value, and the mineral already mined has proved to be of the richest grade. Mr. Weston speaks very highly of the property, and is more than sanguine that the output for the year will be in excess of the quantity contracted for by his firm. Steam drills and derricks are kept busy penetrating into the bowels of the mountain towards the main body of ore. A cut is being made across the hill, 40 feet deep by 10 feet in width, so as to facilitate the working of a large force, and, in making this opening, many fine veins, leading to the main deposit, have been crossed, and a large amount taken therefrom. Mr. Weston reports a great quantity of phosphate in sight, and says that the company contemplates constructing a tramway from the mine to the Rivière du Lièvre to render practicable the shipping of the output during the summer season. Phosphate mining in the County of Ottawa is certainly making rapid strides.

MICA.

In Canada, up to the present time, little or no attention has been directed to this useful and valuable article of commerce. Throughout the Laurentian range large quantities of mica are to be seen on the surface of the rocks, and, wherever mining or quarrying has been carried on, abundance of it is to be met with, but in most instances it is unmarketable. In the majority of cases it is associated with a limestone formation, and this is pronounced to be of no commercial value. In some localities, however, in the Ottawa Valley, it occurs in regular veins, lying between well defined walls of feldspar and quartz, and in others the veins are hemmed in by granite. The mica found in these formations is of a very superior quality and, in clearness and size of the sheets, it is equal to that imported from North Carolina and

New Hampshire. From some such veins, not far distant from the City of Ottawa, a quantity has been extracted and forwarded to different firms in the United States, who have attested to its value and pronounced it equally clear and perfect as any they had before used. It is to be hoped that, at an early day, Canadian mica will be sought after by stove manufacturers and others, and that the same activity will be shown in the mining of this mineral as is evinced by those engaged in working the phosphate and other deposits.

IRON.

There is no metal of so much importance in the material progress and prosperity of any country as iron, and it is to be found in great abundance and variety in all the provinces of the Dominion of Canada. The iron deposits of Eastern Ontario and the western portion of the Province of Quebec are especially noteworthy, as they are destined, at no distant day, to attract the attention of capitalists from all parts of the world. There are to be found, in every direction throughout this part of Canada, strong indications of the presence of the metal, and many veins of magnetic and hematite ore have been opened to a small extent by prospectors and owners of properties for the purpose, merely, of establishing the fact of its existence in paying quantities, and of procuring specimens for analysis. In nearly all cases the result of assays has proved the ore to be of unquestionable richness, without deleterious properties common to that in many other localities; to be comparatively free from impurities, and the presence of titanium is almost imperceptible. In the Township of Hull, in the County of Ottawa, extensive deposits of hematite ore have been exposed; and one mine of magnetic ore, yielding as high as 66 per cent. of metallic iron, has been actively worked for some years, and the ore shipped at small cost to Cleveland, Ohio. In that section of Eastern Ontario lying north of Kingston and Belleville, between Lake Ontario and the waters of the Upper Ottawa, an abundance of iron ore is to be found, occurring chiefly in the Townships of Marmora, Hastings, Tudor, Madoc, Bedford and Bagot; in the last named township the ore is said to yield a high percentage of metal, and to be of marked purity. In some of the other townships the mines have been more or less operated, and the output shipped to the United States to be smelted. In Bagot, however, the deposits have not yet been worked for shipping, owing to their having been isolated from railway and water communication, and to the difficulty of access heretofore encountered; this drawback has, however, been removed by the construction

Pembroke Railway, which now traverses that section of the country, affording easy access to the mines, and means of transporting the ore—that is to say, if property owners continue to ship the output in its raw state to American smelting works; but the Canadian Government is alive to the importance of encouraging home manufacture of iron, and, as an inducement to miners in the country to do so, Sir Leonard Tilley, in his Budget speech, delivered in the House of Commons on the 30th of March, said: "the Government will submit a resolution to the Committee, that on and after the 1st July next, and for 3 years, \$1.50 per ton will be paid on all pig-iron produced in Canada during those 3 years, and \$1.00 per ton during the next 3 years, as a bounty for the encouragement and development of this industry."

The bounty mentioned for the 3 years from the 1st July (\$1.50 per ton) should be ample to defray the cost of mining, and to go towards paying for fuel as well. This should be sufficient to induce capitalists in the Dominion to inaugurate this new enterprise, and, if due advantage be taken of the Government's liberal offer, it will have the effect of bringing Canada prominently among the extensive iron-producing countries of the world.

PROJECTED RAILWAYS.

The inhabitants of those sections of the Province of Quebec adjacent to the Rivers Gatineau and Du Lièvre are much exercised at the prospect of having, within a short time, railway communication from the interior to the line of the Canadian Pacific and the Ottawa River. The surveys have already been made for the Ottawa and Gatineau Valley Railway, and for the Ottawa Colonization Railway, and it is expected that the work of construction on both roads will be begun in the near future and strenuously pushed to completion. The line of the first mentioned road has been located from Hull to a point 80 miles north, and throughout the entire distance no serious engineering difficulties have been encountered; for many miles it traverses a cleared and well cultivated country, and then enters the timber and mineral district of the Gatineau Valley. The Ottawa Colonization Railway, starting from Buckingham, will pass through open country for some distance, and, running west, will penetrate into the very heart of the phosphate region, thus affording rapid means for shipping ore at all seasons of the year. A very fair location for this line has been adopted, and the breaking of ground is looked for with no little interest by those engaged in lumbering and

Dept. of Railways the townships continue Ottawa, 21st proposed route.

quired by the Minister of the Interior, of all products of his mining location, and of the price or amount he received for the same.

21. The Minister of the Interior may direct mining locations to be laid out wherever, from report of the Director of the Geological Survey or from other information, he has reason to believe there are mineral deposits of economic value, and may sell the same to applicants therefor, who, in his opinion, are able and intend in good faith to work the same; or he may, from time to time, cause the said locations to be sold by public auction or tender. Such sales shall be for cash, and at prices in no case lower than those prescribed for locations sold to original discoverers, and shall otherwise be subject to all the provisions of these regulations.

LINDSAY RUSSELL,

Deputy of the Minister of the Interior.

SCHEDULE TO MINING REGULATIONS.

FORM A.—DISCOVERER'S APPLICATION AND AFFIDAVIT.

I, (A.B.) of hereby apply, under the Dominion Lands Regulations, for a Mining Location in (here give general description of locality)

for the purpose of mining for (here name the metal or mineral) and I hereby solemnly swear:—

1. That I have discovered therein a deposit of (here name the metal or mineral)

2. That I am to the best of my knowledge and belief the first discoverer of the said deposit.

3. That I am unaware that the land is other than vacant Dominion Lands.

4. That I did, on the day of mark out on the ground, in accordance in every particular with the provisions of clause four of said Mining Regulations, the location for which I make this application; and that in so doing I did not encroach on any mining location previously laid out by any other person.

5. That the said mining location contains, as nearly as I could measure or estimate, an area of acres, and that the description (and sketch, if any,) of this date hereto attached, signed by me, set forth in detail to the best of my knowledge and ability its position, form and dimensions.

6. That I make this application in good faith to acquire the land for the sole purpose of mining to be prosecuted by myself, or by myself and associates, or by my assigns.

Subscribed before me } (Signature)

FORM B.—RECEIPT FOR DEPOSIT BY APPLICANT FOR MINING LOCATION.

No.

Department of the Interior,
Dominion Lands Office,
Agency 18

Received from (A.B.) of Fifty Dollars, being payment by him of the deposit required by Clause five of the Dominion Lands Mining Regulations accompanying his application No. , dated 18 for a Mining Location in (insert general description of locality).

This receipt authorizes the said (A.B.) his legal representatives or assigns, to enter into possession of the said Mining Location, and during the term of one year from the date of this receipt, and subject to the royalty prescribed in Clause nineteen of Mining Regulations, to take therefrom and dispose of any mineral deposit contained within its boundaries, and on due compliance at any time within that period with the several requirements in that behalf of the said Mining Regulations, entitles him or them to purchase the said location which, provisionally, and until survey thereof, may be known and described as follows: (Insert description in detail).

If the said A.B., or his legal representatives or assigns, fail to comply, as aforesaid, with the conditions that would entitle them to purchase within one year from this date, or, having so complied, do not within that time make payment in full for the land, then the right to purchase shall lapse, and the Mining Location shall revert to the Government, to be otherwise disposed of as may be directed by the Minister of the Interior.

Agent of Dominion Lands.

FORM C.—CERTIFICATE OF THE ASSIGNMENT OF A MINING LOCATION.

No.

Department of the Interior,
Dominion Lands Office,
Agency 18

This is to certify that (B. C.) of has filed an assignment in due form, dated 18, and accompanied by

a registration fee of two dollars, of the right of (A. B.) of to purchase the mining location in

(here insert general description of locality) applied for by the said A.B. on the 18

This certificate entitles the said B.C., or his legal representatives or assigns, to all the rights and privileges of the original discoverer, A.B., in respect of the claim assigned and hereinafter described; that is to say, to enter into possession of the said mining location, and during the term of one year from the date of the receipt No. . . . , granted to the day of subject to the

royalty prescribed in Clause nineteen of the Mining Regulations, to take therefrom and dispose of any mineral deposit contained within its boundaries, and on due compliance at any time within that period with the several requirements in that behalf of the said Mining Regulations, entitles him or them to purchase the said Location, which provisionally, and until survey thereof, may be known and described as follows:— (Insert description in detail).

If the said B.C., or his legal representatives or assigns, fail to comply as aforesaid with the conditions that would entitle them to purchase within one year of the date of the receipt granted to A.B., and now deposited with me, or, having so complied, do not within that time make payment in full for the land, then the right to purchase shall lapse, and the Mining Location shall revert to the Government to be otherwise disposed of as may be directed by the Minister of the Interior.

Agent of Dominion Lands.

COAL.

That coal does not exist in Ontario or Quebec, owing to the geological formation of these Provinces, is an established fact; but being favourably situated in there proximity at all points to other carboniferous regions, and the facility of conveyance afforded by the vast lakes, rivers, canals and railways of the respective provinces, it is easily procurable, and the deficiency is well made up by the vast areas of coal district in the Maritime Provinces and on the Pacific Coast. It is a most important matter for Great Britain to hold on either side of her possessions in this continent, countries possessing this valuable mineral on the coast, the eastern and western portals of the Dominion.

NOVA SCOTIA.—It is probable that Nova Scotia, in proportion to its extent, stands unrivalled in the productive capabilities of its coal fields, whilst nature has afforded every facility for working them to advantage. The coal belongs entirely to the bituminous division, no anthracite having been met with as yet, although there are numerous tracts of carboniferous formation in various parts of the Province; the largest and most valuable are situated near and along its northern shores, and over a considerable portion of the northern and eastern shores of Cape Breton. The chief coal producing sections of the Province are known as *The Sydney, The Inverness, The Richmond, The Antigonish, The Pictou, and The Cumberland Coal Fields.* The most productive of these is the Sydney Coal Field which furnishes coal particularly suited for gas making, and certificates from the English mercantile navy prove it almost

equal to Welsh Steam Coal. The enormous amount of available coal it contains is stated in the Geological Survey Reports to be over 212,000,000 tons. The cost of the coal mined and put on board the cars varies at the different collieries from 60 cents to \$1.25 per ton.

NEW BRUNSWICK.—The only locality in this Province where coal mining operations are at present conducted is in and about the Newcastle River and the shores of the Grand Lake, in Queen's County. The area and thickness of the beds indicate a total productive capacity of 155,000,000 tons, and it may fairly be presumed that with economical management, and a proper system of working, a large portion of this enormous quantity might be profitably extracted. The coal is a true bituminous, is employed both for household and blacksmiths' use, and is said to be of good quality. In Albert County a remarkable mineral known as Albertite was discovered about the year 1850, and since then nearly 200,000 tons of this mineral has been removed and exported to the United States for the manufacture of oil and for the admixture with other coals in the preparation of illuminating gas, for either of which purposes it is admirably adapted, being capable of yielding 100 gallons of crude oil, or 14,500 cubic feet of gas, of superior illuminating power, per ton.

BRITISH COLUMBIA.—The presence of good coal in Vancouver Island and the absence of it in other portions of the Pacific Coast, are greatly in favour of this Province. The coal bearing localities of British Columbia are *Queen Charlotte Island, Vancouver Island, and the Mainland.* The production is increasing with the demand, and, in view of a growing market, works are being freely extended. The output sells at the mines for \$5 to \$6, and in San Francisco for \$10 per ton. The existence of a fine quality of coal on the seaboard cannot fail to be of the very greatest importance when the Canadian Pacific Railway converts British Columbia into one of the world's highways. By that time all the trans-continental railways will connect on the Pacific Coast with lines of coasting and ocean steamers, which will get steam coal from the only North Pacific district that can supply it, namely, Vancouver Island. Dr. Brown, of Edinburgh, who visited the province some years ago, says, "that, in her coal fields, British Columbia has within herself the elements of lasting prosperity," and this cannot be denied.

NORTH-WEST TERRITORY.—it is now an established fact that coal exists in various districts of this vast territory, and it has been discovered in large quantity in the following localities, namely, on the east coast of Hudson Bay and some miles inland from Little Whale

er; on Abitibi and Missinaibi
ers; on the west bank of Coal
k, and at the mouth of Poplar
er; and near Rocky Moun-
House, and between that site
Edmonton; in the region west
Edmonton lying between the
abasca and Red Deer Rivers,
in the Souris district. The
scarcity and low quality of
timber over hundreds of miles
country bordering the two Sas-
sawan Rivers render it a
er of the very greatest impor-
e, in connection with the future
ement of the North-West, and
pening it up either by land or
steam transport, to ascertain
e and at what depth coal can
ocured available for domestic
oses, railroads and steamboats.
etermine this, borings must be
e, as surface examinations will
olve the question.

The recent discovery of coal in
Souris district will prove of in-
valuable value to Manitoba and
country surrounding, and will
be of the most valuable adjuncts
to prosperity and progress of
North-West.

GRATUITOUS ADVICE.

Advantage might be taken by
dians of the advice conveyed
in article which appeared not
since in the *Chicago Journal*
commerce, addressed to grum-
as follows:—

is hardly understood why a few
in this country have so suddenly
become rich. It is because the country
is bling in value every ten years, and
men happen to be in possession of
main arteries of trade and manufac-
and so the land of every town
is in value, so does the railroad and
graph right of way double each ten
and will continue to do so until
country is fully occupied. Every foot
in the North-West, every railroad
telegraph and manufactory will be
double in 1890 what it was in
1880. Only get hold of as much as pos-
sible of the material of this country and
it. If the grumblers would do this
instead of finding fault with owners of
lands because their property doubles
doubles again in value! Opening
and building railroads is not al-
ways a sure road to wealth, but the mines
chance to be bonanzas and the
which chance to be the great high-
will give their holders fortune.
don't stop to grumble!"

TRUE COURAGE.

BY KATE WINDSOR.

ough frame cabin on the bank of a
the mining regions. A dozen men
eaten on the unplanned benches
d the interior, and two girls stand
tful attitude at the doorway. Out-
the banksmen are dexterously load-
the carriage with timber for use in
mine. Until they have completed
labours the operatives cannot go to
respective stalls. All of them ex-
the distinguishing marks of their
g, and many of them bear on their
es the faint blue lines which tell
quent story of perils in the mine.

The delay is tedious to men accus-
tomed, as they are, to severe physical
toil, and a veteran with grizzled looks
and beard, who is evidently recognized
by the others as a leader, suggests that
one of the girls be sent for "drink."

The suggestion is approved by all
with one exception, and this man, John
Walters, remains silent.

The girl has not far to go, and she
quickly returns with a can of the beverage.
Richard Wilson, one of those who
had most heartily assented to the
proposition, takes the can from the girl
and proceeds to dispense the contents.
He approaches Walters in turn and
proffers the brimming glass, but the in-
vitation is declined with thanks.

"So you won't drink, mate?"

"No, Dick; I can't do it."

"You are too partickler, mate; per-
haps it's the company you objects to?"

"You know me better, Dick; don't
press me."

"You had better drink, mate," says
Dick, with an evil gleam in his eyes.

"I've already told you that I don't
want it," is the steady answer.

"Well, take it that way,"—and the
beer is violently dashed in Walters' face.

The man who is so grossly insulted
turns a shade paler as he clenches his
teeth hard to restrain the rising passion,
but he says nothing, and a howl of
derision is raised by his fellow workmen.

"Why, you cur," shouts one; "defend
yourself; a worm will turn if trodden
on."

"Jack Hardy," responds Walters;
"you have worked in the next stall to
me for over a year. We have seen some
trouble in our heading—can you say
that I have ever shown the white
feather?"

"You're doing it now," is the quick
and contemptuous retort.

"I object to fight on principle, and
you know it," calmly replies Walters;
and the appearance of the "boss" is
the signal for closing the discussion.

The foreman reports the workings
clear of gas; the lamps are locked, and
the miners are quickly engaged in filling
their tubs with the "black diamonds."

In the breast of John Walters various
emotions are contending for the mas-
tery. He is a sensitive man and the in-
sult is keenly felt. The struggle is a
sharp one, but the cloud lifting from his
brow shows that he has conquered. He
remembers the time when he drank
harder, and for a longer period at a
stretch, than any of his mates. He re-
members the wretched tenement, almost
devoid of furniture, which in those days
he called his home; and he thinks of
wife and children often hungry and
always thinly clad.

All this is changed now. Not one of
his fellows has a happier family or a bet-
ter appointed home than himself, and all
has been accomplished by total abstin-
ence. By God's grace, he has told him-
self, he would never fall again—and,
although sorely tempted, he never has.

"Hark!"

It is one of the banksmen who is
speaking to his companion. The sound
which causes the exclamation is heard
again, and both men throw themselves
flat on the ground and endeavor to pen-
etrate the inky blackness of the shaft.
There is a strange and unaccountable
stillness below, which is soon broken,
however, by a dull rumbling sound re-
echoing through the chambers and road-
ways of the mine, and the men hold
their breath in the intensity of their ex-
citement. The carriage is at the top,
and one of them arises and hastens to
give the signal to "lower away."

Clang, clang, clang!

The massive hammer has fallen three
times in succession.

"They want to come up; there is

trouble below," says the agent, who has
just reached the bank from the office.

"And death!" answers the leading
banksmen, solemnly.

The carriage is lowered with light-
ning-like rapidity; is raised and its
living freight discharged. Again and
again the operation is repeated, and a
crowd of women and children are by
by this time congregated at the pit's
mouth. They peer anxiously into the
faces of those brought to the surface,
hoping for the best but fearing the
worst. Disfigured features are seen in
every load, and suffering is gauged by
groans of anguish.

"How many were in the pit?" asked
the agent in a voice which tells of
strong emotion.

"One hundred and twenty," is the
prompt answer.

"Then they are not all up?"

"No, sir; the men in No. 4 heading
are still below."

"I fear they are doomed, but an effort
must be made to save them—who goes
with me?" and the agent jumps into the
carriage with a nervous bound.

The example is quickly followed by
several others, but there is no enthusiasm
—only a grim determination to do their
whole duty, though it takes them into
the very jaws of death.

A narrow pathway winding down the
mountain's side. The herbage is scanty,
and yawning fissures and whitened
stones bespeak the frequent torrent. A
solitary goat browses on the slope, and
naught beside, save the tall black der-
rick which rears its head in the distance,
tells of life. The silence is broken by
the tolling of a bell in the tower of the
village church, and soon the pathway is
treaded by a procession of stalwart men
and weeping women. On the shoulders
of the men is borne all that is mortal of
John Walters, the "cur," who has laid
down his life on the altar of love.

The man who has treated him with
insult and contumely was in imminent
danger, for the explosion had come from
his stall, and Walters resolved, if possi-
ble, to save him. Half choked with the
after-damp, he toiled onward through
the subterranean passages until he came
to Wilson's working place. Large por-
tions of the roof had fallen, and it was
necessary to proceed on his hands and
knees. He did not hesitate, but, with a
heart-prayer for success, he boldly en-
tered.

Groping around with his hands out-
spread, they presently came in contact
with the apparent lifeless body, and in
bended posture he retreated—slowly,
laboriously, and painfully.

Once on the roadway, he sought for a
sign of life and found it. The pulsation
of Wilson's heart was perceptible, and it
nerved the gallant fellow to increased
effort.

But at last he sank to the ground; he
could proceed no further; his brain was
dizzy, his sufferings more acute; then all
was lost in unconsciousness—the insen-
sibility of death! The hero, for hero he
was, had paid the last debt of nature,
and had gone to his reward.

Later, when the exploring party en-
tered the mine, the two were found, the
head of the dead pillowed on the breast
of the living—the man who had been
saved at the eleventh hour.

Silently the procession moves on its
way save when a halt is made for a
change of bearers, or when the choir
who lead raise their voices in the pathetic
strain of a funeral dirge, until the grave
is reached and the last sad rites com-
pleted.

"He was a good man," says one.

"Brave as the bravest," is the hearty
response, and the aged minister lays a
kindly hand on the shoulder of Richard
Wilson, and whispers gently: "Greater
love hath no man than this, that a man
lay down his life for his friend"—*Winnipeg Times*.

A prominent mining report of
Denver, Colorado, assayed an aver-
age specimen of quartz, taken from
one of the Manitoba mines, and
found that it carried \$203.58 of
gold to the ton. He speaks of the
ore as being of astonishing richness.

IMPORTANT SALE

Of choice and well situated Farm
Lands in the Province of Mani-
toba and North-West Terri-
tories of Canada.

At Winnipeg, commencing on Tues-
day, the 15th May next, there will be
offered at public auction, a portion of
the even numbered sections lying along
and adjoining the Canadian Pacific Rail-
way in Manitoba and in the Territorial
District of Assiniboia, and of the even-
numbered sections lying between the
belt of the main line of the Canadian
Pacific Railway and the International
Boundary and between the Red River
and the Coteau or Dirt Hills.

COAL LANDS.

Some of the Coal Lands on the Souris
River will also be offered.

Further particulars of the lands, the
upset prices, and the terms and condi-
tions of sale may be learned at the Do-
minion Lands Office, Winnipeg.

By order,

LINDSAY RUSSELL,

Deputy of the Minister of the Interior.

Department of the Interior,

Ottawa, 20th April, 1883.

LACHINE CANAL.

NOTICE TO CONTRACTORS.

Sealed tenders, addressed to the un-
designed, and endorsed "Tender for the
Formation of Basins near St. Gabriel
Locks," will be received at this office
until the arrival of the eastern and west-
ern mails, on Wednesday, the 6th day of
June next, for the formation of TWO
SLIPS or BASINS, on the north side of
the Lachine Canal, at Montreal.

A plan and specification of the work
to be done can be seen at this office, and
at the Lachine Canal Office, Montreal, on
and after Tuesday, the 22nd day of May
next, at either of which places printed
forms of tender can be obtained.

Contractors are requested to bear in
mind that tenders will not be considered
unless made strictly in accordance with
the printed forms.

An accepted bank cheque for the sum
of \$2,000 must accompany each tender,
which sum shall be forfeited, if the party
tendering declines entering into con-
tract for the works at the rates and on
the terms stated in the offer submitted.
The cheque thus sent in will be returned
to the respective parties whose tenders
are not accepted.

This Department does not, however,
bind itself to accept the lowest or any
tender.

By order,

A. P. BRADLEY,

Secretary.

Dept. of Railways and Canals,
Ottawa, 21st April, 1883.

**FOR SALE,
PHOSPHATE PROPERTIES IN THE TOWN-
SHIP OF HULL.**

MINERAL RIGHTS.

Lot No. 15, in the 7th Range.			
" " 14, " 8th "

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,
On which are extensive surface shows and out-croppings of fine quality of Graphite. Price \$1,000. Further particulars to be had at this office.

**PHOSPHATE PROPERTIES
FOR SALE**

IN THE TOWNSHIP OF WAKEFIELD.
Mining Rights on S $\frac{1}{2}$ of Lot No. 16, in the 1st Range.
" " on Lot No. 23, in the 2nd Range.
" " " No. 26, in the 4th Range.
" " " No. 20, in the 5th Range.

The fee simple of Lots Nos. 22 and 23, in the 4th range, (400 acres). All these lots have been carefully explored by experts and very favourably reported on; they are virgin properties and in the heart of the Phosphate Belt. For further particulars and price apply at this office.

**PHOSPHATE PROPERTY
In the Township of Portland West,
FOR SALE.**

Lots 25, 26, 27 and 28, in the 3rd range. Some excellent surface shows have been uncovered on these lots and only require capital for developing. Price and particulars given at this office.

ASBESTOS PROPERTY FOR SALE.

The mining rights on S $\frac{1}{2}$ of Lot No. 11, in the 8th range of Templeton. The mineral is of the finest quality of fibre and in large quantity. Specimens may be seen and particulars and price ascertained at this office.

**PHOSPHATE PROPER
For Sale in North Burgess.**

Mining Rights of W $\frac{1}{2}$ of 13, the 5th range. About 100 ton very high grade Phosphate h been shipped from this prope Will be sold to an immediate chaser for \$750. Apply at office.

**FOR SALE,
White Marble Quarry on Calu
Island.**

At this quarry there is an i haustible supply of most beaut white marble. Price \$800. S ples to be seen and information tained at this office.

MINES AND MINERALS.

Developed and Undeveloped Mines and Minerals of Commercial Value BOUGHT AND SOLD.

PROPERTIES EXAMINED AND ANALYSES MADE OF ORE OF EVERY DESCRIPTION.

A Competent Expert is permanently engaged for the purpose of making Unprejudiced Reports on all Mines pla in our hands for Sale, such reports being at all times open to intending purchasers for examination.

Phosphate, Iron, Iron Pyrites, Copper, Asbestos, Mica, Plumbag
Gold and Silver Mines, and Marble and Sand-
stone Quarries, For Sale.

MINERAL LANDS EXAMINED AND REPORTED ON BY OUR EXPERT; ALSO, ANALYSES OF MINERA
OF EVERY DESCRIPTION MADE BY A COMPETENT ASSAYIST.

**Correspondence with Owners of Mines and Capitalists desirous
investing is most respectfully solicited.**

OTTAWA, JUNE, 1883.

VOL. 1.—No. 8.

Canadian Mining Review.

PUBLISHED MONTHLY.

ANNUAL SUBSCRIPTION - - - \$1.00

ADVERTISING RATES—15c. per line (12 lines to 1 inch).

OFFICE:

PRINTING CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW will continue to be published as a monthly journal in the interest of the mining industries of the Dominion. Information concerning Canadian mines and mineral lands is respectfully solicited by the publishers, who will be, to a great extent, dependent upon their correspondents for reports of progress in mining industries in Canada, especially outside the provinces of Ontario and Quebec. Should misstatements of facts or statistical inaccuracies appear in the columns of the REVIEW the publishers will be indebted to anyone who will at once direct their attention to same and assist them in making corrections. The paper has already a circulation of 4,000, extending over all the provinces of the Dominion, to the United States, Great Britain and Europe, and its main object is to induce the consolidation of local and foreign capital, with a view to bringing about the speedy development of Canadian mineral lands. In order that its aim may be accomplished, a liberal support from those who are interested will be necessary, and is looked for. The advertising columns of the paper are open to those who have properties for sale, to people wishing to invest in mineral lands and to merchants generally. Dealers in machinery and mining supplies will find the REVIEW a valuable advertising medium.

Address all correspondence to the publishers CANADIAN MINING REVIEW, Ottawa.

We beg to call attention to the advertisements, in another column, of mineral lands for sale. True reports of all properties mentioned therein will be forwarded on application by the publishers of the REVIEW.

DOMINION OF CANADA
MINING REGULATIONS.

From letters we have received since the appearance, in the May number of the REVIEW, of the "*Regulations to govern the disposal of mineral lands, other than coal lands*," in the Dominion, it would seem that a misapprehension exists in the minds of a large number of people that, as the said regulations were not on the table of the House for thirty days during the last Session of Parliament, they cannot have become law. Evidently it is not generally known that during last session the Senate so amended the Act that, by publishing any new regulations for four weeks in the *Canada Gazette*, such regulations thereupon become law, and in this case in point the present requirements of the Act have been complied with.

PHOSPHATE MINING.

Throughout the County of Ottawa phosphate mining continues to be prosecuted with the same push and activity that has characterized the industry in this locality during the past two years. In fact it may be said that each month sees additional force enrolled on the lists of miners employed at the various mines, with a correspondingly increased output as a result. New properties are being opened almost daily and in most cases the developments of the deposits more than warrant systematic organization for permanent mining operations. To direct special attention to each company or individual engaged in this great work would be invidious and would require more space and time than we can afford, so numerous are they, but mention

may be made of the more developed and most productive properties at present in active operation. In the Township of Wakefield the "Gemmell" and the "Haldane" are probably the most productive mines; in Templeton the "MacLaurin" the "American Phosphate Co's" and the "Jackson Rae" mines are sending a large quantity of excellent mineral to the point of shipment; in the Township of Buckingham the "Emerald" is being actively worked, and the result of each day's mining exposes new bodies of high grade phosphate of vast extent; in the Township of Portland East the principal operators are the Dominion of Canada Phosphate Company, Messrs. Bacon, Cameron, McLaren and the "French Company," and all of these have already forwarded a large quantity of phosphate to the front, and continue to carry on active operations; in Portland West, Messrs. R. C. Adams & Co. have opened a new property which promises most satisfactory results; the "High Rock" and the "Union Phosphate Company's" mines are the scenes of life and activity, and this year's output from these properties will be considerably in excess of that of any former year, probably double, and the same may be said of nearly all the mines referred to. This industry of phosphate mining is becoming a most important one in Ottawa County and is daily adding to the value of land of every description in the district; it causes a very large amount of money to be circulated throughout the county, enables farmers and their sons to earn liberal wages during the seasons of the year when their time could not be profitably employed at home, and as a natural consequence these men are earning the means to improve their farms by erecting more substantial and commodious dwellings and out-buildings, by employing the modern agricultural appliances for sowing and reaping and by expending a certain amount annually on a permanent system of drainage. All this should be taken seriously into account by the Pro-

vincial Government before it formulates any cast-iron regulations to govern the disposal of mineral lands. It cannot be too forcibly impressed with the importance of giving every encouragement to the men who have already devoted so much time and money in inaugurating the mining industry, in exploring and prospecting the country and in carrying on active mining operations on the properties they have acquired from the Government, and otherwise. These men may be termed the "pioneers" of the phosphate region in the Province of Quebec, and they are certainly the men first entitled to consideration and encouragement at the hands of the Government. To allow our mineral land to fall into the possession of speculators is a most pernicious principle and should be avoided. The parties already engaged in mining and who are prepared and even anxious to extend their operations, should be the first to receive favor from the Government and to whom moderate concession should be made when acquiring Government mineral lands. Speculators purchase properties for speculative purposes, not to work them, and will allow them to remain idle until others, by their enterprise and faithful industry, enhance their value, or until, by misrepresentation and fraud, they can induce confiding capitalists to purchase from them at fabulous prices. Many such transactions might be instanced, and each one has been attended by results that will be most injurious to the country and sooner or later must militate against the prosperity of our mining interests. Those gentlemen most deserving of mention, as being the active promoters of phosphate mining in the County of Ottawa, are Messrs. W. A. Allan, of this City; J. G. Miller, now engaged in mining in the West Indies; Gerald C. Brown, of Lachute; the late E. W. Murray, formerly of Buckingham; Wm. McIntosh, of "High Rock," fame, and Edward Watt, now of Perth. The latest reports that have reached us from the various mines go to corroborate

the figures given in the article on phosphate mining that appeared in the May number of the REVIEW, and there exists no doubt that quite 15,000 tons of first quality ore will be shipped by rail and water from Templeton and Buckingham this season.

Recent accounts of phosphate mining in the Perth district are of a most satisfactory nature and go far to prove that the deposits in that vicinity are holding out well. Some that have been but recently opened are developing even better than any of those that have heretofore been worked.

QUOTATIONS.

There has been a drop in the ruling English quotations for Canadian apatite since those given in the May number of the REVIEW, the latest being 1s. 2d. for 75 per cent. phosphate of lime, with one fifth of a penny rise per unit for shipments over-running 75 per cent. For 85 per cent. mineral this would be equivalent to about \$28.25 per ton of 2,240 lbs. f.o.b., Liverpool.

ANALYSES.

The analysis of shipments of mineral from the principal apatite mines in the County of Ottawa, run at 80, 81½, 83½, 85, and as high as 86 per cent. phosphate of lime. Professor Hoffman, (Geological survey, 1877-78) reports that the mineral from some of the mines assayed as high as 88 and 89 per cent—this of course was for picked specimens, not for whole shipments, as the above figures for this season's output represent.

FREIGHTS.

Freight to Liverpool and London, from Montreal and Quebec, for Canadian phosphate this season, is quoted at 10s. 6d. to 12s. per sailing vessels, and 15s. per s.s. 500 tons were shipped by s.s. on Saturday, 16th inst., to England, on account of Mr. A. Lomer, of Montreal. Tonnage has been offered at rates considerably below those quoted, but this has been special, and at short notice, in cases of emergency.

FATAL ACCIDENT

At a Phosphate Mine in Templeton

A sad accident occurred at Mr. McLaurin's Phosphate Mine in Templeton, on Friday, the 8th of June, by which one man was instantly killed, and three others seriously injured, one of whom has since died from the effects of the injuries he received. The accident, as far as we can learn, is attributed

to no direct carelessness on the part of any of the men in charge of the work. It was occasioned by the sliding in of a portion of one of the walls, and the occurrence, followed by so melancholy a result, could in no way have been foreseen. The employees about the mine number over forty, and the foreman, Mr. Archibald Woodburn, is spoken of as a practical and experienced miner, ever watchful for the slightest appearance of danger, and careful in giving strict instructions to the men under him to avoid anything like carelessness. Mr. McLaurin, the proprietor, has never neglected any precaution to protect his men against accident, and no one, probably, will feel the sad result of this unforeseen disaster more heavily than he. It is to be hoped that a long time will elapse before another such calamity will be recorded.

A NEW COMPANY.

A meeting was held in Montreal on Thursday, the 19th June, at the office of the Graphic Company for the purpose of forming a Company to engage in the Phosphate mining business in Canada. A large number of those interested in such affairs were present, and a Company was organized under the title of the "Dominion Phosphate Mining Company." The following gentlemen were then elected as the first Board of Directors:—Charles Kyte, Fanwood, New Jersey; A. Shepard, Fanwood, New Jersey; Henry Earle, Brooklyn, N. Y.; A. J. Huntson, Brooklyn, N. Y.; W. H. Nichols, Brooklyn, N. Y.; T. C. Keefer, Ottawa, and A. F. Riddell, Montreal. After the election of the Board the meeting adjourned until the Directors should meet for the election of officers. The property owned, and now being operated, by the Dominion Phosphate Mining Company is situated in Portland West, and was referred to in the May number of the REVIEW. The firm of Van Rensselaer, Falding & Co. are working the mine under contract, and the work is progressing in a most satisfactory manner. The contractors are provided with the most modern appliances for carrying on their work to advantage, and are employing competent and skilled labour. The property is one of great value, being unusually rich in mineral of high grade, and was purchased by the D. P. M. Co. from Mr. W. A. Allan, of Ottawa.

RECENT SALE OF PHOSPHATE LANDS BY AUCTION.

On Thursday, the 31st day of May, the Quebec Government held a sale, by auction, of certain phosphate lands in the County of Ottawa, at which were present many of the best known men engaged in active mining operations in the County and a number of mineral land specu-

lators. The sale was advertised to take place at the City Hall, in Hull, at 11 a.m., and shortly after that hour the auctioneer, Mr. F. J. Potter, of Montreal, offered the first lot.

Mr. St. O. Chapleau was the first to secure a lot, and after considerable competition the sale closed. The following list gives the location of the properties sold, average of each lot, the price paid, and the names of purchasers:—

Township of Portland East.

Lot No. 16, in 6th range, containing 161 acres, sold to Mr. St. O. Chapleau at \$5.75 per acre.

Township of Portland West.

Lot No. 18, in 5th range, containing 100 acres, sold to Mr. J. Erratt at \$5.00 per acre.

Lot No. 19, in 5th range, containing 100 acres, sold to Mr. C. H. Mackintosh at \$5.00 per acre.

Lot No. 5, in 8th range, containing 116 acres, sold to Mr. St. O. Chapleau at \$31.50 per acre.

Lot No. 6, in the 8th range, containing 113 acres, sold to Mr. St. O. Chapleau at \$31.00 per acre.

Lot No. 10, in 8th range, containing 89 acres, sold to Mr. Wm. McIntosh at \$5.00 per acre.

Lot No. 11, in 8th range, containing 101 acres, sold to Mr. St. O. Chapleau at \$5.00 per acre.

Lot No. 3, in 9th range, containing 122 acres, sold to Mr. Williams, of the Union Phosphate Co., at \$5.00 per acre.

Lot No. 4, in the 9th range, containing 110 acres, sold to Mr. Williams at \$5.00 per acre.

Lot No. 9, in 9th range, containing 110 acres, sold to Mr. Williams at \$9.00 per acre.

Lot No. 17, in 9th range, containing 109 acres, sold to Mr. C. H. Mackintosh at \$5.00 per acre.

Township of Bowman.

Lot No. 6, in 6th range, containing 100 acres, sold to Mr. Higginson, for Mr. Poupore, at \$8.00 per acre.

Lot No. 8, in 7th range, containing 100 acres, sold to Mr. — Rae at \$6.25 per acre.

The sale was concluded shortly before one o'clock, and the purchasers expressed themselves satisfied with their bargains. The conditions of sale were as follows:—

The purchase money to be paid in full at the time of adjudication, or half the amount may be paid, either in cash or by accepted check, otherwise the land will be immediately offered for re-sale. It is distinctly understood that the whole of the purchase money must be paid before 4 o'clock on the day of sale, otherwise the amount already paid will become forfeited.

The purchaser to pay for any real improvements existing on the lot or lots belonging to any other party.

These sales will also be subject to all the provisos contained in the laws and regulations concerning mines at present in force in this Province.

As an evidence of the rapid increase in the value of phosphate lands it may here be mentioned that in 1877 the Quebec Government were offering their phosphate lands at \$1.00 per acre, subsequently the price was increased to \$2.00; at the sale in Quebec, in November, 1881, the upset price was put at \$3.00, and at this last sale in Hull on 31st May all the lots advertised were offered at an upset price of \$5.00 per acre, being an increase of no less than 400 per cent. in six years.

ROADS! ROADS! ROADS!

Can it be possible that the Quebec Government is indifferent to the opening up of roads into the mining districts of the County of Ottawa? Surely not! And yet, since phosphate mining began in that county, the Government has not, to our knowledge, expended one dollar to facilitate access to the mineral region and the transportation of the product of the mines. It is well known that a considerable sum of money is annually voted for colonization purposes and that a large portion of it is devoted to the construction of roads, leading into the partially settled sections of the province, for the convenience of the pioneer farmer. Why then should the miner's rights be ignored? When it is taken into consideration that, through the enterprise and energy of prospectors and miners the Government has derived great benefits, it is but reasonable that they should demand substantial assistance in making roads that would enhance the value of the mineral lands they have acquired. Owing to their industry the value of the mineral lands still held by the Government has increased ten fold during the past five years, and the amount of money already paid into the Treasury by purchasers not to speak of the vast amount that is annually being circulated by them in the county, is sufficient to warrant liberal recognition at the hand of the Government in the manner referred to. It is to be hoped that attention will be at once directed to this much needed work and that no time will be lost in having the want supplied.

MINING NOTES.

WESTERN ONTARIO AND MANITOBA

The mining fever at Thunder Bay and all through that district is now at a high pitch. Mining parties are prospecting in every direction, and fresh developments are reported almost daily. The mineral wealth of the country is only beginning to be known.

A Winnipeg paper says the Rabbit Mountain silver mine on Lake Superior is said to be the richest of

the continent. Two miners are alleged to have taken out \$100,000 worth of ore within six weeks.

A valuable coal mine has been discovered at Medicine Hat, within stone's throw of the railway line.

Manitoba Gold Mines.

Reports have reached us, in a general way, of how mining is progressing at the Lake of the Woods. The work of developing the properties in operation goes ahead apace, and the results have been in the main most satisfactory. In the majority of cases, as the shafts descend, the veins show positive signs of increasing in width and the lartz improves in richness. The "Winnipeg," the "Keewatin," the "Argyle" and the "George Heenan" companies have been doing good work, and confidence has been established in the value of the properties under their control. Rushing mills, steam hoists and other modern machinery have been erected at the mines and more is being taken in, operations are being conducted with the unwavering activity which has characterized the movements of the Manitoba mining organizations ever since their inception, and the public may look for purishing accounts of the gold held in the Lake of the Woods district during the present summer.

It is stated that the Hon. Nelson Hood, Secretary-Treasurer of the Argyle Gold Mining Company, has received a telegram informing him that another large vein was discovered a day or two since, that the stamp mill is running full blast, that the mine is looking very well and as rich as ever. An assay has been made of the ore, which shows a yield of \$7.29 to the ton of 2,000 lbs.

MINES ON LAKE SUPERIOR.

The following article on mining near Lake Superior, appeared in the *N. Y. Mining Record* of June 9th, and goes far to corroborate the reports of the vast richness of the mines referred to, which have appeared in some of our Canadian newspapers.

"The Huronian Mining Co.—It appears from reliable reports and formation, that the richness of the Black Fish mine, now being worked by the Huronian Company, was fully practically realized last summer. Although assays of picked specimens have heretofore shown an enormous yield of the precious metals, the real value of the mine was only ascertained last year, when Messrs. Keefer & McKellar took it over a ton of the average ore, packed it on Indians' heads for several miles, and conveyed it by birch-bark canoes through the small streams and lakes of the region to the railway, and from thence had it conveyed to New York for practical treatment. Since test referred to

was made in September last, the Thunder Bay branch of the C. P. Railway has been opened, and the district is now supplied with railway accommodation. Vein occupied is a true fissure from six to eight feet wide, traversing the highly prized talcose slate formation of Huronian age. It carries both gold and silver in paying quantities, and the ore is free milling. In it is also found the extremely valuable sylvanite ore—the true telluride of gold and silver. An assay of the high grade ore yielded to Messrs. Ledou & Ricketts, \$5,971.60 of gold and silver to the ton, chiefly the former, while the yield of a ton of average ore, taken without selection, crushed, sampled and assayed, went \$19.28 to the ton. This is a showing which at once brings the district into the line with the other rich gold and silver producing camps on this continent. The machinery is now being set up and prospectors are already invading the country, as it is well known that the district abounds in metalliferous veins, which, like the Huronian Company's property, have remained so long untested, owing no doubt to want of railway communication, an inconvenience which no longer exists. Messrs. Keefer & McKellar have also formed another company to operate in the district, known as the Laurentian Mining Company, and as they are not seeking subscribers or sale of stock, it is evident they have faith in their undertakings, which argues well for the district.

Prince Arthur's Landing (Port Arthur) is terminus of Canadian Pacific R. R. on Lake Superior. Gen. Wild is one of the fortunate mining men operating on Lake Superior. He is one of the proprietors of the mine known as the Rabbit Mountain silver mine, a recent discovery within twenty-five miles of Prince Arthur's Landing, on Thunder Bay. Practical work has also been commenced on his property. Houses are up, roads made and mining commenced, a considerable quantity of ore being on the dump. A stamp mill and suitable machinery will be erected as soon as navigation opens to that district. Very rich specimens (one weighing a pound of solid black silver) have been taken from this mine, which is in the black silurian slate formation. The lode, a large one, carries silver in paying quantities. It is claimed that it averages several hundred dollars to the ton, but as no test has yet been made in a large way, that we are aware of, it is sufficient to know in the meantime that silver exists in it, at any rate in large paying quantities. The district was once made famous by the wonderful productions of Silver Islet. The recent rich finds in new localities again bring it into notice, and they promise the establishment of permanent mining camps.

The owners of the mine are General Wild, Captain Dan McPhee and Oliver Dounis, the discoverer.

During the winter the men have been occupied in opening up a road to the mine to Point De Meuron, and actual mining was not commenced until lately. Mr. Louis arrived in town yesterday, and a *Herald* reporter had an interview with him last evening to ascertain what had been done in the way of mining. He informed the reporter that himself and Captain McPhee commenced mining on the 14th of February last. They have sunk a shaft and commenced cross-cutting on the vein. Up to the present they have gone a width of forty-five feet, but as yet have not reached the width of the vein, which is a true fissure. Every particle of rock that has been taken out is fit for the stamp mill. The ore taken out is quartz and spar. The appearance of the silver is black—black sulphate and native—the purest silver there is. The vein ore carries none of the baser metals; nothing but the pure silver. The vein can be traced for a considerable distance on this property, and in any part of it can be found silver in paying quantities. No more than two miners have been at work as yet, and in six weeks' work they have taken out one hundred thousand dollars' worth of silver. This statement seems almost incredible, but it is nevertheless true. In crossing the vein they discovered a vug, in which have been found nuggets of silver weighing from one half a pound to seven pounds—black sulphates. In this vug they did not put in a blast, but could pick out the nuggets of silver with their hands and shovels without actual mining. Out of this vug they have taken thirty-five thousand dollars' worth of native silver. The full width of the vein is not known, but they have already crossed it for forty-five feet. The location is situated about a mile and a half beyond Rabbit Mountain, which is just outside of Paipoonge, about twenty-four miles from Port Arthur. The mine is in a valley at the foot of the mountain. Mr. Dounis informs us that a team has been sent up to the mine to-day for the purpose of bringing back a load of silver. Several loads will be brought to this place and shipped to the smelting works. The mine is reached by the road to Point de Meuron, thence by a new road cut to the mine, a distance of seven miles. General Wild and Captain McPhee will be here in a few days. The General will take the silver east, and while there will purchase all the necessary machinery for the full working of the mine, and a stamp mill, which will be forwarded here at once and sent to the location. This mine is paying for itself. The owners have worked with their own hands and taken out the silver, with the receipts from which they will purchase the machinery for the further working of the mine. A mine where nuggets of silver weighing seven pounds and under, can be picked up, and some of the products of

which will go at least \$12,000 to the ton, must be pronounced to be among the foremost mines of this continent. There is a likelihood of the vein improving as they go down, as it is in the proper kind of rock."

CANADA NORTH-WEST LAND CO.

We learn by cable from London that the report of the transactions of the Canada North-West Land Co. for the past nine months, which has just been issued, shows a net profit of £64,000. At the end of this month the annual meeting will be held, when a recommendation will be made to divide the earnings as follows: The payment of a dividend of two shillings per share, which is equivalent to five and a half per cent. per annum on the amount paid up; £14,000 to be placed to the reserve account, and the balance of £23,000 to be carried forward. When it is considered how few land companies are in a position after their first year's operations to pay a dividend, the stockholders of the Canada North-West may be congratulated on the success of their venture, for not only has this result been accomplished, but the foundation of a reserve fund has been laid; and not only so, but a sum sufficient for a reasonable dividend on the ensuing year's transactions has been carried forward. The company's prospects are bright, especially in view of the expected immigration to the North-West during the ensuing season.—*Toronto Mail*, June 16.

The Development of the Saskatchewan Coal Co's Mines.

The Saskatchewan Coal Mining and Transportation Company are meeting with success in the development of their mines west of Medicine Hat. A trial of the coal has recently been made with a stationary engine, and gave unqualified success. A more thorough trial on a much larger scale is to be made this week with a C.P.R. engine, and several of the directors will witness the test. The company expect to be able to sell coal in Winnipeg for eight dollars per ton.

ASBESTOS.

Since our May article on this mineral we have received no further reports on the progress in mining in the Eastern Townships, beyond advice that the mines are holding out well and that the daily output continues to be about the same. The mines are returning good profits to the owners, and the mineral is of an excellent quality. Several letters have recently been received at this office, from people seeking information about the Asbestos deposits in the Ottawa Valley, but unfortunately the properties, in which the mineral occurs in this part of Canada, have not been sufficiently developed

to admit of our making an intelligent report of their probable value. The quality is of high grade but, until more work has been done in the way of opening up the deposits, the quantity of mineral will remain a matter for speculation. As capitalists usually like to know what they are purchasing, and as it is satisfactory for owners to have some idea of the value of the property they are offering for sale, we would strongly recommend them to expend a small sum of money in preparing their Asbestos deposits for inspection.

We will at all times be pleased to receive information concerning the discovery of Asbestos in any part of Canada and to render every facility in our power to open up negotiations between owners and those seeking investment in properties, with a view to the speedy development of mines. A recent report on the deposit, referred to in our last number, occurring on S $\frac{1}{2}$ of Lot 11, in the 8th Range of Templeton, speaks of the property as one of considerable value.

It is reported from Montreal that Mr. L. A. Senecal has purchased an Asbestos property in the Eastern Townships, from Mr. Charles Lionais, for \$45,000. This is a large sum, and, if the report be true, the property referred to should be one of considerable extent and unusually rich in mineral.

MICA.

For many years it has been a grave question in the minds of prospectors and others as to whether any of the Mica deposits, in the formation contiguous to the Ottawa Valley, would prove to be of merchantable value. Recent discoveries have settled this question in a most satisfactory manner; specimens sent to us from several localities show that, not many miles from this city, there exists extensive deposits of Mica, of a very excellent quality, as regards clearness and the size of the sheets to be obtained, and experiments prove it to be capable of withstanding the greatest degree of heat without showing signs of crepitation. That Mica mining will, at an early date, be numbered among the many important industries of this section of the Dominion of Canada is now beyond a doubt, and we strongly advise farmers and others throughout the country, who have already observed, or may hereafter discover this mineral on their property, to bring, or send by mail, to the office of the MINING REVIEW, fair average specimens, with a description of the rock with which it is associated, the name of Township and the number of Lot and Range in which the deposit occurs, mentioning also the probable size of the sheets that can be taken out, in order that we may make a clear and unprejudiced report

on same. We have had many enquiries lately from our correspondents about this mineral and desire to put ourselves in a position to give the public reliable information on the subject.

IRON.

Valuable discoveries of Iron Ore are being brought to our notice almost daily. Specimens sent to us quite recently from the Township of Bagot prove to be of unusual purity; it is a magnetic ore of high grade and free from titanium, with an almost imperceptible trace of phosphorus, not sufficient to depreciate the value of the ore in the smallest degree. Specimens of Red Hematite have also been sent to us from the same district, and in the next number of the REVIEW will be found complete analyses of the samples in our possession.

It is to be hoped that the manufacturing of pig-iron at our Canadian mines may be looked for in the near future. A movement is on foot to induce the Dominion Government to increase the bounty they have offered to pay on home manufactured "pig." A deputation of influential men have already waited on Sir Leonard Tilley and have framed their arguments, in favour of the proposed increase, in most forcible terms. The matter will receive the favourable consideration of the Government, but no definite action can be taken until the next Session of Parliament.

A New York writer, in calling attention to the vast number of Iron deposits in Canada, says there is every probability of a heavy rivalry between Canada and the United States in the manufacture of this metal, not only on account of the remarkably excellent quality of the Canadian metal, but on account of the low prices of labour and material employed in its production; and the writer exemplifies its quality from a test made by the Superintendent of the West Point foundry, who reports a square inch of Canadian iron resisting 20,000 lbs. more pressure than that from the most popular works in the United States. The same iron, he says, has been manufactured into beautiful specimens of steel.

IRON PYRITES.

A great quantity and variety of Iron Pyrites is distributed throughout the Ottawa district, in fact it is more or less associated with every other mineral yet discovered, but not in sufficiently paying quantity to warrant its being mined for merchantable purposes. The only well defined vein of any size, that we know of, occurs within

half a mile of the Ottawa River. The vein, as it appeared on the surface, measured about two inches in width and can be traced for some four or five acres in length. An opening has been made and a shaft sunk forty feet on the vein, at which depth it has increased to six feet in width, and shows signs of widening at the same ratio as it descends. There has been about 300 tons of Pyrites taken from this shaft, the analysis of which shows about 1,000 lbs. of sulphur per ton. In the very heart of the hard granite rock in which the mineral occurs is frequently to be found a conglomeration of a bluish clayey substance, of a soft soapy consistency, and which hardens when exposed to the weather; it appears to be impregnated with sulphur, and that it should be met with in the heart of this hard solid rock caused some surprise to the inexperienced miners engaged in the work. This property has been placed for sale with the publishers of the REVIEW.

COPPER MINING IN NEWFOUNDLAND.

Copper mining has become, during the past few years, a source of wealth in the Island of Newfoundland, and the day having gone by when speculators and others were exercised by the copper fever, the industry has reached a solid basis and mining operations are now carried on with systematic activity. The three most active mines are the "Tilt Cove," "Bett's Cove" and "Little Bay." The "Tilt Cove" was the first mine opened and up to the close of 1879 its owners had exported ore to the value of over one and a half million of dollars, the ore averaging about \$30 per ton. From 1875 to 1879 nearly three million dollars worth of ore was exported from "Bett's Cove" mine, averaging about \$24 per ton, and the total value of the ore shipped from the Island previous to the close of 1879 exceeded four and a half millions of dollars. The "Little Bay" mine is said to be improving as greater depth is reached, the ore increasing in quantity and yielding a greater proportion of metallic copper as mining operations proceed. It was opened in 1878, and up to the close of 1881 sixty-six thousand five hundred tons of ore had been exported at an approximate value of \$1,750,000.

The export of copper ore from Newfoundland during the past three years, viz: 1880, '81 and '82 has reached an average value of nearly half a million annually, and, though the statistical returns of work done during last year have not yet reached us, we are prepared to hear of a considerable increase in this year's exportation.

NOTES ON COPPER MINES.

THE COPPER MINES OF CORNWALL (England), which have been worked for centuries, continue to be worked at a handsome profit; the average yield of the ore is 6 $\frac{7}{10}$ per cent., the veins are from 3 inches to 4 feet wide.

THE DEVON GREAT CONSOLIDATED COPPER MINING COMPANY, commenced operations in 1844, with £1 per share then paid in, steadily continued work. In 1881 the large amount of £358 had been paid in dividends on each share. In 1856 the £1 shares sold for £4; in 1881 the mine was paying monthly dividends and the shares were quoted at £410. The yield is 8 $\frac{3}{4}$ per cent.; the veins are 4 inches to 6 feet wide.

THE WHEEL BULLER COPPER MINE.—The par value of the share when the company was first organized, was £5; the stock has steadily increased in value, and in 1881 worth £1,025 per share.

THE CAPELTON COPPER MINE, near Sherbrook, in the Province of Quebec, was said to pay a profit of \$45,000 annually on the capital invested, though the average yield of the ore is but 4 per cent.

The copper mines of Sweden; worked at a profit, notwithstanding the ore yields but 1 or 1 $\frac{1}{2}$ per cent. and a little silver.

THE NEWFOUNDLAND COPPER MINES, which are considered very valuable, yield (according to the return of sales at Swansea) 6 $\frac{1}{4}$ per cent.

THE CALUMET AND HECLA COPPER MINE, on the south side of Lake Superior, yielding 4 $\frac{1}{2}$ per cent. metal, has been worked for nearly a quarter of a century; the par value of shares is \$25; to-day they are worth \$238 and the amount paid in dividends has reached \$22,850,000. The estimated value of the metal copper raised in 1879, was over \$6,000,000. The current value of the mine is \$24,000,000.

THE AUSTIN MINE, on the shore of Echo Lake, County of Algoma, Province of Ontario, according to corroborated report, has a vein of yellow sulphuret of copper ore, extending the entire length of the company's property, varying from 25 inches to 35 feet in width. The vein is enormously rich, yielding from 10 to 20 per cent. of metallic copper, as per the following assay one made by an analytical chemist in Boston gave 15 $\frac{3}{4}$ per cent.; second made by Christian Hoffman Esq., chemist to the Geological Survey of Canada, yielded 18 per cent., and the average of the different assays made by Professor George Baptie, Esq., M.A., B.A., the Normal School at Ottawa, produced 22 $\frac{1}{2}$ per cent. of metal. The average ore, at the depth of 40 feet in the shaft, yields 10 to 12 per cent. of metal, and yet this valuable property is allowed to remain idle. Can this be explained?

GOLD MINES OF NOVA SCOTIA.

Having had occasion to ask for information concerning the gold mines owned by the Hon. Justice Henry, at Wine Harbour, N.S., the following general description of the property has been forwarded to us:—

It consists of 190 mining areas, about 100 acres, and is situated on the Atlantic Coast, about 100 miles east of Halifax, and ten miles from Goldenville, in a district where Gold mining has been carried on successfully for years. There are numerous quartz leads crossing the property on an east to west course, measuring from one and a half to eighteen inches in width, and most of them showing gold. A belt of slate, about twenty feet in width, also appears, and it is reported to be workable from the surface at a good margin of profit. The main shafts have been sunk on some of the leads and the quartz taken therefrom has yielded from one and a half to nine ounces of gold to the ton. The engine employed for the steam hoists and pumps is said to be capable of also working a fifteen stamp crusher, but up to the present time an eight stamp crusher, run by water power, has been used—available water power being convenient to the property. The quartz is carried to the crusher, a distance of about one mile from the shafts, at a nominal cost. Best quality of steam coal is worth, at the mine, about four dollars a chaldron. In 1881, and part of 1883, six hundred and ninety-seven tons of quartz were mined at Wine Harbour, yielding 887 ounces of gold—the average yield per man being \$2.35 daily. If more capital were employed on this property, under proper management, there exists little doubt that the work could be carried on to better advantage. Statistical reports go to show that gold mining in Nova Scotia has yielded a higher rate of remuneration, for the labour employed, than in Australia or California.

A GOLD BRICK.

A communication from Halifax reached us on the 15th inst. announcing the arrival in that city of a gold brick valued at \$3,000, being the product of about forty ton of quartz, from the Gallagher mines at Isaac's Harbour. This shows a yield of \$75 of the precious metal per ton, and if the 40 ton referred to is of the average richness of the lode, the Gallagher mine is certainly a valuable property.

The Gallagher mine is situated in Stormont, County of Guysboro', and is spoken of in the Report of the Department of Mines for Nova Scotia for 1882, as follows:—

"The Gallagher Gold Mining Company is now in regular working order. A shaft has been sunk, cut-

ting the Mulgrave lode at 360 feet. At 260 feet a cross-cut has been made to the Gallagher lode; levels have been driven, and stoping carried on systematically. Trial shafts on a lode, lying south of the Mulgrave lode, 6 to 10 inches thick, with 5 feet of slate having suckers of quartz, have given very satisfactory results.

The new mill is driven by a 12 inch cylinder, and has 10 stamps of 750 lbs. each, and is on an excellent design. Two Burleigh drills are used at this mine, and were found to give satisfactory results in sinking and driving."

The total yield of gold in the Province of Nova Scotia during 1882 amounted to 14,107 oz., 3 dwts, 20 grns., against 10,756 oz., 13 dwts., 2 grns. during 1881. This is the largest yield since the year 1871, excepting during 1877, when the production rose to 16,882 ounces.

SANDSTONE.

It has been reported that the stone for the new post-office at Brockville is being taken from Mr. Moffat's quarry near Pembroke. A gang of men has been for some time employed in stripping and putting the quarry in shape to accommodate a large force of workmen. There will be about 10,000 cubic feet of stone required for this building, and the first shipment of stone will be made when the foreman has demonstrated that the full quantity of available stone required can be procured from this quarry. The colour of the stone is a red-brown, and the quality is faultless; if possible it is superior to the famous "Ohio stone," which has been so much used in Canada.

It has also been stated that the new Government buildings in this city will probably be constructed of this stone, but this is not to be thought of, for, though the quality and colour is all that could be desired, the quantity need not be looked for in Mr. Moffat's quarry.

RAILWAY NOTES.

Rapid as the strides made by the Phosphate industries of Ottawa County have been, practical experience justifies us in predicting a remarkable impetus during the next few years, for what has been a necessary adjunct to the development of mineral interests, is about to be supplied by the construction of the Ottawa Colonization Railway. The line, as located, starts from a point near Rockland, on the east side of the Aux Lièvres River, and, running northerly and westerly through the heart of the phosphate region, will connect with the Ottawa and Gatineau Valley Railway at Aylwin, on the west side of the Gatineau River. The charter for the first mentioned line was secured by Mr. C. H. Mac-

kintosh, M.P., in May 1882, and at the time of organization that gentleman was elected President. The two schemes, viz: The Ottawa Colonization Railway and the Ottawa and Gatineau Valley Railway were practically united, with Mr. W. A. Allan as vice-President of the former company, and to these two gentlemen much credit is due for their untiring zeal in carrying on the preliminary work and in overcoming the many obstacles that have been thrown in their way. The utmost activity has been displayed by the promoters, who have succeeded in enlarging the company, and there is every reason to believe that construction will begin, simultaneously on both roads, about the middle of July, and will be proceeded with rapidly until completed. Messrs. Harrison Bros., J. Stoddart, Josiah Sypher, W. H. Pitts, C. Gilbert and other well known Americans, now largely interested in phosphate mining, have been elected directors or become shareholders, and by the time our next number appears we will doubtless be in a position to publish full details, together with the names of directors and other interesting information. We are informed that Mr. J. Murray Mitchell, who was for some time on the Board, has now no connection with the enterprise.

OBITUARY.

It is our painful duty to record the death of Mr. E. W. Murray, who passed away, at his home in Buckingham Village, on the 30th of May, after a short illness. Mr. Murray was among the earliest phosphate miners in the County of Ottawa, and, at the time of his death, was owner of one of the most valuable mines on the Aux Lièvres River, in the Township of Buckingham; he was widely known in Montreal and in Ottawa, as well as at home, as a gentleman possessing many sterling qualities, and his genial disposition, generous nature and unassuming manner had gained for him a host of admiring friends, whom he has left behind to deplore his untimely departure from among them, and who all unite in an expression of deepest sympathy with his bereaved family. The interment took place on Friday, the 1st of June, and never before in the history of Buckingham Village was such a funeral procession witnessed. People flocked from far and near to pay a last tribute to the deceased, and the number that followed his remains to their last resting place bore evidence of the wide-spread popularity of the late E. W. Murray.

Charles Burleigh, inventor of the Burleigh Rock Drill, died in Fitchburg, Massachusetts, on Monday, the 28th of May, aged 58. The name of this distinguished man has been familiar to Civil Engineers,

Miners and Contractors in Canada for very many years. The "Burleigh" was the drill used by Messrs. Walter and Frank Shanly on the Hoosac Tunnel, and the good work it accomplished aided them in no small degree in bringing the gigantic undertaking to a successful completion.

OBSTRUCTIONS.

The municipal authorities of some of the corporations of the County of Ottawa cannot be too severely criticised, or even censured, for their shortsightedness and obstinate disregard to the rights of the taxpayers, the convenience of business men and the comfort of the travelling public. In some sections of the country the public roads are a disgrace to any community, and in no section, however remote from civilization, or inaccessible, is any road to be found in a worse condition than that leading from Buckingham Station, on the Canadian Pacific Railway, to the village, a distance of not quite three miles. That this state of things should continue to exist is not to be tolerated by those who are entitled to better treatment, and, for many reasons, it is quite inexcusable. The traffic on this road is increasing year by year; the annual freight carried between the village and the railway station amounts to thousands upon thousands of tons, and, taking into account the fact that the owners of this freight are the mainstay and support of the village and township, it is but reasonable to say that they are entitled to some consideration at the hands of the municipal authorities. The owners and operators of phosphate mines on the Aux Lièvres River will have sent upwards of 13,000 tons of ore this year over the road referred to, and will have circulated not less than \$100,000 in the Aux Lièvres section of the county of which the Township and Village of Buckingham will derive nine-tenths of the benefit. Up to the present time these gentlemen, who are enriching the inhabitants by their enterprise, have been obliged, at their own expense, to keep the public road, from the village to the railway station, in repair for winter traffic—surely the Township Council might do something towards making some permanent improvement to the road for traffic during the summer months. Many of the firms engaged in phosphate mining in the district have expressed their willingness to defray a portion of the expense of carrying out this much needed improvement, and they should certainly be met more than half-way. Mr. J. Kelly is the Mayor of the Township and he will certainly be very lax in the discharge of his duty if he does not bring the matter before the Council and strenuously urge them to authorize the expenditure of a liberal sum of money in macadamizing and thoroughly repairing this piece of road.

LIABLE TO MISLEAD.

Exaggerated reports of the prices paid for mineral lands in the Ottawa district have of late found their way into the columns of the newspapers, and that this is likely to have a prejudicial effect cannot be questioned. It was reported in a local paper, not long since, that a phosphate lot in the Township of Templeton had changed hands, the former owner having received \$60,000 cash for the property—the result of enquiry goes to show that this is quite incorrect. A Toronto newspaper of a recent date refers to the sale of a "mica" mine in the Ottawa Valley for \$75,000. That very good mica has been discovered in this locality cannot be denied, but there exists in the minds of those who ought to know very grave doubts that any such sale as the one referred to has been effected. Such statements as the above have a tendency to do more harm than good, if unreliable, by creating a fictitious value for mineral lands and rendering owners indisposed to sell property at a reasonable price to people willing to purchase and develop mines.

B. B. B.

(BLASTED BIG BLAST.)

A worthy contemporary calls attention to a blast of unprecedented magnitude, thus: "At a recent blast at one of the McLaren Phosphate mines, in Portland Township, one piece was taken out weighing six thousand tons, probably the largest yet taken out in one lump."

Probably so, 6,000 tons of phosphate represents a body of vast dimensions—it has been suggested, that, to accomplish this wonderful phenomenal eruption a combination of circumstances must have favoured Mr. McLaren, such as, an enormous deposit of mineral, unusually powerful explosive employed and a slight defect, in favour of the shipper, in the scale used in weighing the lump.

Answers to Correspondents.

NEW YORK, 6th June, 1883.

Publishers CANADIAN MINING REVIEW, Ottawa.

Dear Sirs,—Will you kindly inform me what is the most direct route to take from New York to the phosphate region of the County of Ottawa? I hope to visit the mines about the end of the present month, and would like to be posted, in a measure, before starting.

C. M. S.

Proceed to Montreal, thence, via Canadian Pacific Railway, to Buckingham. Three steamers leave the latter place at 9 a.m. daily, and run about 20 miles up the Aux Lievres River, stopping at any point and returning same day. This takes in

the Townships of Buckingham, East and West Portland.

For Templeton and Wakefield, Ottawa City is unquestionably the best starting point; and further information, if required, can be obtained at our office.—[Ed.]

PHILADELPHIA, 12th June, 1883.

Publishers CANADIAN MINING REVIEW, Ottawa.

Gentlemen,—I observe, in an article on Canadian Phosphate Mining which appeared in the May edition of the REVIEW, it is stated that "there is likely to be no less than 15,000 tons of high grade ore shipped during the summer of 1883 from the Ottawa district alone." Have you received these figures from reliable source, and do you consider them to be not excessive? G.M.

The figures quoted are to be relied upon. Since the publication of the May edition of the REVIEW they have been verified by personal inspection. See article on Phosphate Mining in this number.—[Ed.]

PERSONALS.

Mr. Thomas Macfarlane, of Montreal, was in Ottawa not long since, and, in discussing the mineral wealth of Canada and the prospects of its development, expressed it as his opinion that mining in the Dominion of Canada promises to develop into enormous proportions. Mr. Macfarlane was at one time Superintendent of the Acton Copper Mines in the Eastern Townships, afterwards he became connected with the smelting works of the Silver Islet Company in Detroit, and subsequently was engaged in the Madoc gold region.

Mr. W. R. T. Pitts, of Philadelphia, Manager in Canada for the American Land and Phosphate Mining Company, was recently in Ottawa and decided to make this city his headquarters. He has secured a residence on Sandy Hill and will occupy it with his family during the present month.

Mr. W. deL. Benedict, M.E., of the firm of Benedict & Cole, New York, has been spending some time in Ottawa and vicinity. He is much interested in the future developments of our mineral resources and considers the prospects bright. Mr. Benedict is a gentleman of some experience in mining, practical and professional, and his opinions and suggestions will doubtless be valuable to those who have been fortunate enough to meet him.

The following gentlemen, prominently associated with the mining industry in the County of Ottawa, have been in the city during the past month. Mr. W. H. Williams, of New York, President Union Phosphate Company; Mr. Wm. McIntosh and Capt. Williams, employed by the U. P. Co., as Superintendents; Mr. Charles Kyte, of Fanwood, N.J., Trustee of the Dominion Phosphate Company; Mr. F. J. Falding and Mr. James C. Weston, of the firm of Van Rensselaer, Falding & Co., of New York, Contractors for operating the mines of the D. P. Co.; Mr. Robert C. Adams, of Montreal; Mr. W. R. T. Pitts, of Philadelphia, Manager for the American Land and Phosphate Company; Mr. Haldane, of Aylmer, and others.

N.B.—Gentlemen interested in mining enterprises, who have occasion to visit Ottawa, are cordially invited to call at the office of the REVIEW.

PARTING WITH THE FAMILY PET.

Some Pathetic Facts Concerning an Amiable and Domesticated Mountain Lion.

The other morning, while the proprietor of the approaching circus and managerie was picking his teeth on the steps of the Russ House, a tall, sunburned, bald-headed man, with pine burs in his clothes and a stick of sassafras in his mouth, approached and said:—

"Be you the wild-animal man, mister?"

The proprietor of the circus admitted that such was the fact.

"Then," proceeded the man from the mountains, "I think I'll get you to make me an offer for a large-sized California lion I've got."

"Good specimen, eh?" asked the circus man.

"Good? Well, I should say so. Measures eleven feet from the tip of his nose to the tip of his tail. Caught him myself when a cub. Just four years old to-morrow."

"Hum—good appetite?"

"Appetite? Great Scott—appetite? Well, I should smile—that's just the point—I call him Jay Gould because he takes everything in. If it wasn't for his appetite and the queer little things it makes him do, I wouldn't part with Gould for a fortune."

"Savage, eh?"

"Well, no: I don't know as I should call Jay savage, exactly—sorter nibblish, though, he may be. He has a kinder habit of gnawing up things, so to speak. In fact, the neighbours—I live up in Bladder's Peak—have gotten to be so fussy and particular of late that I can't so much as unchain J. G. for a little fresh air, without their getting grumpy about it!"

"There's no pleasing some people," said the hippodromer.

"I should say so. Now, for instance, 'bout three months after Jay got to be as big as a boarding-house sofa, I came home one day from a picnic and found he had eaten up Aunt Maria, who had been left at home to mind the house—

leastwise she was nowhere to found; and as Jay Gould seemed sorter bulgy-like and kept enough up hair-pins and false-teeth for day or two, we kinder suspicioned the whole thing."

"Maternal aunt?" inquired the showman, thoughtfully.

"Exactly. My wife took dreadfully at first, and wanted to shoot Jay right off. But I told her that he had probably suffered good deal as it was, and that, most likely he'd catch rheumatism and things from the remains, we better call it square."

"And did she?"

"Well she kinder got reconciled after a while, especially as Jay seemed fond of playing with the children. One morning soon after that, my wife's mother—who family lived with me, you see—didn't come down to breakfast. All her false hair was hanging over a chair-back, and Gould crawled out from under the bed, licking his chops, and with his tongue a good deal coated—mother-in-law was always taking things for the live complaint—we saw at once it was another visitation of Providence and that the heavy hand of affliction was again upon us."

"Looked that way, didn't it?"

"Well, as you may suppose, the old lady—that's my wife—pranced around a good deal then, and got down the breach-loader right away. But just then arrived a gold medal from the S. P. C. A. Society, awarded on account of my forbearance in the Aunt Maria business, and so I got her calmed down after a while."

"Pacified her, eh?"

"Yes; I managed to arrange a reprieve for Jay somehow. You see, I was always fond of pets, and tender hearted, and all that, you understand. I argued that the poor animal didn't know that he was doing wrong—merciful man is merciful to his beast, etc. That smoothed things over for another month."

"What happened then?"

"Well, one day I sent Johnny our youngest boy, down to the store for some sugar, and he took Gould along for company. Now, whether it was because Jay was fond of sugar or not, I don't know, but he came home alone, and soon we noticed a peculiar kind of bulge on his ribs, about as big as Johnny, and we concluded that the dread archer had marked another Skidmore—my name is Skidmore—for his own. The whole family took on like mad, and Mrs. Skid. was about to shove the powder-keg under Jay Gould and touch it off herself, when I pointed out that it wouldn't do to desecrate our offspring's tomb in that way. So I just had the burial service read over the lid and tied crape around his neck for thirty days. How does that strike you?"

"After that you kept the animal chained?"

"Well, no. The fact is I set out to get a chain several times, but one

ing and another prevented, until the day last week I actually missed the old lady herself. I looked around for a couple of days, when somehow of a sudden I sorter intened where she was. I gave up about half a pound of emetic right away, but all we could get out of him was a pair of high-heeled shoes and a chest-protector. It was too late—too late. We put the bones and things in a coffin and had it led behind the hearse to the cemetery. Wanted to have as much of the corpse present as possible—don't you see? We had the animal all decorated with flowers and things, as fine as you please. Folks said it was the touchingest thing that ever took place in them parts," and the bereaved husband shed heavily.

"Don't wonder you want to sell the beast," remarksd the menagery man, after a pause.

"Well, I sorter do and sorter don't" said Mr. Skidmore, abstractly. "There's so many memories and things clustering around J. G. seems kinder like parting with the family burying-lot, as it were. On the other hand, though, now that the old lady is gone, I sorter feel as if the old insect had—well, he outlived his usefulness, so to speak. So suppose I just have his box hauled around to your show after the performance this afternoon, and see if we can't strike a bargain." "All right," said the manager. "I'm going up Salt Lake way after while, and perhaps I can work him off for big money to some of the Mormon elders."

"There's a mut of money in him as a family pet," said the other earnestly, and after striking the circus proprietor for a season dead-end the widower shouldered his umbrella and drifted sadly down street.

PHOSPHATE PROPERTY

For Sale in North Burgess.

Mining Rights of W $\frac{1}{2}$ of 13, in the 5th range. About 100 tons of very high grade Phosphate have been shipped from this property. Will be sold to an immediate purchaser for \$750. Apply at the office of the MINING REVIEW.

PHOSPHATE PROPERTIES FOR SALE

IN THE TOWNSHIP OF WAKEFIELD.

Mining Rights on S $\frac{1}{2}$ of Lot No. 16, in the 1st Range.
" " on Lot No. 23, in the 2nd Range.
" " " No. 26, in the 4th Range.
" " " No. 20, in the 5th Range.

The fee simple of Lots Nos. 22 and 23, in the 4th range, (400 acres). All these lots have been carefully explored by experts and every favourably reported on; they are virgin properties and in the heart of the Phosphate Belt. For further particulars and price apply at the office of the MINING REVIEW.

THE MINING RIGHTS ON
1,000 ACRES
OF

PHOSPHATE LANDS

SITUATED IN THE

Township of Hull, Province of Quebec

All of which have been carefully selected and have excellent shows of

PHOSPHATE.

The price asked for these lands is

\$5 PER ACRE

And at this rate parties can purchase lots from 100 to 1,000 acres. Specimens on view, and all information given at

F. FOOKS'

Mineral Agency,

307 and 309 Wellington St
OTTAWA.

ALSO THE

Phosphate Lot No. 30

In the 8th range of the Township of Wakefield, containing

100 ACRES.

Price \$1,000. (This is the property of Mr. Farley of Hull.)

Apply to

F. FOOKS.

(Address as above.)

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and outcroppings of fine quality of Graphite. Price \$1,000. Further particulars to be had at the office of the MINING REVIEW.

STEAM DRILLERS, MINING CAPTAINS AND MINERS.

Frequent enquiries are made at this office for men who understand running Steam Drills, for Mining Captains and Practical Miners. Such men who are out of employment may find it to their advantage to forward name and address, mentioning the class of work they are qualified for, etc., to the CANADIAN MINING REVIEW, Union Chambers, 14 Metcalfe Street, Ottawa.

LACHINE CANAL.

NOTICE TO CONTRACTORS.

Sealed tenders, addressed to the undersigned, and endorsed "Tender for the Formation of Basins near St. Gabriel Locks," will be received at this office until the arrival of the eastern and western mails, on Wednesday, the 6th day of June next, for the formation of TWO SLIPS or BASINS, on the north side of the Lachine Canal, at Montreal.

A plan and specification of the work to be done can be seen at this office, and at the Lachine Canal Office, Montreal, on and after Tuesday, the 22nd day of May next, at either of which places printed forms of tender can be obtained.

Contractors are requested to bear in mind that tenders will not be considered unless made strictly in accordance with the printed forms.

An accepted bank cheque for the sum of \$2,000 must accompany each tender, which sum shall be forfeited, if the party tendering declines entering into contract for the works at the rates and on the terms stated in the offer submitted. The cheque thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,

A. P. BRADLEY,
Secretary.

Dept. of Railways and Canals,
Ottawa, 21st April, 1883.

TENDERS FOR TIMBER LIMITS IN THE N. W. TERRITORIES.

Sealed tenders, addressed to the undersigned, and marked "Tenders for Timber Berths," will be received at this office until noon on Monday, the 2nd day of July next, for Timber Berths in the North-West Territories, situated on the Moose Mountain, in the District of Assiniboine, and on the Bow River and its tributaries, above Fort Calgary in the District of Alberta.

Sketches showing the positions, approximately, of these berths, together with the conditions on which they will be leased, may be obtained at this Department, or at the Crown Timber Office, Winnipeg.

ASBESTOS PROPERTY FOR SALE.

The mining rights on S $\frac{1}{2}$ of Lot
No 11, in the 8th range of Tem-
pleton. The mineral is of the finest
quality of fibre and in large quan-
tity. Specimens may be seen and
particulars and price ascertained at
the office of the MINING REVIEW.

FOR SALE,

**White Marble Quarry on Calumet
Island.**

At this quarry there is an inex-
haustible supply of most beautiful
white marble. Price \$800. Sam-
ples to be seen and information ob-
tained at the office of the MINING
REVIEW.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the
3rd range. Some excellent surface
shows have been uncovered on these
lots and only require capital for de-
veloping. Price and particulars
given at the office of the MINING
REVIEW.

TIMBER LIMIT

ON LAKE WINNIPEG

FOR SALE.

50 Square Miles.

This limit will be very valuable.

CANADIAN MINING REVIEW

VOL. 1.—No. 9.

OTTAWA, JULY, 1883.

VOL. 1.—No. 9

Canadian Mining Review.

PUBLISHED MONTHLY.

ANNUAL SUBSCRIPTION - - - \$1.00
ADVERTISING RATES—15c. per line (12 lines to 1 inch).

OFFICE:
UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

CANADIAN MINERS IN THE COUNTY OF OTTAWA.

Of the total output of Phosphate for the year, it is noticeable that about 60 per cent. will have been mined by Canadian firms, the principal contributors to which are Messrs. J. A. Gemmill & Co., Haldane & Co., McLaurin & Co., Gillespie, Moffatt & Co., Jackson, Rae & Co., J. H. Post & Co., Adams & Co., McLaren Bros., and W. A. Allen & Co. The mines owned by these firms are situated in the Townships of Wakefield, Templeton, East and West Portland and Buckingham; they are all very valuable properties, but the most productive

of them are those owned by Messrs. W. A. Allan & Co., and McLaurin & Co., and from them an almost unlimited quantity of the highest grade ore can be raised. This season's shipments by both these firms will yield 85 per cent. of phosphate of lime, and have commanded the highest prices. It is very important that miners should be careful to have their phosphate well cobbled and brought to a high standard before shipping. By this means they will establish a reputation for their mines and create a preference for their output. Carelessness on this point is frequently attended by serious results, if one shipment fails to come up to the standard, the buyer will become prejudiced in his future dealings with the shipper, and the mine will be unfavourably advertised. A case of this kind has been brought to our notice this season and has resulted prejudicially to the owner of the mine, who asserts that after the delivery of his output at the point of shipment it was mixed with a quantity from another mine of a lower grade, the buyer, however, will not admit that such is the fact, and no settlement of the case has yet been arrived at.

AMERICAN CAPITALISTS

Visit their Phosphate Mines in Ottawa County.

On July 10th, the following names were registered at the Russell House, Ottawa:—Messrs. W. H. Williams, W. White, C. S. Henry, F. Platt, Jos. A. Marsh, B. H. Campbell, W. R. Bailey, J. N. Galway and General Jordan, (one of the Editors of the *N.Y. Mining Record*). All these gentlemen, with the exception of General Jordan, are Directors or

Stockholders in the Union Phosphate Mining and Land Company and were *en route* to their property in Portland West, few of them having ever before visited the phosphate district of the County of Ottawa. Leaving the city on the following morning, by the Canadian Pacific Railway, they reached Buckingham Village at 9.45 a.m., and proceeded thence by steamer 18 miles up the Aux Lièvres River, arriving at the company's dock about noon; here they were joined by Messrs. J. E. Smith and Wm. McIntosh, managers for the company, and escorted by them to the mines, where they were afforded an opportunity of witnessing a large force of miners, carpenters and other mechanics and workmen busily engaged in their several occupations. The piles of phosphate at the mouth of the pits, the machinery that has been erected and the buildings that have been constructed presented a scene such as few of the visitors had looked for. That the property owned by the "Union" Company is a valuable one is indisputable, and as the men entrusted with the supervision of mining operations are conspicuous for their energy and ability as well as for their practical experience in mining Canadian apatite, it is but reasonable to predict prosperity for the company, and a good dividend in the near future. The property of the company, covering an area of 1,300 acres, in the Township of Portland West, was purchased from Mr. Thomas Preston, of Orange, N.J.; it is divided into two locations known as the "Dugway" and the "Star Hill," and the preliminary work was not begun until the first week in April of this year; since then the following improvements have been made:—at the "Dugway," a boarding-house, 37 by 18, two stories high, has been erected; at the "Star Hill," there is another two story building 50 by 24 feet, with 24 by 18 feet, and wash-room 20 by 16 feet,

capable of accommodating one hundred men; a commodious stable, a storehouse and blacksmith's shop of large dimensions. The buildings are all constructed in a workmanlike manner, of seasoned timber and lumber, with a view to comfort, convenience and permanency. There are also at the mines, 2 derricks, 2 steam drills and hoists (manufactured by Graydon & Denton, N.Y.), and a 20 horse power boiler from the Ames Iron Works, Oswego, N.Y. The company has also built two substantial docks, one at a point on the Aux Lièvres River, a mile and a quarter from the mines, and the other at Buckingham Village, three miles from the railway station. A waggon road has been graded from the mines to the river bank (1½ m.), on which there are some substantial bridges, and one of the company's managers is now purchasing material for the immediate construction of a tramway from the mine to the upper dock. In the absence of this tramway, the output, which at present amounts to about 600 tons of high grade ore, will be forwarded to the river in waggons, and thence by scow to Buckingham Village, where it will be again loaded into waggons and carried to the railway station. It must naturally appear that this mode of transportation and the frequent handling of the mineral would constitute a great additional expense to the cost of mining, and so it does (about \$2.50 per ton), but the day is not far distant when there will be railway communication from the mines, and in the meantime miners must be content with present profits. The Union Phosphate Mining and Land Company is composed of a body of American gentlemen, whose positions in the commercial world of the United States is sufficient guarantee of their ability to prosecute operations with profit to themselves and others interested with them. On the return to Ottawa of the above named gentlemen, after

their visit to the mines, they expressed themselves greatly pleased with what they had seen and more than satisfied with their investment.

AMERICAN MINING COMPANIES Operating in Ottawa County.

THE AMERICAN PHOSPHATE MINING AND LAND COMPANY

was organized in January, 1882, and has carried on active operations in the Township of Templeton since September of the same year. In the early part of this season the company shipped 400 tons of first quality phosphate direct to London and 200 tons are now at the mines awaiting shipment. The property owned by this company is distributed over the Townships of Templeton, Portland East and Loughborough, and covers an area of 900 acres of carefully selected mineral lands. In the last two mentioned townships no work has yet been done beyond prospecting, but it is the intention of the local managers to extend operations during the present season. The company, whose head-quarters are in Philadelphia, has for its President Mr. J. Marshall Stoddard, Secretary and Treasurer, Mr. Fred. L. Pitts, both of Philadelphia, with five Directors, representative commercial men of Philadelphia and New York.

THE INTERNATIONAL MINING AND LAND COMPANY

is not yet engaged in active operations. The company's property consists of 1,700 acres of phosphate land situated in the 11th and 12th Ranges of the Township of Templeton and in the 3rd Range of Portland East, and was purchased by a syndicate from the Quebec Government in November, 1881, at auction. In January, 1883, the present company was organized and assumed the above title. With the disappearance of the snow last spring prospectors were engaged to thoroughly examine the several locations. The officers of the company state that many valuable deposits of apatite have been discovered and that they have reason to be satisfied with their purchase. They are making preparations to begin mining at an early date, when an opportunity will be afforded to test the extent of the deposits. Mr. Willis P. Hazzard and Mr. A. G. Elliot occupy the positions of President and Secretary, respectively, and the Board of Directors is composed of gentlemen of high standing. All the officers are business men of Philadelphia, where the company has its headquarters.

THE DOMINION PHOSPHATE MINING COMPANY,

incorporated under the Canadian Joint Stock Company's Act, is virtually an American organization, with Mr. T. C. Keefer, of Ottawa, and Mr. A. F. Riddell, of Montreal, Canadian Directors, on a board of seven, the other five being residents of Fanwood, N.J., and Brooklyn, N.Y. The Company's property, situated in the Township of Portland East, is a very valuable one and is being successfully operated by a New York firm of contractors. To put the mine in proper shape for future development a considerable amount of dead work was necessary, the contractors have made an open cut several hundred feet in length, 10 feet wide and 40 feet deep running into the Mountain towards the main body of phosphate, and have crossed several minor veins. They have now reached the objective point and are taking out a large quantity of mineral daily. To make this cutting has required the expenditure of considerable money but now that it is accomplished the advantages it affords will be felt by the contractors in their mining operations hereafter.

THE UNION PHOSPHATE MINING AND LAND COMPANY

has on its Board of Directors men of influence and capital from the principal cities of the United States. New York, Philadelphia, Cincinnati, Detroit, Chicago and Kansas City being all represented. This company is carrying on active mining operations in Portland West, and a full description of its property will be found in another column.

THE "HIGH ROCK" MINE

adjoins that of the "Union" Company and is one of the most productive properties yet developed in the county. It is owned by an English company and has been successfully worked by them during the past three years. Quite 10,000 tons of high grade ore have been shipped from this mine and it continues to yield liberally under the management of Mr. A. McIntosh.

PHOSPHATE MINING.

This comparatively new Canadian industry continues to attract much attention at home and abroad, more particularly in England, France and the United States, and during the past month a number of capitalists and experts from these countries have visited the mines in operation in Ottawa County, and have examined many undeveloped properties, with a view to engaging in what has been proved to be a very profitable investment. Those of them who have devoted sufficient time and patience to make a searching examination of the phosphate bearing district of the county have satisfied themselves that the quantity of apatite, existing in paying deposits, is enormous, far exceeding

anything they had anticipated. That this conclusion is a correct one there can remain no doubt, and it has given rise to careful enquiry into the question of supply and demand. England and Germany have been, and still are, the chief bidders for Canadian mineral phosphate, and in each of these markets a ready sale can be found for a much larger quantity than this country can hope to produce for years to come. In the United States also a considerable quantity has been used, and some small lots have been shipped to Denmark. The experience of shippers heretofore has been that better prices can be procured in Germany and Denmark than in any of the other foreign markets, but the uncertainty of procuring cheap and direct tonnage from the Montreal or Quebec ports to those countries stands as an obstacle to making contracts ahead. Recent advices from London and Liverpool are of a very satisfactory nature and should suffice to counteract the disquietude occasioned in the minds of miners by the discouraging theorizing of the Montreal buyers, the majority of whom are bears, and naturally so. Some of the more extensive operators are having their eyes opened to the fact that they can realize much better prices by shipping direct to the foreign market, wherever it may be, than by dealing with Canadian middle men; others will see the advantage of this, and if the Montreal shippers do not evince a disposition to deal more liberally they will soon have to content themselves with handling small lots, the output of properties in the hands of irresponsible men.

The exports of phosphate from all parts of Canada during the past fiscal year amounted to 17,181 tons, distributed as follows:—Great Britain, 13,197 tons; to the United States, 2,080 tons; to Germany, 1,469 tons; and to Denmark, 435 tons. This year's shipments will be somewhat in excess of those of last year, but were they to be double or five times the quantity it would in no manner effect the current prices abroad.

Quotations.

During the past month there has been no perceptible fluctuation in value of Phosphate, though some sales of small lots have been reported at low figures. Such lots, however, were not guaranteed and were the output of unimportant mines owned and operated by men who had been compelled to realize on almost any terms. Owing to the scarcity of tonnage offering at present from Montreal to Liverpool the local buyers have not been bidding and, though the foreign market continues firm at 1s. 3d. for 80 per cent., shippers are not anxious for consignments.

Fifty thousand dollars' worth of copper ore has been shipped this year from Canada to Great Britain.

Introducing Steam Power.

That phosphate miners in Canada have awakened to the advantages of employing steam power is made apparent by the fact that steam-drills and hoists are in use at no less than five of the more important mines in Ottawa County. A fifteen horse-power boiler, steam-drills and hoists have recently been shipped to one of the mines on the Aux Lievres River by the manufacturers, Messrs. Millar Bros. & Mitchell, of Montreal, and have been erected under the personal supervision of the senior member of the firm. Everything has the appearance of excellent workmanship and will doubtless perform good work.

Stock Watering Kettles.

At a recent meeting of the Farmers' Club, at Elmira, N.Y., a newly designed kettle for stock-watering purposes was exhibited and highly approved of.

Many of the mining companies of this continent would do well to provide themselves with these useful vessels.—[Ed.]

A Disappointment.

A specimen of Asbestos, of rather an inferior quality, was brought to Ottawa recently by a man who claimed to have discovered a vein on his farm and described it as being of unusually large dimensions. A careful examination of the locality by an expert resulted in no Asbestos of any consequence being met with and the owner of the property could not direct him to the spot from which he professed to have taken the specimen referred to.

HAYCOCK IRON MINES.

The London *Iron Trade Exchange*, in its number of July 7th publishes in full Mr. R. Howson's report on the Haycock Iron Mine dated Middlesbro, 21st May, addressed to the Directors of the Ottawa Iron and Steel Manufacturing Company, and says that the report on the Haycock Iron Mines, Timber Limits, etc., which has been specially prepared by Mr. Howson, the well known expert, confirmed as it is by other authorities, needs no comments beyond stating that the Ottawa Iron and Steel Company appears to have almost unlimited resources for the production of the best qualities of charcoal steel and iron.

Mr. Howson made a personal examination of the various properties of the company in April last and expresses himself satisfied that the representations made in former reports thereon are of a *bona fide* character. His report is very complete and intelligent and, in the main, coincides with the most favourable reports of Professor Chapman and Mr. Birkinbine—he enters fully into detail for further operations and concludes his report by stating that he had several interviews with Professor Chapman and Mr. Birkinbine, both of whom

gentlemen of high character, and that he agrees with them that prompt and energetic action, combined with careful management, the property of the Ottawa Iron and Steel Company will prove to be source of considerable profit.

Mr. Fraser, the Secretary of the above company has returned within the last few days from England where he has been for the past six months endeavouring to place the company's property on the London market. He states that he has succeeded in organizing a new company with a capital of £350,000, that they will begin operations this fall and that it is the intention of the company to engage in the manufacture of steel rails.

The Robert's Iron Company of Robertsville, Frontenac County, has suspended operations in its mine owing to the depression of the iron trade and the consequent falling off in the demand for ore on the other side of the border. This company has for some time past been raising about 100 tons of ore daily and employing a number of experienced miners. It is to be hoped that this trade may soon revive in order that active operations may be resumed.

ECONOMIC MINERALS

IN THE
PROVINCES OF ONTARIO AND QUEBEC.

COPPER.

Copper constitutes one of the most important of the mineral treasures of the Dominion of Canada, and is destined to occupy a very important rank among its resources. Its ores are distributed over vast tracts of country in Ontario, in the Eastern Townships of Quebec, in Nova Scotia, British Columbia, and traces of it are met with in New Brunswick.—Thus writes Dr. Small in his hand-book for 1882.

ONTARIO.—The richest copper producing section of this Province is that embraced by the northern shores of Lakes Superior and Huron. The north shore of the former, especially, is very rich in this mineral, where it frequently occurs in the form of native or metallic copper. Excavations of aboriginal mines are occasionally met with, and the stone implements used are also found in them. An open cutting, supposed to have been made by the early French explorers, was found near Mamainse Point, the marks of the drills being still visible, and old shafts are here and there met with, but its history is completely lost. On the south shore of Bachewaning Bay, the cliff is stained with blue and green carbonates of copper; at Mamainse Point, veins of gray sulphurate occur, and prisms are met with nearly filled with native copper; at Pointe Aux Mines,

numerous veins occur; and at Mica Bay considerable money was spent in testing a vein, which, though rich in ore, was not lasting enough to be productive of results that would warrant a continuance of mining operations. A number of localities on Michipicotin Bay and Island are rich in copper; among them is Fletcher's Mine, from which large quantities of ore have been extracted, and veins appear along the coast east and west of Otter Head, The Island of St. Ignace, Black Bay, Flour Island, Simpson's Island, Point Porphyry, Edward's Island, Thunder Cape, Prince's Bay and Spar Island, on the north-west shore, are all rich in copper, native copper being abundantly found in these localities. Pigeon River and the district south-west of the Kaministiquia River give evidence of the existence of copper in large quantities. It is asserted that the Superior district contains the most extensive copper deposits in the world, capital being the one thing necessary for their development. Along the shores of Lake Huron, copper is abundant, in fact no very large area within this region is destitute of copper-bearing veins. The Bruce Mines, the Wellington Mine, and the Huron Copper Bay Mine are here situated, and have produced a large amount of very rich ore. Numerous veins occur at the mouth of Whitefish River, and at Spanish River, and the district contiguous to it; at Echo Lake, on the east branch of Cariboo River, at Limestone Point and at Root River, there are abundant shows of copper. The ore found at the above named points is chiefly pyrites and yellow sulphurets, and the indications are rich enough to lead to the belief that ere long the Lake Huron district will be one of the most important mining sections of this country.

In Eastern Ontario, in the County of Hastings, in Hungerford Township, and Anglesea, west of the Addington road, and occasionally scattered elsewhere, traces of copper in the form of pyrites have been found, but of no economic value as far as known at present.

QUEBEC.—In Eastern Canada, the native copper, which is so abundant in the Superior district, is met with but in few cases. Sir William Logan describes the copper deposits of this part of Canada as similar in point of structure and mode of occurrence to those of Norway and Sweden. In some of the localities in this Province the ore met with is a sulphuret, but these veins are seldom continuous for great distances. At the outset of copper mining in this section a great rush was made for mining rights; companies were formed, the majority of which sank a great deal more money than they could afford and had to yield to the pressure of the times before realizing any return on their outlay. Despite all this there has been sufficient development to prove

that in several districts copper mining could be carried on successfully. The extraordinary number of 557 locations have been enumerated in the Eastern Townships where copper exists and has been traced. The Acton, the Harvey Hill, the Prince of Wales, the St. Francis and the Lower Canada Mines, as well as one at Garthby, were being worked at one time. The Coldspring, the Balrath, the Brompton Gore, the Ascot and Belvedere; Victoria, Reid Hill, Warrington, Griffiths and Ham Mines gave good evidences of copper, but were respectively abandoned. Copper has been traced through the Townships of Potton, Bolton, Stakeley, Oxford, Brampton, Melbourne, Cleveland and Shipton; and in numerous other localities, such as Wickham, Durham, St. Flavien, Sutton and Halifax, the existence of ore, in the form of sulphuret, rich in copper, has been discovered. In the Ascot district the Hartford, the Crown and the Albert Mines have been for some time worked, and the Sheffield and Hepburn Mines were opened under favourable auspices last year.

The Eastern Townships ores demand a peculiar metallurgical treatment, and to separate the copper gangue they require additional power and more sulphurous ore in the smelting works. It is stated that the quantity of fuel required by the present mode of treating the ores is such that the richer ores must be carried to the vicinity of coal; hence it is not unlikely that these from Eastern Canada will eventually find their way to the coal fields of the lower Provinces.

MICA.

Mr. H. G. Vennor in his published letters, thus speaks of this valuable mineral:—

"The constant new uses to which mica is being put year by year, keeps it continually in demand and ensures a good price always for a good article. A "good article" in mica must possess at least two qualities, viz., clearness of colour and size of crystals, characteristics not always found together. Clearness of colour alone is of little importance, if the size is insufficient; and the latter by itself is nothing without the former.

Mica occurs all through the stratified upper portion of the Laurentian series of rocks, but chiefly in a finely divided and disseminated form in the gneiss and schists. In fact it is as much a component part of the rocks as is the quartz, feldspar or hornblende.

The economic deposits, however, are all towards the summit of the series and in connection with the phosphate of lime rocks; but by some unaccountable process or agency the mica in these deposits has been "faulty" from its birth. For besides being in the majority of instances of a very dark colour it is affected by "joints" or cleavage

planes at right angles to what may be termed the *plate cleavage*, which being often accompanied by a slight displacement or dislocation, produces a very uneven natural fracture. Wrinkles or corrugations likewise spoil very many of the large crystals and render them entirely unfit for the market. Hence, out of one hundred and more localities examined, where mica occurred in considerable quantities, only some two or three were found to yield anything like a suitable article."

As illustrative of the quality of mica required by mica men we give the following from the *Manufacturer and Builder* of a recent date:—

"This mineral, simple in itself, is but an aggregation of infinitesimal crystals, which by some unknown natural process have united in a massive form, with a laminated structure capable of being subdivided on a plane with its axis to such an extent that one cubic inch can be subdivided by the eye into about 180 superficial inches, and the same be again subdivided by the aid of the microscope until one cubic inch of mica is made to cover four or more superficial feet. This capability of subdivision in plates or laminae is not its only peculiarity. It varies from transparency to translucency."

The demand for mica, for stores alone, is greater than the supply, thus causing an uninterrupted demand. To the uninformed it may appear strange, but mica is to-day a staple article of commerce. The fact that mica in stores must be replaced almost annually, creates a steady demand. Recently has been patented its application to shoes, whereby soles at a trifling expense are rendered waterproof. And whenever the quantity of mica produced is sufficient to supply the demand, and the market price is reduced, then new uses and applications of it will arise. As a lubricator it stands pre-eminent, owing to its non-frictional qualities.

It will be thus seen that in mica mining we have an industry worthy of development, and one which requires no expensive manipulation of the product subsequent to excavation.

The largest and altogether the most important deposits of mica yet discovered in Canada occur in Ontario. Here the mica is without the usual association of phosphate of lime, and is of an unusually clear colour and suitable size.

In Ottawa County, Province of Quebec, the deposits are innumerable, and mica constitutes a large part of the debris thrown out of nearly every opening made in search of phosphate, but the majority of this is worthless stuff.

All of the large-plated mica occurs in one particular plane of bedding or horizon, which would appear to lie just between the apatite and plumbago-bearing rocks.

The neighbourhood of Grenville,

abounds in mica of fair quality and as no deposits of phosphate of lime of any importance have yet been discovered in this direction, it would seem to indicate that this latter economic belongs to a higher portion of the rock series, which has not been deposited to any extent in this section. In fact, this truth has already been established in Ottawa County, the mica-producing rocks always having been observed to "come in" before those in which the phosphate of lime occurs.

GALENA IN FITZROY.

It has been rumoured in Ottawa that a property was purchased not long since in the Township of Fitzroy by some American gentlemen. This property is said to be very valuable owing to the presence of an extensive deposit of galena having been discovered thereon, supposed to carry a large percentage of silver. It is stated that \$16,000 is the price that was paid and that it is the intention of the present owners to begin mining operations at once.

We cannot vouch for the correctness of these statements and will be pleased to receive authentic information in verification of current rumours. —[Ed.]

GOLD MINING IN WESTERN CANADA.

(From the Montreal Star.)

The Lake Winnipeg and the Keewatin Gold Mining Companies have recently obtained their charters from the Manitoba Legislature. Mr. H. L. Borden, the former company's superintendent, was in the city the other day, en route for Nova Scotia, where he goes to purchase machinery and engage miners for both companies. He was intercepted by a Star reporter, who obtained from him the following information regarding these two enterprises. "Both companies are composed of Canadian and American capitalists, the Board of Directors of each being the same. The subscribed capital of each is two million dollars. The Lake Winnipeg Company's mine is situated on the Big Black Island, in Lake Winnipeg, about seventy-five miles north of the mouth of Red River. The island is about nine miles wide and thirteen long, and the Saskatchewan steamers pass it regularly on their route, thus affording easy communication with Selkirk via the branch of the Canadian Pacific Railway from Colville Landing. The company began work last fall and have sunk a shaft to a depth of 56 feet all the way through "pay rock." Operations have not yet gone far enough to enable a calculation to be made of the probable extent of the lode, but where it crops out at the bank it is about 20 feet deep. The company intend to sink another shaft further back, to strike the lode about 200 feet below the sur-

face. The assays which have been made of the ore yielded from \$90 to \$150 of gold per ton; a single, very rich specimen gave \$300 per ton. The ore will have to be reduced by what is known as the "washer" process; there is some free gold in the mine, but a great deal is refractory ore.

"When will you be ready to begin to work the mine?"

"Everything is waiting for the machinery. The company have constructed a wharf at which any steamer on the lake can land, and all the necessary buildings for working the mine—boardinghouse, machine and blacksmith shops, etc., are built; but we won't begin to take out ore until the other shaft has been sunk. I don't think it pays to commence operations before we are fully prepared."

"Do you expect to get the machinery you require manufactured in Nova Scotia?"

"The purpose is to get all the machinery we can in the Dominion, and we hope to find what we require in the gold districts of Nova Scotia. I am also going to engage miners there, where they are to be found in large numbers, for men who have had the experience are the most profitable to employ."

"By whom was this mine discovered?"

"By Messrs. Anderson and Guest. They also discovered iron and abundance and of excellent quality on this island, part bog ore and part hematite. There are indications of coal in the island, too."

"What about the Keewatin Company's mine?" "It is on Hay Islands in the Lake of the Woods, nine miles south of Rat Portage, where the Canadian Pacific Railway touches the lakes. This is one of the richest mines in the Dominion. There are at least some thousands of tons of ore right inside of it. It crops out of the side and you can hardly pick up a piece of stone but you can see free gold in it. The lode can be traced for about half a mile very plainly. About a thousand feet distant from these croppings, the company have sunk a shaft 62 feet deep; and the ore looks better the deeper they go. This can be made a paying mine right away, and it is intended to put up the mill the first thing as soon as it reaches the place. The company expect to pay a dividend on the first operations, besides paying all the expenses of working the mine. It is hoped that the mill will be running in the course of three or four months from now, everything else being ready for operations, and about four hundred tons of ore having already been taken out."

"What are the prospects for mining generally in Manitoba?"

"The only obstacle in the way of the speedy and extensive development of the mineral resources of the province is the lack of confidence on the part of the men who have

the money to invest, and that is a serious difficulty. A great many persons speculated largely in land during the great boom about a year and a half ago, and many of them were badly bitten, too. The capital invested in this way is now locked up, while those who have available funds are afraid to invest it. There is a great deal of the country yet unexplored, which, I believe, will yield immense mineral wealth. The native Indians are continually bringing in specimens of gold and silver ore astonishingly rich, but they cannot be induced by any means to tell where the ore is taken from. It is, no doubt, somewhere between Lake of the Woods and Lake Winnipeg. The country is now being slowly explored, and shows a large mineral belt. The other mines in Manitoba already in operation are in a prosperous condition, and their owners seem confident of success; all they want is capital to develop them."

Captain Robbins, President of the Eureka Mines, Nevada, visited Port Arthur recently, and, it is said, while there, representing the Bullion Club, of New York City, he purchased the property at Clearwater Bay, known as the "Joe Thompson location" for \$35,000. It is further stated that Captain Robbins will at once erect an \$80,000 stamp mill at Rat Portage for his own use, and capable of working up the output of other mines in the district.

Mr. Langdon, of Langdon, Shepard & Co., contractors on the Canadian Pacific Railway, arrived in Winnipeg about the middle of July from the end of the track, with a car load of curiosities. He brought a specimen of lignite coal of a bright, clear character, some of which had been used for the engine driving piles in the Saskatchewan River. It burned excellently, retaining its character of forming no clinkers. Mr. Langdon will experiment with the specimen he has with him when he reaches St. Paul and, if it comes up to his expectations, a car-load will be forwarded at once.

In addition to coal, he brought some very interesting specimens of petrified pine, showing perfect formation of the ancient tree, clinging to which there were clusters of quartz, showing indications of gold. A quantity of buffalo bones and some very handsome antlers formed a portion of this curious cargo.

Early in July Saskatchewan coal was tested on the Canadian Pacific Railway and was pronounced to be of very superior quality for steam purposes. It is said to burn without forming "clinkers."

Negotiations are afloat to organize a company to engage in extensive coal mining operations in the Souris district. The owners of the location are sanguine of success.

GOLD MINING ON THE LAKE OF THE WOODS.

(From our Special Correspondent.)

RAT PORTAGE,

July 24th, 1883.

Your correspondent has just had an opportunity of visiting some of the gold mines of the Lake of the Woods, and has obtained the most recent reliable information in regard to the others. The following notes will, therefore, give a pretty good idea of what has hitherto been done, and of the present condition of mining up here.

I may premise that there is now less activity than existed two months ago, but this arises from the difficulty of obtaining money in Winnipeg, where the mines are owned, and not from any failure or diminution of confidence in the mines themselves. Most of the discoveries so far made are situated around Big-stone Bay, in the northeastern part of the lake, and near Clearwater Bay, in the northern part. Hay Island, which has become well known on account of its gold-bearing veins, lies on the south side of the former bay.

The Winnipeg Consolidated Mine is on the south-eastern side of Big-stone Bay, about twelve miles from Rat Portage. The vein, including some green schist, is from two to four feet wide and runs about north-east. The main shaft is down 105 feet. At 80 feet from the surface an adit is driven 30 feet N.E., and 20 feet S.W. The ore is a finely granular porous quartz containing copper and iron pyrites, with free gold. The accompanying schist also holds gold. At the mine are a wharf, shafthouse, boarding-house and stamp-mill containing a battery of five stamps in position, and another ready for putting in a similar number. In April, the mill made an experimental crushing of about 17 tons which yielded some \$45 to the ton, and the tailings were found to contain \$16 to the ton, the loss having been due to the imperfect amalgamation on the new plates and the want of other means of saving the gold. A grinding pan and amalgamator have just been put into the mill. Work was begun at this mine in October, 1882. About 40 men were employed in April and May, but the sinking and driving are now almost at a stand still from the cause already mentioned.

The Canada Mining Company's vein is a continuation of the Consolidated. They are working with five men and are down about 30 feet.

The Lake of the Woods Company are working a further continuation of the same vein. Their shaft which is down 20 feet, is all within the walls of the vein, which is here about 8 feet wide.

The Keewatin Mine is on the north end of Hay Island. A shaft

as been sunk here to a depth of about 60 feet on a vein four inches wide. Near the shaft a bunch of quartz has been discovered carrying free gold and measuring about 20 feet in diameter. Formerly this company employed about 20 men, but their staff is now reduced.

The George Heenan Mine is situated on the east end of Hay Island between the last mentioned mine and the Consolidated. Here three shafts (the deepest only 20 feet) have been sunk on a narrow but rich vein, the quartz showing many small nuggets. About half a dozen men are employed. A quartz vein carrying considerable copper pyrites intersects the gold vein.

The Boulder Island Mine, situated on a small island in the middle of Big-stone Bay is abandoned at present.

The Minnisabic Mine is on another island in the same bay, midway between Boulder Island and the Consolidated Mine. Two shafts, now 25 and 15 feet respectively, are being sunk by contract. Two veins occur here, one running N.E., and the other due N. They measure 8 and 18 inches, and both contain free gold.

The Canadian Comstock Mine is at the head of Pine Portage Bay on the north side of Big-stone Bay. The vein is known as "The Whale." It is from 3 to 10 feet wide, and lies in the bottom of a little canyon, and so far only open cutting has been carried on in the bottom of it. The largest stamp-mill in the region has been erected at this mine. One battery of five stamps has been placed and everything is on hand for three more of the same capacity, or 20 stamps in all. The machinery is by Fraser and Chalmers of Chicago. About 15 men are employed at the mine and mill. This mine is owned by Messrs. Dobbie and Palmer.

The International Mining Location, owned by Messrs. Wm. Young and D. Morrison is on a small island in the bay next east of Pine Portage Bay. Here a vein 2 feet wide shows fine gold, but it has not yet been worked.

The Argyle Mine is situated on a point in Clearwater Bay, lying three miles south-east of Lake Deception. The vein is from 1 to 3 feet wide and runs east and west. A number of pits or shafts have been sunk, the deepest only 25 feet. At one time the company employed about 30 men, but they are now working with a smaller force, in sympathy with the general retrenchment. The 10 stamp mill, which is erected here for a short time on the ore which had been taken out. There are also two Frue Vanners and a Blake stone-breaker. Captain F. S. Miller is President of the company and General Manager of the works.

NEW DISCOVERIES.

It is currently reported that a phosphate deposit of more than ordinary importance has been discovered by prospectors in the 11th Range of the Township of Hull, near Kirk's Ferry.

New discoveries of mica are daily reported, and some of the deposits are capable of yielding an almost unlimited quantity, but the quality of the mineral is very inferior. A few specimens of really good quality of mica have been sent to us, but it is said not to occur in paying quantity.

Another rich lead, measuring 6 inches in width, is said to have been quite recently discovered at Chezetcook, in the vicinity of the Oxford Gold Mining Company's claim. During last year important discoveries were made in this district, to the north and west of the Oxford property, by Mr. Stather, Mr. McKay and the Messrs. Vaughan.

It is stated that in the neighbourhood of Sooke, Vancouver, B.C., a vein of copper ore has been traced a distance of 20 miles, and that a company has been organized to work the lode. So far the names of the owners of the property and the promoters of the company, as well as a description of the ore, have been withheld.

Early in the month of June information reached us of an important new discovery of gold in Halifax County, N.S. We have endeavoured to obtain definite information on the subject, but have not succeeded in gathering more than the following bare facts. The discovery has been made on the DeWolf property, in close proximity to the well known Rose lead of the Montagu Mines. Three veins measuring 7, 10 and 35 inches, respectively, have been found at a depth of 12 feet from the surface, and are said to bear indications of unusual richness.

The *Chicago Mining Review* of July 19th refers to the discovery of a copper lead on Hay Island, in the Lake of the Woods, measuring 30 feet wide.

The same Journal, in its number of July 12th, calls attention to reported coal discoveries in the County of Ottawa. No report of this nature has yet reached us. The non-existence of coal in the Provinces of Quebec and Ontario has long been an established fact; but being situated favourably in their proximity at all points to other carboniferous regions, and the facility of conveyance afforded by the Lakes, Rivers, Canals and Railways of the respective Provinces, it is easily procurable, and the deficiency is supplied by the vast areas of coal districts in the Maritime Provinces and on the Pacific Coast.—[Ed.]

PROJECTED RAILWAYS TO PENETRATE MINERAL SECTIONS OF CANADA.

The Kootenay Railway and Transportation Company.

During the last session of the British Columbia Legislature a bill was passed incorporating the above company and donating 750,000 acres of land to its promoters, including all mineral lands other than gold or silver. This railway will penetrate a section of the Province known to be rich in mineral and farming lands, and the only reason why it has been neglected, heretofore, has been its inaccessibility. The object of the railway is to connect Kootenay Lake with the navigable waters of the Columbia River and to act as a feeder to the Canada Pacific Railway. That the company's charter is a very valuable one, it is admitted on all sides, but the fact that the land grant and franchise have fallen into the hands of Americans has created much local dissatisfaction, so much so, that on the 23rd of April a public meeting was held in the City Hall, at Victoria, B.C., for the purpose of considering the grounds upon which exception was taken to the passing of the Act of Incorporation. The meeting was largely attended and resolutions then passed were submitted on the 28th of the same month to the Lieutenant Governor for transmission to Ottawa. The meeting protested against the Act of the Local Legislature and invoked the intervention of the Dominion Government. Since then the matter has been fully commented on by the press, one journal going so far as to state that the charter had been disallowed. That this has not been done is apparent by the fact that such disallowance has not appeared in the *Canada Gazette*. The resolutions referred to, and many communications in connection therewith, have been received by the authorities at Ottawa, and the matter has been reported on by the Minister of Railways and Canals and the Government Chief Engineer, but no action has yet been taken. It is not in the least improbable, however, that the Minister of Justice who, with the Government Engineer, has proceeded to British Columbia on public business will, while there, discuss the question at issue with the local authorities, and it may result in certain features, objectionable in a Dominion point of view, being illminated from the bill during the next session of the Local Legislature.

That the construction of this railway will be a boon to the Kootenay district, and of much benefit to British Columbia, is acknowledged on all sides, and it is universally admitted that the Local Legislature has been most generous to the promoters in granting them the fran-

chise and in its land subsidy, but it would seem that the greatest grievance the petitioners have exists in the fact that the successful applicants are Americans.

It appears that these gentlemen are personally interested in the development of the district into which the railway will penetrate, having become owners of the largest deposits of silver bearing galena yet discovered on the Pacific Coast, situated on the east side of Kootenay Lake. Therefore, nothing is more natural than that they should seek substantial Government aid to enable them to open up a section of country in which they are so deeply interested. The company to construct the railway has been organized with \$5,000,000 capital stock, divided into \$50,000 shares of \$100 each; \$4,000,000 has already been subscribed and the balance will be allotted in California. Are there any local men capable and prepared to undertake the construction of this work on similar terms to those that have been granted to Messrs. Ainsworth? If not, then it is short sighted policy that will permit sentiment or prejudice to delay the opening up and development of the natural wealth of our Pacific Province or of any other Province of the Dominion.

Ottawa and Gatineau Valley and
Ottawa Colonization Railways.

The contract for the construction of the Ottawa & Gatineau Valley Railway has been awarded to Messrs. Macdonald, Bray & Jones, of Toronto, and work will proceed about the first week in August, the entire line to Desert to be finished within three years. The Ottawa Colonization Railway will be under construction within a few weeks and vigorously prosecuted thereafter. The company of course depends upon the active assistance of property owners and taxpayers and, after making the regular location survey, will ask the Townships to manifest their desire to get a railway by granting small bonuses, and the property owners to grant right of way. We would urge every public spirited ratepayer to work indefatigably in the interest of the enterprise, as it will be the making of this portion of the country. We congratulate the promoters of the railways upon the progress already made and feel confident that success will crown their efforts.

AMBER AND ITS ORIGIN.

According to a recent volume on the flora of the amber-bearing formations of East Prussia, by Messrs. Goeppert and Menge, there must have existed in that part of Europe in ancient days a group of conifers which comprised specimens from almost all parts of the world. There were present such magnificent repre-

sentatives of the Californian Coniferæ as the Red Wood, the Sugar Pine, the Douglas Spruce; the scarcely less majestic Bald Cypress, Red Cedar, Thuya and *Pinus rigida* of more eastern States; the Chilian Incense Cedar, the Parasol Fir, the Arbor-Vitæ, the *Gyptostrobis* and the *Thuyopsis* of the eastern coasts of Asia; the Scotch Fir, the Spruce and the Cypress of Europe, and the Callitris of Southern Africa. The causes which led to the dispersion and extinction in Europe, in relatively recent times, of so considerable a group of coniferæ would be interesting to trace out. From generations of these resin-bearing trees along its shores have been produced the deposits of amber for which the Baltic is noted. The richest deposits are situated along a strip of coast between Memel and Dantzic, but the real home of amber has been supposed to lie in the bed of the Baltic between Bornholm and the mainland. It rests upon cretaceous rocks, and consists chiefly of their *debris*, forming a peculiar mixture known as blue earth, which appears to exist throughout the Province of Samland at a depth of eighty to one hundred feet, and to contain an almost inexhaustible supply of amber. This strip of blue earth extends along the coast for sixty miles, with a breadth of twelve miles and an average thickness of ten feet. Immense quantities of amber are washed out to sea from the coast, or brought down by rivulets and cast up again during storms or in certain winds. The actual yield by quarrying is 200,000 to 300,000 pounds a year, or five times the quantity estimated to be cast up by the waves on the same coast.—*Mail*.

A Submerged Forest.

A Wonderful Formation at the Bottom of Lake Tahoe.

Carson (Nev.) Appeal,

For some years there has been a bank in Lake Tahoe, which in clear weather has generally been taken for moss formation. It lies at the right of the steamer's course between Tahoe City and Tallac, about two miles beyond Idlewild. It looked as if a lot of trees had sunk to the bottom of the lake and that moss and slime had collected there till the whole presented a wavy, semi-transparent appearance, about fifty feet below the surface. During the past few weeks the moss and *debris* have disappeared and now when the water is clear a forest of pine trees can be plainly seen, with every limb and twig perfect. Recently some fishermen went out there in a boat and, lowering grappling irons, secured several splendid pieces of the petrification. One is a pine branch about three feet long, which, when held a few feet from the eye, has the appearance of a pine branch just taken

from a living tree and apparently fresh and green, the brittleness and weight distinguishing it from the freshly cut bough.

The specimens brought to Mr. Kinney's were speedily disposed of to tourists. The largest piece was purchased by Henry Townsend of San Francisco for \$25. This is said to be the first thing of the kind ever found in the lake. The forest occupies about two acres and seems like a forest just immersed, except that its stony branches are forever still and tall weeds and vines which cluster about the trunks of the giant trees are as motionless as the rocks. No wind ever stirs this strange verdure and the birds which once sang in the branches centuries ago have given way to fish, which swarm through the forest in thousands.

A PETRIFIED FOREST.

The *Albuquerque* (N.M.) *Journal* thus describes the appearance of a petrified forest near Corrizo, on the Little Colorado River:—

"The road, at a distance of ten miles from Corrizo, enters an immense basin, the slope being nearly a semicircle, and this inclosed by high banks of shale and white fine clay. Half an hour's good driving from this point takes one to the heart of the forest. The petrified stumps, limbs, and, in fact, whole trees, lie about on all sides. The action of the waters for hundreds of years has gradually washed away the high hills roundabout, and the trees that once covered the high table lands now lie in the valley beneath. Immense trunks, some of which measure five feet in diameter, are broken and scattered over a surface of three hundred acres. Limbs and twigs cover the sand in every direction, and the visitor is puzzled as to where he shall begin to gather the beautiful specimens that lie within easy reach. There are numerous blocks or trunks of this petrified wood, which have the appearance of having been just cut down by the woodman's axe, and the chips are thrown around on the ground so that one instinctively picks them up as he would in the log camps of Michigan and Pennsylvania. Many of the small particles, and even the whole heart of some trees, have now become thoroughly crystalized, and the beautiful coloured cubes sparkle in the sunshine like so many diamonds. Every colour of the rainbow is duplicated in these crystals. The grain of the wood is plainly shown in nearly every specimen."

Siberia now ranks only barely below the United States and Australia as a gold producing country. The best Russian authorities think its mines will yield nearly or quite \$25,000,000 worth of the metal this year, and the output is steadily increasing.

How HE GOT HIS START.

The First Big Hit made by Jones, of Nevada.

Many remarkable anecdotes touching the life of Senator Jones, of Nevada, have appeared, from time to time, in the American journals. The following history of his early experience in the gold diggings has appeared in the *Washington Sunday Herald*, and may be of interest to some of our readers:—

"Jones had gone to California with thousands of others when the wonderful discovery of gold in that far-off land thrilled every hamlet and village. Among those who went to seek their fortunes there was a man named Hayward, from Vermont. He was rather the superior of his associates in education and totally unlike them in habits. They were working in pretty good pay dirt and at first had fair success; but finally one after another went away to more promising localities, until Jones and a few others, among them Hayward, were left at the old diggings. Hayward had a claim on the mountain side that as yet had shown no particular promise. Still he stuck to it. One hot summer day, when the red hills were quivering with heat, Hayward came to see Jones. Said he, 'Jones, I am very near to a wonderful vein. I know it; I feel it. But I am flat broke. I want \$2,000. With that I will make both our fortunes.' 'Now, old fellow,' said Jones, 'I have known just 1,000 men in exactly your fix. They only needed \$1,000, and sometimes \$100, to make their eternal all.' But Hayward continued. Finally Jones said 'I will give you this money. I have \$3,000 buried under the fireplace, and when the fire goes out and my Chinaman leaves I will give it out to you. But don't ask me for any more. I cannot afford to lose more than that; and, while I give it to you with the utmost heartiness, don't ask me for any more.'"

Hayward got the money and said: "When I strike it I will give you a quarter interest." One afternoon, about a month after this happened, Jones was sitting in his cabin, when Hayward suddenly burst in, as white as a sheet. "Jones," said he, "I have struck it." "Struck what?" said Jones. "I don't know what just yet," answered Hayward, "but I have struck the richest vein I ever seen." They went together to look at it, and sure enough, Hayward had struck an immense "bonanza" or pocket of almost pure gold. Jones, with his experience, saw it was the richest mine in California. They sent for Eugene Kelly of San Francisco, then a young mining expert of great ability. He pronounced it the greatest strike in his time. Hayward had found the New Amador, the richest gold mine in the world. He sold it to Wells-Fargo and some

others for \$5,000,000, and the day the sale was made he gave Jones \$1,250,000. Jones afterwards married Hayward's daughter. This is the history of the New Amador, and of the great start in life of Jones, of Nevada.

MISCELLANEOUS.

The world's production of precious metals for 1882 is estimated at \$212,000,000. Of this amount the United States produced \$87,000,000; Europe, \$21,000,000; Asia, \$16,000,000; Australia and other countries, \$88,200,000.

Leadville during the past five years has produced twenty-eight million ounces of silver, one hundred and forty thousand tons of lead, and twenty-six thousand ounces of gold, inclusive of one hundred thousand tons of ore shipped to other towns for treatment.—*N. Y. M. Record*.

A cubic inch of gold is worth \$210; a cubic foot, \$363,380; a cubic yard, \$9,797,762. This is valuing it at \$18 an ounce. At the commencement of the Christian era there was in the world \$427,000,000. When America was discovered it began to increase. Now the amount of gold in use is estimated to be \$6,000,000,000.

From surveys and calculation made by J. A. Farrington, Civil Engineer, the famous Washington Boulder, near Conway Corner, N.H. is found to measure 30 feet in height, 46 feet in length, 35 feet in width and to weigh 3,867 tons. This is the largest known isolate piece of granite in the world.—*Granite Cutters' Journal*.

The development of the coal field of Asturias has greatly advanced within the last few years. In 187 the output was 167,586 tons, and in 1882 the quantity raised amounted to 219,508 tons. With the increased demands of railway companies and industrial establishment the product will be increased beyond anything that the above figures might indicate. This may be looked for in the near future.

The burning of the lignite beds Colorado, Wyoming, Montana, and Dakota, Mr. Charles A. White says was caused by spontaneous combustion, contact at exposed places with prairie fires, or by human agency. The weight of the evidence goes to support the theory that, in the great majority of cases, the fire have occurred in a purely natural way, or spontaneously, like those which are often seen in progress the piles of refuse coal that collect about the mouths of coal mines. A large part of such burnings of lignite is very ancient, more so, perhaps, than the introduction of artificial fire upon this continent.

Herr Schell, of Grund, Germany, has reported that in the course of mining operations in the Hartz Mountains the sounds made by the firing of shots in a cross-cut were audible through the rock at a point 437 feet distant in a horizontal direction; and the dropping of a 320 pound stamp on the surface was heard in a tunnel through 571 feet of rock, the tunnel being 538 feet below the surface and under a point distant horizontally 187 feet from the stamp-mill.

STEAM DRILLERS, MINING CAPTAINS AND MINERS.

Frequent enquiries are made at his office for men who understand running Steam Drills, for Mining Captains and Practical Miners. Such men who are out of employment may find it to their advantage to forward name and address, mentioning the class of work they are qualified for, etc., to the CANADIAN MINING REVIEW, Union Chambers, 14 Metcalfe Street, Ottawa.

PHOSPHATE PROPERTY

For Sale in North Burgess.

Mining Rights of W $\frac{1}{2}$ of 13, in the 5th range. About 100 tons of very high grade Phosphate have been shipped from this property. Will be sold to an immediate purchaser for \$750. Apply at the office of the MINING REVIEW.

PHOSPHATE PROPERTIES FOR SALE

IN THE TOWNSHIP OF WAKEFIELD.

Mining Rights on S $\frac{1}{2}$ of Lot No. 16, in the 1st Range.
 " " on Lot No. 23, in the 2nd Range.
 " " " No. 26, in the 4th Range.
 " " " No. 20, in the 5th Range.

The fee simple of Lots Nos. 22 and 23, in the 4th range, (400 acres). All these lots have been carefully explored by experts and very favourably reported on; they are virgin properties and in the heart of the Phosphate Belt. For further particulars and price apply at the office of the MINING REVIEW.

Thousand Islands, River St. Lawrence.

LEASE for twenty years (renewable) of certain islands in the above group. Situated in the vicinity of Gananoque, in the County of Leeds, Ont., which have been specially selected for their beauty and position, will be offered at auction at the Custom House, Gananoque, at 2 p.m. on Thursday, the 9th proximo.

No more than one island will be allowed each purchaser, and successful competitors at the auction must pay the first year's rent down to an officer of this Department, who will attend at the time and place above named, otherwise the island will be immediately put up again to competition.

A map showing the islands referred to may be seen, and the conditions of lease learned, at any time during office hours, between this date and the date of sale, on enquiry at the Custom House, Gananoque, or at this Department.

L. VANKOUGHNET,

PHOSPHATE CRYSTALS.

Farmers, Miners and Prospectors, having unbroken
Phosphate Crystals for Sale, can find a cash
purchaser by applying at the Office of

THE CANADIAN MINING REVIEW,
Union Chambers, 14 Metcalfe Street, Ottawa.

Parties offering crystals for sale will please mention the
colour, length and diameter—large ones preferred.

MINES AND MINERALS.

Developed and Undeveloped Mines and Minerals of Commercial Value
BOUGHT AND SOLD.

PROPERTIES EXAMINED AND ANALYSES MADE OF ORE OF EVERY DESCRIPTION.

A Competent Expert is permanently engaged for the purpose of making Unprejudiced Reports on all Mines placed
in our hands for Sale, such reports being at all times open to intending purchasers for examination.

Phosphate, Iron, Iron Pyrites, Copper, Asbestos, Mica, Plumbago,
Gold and Silver Mines, and Marble and Sand-
stone Quarries, For Sale.

MINERAL LANDS EXAMINED AND REPORTED ON BY OUR EXPERT; ALSO, ANALYSES OF MINERALS
OF EVERY DESCRIPTION MADE BY A COMPETENT ASSAYIST.

Canadian Mining Review.

PUBLISHED MONTHLY.

ANNUAL SUBSCRIPTION - - - \$1.00
ADVERTISING RATES—15c. per line (12
lines to 1 inch).

OFFICE:
UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

DEVELOPMENT OF CANADIAN PHOSPHATE MINES.

It is encouraging to know that the Canadian phosphate deposits are occupying the attention of business men and capitalists outside of the Dominion. The articles bearing upon the subject which have appeared in the last three numbers of the REVIEW have been the means of convincing many, who have heretofore been skeptical as to the feasibility of profitable phosphate mining, that with proper organization and management the industry has become one of more than ordinary importance, and that the majority of the mines

in operation yield, not only a fair rate of interest on the purchase money, but a handsome profit on the working capital employed. That this condition of affairs may continue, a strict observance of careful and business-like management will be required. Economy should be as carefully studied in mining as it would be in any other business enterprise, and everything approaching extravagant organization must be religiously avoided. It is noticeable that, with few exceptions, the properties that have fallen into the hands of business men, with means at their command, have paid handsomely and continue to yield large profits. The successful miners have been those who began cautiously and proved the value of their properties before preparing to carry on permanent operations. To establish the capacity of a phosphate location is an item of no great expense, and, unlike other mineral deposits, but little time is required to prove its value. When it can be shown that a property is capable of a certain specified output, machinery and modern appliances should at once be employed that will mine, handle and deliver the mineral at point of shipment to the best possible advantage. That a great deal of time and much money has been squandered by miners doggedly adhering to the primitive mode of drilling and hoisting, cannot be denied, but the number of steam drills, hoists and tramways now employed at many of the mines is evidence that the error has been realized and the remedy applied. Last year there was but one phosphate mine in the County of Ottawa at which a steam drill was in

use; now there are no less than six, and before the close of the year it is to be hoped that the number may be doubled. The condition of the majority of the mines more than warrants the trifling expense entailed, and the cost of mining would be greatly reduced were the value of steam power more generally appreciated.

THE "HIGH ROCK" MINE.

The reputation of this mine has been so well established that there remains little, if any, doubt that it is one of the most valuable properties in the county. For some years it has been steadily worked, and the annual output shows no signs of diminishing; no mine in Canada has produced anything like the quantity of high grade ore that has been shipped from "High Rock," and the probability is it will rank among the best paying properties so long as phosphate mining continues to be a profitable industry. The mine has been carefully and successfully managed by the company's representative, and much of the present activity in the mining sections of the County of Ottawa is due to its productiveness.

THE "DUGWAY" AND "STAR HILL" MINES

are the property of the Union Phosphate Mining and Land Company, and, though it is only within the last four months that work was begun, both these locations promise to yield a vast amount of high grade apatite. The company displayed good sense in securing the services of Mr. Wm. McIntosh, formerly the manager of "High Rock," under whose able management their property is rapidly increasing in value. The present appearance of the mines must be very encouraging to the owners; every day there is fresh evidence of the vastness of the deposits, and the quantity of ore in sight will measure several thousand

tons. The ore already mined is being forwarded to the railway depot at Buckingham, and within a very short time a tramway from the mine to the company's upper dock on the Aux Lievres River will be completed and will materially facilitate transportation. Captain J. E. Smith, under whose superintendence this work is being carried on, has had wide experience in the construction of trams, and there is every guarantee that the work entrusted to him will be intelligently carried out.

THE "NORTH STAR" MINE

in Portland East, owned by the Dominion Phosphate Company, is a very valuable property, and that the company has a high opinion of its yielding capacity is evidenced by the amount of dead work they are doing preparatory to mining in paying ground. As was stated in the last number of the REVIEW, a open cut has been made to facilitate handling the output from the main body of ore. This was completed by contract, and the company is now engaged in running a cross-cut to further facilitate permanent mining operations. Before going to this expense, the property was carefully tested and the quantity of ore to be moved has been thoroughly established. When the company is prepared to work on the veins, a large quantity of phosphate will be rapidly mined. The quality of the ore is equal, if not superior, to the best that has been shipped from the district, several hundred tons of which have been taken out of smaller leads, converging at the main body, which were crossed in making the cutting referred to.

THE "EMERALD" MINE

continues to yield largely, and the daily output is forwarded to the railway depot at Buckingham. This is no doubt the most conveniently situated mine to the point of shipment, and there appears to be no falling off in the quantity of ore in sight. As

development proceeds, large bodies of mineral of high grade are exposed, and the deposits are sufficiently extensive to warrant the improvements which are in progress on the property.

THE "MCLAURIN" MINE

in Templeton, is among the oldest and most developed mines in Ottawa County, and its owners should be well satisfied with the profits they have derived from working it. The reputation of the ore forwarded from this mine is well established, and analyses of shipments have proved it to be uniformly of a high percentage, so that the shippers invariably realize the highest price for the annual output.

THE "POST" MINE,

also in Templeton, is developing satisfactorily, and continues to increase in value. A quantity of ore has been delivered at East Templeton, and teams are steadily engaged in hauling it from the mine.

OTHER MINES

throughout the county are being vigorously worked. The American Phosphate Company's, the Jackson Rae, the Haldane and the Gemmill Mines, as well as one in Wakefield, under lease to Mr. Isaac Moore, are all yielding well. Recent reports received from the latter property are of a very encouraging nature, about 600 tons of phosphate have already been mined by Mr. Moore, and several new and extensive veins have been opened within the past few weeks, some of them measuring very wide and running for long distances.

Reviewing this summer's work at the mines in the County of Ottawa, the developments prove to be of almost incredible magnitude, which augurs well for the future of the phosphate industry.

Phosphate Quotations.

During the past month there has been a marked depression in the market, and the price of phosphate has declined. It is now quoted in London at 1s. 1d. for 75 per cent., and Montreal buyers are not anxious to purchase. There is every reason, however, to think that this is merely a temporary dullness, and that contracts for next season's delivery will be made at much higher figures. The crops abroad are said to be abundant, and a prosperous season among farmers is invariably followed by increased demand for fertilizers, which has the effect of enhancing the value of the raw material, and so causing a rise in price for Canadian apatite.

COMPARATIVE ANALYSES OF CANADIAN AND EUROPEAN APATITE.

The analyses as given in Table No. 1, were made from samples which were in all cases good sized hand specimens taken from large heaps, such pieces being selected as were most free from foreign mineral admixture, and as a rule the analyses may be said to represent, in a measure, the composition of the mineral of the several localities in its greatest practically attainable state of purity; such, indeed, as might be secured by careful cobbing.

Manufacturing Super-Phosphate.

This is an industry that would appear to be within easy reach of enterprising Canadians, and in fact the feasibility of erecting factories for the purpose, convenient to the apatite deposits, is occupying the attention of some of our go-ahead neighbours across the frontier. When it is taken into consideration that thousands of tons of our Canadian apatite are forwarded annually to England and manufactured there and shipped in the form of super-phosphate to Baltimore and other American ports for consumption throughout the United States, it is but reasonable to reflect upon the advisability of utilizing the many natural facilities we have in Canada for manufacturing the product of our apatite deposits. The raw material for the production of sulphuric acid is in abundance; water-power and fuel are everywhere to be found, and cheap labour is procurable. All these are important considerations, and the question of home manufacture of super-phosphate should be carefully looked into. The industry has paid enormously elsewhere, under less favourable circumstances. Why should it fail in Canada?

AN ATTEMPT TO SWINDLE

In almost every mining district there are to be found men who are unprincipled enough to resort to anything that will aid them in perpetrating fraud. Until within a short time, however, the property owners in the County of Ottawa have enjoyed the reputation of being singularly honest in negotiating the sale of their mineral lands, but, alas, a clumsy attempt to *salt* a property in the Gatineau Valley has recently been discovered. The owners, whose names are known to us, are brothers, who, for some time, have been giving their attention to salting their farm with phosphate, and had succeeded in transplanting several hundredweight of the mineral before their fraudulent occupation was detected. When we are in possession of further information on this matter, the names and locality will be published, and in future, any attempts at deception of this nature will speedily be exposed when brought before our notice.

HAYCOCK IRON MINE.

Notwithstanding that very encouraging reports have reached Ottawa during the past few months, relative to the negotiations in England for the sale of the Haycock Iron Mine, it is to be regretted that the matter should not, ere this, have taken more definite shape. A sale can hardly be said to have been concluded until money has changed hands, and we have not yet heard of the English capitalists having

paid over any sum that would effectually bind them to close the bargain. From articles on the subject, which have appeared in the London journals, it is natural to suppose that the gentlemen who are to represent the new company have more than satisfied themselves of the value of the property they have been bidding for. Nothing could be more flattering than Mr. Howson's report, the English expert who was sent out expressly to examine the mine, etc., and, coinciding as he does in every particular with the views formerly expressed by Professor Chapman and others as to the richness of the property, it would appear needless to look for further justification before concluding the purchase, and yet negotiations will remain *in statu quo* pending the arrival of one more visitor from England who has been dispatched for the purpose of re-examining and reporting. It is to be hoped that, at this stage of the negotiations, no unexpected hitch may arise to upset anything that has been already accomplished. That the Haycock Mine is one of great value is an established fact, and that it should have remained idle for so long is much to be regretted, consequently any arrangements with English capitalists that will bring about the resumption of active operations will be satisfactory to those who are interested in the company's welfare and to the Ottawa people in general.

GOLD AND SILVER

In the County of Ottawa.

For some years back repeated rumours have been afloat to the effect that gold and silver-bearing quartz had been discovered in the Township of Wakefield. But a few days ago a local journal gave Mr. Vennor credit for having discovered gold and silver in paying quantities in quartz in the third Range of the above named township. That gold and silver-bearing quartz has been found in the locality there is no reason to doubt, but that it occurs in paying quantity will remain a subject for speculation. Careful examination of the location and the quartz referred to, has convinced scientific men that the precious metals are not to be found there in paying quantities.

ASBESTOS.

The mining rights on the asbestos property, known as Lot No. 11, in the 8th Range of the Township of Templeton, passed into new hands during the month, and the present owners, who are engaged in the manufacture of asbestos goods in New York, are making preparations to begin mining operations. This property, though a good one, has been allowed to remain idle up to the present, and there is every indication that it will develop into one of great value. When work begins

on this property it will be the initiation of asbestos mining in the district, and will doubtless be the means of attracting attention to other deposits, and inaugurating another industry in the Ottawa Valley.

Asbestos mining in the eastern townships actively continues and the mines are yielding freely. The quality of mineral is of high grade as to texture, and the fibre varies in length from one to four, and, in some cases, six inches. In Thetford, Broughton, and Colrairie townships, and at Danville and Wolfstown, the quantity being mined is very great, and the capacity of the mines is being thoroughly tested. It is a question in the minds of many who have visited the localities if the properties are being worked to the best advantage as regards economy, and it is quite possible that some improved system might be devised that would yield a larger profit to the owners.

MINERAL RESOURCES

vs.

SCIENTIFIC MINING.

The following article has appeared in the *Chicago Mining Review* and will bear republishing, as it applies as forcibly, if not more so, to the miners of Canada, as to those of any other section of the globe.

"The many improvements made in mining machinery, and numerous new appliances which are constantly coming to light, tend, in a measure, to show that a great need is becoming recognized, and the inventive minds of the age are running in a direction where much is yet required.

"Mining is practically a new industry to many of our people, and it is evident that the rapid growth of this business and its establishment in widely different fields has been far in advance of the methods and appliances required to secure the best results. That the problem will be successfully solved no one, who comprehends the magnitude of the immense resources to be developed and the important advancement of this great industry, can for a moment question. The mineral field is wide, its character diversified, and its requirements have not been fully met, as the two great factors of cost and loss too plainly testify; but we are making rapid strides in the direction of improvement, and better results indicate the progress made.

"It is very plain to the student of the economic plan of nature that everything created has, somewhere and at some time in the history of development, a place and use; hence it is evident that there is in mineralogy and metallurgy much to be learned, and it is certain that many things, now destroyed as useless, have a value, and should be more carefully investigated and studied by worker and scientist.

"There cannot be too many improvements or new inventions; all must be tried by the test of practical experience and success made from the study of repeated failures. The knowledge gained by the many experiments, in widely diversified fields, must be crystalized into the lines of an exact science, and progress built up from increasing knowledge."

MINING NOTES.

Nova Scotia.

Everything about the mine and mill of the Oxford Gold Mining Company is in a satisfactory condition. The late scarcity of miners, during the fishing season, somewhat retarded operations, but they are now more plentiful, and opening work on the different leads will be proceeded with thoroughly and vigorously. The face of the east bluff is 25 feet high, and enough ore is in sight for three months' work. Work continues on the lake lead, and on the mill lead the main shaft will be sunk by contract as soon as tenders will have been received by the company. The ore in this lead continues of the same high grade that has characterized it heretofore. The milling plant on the property is very complete and is pronounced the best in the province, and equal to any that is in use elsewhere. The assay of tailings at the mine made from time to time shows hardly more than a trace, and the *N. Y. Engineering and Mining Journal* refers to a lot that was tested in New York and gave only 88 cents per ton, which, from perfectly "free" ore, is, to say the least, not a little remarkable when it is milling over \$60 per ton.

This company has declared its regular monthly dividend (No. 6) of 5 per cent., payable August 25th.

Manganese deposits of a very superior quality have been discovered and tested by Mr. R. J. Stephens, near Walton, Hants County, Nova Scotia. It lies in the same formation as the ore of the Tenecape Mine, and is distant from it about eight miles. In Hants County, an irregular annual export of manganese has been maintained, amounting, since 1861, to about 2,000 tons, valued at \$110,000. Formerly extensive operations were carried on at Tenecape, Walton and Pembroke, but are now confined to the first-mentioned locality. The Hants County ores are of a very high grade, yielding 90 per cent. and upwards of peroxide, and, being almost free from traces of iron, are valued by the flint glass maker, as glass is apt to contract a greenish tinge from the presence of iron. It is also used for black enamel for pottery, tiles, etc.; in calico printing, and in many other industrial appliances. The manganese yielding district in Hants County, which gives promising indications, is over

150 square miles in extent, and the absence of workings may be traced, not to a deficiency of the ore, but to a want of enterprise and capital.

The agents of a powerful syndicate of Boston and New York capitalists have been, during the past few weeks, visiting and inspecting a number of gold locations in the Province of Nova Scotia. The result is they have purchased a mine at Mount Uniacke, one at Chezetcook, and, it is rumoured, several others. The proprietors will work their newly acquired properties extensively and vigorously.—*New Era, Halifax.*

The Renfrew Consolidated Gold Mining Co. have for some time been carrying on operations at a heavy loss in the hope of striking paying quartz at a lower level. After sinking upwards of 100 feet through barren rock, the miners have come on a body of ore, three feet in width, carrying a large percentage of gold, and the prospects are that the company will be rewarded for their pluck and labour.

Operations are said to be proceeding with most efficient regularity and system at the Coxheath Copper Mines, near Sydney, Cape Breton, and, though a new enterprise, the results are already exceedingly gratifying and are apparently certain to become more so in the immediate future. These mines are owned by Boston capitalists.

A bar of gold weighing 126 ounces, the product of 42 tons of quartz from the Lake Catcha district, was recently shipped from East Chezetcook in Nova Scotia. This shows a yield of three ounces of gold to the ton of quartz, and the mine is reported to be growing richer as the work progresses.

Ontario.

It is reported from Silver Islet that another rich pocket of ore has been met with in the 1,600 ft. level. Such pockets of silver have been phenomenal in this mine and have invariably been very productive. This latest intelligence has had the effect of increasing the value of the stock, principally held in Boston, from four to eight dollars per share. Silver Islet stock on the 16th July was sold at \$3, on the 18th, it had risen to \$7.50, on the 23rd, it had declined to \$6.50, on August 1st, the stock had fallen to \$5, on 9th inst., it reached \$4, at which price it is now quoted. The sudden rise from \$3 to \$7.50 in two days was caused at the time by the rumour above reported. That the stock should have since declined to \$4 is substantial evidence that the rumour had been somewhat exaggerated.

Professor Selwyn, who has been for some time in the mining district of Western Ontario, left Thun-

der Bay about the middle of the month, accompanied by Mr. T. A. Keefer, for the Rabbit Mountain Silver Mine. As this mine has been spoken of as one of the richest discoveries in America, Professor Selwyn's report will be looked for with much interest, as it was his intention to spend some time in carefully examining the location.

At the "Large Wollaston Mine" in the County of Hastings, a large force of miners are employed, and there is now about 25,000 tons of magnetic iron ore mined and ready for shipment. The ore yields a high percentage of metal, and is free from objectionable features. As soon as the means of transportation are completed, this output will be forwarded to smelting works in the United States.

At the "Glendower Iron Mine," in Bedford, County of Frontenac, about 3,000 tons of ore await shipment, and mining is being vigorously pushed. The ore is magnetite of a very fine quality, and the mine is turning out very well. The shaft is down 50 feet, and the body has been open 25 feet from the hanging wall without the foot wall having been reached.

A very handsome specimen of native gold in quartz has been received from the County of North Hastings. It was taken from a newly discovered lead said to be 9 feet in width and traceable for a considerable distance. The specimen referred to carries at the rate of several ounces of gold to the ton.

Manitoba.

If all that is written about the gold mines in the Lake of the Woods District is reliable, then indeed we may look for developments that will, in point of richness, equal anything that has been experienced in California or Australia; but it is to be feared that in too many instances the hope is father to the thought, and that those who are directly interested in the success of the mines in that section allow themselves to be carried away by the excitement of the moment, and are apt to exaggerate facts in some degree. That this part of the province is destined to become an important gold and silver producing section there can be little doubt, but it is dangerous to expect too much at the outset, or to misrepresent the value of the mines or the yielding capacity of the ore. Those companies that have been engaged in active mining have every reason to feel satisfied with results so far, and success will surely crown their efforts if they will but exercise ordinary patience and conduct their operations economically and with proper care and intelligence.

The *Rat Portage Progress* publishes the following:

RAT PORTAGE DISTRICT.—Pros-

pects are very cheering for mining industry to become permanent and develop to large proportions. Numbers of experts, mining engineers and representatives of syndicates and capitalists who have been visiting here of late, could but have a good effect when it is considered that, without a single exception, they have expressed themselves thoroughly satisfied with the prospects. Already English and American companies are bidding high for two or three partially developed properties on the lake, and it is to be hoped owners will not stand in their own light by placing their figures beyond reason. Even one company with a large capital, and the proper men to operate the mine, would establish the mining industry on a sure and solid basis.

PINE PORTAGE.—The ore on this property is turning out beyond the most sanguine expectations. Every shot shows an improvement in the vein. Both the foot and hanging walls glitter with the precious metal, and the old and tried miners become excited as they view it. The richness of this mine is regarded as fabulous. Several offers have been made for its purchase but all to no use.

In the Lake Winnipeg region some extensive bodies of Hematite and Bog iron ore have been met with, the former assaying 54 and the latter 44 per cent. of metal. The deposits are said to be conveniently situated for transportation of ore, of which immense bodies are reported in sight.

WINNIPEG CONSOLIDATED.—The new machinery lately put in the mill is working without any interruption. The amalgamating and grinding process is going on night and day, and a large gold brick at no distant day will gladden the hearts of the promoters.

British Columbia.

Most favourable reports come from the mining centres of the province, and capital is being brought in to improve the mines and to give an impetus to the industry generally. The Cariboo district is particularly promising and is again attracting much attention, and the miners are said to be somewhat excited over the prospects. The *Victoria British Colonist* publishes the following letter written by a gentleman who has recently visited the district:

CACHE CREEK, July 30.

I have sent some quartz specimens to Mr. F. S. Barnard, taken from the Enterprise tunnel, lately located by J. Perkins, as the previous record had lapsed. Fifteen hundred feet is the extent of the ledge, and the tunnel has been run in four hundred feet. Men are now working a shaft about thirty feet ahead of the tunnel, from which

came the specimens I have forwarded; also sent down the gold which fell from the quartz as I was breaking it. I left Baker ville eight days ago. Mr. Mouatt told me that twice the amount of gold had passed through the assay office this year as compared with last. Several claims are paying well. The Chinamen also on Antler Creek are in excellent spirits. I am certain that if the prospects that are on Burns Mountain were in Mexico or Arizona they would be thought very good and be worked with a will. A company with \$10,000 capital has been formed to prospect Slue Creek, and propose to pay, if required, 10 per cent. per month. They will probably have a boring machine to enable the true channel to be found.

W. P. TROUNCE.

United States.

The Calumet and Hecla Copper Mining Company have declared their regular quarterly dividend, payable this month, of five dollars a share, aggregating \$500,000, and making the total of dividends for this year, to date, \$1,500,000.

THE RICHMOND CONSOLIDATED MINING COMPANY paid a quarterly dividend of \$1.25 a share at their London Bank on the 10th instant, aggregating \$67,500. Total of dividends to that date, \$3,974,887.

THE HOMESTAKE MINING COMPANY have declared their usual quarterly dividend, payable this month, aggregating \$50,000, and making \$400,000 paid since 1st January.

CORRECTION.

It was stated in the July number of the REVIEW that mining operations had been suspended by the Roberts Iron Company, of Roberts-ville, Frontenac County, owing to the falling off in the demand for ore. The Company's superintendent corrects this statement by letter and reports that there has been but a temporary reduction in the operative force at the mines. We are pleased to know that our information was not authentic, and lose no time in correcting the mis-statement.

Answers to Correspondents.

Editor CANADIAN MINING REVIEW
Ottawa.

Dear Sir,—Will you be good enough to give me some information concerning the "Canada Consolidated Gold Mining Company," whose property is situated in the vicinity of Belleville, Ontario? I wish to ascertain in what shape the Company's property is at present, what work has been done, the amount of money that has been spent, and, in short, I will be obliged for any in-

formation you may be able to extend to me through the columns of the REVIEW or otherwise.

W. A. P.

THE CANADA CONSOLIDATED GOLD MINING COMPANY was organized under the laws of the State of New York in 1880 with a capital of \$500,000, in shares of \$1.00 par value; of this, \$75,000 was set aside for working capital, and the balance duly allotted to subscribers in Montreal, Quebec and New York, and subsequently a number of shares found their way into the hands of some gentlemen in France. The Company's property is situated in Marmora Township, County of Hastings, and consists of about 800 acres of land on which there are veins of gold-bearing quartz about 3,000 feet in length, covering a width of some 20 feet. At the close of 1881 three shafts had been sunk a depth of 180, 70, and 50 feet respectively, and three to a depth of 40 feet each. From the 180 foot shaft, four levels had been driven, aggregating 250 feet. This work has all been done on the veins, and about 8,000 tons of ore raised, of which 1,000 tons were unskilfully reduced and \$2,100 realized therefrom. The property is well equipped with mining machinery, Blake crushers, jigs, etc., and the plant is approximately valued at \$20,000. Besides some dwellings that have been erected, there is a boiler and engine house 40 x 20 feet, and a furnace house 220 x 60 feet, supplied with 17 arsenic chambers, all of which are now quite full of arsenic.

Mining operations were vigorously pushed during the first year, and at the close of 1881 they ceased, the company having expended the \$75,000 set aside for working capital. First mortgage bonds were then issued for \$100,000, and during 1882, and until a few months ago, attention was given exclusively to experimenting with the ore and devising and erecting machinery for the purpose. The \$100,000, the proceeds of the first mortgage bonds, was in this way exhausted, together with an additional \$50,000, or thereabouts, to which amount the company found itself in debt. The company, as may be seen, has spent \$225,000 since its inauguration, and has 7,000 tons of ore ready for crushing, having realized \$2,100 in gold from 1,000 tons of ore, with additional assets in the shape of buildings and machinery. During the past few months no work has been done on the property, but it has recently been leased to a party of gentlemen, members of the company, on the following conditions: lessees have agreed to expend \$150,000 in erecting suitable mills and machinery for treating the ore, and in other ways to improve the property. For this they take second mortgage bonds on the property for \$300,000, and apply the profits to reimbursing themselves.

When the \$150,000 will have been paid off in this way, the second mortgage will be discharged, and the lessees will receive \$300,000 in fully paid up stock. It is to be presumed that it will be necessary to increase the capital stock that amount (\$300,000), the original \$500,000 having been all allotted. The property is said to be valuable, but it has been found difficult to treat the ore advantageously. A large amount of money has been spent in finding this out and discovering the means of overcoming the difficulties, of which the present lessees will have the full benefit. The ore, which is mispickel, will be treated by the chlorination process, and elaborate preparations are now being made to proceed with the reduction of the ore scientifically and on a large scale, and it is to be hoped that this venture may be attended with more profitable results, and that the lessees may realize their anticipations.—[Ed.]

Editor CANADIAN MINING REVIEW.

Dear Sir,—I have a quantity of second quality of phosphate at my mine in Templeton, and would like to dispose of it. Can you tell me what is its probable value, and where I could find the most profitable market?

A. S.

There has been a large quantity shipped to Chicago and other Western cities, the majority of which was forwarded by Mr. Lomer, of Montreal, a phosphate buyer. There certainly is a market for second quality, but, having no idea of the percentage of your lot, it would be difficult to quote a price.—[Ed.]

THE MONTREAL G. AND S. MINING COMPANY.

As queries are made of us regarding the value of the stock of this company, we should be obliged to the CANADIAN MINING REVIEW for the information whether such organization actually exists, and if so, the locality of their property, as well as its industrial condition at the present writing.—*Mining Record, N. Y.*

Inquiries have been made in the mining centres of Canada, as well as at the Provincial and Dominion Registry Departments, but up to the present moment no information has been obtained to prove the existence of the above-named corporation. It is quite possible, however, that such a company may have been organized under a State law of the United States.—[Ed.]

Navigation of the Aux Lievres River.

Complaints are made by the residents of Buckingham and the country north of it, that no steps have been taken towards making the much needed improvement at the Little Rapids, for which an appropriation was made by Parlia-

ment last session. The traffic on the Aux Lievres has assumed such dimensions that the improvement of the navigation of the river has become a matter of public importance. It is contended that a dam which would raise the water at the Little Rapids six feet above its present level would obliterate the Long Rapids and give uninterrupted navigation from Buckingham to the High Falls, and that this could be done without flooding more than twenty acres of land. Captain Cooke is running a small steamer above the High Falls to the Pines, a distance of 18 miles. The delightful scenery of the Lievres is attracting the attention of pleasure seekers. Every steamer leaving Buckingham on the upward trip has been crowded with tourists, many of whom have availed themselves of the accommodation furnished by Captain Cooke to visit the romantic country north of the far-famed Chute. Numerous camping parties have sought the shady retreats of the Laurentian Hills, and fished in the "endless, endless lakes" during the holiday season. When the Ottawa Colonization Railway is constructed, the northern country will attract more tourists than even the Thousand Isles or the Rideau lakes—certainly more sportsmen and fishermen, to whom it is a paradise from which they have long been excluded by the formidable chain of hills and pathless forests extending north of the city.—*Daily Citizen.*

If these improvements can be accomplished it would greatly facilitate the transportation of phosphate during the summer season from mines up the river, and would increase the value of mineral land that now lies too far distant from water or railway communication to render ore transportable.

RAILWAY NOTES.

Ottawa and Gatineau Valley Railway.

The contractors for the construction of this railway are providing themselves with plant and organizing in a manner that will ensure the rapid prosecution of the work they have undertaken. Owing to the scarcity of men, at the time the contract was signed, but a small force had been employed to within a few days ago, when a force of Italian labourers, numbering about sixty, were imported from New York State and engaged on the works. Mr. Macdonald, the senior member of the firm of Macdonald, Bray & Co., contractors, arrived in Ottawa during the latter part of the month, and has been busily engaged in perfecting a permanent organization that will enable the firm to proceed with construction systematically and with despatch. Some grading has already been done, and before winter sets in there is every prospect that several miles of the line will be ready to

receive the rails. Energy and activity have characterized the efforts of the promoters of this enterprise, and it is to be hoped that the contractors will prove themselves as capable of completing the undertaking as have been the promoters in inaugurating it.

It would be natural that the company should look for co-operation and substantial assistance from the property owners along the line rather than antagonism and unreasonable exaction. This railway, when completed, cannot fail to be a boon to the residents of that part of the country through which it will run, and will have the effect of enhancing the value of property. This should be seriously taken into consideration, and should influence owners of property in their negotiations with the company for the right of way; but such has not been the case, and at the outset the very men, influential in the county, who had pledged themselves to promote the interests of the railway, were the very ones to inaugurate a system of extortion which, as might have been expected, is being adopted by their equally grasping neighbours, and the prices asked for land, useless for agricultural purposes, and valueless in other respects without the railway, are outrageous. Such want of public spirit was not to be anticipated, and it is to be regretted that the company should now find themselves hampered by those who had heretofore professed themselves staunch supporters of the project.

That the road, when constructed, will lend an impetus to the mining industry in the County of Ottawa is made apparent by the fact that prospectors are already busy exploring that section of country lying many miles north of the district in which mining has heretofore been carried on, and repeated reports have come in of newly discovered mineral deposits which have been neglected on account of their inaccessibility and the impossibility of transportation in the absence of railway communication. The Ottawa and Gatineau Valley Railway will doubtless be the means of developing the natural wealth of the country it is to traverse.

Sherbrooke and Magog Railway.

This road, when completed, will furnish an important auxiliary to our mining industries, which should not be overlooked in estimating the advantages it will confer on those sections of the eastern townships it is proposed to traverse. It is the intention to construct a branch line to the mining properties already developed, known as the Suffield Copper and Silver Mines, and the Hepburn Copper and Sulphur Mine, which branch will also run close by Mr. Clark's rich iron mountain. The ore from these mines can thus be taken by rail to the smelting-works on the main line, or find a direct outlet to New York down the Hudson River Valley.

The Kootenay Railway.

As was foreshadowed in the July number of the REVIEW, Sir Alexander Campbell's visit to British Columbia has virtually settled the vexed question of disallowance. After receiving a deputation at Victoria, from the Board of Trade, who are in favour of the bill, and also a body of gentlemen who are opposed to the granting of the charter and land subsidy, the Minister of Justice dealt with the subject liberally and practically. He suggested that an amendment to the bill, making it obligatory on the company to use the C.P.R. line in the transportation of the products of the Kootenay mines, might be passed at the next session of the Local Legislature; also that they would not be allowed to go nearer than twenty miles of the boundary in the shipment of their ores. These suggestions had previously been made by him to the promoters, whom he had met in San Francisco, and as they had expressed themselves quite willing to submit to the proposed amendments, Sir Alexander thought the company might proceed with their expenditures with the certainty of the bill being allowed. As the construction of this railway will open up a section of country abounding in mineral wealth, but heretofore inaccessible, and will circulate a large amount of foreign capital in the province, the promoters should receive every assistance and encouragement that would in any manner precipitate the successful completion of their undertaking.

A Miniature Locomotive.

The *Engineering and Mining Journal*, of New York, quotes from the *Railway World* that the smallest locomotive engine ever built in the United States for regular work was recently turned out by M. M. Buck & Co., of St. Louis, and shipped to the Edmee plantation, St. Charles Parish, La. This little engine was designed by and built under the supervision of Mr. Jay Noble, and is as perfect a piece of mechanism as one would wish to see. Its diminutiveness may be understood from the following facts respecting it: twenty-one and one half inch gauge; diameter of cylinder, $6\frac{1}{4}$ inches; stroke, 10 inches; four wheels, diameter of driving wheels, 24 inches; height of engine to top of boiler, 4 feet 7 inches; weight, without water, 5,250 pounds. The engine has link motion, and is made of the best materials throughout. The boiler is of $\frac{1}{2}$ inch iron, and is 30 inches in diameter in the barrel. It is provided with an Orm patent pop-valve, has a steel fire-box and is fed by two inspirators. The tank is made of No. 10 iron, has four wheels of a diameter of 16 inches, a capacity of 380 gallons, and weighs, without water, 1,400 pounds. In experimenting with the engine before it was shipped, it was found to act very obediently

under the hand of the engineer. A locomotive such as the one described should be well adapted for tramways at mines where ore is carried any distance to point of shipment. Miners desirous of obtaining particulars as to price and capacity can do so by applying to the publishers of the CANADIAN MINING REVIEW.

GEOLOGICAL MUSEUM OF CANADA

During the past three months the field geologists attached to the Geological Survey, one of the most important branches of the Government service, have been steadily engaged in exploring and examining the mineral sections of the Dominion and in noting the progress made in the mining districts where active operations are being proceeded with. A large and most interesting variety of specimens have been forwarded by them to the museum at Ottawa, and will shortly be exhibited for public inspection. In addition to the specimens of economic minerals, there are many that have no commercial value, but are wonderfully interesting to the student of geology, some of which are very beautiful and valuable as curiosities. The museum continues to attract a large number of visitors and, as the official book shows, there have been no less than 3,158 names registered from June 1st, up to August 24th inclusive, being an important increase on the number registered during the same period of last year.

ADMINISTRATION OF MINING ENTERPRISES.

One of the chief causes of financial mishap to so much of the money invested in mining enterprises in this country, is in the manner that the business side of the adventure is carried on.

Men associating themselves together to employ their money in the enterprise of manufacturing hats or shoes, cotton or woollen fabrics, or even to build or operate a line of railway, are sure to be at much pains to place the immediate supervision of the industrial conduct of their business in the hands of men practically acquainted with all the details, say, of making hats or shoes, or, in case it were a railway to be laid out or built, the work of planning and overseeing would be entrusted to practical and experienced engineers, men thoroughly acquainted with such undertakings. It is hardly in this rational manner that mining in Canada has been conducted by associated capital, and, as a consequence, many wrecks have resulted in an industry which intrinsically affords a most fertile field for investments if properly cultivated by men having a practical knowledge of their business.

A board of directors composed of merchants or bankers, aided by a

clever solicitor, cannot safely or intelligently dictate from their city offices the underground workings of a silver, gold or copper mine, or how such a property should be exploited. Capitalists should engage in mining in the same intelligent, practical and business-like way that they do in railway construction or manufacturing, and they would learn that there are few enterprises more likely to yield good returns on the money invested. The pith of the foregoing is taken from an article which has appeared in the *N. Y. Mining Record*, addressed to capitalists in the United States who invest their means in mining ventures and give no attention to the manner in which their money is employed. If nature has, in some instances, so provided that failure is impossible, all is well, but, on the other hand, should success not crown their efforts to make the mine profitable, the shareholders and directors condemn the property and attribute their failure to a deficiency in the quantity or quality of its ore. From end to end of the Dominion there are monuments to wasted capital in abandoned mines where, if proper management had been observed and skilled and competent labour employed, together with scientific knowledge and suitable machinery, there is abundant mineral wealth to pay large profits on the capital necessary to their proper development. Hardly a day passes but some such property, that has long since been abandoned, falls into the hands of English or American companies, and in many instances, under careful and practical management, they are found to yield profitably. The majority of Canadian people are too conservative to invest in mining enterprises, many have not the means, and those who have, if they are not disposed to risk sufficient to thoroughly organize and equip their mines, with a view to carrying on operations to the best advantage, will do well not to engage in such undertakings.

MORE OF CONNECTICUT'S TRACK MARKED SLABS.

Some remarkable specimens of the tracks of fossil beasts and birds have been discovered recently in the Portland, Conn., quarries. The tracks were taken from a stratum about six or seven inches thick, lying at a depth of about eighty feet from the top of the quarry. One track measures fifteen inches by eleven, and is larger than the track of any living elephant, shows the impression of the toes very distinctly and unmistakably, and also the reverse representation of the impressions of the inner muscular projections of the bottom of the huge foot. Of tracks there are three on a single slab five to six feet long and perhaps a yard or more wide and seven inches thick. There is no mistaking these tracks. They

are evidently the tracks of some huge beast—and one of the elephant kind, too—and not any mere accidental formation by other cause. On one slab near the creature's tracks is a stony heap of his ordure, known in geology as coprolites.

One slab bears the unmistakable tracks of some three-toed bird, seemingly of the ostrich family. These tracks are remarkable for being almost perfectly in a straight line, as if the creature had but one leg; no Indian could step straighter. The stride is about a foot and a half. However it may be with some other supposed "fossil bird track" in the Connecticut valley sandstones, these certainly are no tracks of the labyrinthon or any other ancient frog; they are bird tracks.

One slab bears the impress in relief of the longitudinal half of a tree trunk, seemingly, according to most observers, a hickory tree—for its shaggy bark and its very texture are wonderfully preserved. The slab was ten feet long, and bore the cast of the tree all the way, but this specimen is but three feet long—the part of it having been cut off at the quarry.—*Granite Cutters' Journal*.

MACHINERY for SALE

Milling Machinery that has been in use at a gold mine is offered for sale. The entire machinery referred to is said to be in good order and will be sold at a bargain to anyone having use for it. Particulars can be obtained on application to the publishers of the CANADIAN MINING REVIEW.

TEAM DRILLERS, MINING CAPTAINS AND MINERS.

Frequent enquiries are made at this office for men who understand running Steam Drills, for Mining Captains and Practical Miners. Such men who are out of employment may find it to their advantage to forward name and address, mentioning the class of work they are qualified for, etc., to the CANADIAN MINING REVIEW, Union Chambers, 14 Metcalfe Street, Ottawa.

PHOSPHATE PROPERTY

For Sale in North Burgess.

Mining Rights of $W\frac{1}{2}$ of 13, in the 5th range. About 100 tons of very high grade Phosphate have been shipped from this property. Will be sold to an immediate purchaser for \$750. Apply at the office of the MINING REVIEW.

PHOSPHATE PROPERTIES FOR SALE

IN THE TOWNSHIP OF WAKEFIELD.

Mining Rights on $S\frac{1}{2}$ of Lot No. 16, in the 1st Range.
 " " on Lot No. 23, in the 2nd Range.
 " " " No. 26, in the 4th Range.
 " " " No. 20, in the 5th Range.

The fee simple of Lots Nos. 22 and 23, in the 4th range, (400 acres). All these lots have been carefully explored by experts and very favourably reported on; they are virgin properties and in the heart of the Phosphate Belt. For other particulars and price apply to the office of the MINING REVIEW.

FOR SALE.

THE MINING RIGHTS ON
1,000 ACRES
 OF
PHOSPHATE LANDS
 SITUATED IN THE

Township of Hull, Province of Quebec
 All of which have been carefully selected and have excellent shows of

PHOSPAHTE.

The price asked for these lands is

\$5 PER ACRE

And at this rate parties can purchase lots from 100 to 1,000 acres. Specimens on view, and all information given at

F. FOOKS'

Mineral Agency,

307 and 309 Wellington St.
OTTAWA.

ALSO THE

Phosphate Lot No. 30

In the 8th range of the Township of Wakefield, containing

100 ACRES.

Price \$1,000. (This is the property of Mr. Farley of Hull.)

Apply to

F. FOOKS.

(Address as above.)

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and out-croppings of fine quality of Graphite. Price \$1,000. Further particulars to be had at the office of the MINING REVIEW.

**NOTICE TO CONTRACTORS**

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Departmental Building, Ottawa," will be received at this office until WEDNESDAY, the 12th day of September next, inclusive, for the erection of a

DEPARTMENTAL BUILDING,

AT

OTTAWA, ONT.

Plans and specifications can be seen at the Department of Public Works, Ottawa, on and after MONDAY, the 20th instant.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honourable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party declines to enter into a contract when called on to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS,

Secretary.

Department of Public Works,
 Ottawa, 14th Aug., 1883.

**DEPARTMENT OF PUBLIC WORKS.****AUCTION SALE.**

Public Notice is given that under instructions from the Honourable the Minister of Public Works, there will be offered for sale by Public Auction—A. B. Macdonald, Auctioneer—at the Pump House, at the foot of the Rideau Canal, Ottawa, at 2 o'clock p.m. sharp, on Saturday, the 1st September next, the Machinery which supplied the Parliament and Departmental Buildings with water previous to the completion of the Ottawa Water Works, and which would be capable of efficiently supplying any small town, mill or manufactory.

This Machinery to be sold consists as follows:—

A Horizontal High Pressure Engine 14 inches diameter and cylinder, and 30 inches stroke, two double acting pumps, each 6 inches diameter by 24 inches stroke.

The machinery will be sold in one lot as it stands now in Pump House, at the foot of Rideau Canal, in the city of Ottawa. The whole to be removed by the purchaser at his own cost, within 14 days from date of sale.

The terms will be 25 per cent. of the purchase money to be paid on day of sale, and the balance within four days thereafter.

The machinery can be seen at any time, and a detailed catalogue of the various machinery has been prepared, and will be had on application to A. B. Macdonald's office, or at this Department, on and after the 9th instant.

By order,

F. H. ENNIS,

Secretary.

Department of Public Works,
 Ottawa, 7th August, 1883.

ADVERTISING RATES—15c. per line (12 lines to 1 inch).

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

CANADA'S 'PHOSPHATE INDUSTRY.'

Reports received during the month from the phosphate mines in the County of Ottawa are of a very satisfactory nature, and the output continues to be appreciably in excess of any previous year. The temporary dullness of the market has in no way affected the conviction of miners that prices will improve by the time manufacturers abroad are prepared to make contracts for next season's shipment; this is evidenced by the activity prevailing at the mines and the determination of owners to increase their facilities for

raising ore. There has been no noticeable falling off in the number of men employed, except in isolated cases and under extenuating circumstances. Several new mines have been opened during the past month, but, as yet, there has not been sufficient work done to warrant any detailed account of prospects or even a description of the properties. Some of them have, however, paid from the surface, and continue to improve. The weather has been everything that could be desired for the profitable prosecution of work, and it has been fairly taken advantage of.

The analyses of shipments to England during the summer show that the output sent forward was of a higher standard than that of any former season, which goes to prove that miners have begun to appreciate the importance of shipping their mineral in as high a state of purity as can be arrived at by hand manipulation. The extra labour employed in careful cobbing is insignificant compared with the advantage to be gained by raising the analysis of a shipment two or three units; not only is there immediate benefit derived, but it has a tendency to facilitate negotiations for future sales.

A party of English gentlemen, more or less interested in mining matters at home, visited some of the phosphate mines in this neighbourhood, and in the vicinity of Perth, and expressed themselves much interested in the industry. No doubt we will hear from them again, as they were very careful in collecting statistics and all information and data that would enable them

to speak intelligently on the subject when they returned to England. These gentlemen had no idea that phosphate mining in Canada had assumed such proportions, which is fresh evidence that this important Canadian industry is known abroad but to the few. There is capital in England awaiting investment that will be sent to Canada for the development of any legitimate enterprise, and it is the duty of everybody, directly or indirectly interested in our phosphate industry, to do all in their power to establish it on a sound and permanent basis. Lack of capital to develop the natural wealth of Canada has been the cry for years. Let Canadians prove themselves worthy the confidence of capitalists outside of the Dominion, and the requisite means will be forthcoming.

THE MINES.

Owners of mines express themselves satisfied with the result of the month's work, many of whom are forwarding their output regularly to the Canadian Pacific Railway Stations, while others, not so conveniently situated, are allowing theirs to accumulate, awaiting winter transportation.

THE "HIGH ROCK" MINE

continues very productive and the openings are developing with that regularity which has already established the character of the mine. About 15 tons are being raised daily, and the ore is of a high grade. This property has much increased in value in the hands of its present owners, whose manager, Mr. A. McIntosh, appears to understand his business and to watch the interest of his employers beyond the ocean.

THE "DUGWAY" AND "STAR HILL" MINES

owned by the Union Phosphate Mining & Land Company, though more recently opened, are keeping pace with "High Rock" and their daily output is much the same. The ore raised on this Company's property is very pure, and a quantity has already been delivered at Buckingham station—it appears to have been carefully picked over and has been forwarded in a clean state. The many openings which have been made on the location are developing most satisfactorily, and are confined to but a small portion of the Company's territory. Money has not been spared in equipping the mine with appliances most suitable to this class of mining, and everything connected with it is of a substantial character.

THE "NORTH STAR" MINE,

formerly worked by a firm of contractors, is now being developed by its owners, the Dominion Phosphate Company, with encouraging prospects. The mineral at this mine is the purest that has been raised from any part of the County, free from admixture with impurities, with which Canadian apatite is so frequently associated, and which adds to the cost of cleaning up. Mining operations are being conducted by Mr. W. H. Smith, a practical and shrewd superintendent, and the general management of the work is carefully attended to by Mr. Huntton, Managing Director of the Company. The amount of phosphate being raised is limited, as the force is employed, exclusively, in making a second open cut before attacking the body of ore, but, in doing this, a considerable quantity of phosphate has been met with, the value of which will reduce the cost of dead work to a minimum.

THE "EMERALD" MINE,

now the property of Mr. W. A. Allan, of Ottawa, is, without doubt, the most valuable phosphate mine yet discovered in

Canada, not only on account of the quantity and purity of the mineral, but from the fact of its being the most conveniently situated mine, within a stone's throw of the navigable waters of the Rivière du Lièvre, and not more than ten miles distant from the railway station. During the summer, each day's output has been sent forward, and in the winter season it will be delivered for about one-half the cost to other miners. There is, comparatively, but a small force of men employed at the mine, and yet the daily output amounts to 20 tons, and the body of ore in sight measures several thousand tons; in fact the wall has not yet been reached in any direction, and the bottom of the pit shows solid mineral.

THE "McLAURIN" MINE.

Of this mine little can be said that is not already known to people in any degree interested in the phosphate industry of this section. For some years past the repeated reports of practical men have characterized it as a property of great value and it continues to deserve the enviable reputation it has earned. Ever since it fell into the hands of its present owners a uniform annual output has been sent forward, and shipments have invariably analysed 85 to 86 per cent.

THE "POST" MINE.

situated in the Township of Templeton, not far distant from the McLaurin property, is sending a quantity of very fine phosphate to the front, and the mine is looking well; a large quantity of mineral is in sight, and development shows the deposit to be one of considerable extent and of a solid character.

OTHER MINES

continue to improve with development, and prospects are reassuring to their owners. The "Gemmell," the "Haldane," the "Jackson Rae," the "Moore," the "International" and many less important, and more recently opened mines are carrying on active operations; in fact from end to end of the County of Ottawa phosphate mining is being established on a permanent basis, and the force employed aggregates about 450 men, distributed, approximately, as follows: "High Rock" 70, "Union Phosphate Mining and Land Company" 60, "Emerald" 30, "North Star" 12, "Chapleau" 20, "Philadelphia Company" (Portland East) 20, "McLaren" 15, "French Company" 40, "McLaurin" 30, "International"

10, "Jackson Rae" 15, and at other mines about 100. A report has come in that the "Moore" mine in Wakefield, is opening up well, and that recent stripping has exposed large bodies of phosphate. This is comparatively a new mine and is capable, no doubt, of being vastly improved. With further development it will, of course, increase in value.

2nd Quality Phosphate.

A large quantity of low grade phosphate is lying at the mines, and many hundred tons have been delivered at point of shipment, but owing to there being no demand at present for "seconds," it is not being forwarded. This grade of ore is the refuse of the mines, or so mixed with rock and other impurities that miners have found it more profitable, while they had a market, to sell it at a low price than to pick it over and cob it. The demand having ceased, Mr. Allan, who has a large quantity at Buckingham Station, has set men to cob and clean up so as to raise it to the standard of first quality. This is unquestionably a wise move, and others might do well to benefit by the example.

Phosphate Quotations.

Prices have taken another drop and Canadian apatite is now quoted in London at 1s. for 75 per cent., which is equivalent, all charges accounted, to \$15 per ton at points on the Canadian Pacific Railway, for 80 per cent. mineral. The cause of this drop is not attributable to any special cause, and those who can afford to hold will unquestionably realize better prices for next season's delivery. Manufacturers in Europe are not anxious to buy at present, and recent sales have been made under pressure.

Transportation of Phosphate.

Messrs. Allen and Bothwell, owners of one of the steamers on the du Lièvre, are building a scow of 60 tons capacity for the accommodation of miners up the river. It is their intention to contract with owners of mines to deliver their output, during the season of navigation, at the Buckingham landing, from whence it will be forwarded to the railway station or Ottawa River in waggons, a distance of 3 and 4 miles respectively. The steamer, with the scow in tow, will make a daily trip to High Falls, and this extra facility for transporting ore will, undoubtedly, be a great convenience to the owners of phosphate mines contiguous to the river.

Weighing Phosphate.

Mr. R. Smith, agent of the High Rock Mine at Buckingham Station, is about to erect a Fairbank Scale at the entrance to the yard for the

accommodation of shippers. Herebefore the phosphate hauled to the Canadian Pacific Railway has been weighed in the waggons or sleighs at the village of Buckingham, and afterwards forwarded to the station. This has always been looked upon as risky, there being no check on teamsters after their load had been weighed until it was deposited in the bins at the railway, and, as it had to be carried quite 3 miles, the opportunities and temptations for dishonesty have been manifold. The proposed scales at the station will circumvent any contingency of this nature and, as they will be so erected that teamsters will drive on them on entering the yard and continue thence to the bins, they must prove a great convenience, and will supply a want long and seriously felt.

ANALYSES.

HOW SAMPLES OF PHOSPHATE ARE SELECTED FOR ANALYSIS IN ENGLAND AND ON THE CONTINENT.

As many of our readers are unaware of the *modus operandi* for the proper selection of samples from shipments of our phosphate for analysis, we herewith furnish full details of the manner in which it is carried out. The phosphate is discharged over the vessel in a shoot on to a wooden staging, from whence it is wheeled in barrows over the weighing machine, and then on to the warehouse. Every hundredth barrow load is, after being weighed, run into a small bed close by, the floor of which is stone, well swept, and quite dry and clean. The whole of the sample is well mixed together and put through a crusher, after this the sample is divided, and half put through the machine again; then, after well mixing, a tenth part is put through the machine, after which the sample is again divided in tenths, and one portion filled into clear dry glass bottles, sealed, and forwarded to the chemists selected for analysing. This information is given to us by one of the largest exporting houses in Montreal.

IMPORTANT SALE.

Mrs. E. W. Murray, of Buckingham, has sold her half interest in the "Emerald" mine to Mr. W. A. Allan, of Ottawa, for the handsome sum of \$40,000 in cash, the money having been paid on the 21st inst. Mr. Allan, who was part owner with Mrs. Murray in this mine, is now the sole proprietor of the most valuable phosphate mine in Canada, and has by this purchase added one more to the list of valuable mines of which he is the fortunate owner. He is to be congratulated on acquiring the proprietorship of this property, and Mrs. Murray has been very fortunate

in realizing such a handsome sum, in cash, for that portion of her late husband's estate which could not receive her personal attention.

ROADS.

Again it becomes necessary to direct attention to the bad condition of the road leading from Buckingham Village to the Railway Station. Shippers of phosphate are crying out for improvements, of a substantial and permanent character, that would render traffic more practicable. The owners of mines whose output must find an outlet over this road have, time and again, expressed a willingness to co-operate with the municipal authorities in making the much required improvements, but there has been no disposition shown to meet them half way. The amount of freight in the shape of lumber, phosphate and farm-produce that is daily hauled from the village to the railway is very great, and no temporary patchwork, such as has been done at odd times, since last spring, can be expected to stand the wear occasioned by such traffic. The wet fall weather is approaching, and, unless prompt attention is given to putting the road in good order, it will shortly become impassable for heavy freight. Let the ratepayers of Buckingham combine with the phosphate miners to devise some means of inducing the corporation to give attention to such important requirements of the municipality.

A NEW INDUSTRY

For the County of Ottawa.

That the articles which have appeared from time to time in the Review, setting forth the importance of the Canadian phosphate mining industry, are having a good effect, is made apparent by the many letters, asking for further information on the subject, which have been received, from the United States and England, at the Review office. We are now in receipt of communication from some scientific gentlemen, experienced in mining and treating minerals, asking for our views on the feasibility of, and the advantages that might be expected to attend, a new enterprise which they propose to inaugurate in connection with our phosphate industry—which is as follows. They propose to form a company with sufficient capital to enable them erect crushing and concentrating mills, with a view to the utilization of the waste phosphate rock which so rapidly accumulates about the mines. These gentlemen are holders for Canada of the patent of Paddock's Pneumatic Ore Separator and they profess to be able to utilize all rock containing 75 per cent. down to 20 per cent. of phosphate, and, by means of crushing and concentrating, to bring it up to 85 per

cent. standard. Their machine has been successfully in use for all kinds of minerals, and phosphate, though but experimentally, has been treated by it with success. The extensive graphite concentrating mills at Tyconderoga use this machine exclusively.

The phosphate rock treated by the above process, would of course be pulverized, and our correspondents state that it would ultimately be to the advantage of the Company to add plant for the manufacturing of super-phosphate.

This is a matter well worth the attention of owners of mines, and we will be obliged to them if they will formulate their views as to the practicability of conducting such an enterprise on a paying basis, and forward them to the REVIEW. Much will depend on the quantity of waste rock as above described; the intention of the promoters would be to purchase from owners at the mines or mill, and to treat it as their own property. They appear to be quite confident that, if the quantity of raw material can be had to keep the mill working, the Company would experience no difficulty in paying handsome dividends. We are of opinion that such an enterprise would be of enormous advantage to miners, as it would not only free their properties, to a great extent, of waste heaps, but would provide a convenient market for their second, third and lower grade ore.

MONTREAL HOUSE, BUCKINGHAM.

People who are interested in mining in the valley of the Rivère du Lièvre, and who have occasion to visit Buckingham, will regret to hear that Mr. J. W. Lynch, the popular proprietor of the Montreal House, will shortly retire from the business of hotel-keeping. For many years his house has been a favourite stopping place for mining men, and though it may fall into other hands, its former genial proprietor will be greatly missed. Mr. Lynch is now, and for sometime has been, Superintendent at the Emerald Mine, and has become so interested in his work, that it has effectually weaned him from any attachment he may have had for his former occupation. He takes with him the best wishes of all his old patrons.

MICA.

The production of mica promises to become one of Canada's important mining industries. During the past few months much attention has been given by explorers to searching for this mineral, and innumerable deposits have been discovered; many of these have proved to be valueless, some on account of its not appearing in paying quantities, and others owing to the inferior quality of the mineral. Some valuable

veins have, however, been found, carrying crystals from which large sheets of clear white mica can be obtained. One such vein occurs in the County of Ottawa, and, although the work of developing it has not yet been started, the surface indications are such as to allow of no reasonable doubt as to the quantity of marketable mica that can be mined. The specimens sent to this office with a description of the geological formation and diagram of the vein, lead to the belief that this property is one of great value. Another vein, though occurring in a different formation, is now being opened at a point on the Upper Ottawa, and the mica is above the average in point of size and clearness. The vein, which is well defined between granite walls, is of fair width at the surface, and extends for several hundred feet in length. What little work has been done on the vein goes to show that the crystals increase in size and are more compact below the surface, while the sheets become almost free from discoloration. But little more work on this property will be necessary to establish its value, and mica mining, once successfully begun, will rapidly become an industry in the district of as great importance as the mining of any other mineral.

THE HAYCOCK IRON MINE.

Negotiations with the English capitalists for the reorganization of the Ottawa Iron and Steel Manufacturing Company, and the resumption of work at the mine, have not yet been concluded. Every detail connected with the proposition that has been made to them is being carefully considered, and a thorough examination of the property by experts, sent from England for the purpose, has satisfied the people in England of the correctness of the statements and reports that have been laid before them. In view of this, it would be unreasonable to anticipate any hitch, and it is not unlikely that satisfactory terms will be definitely agreed upon within a short time, and the nature of same publicly announced.

NEW DISCOVERIES.

A report has reached us of a recent valuable discovery of silver in the Township of Grenville, County of Argenteuil, but we are not informed as to whether it occurs in native form, argentiferous galena, or as sulphuret of silver ore. Further particulars of the discovery will be looked for with much interest.

Recent discoveries of phosphate deposits in Florida have been purchased by the Ashley Phosphate Company, of Charleston, S.C., who value the property at a high figure, not only on account of the extent of the deposits, but owing to the grade

of the mineral, which has been pronounced superior to that of South Carolina.

Phosphate has also been discovered in North Carolina, similar in composition to the deposits of South Carolina. It is found to occur in the same formation and has been traced to various points in the State. No mining has yet been done and the extent of the deposits is therefore not determined.

Phosphate mining in the Southern States will in no manner affect the industry in Canada, as the mineral, which is of a much lower grade, averaging not higher than 50 per cent., finds a different market, and dealers have not yet been known to be in competition with shippers of Canadian apatite.

MINING NOTES.

Manitoba and Nova Scotia Gold Mines.

Rat Portage, District of Keewatin.

The contract work has been completed on the Minnisabic, and Messrs. Rideout and Gibbons are more than satisfied with the results.

The "Lake of the Woods Company's" property has for some time been idle, but hopes are entertained that work will be commenced on it within a few days.

The "Argyle Company" are steadily working on their property, and proving that, although far from being the richest vein on the lake, it is a good location, and will amply repay the work done.

The "Winnipeg Consolidated" have put in the water pumps and have placed in their mill the Caldwell Grinder and Amalgamator, by which it is expected to take over \$50 per ton out of the ore. The shaft is down 114 feet, and the vein is widened out to 6 feet.

The "George Heenan Company" are jubilant over the acquisition of a new mine, the "Red Star," said to be the mammoth vein of the lake. It is 40 feet on the face and at some points across the island measures 80 feet. The pyrites contains 23 $\frac{2}{3}$ per cent. of copper and \$118.93 in gold. Where the vein matter does not carry copper, it runs \$15 to the ton. Five dollars a ton will both mine and mill the rock. A number of Chicago capitalists are expected to take hold of the property. —*N.Y. Mining Record.*

The correspondent of the CANADIAN MINING REVIEW at Rat Portage, reports that, comparatively speaking, mining matters are dull in the district owing to the scarcity of money necessary for further development, rather than to any depreciation in the value or richness of the mines.

Nova Scotia.

OXFORD GOLD MINE.—The clean-up for the last week of August resulted in 114 ounces from 30 tons of ore, or about \$80 per ton.

SALMON RIVER MINE.—A bar of gold weighing 300 ounces and valued at about \$6,000 was the result of work at this mine during the month of August.

The "Sydney and Lewisburg Coal and Railway Company" has recently engaged in the manufacture of iron from the Cape Breton Island ore. The ore, as well as an inexhaustible amount of coal, is in large quantity on the island.

BRIDGEWATER.—A bar of gold weighing about 70 ounces has recently been forwarded from newly discovered lodes near Bridgewater, Lunenburg County. It is said to have been taken from 600 pounds of quartz, selected out of four or five tons of ore. If this statement is correct it would appear to yield a minimum of fourteen ounces per ton, which, if maintained, at once stamps the new field as one of the most valuable in the province. —*Ibid.*

BRUNSWICK G. M. Co.—This company is one of the few mining companies that seem to conduct their business on true business principles, and bids fair to be very remunerative to those interested. The property is a mile in length, 1,000 feet in width, with a 10-stamp mill, 30-horse-power engine, with buildings for the miners, blacksmith shop, etc., all in perfect condition. Their close proximity to Halifax by water enables stores, etc., to be cheaply and quickly transported. Three shafts are being sunk on the lode, and, although rich from the start, is improving in depth. Since the cleaning up in August the mill has been running on rich ore, and the plates indicate more than satisfactory results. Owing, no doubt, to judicious management this company's property appears to be one of the best paying mines in Nova Scotia. Two bricks, weighing 115 and 112 ounces respectively, have recently been forwarded from the mine to the head office of the company.

COXHEATH.—According to reports, work has been temporarily stopped at this copper mine. This is said to be in consequence of the large quantity of ore which has already been raised and hauled, the company not having fully decided whether to ship the ore abroad or have it smelted at Cape Breton. The mine is situated near Sidney, C.B., and, as has already been stated in the REVIEW, is owned by Bostonians. Reports of progress received lead to the conviction that this temporary suspension is attributable solely to the cause above mentioned and not to the development of any weakness in the mine.

IRON.

The quantity of iron ore that has been exported to the United States has been the means of establishing a reputation for the product of Canadian mines and, as a consequence, the sales of many iron locations have been reported. Information has been received, from an authentic source, to the effect that a number of Cleveland gentlemen, having formed a syndicate, have placed a large amount of money in iron mines in the Province of Ontario. The *New York Engineering and Mining Journal*, thus speaks of their prospects: "The iron range is 90 miles inland from Lake Ontario, and the area is supposed to be in the neighbourhood of 60,000 acres, part of which, however, is owned by Canadian and New York capitalists. The mines will be

reached by the Central Ontario Railway, which is now in course of construction, and which will have the entire monopoly of the carrying trade of all the mines. The terminus of the road is on Weller's Bay, the best harbour on Lake Ontario, and only 60 miles distant from Oswego, and about 36 miles from Rochester (this should be about 70). Extensive docks and ore-pockets have been constructed to facilitate the shipment of ore to the United States. The ore outcrops at considerable elevation, and, in order to secure a large output from the mines that have been started, it will not be necessary for some time to erect expensive plant. The mines have already been located, and the output the first year the road is completed will be somewhere in the neighbourhood, it is thought, of 100,000 tons. The whole matter is yet in such a shape as to give very little idea of the resources of the beds. It will be some time

before the Central Ontario Railway is completed, and until then operations cannot be commenced. Samples taken from a number of localities on the range show magnetic and Bessemer ore of the finest quality. The Cleveland syndicate starts out with a capital of \$2,000,000."

This augurs well for the future development of the iron mines in the district referred to, and, as the gentlemen composing the syndicate have already invested a very large amount of money in the construction of the extension of the Central Ontario Railway, it is more than probable that work at the mines will be vigorously pushed, as the ore will be the principal freight carried on the road, and its main support.

The extension of the Kingston and Pembroke Railway, now in course of construction, penetrates a section of country where extensive deposits of magnetic and hematite iron ore have been discovered, and

which have attracted much attention since the location of the railway through the district. In the Township of Bagot, the ore carries a high per centage of metallic iron and the outcroppings indicate almost inexhaustible deposits; analyses show the ore to be exceptionally free from objectionable features, and there exists little doubt in the minds of experts that the locality lying to the north of Kingston, and traversed by the above mentioned railway, is capable of producing iron ore of as high grade and in as great quantity as any other section of Canada. The lake terminus of the road at Kingston is not more than 65 miles from Oswego, so that the mines will be conveniently situated for transportation of ore to the United States. A number of deposits have already been located in this section, and it is not at all improbable that active mining operations will be begun within a short time.

ANALYSES OF CANADIAN IRON ORES.

The following tables, compiled from different sources, will serve to illustrate the composition of Canadian magnetic and hematite ores.

A GREAT MINE'S OPERATIONS.

(From New York Mining Record).

At the recent meeting of the shareholders in Boston of the Calumet & Hecla Copper Mining Company, 81,490 out of 100,000 shares were represented; the old board of trustees was unanimously re-elected. It consists of Alexander Agassiz, Quincy A. Shaw, H. H. Hunnewell, George Higginson, James N. Wright, all of Boston or its suburbs, except Mr. Wright, of Michigan.

At a subsequent meeting of the directors, Alexander Agassiz was re-elected president, and Chas. W. Seabury, secretary and treasurer.

According to the financial statement, \$1,250,000 has been paid within the financial year ending April 30th, for 120 acres of land purchased—a property worth to the company more than \$5,000,000. The opening on the south part of the property is being done "little by little" and the product of 50,000 tons of rock, secured in opening, has paid a profit of about \$20,000. This new property will come in as a "reserve" when the old mine is "worked out," but in making this statement, President Agassiz did not name any particular date for that event of the future. Included in the extra expenses was the purchase of a large tract of timber and for the use of the mine, which is now well supplied. They are using less and less wood for fuel, coal being substituted, and the principal demand for that purpose now is the supply for family use. The demand for timber for use in the mine, is naturally large.

The following statement of the assets and liabilities for three years, will give a condensed view of the general results of its business.

ASSETS AND LIABILITIES.

	1881.	1882.	1883.
Total assets.....	\$3,151,790 38	\$3,912,038 26	\$2,438,674 11
Less liabilities.....	668,914 24	432,725 70	452,849 58
Surplus May 1.....	\$2,882,876 14	\$3,479,312 56	\$1,980,824 53
Div. due May 15.....	500,000 00	500,000 00	500,000 00
Actual net surplus.....	\$2,382,876 14	\$2,979,312 56	\$1,480,824 53
Increase or dec.....	dec. 31,795 58	inc. 596,436 42	*dec. 1,498,488 03
Profits of year.....	\$1,968,205 42	\$2,596,436 42	*See note.
Dividends paid.....	2,000,000 00	2,000,000 00	\$2,000,000 00

The annexed statement of the product of the mine for four official years, given in monthly figures, as actually smelted, shows the magnitude of the property and its resources, being more than an average of 1,310 tons of ingot per month in 1882-83.

	1879-80.		1880-81.		1881-82.		1882-83.	
	Tons.	lbs.	Tons.	lbs.	Tons.	lbs.	Tons.	lbs.

November.....	1,617	320	1,665	1,304	1,652	173	1,708	1,309
December.....	1,737	1,253	1,703	1,570	1,734	252	1,530	1,824
January.....	1,761	1,557	1,659	207	1,691	1,432	1,655	1,195
February.....	1,519	951	1,435	1,835	1,713	1,799	1,518	1,699
March.....	1,733	164	1,710	1,496	1,908	707	1,935	1,908
April.....	1,701	972	1,881	1,797	1,901	353	1,713	1,067
Total.....	18,465	1,616	20,290	1,137	20,905	1,187	20,392	1,480
Per cent.....	77.32		77.86		76.95		77.06	
Ingot, tons.....	14,277	1,435	15,797	1,300	16,094	1,985	15,714	258
Ingot, pounds.....	28,555,425		31,595,300		32,189,985		31,428,258	

The above figures are given in a manner to conform to the fiscal year of the company, which ends April 30th. Annexed are the figures for the first six months of each calendar year from 1879. The figures given are officially smelting returns, which run about five per cent. ahead of the product, as published each month.

	1880.		1881.		1882.		1883.	
	Tons.	lbs.	Tons.	lbs.	Tons.	lbs.	Tons.	lbs.
January.....	1,751	1,557	1,152	207	1,691	1,431	1,655	1,195
February.....	1,519	951	1,435	1,835	1,713	1,799	1,518	1,699
March.....	1,733	164	1,710	1,496	1,908	707	1,935	1,908
April.....	1,701	972	1,881	1,797	1,901	355	1,713	1,067
May.....	1,713	1,528	1,764	1,019	1,906	1,610	1,915	1,977
June.....	1,727	953	1,713	898	1,609	1,840	1,740*	1,558
Total mineral.....	10,147	125	10,208	7,252	10,728	1,742	10,480	1,404

*There is an apparent decrease in assets of \$1,498,488.03, and the net profits of the year would appear to be only \$501,511.97, against \$2,000,000 paid in dividends, but \$1,250,000 was paid for lands purchased last year, and probably \$100,000 to \$150,000 additional extra expenses.

*Five per cent. added to the June product which the smelting return will over-run to that extent.

THE GOLD FIELDS OF CANADA.

Gold mining in Canada is, for the most part, in its infancy, and her gold fields are not yet in a position to admit of a fair comparison with those of other countries where all the appliances which art, experience and money can bring to bear have long been in operation. Until within a few years ago our miners were unskilled and the machinery employed at the mines was of the most crude and cheapest description. This state of affairs is, happily, giving way to the introduction of modern machinery, while the management of the mines is being transferred to practical and scientific men, and the result will soon be felt. From the Atlantic to the Pacific Oceans, in every province of the Dominion, excepting Prince Edward Island, gold has been discovered to exist in paying quantities in auriferous alluvions and in quartz. In

Nova Scotia

the discovery of gold was first made known in 1860, and it has since been traced over an area of quite 5,000 square miles. The principal gold mining districts in this province are: Cariboo, Moose River, Fifteen Mile Stream, Gray's River, Lawrencetown, Montagu, Waverley, Oldham, Renfrew, Sherbrooke, Isaacs, Stormont, Wine Harbour, Tangier, and Mount Uniacke, while the existence of gold is reported in numerous other localities. In

New Brunswick

no gold mining has yet been done, though it has been discovered at several points on the coast, in Albert County and in the Tobique River, a northern tributary of the St. John. Indications lead to the belief that the quartz veins of the Province of Quebec extend across the central part of New Brunswick, in the direction of the Bay of Fundy, and this is not improbable. In the

Province of Quebec,

gold has been traced over an area of 15,000 square miles, bounded to the north by the Notre Dame Range of Hills, to the south by the International Boundary Line, and extending east and west from the headwaters of the Rivière du Loup (*en bas*) to Lake Champlain. Of this, about 4,000 square miles are the richest, and contain the metal in the form of alluvial gold, quartz and gold bearing black sand. This area embraces the beds of the Rivers Chaudière, Des Plantes, Gilbert, Famine and Du Loup (*en haut*) where alluvial gold mining was carried on in a primitive way for years at a fair profit. The gold fields of this province are capable of yielding metal at a fair profit if they were in the hands of experienced and practical men with the means to enable them to prosecute mining operations to the best advantage. In the

Province of Ontario,

the region embracing gold is supposed to extend from Madoc to the

northern shores of Lake Huron, but the richest and paying deposits occur in the Townships of Madoc, Elgin, Hungerford, Marmora, Lake and Tudor. There are no alluvial deposits in this district, the gold appearing in brown ferruginous earth in crevices of the rocks, in quartz and sulphurets and associated with antimonial grey copper ore. Further to the west, in the Province, it is thought probable that gold will some day be added to the mineral riches of Lake Superior, and already active gold mining operations are being carried on on the Lake of the Woods, and at Rat Portage, with most promising indications. The last mentioned locality is in disputed territory, and may some day belong to the Province of

Manitoba,

where important gold leads have been found during the past few years. Prospectors are still busily engaged in exploring the Province, and new discoveries are almost daily reported. Some valuable mines are being already worked, at which expensive machinery has been erected during the past summer, and gold mining in Manitoba bids fair to becoming an important and very profitable industry. In the

North-West Territory,

traces of gold have been found a short distance south of Great Whale River, on Dog Island, near Cape Jones, and in the Little Whale River Valley. On the North Saskatchewan gold is found, more or less, below the mouth of the Brazeau, on the bars and in the river banks. It occurs in the gravel in the bed of the South Saskatchewan, about Edmonton and in the Peace River district. In

British Columbia,

it may be said, without exaggeration, that there is scarcely a stream of any importance in the Province in which the "colour" of gold cannot be found. Its discovery, first made known in 1858, led to the influx of miners during that and the following year. Gold, thus the first cause, attracting attention to the country, has ever since been an important factor in its prosperity. The Cariboo, Kootenay, Omineca, Cassair, and the Fraser River districts, as well as the Leech River district in Vancouver Island, have been the chief centres where gold mining has been carried on. The alluvial deposits have so far absorbed the mining energy of the country, but attention cannot be too soon or too carefully directed to the more permanent quartz mining, as it would give a more reliable character to the industry and would indirectly tend to cheapen labour by affording steady employment. In the discovery and development of her gold mines, British Columbia has laboured under many disadvantages, such as their inaccessibility and the cost of labour and supplies. The condition of the Province is rapidly changing, however, and the

increased facilities for communication, together with the rapid growth of farming settlements, will do much towards removing many of the difficulties which have heretofore retarded the development of the mining interests.

LAKE SUPERIOR COPPER MINES.

The multifarious uses for which the mineral can be employed and the cheapness of its production renders copper-mining one of the most lucrative fields for capital, and the Lake Superior region is being proved one of the most productive of this metal. Hitherto our neighbours in Michigan have carried off the palm for copper production, but there are indications that Canada has entered the lists, and that she will make a fair exhibit before many years is not at all improbable.

Two English companies have commenced the development of the native copper deposits on the north shore of Lake Superior viz: "The Michipicoten Copper Company," at Michipicoten Island, and "The Lake Superior Native Copper Company," at Mamainse. These companies have been engaged during the past eighteen months in equipping their mines where mining operations have, so far, met with most flattering results. Each company has expended over two hundred thousand dollars on its property, and they have now reached the point when handsome returns will reward them for their large outlay. The crushing mills and dressing floors at Mamainse will be in operation this month, and we learn that sufficient ore is in sight to keep the stamp mill running for two years, while new ground is being opened. This company expects to double the capacity of its mill next spring by the addition of a ball stamp. About 160 men are employed at this mine; a post office has been established, and the number of buildings that have been erected for the accommodation of the employés and other uses, present the appearance of a village where, but a short time ago, a barren wilderness existed. The steamer *Steinhoff* has recently been purchased by the company; she is capable of accommodating sixty to eighty passengers, as well as about two hundred tons of freight, and will ply between the mine and Sault St. Marie, and probably Michipicoten, supplying a want long felt by fishermen and miners in the vicinity.

"The Michipicoten Company," although somewhat more tardy in getting its crusher in operation, gives assurance of a prosperous future, if we may judge from the mineral now being taken from the shafts, specimens of native copper ore from which, weighing from $\frac{1}{4}$ to 10 and 12 lbs., have been received at the office of the Managing Director, in Montreal, where we had the opportunity of inspecting

them. This company has all its surface work completed and is now directing its attention to opening up the mine, where about 60 men are employed. We are informed that the company purposes starting its new Crushing Mill next spring, by which time sufficient ground will have been opened to insure its continued working.

Both of these companies are prosecuting their mining operations with the most approved rock drills and air compressors, with which treble the amount of work can be accomplished, in the same time, as formerly. We will keep our readers informed, from time to time, of the progress of this important industry, the value of which, to the country, can scarcely be overestimated. The successful prosecution of mining in, and the extension of railway facilities to, the Lake Superior region is all that has been requisite to open up to capital and enterprise this extensive mineral field which, until now, has been looked upon as quite inaccessible.

TO ENGLISHMEN AND ANGLO-CANADIANS.

The Mineral Resources of Canada.

That Canada is, day by day, growing in importance, in the eyes of capitalists and scientists of other countries, as a field for the investment of foreign capital, is fairly demonstrated by a letter, under the above heading, which has recently appeared in the *Mining Journal*, London, England, as follows:—

SIR,—As this subject may interest many of your readers, I have forwarded you some practical hints, which may be turned to suit the requirements of the present time, so as to hasten the development of what may be the most valuable portion of Canada, and which has not been especially named by previous writers on mining subjects. You will see by the enclosed complimentary article of April 6th, 1878, from the *Mining and Scientific Press*, of San Francisco, that the opinions expressed in my "Explorers', Miners' and Metallurgists' Companion," published so far back as the year 1869, as to where extensive mining fields would be found on this Continent, have been, in all cases, fully realized in and across the United States on the several slopes of the northerly trending mountains and their foot hills, as therein more particularly named. The chief reasons for this present communication, are to show, so far as proved in the United States, even up to points very near its northern boundary, that these predictions have been practically demonstrated by innumerable operations and very large profits; secondly, to repeat these statements and call renewed

attention to the established facts that the same mountain ranges will carry similarly favourable analogy northward in their courses through British possessions.

The Americans are the best prospectors for mineral in the world, and have, during the period named above, performed an amazing amount of exploration work, and made many valuable discoveries. The trans-continental railway of Canada will enter into and cut its way across—or in a mining manner, coastwise—the whole mountainous portions of the country, and will soon enter the wide and most interesting mineral zones of the Rocky and Wasatch mountains, where intelligent observations and explorations will, in my opinion, cause Old England to be once more proud of Colonial wealth.

This field for mining, with mountains running over 1,000 miles northerly, the whole breadth of the Canadas, will probably extend across the longitudes of Western Dakota, Montana and Idaho, of the United States of America, but for lode or vein mining will not reach so far west as Cariboo in British Columbia, as the Sierra Nevada chain of mountains is thereabout broken and detached for a few hundred latitudinal miles. This does not prevent the possibility of auriferous discoveries in gravel formations, which are very likely to be found in many valleys that have received the water washed debris from the western declivity of the previously named mountains along the route. I have been frequently questioned by letters from England: Where is the best place to explore for minerals? and I answered both English and Canadians—Prospect the breadth of the Canadas on either side of the advancing railway, but more particularly opposite to Western Dakota, Montana and Idaho, for vein mining, and thence westward for gravel and placer gold, where vast mineral areas lie unexplored.

When this railway is sufficiently far advanced, the north and south branches of the Saskatchewan River, the Athabaska, and Peace Rivers, and the Rivers Laird, Peel, and McKenzie, will be found also convenient for both prospecting and power for mining this 1,000 miles long of the east slope of the Rocky Mountains, whilst the five branches for mining the head waters of the great Yukon River may be utilized for the north-western slope with its spurs and parallel range. A few brave and strong men may make immense fortunes along this range of mineral-bearing strata. I know of no other unexplored belt in North America that exposes superior inducements, and there is probably nothing on this continent but the unexplored eastern slope of the mighty Andes, which extends 4,000 miles from north to south through the several rich countries of Columbia, Ecuador, Peru, Bolivia, the Argentine Republic, and Patagonia;

but Canada has the great advantages of your own language, laws, and flag; whilst these are mostly inaccessible, and more particularly so to foreigners.

I have not the slightest interest in this matter beyond goodwill for my countrymen; but, having during the last 18 years travelled over North America, and studied its mineral formations as much as but few men, and feeling certain that this region will be found valuable, I perform this pleasant duty of publication.

J. S. PHILLIPS,

State St., New York.

August 4th, 1883.

The article referred to in the former part of the above letter as having appeared in the *Mining and Scientific Press*, of San Francisco, April 6th, 1878, was reprinted by the *London Mining Journal*. It gives Mr. Phillips much praise for familiarity with the geological condition of North America, evidenced by subsequent events which have so largely verified opinions advanced by him in his "Explorers', Miners' and Metallurgists' Companion," published in 1869.—[Ed.]

OTTAWA & GATINEAU VALLEY RAILWAY.

*The work of construction is being pushed ahead, and about five miles of the road-bed is already graded, notwithstanding that the Contractors and the Company have been severely handicapped by the many obstacles that have been thrown in their way by property owners along the line. Much difficulty has been experienced in acquiring the right-of-way in consequence of the unreasonable prices demanded for land. It would appear that the residents of that section of country to be traversed by the railway were indifferent to the many advantages they and the public at large will gain by having railway communication, and that they were ignorant of the fact that the construction of the road will enhance the value of their property to a very great extent. It would not have been expecting too much if the Company had looked for a free grant of the right-of-way from one terminus to the other, including the land necessary for station grounds; but they did not ask for this, and have been disposed to pay very liberally for all the land it is necessary for them to acquire, and that the progress of the work should be retarded by the exorbitant demands of property owners is to say the least, unreasonable, and shows a great lack of public spirit and an absence of fair and honest feeling on the part of those who have been instrumental in occasioning delay. That the road will be ultimately completed, despite a

obstacles of this nature, no doubt exists, and it is not at all unlikely that those very people who have been the prime movers in an endeavour to hamper and embarrass its promoters will derive the greatest benefits from the advantages and accommodation the railway will afford.

READ THIS!

(From the Chicago Mining Review.)

"The chief factor in the development of the mining industry of any locality is the unappreciated and usually poorly sustained local paper. The true value of mining claims, the advantage to capitalists, the rich strikes of well conducted properties all fail of their legitimate influence if the fact is not made known outside of the narrow circle of isolated localities. As important as is the local and special press to the mining interests, it has been proven in a thousand cases, no other business expects so much or pays so little to the very right arm of its success. Papers that have earnestly and faithfully laboured to attract the attention of capital and to build up on a permanent basis the mining industry of a camp, have been left to starve and die in the place that they have done so much to establish. No other business expects gratuitous advertising, and it is a short-sighted policy for miners and mining companies to neglect the best, and in many instances the only means that can be used to advance the interests of the camp and industry."

Subscribers to the CANADIAN MINING REVIEW are not as numerous as they might be, and correspondents are not prompt in reporting progress at the mines. We look for reform in both particulars. [Ed.]

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for a Breakwater, Prince Arthur's Landing," will be received until Thursday, the 25th day of October next, inclusively, for the construction of a

BREAKWATER

AT

Prince Arthur's Landing,
THUNDER BAY,

according to a plan and specification to be seen on and after Thursday the 4th of October, at Prince Arthur's Landing, on application to L. B. Archibald, Esq., Superintendent, Canadian Pacific Railway, and at the Department of Public Works, Ottawa.

Persons tendering are notified that tenders will not be considered unless made on printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Hon. the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 18th September, 1883.

OFFICE:
UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

CANADA is now, and for some time has been, making rapid strides towards the development of her mineral resources, and in almost every Province of the Dominion a vast amount of capital is employed in mining operations and in the reduction of the product of the mines. In Nova Scotia, Quebec, Ontario, Manitoba, the North-West Territories and in British Columbia, discoveries are made, almost daily, of economic mineral deposits, and foreign capital is not unavailable for their immediate development. As it has been in other countries, where mining is carried on to any extent, so has it been in Canada; many

mines have proved unprofitable and much money has been wasted through inexperience and the absence of suitable machinery for the proper treatment of the ores mined. That some, in fact many, of the properties, long since deserted might to-day be worked to advantage with the modern improvements in machinery and the facilities afforded by the advancement in science, there is not the slightest doubt, but a property once abandoned is afterwards looked at with suspicion, and it requires more than ordinary courage to endeavour to revive what has for years been looked upon as a "dead horse." Some mines, however, that had lain idle for a quarter of a century, have been reclaimed within the past few years, and work resumed with most satisfactory and encouraging results to those who were not tardy in seeing where the original operators had fallen into error and where discarded ores had become valuable under modern treatment. People of to-day who are disposed to engage in mining enterprises have many advantages that were denied the pioneers of the industry, from whose experiences valuable information can be derived. With the use of the Diamond Drill, prospecting can, in many localities, be reduced to a minimum of cost; steam drills and powerful explosives are important factors in the reduction of the cost of mining; recent scientific discoveries by chemists, metallurgists and mechanical engineers, render the reduction of ores less expensive, and the rapidly increasing demand, through the many new uses to which various minerals are applied, combine to increase

the value of the mines' production, and to offer better inducements for the investment of capital in mining enterprises of the present day than at any former period.

The mineral deposits of economic extent, that are distributed from ocean to ocean over the Dominion of Canada, comprise a large portion of her natural wealth, and the forming of companies and the importation of foreign capital, for the purpose of developing this wealth, should be with a view to the permanent working of our mines on a fair mercantile basis rather than with the expectation of reaping immediate fortune. Bonanzas are not to be found every day, but prospectors are ever searching with the hope that each day brings them nearer to fortune, in consequence of which mineral deposits of extraordinary richness are occasionally, though not frequently, met with.

It is but natural that, during a mining boom, people should be apt, under excitement of the moment, to exaggerate the importance of discoveries in which they are personally interested, but all those who have Canada's interests at heart should aid in suppressing the organization of wild-cat schemes and the operations of intriguing manipulators. If Canadian mine owners adopt an honest policy at the outset, in their transactions with the public, it will lead to the establishing of confidence abroad, and continued prosperity for themselves and their fellow countrymen will follow.

The Engineering and Mining Journal, New York, in its issue

of October 13th, publishes, editorially, as follows:—

"Those who have invested capital in the phosphate lands of the Province of Ontario are considerably alarmed at a recent decision in the Quebec courts. The Local Legislature had passed an Act cancelling the title to certain Crown Lands, on the ground that the necessary settler's improvements had not been made, and had sold them as phosphate lands. This Act has now been set aside by the courts, and, should their decision be sustained, on appeal, by higher courts, the titles, under which many phosphate mines are worked by American capital, would be destroyed."

There is no doubt that the recent decision of Mr. Justice Macdougall, at Aylmer, in the case of Holland Brothers vs. Ross, involves a nice point, bearing on the administration of Crown Lands in the Province of Quebec. The judgment sets aside an Act of the Local Legislature cancelling the titles to certain Crown Lands in the County of Ottawa, on the ground that the necessary settlement duties had not been performed in conformity with the conditions governing the grants. This Act applies to thousands of acres of land, and if Judge Macdougall's decision holds good in one case, it must nullify the legality of the Act as affecting all other lands similarly held. The Local Government were not a party to the suit, and allowed it to be conducted as between individuals, but, as the Judge's decision has brought the constitutionality of the Act into question, it will be tested, if necessary, before the highest tribunal, in the interests of the Province, and it is not improbable that this recent decision will

be reversed, and the title to the phosphate lands, referred to in the *Engineering and Mining Journal*, thus ratified; in the meantime there is no cause for alarm. That any action of the Quebec courts could affect the titles to Crown Lands in Ontario is impossible, and the allusion to them in the article published in the *Engineering and Mining Journal* is an error.

THE OUTLOOK FOR PHOSPHATE MINING IN CANADA.

In the September number of the REVIEW, reference was made to the high standard of the summer's shipments of phosphate from Canadian mines, as shown by analyses returned by English buyers. Communications received from London and Liverpool during the month are less satisfactory, as they report the recent receipt of several heavy shipments of ore which, upon being analysed, proved to be of an inferior grade, and had much to do with the falling off in the demand for Canadian phosphate in the English market. This unfortunate circumstance is due in no measure to inferiority of the deposits, but can be attributed exclusively to a desire on the part of miners to increase their output beyond the capacity of the mines. No greater mistake can possibly be made, and it becomes necessary to reiterate the advice already frequently given to owners of mines, to economize neither time nor labour in separating their ore from refractory matter and other objectionable matrix. The complaints that have reached us from abroad are of a very serious nature, and consignees, in criticising recent shipments, describe the mineral as being badly mixed with iron pyrites and mica, and to such an extent that some manufacturers who purchased have been exposed to serious extra expense in its manipulation. This attempt to increase the bulk of shipments is a shortsighted policy, and is having the

effect of prejudicing manufacturers against Canadian phosphate and of lowering its value in foreign markets. That all miners should suffer from the carelessness of the few is unjust, but, unless prompt steps are taken to prevent low grade mineral from going forward as "1st quality," such will be the inevitable result, and this important industry will be permanently injured. Canadian apatite can be shipped as free from refractory matter as can that from any part of the world, and the expense of cleaning up, so as to bring it to a high state of purity, is much more than counterbalanced by the increased value of the output. During last year one of the most valuable mines of Ottawa County produced a large quantity of ore, and the shipments during the summer show by analyses a variation of seven per cent., all taken from the same deposits. The mineral from the mine referred to should run of a uniform grade of not less than 82 per cent, whereas some of the cargoes sent forward returned analyses varying from 72 to 79 per cent., showing plainly that some one had been responsible for gross carelessness at the mine.

The mines are to-day more capable of producing high grade mineral than they have ever been, and they are yielding abundantly. Owners are equipping their properties with machinery suitable for carrying on permanent operations, and many of them are introducing valuable facilities for the more expeditious and economical handling of the output. The market abroad shows signs of improvement; higher figures are already offered for next spring delivery, and there is every reason to believe that prices will range as high during the winter as they did during the same season a year ago. Much, however, will depend on the quality of the ore sent to point of shipment, as it will there undergo close inspection before being forwarded, so as to avoid a repetition of the recent experiences above referred

to. Let miners look carefully to their own interests, and those of others, and not jeopardize future prospects nor depreciate the value of their properties by shipping phosphate of an inferior grade.

THE MINES.

Nothing could be more encouraging than the present appearance of the mines in the Ottawa district, and owners have begun to prepare for work during the approaching winter. During the autumn season much new ground has been prospected and many promising deposits have been discovered which will afford employment for a large number of miners. At

"HIGH ROCK"

nothing of importance has taken place during the month. The output continues much the same as formerly, viz., about 15 tons daily, and it is not improbable that this will be the average yield for some time to come.

THE UNION P. M. AND L. COMPANY'S

property adjoining "High Rock," is developing as well as could be expected, in fact the most sanguine members of the company could not but be highly pleased with what has been accomplished since the company broke ground last spring. The deposits continue to increase in size as work proceeds, and many new openings of a promising character have been made on the property, while the improvements, in the shape of buildings, docks and a tramway, do much credit to Captain Smith, under whose immediate supervision this work has been carried on. Stockholders and others interested in this company's prosperity will do well to visit the property and judge for themselves of the extent of the developments and of the substantial character of the improvements. A large quantity of mineral is being raised daily and is being forwarded in a state of purity that does credit to the manager of the mine, and that will establish a reputation for the property.

"NORTH STAR."

At this mine a shaft is now down 30 feet in phosphate and several new deposits have been met with equal to, if not better than, anything that has yet been discovered on the company's location. To work this property to advantage at least 100 men might be employed as it has been put in good shape to ac-

commodate a large force. We learn that at present not more than 20 miners and other labourers are engaged, which is, to us, unaccountable for we look upon the property as next, in yielding capacity, to the "Emerald," and when properly developed it will prove to be of great value. We have pronounced the mineral already shipped from this mine of exceptionally high grade, and in this particular there is no falling off in what is being now raised.

THE "EMERALD"

is looking as rich as it ever did, and the quantity of mineral raised each day is about twenty tons, or much the same as it has been for months past. The quality of the mineral is above the average, and, as it is being carefully picked, there is little doubt but that shipment will run uniformly 82 per cent. This mine is now well known to phosphate miners, and it is generally conceded by them to be the most valuable property in the district. Certainly no property has yet been developed that is capable of yielding the same amount of high grade ore at small cost. With proper management there should be nothing to prevent the ore being mined and delivered at the railway depôt at a maximum cost of \$4.00 per ton, and taking this as a liberal estimate, it will not be difficult to calculate the net daily profits on the output.

THE "MCLAURIN" MINE

continues to give employment to a fair force of men and yielding freely, there being apparent diminution in the quantity of ore in sight nor in the daily output. The mineral hauled out of the same high grade as is cobbled to the uniform standard that has long since marked the output from this mine south after in the English market.

THE "POST" MINE

shows no signs of weakness; it is equally productive as it has been at any past period; the mineral is of almost a similar grade to that of the McLaughlin Mine, but that less care is taken by those in charge at the mine to forward it in as high a state of purity is visible to anyone who may have inspected that portion of the summer's output lying at Templeton Station.

THE "HALDANE" MINE

is yielding well, but the ore taken from some of the pits is not as clean as could be wished. Other pits are, however, sending out very good mineral.

and by keeping them separate, as two distinct grades, the owners need not suffer from the inferiority of one. The property is capable of producing large quantities of 1st and 2nd quality, and, ere long, it is to be hoped a convenient market will be established for low grade ores from all the mines in the district.

THE "GEMMILL" MINE

is looking better to-day than at any time during the past year; in fact, it may be said that those in charge are of opinion that heretofore they have been working on mere spurs, or strings, and that present indications lead them to the belief that they are only now approaching the main body. This has been a very profitable property to its owner. Several thousand tons have been shipped and the quality of the mineral is of a very high grade—shipments having run uniformly about 83 per cent.

OTHER MINES

have done nothing of much importance during the month, though report of progress is very satisfactory, and a large amount of mineral is accumulating for winter transportation to points of shipment. The average yield continues to be about the same, and the popular opinion is that the Canadian Pacific Railway Company will be compelled to provide increased facilities at the stations for stowing the output until it can be forwarded. The company have already received applications from four mine owners for accommodation for 15,000 tons, and the erection of a large number of bins for the purpose is contemplated. This gives some idea of the quantity of phosphate that will be shipped from Canada next season.

Phosphate Quotations.

It was stated in the last number of the REVIEW that those who could afford to hold over their summer's output would unquestionably realize better prices for next season's delivery, and the correctness of the statement has been fully proved during the month by offers from dealers in England to make contracts for spring delivery at prices well in advance of what has been rendered producers during the past four months. It must be borne in mind, however, that high grade phosphate is what manufacturers look for, and shippers of inferior quality need not expect to find ready sale at current prices. The latest quotations received for imme-

diately delivery on dock at Liverpool, London and Glasgow, are 1s. 2d. to 1s. 3d. per unit for 80 per cent. guaranteed.

Freight to Montreal.

It is gratifying to learn that the Canadian Pacific Railway Company are likely to reduce the rate of freight on phosphate, responsive to a petition by the more important shippers. The reduction anticipated will be about 12½ cents per ton, or about \$1.12½ per ton from Buckingham Station to the Montreal terminals. The railway company are also preparing to construct additional bins for the accommodation of the steadily increasing output of mineral, which looks as though they proposed holding the carrying trade at all hazard; but, as owners of barges are bidding for this patronage, and are prepared to cut prices, the Railway Company will do well to consider the question of rates. In shipping by water much handling is avoided by barges discharging alongside the vessel.

GENERAL MEETING

A special general meeting of the Dominion Phosphate Mining Company will be held at the office of the company in Montreal on the 14th of November, for the purpose of increasing the capital stock. This corporation holds its charter under a special Act of Parliament, passed during the session of 1882, and has for its officers, Henry Earle, Esq., President; A. F. Riddell, Esq., Vice-President; Chas. Kyte, Esq., Secretary-Treasurer; A. J. Hantoon, Esq., Managing Director. The company's property is known as the "North Star," situated in the Township of Portland East, and is one of the most promising locations in the County of Ottawa.

ACCIDENT

On the Riviere du Lievre.

It was only last month that we called attention to a new scow on the Riviere du Lievre that had been constructed by Messrs. Allen & Bothwell, capable of carrying sixty tons of phosphate. On her first trip an accident overtook her in the Little Rapids on the way to Buckingham Landing. While in the narrow channel she struck a rock, staving a hole in her bottom, and, after drifting a short distance, sank in fifteen feet of water, taking with her about fifty tons of phosphate belonging to the Union Phosphate Company. Divers have since been at work endeavouring to raise her, but without success. It has at last been discovered that she lies embedded in clay, and all hope of moving her has been abandoned until the water lowers. That such an accident should have happened is unfortunate, and that it should have been attended by the loss of valuable property is to be much deplored.

A TEST SHAFT.

Not long since a report was current that Mr. Vennor had expressed an intention of sinking a fifty feet shaft on property adjacent to the Emerald Mine, in the Township of Buckingham, with a view to demonstrating a theory that the large body of phosphate exposed by the development of the Emerald Mine extended beyond the boundaries of Mr. Allan's location, and would be found at a calculable distance below the surface. It is to be earnestly hoped that this theory, or "conjectured turn-over of the bedding" as it has been termed, is a correct one, and that the test spoken of will be made without loss of time; but the sinking of a shaft of suitable dimensions does not appear to be absolutely necessary, more especially as it is said to be the intention to sink continuously until the required depth has been reached regardless of any mineral deposit that may be met with that does not appear to be the main body sought. If there exists any serious intention, on the part of owners of property contiguous to the Emerald Mine, to adopt this means of searching for the phosphate bed within the limits of their respective claims, we would suggest that a co-operative movement might be set on foot, and the several properties prospected with a Diamond Drill at a minimum of cost, thus avoiding the expense of shaft sinking. Should this suggestion meet with favour, we will be happy to provide owners with estimates of the probable cost attending this effectual method of prospecting.

TREATING LOW GRADE PHOSPHATE.

Since the publication, in the September number of the REVIEW, of an article on this subject, we have had an opportunity of personally visiting many of the phosphate mines, and were much impressed with the vast amount of low grade ore that is lying at the mouths of the pits, and at the seemingly large quantity of mineral mixed with the rock in the dumps, all of which is cast aside as unmarketable in the absence of suitable machinery to separate them. We have recently been favoured with a detailed explanation of the *modus operandi* by which the separation may be accomplished, and the low grades converted into merchantable condition, and, unless some grave miscalculation has been made, the machinery which is to do the work appears to be well adapted for the purpose. That this proposed new industry would be of great benefit to the district, it is admitted on all sides, and even those who are most skep-

tical as to its feasibility are open to conviction. That the ore can be successfully manipulated it will shortly be practically demonstrated, after which a company will be formed with sufficient capital to carry on operations on a large scale. Much of the stock has already been applied for.

NAVIGATION OF THE RIVIERE DU LIEVRE.

About three years ago this important question received attention from the Department of Railways and Canals, and some work, of an experimental nature, was done at the Little Rapids with a view to deepening the channel and rendering that part of the river navigable. A considerable quantity of rock was removed from the river-bed and, to a certain extent, the work done proved efficacious, but the traffic, in connection with the mining interest contiguous to the river, increased to such an extent the following season that improvements of a more permanent character became necessary, and it was resolved to petition the Government to cause a lock to be constructed at the point above referred to, that would answer the double purpose of raising the water sufficiently at the Long Rapids and of making the Little Rapids navigable, without regard to high or low water, for any vessel suitable to the requirements of the ordinary traffic of the river. The petition was favourably received and an appropriation of \$10,000 made for the purpose of the immediate carrying out of the proposed improvements, but, through the intermeddling of an individual, or individuals, it was subsequently represented to the Minister of Railways and Canals that the expenditure of the appropriation, for the purpose for which it had been voted, was unnecessary, and that the small amount of work that had been done was sufficient to render navigation on the river practicable and safe. The intention of constructing the lock was, therefore, abandoned, and all the property owners and miners in the vicinity of the Riviere du Lievre have been allowed to suffer in order that the selfish object of an individual might be attained. The first casualty that has been recorded, on account of the absence of the improvements asked for, occurred but a few days ago, when an attempt was made, for the first time, to run the rapids with a barge laden with fifty tons of phosphate; it resulted in the craft going to the bottom with her valuable cargo, particulars of which will be found in another column, and may be the means of convincing its owners that the construction of a lock at this point is not altogether unnecessary. We trust it will be followed by a movement to revive the cry for the speedy execution of the much needed improvements.

GRAPHITE.

For years Ceylon supplied the world with plumbago; the celebrated Cumberland Mine in England is well nigh exhausted, after having been worked for over a century; the United States have of late years taken fair rank in its production, but it is in Canada that deposits of plumbago exist, the richness and purity of which, and freeness from lime—an impediment detrimental to the manufacture of good crucibles—if properly developed, would place Canada, if not in advance of Ceylon, at least before all other countries of the world now producing this mineral. Its abundant existence in the County of Ottawa and throughout eastern Ontario is conclusively established. In Ottawa County it occurs in three distinct forms, viz: as disseminated scales or plates; as lenticular or disseminated masses imbedded in limestone, and as fissure veins cutting the enclosing strata. The plumbago deposits in this district must sooner or later become known the world over for their vastness and for the superior quality of the mineral, as they offer strong inducements for the investment of capital, with every prospect of fortune.

To illustrate the important position Canada might occupy among the plumbago producing countries of the world, and that the superiority of her mineral is recognized outside of the Dominion, we publish the following article on graphite which appeared in the *New York Engineering and Mining Journal* over the signature of Mr. John A. Walker.

"As a mineral, graphite is widely distributed in the United States; as an ore it is found in but few places in sufficient quantities and purity to be profitably worked. It is found in the older rocks of the Appalachian chain from Alabama to Canada. Several discoveries of it have been reported from Michigan. Mr. F. F. Chisholm reports its occurrence in "great purity in five different localities in Albany County, Wyoming Territory, in veins from 18 inches to five feet thick. In Colorado, it is found in different parts of the State. At Pitkin, in Gunnison County, it occurs in beds two feet thick, but very impure. In New Mexico, pure graphite is found in small quantities in the Coal Measures, where it is probably the result of metamorphism. Graphite occurs sparingly in the Black Hills of Dakota." It has been mined at the Senora Mine, Tuolumne County, California.

Of the eastern deposits, those of Pennsylvania, New Jersey, New York, and Canada are of the crystalline or foliated variety, are the best known, and are the only ones which are at present worked. The deposits occurring in Alabama, North Carolina and Virginia are of the amorphous variety. These are of such a nature that purification is economically impossible. They can be used only in the crude state and for but few purposes. The western deposits are still undeveloped.

Origin and Characteristics.—Graphite is now generally conceded to be of organic origin—the result of the metamorphism of some of the products of destructive distillation of vegetable tissue. It occurs in veins, beds, and disseminated through strata (graphitic schists). The veins occur principally in New York, Canada, and the far West. They are true fissures in gneissoid rock. The vein graphite is usually associated with calcite and quartz. Pyroxene, mica, and apatite are sometimes found with it. Crystals of calcite are found which, on being split, show scales of foliated graphite along the planes of cleavage. Graphitic schists are found in the same regions as the veins, and also in New Jersey and Pennsylvania. These are metamorphosed sandstones with foliated graphite very evenly disseminated throughout in small flakes. The graphite found in beds is amorphous, and occurs principally in the south. It is in a sedimentary formation, is quite impure, and on account of its fineness cannot be successfully purified. Geologically, graphite occurs from the Coal Measures back to the oldest rocks.

Productive Localities.—The only place in the United States where graphite is now mined successfully is at Ticonderoga, New York. This property, owned originally by the American Graphite Company, now belongs to the Joseph Dixon Crucible Company, of Jersey City, New Jersey. The American Graphite Company worked the vein deposits to a depth of 600 feet. The Dixon Company now mines a graphite schist 15 feet thick, carrying from 8 to 15 per cent. of graphite, practically an inexhaustible supply.

Numerous attempts have been made to work the similar deposits of Pennsylvania and New Jersey, with only partial success. The parties interested in these attempts are: The Pennsylvania Plumbago Company, the Eagle Plumbago Company, and the Phoenix Plumbago Company, all of which have worked deposits in the Pickering Valley, Pennsylvania; the American Chemical Manufacturing and Mining Company, of Rochester, New York, which has worked the deposits of Northern New Jersey; and Mr. A. Z. Ryerson, who in 1882 worked the deposit at Bloomingdale, New Jersey. Mines of merit are known in Georgia and California, but these cannot now be worked on account of the expensive transportation.

Ore Dressing.—Several methods (both wet and dry) of dressing the ore have been attempted. The process used by the Dixon Company, at

Ticonderoga, owes its success to careful supervision. It is a wet process in which the ordinary practice is reversed, the "tails" being the useful product, while the "heads" are thrown away. All attempts at dry concentration have failed.

Production.—In 1882, the output of the Ticonderoga mine was 400,000 pounds. The output from the other mines have been so spasmodic that it is impossible to give them accurately. Probably 25,000 pounds would cover them all, making a total output in 1882 of 425,000 pounds. For 1883, the Dixon Company have arranged to produce 500,000 pounds; and again estimating the product of the others at 25,000 pounds, we have for 1883 a total output of 525,000 pounds. The average spot value may be stated at eight cents per pound.

Kinds.—On account of the peculiar advertising it has had, graphite is commercially known as German black-lead, Ceylon plumbago, and American graphite. German black-lead is a product of Bavaria. It is of the amorphous variety, and is dressed chiefly by washing. Its price depends on its percentage of graphite and the nature of its impurities, varying from \$1 to \$10 per hundredweight in cargo lots. It is used in the manufacture of pencils, stove-polish and foundry facings. Ceylon plumbago is mined at Travancore, Ceylon, and is shipped from Colombo to all parts of the world. It occurs in immense veins of great purity. Cobbing and sizing are the only preliminary operations it undergoes. It appears in the market graded according to size, as large lump, small lump, chip, and dust. Its price varies from \$2 for dust to \$10 per hundredweight for prime lump, in cargo lots. It is used for all the purposes of the trade, except the manufacture of pencil leads. American graphite, from the nature of its occurrence, appears in the market only in the dressed condition. Its price ranges from \$2 to \$10 per hundredweight wholesale according to purity and fineness. Fineness exercises considerable influence on the price of graphite, on account of the difficulty of pulverizing it. American graphite is used for all purposes of the trade, and excels all kind as a lubricant. It is the same geologically, etc., as the Canadian. Before the development of the American and Canadian mines, the Ceylon miners was the standard.

Analyses.—In 1876, the Canadian government authorized an extensive survey and investigation of the comparative merits of the Ceylon and Canadian varieties. The following table of analyses of carefully prepared samples is from the report of the survey:

ANALYSES OF CANADIAN AND CEYLON GRAPHITES.

LOCALITY.	Specific gravity.	Volatile matter.	Carbon.	Ash.
		Per cent.	Per cent.	Per cent.
Canada, Buckingham; vein graphite; variety, foliated.	2-2689	0-178	99-675	0-14
Canada, Buckingham; vein graphite; variety, columnar.	2-2679	0-594	97-626	1-71
Canada, Grenville; vein graphite; variety, foliated.	2-2714	0-109	99-815	0-0
Canada, Grenville; vein graphite; variety, columnar.	2-2659	0-108	99-757	0-1
Ceylon; vein graphite; variety, columnar.	2-2671	0-158	99-792	0-0
Ceylon; vein graphite; variety, foliated.	2-2664	0-108	99-678	0-2
Ceylon; vein graphite; variety, columnar.	2-2546	0-900	98-817	0-2
Ceylon; vein graphite; variety, foliated.	2-2484	0-301	99-284	0-4

These analyses prove the oft-repeated claim of the dealers in Canadian and American graphite that it is equal to the best Ceylon.

Manufactures.—The properties of graphite make it useful for following general purposes: The manufacture of refractory articles, lubricants, electrical supplies, pigments, and pencil leads. A detailed table of the articles made from it is annexed, with an estimate of the per cent. used for each purpose:

PROPORTIONATE AMOUNTS OF GRAPHITE USED FOR DIFFERENT PURPOSES.

MANUFACTURES.	Kinds of graphite used.	Per
Crucible and refractory articles, as stoppers and nozzles, crucibles, etc.	Ceylon, American.	
Stove-polish.	Ceylon, American, German.	
Lubricating graphite.	American, Ceylon.	
Foundry facings, etc.	Ceylon, American, German.	
Graphite greases.	American.	
Pencil leads.	American and German.	
Graphite packing.	Ceylon, American.	
Polishing shot and powder.	Ceylon, American.	
Paint.	American.	
Electrotyping.	American, Ceylon.	
Miscellaneous—piano action, photographers' gilders', and hatters' use, electrical supplies, etc.		

The earliest use of graphite was for pencil leads. La Moine cites a document of 1387 ruled with graphite. Its use for this purpose has become so extended that in 1882 over 150,000,000 pencils were made in the world. Previous to 1827, black-lead crucibles were made only in Germany. In that year, the late Joseph Dixon began their manufacture in this country, using graphite from New Hampshire. He afterward saw samples of Ceylon plumbago, and appreciating its value, he secured a shipment from Ceylon in 1829. This was the first importation of Ceylon plumbago into this country; since that time, its use has steadily increased. In the fiscal year 1882, 16,047,100 pounds of plumbago were imported, most of which was from Ceylon; the rest from Germany.

Graphite has long been used as a lubricant. This is one of its most useful applications and one which promises most for the future. Formerly, it was offered to the engineer only in the form of a dry powder; now it is compounded, or mixed with fats and oils in many ways, some of which are patented. This use of graphite is attracting the attention of all interested in the problem of the reduction of friction, and promises to outstrip all others. The barriers which have prevented its extensive use in this direction have been the price and the difficulty of securing purity and freedom from all grit. These are now both overcome, the price being now less than 25 per cent. of what it was fifteen years ago. The purity which now is absolute, was then only approximate. For all heavy work, graphite is undoubtedly the lubricant of the future.

The growth of the graphite industry has kept pace with the age, each new development in metallurgy and engineering offering some new field of usefulness for graphite. For instance, it furnishes the pots for the manufacture of cast-steel, and the nozzles and stoppers used in the Bessemer process. It is used in the manufacture of electrical supplies, etc. Fifty years ago, graphite was little known and misnamed. Now, it is of constantly increasing importance. From an insignificant beginning in the present century, the industry has grown to its present proportions."

MINING NOTES.

The Chili Gold Mine, of Venezuela, owned by an English company, sent to London, between the 1st of January and the 28th of June, gold bullion to the value of \$228,000. At this rate the property will give about \$456,000 during 1883.

It is stated that the Cumberland Coal and R.R. Co., N.S., will, by next year, be able, by means of increased facilities, to raise 1,500 tons of coal per day. It now supplies, it appears, 8,000 tons per month to the Inter-colonial Road. Some 700 men are employed by the Company in the mines and on the railway.

A new silver mine has been opened near Little Placentia, Newfoundland, under the management of Mr. F. Ellershausen, who purchased the claim from the discoverers for £4,500 sterling. Some of the richest specimens yielded, on analysis, 300 ounces of silver to the ton. It is considered a most promising mine. A large number of men are employed in working it.

British Columbians are not wanting in enterprise, as has been shown recently by the action of Messrs. Livesley & Co., Contractors, for sinking a shaft for the Vancouver Coal Company, who increased the wages of the workmen twenty-five per cent., as an incentive to them to drive the shaft as rapidly as possible to coal level. This was done with a view to getting a cargo shipped to San Francisco before Christmas.

Gold mining on the Chaudière River, Beauce County, Province of Quebec, is reported as having been

fairly prosperous this season, and preparations have been made for extensive operations next year. There is now a sanguine individual busily at work sinking a deep shaft in full reliance upon its indications. If he succeeds in striking pay-ground he will be paid a fixed sum by the owners of the property. If he fails he will lose his time and expenses.

The Roberts' Iron Company have shut down for the present at their mine in Frontenac County, having raised all the ore that was in sight in the main drift. During the summer the company thoroughly prospected their property with a Diamond Drill and, we understand, succeeded in striking promising deposits in new ground which will probably be opened up within a short time. We will be glad to hear that the company have resumed work on as large a scale as formerly, and will look with interest for reports of progress.

THE WINNIPEG CONSOLIDATED GOLD MINING COMPANY, at the Lake of the Woods, were reported last month to be drifting at the fifty and one hundred feet levels. From the former they were drifting westward in rich ore about three feet in width. On the one hundred feet level they were driving eastward in an ore body, about six feet in width, heavily mineralized. Stopping in the west drift has been commenced with the intention of continuing through to the fifty feet level, in order to have better circulation; the ore thus mined will keep the stamp-mill going.

The Nova Scotia Gold Mines are

reported to be yielding fair profits now-a-days. The "Gallagher," the "Empress," the "Pactolus," the "Oxford" and the "Salmon River" Mines are said to be in a fair industrial condition. Of the two last named, the Oxford is paying handsome dividends, if report be true, and the Salmon River Mines are bringing in a large revenue to the present holders. It is, however, not improbable that a movement will be on foot shortly to dispossess those who are now operating the location, there being a dispute as to the proprietorship, in which the Local Government is mixed up, and serious complications are anticipated.

THE OXFORD GOLD MINING COMPANY, N.S.—This pushing and enterprising association has just opened upon its property near Lake Catcha, Chezetepok, a new lode which promises to eclipse the famous "Mill Lode" which the company has been mining very successfully for some time. When the "Mill Lode" was first opened, some eighteen months since, we predicted a brilliant future for it. The subsequent working of it, as shown by the regular dividends declared by the company, proves the correctness of our judgment. The new find above referred to is about 60 feet north of the "Mill Lode." It has been measured for a distance of fifty feet along the lode, and presents to view a vein of quartz from one to two feet in width. In wealth of gold it probably surpasses anything uncovered in this Province for many years. The gold is free—both coarse and fine, and it permeates the rock so thoroughly and uniformly that we cannot but conclude that it will prove to be a real "Bonanza."—*New Era*.

HAYCOCK IRON MINE.

That work on this valuable property will be resumed has become an assured fact, and the news will doubtless be received with gratification, not only by those directly interested, but by the Ottawa people in general. The new company, which is composed of English capitalists, have expressed their intention to work the mine on an extensive scale, though in a systematic and husbandly manner. Suitable furnaces will be constructed and extensive rolling mills, for the manufacturing of steel rails, will be erected. Skilled labour and the most modern machinery will be employed in all the branches of the company's business, and an enterprise such as this promises to become, supported as it will be by capital, almost unlimited and, having such unusual natural advantages, cannot fail to prosper, and the section of the country in which it will be established must of necessity derive immeasurable benefits. The managing director has been for some time, and still is, in Canada, and gives

every assurance that the day is not far distant when the vicinity of the Gatineau will become the scene of unprecedented activity, and the sound of drill and the report of explosives will be again heard at the Haycock Iron Mine.

Dr. SELWYN'S RETURN.

What He has to Say about Our Western Coal Mines and the Lake of the Woods Gold Regions.

(From the Winnipeg Times.)

Dr. Selwyn, of the Dominion Geological Survey, arrived in the city last evening. He was interviewed this morning by a *Times* representative as to the result of his travels. The gentleman refused, however, to say anything regarding his researches in the Rocky Mountains until his report had been sent in to the Government. As regards the deposits of coal at Medicine Hat and Calgary, he said:—

"The Medicine Hat coal exceeded my expectations, and I consider it a splendid bituminous coal, and the quantity will be sufficient to supply the North-West for ages to come. The coal in Mr. Anderson's cascade mine is a magnificent sample of anthracite, and can be easily mined."

"What about the statement which has been published to the effect that there is no coal deposit near Brandon?"

"I am satisfied that there is no coal in that vicinity."

"Are there any deposits of iron there?"

"There are certainly traces of mineral, but it can never be mined in paying quantities."

"There is a feeling abroad that you are prejudiced against the Lake of the Woods country as a mining region?"

"I am not prejudiced against anything, but would prefer not to give my opinion on that district. Regions with a similar rock formation have, however, been proved not to possess minerals in paying quantities."

The doctor did not wish to say anything regarding his future movements, as they would not be decided on until his report had been submitted.

Manitoba and the North-West Territories.

Many applications have been received at the Department of the Interior in Ottawa for mineral locations in the North-West Territories, chiefly in the Bow River District, and additional applications come in almost daily. Gold, silver and coal have been prospected more assiduously than any other minerals, and the claims already located are said to be very rich. The areas allowed are limited to twenty acres each, but no grants have yet been

made, although it was provided for, by Act of Parliament last session, that, until the Mining Regulations for Manitoba and the North-West Territories should come into force, regulations to govern the disposal of mineral lands in the North-West might be made by Order in Council. In the meantime all applications, which have been made in conformity with the proposed regulations, remain on file in the Department at Ottawa awaiting the action of the Government.

BRITISH COLUMBIA.

CARIBOO.

News from All the Creeks.

There was an exceedingly dry summer, the driest since 1868. Principal mining is hydraulic. The absence of water has prevented the claims from running off much ground and almost entirely stopped them from cleaning up the bed rock.

On Antler Creek the disastrous fire that occurred, coupled with the absence of water, has almost stopped mining operations until the damage can be repaired and the fall rains give water. There are about 30 Chinese companies working on the lower end of Antler taking out a great deal of gold.

The Waverly Company, on Crouse Creek, whose operations had been entirely suspended for the lack of water, have begun piping again. Among the claims that have done fairly well this season may be mentioned the Simms & Jarvis Brown, Stevenson & Reid, Larry & Bunden Co's. The Jenny Lind Co. having acquired the first right to the water at the upper end of William Creek, have begun to clean up. They have some good ground which is expected to pay well.

The old Barker Co. are preparing to work and with good reason for thinking they will be on pay all winter.

On Jack of Clubs Creek the Two Sisters Co., the controlling interest in which is held by Messrs. Mason and Daly, have succeeded in draining their upper diggings, and will begin taking out gold immediately. This company will be able to work all winter, as will also the Discovery Company, whose claim adjoins the Two Sisters at the upper end.

On the Mosquito Creek the Discovery claim, owned by the Flynn Bros., has done well for the season. The Alabama Company took out their first gold this year after five years' work in running a cut to open their mine and in bringing water on it. They have a splendid bank of gravel and the prospects obtained, during the time that they were able to pipe, promise a rich harvest for their pluck and energy. It has

been an exceedingly heavy piece of work to open the claim, and reflects the greatest credit on the shareholders. Butts & Co. are also doing good work and taking out gold.

The Sugar Creek Hydraulic Co's. claim also promises well for the future if getting considerable gold may be considered a fair indication.

The Black Bull claim on Lowhee has also been paying well all summer. At least one half of the gross product is in the hands of the heathen, who are slowly absorbing much good mining ground without any beneficial result either to the province or the people.

The Burns Mountain Company are pushing their tunnel ahead vigorously. The prospects obtained in the ledge are very encouraging. — *British Colonist.*

MISCELLANEOUS.

The steamer *Gallia*, of the Cunard Steamship Company, which sailed from Liverpool for New York on the 27th of October, had on board a half million in gold.

It was reported during the month that prospectors were following up indications of galena in Ottawa County, and that they were hopeful of discovering valuable deposits. We will be glad to hear that they have realized their expectations.

Messrs. Adams & DeCamp have purchased the property east and adjoining the Oxford Gold Mining Company's property, at Lake Catcha District, East Chezetcook, N.S., for the sum, it is reported, of twenty thousand dollars.

The reported value of the diamonds from the African fields, sent chiefly from the Cape of Good Hope by mail, since the 1st of June 1876, to the close of 1882, as officially estimated, has been about \$102,047,924.

It is stated that English capitalists are seriously contemplating investing in gold mining properties in the Lake of the Woods district, and will shortly dispatch experts across the ocean for the purpose of examining and reporting on several valuable locations which have been selected.

Eight railroads, with a capital stock aggregating \$84,934,300, declared dividends, payable in October in Boston, amounting to \$913,414. A single mining company, the Calumet & Hecla, will pay a quarterly dividend of \$500,000 in November, in the same city. — *N. Y. Mining Record.*

At the office of the REVIEW may be seen specimens of white marble from the Ottawa district that are equal in the closeness of the grain to any Italian marble that has been

imported to this country. It takes a beautiful polish and is said to lie in beds that are capable of producing blocks of almost any dimension.

Specimens from recently discovered plumbago deposits have reached us, and the ore appears to be equal in point of richness to anything yet reported on. The deposits, which exist on the Upper Ottawa, are said to be capable of producing an unlimited supply of high grade ore, in fact, if report be true, they should be practically inexhaustible.

IRON WATCHES.—Messrs. Crowther Bros. & Co., of Kidderminster, in order to prove the malleability and ductility of their iron, have constructed a watch entirely of that metal, which keeps excellent time. Claudius Saunier, in reporting this fact in the *Révue Chronométrique*, adds: "There is nothing new under the sun. We have a watch upon which is engraved the date of 1504, and in which all the wheels and pinions are made of iron."

Search for mica is unabated, and the discovery of deposits of some extent are reported. The quality of the mica, if we may judge from samples forwarded to this office, is superior to any that has been met with in Canada heretofore, but the quantity is problematical and will not be known until some development work has been done. The most promising deposits are in localities contiguous to the Ottawa River, and one in the County of Hastings is said to be valuable.

DIVIDENDS.

THE CALUMET AND HECLA COPPER MINING COMPANY, of Michigan, has declared its regular quarterly dividend of \$5 per share, aggregating \$500,000, making the total amount paid to date \$24,350,000.

THE OSCEOLA CONSOLIDATED COPPER MINING COMPANY, of Michigan, has paid another dividend of 50 cents a share, or \$25,000, making a total of \$150,000 in dividends paid this year.

THE SIERRA GRANDE MINING COMPANY, of New Mexico, has paid \$500,000 in dividends this year; the last being 25 cents per share, aggregating \$100,000 was paid on the 3rd of October.

THE PLYMOUTH CONSOLIDATED MINING COMPANY, of California, have paid during the month their fifth consecutive monthly dividend of 50 cents a share, aggregating \$50,000. Total of dividends this year \$250,000.

THE COPPER QUEEN MINING COMPANY, of Arizona, declared their regular quarterly dividend of 50

cents a share, or \$125,000, payable on the 16th of October, making a total of \$500,000 paid this year.

THE HOMESTAKE MINING COMPANY, of Dakota, should have paid during October their sixty-third successive monthly dividend of 20 cents a share, aggregating \$25,000. Total of dividends this year \$175,000.

PICTURESQUE CANADA.

A gentleman, identified with Canadian mining industries, was in Ottawa recently and gave a most graphic description of the scenery at the western end of the eastern division of the Canadian Pacific Railway. He had occasion to spend a short time at Lake Nipissing and was perfectly enchanted with what he had seen, especially in the immediate vicinity of North Bay, where there is a magnificent sand beach, and from which point the view of the Lake, studded with innumerable islands, surpasses, in scenic grandeur, anything he has met with on this continent, and he predicts that, ere long, North Bay will be known as the Canadian Saratoga.

THE MINING REVIEW, PUBLISHED WEEKLY

NOTICE

AS A NUMBER OF SETTLERS WERE unable for one cause or another to avail themselves of the offer made by the Department to grant a reduction of 25 per cent. on all arrears of interest paid up to the 25th of June, it has been decided to extend the time during which this extension will be granted, up to and including the 31st December next, to all settlers who pay to the agents the sums due by them.

After that date legal proceedings will have to be taken against all those who have not then paid.

W. W. LYNCH,
C.C.L.

Department of Crown Lands,
Quebec, August 24th, 1883.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Collingwood Works," will be received until Friday, the 16th day of November next, inclusively, for the construction of a further length of Breakwater at Collingwood, Ontario, according to a plan and specification to be seen on application to Adam Dudgeon, Esq., Mayor, from whom printed forms of tender can be obtained.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honourable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 22nd Oct., 1883.

NOTICE TO CONTRACTORS

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Cheverie Works," will be received until Friday, the 16th day of November next, inclusively, for the construction of a Breakwater at Cheverie, Hants County, N.S., according to a plan and specification to be seen on application to John G. Burgess, Esquire, Cheverie, from whom printed forms of tender can be obtained.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honourable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 22nd Oct., 1883.

PHOSPHATE PROPERTY

For Sale in North Burgess.

Mining Rights of $W\frac{1}{2}$ of 13, in the 5th range. About 100 tons of very high grade Phosphate have been shipped from this property. Will be sold to an immediate purchaser for \$750. Apply at the office of the MINING REVIEW.

ST. LAWRENCE CANALS.

Notice to Contractors.

SEALED TENDERS, addressed to the undersigned and endorsed "Tender for St. Lawrence Canals," will be received at this office until the arrival of the eastern and western mails on TUESDAY, the 13th day of NOVEMBER next, for the construction of a lock and regulating weir and the deepening and enlargement of the upper entrance of the Cornwall Canal.

Also for the construction of a lock, together with enlargement and deepening of the upper entrance of the Rapide Plat Canal, or middle division of the Williamsburg Canals.

Tenders will also be received until TUESDAY, the 27th day of NOVEMBER next, for the extension of the pierwork and deepening, etc. of the channel at the upper entrance of the Galops Canal.

A map of the head or upper entrance of the Cornwall Canal and the upper entrance of the Rapide Plat Canal, together with plans and specifications of the respective works, can be seen at this office, and at the Resident Engineer's Office, Dickenson's Landing, on and after TUESDAY, the 30th day of OCTOBER next, where printed forms of tender can be obtained.

A map, plans and specification of the works to be done at the head of the Galops Canal can be seen at this office and at the lock-keeper's house, near the place, on and after TUESDAY, the 13th day of NOVEMBER next, where printed forms of tender can be obtained.

Contractors are requested to bear in mind that tenders will not be considered unless made strictly in accordance with the printed forms, and—in the case of firms—except there are attached the actual signatures, the nature of the occupation and residence of each member of the same; and further an accepted bank cheque for the sum of Two Thousand Dollars must accompany the tender, which sum shall be forfeited if the party tendering declines entering into contract for the works at the rates and on the terms stated in the offer submitted.

The cheque thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,
A. P. BRADLEY,
Secretary.

Department of Railways and Canals,
Ottawa, 28th Sept., 1883.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Examining Warehouse, Montreal," will be received at this office until WEDNESDAY, the 31st instant, inclusively, for

RECONSTRUCTION OF FLOORS

—TO—

EXAMINING WAREHOUSE

—AT—

MONTREAL.

Plans and specifications can be seen at the Office of J. Nelson, Esq., Architect, Montreal, and at the Department of Public Works, Ottawa, on and after MONDAY, the 22nd instant.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Hon. the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

PARLIAMENT HOUSE

PRIVATE BILLS.

PARTIES intending to make application to the Legislature of the Province of Quebec for Private or Local Bills, either for granting exclusive privileges or conferring corporate powers for commercial or other purposes of profit, for regulating surveys or boundaries, or for doing anything tending to affect the rights or property of other parties, are hereby notified that they are required by the Rules of the Legislative Council and the Legislative Assembly respectively (which are published in the Quebec Official Gazette), to give ONE MONTH'S NOTICE of the application (clearly and distinctly specifying its nature and object), in the Quebec Official Gazette, in the French and English languages, and also in a French and English newspaper published in the District affected, and to comply with the requirements therein mentioned, sending copies of the first and last of such notice to the Private Bills Office of each House, and any persons who shall make application shall within one week from the first publication of such notice in the Official Gazette forward a copy of his Bill, with the sum of one hundred dollars, to the Clerk of the Committee on Private Bills.

All petitions for PRIVATE BILLS must be presented within the "first two weeks" of the Session.

L. DELORME,
Clerk. Leg. Assembly.

Quebec, 1st October, 1883.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the
3rd range. Some excellent surface
shows have been uncovered on these
lots and only require capital for de-
veloping. Price and particulars
given at the office of the MINING
REVIEW.

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and
out-croppings of fine quality of Graphite.
Price \$1,000. Further particulars to be
had at the office of the MINING REVIEW.

TIMBER LIMIT

ON LAKE WINNIPEG

FOR SALE.

50 Square Miles.

This limit will be very valuable.
Apply at the office of the MINING
REVIEW for price and particulars.

FOR SALE,**White Marble Quarry on Calumet Island.**

At this quarry there is an inex-
haustible supply of most beautiful
white marble. Price \$800. Sam-
ples to be seen and information ob-
tained at the office of the MINING
REVIEW.

**PHOSPHATE PROPERTIES
FOR SALE**

IN THE TOWNSHIP OF WAKEFIELD.

OFFICE:
 UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

THE office of the Keeper of Mining Records, in England, has been abolished, and the collecting of mine statistics in Great Britain will hereafter be conducted by inspectors under the surveillance of the Home Office.

FROM England and the United States money is coming abundantly to Canada for investment in her mining industries, and this, in addition to a large amount of local capital employed, is bringing about the rapid development of the mines throughout the Dominion. In Nova Scotia the gold mines are, in instances, yielding more

per man employed than are those of any other gold region in the world, and latest reports go to show that the majority of the mines in the Province are being profitably worked. Some of the copper and iron mines are also paying well, though the latter mineral has not yet received attention commensurate with its presence, or the advantages of the fuel, fluxes, and ore beds occurring close together, and her coal fields have, for many years, been a source of great wealth to this Province. Coal is also profitably mined in New Brunswick, but the attempts that have been made to mine iron and copper ores in the Province have been attended with indifferent success.

In that portion of the Province of Quebec, known as the Eastern Townships, copper and asbestos mining has, for some years, been carried on most successfully, and in the County of Beauce alluvial gold mining gives employment to a large number of miners during the summer season. In Ottawa County phosphate mining has developed into an industry of great importance, and, although the plant and machinery required for the working of these mines is simple and inexpensive, capital is flowing in for the purpose of extending operations. The Haycock Iron Mine in the same County will shortly be in full blast under an entirely new management with ample capital to provide every necessary facility for the proper developing of the company's property.

In Eastern and Central Ontario a vast amount of money is invested in gold, iron, phosphate and mica mining, and in the

western portion of the Province, gold, silver, copper and iron mines are being vigorously worked, chiefly with American and English capital, notably the Silver Islet, and the Michipicoten and Lake Superior Native Copper Companies, while in the Lake of the Woods gold mines, and in the Rabbit Mountain and Huronian silver mines, there is more Canadian than foreign capital invested.

In Manitoba and the North West Territories the capital stock of the various mining companies that have been incorporated by Letters Patent, under the Canadian Joint Stock Company's Act, amounts, in the aggregate, to many millions of dollars, and the result of development work on these locations, which are chiefly gold, coal and copper, is anxiously awaited.

In British Columbia the mining industries are attracting much attention, and the mines are, for the most part, yielding profitably, in some instances under most unfavourable circumstances, and Californian and English capitalists are investing largely in the mineral districts of the Province.

From the Atlantic to the Pacific Coasts, throughout the entire breadth of the Dominion, the mineral wealth of Canada is being rapidly opened up, the mining industries are inviting foreign capital for circulation in the country, and are affording employment for innumerable miners, artisans and professional men, and the Dominion and Provincial Governments' annual reports of progress at the mines will be looked for with greater interest after the close of 1883 than at any former period in the history of Canadian mining.

CANADIAN APATITE.

During the past month more than ordinary interest has been centered in the Phosphate Mining industry, and some important transactions have been recorded, notably the sale, to an American Company, of the famous Emerald Mine, in the Township of Buckingham, for \$125,000 cash, particulars of which will be chronicled in another column. Other properties are about to change hands, it is said, and if report be true, within a few weeks an additional half-million of dollars will be employed by incoming operators in the Phosphate Mining industry of the County of Ottawa.

Captain Robert C. Adams, of Montreal, one of the most experienced, and certainly one of the most successful phosphate miners of Canada, has issued a prospectus for a company to be incorporated that will assume the proprietorship of a large tract of phosphate land now owned by him in the mineral belt, and distributed over the Townships of East and West Portland and Templeton.

The Post Mine is said to be bonded to a Glasgow firm and hopes are entertained that a sale will be effected at a fair price.

Other developed properties have recently been examined and reported on by experts employed by intending investors, and, from what is known of some of these mines, there exists little doubt but that terms will be arrived at in some instances. The main object the owners of these valuable properties have in view, in offering them for sale, is the acquiring of capital that will enable them

to develop virgin properties that they own and on which are very promising surface indications. The developed mines that are being taken up by wealthy companies will become more productive in their hands; modern machinery will be introduced and capital will not be wanting for the most advantageous prosecution of mining operations.

The appearance of the mines throughout the country, the influx of capital, the opening up of new properties and the gradual rise in value of the ore in foreign markets are strong indications that the output for shipment next season will be much in excess of what was sent forward during the past summer. Another feature, which promises to popularize Canadian phosphate abroad next year, is the marked improvement in the quality of the mineral now lying at the mines, and of some that has already been forwarded to point of shipment. This year's experience has, no doubt, taught producers that it is greatly to their advantage to devote more attention, than has formerly been their practice, to the careful clobbering of their output, and, if they continue to clean up the mineral to the high state of purity which characterizes that which is now lying at the mines, shippers will have no difficulty in finding ready sale at best prices.

For the declining quotations during the past summer for Canadian apatite abroad, various theories have been advanced, but from what has come to our knowledge, we are of opinion that it has been confined to three distinct causes. The general temporary depression in the fertilizer trade has, of course, had much to do with the fall in value, and, as was stated in the last number of the REVIEW, the unclean condition of the bulk of Canadian phosphate prejudiced buyers against the mineral, while the third cause of sales having been slow, and at comparatively low figures, was the erroneous impression that went abroad as to the amount

of ore that was awaiting shipment, brought about by producers placing their output in the hands of two or three brokers at the same time for sale, who, in turn, offered it in England and Germany. The same lot being thus offered by different middlemen, conveyed the impression that the season's output was considerably in excess of what it actually amounted to, and stimulated the "bears" to action. These two last mentioned causes for the reduction in price can be easily obviated by producers sending their mineral forward in a clean state and employing but one broker to sell their output, and the MINING REVIEW will endeavour hereafter to keep dealers advised, from month to month, of the approximate amount of mineral raised throughout the district. The depression in the phosphate market is quietly passing away, and, although prices are better now than they have been, it is not premature in stating that they will rule still higher before the opening of the shipping season of 1884.

Another matter which should engage the attention of those who are interested in phosphate mining is the establishing of an assay office in Montreal where shippers could obtain analyses of their shipments before forwarding. The necessity for this is being felt more and more each year, and now that the industry has assumed such increased proportions, the combined patronage of the phosphate miners should amply employ a reliable man for this purpose.

Phosphate mining has become a very important industry in the County of Ottawa, and great improvements have been accomplished during the past few years at the mines, but in the handling of the output there exists ample room for reform which owners of properties will do well to bring about.

THE MINES.

THE "JACKSON RAE."—Of this mine little has been said in the REVIEW, as we had not been

put in possession of any facts concerning its condition, its yielding capacity, or its value. We are now indebted to Mr. Mason, the Superintendent, for a comprehensive description of the property that shows it to be justly entitled to a place among the prominent mines of the county. It is situated in the Township of Templeton, W $\frac{1}{2}$ of Lot 9, in the 10th Range, and is equipped with suitable machinery—a steam drill, hoist and ejector, all worked by the same power, are in operation. A tramway has been constructed from the end of the drift to the sorting shed, and work is conducted in a most systematic manner. The quality of the mineral is of a high grade, the past season's shipments having averaged something over 80 per cent. The mine itself is looking well and with the peculiar facilities for carrying on mining operations it should be a profitable property.

THE "POST MINE," adjoining the "Jackson Rae," it is stated, will shortly change hands and has been idle for some time back, pending the arrival from abroad of an expert to examine it in the interest of the intending purchasers.

THE "McLAURIN MINE" is being steadily worked, and other mines in Templeton are employing a fair number of miners. One property, in the 6th Range, has, within the past few days, been leased to two gentlemen of Ottawa and Montreal, who are now engaged in equipping the mine with necessary plant for the winter's operations.

IN PORTLAND WEST the "High Rock" and the "Union Phosphate Mining and Land Company's" Mines are being vigorously worked as heretofore, and are yielding large quantities of mineral. At other mines in this township good work is being done, and in the 10th Range, on Captain Adams' lots, numerous deposits of mineral have been discovered, the result of careful prospecting.

IN PORTLAND EAST the "Dominion Phosphate Company" have, for weeks past, been working in mineral at the North Star Mine, which is developing into one of great value. At other mines in the township, the "Philadelphia," the "McLaren," and the "French Company's," there is the usual activity, and a considerable amount of mineral is being raised.

IN BUCKINGHAM TOWNSHIP the "Emerald" attracts the most attention and sufficient has been said of this property to convey some idea of the extent of its yielding capacity—it is almost unlimited—and it is expected that this mine will become more productive than ever before in the hands of its present owners, who are men of wealth and experience.

IN THE TOWNSHIP OF WAKEFIELD the "Gemmell" is developing satisfactorily and the quality of mineral continues to be of a uniform high standard.

In every direction throughout the County of Ottawa, miners are busy, and it is very satisfactory to receive the favourable reports that have reached us from nearly all the mines where active operations are in progress.

In the December number of the REVIEW we will publish a correct statement of total production in the county for the year, and, as nearly as possible, the individual output of each mine.

Phosphate Quotations.

The most recent intelligence that has reached us in regard to the probable value of Canadian apatite for the coming season is that offers have come from buyers in England and Germany for delivery next summer at 1s. 3d. per unit for guaranteed 80 per cent. mineral.

We are informed that Mr. W. H. Williams, the energetic President and General Manager of the Union Phosphate Mining and Land Company, will shortly sail for England to complete permanent arrangements for the receiving of the annual output of the company's mine.

A NEW COMPANY.

A prospectus is out for the "Adams Phosphate Mining Company" (limited), the objects of which are the acquiring of certain Phosphate areas, now owned by Capt. R. C. Adams, of Montreal to mine, buy, and sell phosphate, and to buy, develop and sell phosphate lands. The capital stock of the company will be \$250,000, divided into 25,000 shares of \$10 par value each. The working capital to be \$50,000, part of which will be held as a reserve for the purchase of other lands, apart from Capt. Adams' locations, which are situated in the Townships of Templeton, and East and West Portland, comprising a total area of about 2,000 acres. These locations are offered to the company for \$50,000 cash, and 40 per cent. of the capital stock; and Capt. Adams, who is

widely known among phosphate shippers and buyers in Canada and abroad, will assume the management of the company's business. His long experience in phosphate mining in Canada should eminently fit him for the position of General Manager, and should render his services in this capacity invaluable to such a company.

ANOTHER CRAFT

FOR THE

RIVIERE DU LIEVRE.

Mr. W. A. Allan of this city, who has acted so prominent a part in the development of Phosphate mining in Canada, has purchased the steam yacht *Rocket* and will place her on the river next summer. She is now lying in the Ottawa River at Buckingham wharf, awaiting good winter roads before being forwarded to the lower landing on the du Lièvre, from which point she will make her first trip up the river on the opening of navigation next summer.

The 60 ton scow which went to the bottom of the Rivière du Lièvre some weeks ago, of which particulars were published in last month's edition of the REVIEW, has since been successfully raised, and the greater portion of the phosphate with which she was laden has been recovered. The scow was in no way injured beyond having sprung a leak, which caused her to sink, and this proves that the builders who designed and constructed her understood their business. The operation of raising this craft was a crucial test of her strength, but she resisted it and came to the surface apparently uninjured.

OTTAWA COLONIZATION RAILWAY.

Since the work of construction was suspended on the Ottawa and Gatineau Valley Railway the engineers have been employed on the survey of the Colonization Railway from Buckingham village northward. Latest advices from their camp report that an excellent location has been staked out as far as the Little Rapids on the Rivière du Lièvre, and that no engineering difficulties have been encountered. The survey will be pushed forward to the High Falls, and when the route has been definitely located it is expected that the construction of the line will be begun, and when completed the road will necessarily become an important factor in the mining industry of the district it is to traverse.

MINES SOLD.

SALE OF THE EMERALD MINE.—During the past few years many valuable phosphate mines in the County of Ottawa have changed hands, sales at fair prices having been made to English, American and

Canadian capitalists, but the most important sale of property in the history of phosphate mining in Canada was concluded on the 9th instant, when Mr. W. A. Allan of this city sold the famous Emerald Mine to a company of American gentlemen, for the sum of \$125,000 cash. Two months prior to the date of the sale, Mr. Allan, who had been owner of but one-half of the property, became sole proprietor on payment, to his co-owner, of \$40,000.

The property is situated in the Township of Buckingham, County of Ottawa, and is universally admitted to be one of great value. Its present owners are more than satisfied with their purchase, and hold the mine at a valuation greatly in excess of the amount paid for it.

The firm of Ledoux & Richettes, of New York, who enjoy the reputation of being mining engineers of the highest standing, were engaged to report on the property, in the interest of the purchasers, and Mr. W. deL. Benedict was promptly dispatched by them to make the necessary examination. Upon his report, which was a most flattering one, the sale was consummated. Mr. Benedict is a mining engineer and expert who has been engaged on several occasions to examine phosphate deposits in Canada, and his reports have shown that he possesses more than ordinary ability and practical knowledge.

Mr. Allan is to be congratulated upon receiving such a handsome sum for his property, and Messrs. Fanclot, Sweet and Paige, representing the purchasers, are to be envied the possession of the Emerald, the most valuable mine yet discovered in Canada.

The phosphate property known as the "Brown Mine," in the 8th Range of Portland West, has been sold within the past few days to English capitalists for \$22,000 cash. Mr. A. G. Cole, of this city, purchased the property not more than a year ago, at a moderate price, and although he has received a handsome advance on his outlay, the purchasers have received fair value for their investment. Mr. Hepworth Brown, a mining engineer, was sent from England to examine and report on the mine, and upon his advising its purchase, negotiations were concluded. One deposit of great extent exists on the property, and many less important ones have been uncovered. About 50 tons of phosphate have been mined, and it is the intention of the present owners to prepare for active mining operations without loss of time.

It is currently rumoured, and with some authority, that Mr. W. A. Allan contemplates purchasing the "Watt Mine" in the Township of Portland East, immediately south of the Little Rapids. This mine was successfully worked by the

Buckingham Mining Company until their suspension, and a large quantity of high grade phosphate was raised. The deepest shaft known to have been sunk at any phosphate mine in Canada is on this property, a depth of 187 feet having been reached, in the bottom of which there is a large body of mineral. Other openings on the lot expose veins of more than ordinary dimensions and a large amount of high grade phosphate is in sight. Mr. Allan has ten men busily engaged in prospecting the ground, and it is more than probable that before this number of the REVIEW issues he will have become the owner of this valuable property.

Since writing the above we have received positive information that Mr. Allan has purchased the "Watt Mine," and will proceed with mining operations during the winter, which will be confined to the development of the deposits near the surface. The deep shafts on the property will not be emptied or worked before next summer.

The Halifax *New Era* records the sale of a gold mine by Messrs. Adams & DeCamp, to the Oxford Gold Mining Company for \$25,000. The property is an extension eastwardly of the Oxford location at Chezzetcook, and was not long since purchased by Messrs. A. & DeC.

ZINC IN CANADA.

Until recently no deposit of zinc of any consequence had been discovered in the Dominion. Many of the metaliferous veins which had been worked, especially those of copper, lead, and silver, contained more or less blende or "black jack," which is the sulphide of the metal. In working the Victoria lead mine, in the neighbourhood of the Sault Ste. Marie, this mineral occurred in considerable proportions. At Blende Lake, near the head of Thunder Bay, fine crystalline bunches of blende are found in a calcspar vein, but the quantity did not prove sufficient to pay for the working of so low priced an ore.

About three years ago the McKeller Brothers, of Fort William, discovered a number of large deposits of zinc blende about ten miles back from Lake Superior on a small stream called the White Sand River, which falls into the north side of the lake a short distance east of Nipigon Bay. At the first meeting of the Royal Society in this city in May 1882, Professor Bell, of the Geological Survey, presented a short paper, accompanied by a map, in regard to this discovery. It appears that the blende here occurs under different conditions from any of the deposits which had been previously known in Canada. Instead of being scattered in a vein, it takes the form of solid crystalline masses, of great size, following the stratification in a hornblende rock. One of

these masses was stated to measure 70 feet in length by about 15 feet in breadth at the middle. A number of smaller masses were exposed at the locality, and another supposed to be the largest of all was found by "costeaning," but its extent was not ascertained. The ore is black and resembles coarsely crystalline magnetic iron. A specimen brought down by Dr. Bell was analysed by Mr. Hoffmann and found to contain 54 per cent. of metallic zinc.

Blende occurs under similar conditions in Scandinavia, and the discovery above referred to shows that new forms of ores of great importance may be found in this country where their existence has not hitherto been expected.

MINING NOTES.

It is stated that at a depth of 680 feet the borings have produced a continuous flow of oil in the wells at Billiveau, Albert County, N.B., also that the oil is remarkably pure.

Development at the Gold Mines near Bridgewater, N.S., has been productive of encouraging results. One lode has increased from 8 inches in width on the surface to 15 inches at a depth of 80 feet, and the quartz is said to carry an unusual quantity of gold.

About twenty tons of anthracite coal has been forwarded to Winnipeg, consigned to the Canadian Pacific Railway Company, to undergo an official test. The seam from which this shipment was taken is situated on Devil's Head Creek, in the Rockies, but the owners will not operate the mine before early in next year.

The bullion shipment from the Oxford, N.S., Gold Mine on the 12th inst. was 197½ ounces. This is the result of crushing 90 tons of ore for the two weeks previous, during which time the mill was one day idle. The greater portion of this shipment was from the company's newly acquired lode, referred to in another column, which is said to be yielding liberally.

A Boston Company has resumed work at the Copper Mines of Dorchester, N.B. The company is giving its attention at present chiefly to the erection of suitable buildings and machinery and it is expected that mining operations will be conducted on a large scale under the supervision of a well known and experienced mining engineer. At present there are about fifty men employed.

The disparaging rumours which have reached us of late concerning the industrial condition of the Coxheath, N.S., Copper Mine are said to be unfounded and we are pleased to be able to report that the prospects at the mine are of a very

encouraging nature. The company is well satisfied with the result of recent development and believes that the mine has increased in value of late in a marked degree.

LAKE OF THE WOODS.

Our advices from this district are up to the 21st inst. The Winnipeg Consolidated Mine had lately procured another small brick of gold of sufficient value to pay working expenses. This mine is now sufficiently developed by the two levels, each of which is driven a considerable distance from both sides of the main shaft, to produce more ore than the present mill could crush, and a new ten-stamp mill was ordered from Messrs. Fraser & Chalmers, of Chicago. This mill is said to have been already shipped and will be teamed to the mine at Big-stone Bay as soon as the ice is strong enough.

The Manitoba Consolidated Mine at Clearwater Bay, is the only other one at which any work is being carried on at present. The Argyle Mine in the same neighbourhood has suspended operations. It is said that, owing to mismanagement, the available funds of the Company have been exhausted without a thorough test of the property having been made.

The Pine Portage Mine is awaiting the arrival of hoisting and ventilating machinery before the sinking of the shaft can be continued with advantage. A considerable pile of rich ore is on hand at this mine.

Owing to various causes, although apart from the merits of the mines themselves, great dullness in connection with this branch of industry is reported from the whole of the Lake of the Woods district.

COAL MINING

IN BRITISH COLUMBIA.

In June of 1881 the Vancouver Coal Company, under the personal supervision of Mr. Jas. Beaumont, mining engineer, commenced the sinking of No. 1 shaft on the Esplanade, near the Indian reserve. The shaft reached the coal about 10 o'clock on Friday night, the 2nd inst., at a distance of 635 feet from the surface. The next morning it was ascertained that the seam was 7 feet 4 inches in thickness, with a slight pitch towards the harbor. The coal is clean and hard and of a very superior quality. This proves a large extent of the company's valuable property, and has inspired confidence in the future of the city of Nanaimo.

The shaft is a round one, 20 feet in diameter, clear of the wooden blocks which line the shaft. The arrangements around the shaft, with the double cages, will enable the company to take out a thousand tons of coal daily.

One very gratifying feature in connection with this work, and one that reflects highly on the skill and carefulness of Mr. Beaumont, is the fact that this immense shaft has been sunk to a depth of 635 feet without inflicting a serious injury on anyone.

Great difficulty has been experienced, owing to the immense amount of water to handle, and the presence of large quantities of sulphur. The latter, at times, almost blinded the men, and compelled the adoption of three hour shifts.

On Monday, the 15th inst., the traditional bullock was roasted whole, and subsequently, by invitation of Mr. Jas. Beaumont, on behalf of the Vancouver Coal Company, the employees of the company, to the number of 250 or more, and several invited guests, sat down to a sumptuous dinner in the Institute Hall.

THE MINERAL RESOURCES

OF THE

NORTH-WEST TERRITORIES.

"Prospect the breadth of Canada on either side of the advancing railway (C.P.R.) but more particularly opposite to Western Dakota, Montana and Idaho, for vein mining, and thence westward for gravel and placer gold, where vast mineral areas lie unexplored!" Such is Mr. Phillips' advice to Canadians and others, given in his letter to the *London Mining Journal* and republished in the *REVIEW*. That he is sincere in his expressed interest in Canada's future as a mineral producing country there exists no reason to doubt, and that he is correct in his opinions as to the mineral wealth of that portion of the N. W. Territories specially referred to, there is good reason to hope. Having predicted a prosperous future for the country, he now volunteers valuable advice as to how this prosperity can best be attained—encourage and protect the explorer! Such is the advice given us, and, in view of Mr. Phillips' extensive knowledge of mining in the United States, he is competent to point out where the mining laws of his country have been defective, and to offer valuable suggestions to guide the Government of Canada in framing suitable laws for the protection of honest and hardworking explorers. It is with much pleasure, therefore, that we publish the following letter just received, which applies more particularly to locating claims for the precious metals, and we commend it to our readers as worthy of careful perusal:—

Editor CANADIAN MINING REVIEW. PRE-EMPTION OF MINERAL CLAIMS.

Responsive to your desire for a letter from my hand, I select the above immediately important subject, and forward the following thoughts as to the best mode for perfect security in tenure of mineral lands.

In thanking you for the repetition of my recent letter to the *Mining Journal* (of London), on the "Mineral Resources of Canada," I may reiterate the opinion that "there will be very important discoveries made just continuously northward from the Rocky and Wahsatch mountains, extending for a thousand miles across the Dominion of Canada, on the slopes of these mountain ranges, that will surpass anything yet found in your country;" therefore the time and opportunity are convenient for immediate action in framing appropriate common-sense laws, so as to prevent expensive, vexatious and retarding litigations in future mining operations.

Give your brave frontiersmen, prospectors and miners fair play, and foster them by generous and certain privileges!

Make laws that wayfaring men may understand! for equitable majesty and not inglorious legal uncertainty!

We have too many inherent risks in interior mining life; and "legal cap" should be exchanged for percussion, so that the killing of the vicious beast may preserve the man.

The reader may, at his leisure, retrospect the plexiform complications of evidence and questionable decisions of the past, as generated under the too theoretical laws of "following the vein by its sinuosities, angles, dips and spurs; intersections, faults and divisions; by pockets and bonanzas; complicated breaks and uncertainties; of no vein or another's vein; the proof and counter proof; possession or dispossession, by shot guns, shooters and rifles; and suck-like disparagements to the substantial industry of mining.

I would now call your attention to, and define the leading points and features of, a better and safer system by the following few words:

1st. Allow the discoverer of mineral a preliminary right of, say, one thousand feet radius to swing a 2,000 feet circle, for the period of, say, one month from date of his discovery, as claimed by the paper of location, on the spot where the mineral has been found, at the centre of this "discovery circle."

2nd. During this month of protection by 1,000 feet radius, he must examine his vein or deposit as to its bearing, and dip for future development, under the final or permanent rectangular grant of, say, 2,000 feet long by 1,000 feet wide, which he must swing into position and define by corner monuments,

before the month expires, as he may please to direct, provided the first discovery or centre of the "discovery circle" is within its lines. Should he fail to fix his bearings for position during this privileged month, outsiders may then locate and claim in any direction to within 1,000 feet of his first centre.

Extension claims should not necessarily be rectangular; as this would prevent correction for bearings, but opposite sides must be parallel.

3rd. The four monumental columns being thus placed at the corners will bound the surface area, and his mineral rights should be restricted by imaginary vertical planes suspended from corner to corner, at both sides and ends, so that he may take all that lies within but nothing from outside.

In other words, his claim is an inverted rectangular solid pyramid from the surface to the centre of the globe, from which he may extract minerals from any number of veins or deposits therein contained, to any practical depth, within its vertical sides, but nothing from outside of this block of country rock. Thus defined, his right is so clear to all that none may be excused for trespass.

4th. Should any company of miners, during the development of first vein, discover another vein that dips outwardly, before the adjoining side ground has been claimed by others, the first party should be allowed a lateral extension of, say, 500 feet wide for the whole length of their original pre-emption.

5th. Tunnel privileges for the purposes of cross cutting through hills or mountain slopes in speculative search for veins and deposits, ought to be encouraged, and such grants should command at least 1,000 feet on each side of the drift.

6th. Mineral grants should not be allowed to remain idle for unreasonable periods, and a statute should be provided for the ejection of "dogs in the manger."

This positive, unquestionable title will secure all from encroachments, and therefore should be strongly advocated in new countries by every true friend of the miner.

J. S. PHILLIPS,

Author of *The Explorer's, Miner's, & Metallurgist's Companion*.

A WESTERN ELDORADO.

Rich Mineral Discoveries in Idaho
—Gold and Silver in large
Quantities.

There is great excitement throughout Western Montana over rich mineral discoveries in Coeur Dalene Mountains. Prospectors who have returned state that no mines have ever been discovered in the history of the Western States and Territories equal in richness and volume to the

newly discovered fields. The minerals consist of silver, tellure, and free-milling gold. A hundred dollars per man per day is being taken out of the rim rock of gulches, while in the gulches \$25 to \$30 per man per day is panned out. The streams are in the northern part of Idaho, near Eagle City, forty miles from Bozeman on the Northern Pacific Railway. There are now about five hundred people in the camp.

DIVIDENDS.

THE HORN SILVER MINING COMPANY, Utah, have declared a quarterly dividend of 50 cents a share; aggregating \$200,000. Total dividends this year \$1,100,000.

THE UNITED VERDI COPPER MINING COMPANY, of Arizona, paid its first dividend on the 31st Oct., of 12½ cents per share, aggregating \$37,000.

THE HOMESTEAK MINING COMPANY, Dakota, has declared its regular dividend this month of 25 cents per share, aggregating \$25,000. Total dividends this year, \$500,000.

THE ONTARIO SILVER MINING COMPANY, Utah, has resumed its regular dividends, and the 89th, amounting to \$75,000, was to be paid November 10th. Total dividends paid to date, \$5,075,000.

THE STANDARD CONSOLIDATED MINING COMPANY, of California, has declared its monthly dividend of 25 cents per share, payable November 12th. Total dividends to date \$4,325,000.

THE EVENING STAR MINING COMPANY, of Colorado, paid its 56th dividend this month, aggregating \$25,000, making the total of dividends to date, \$1,400,000.

MINERAL RESOURCES

OF THE

UNITED STATES.

Some interesting details are given in a report about to be issued, for 1882, and the first six months of 1883, by Mr. Albert Williams, jun., Chief of Mining Statistics and Technology division, United States Geological Survey, and an abstract from the advance sheets furnishes the totals of the production of the more important mineral substances.

COAL.—The only statistics in which the trade is interested are those relating to the amount of coal which is mined for and reaches the market. There is besides a coal and colliery consumption which is usually disregarded in statistics, and which ranges from 5 to 6½ per cent. on the total shipments. Of what may be called the commercial product, the quantities in 1882 were: Pennsylvania anthracite, 29,109,966 gross tons; bituminous,

brown coal, lignite, and small lots of anthracite mined outside of Pennsylvania, 57,963,038 gross tons: total, 87,083,134 gross tons. The spot value of the commercial product was as follows: anthracite, \$65,520,216; bituminous and other coals, \$72,452,797; total, \$137,973,013. During the first six months of 1883 the output was: Pennsylvania anthracite, 14,010,767 gross tons; bituminous and all other coals, 30,000,000 gross tons: total, 44,010,767 gross tons. The spot value of the commercial product during the first half of 1883 was: Pennsylvania anthracite, \$31,524,226; bituminous and other coals, \$37,500,000; total, \$69,024,226. Including the local consumption, etc., the total product in 1882 may be stated at 92,219,454 gross tons—31,358,264 tons of Pennsylvania anthracite and 60,861,190 gross tons of other coals; and the value at the mines was: Pennsylvania anthracite, \$70,556,094; bituminous coal, etc., \$76,076,487; total, \$146,632,581.

IRON.—The principal iron statistics for 1882 are as follows; Pig iron made, 4,623,323 gross tons; spot value, \$106,336,429. Iron ore mined, 9,000,000 gross tons; spot value \$32,400,000. Domestic iron ore consumed, 8,700,000 gross tons; spot value, \$31,320,000. Imported iron ore consumed, 589,655 gross tons. Total iron ore consumed, 9,289,655 gross tons. Total spot value of all iron and steel in the first stage of manufacture, excluding all duplication, \$171,336,429. Anthracite consumed in all iron and steel works, including furnaces, 3,800,000 gross tons. Bituminous coal consumed in all iron and steel works, including furnaces, 6,600,000 gross tons. Coke consumed in all iron and steel works, including furnaces, 3,350,000 gross tons. Charcoal consumed in all iron and steel works, including furnaces, 107,000,000 bushels. Limestone consumed as flux, 3,850,000 gross tons; spot value, \$2,310,000.

For the first six months of 1883 the totals are as follows: Pig iron made, 3,352,019 gross tons; spot value \$47,040,380. Iron ore mined and consumed, 4,500,000 gross tons; spot value, \$12,375,000. Imported iron ore consumed, 185,000 gross tons. Total iron ore consumed, 4,685,000 gross tons. Total spot value of all iron and steel in the first stage of manufacture, excluding all duplications, \$71,000,000. Anthracite consumed in all iron and steel works, including furnaces, 1,810,000 gross tons. Bituminous coal consumed in all iron and steel works, including furnaces, 3,140,000 gross tons. Coke consumed in all iron and steel works, including furnaces, 1,780,000 gross tons. Charcoal consumed in all iron and steel works, including furnaces, 38,750,000 bushels. Limestone consumed as flux, 1,950,000 gross tons: spot value, \$1,072,500.

GOLD AND SILVER.—The Mint

authorities furnish the following statistics for 1882:—Gold, \$32,500,000; silver, \$46,800,000; total \$79,300,000; or an increase of \$1,600,000 over the output in 1881. For the first six months of 1883 the product is estimated at \$16,250,000 gold, \$23,400,000 silver, and \$39,650,000 total; the rate of production being assumed to be the same as in 1882.

PETROLEUM.—The production of crude petroleum in the oil fields of Pennsylvania and New York in 1882 was 30,053,500 barrels of 42 gallons each, worth, at an average spot value of 78½c. per barrel, \$23,704,698. During the first half of 1883 the yield was 11,291,663 barrels, worth, at an average spot value of \$1.00½ per barrel, \$11,305,778. In addition to the quantity above stated, California produced in 1882 about 70,000 barrels.

COPPER.—The production of copper in 1882 was 91,646,232 lbs., worth, at an average value of 17½c. per pound in New York, \$16,038,091. For the first half of 1883 the production is estimated at 58,000,000 lbs., worth, at an average price in New York of 14½c. per pound, \$8,500,000. The spot value of copper at the point of production is a matter which cannot be stated with any accuracy; nor was any attempt made to ascertain the tons of copper ore mined. In 1882, 3,325,000 lbs. of bluestone, worth \$191,187, were made; and in the first half of 1883 the manufacture of bluestone is estimated at 1,662,500 lbs., worth \$95,593.

LEAD.—In 1882, 132,890 net tons of lead were produced, worth, at an average value of \$95 per net ton on the eastern seaboard, \$12,624,550. For the first half of 1883 the production is estimated at 70,000 net tons, worth, at \$90 per ton, \$6,300,000. In this case, as with copper, it is impossible to state the average spot value of the lead, or the tons of lead ore mined. A very large proportion of the lead ore smelted is argentiferous, and is worked for its silver contents and not for the value of the lead. In the census year ending May 31, 1880, the amount of white lead corroded was reported at 123,477,890 lbs., worth \$8,770,699.

ZINC.—The production of metallic zinc in 1882 was 33,765 net tons, worth, at an average value of 5½c. per pound in New York \$3,646,620. The production during the first six months of 1883 is estimated at 18,000 net tons, worth, at an average value of 4½c. per pound in New York, \$1,665,000. In addition to the spelter and sheet zinc made in this country there is also a large manufacture of zinc oxide made directly from the ore. As in the case of copper and lead it is impossible to fix an average spot value for the product, and the collection of statistics of zinc ore mined has not been attempted. In the census year 1880 the amount of zinc oxide manufactured, including that made

from scrap zinc, was reported at 20,121,761 lbs., worth \$766,337.

QUICKSILVER.—In 1882 the production of quicksilver was 52,732 flasks (of 76½ lbs. each = 4,033,998 lbs.), worth, at an average price in San Francisco of 36½c. per pound, \$1,487,537. During the first six months of 1883 the production was 22,740 flasks (= 1,739,610 lbs.), worth, at an average price of 35½c. per pound, \$613,213. During the year 1882 700,000 lbs. of vermillion were made in the United States, having a total value of \$315,000.

NICKEL.—The production of pure grain nickel in 1882 was 277,034 lbs., worth at \$1.10 per pound, \$304,737. There was also a production of 50 per cent. copper nickel alloy containing 4582 lbs. of nickel, worth \$5,040. The total nickel production was therefore 281,616 lbs., worth \$309,777. The only nickel reduction works in the United States were closed during the first half of 1883.

COBALT.—The value of cobalt ores and matte for 1882 was about \$15,000. The amount of cobalt oxide made was 11,653 lbs., worth \$32,046.

MANGANESE.—The production of manganese ore in 1882 was 3,500 gross tons, and the spot value at the mines, estimated at \$15 per ton, was \$52,500.

CHROMIUM.—The production of chrome iron ore in 1882 was about 2,500 net tons, worth, at an average price of \$40 per ton in Baltimore, \$100,000. The spot value cannot be ascertained.

TIN.—A trifling amount of tin ore was mined in 1882 and the first half of 1883, and production of metallic tin began on a small scale towards the close of the latter period.

ANTIMONY.—The production of metallic antimony, so far as ascertained, was 60 tons in 1882, worth about \$12,000.

BUILDING STONE.—It is estimated that the value of the building stone quarried in 1882 was \$21,000,000.

BRICK AND TILE.—It is estimated that the total value of the brick and tile made in the United States in 1882 was \$34,000,000.

LIME.—There were 31,000,000 barrels (of 200 lbs. each) made in 1882, having a total spot value of \$21,700,000 at the kilns.

CEMENT.—The amount of artificial Portland cement made in 1882 was 85,000 barrels, worth, spot, \$191,250. Of the cement manufactured from natural cement rock there were 3,165,000 barrels made, worth, spot, \$3,481,500. The total production of cement was 3,250,000 barrels, worth \$3,672,750.

PHOSPHATES.—The production of washed phosphate rock in 1882 by the land mining companies of South Carolina was 191,305 gross tons; spot value, \$1,147,830. By the river mining companies, 140,772 gross tons; spot value, \$844,632. Total 332,077 gross tons; spot value, \$3,992,462.

SEALED TENDERS addressed to the undersigned, and endorsed "Tenders for Telegraph Poles," will be received at the Department of Public Works, Ottawa, up to SATURDAY, the 15th day of DECEMBER, next, for the supply of about

1,225 Telegraph Poles more or less,
of the following dimensions, viz., Cedar Poles, barked, 25 feet in length and not less than 6 inches diameter at the small end and 10 inches diameter five feet from the butt.

To be delivered on or before the 1st day of April, 1884, between the Great North Western Telegraph Company's Station at Chatham and Point Escuminac, New Brunswick, via Blackbrook Mills, the Lower Black River, and the main road, each pole to be laid alongside the roadway and fifty yards apart.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honourable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,

F. H. ENNIS, Secretary.

Department of Public Works,
Ottawa, 28th Nov., 1883.

Notice to Contractors.

SEALED TENDERS, addressed to the undersigned and endorsed "Tender for Post Office, etc., Berlin, Ont.," will be received at this office until WEDNESDAY, the 19th December next, inclusively, for erection and completion of

POST OFFICES, ETC.,

AT

BERLIN, ONT.

Plans and specifications can be seen at the Department of Public Works, Ottawa, and the Post Office Berlin, on and after MONDAY, the 26th instant.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honourable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned. The Department does not bind itself to accept the lowest or any tender.

By order,

F. H. ENNIS, Secretary.

Department of Public Works,
Ottawa, Nov. 16th 1883.

Graving Dock.

British Columbia.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Graving Dock, B.C.," will be received at this office until FRIDAY, the 8th day of February, 1884, inclusively, for the construction and completion of the partially finished

Graving Dock at Esquimalt Harbor, British Columbia,

According to plans and specification to be seen on and after Monday, the 24th December next, at the Department of Public Works, Ottawa, and on application to the Hon. J. W. Trutch, Victoria, B.C.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and prices affixed to the whole of the items stated therein, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque for the sum of \$7,500, made payable to the order of the Honourable the Minister of Public Works which will be forfeited if the party decline to enter into contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

This Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS, Secretary.

Department of Public Works,
Ottawa, 12th Nov., 1883.

ST. LAWRENCE CANAL.

NOTICE to CONTRACTORS.

The letting of the works at the upper entrance of the CORNWALL CANAL, and those at the upper entrance of the RAPIDE PLAT CANALS, advertised to take place on the 13th day of November next are unavoidably postponed to the following dates:—Tenders will be received until TUESDAY, the fourth day of December next.

Plans, specifications, etc., will be ready for examination at the places previously mentioned on and after Tuesday the twentieth day of November.

For the works at the head of the Galops Canal, tenders will be received until Tuesday, the eighteenth day of December. Plans and specifications, etc., can be seen at the places before mentioned on and after Tuesday, the fourth day of December.

By order,

A. P. BRADLEY, Secretary.

Department of Railways and Canals,
Ottawa 20th Oct., 1883. 47-5.

MACHINERY for SALE

Milling Machinery that has been in use at a gold mine is offered for sale. The entire machinery referred to is said to be in good order and will be sold at a bargain to anyone having use for it. Particulars can be obtained on application to the publishers of the CANADIAN MINING REVIEW.

The CANADIAN MINING REVIEW
 devoted to the opening up of the
 general wealth of the Dominion, and
 publishers will be thankful for
 any encouragement they may receive
 from the hands of those who are inter-
 ested in its speedy development.

Visitors from the mining districts
 as well as others interested in Cana-
 dian Mineral Lands are cordially
 invited to call at our office.

Mining news and reports of new
discoveries of mineral deposits are
valued.

All matter for publication in the
REVIEW should be received at the
office not later than the 5th of the
month it is to appear.

Address all correspondence, &c.,
to the Publishers of the CANADIAN
MINING REVIEW, Ottawa.

Many of our subscribers have
expressed a wish that the
"Review" should issue on or
about the 15th, instead of on the
1st day, of each month, it was
decided that the day of publi-
cation should henceforth be in
accordance therewith, and we
excused ourselves of the compar-
atively inactive season at our
press to make this change, by
publishing a DECEMBER AND
JANUARY number.

The heavy falls of snow which have come one upon the other since the beginning of the year, and the extreme cold weather, have, in a measure, retarded the progress of mining operations in Canada, and more particularly has this been the case where a level has not been reached beyond the influence of these unwelcome elements. The inconveniences they occasion are more felt, probably, among the phosphate miners than by those at any other description of mines in the country, and yet, throughout the Ottawa district, the mines are being vigorously worked and phosphate is coming abundantly to the surface—the mineral is being more carefully handled than formerly, in respect to clobbering, and the price now offered for the output is encouraging producers to invest more capital in equipping their mines with such plant as will enable them to proceed with mining operations to the best advantage. An article in another column will convey some idea of what is going on at the phosphate mines, and will give a fair report of last year's shipments and the probable quantity of mineral that will go forward during the season of navigation of 1884.

Mining in Nova Scotia and New Brunswick has been a profitable industry during the year and has been carried on much more actively than for years before, especially in the gold producing districts of the former province. In the Eastern Townships of the Province of Quebec there has been more than an average production of asbestos and copper ores, but we have received no recent report of progress at the mines. The quantity

of gold raised during the year in Beauce district is over the average, and a fair amount of money has been disbursed on account of prospecting which will not have been in vain, as many promising properties have been opened up. Iron mining in Central Canada never offered better inducements to capitalists, and much foreign capital, American and English, has been invested in the industry which is destined to become one of great importance in the country. Throughout those districts to the north of Kingston and Belleville, and contiguous to a portion of the line of the Kingston and Pembroke Railway, much interest is being manifested in the iron deposits, and an extensive section of country has been carefully prospected—new bodies of ore have been discovered and some of them have been tested with satisfactory results. The Haycock Iron Mine, in the County of Ottawa, has passed into new hands, and it is to be hoped that the property will develop so that the company may realize its most sanguine expectations. A new industry has been quite recently inaugurated in the vicinity of Perth by one of the most energetic and successful miners in this section of Canada who is developing a valuable mica property, which promises to yield an almost unlimited supply of the mineral—very clear and white and hardly inferior to that of New Hampshire or North Carolina. Proceeding further to the west, to that section lying to the north and north-west of Lake Superior, the year's operations at the mines have been attended by successful results, some particulars of which are reported in another column under

the head of "The Mining Industries North of Lake Superior." Since the last report in the REVIEW of progress at the Lake of the Woods gold mines and the mines of Manitoba, little has transpired to chronicle, except in a general way—in the former locality some of the mines continue to be carefully worked, and with success, while at others there has been a temporary suspension of operations pending the forthcoming of more capital which is looked for with the opening of spring. The result of the past summer's prospecting in the Rocky Mountains has been many important discoveries of gold, silver, copper and iron, and some capital has already been subscribed in England, the United States and in Canada for their immediate development. Some of the coal mines of the North West Territories have been vigorously worked during the past year and have supplied a large quantity of good coal to the Canadian Pacific Railway Company and to settlers. A vast amount of money is invested in this important enterprise and much speculation has been indulged in by manipulators who have no intention of entering into active mining, but who may be rewarded by over-credulous capitalists being led away by misrepresentation. It is to be hoped that capital, which is so much needed for the legitimate development of our mineral lands, will not find its way into any unprofitable enterprises, and that wild speculation and intrigue will be the main thing to the main. has been, and to a great extent is now being, carried on, it must

be said to be unscientific, even primitive; time will correct this however, and at the close of 1884 we will doubtless see still greater advancement in this respect than was accomplished during 1883. From the mining districts of British Columbia no recent news has reached us.

A feverish and unsettled condition, as well as a serious decline in prices, having characterized the Iron trade in England during 1883, it is a remarkable fact that the production of pig iron in the North has exceeded that of any former year, it having reached, as nearly as can be arrived at, not less than 2,765,000 tons, as compared with 2,688,650 tons in 1882. At the beginning of the year prices ranged from 43s. to 43s. 6d., and at the close 36s. to 36s. 6d. were the ruling quotations; showing a decline of 7s. from a price that was considered not more than sufficient to yield a fair margin of profit on cost of production. The excess in the amount produced does not remain with the producers, for it is known that the stock on hand is no more than they were carrying at the close of the previous year. There has been a marked falling off in the exportation of crude iron during the year, remarkable in the quantity sent to the United States, and this, in addition to the fact that the production was greater than that of any former year, leads to the conclusion that the demand for home manufacture was brisk, and, in a notable degree, exceeded what has ever before been known in the history of the English Iron trade. Large imports of ore from Spain and other countries have been made into Wales, Durham and Scotland. In Scotland there has been the same large production, and in the Cleveland and Durham districts the output shows the largest record in the history of the trade. Yet prices have declined.

Attention is directed to Mr. Obalski's advertisement in another column on behalf of a French Company who desire to purchase copper ores and mattes.

THE PHOSPHATE ROCKS.

Nature of the Deposits. Will Deep Mining Pay?

BY HENRY G. VENNOR, F.G.S.

In the present active state of phosphate mining and general enquiry concerning our mines, it will be of interest to consider briefly the conditions of the deposits, and more particularly what evidence there is of these being deep-seated. I have elsewhere stated—and oftener than once—that the apatite rocks were, geologically considered, superficial. Hence the query naturally arises, Will deep-mining pay?

This question is an important one at the present time when so much capital is being invested in mines and mining properties, but, in so far as I have seen, no answer of a satisfactory nature has yet been given. The question, however, is a simple one, when we look into the nature of the deposits, *i.e.*, their geological conditions. The miner, who hitherto has been at work at economic ores in *true fissure veins* cutting alike all the rocks of a particular mining district, is entirely at sea when he is placed in the phosphate field. He may talk as he pleases about being on or off the "main lode," but of one thing only is he really certain, and that is of being supremely puzzled. Tell him to search in the direction of the bedding and he will laugh you to scorn and inform you that "true veins" but rarely run so. Yet, such is the truth—the very truth—in the case of phosphate deposits. These are nothing more than a series of irregular (large and small) masses distributed along one or two plains of bedding in *one particular belt of rock*. Leave this *particular belt* and you lose your phosphate: follow it, and you continue to discover new deposits. As is only natural, of course, and the case with iron ore and similar deposits, *true veins* occur as *spurts* or infiltrations from these embedded masses, but only run for very limited distances. The very finding, however, of one or two of such *veins* is enough for the embryo mineralogist and geologist, and he hastens to set it down as an established fact, that as such are our economic deposits of apatite.

The phosphate rocks, geologically speaking, are superficial, and have many thousands of feet of strata beneath them, but with this the practical miner has

nothing to do; they are plenty deep enough for his purpose, and he may rest assured of still finding his mineral in workable deposits as deep as he cares to delve. For example, let us take the rich outcrop of phosphate rock along the du Lievres river. This dips off to the westward at a high angle and plunges down to unknown depths, but comes up to the surface again in Wakefield—away over on the Gatineau river side—still carrying its phosphates. Now, as we cannot by any common sense reasoning conclude that the deposits of mineral are exclusively confined to the two outcrops of the rock, the one in the du Lievres and the other on the Gatineau side, it must be inferred that these continue with the rock to great and unknown depths in the interval of country between the rivers named. Consequently I have no hesitation in affirming that the mineral "goes deep"—but as to whether the miner can mine deeply is quite another question, and depends entirely upon the size and nature of the deposit or deposits he is following down. I do not believe that any one mass of apatite will ever be found to run connectedly to a great depth, but possibly by means of "stringers" one mass may lead to the discovery of another much lower down. It is doubtful, however, whether such mining would prove remunerative, as the removal of much barren rock between the deposits would in all probability turn the balance in favor of abandoning the opening.

As an illustration of great *fissures* in this same district, I would allude here briefly to the groups or series of trap dykes which intersect the strata continuously for miles at a stretch. These undoubtedly represent or mark out the direction of great rents or *fissures* by which the rocks were affected at some period subsequent to the deposition of the phosphate of lime. Now, had these great rents through the strata become filled with the mineral last named instead of the doleritic trap, we would have just the sort of thing most of our miners are and have been looking for, namely, "main lodes," "true veins," etc. of phosphate of lime, and we would have something more tangible and definite to base our calculations upon respecting deep mining. Another illustration of the condition in which the deposits of this mineral occur may be found in the distribution of the proper or *parent* rock through Ottawa County, which

clearly establishes the fact of the rock *carrying the mineral with it*, and not the mineral *traversing merely one particular portion of it*, as must be the case were we to fix upon the *true vein* theory. We have, for instance, one particular volume of rock signally impregnated with the mineral in grains, veins, and masses large and small. The rock is not bedded, but is of a granitoid structure and highly crystalline. The chief constituents are pyroxene (in grains and crystals), hornblende, feldspar, calcite and apatite—with a greater or less admixture of iron pyrites which generally gives to both rock and apatite a reddish brown weathered appearance. In such a volume of rock are all of the deposits of mineral of an importance hitherto discovered either in Ottawa County or in the Rideau section towards Perth and Kingston in the Province of Ontario. Go where one will in the course of this belt of rock phosphate of lime is found in one form or another, but leave it (the proper belt) and travel across the strike of the rocks (*i.e.* contrary to their run) and very speedily a trace of the mineral is lost. Beyond this thoroughly established truth nothing further is wanted in proof of the bedded condition of the main deposits.

GEOLOGICAL MUSEUM

The number of persons who registered their names as visitors to the museum of the Geological Survey this city from 1st January, 1883, 1st January, 1884, was 12,027. In addition to these, however, a considerable number of gentlemen, who did not enter their names in the museum book, called every day the various officers of the Survey and many of them inspected the museum before leaving. These, it is estimated, would increase the above figure by from 3,000 to 5,000 so that the total number of visitors during the year 1883 may be safely set down at 15,000, or about times the average number while the museum was in Montreal.

THE PHOSPHATE MINES OF OTTAWA COUNTY.

More than ordinary interest has been directed towards the phosphate mining industry in this section during the year just closed, and is rapidly increasing in importance. Speculation and the manipulative properties have given place to legitimate mining, and mine owners in most cases, preparing for permanent working. The mines are developing well and, wherever operations have been prosecuted with ordinary

care and judgment, fair profits have been realized—in some instances the net profits on last year's output have reached 100 to 300 per cent. on actual cost of production and delivery—many of the mines have greatly increased in value during the year—the facilities of access to the mines, and for summer transportation of the ore, have been improved to a great extent and it may be said that the prospects for a successful future were never brighter than at the present time.

In the Township of Portland West the "High Rock" and the Union Phosphate Company's mines are the most important. The first mentioned property, according to reports recently received, continues very productive and the openings that are now being worked look favorable for an abundant yield. The U. P. Co.'s mines have developed well, and another extensive deposit of mineral has been lately discovered on the company's property which has added to its value. During the short time this location has been in the hands of its present owners much has been accomplished by them, and there is no doubt that the year just entered upon will be one of prosperity for the company. The "High Rock" and U. P. Co.'s mines employ about 75 men each.

In Portland East the Dominion Phosphate Company have begun work in earnest and their "North Star" mine is developing most satisfactorily. Sixty miners are now employed on this property, and the company, having completed the dead-work, will give attention in future exclusively to taking out ore. The "North Star" mine is capable of yielding a large annual output of highest grade ore, and the future will prove the wisdom of employing a force adequate to its capacity. The capital stock of the company has been increased from \$75,000 to \$125,000, and at a general meeting of the stockholders, held in Montreal in December, some other important business was transacted. The stockholders are now confident of receiving a handsome dividend in the near future, and with proper management their expectations will surely be realized. The French Company continues to work some of their properties in this township and employ about 35 miners.

At the "Watt" mine in Buckingham Township Mr. Allan has a force of 12 miners employed, and the property has much increased in value since he purchased it but a few weeks ago. On this property there are several shafts sunk to considerable depth, the deepest of which is about 170 feet, and in each of them is a bed of phosphate extending across the bottom of the shaft, and sinking to the depth that has been reached many veins of rich mineral have been cut through, upon which no stopping has yet been attempted. Some new ground has already been opened and has developed most satisfactorily. Mr.

Allan's success in phosphate mining has been due to his unerring judgment, his energy and the business-like manner in which he has always conducted his mining operations, and these three useful qualifications he will doubtless exercise in the developing of the "Watt" mine.

Of the "Emerald" mine, in the same township, little if any more can be said than that it is the most valuable phosphate mine yet discovered in Canada, and its owners are very much pleased with their purchase. A good force of miners, numbering about 45, are working in the ore bed from which mineral is being abundantly raised, and the mining, which is conducted by an experienced Cornish miner, is carried on in a systematic and careful manner.

In the Township of Templeton the McLaurin Mines are being vigorously worked with a force of about 30 men, and good work is being done on the properties owned by R. C. Adams, Jackson Rae and Gillespie, Moffatt & Co., of Montreal. At the Post mine, and at one owned by the Roach estate, of Quebec, active operations have been suspended. In the same township Mr. G. Cowan is opening some properties owned by the Perkins estate, and Laurie & Co., of Montreal, have recently begun work on a lot in the 7th Range, which shows signs of developing into a mine of some importance.

In the Township of Wakefield the "Haldane" mine is yielding well, and the "Moore" mine, which is now under contract, is yielding a fair quantity of high grade phosphate. The "Gemmill" property still retains the high reputation it has enjoyed for years past, and yields a steady output of mineral, the quality of which has long since established the reputation of the mine.

At other less important mines work is going steadily ahead and helps to increase the aggregate annual shipment from the district. From many of the mines in the county some mineral has already been delivered at point of shipment, but from those contiguous to the Du Lievre River there has been no hauling done yet. It was expected that transportation would have been practicable on the river about the 10th January, but the quantity of snow that has fallen since then will in all probability cause delay.

Phosphate Quotations.

No fluctuation has been reported during the past month in the value of Canadian phosphate in the foreign markets. It is quoted from at 1s. 3d. per unit for 80 per cent. mineral on wharf at Liverpool, London, or Glasgow. This is equivalent to \$20 per ton delivered in Montreal.

Phosphate Shipments for 1883.

The total quantity of phosphate shipped from Canada during the season of navigation of 1883 amounted to 17,840 tons, and was forwarded to foreign ports as follows:

To Liverpool	7313 tons.
" London	3625 "
" Bristol	1951 "
" Hamburg	1576 "
" Glasgow	942 "
" Stockholm	650 "
" Dublin	400 "
" Swansea	375 "
" Gloucester	374 "
" Cardiff	200 "
" Barrow	180 "
" Plymouth	129 "
" Hartlepool	107 "
" Hull	18 "

Total..... 17,840 tons.

[About 15 % of this total was forwarded from mines in the Kingston and Perth districts, the balance (85 %) was the output of the mines of Ottawa County.]

As nearly as can be estimated at present the mines now in operation will produce for shipment, before the close of navigation this year, as follows:

TOWNSHIP.	TONS.
Portland W., Ottawa Co.	8,000
" E., " "	3,000
Buckingham " "	6,000
Templeton " "	3,000
Wakefield " "	1,000
	21,000
Kingston and Perth districts,	3,000
Total	24,000

This is of course nothing more than an approximate estimate, but the present appearance of the mines and the quantity of mineral already raised are fair indications that the total output for the season of 1884 will be in excess of that of last year quite 6,000 tons.

MICA.

The demand for good mica has so increased during the past year that its market value has greatly advanced and, as a consequence, there has been a vigorous search for deposits of this mineral. Mr. W. A. Allan, of Ottawa, is among the first to secure a location in North Burgess capable of producing merchantable mica in any quantity, and he has already ten men at work. Three shafts have been sunk on the property to a depth of 18, 25 and 35 feet respectively, and a quantity of excellent mica has been obtained. At the bottom of each pit there is a strong micaceous lead with bodies of well formed crystals, some of which will cut into sizes 8x10 inches, and all of them are capable of producing marketable sizes in clear white sheets. It is certainly a valuable mine, and Mr. Allan is to be congratulated for his foresight in securing it.

THE HAYCOCK IRON MINE.

Much has been said about the resumption of work on this property under the management of a wealthy English organization, and as time rolls on, the people of Ottawa become anxious for more substantial information on the subject than can be gathered from newspaper reports and street rumor. It would seem that negotiations, for the present, are at a standstill. A strong company has been organized in England with large means, and to all appearances, with a full determination to proceed with operations, when negotiations will have been definitely closed. Eminent experts have been sent from England and elsewhere to examine the deposits, and their reports have been favorable to the property. A fair sum of money has been paid, which looks like an evidence of good faith, and it is but reasonable to assume that the transfer will eventually be consummated; but why this prolonged delay?

THE MINING INDUSTRY

OF

New Brunswick and Nova Scotia.

A newspaper correspondent who has been looking up the mining interests of the Eastern Provinces finds that there is an abundance of good iron ore (hematite) on the Cobequid Mountains at Acadia Mines, N. S., where the Canada Steel Company has located works giving employment to 500 men. The output of ore last year was 50,000 tons which was made into pig and bar iron, car wheels, etc., valued at over \$600,000. Iron ore is found in other localities, but not to any such extent as here.

The largest colliery in Canada is at Spring Hill Mines, N. S., where about 500 men are employed, and the output last year amounted to 200,300 tons of coal, or nearly one sixth of the entire production of Nova Scotia. At Stellarton, N. S., 141,000 tons of coal were raised last year, and 12,512 tons of coke manufactured. At Sydney, Cape Breton, the coal fields underlie over two hundred square miles, the greater part of which is under the Atlantic. Mining rights covering over one half of this submarine coal have been taken out. The Sydney mines give employment to about 1,500 men, and coal is seen, smelt, and felt everywhere. At Pictou, N. S., coal has been exported since 1798, though the amount was small till 1829. It is now the principal business of the port. At Bridgeport, C. B., the International Coal Mines give employment to 300 men and boys, and the output for last year was 109,286 tons. At the Joggins Mines, N. S., an attempt has been made to obtain railway facilities from Macan on the Intercolonial Railway, so that the coal now mined there may find a more ready market. The famous

Albertite coal that was obtained from the Albert Mines, N. B., for several years, has become exhausted, and mining has been discontinued.

As regards the gold product, the following figures will serve to indicate the value of the mines: At Mount Uniacke, N. S., there are three gold mines and four quartz mills. Last year 3,440 tons of quartz were crushed, furnishing 9,128 days' employment, and yielding \$3.52 per day per man. This was the best return of any mines in the Province. At Sherbrooke, N. S., the ore is low grade, but easily worked and distributed in large quantities over an area of eighteen square miles. The yield of six quartz mills last year was 2,572 ounces, 17 penny-weights, 14 grains. At Goldenville, three miles from Sherbrooke, \$500 was found the day the mines were discovered in 1861, and there has been a yield of \$2,000 per man, per year, during some years. At Tangier, N. S., the yield last year was 789 ounces from 1,622 tons of ore. At Waverly, N. S., the yield was 234 ounces, 7 penny-weights, 5 grains, from 554 tons of ore; three mines having been worked and 2,238 days' labor performed. At Wine Harbor, N. S., the ore is easily worked, but poor, yielding only 94 cents per day per man. At Country Harbor, N. S., 903 ounces were obtained last year from 511 tons of quartz, and the Oxford Gold Mining Company, of Chezzetcook, N. S., obtained \$6,800 from 130 tons of ore worked during twelve days in last May.

NOTE.—Where the term "last year" is used it refers to 1882.

THE MINING INDUSTRY NORTH OF LAKE SUPERIOR.

At Silver Islet, about 50 miners are employed, a depth of 1,200 ft. has been reached, and on the 1,160 ft. level they are drifting both ways. The mine is said to be yielding silver in paying quantities. This company own a large tract of land on the main shore at Mamainse, which has been successfully prospected, and native copper, yellow and gray copper ores in veins have been discovered, as well as native silver, said to be very rich. On the property adjoining this last mentioned location, the Lake Superior Native Copper Company are expending about \$12,000 per month, and employ 175 men. A shaft has been sunk 200 ft. and in one of three levels they have drifted 600 ft. The ore at the depth obtained carries about 3 per cent. of metal. The Michipicotin Native Copper Company are doing good work at their mine, to the N.W. of the L.S.N.C. Co's. property, and it is said they have struck ore rich in native copper. Both of these mines are being worked by English capital. Within 25 miles of Port Arthur

the Rabbit Mountain Silver Mine is located, and of this property much has already been read in the Canadian press. Nuggets of black silver, weighing as much as 12 lbs. each, have been taken from the vein, through which silver appears well disseminated. The vein is unquestionably a large one, and a large quantity of silver is in sight. The Rabbit Mountain District is eminently a silver bearing country, and it has, as yet, been but partially explored. To the north and west of Rabbit Mountain, around Lakes Shebandowan, Kashabowie, and north of Lac des Milles Lacs, sufficient prospecting has been done to prove it to be a gold bearing district. Free gold has been found here, and some of the quartz taken from a vein near Partridge Lake yielded \$30 to the ton. To the west of Lake Shebandowan, the Huronian Company's gold and silver mine is located, near Jack Fish Lake, and it may be said that this is one of the richest mines, at which work has been done, that has yet been discovered in the Lake Superior region, and it is satisfactory to know that it is being actively and carefully developed by a strong Canadian Company. The vein, which is a large one, is rich in mineral, and is free milling, a shaft is down 50 ft., and a drift of as many feet has been run on the vein from which a large quantity of rich ore has been raised. The company have a ten-stamp mill and four Frue Vanners ready to begin work on the ore, and it will not be long before the result of milling will be made known. It is a certainty that the Lake Superior district is rich in mineral, and when capital is available for the proper development of the mines their yielding capacity will be demonstrated, but not till then.

THE HURONIAN MINE.

A letter from the manager of this mine lately received by a gentleman in this city gives a very encouraging account of the work. He states that the vein has held good all the way from the surface to the present depth both as to size and the show of gold. The stamp-mill had commenced running and worked well. The difficulties arising from the isolated position of the mine had been surmounted, all supplies had been delivered and a force of men was engaged in cutting a main road from the Barrel Portage, which is a much more direct course from Port Savanne than the old route by Shebandowan Lake. The company, whose head office is in Ottawa, is working in a thoroughly *bona fide* manner, having expended upwards of \$30,000 in the actual development of the mine itself, and it is deserving of the success which is attending its operations.

WELLINGTON COAL.

The coal from the Wellington Mines, at Vancouver, B. C., has become very popular in San Francisco, Cal., evidenced by an article which appeared in the *S. F. Call*, 29th Nov., as follows: "The *Bar-nard Castle*, with Wellington coal, is due here to-day. So great is the demand for this coal that carts and waggons began to arrive on the wharf Tuesday morning, and by night a line two blocks in length had formed, which camped out with the intention of staying till the steamer arrived. Many of the men at night slept in their carts, and the horses are fed where they stand."

General Manager Van Horn, of the Canadian Pacific Railway, expresses himself highly pleased with the abundance and the quality of the coal in the North-West. The supply is practically unlimited, and as the railway is said to consume a ton every two minutes, Mr. Van Horn's pleasure on account of its presence in a section of the country so remote from other coal fields and so sparsely timbered, cannot be wondered at.

Gold Discovery in Norway.

The *London (England) Mining Journal* reports the discovery of gold in Norway, and attaches much importance to it as it is stated that, thus far, the development of the lode has revealed what is considered to be one of the most wonderful auriferous veins that has been met with in any country for many years. A well known eminent practical authority has recently examined the property, and his report fully warrants the views above expressed. He brought home a number of samples (each weighing over a quarter of a hundred-weight) taken from much larger quantities of stuff shot down from the lode, well mixed and divided, the essays of which give exceedingly good results, while a number of selected specimens are extremely rich; one stone in particular having a strong branch of gold about an inch wide running through it, which can be seen in the lode where this stone was taken from; the gold in the specimen alone is valued at £60 (about \$300). A private company is being organized in England with ample means to carry on operations on the property in an approved and business-like manner. The property is easily accessible, and it is no inconsiderable advantage that it is within two days' journey of England. Great results are expected, and report of progress in development work on the lode will be looked for with much interest the world over.

Australian Nuggets.

These have been the largest ever found, "as may be seen from the undergiven list of some of the largest in the Colony of Victoria. In this Colony nearly a hundred have been unearthed that averaged 370 ounces of gold; six of these realized for their fortunate owners:

The Welcome Stranger, found near Dunolly.....	\$46,361
The Welcome, found near Ballarat....	45,366
The Blanche Barkley, found near Kingower.....	33,693
Nugget, unnamed, found near Canadian Gully.....	27,812
The Heron, found near Fryer's Creek	19,848
Lady Hotham, found near Canadian Gully.....	14,595

Total value of six nuggets.....\$187,675
Average.....31,279

N. Y. Mining Record.

THE SOURCE OF THE ALLUVIAL GOLD IN THE NORTH-WEST TERRITORIES.

It has long been known that alluvial gold is found in the North-West Territories on the rivers flowing eastward from the Rocky Mountains. The Peace River and the North Saskatchewan have been especially noted in this connection. Now that the precious metals have been discovered in small quantities in the Rocky Mountains, near the proposed route of the Canadian Pacific Railway, the question is again asked, may not the gold of the Saskatchewan have been washed down the rivers from the mountains? This was the original popular theory, until many years ago, when Professor Bell, of the Geological Survey, showed that it was much more probable that the gold came from the northward than the west. (See Report Geo. Survey 1873, p. 86.) This opinion has since been quoted by Professor Hind and Dr. Selwyn. The gold, as Dr. Bell showed, is washed out of the drift which covers the auriferous strata of the plains, and as this drift came from the northward (as proved by its composition) it follows that the gold came from this quarter also. In the report referred to, it was supposed that the gold might have been derived from Huronian rocks in the direction of Lake Athabasca, and since that time these rocks have actually been found to be well developed on this lake; but, although some of the alluvial gold of the plains may have had its source in this direction, Professor Bell is of the opinion that it is quite as likely that the gold of the North Saskatchewan has been brought by the ancient glaciers from the valleys of the upper part of the Liard River and the northern branches of the Peace River. The reason why the gold is not found much above Edmonton is owing partly to the slope of the ground, and partly to the smaller glaciers of the drift period in that latitude proceeding eastward from the Rocky Mountains, keeping the great glaciers from the northward from approaching any nearer to the mountains.

The most reliable assays of ores from the recent discoveries in the Rocky Mountains, above referred to, show but little gold, and even if more should prove to exist the locality is too far south for any of it to have found its way into the North Saskatchewan, at the sources of which no gold has yet been found.

On the other hand, it is well known that rich placers exist on the upper branches of the Liard and large quantities of gold have already been taken from them, especially in the Cassiar District. It therefore appears to us that Professor Bell's explanation accounts best for all the facts.

MINERALS OF THE HUDSON'S BAY TERRITORIES.

The report of the Select Standing Committee, on Immigration and Colonization, of last session which has lately been published, contains much valuable information on the country around Hudson's Bay. In the evidence of Professor Bell, of the Geological Survey, we find the following in answer to a question by Captain Scott, of Winnipeg: "In a general way, in the Hudson's Bay territories are there many useful minerals?" "As far as we know there are, but very little search has been made. I can, however, mention numerous minerals which are already known to exist. They embrace iron, as hematite, magnetite, clay ironstone and rich manganese iron ore on the Eastmain coast, copper in the native state, and in various combinations, lead, silver, gold, molybdenum, antimony, manganese, chromium, phosphate of lime, jade, chrysoprase, agate, carnelian, malachite, jasper, serpentine, jet, lazulite, petroleum, asphalt, peat, anthracite, bituminous coal, lignite, limestone, granite, sandstone, and sand for glass making, moulding sand, clays, marls, ochres, gypsum, iron pyrites, salt, medicinal waters, sheet mica, soapstone and plumbago.

"These are all known to occur, many in various parts of the territory and most of them certainly well worth looking after. Sir John Richardson mentioned that he thought it would be to the advantage of the Imperial Government and the Hudson's Bay Company to explore the country for minerals. He was convinced that it would not be long before the value of the mines of the Hudson's Bay territory would far surpass that of the fur trade."

PERSONAL.

Mr. W. H. Williams, President of the Union Phosphate Mining and Land Company, will be a passenger on the *Arizona*, from New York, on the 29th of January. Mr. Williams' object in going to England at this season is to complete arrangements there for the receipt of the output from the phos-

phate mines in Ottawa County owned by the company, of which he was the founder.

The numerous friends of Capt. R. C. Adams, of Montreal, who has occupied so prominent a position among the phosphate miners of Canada for years past, will have learned with regret that he was one of the victims in the accident on the Canadian Pacific Railway some days ago, and all of them will look for report of his speedy recovery.

Mr. G. A. Mountain, D.L.S., and P.L.S. for the Provinces of Ontario and Quebec, has recently returned to Ottawa, after successfully passing his examinations for P.L.S. in Ontario. Mr. Mountain received his diploma for the Province of Quebec some years ago, and in 1882 he passed a brilliant examination before the Dominion board at Ottawa, receiving the maximum marks. His many friends in the city were pleased to have another opportunity to congratulate him on his return to the city after his recent achievements in Toronto.

MINING NOTES.

At the oil wells at Bellevue, Westmorland County, N.B., the prospects are not so bright as has been reported. At a depth of 657 ft. it is said that oil flowed copiously. Now that a depth of 900 ft. has been reached no oil is noticeable in the boring.

The diggings at the Bridge River Gold Mines, about 60 miles from Lillooet, B.C., are attracting some attention. Two men, it is said, washed \$527 in one month previous to closing down for the winter.

The Manganese mines at Markhamville, N.B., have been worked continuously for over 25 years and produce ore valued from \$16 to \$100 per ton.

The Oxford Gold Mine, N. S., yielded \$10,300 in bullion for the month of November, the cost of production being but \$1,700.

The gold, silver and lead product of the Colorado mines during 1883 has been valued at \$26,126,130.

The gold yield of the United States mines during 1883 reached a valuation of \$32,000,000.

The products of the Montana gold mines will reach \$15,000,000 for 1883.

DIVIDENDS DECLARED.

THE STANDARD CONSOLIDATED MINING COMPANY, Cal., paid in December their regular monthly dividend, and an extra dividend aggregating \$50,000. Thirteen dividends paid during the year amounted to \$325,000. This company has declared its seventy-ninth successive monthly dividend, payable January 12th, aggregating \$25,000, thus swelling the total

amount of dividends to date to \$4,400,000.

THE IDAHO GOLD MINING COMPANY, of Grass Valley, Cal., raised their dividend in December to four dollars a share, aggregating \$12,400. Total of twelve dividends during 1883 amounted to \$82,000.

THE HOMESTAKE MINING COMPANY, of Deadwood, Dakota, declared their regular monthly dividend, payable on 26th December, aggregating \$25,000. Total dividends for the year, \$225,000.

THE CONTENTION CONSOLIDATED MINING COMPANY, of Arizona, paid a dividend of 25 cents a share on 24th Dec., aggregating \$62,500. Seven dividends during the year amounted to \$437,500.

THE ONTARIO MINING COMPANY, of Utah, paid in December their nineteenth dividend, for 1883, aggregating \$75,000. Total dividends to date, \$5,150,000.

Sixty gold, silver, and copper mining companies of the United States paid out \$9,871,600 in dividends during 1883.

THE IRON DEPOSITS OF CENTRAL CANADA.

An evidence of the importance attached to Canadian Iron deposits by our more enterprising neighbors beyond the border was given in New York on the 27th of December, when a meeting of influential merchants was convened at the Fifth Avenue Hotel to arrange preliminaries for bringing about an agreement by which coal and iron ore will be allowed to enter free of duty into Canada and the United States. Those interested in mining coal in certain bituminous districts of Pennsylvania and Ohio, and those engaged mining iron ore in Canada and in manufacturing pig iron in the United States, are in favor of such reciprocity. Another evidence of the impetus that may be looked for to iron mining in Canada is the interest evidenced in the industry by the *American press*. The following letter by Mr. M. C. Read, member of the Ohio Geological Survey, was recently published in the *Trade Review and Western Machinist* of Cleveland, O., and is highly commendatory of the value of many of the deposits in certain iron-bearing districts:

"As early as 1852-3 the Canadian Geologists called attention to the iron ores, both hematite and magnetic found in this county. In 1866 Mr. Thomas Macfarlane contributed to the geological survey of Canada a special report upon these ores which was followed by Mr. Henry G. Vennor with a more detailed report in 1869. The presence of excellent ore was noticed by these geologists in various parts of the county and in the townships of Madoc and Marmora considerable ore was mined many years ago, but the extent and magnitude of the ore deposits in the county has been until recently very

inadequately appreciated. Some years ago Mr. Coe, an enterprising Englishman residing in the village of Madoc, commenced a systematic examination of the more unexplored parts of the county and gradually obtained the title to much of the most promising territory. Some three years ago he obtained the co-operation of the Messrs. McMullens of Picton, Ontario, and S. J. Ritchie, of Ohio, men who had the enterprise and means requisite for the development of the mineral resources of the county. After a careful examination of the territory, and repeated analyses of specimens of the ore from different exposures, these gentlemen secured the title to something over 100,000 acres covering the mineral belt, purchased a railroad from Picton to Trenton, and obtaining a very favorable charter from the Dominion Government, continued the road northward and are now laying the track on the graded bed of the north half, at a rate which promises the completion of the road to several of the principal mines during the coming month. They have obtained a route, with light grades and long curves, are building the road in the most substantial manner with steel rails and steel bridges; have purchased the entire frontage of an excellent harbor on the lake, are building extensive piers and securing every appliance needed for the cheap and rapid transfer of the ore from the mines to vessels on the lake.

The character of the deposits of ore will be better understood after a brief description of the geological structure of the district.

The silurian limestone covers the Southern part of the county, resting unconformably upon the underlying rocks, which the Canadian geologist designates as Laurentian. They are substantially on the same horizon as the Huronian rocks of Lake Superior and it is pretty certain that they are of the same age.

The upper division of these rocks consists of a series of limestone and calcareous schists, Gneissoid quartzites with silicious and mica slates, attaining in all a maximum thickness according to Mr. Vennor's report of over 21,000 feet. Below this is mass of Hornblende rock with various quartzites and green stones, reaching in places, according to the same authority, a thickness of over 4,000 feet. This is the feriferous divisions and includes the important ore beds of the district. Below this is a vein of Syenitic Gneissoid and limestone rocks attaining a thickness according to Mr. Vennor of over 12,000 feet, all of which is geologically below the iron bearing rocks. A series of upheavals, with subsequent denudation through glacial action has left this lowest of the rock series, as the surface rock, over large areas, has exposed the upturned edges of the iron bearing rocks and disclosed their presence over a large part of nine townships in the county.

To be continued.

MACHINERY for SALE

Milling Machinery that has been
in use at a gold mine is offered for
sale. The entire machinery referred
to is said to be in good order and
will be sold at a bargain to anyone
having use for it. Particulars can
be obtained on application to the
publishers of the CANADIAN MINING
REVIEW.

**NOTICE TO CONTRACTORS.**

SEALED TENDERS, addressed to the
undersigned and endorsed "Tender for
Mispeck Works," will be received until
TUESDAY, the 1st day of FEBRUARY next,
inclusively, for the construction of a

BREAKWATER

AT

MISPECK, ST. JOHN COUNTY, N.B.,

according to a plan and specification to be
seen at the office of the Department, Custom
House Building, Saint John, N.B., where
forms of tender can be obtained.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied, the blanks properly
filled in, and signed with their actual signa-
tures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honorable the Minister of Public
Works, equal to five per cent. of the amount of
the tender, which will be forfeited if the
party declines to enter into a contract when
called on to do so, or if he fail to complete the
work contracted for. If the tender be not ac-
cepted the cheque will be returned.

The Department will not be bound to accept
the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 5th Jan., 1884.

**NOTICE TO CONTRACTORS.**

SEALED TENDERS addressed to the un-
dersigned, and endorsed "Tender for
Additional Cell Wing, Boiler House, &c.,
Manitoba Penitentiary," will be received at
this office until MONDAY, the 17th March
next, inclusively, for the erection and com-
pletion of

ADDITIONAL CELL WING, BOILER HOUSE,
&c., AT

Manitoba Penitentiary.

Plans and specifications can be seen at the
Department of Public Works, Ottawa, and
at the Dominion Public Works Office, Winni-
peg, Manitoba, on and after MONDAY, the
11th February next.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied, and signed with their
actual signatures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honorable the Minister of
Public Works, equal to five per cent. of the
amount of the tender, which will be forfeited
if the party declines to enter into a contract
when called on to do so, or if he fail to com-
plete the work contracted for. If the tender
be not accepted the cheque will be returned.

The Department does not bind itself to ac-
cept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, Jan. 9th 1884.

**Graving Dock.**

British Columbia.

SEALED TENDERS addressed to the un-
dersigned, and endorsed "Tender for
Graving Dock, B.C.," will be received at this
office until FRIDAY, the 8th day of February,
1884, inclusively, for the construction and
completion of the partially finished

**Graving Dock at Esquimalt Har-
bor, British Columbia,**

According to plans and specification to be
seen on and after Monday, the 24th December
next, at the Department of Public Works,
Ottawa, and on application to the Hon. J. W.
Trutch, Victoria, B.C.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied and prices affixed to
the whole of the items stated therein, and
signed with their actual signatures.

Each tender must be accompanied by an
accepted bank cheque for the sum of \$7,500,
made payable to the order of the Honorable
the Minister of Public Works which will be
forfeited if the party declines to enter into
contract when called upon to do so, or if he fail
to complete the work contracted for. If the
tender be not accepted the cheque will be re-
turned.

This Department will not be bound to ac-
cept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.
Department of Public Works,
Ottawa, 12th Nov., 1883.

ESQUIMALT GRAVING DOCK,
British Columbia.

The time for inspection of plans and speci-
fications for the completion of the Graving
Dock at Esquimalt, British Columbia, is
extended to Thursday, the 17th day of Janu-
ary next, inclusively, and for receiving
Tenders to Friday the 27th day of February.

By order,
F. H. ENNIS,
Secretary.
Department of Public Works,
Ottawa, 20th Dec., 1883.

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

NEW BOOK FOR MINERS.

We understand that a new book, written by Professor Bell, Assistant Director of the Geological Survey, will be issued shortly, on the Mineral Resources of Canada, comprising an account of the Economic Geology of the Dominion and of the progress of mining for the last twenty years. Such a work will supply a long felt want, and no one is better qualified than the author to do justice to the subject.

During the past month inactivity has, to a certain extent, characterized the mining industry in the Dominion, and there has been nothing of much importance to report from the mining centres. In another column will be found extracts from the President's report to the shareholders of the Oxford Gold Mine, Lake Catcha District, N.S., at the first annual meeting of the Company. We learn that many of the gold mines in the Province of Nova Scotia are being profitably worked, and at others development work is being vigorously pushed with satisfactory results. The gold mines of Beauce, in the Province of Quebec, are attracting the attention of capitalists on account of the flattering reports that have been made of the result of last summer's operations, and in the Eastern Townships, County of Megantic, the Asbestos mines have increased in value, owing to the rapidly increasing demand for the mineral. In Ottawa County there is probably more activity displayed at the phosphate mines than in any other mining district of the Dominion, and the demand for phosphate lands is greater than it ever has been known to be, but it is not probable that any sales of undeveloped properties will take place until the snow leaves the ground. In Burgess Township, Province of Ontario, a good force of men are employed at Mr. Allan's mica mine, and a quantity of mica of very fine quality has been shipped. The iron mining industry of Central Ontario is on the boom, and the reciprocity movement, inaugurated by gentlemen across the border, to have coal and iron

ores included in the free list is occupying the attention of the proper authorities in the United States and Canada, and it will doubtless be a question for discussion for some time before a decision will be arrived at. During the past month we have received no reports of progress at the Canadian mines on Lake Superior and at the Lake of the Woods gold mines. The Huronian and Rabbitt Mountain mines are said to be steadily improving as the work of development proceeds. In the Rocky Mountain District mining was almost entirely suspended when the winter set in, but it is expected that operations will be vigorously resumed with the opening of spring. From British Columbia some interesting news has quite recently reached us and is reported in another column.

We are informed that the revised Regulations to govern the disposal of Mineral lands, other than Coal lands, in the Province of Manitoba and the North West Territories have been definitely framed and are at present in the hands of the Minister of the Interior preparatory to being submitted to the Government for adoption—after which it is required that they be on the table of the House for thirty days before becoming law. It is to be hoped that after these Regulations will have been adopted it will not be discovered that they contain impracticable clauses, and still more is it to be hoped that the interests of the prospector have been carefully considered and protected. The important part they play in the opening up of every mineral

district should never be lost sight of by those in whose power it lies to protect and encourage them.

SOLID INDUSTRY.

As so many and important discoveries of economic mineral deposits have been reported by the army of prospectors who are now distributed over the length and breadth of the Dominion of Canada, it becomes the duty of those who desire that these discoveries be made valuable to use every legitimate argument that will invite capital to the country for developing them, and then to be scrupulously careful in seeing that whatever capital may be forthcoming for this purpose will be employed in such a manner as will encourage the investor and convince him that mining operations are not unprofitable. This being the case it is not inopportune to reprint an article which has appeared in the *Chicago Mining Review* under the above heading, as follows :

"While it is certain that no enterprise in which men engage can show more certain and tangible proof of profitable permanence than the mining industry, it is probably true that no avocation is at the present time regarded with so much uncertainty and suspicion as far as a reliable and certain reward is concerned. While the mining field and the product of mining development is the very symbol of solidity and permanence, and all operations connected with it can be definitely estimated and determined, the actual results have not been such as to give to this business a reliable character to which it is entitled. But this reputation we are certain comes more from unfavorable circumstances and lack of judgment and knowledge, on the part of those who have attempted to prosecute this work, than from any possible obstacle or want of value on the part of the mines

or the mineral resources themselves. As a rule mining operations have generally been attempted at such a distance from the source of supplies and the market for ores, that the transportation has been in many cases greater than the value of the ores in the market centres. Under these circumstances no profitable results can be expected, and one mistake has been in expecting immediate results from operations in this direction. No sane man would open up and place in order for production a tract of agricultural land at such a distance from the market and points of consumption that the cost of transportation would be more than the value of the grain when it reached the market, and it is just as absurd to expect profit from mining operations under similar circumstances. All that can really be reasonably demanded from operations in a large proportion of the mining camps at present is development so that the mines may be ready to produce ore when milling, market, transportation and other facilities are available. The fact that under all these adverse circumstances mining operations have been able to show such a favorable result upon the whole, is a most conclusive proof of their magnificent value, when circumstances and conditions are favorable to their legitimate operation and prosecution. We must protest against the common verdict which is rendered against mining, when the true facts connected with its development in the direction of legitimate production are not taken into consideration."

THE PHOSPHATE MINES OF OTTAWA COUNTY.

After a visit to the mines in the near vicinity of the Riviere du Lievre, one cannot fail to be impressed with the belief that phosphate mining is a very profitable industry. For eighteen miles from the village of Buckingham, along the ice road on the river, can be seen a moving stream of teams hauling mineral to the C. P. R. Depot for shipment, and the thousands of tons that have already been delivered there present an interesting sight. Owing to the difficulty of forwarding the ore to point of shipment during the summer it is allowed to accumulate for winter transportation, and at present there are not less than

two hundred and fifty teams continually engaged hauling from the different mines. The road on the ice is, and has been all winter, in excellent condition for this purpose, and the mine-owners are confident they will continue so for a sufficient length of time to enable them to forward all their output to the railway without increasing the carrying force. The mines are turning out phosphate in large quantities, and the average cost of mining, in the du Lievre district, will not exceed \$5 per ton when dressed and ready for shipping. Mining operations are being conducted at present with better system than heretofore, and to an observer the scene at the mines is one of unusual activity.

THE MINES.

"HIGH ROCK."—Eighty men are employed at this mine and about twenty tons of mineral is estimated to be the daily output. The manager reports that he will deliver 5,000 tons at Railway Depot before the winter roads break up.

THE "UNION" gives employment to 60 miners and the daily output is not less than 20 tons. There has already been forwarded 2,400 tons of very fine mineral, with more to follow. At this mine there are in use steam hoists and drills and other modern machinery, and the buildings on the property are most complete in every respect. Captain Smith, manager for the Union Phosphate Company, deserves much credit for the manner in which he has equipped this property.

"NORTH STAR."—This mine is looking well, in fact better than at any former period. A force of sixty men produce 12 tons daily, and if the property continues to improve as it has done during the past month the daily output will much increase. Seven hundred tons of phosphate have been delivered at the railway depot and 400 tons are mined and awaiting transportation.

THE "WATT," now known as the Little Rapids Mine, has not been worked for ore since Mr. Allan purchased it in the winter, but, preparatory to organizing for active operations in the spring, a small force is employed opening a new deposit which is developing well and adds greatly to the value of the property. The quality of the mineral at this mine is unequalled at any phosphate mine in Canada.

THE "EMERALD" employs 56 men who raise 20 tons daily, and 2,000 tons of fine mineral, now mined and dressed, will be forwarded to point of shipment this winter. A drift has been run from the face of the mountain for 63 ft. in the direction of the main pit, and an-

other for 31 ft. from the pit towards it, which leaves 20 ft. of drifting to be done before they join. When this has been accomplished work will go ahead more rapidly. The phosphate that is being taken from this mine is very clean and pure.

The property adjoining the "Emerald," known as the Fitzgerald Mine, has been purchased by the Dominion Phosphate Company, and mining operations will begin as early as practicable in the spring under the superintendence of Mr. W. H. Smith, the Company's manager at their North Star mine.

In the Township of Templeton the "McLaurin" and the "Post" mines are turning out ore plentifully and the property being worked by Laurie & Co. is developing well.

In Wakefield the "Haldane," the "Gemmil" and the "Moore" mines have been improving for some time past and have developed into very valuable properties. From each of these mines a fairly large quantity of fine mineral will be forwarded for summer shipment, aggregating from 1,000 to 1,200 tons.

Phosphate Quotations.

The latest quotations received from abroad show no variation from last month's report, the ruling price being 1s. 3d. per unit for 80 per cent. mineral on wharf at Liverpool and other points. No recent sales have been reported that would establish a price to govern the season's transactions.

Navigation of the Riviere du Lievre.

It has at last been definitely settled that the much needed improvements at the Little Rapids are to be made, and work will be begun as soon as the ice will have left the river. A petition, signed by a large number of the prominent lumbermen and phosphate miners of the Du Lievre district, was forwarded to the Minister of Public Works praying that a Lock should be built at the Little Rapids, and that the same should be so constructed as to raise the water above the lock sufficiently to make the river navigable as far as High Falls. Subsequently Mr. Alonzo Wright, M.P., in company with Mr. Andrew Holland of this city, representing the petitioners, called upon Sir Hector Langevin who promised them positively that the necessary improvements would be begun in the spring and energetically pushed to completion. An appropriation (\$6,000) is included in the estimates for this purpose, and there now exists no doubt that the day is not far distant when steamers of useful capacity will ply between Buckingham village and High Falls.

Too much credit cannot be given to the popular member for Ottawa County for the deep interest he has always evinced in matters affecting

the requirements of his constituency, and in this instance the granting of the petition has been due to his prompt and earnest action.

It is gratifying to know that the articles which appeared in *Review* directing attention to the necessity of the improvements above referred to, have not been disregarded. Other improvements, strongly urged in its columns, to facilitate the transportation of phosphate from the landing at the Village of Buckingham to the C. P. Ry., will be carried into effect early in spring, arrangements having been completed, we understand, to repair and macadamize the road between these points by private enterprise. This will overcome a most obnoxious hindrance which the phosphate miners have had to contend against since the industry was first started in the district.

OXFORD GOLD MINE.

The report of Mr. M. F. Hunt, President of the Oxford Gold Mining Company, of Lake Catcha District, Nova Scotia, dated New York, 15th December, 1883, addressed to the stockholders, at the Company's first annual meeting, could not fail to have been received by them with unqualified satisfaction. The President after describing the property known as the Oxford Gold Mine, composed of 63 mining areas, proceeds to carefully review the Company's operations from the time of its organization up to December 1st, 1883, and to point out what has been accomplished on the properties since the beginning of actual mining operations in March 1882, and shows that such operations have resulted in producing an output of 2,177 tons of milled ore, yielding an average of \$29.82 per ton, representing a bullion product of \$64,934.81 received in New York from August 9th, 1882, to November 30th, 1883. Attached to the report is the financial statement showing the total receipts from the product of the mine to have reached the handsome sum of \$65,735.55, and the disbursements, for actual operating expenses, to have amounted to but \$30,266.91, in addition to which a large amount is shown to have been expended on plant and \$27,125 paid in dividends.

Since the President's report was published we have learned that the bullion product for the month of December amounted to \$4,380.10, and on December 31st dividend No. 10 was paid, amounting to \$2,875; making a total of \$30,000 paid in dividends during 1883.

Such flattering representations as those we have quoted cannot but lead to the conclusion that the Oxford Gold Mining Company is in a flourishing industrial condition. This state of affairs is not more attributable to any extraordinary richness or extent of the different

lodes on the properties than to careful management and a thorough knowledge of mining on the part of those under whose immediate supervision the operations at the mine have been conducted.

There are many mining companies in Canada at the present time owning valuable properties and carrying on operations at a heavy loss to the shareholders owing to deplorable mismanagement. Such properties might become sources of large revenue if those having control would see that mining operations were prosecuted on scientific principles and would study economy and good management. If such a system could be inaugurated it would, beyond a doubt, give an impetus to, and effectually ensure prosperity for, our mining industries at large, as it has done in the case of the Oxford Gold Mining Company.

ASBESTOS MINES OF THE EASTERN TOWNSHIPS.

The rapidly increasing demand for the mineral has become a forcible incentive to the owners of asbestos properties to develop the deposits, in order that they may avail themselves of the present advanced price that is being offered by manufacturers in the United States and abroad. An almost unlimited quantity of asbestos of very fine quality is distributed throughout the serpentine belt, traversing a portion of the County of Megantic, which appears to attain its greatest prominence in the Townships of Thetford and Coleraine. In the Township of Broughton, as well, some valuable deposits have been worked to some extent. At the Boston Asbestos Packing Company's Mine, in the first named township, about 70 men are employed; a depth of 75 or 80 feet has been reached, covering a large area, and the daily output averages 2 tons. The "Johnson," "King" and "Ward" mines, also in the Township of Thetford, are being actively worked, and when the snow will have disappeared in the spring, it is not improbable that mining operations will be begun on the Read property in the Township of Coleraine. Some New York capitalists, have, within the past few days, purchased a location in the Township of Broughton from which a fair quantity of mineral has already been shipped, and owing to its superior quality the owner received the highest price for the shipment that has been paid for many years. A firm of Turin, Italy, has recently made a bid for a portion of the output of this district, but as the American manufacturers are offering a much higher figure—about \$25 per ton more—the Italians are not likely to be supplied at present from Canadian mines. New uses, to which this mineral can be applied, are being almost daily discovered in various

quarters of the globe. Its value will increase correspondingly with the demand, and the outlook for owners of asbestos mines in the above named district was never brighter than at the present time.

MICA.

Latest reports from Mr. Allan's mica mine in Burgess are of a very satisfactory nature. As lower level is reached in the different shafts that are being sunk the crystals increase in size and number and the quality steadily improves. A fair force of miners are employed, and, although it was but a few weeks ago that work was started, a considerable quantity of high grade mica, very clear and cut into sheets running as large as 10x6, has been already shipped to dealers in the United States and Canada.

Mr. Allan has just completed the purchase of another mica property in the County of Ottawa, and will begin work just so soon as the snow disappears. Samples of the mica received are very white and clear, and of good size.

ALMANDITE.

An extensive deposit of this mineral, which is a variety of Garnet, has recently been discovered in the Township of Rawdon, Province of Quebec, and has become the property of some enterprising gentlemen identified with the mining industry of Canada. The owners purpose opening up their property without loss of time, and are already in negotiation with New York parties for the sale of their output.

This garnet rock is extensively used as a substitute for emery, being almost equal to it in hardness, and is a valuable mineral. The present sources of supply are the States of North Carolina and Georgia where the few deposits that have been discovered are said to be very profitably worked. It is supposed that the emery mines in Asia are working out, and if this be so, it is only a question of time when such substances as garnet and sapphire stone, etc., will be almost exclusively used as a substitute. It is therefore a source of gratification to learn that deposits of this mineral have been found to exist in Canada in workable quantity.

THE HAYCOCK IRON MINE.

Since the last number of the REVIEW was published, earnest enquiry as to the cause of delay in the negotiations in England for the transfer of this property has failed to elicit any information beyond the fact that there is a hitch, the nature of which, however, has not yet been ascertained. It is to be hoped that nothing has occurred to alter what had appeared to be a positive decision on the part of the English company

to accept the terms upon which the property was offered to them. It is a great pity that this mine and the company's plant should continue in its present deserted state year after year and, at a time when the public were led to expect early resumption of operations, mysterious delays, or, for aught they know, definite abandonment of negotiations, are very disappointing.

A Fatal Mistake. (Wall Street News.)

The president of a New Mexico mining company—headquarters in Boston—entered his office the other day to find everything and everybody in a hubbub, and his demand to know the cause was replied to with:

"Our mine has been turning out ore."
"No!"
"It's so! Here's a telegram announcing that we have actually struck it rich!"

"Great Scots!" gasped the president, as he sank back into a chair. "What did those idiots want to go and discover ore for just as we had got ready to levy an assessment of \$2 per share to dig a three-mile tunnel to drain our hole. Why, stockholders will be kicking like steers in less'n a week."

MINING NOTES.

GOLD MINING.

Mr. Allan of this city and Mr. Humphrey of Quebec are sinking a shaft on the old bed of a river near St. George East, Beauce County. The shaft is now down about 135 feet and properly timbered. Bed rock has not yet been struck, but pay dirt has shown itself, and it is safe to predict that when a 10 ft. lower level has been reached the richness of the dirt will have much increased, and the value of the property will be established.

It is stated that an American Company has purchased a portion of the Canada Gold Mining Company's property in Beauce, and will organize at once for early mining operations.

The Barker claim in Cariboo District, B.C., continues on good paying ground. On January 22nd a wash-up for two day's work produced 62 ounces. On 26th, another wash-up gave 102 oz., making a total for one week of 164 ounces, and ground continuing good paying. The work of the week previous produced 90 ounces and as much as \$6 to one pan was washed up. It is stated that on other claims down the creek miners have commenced taking out pay.

News from Cassair, B. C., states that at the gold mines at McDame's Creek the snow is 17 feet deep, and that in November the thermometer registered 40° below zero. There are 80 men at the mines—whites and Chinamen—and on account of the severe cold the latter were obliged to tuck in their shirts. *Fools if they didn't.*

In the Halifax *New Era* it is stated that the Bridgewater gold mines are improving very rapidly, the richest lode, giving about 11 oz. to the ton, increased from 8 inches in thickness to 15 inches, and in going down 80 ft. shows the same ore all through.

A report of progress in operations at the Canada Consolidated Gold Mining Company's property, in Hastings County, Province of Ontario, will be gratefully received.—[Ed.]

PRODUCTION OF GOLD.

The returns thus far received by the Director of the mint indicate that during 1883, the production of gold in the United States amounted to \$30,000,000.

Mining in Canada—Sulphur Ores and Phosphate.

(From the N. Y. Engineering and Mining Journal.)

Time works marvels in the lives and interests of individual citizens, but much more so in the history of manufactures and of states. We live on the eve of great changes, and the wisest among us, not blinded by political bias, can see that the probable reform of the tariff in the near future must bring with it certain radical alterations in our manufactures and commerce. Whether serious changes in the trade of the two countries occur or not, there are raw materials in Canada which are now valuable, and will speedily become more so as our consumption of sulphuric acid and fertilizers increases. Except coal, sulphur ores, and phosphates, the minerals of Canada possess but little interest for the American investor. Now and then, he may meet with something worth notice in other directions, but not often. In the case of sulphur ores and phosphate, it is not so; for outside of our Carolina supplies of phosphate, there is none so near or so rich as the apatite of Canada, while our available sulphur ores are widely distributed.

It is not many years ago since Canada phosphate began to attract notice in the United States and Europe. Of late years, Americans have kept a steady lookout for property in Canada which they could work themselves for the requirements of their own factories. The importance of the fertilizer trade in its present condition, and the proportions it promises to assume in the near future, are the principal causes of this diversion of interest. It is not many years ago that the home manufacture was expressed in five figures; now it takes seven. This change has

been accomplished in the short space of ten years. What it will be in the next decade will depend mainly on the supply of the raw material, and especially on the cost of the sulphuric acid. When Canada apatite first came on the market, some eight years ago, practical men shook their heads at the hard and unpromising looking material. Many of the mills then in use in fertilizer-works were the buhrstones used to pulverize coprolite and other comparatively soft material. The difficulty of grinding has now been overcome, and it is no longer a source of danger to workmen and of perplexity to manufacturers. Instead of using it as they did coprolite, it is mixed largely with other softer materials, which enables the operating chemist to first saturate the apatite with sulphuric acid, and use Carolina phosphate or bone-ash as a drier. The use of these materials assists largely in lengthening the chemical action of decomposition; the carbonic acid of the softer materials offers a mechanical agent to sustain the acid in its attack on the hard and crystalline apatite. Up to the close of June, 1881, the total export of Canada phosphate was 15,600 tons, the average value of which was about \$16 a ton. In 1882, these figures were increased to 18,000 tons, which commanded a higher average of value. Last year, the amount was 23,000 tons, and a slightly increased value over the year previous. Being a more concentrated phosphate than any other in the world, it has very naturally been sought for to bring up the acid phosphate fertilizer to high percentages of phosphoric acid. A statement of the analytical composition of a few of the leading phosphates of commerce will indicate the high value of Canadian apatite:

Raw phosphates.	Content of tri-basic phosphate of lime. Per cent.
Russian :	
Government of Orel.....	29.14
Government of Podolia.....	66.78
English :	
Cambridge coprolite	57.78
French :	
Ardennes coprolite	45.21
Bordeaux phosphate	77.41
Spanish :	
From two mines, from.....	74.85
West Indian :	
Navassa Island	72.43
Old Curacao Island	70.99
New Curacao Island	88.80
Sombrero	81.88
Redonda	87.73
Elroque	69.86
Rio Grande :	
Bone-ash	70.80
South Carolina :	
Coprolite	48.60
Phosphate	51.61
Canada :	
Apatite.....	72.94

Those who have secured properties in the Ottawa District have worked them most energetically for all they are worth, and their returns have been very encouraging so far. The expenses vary of course with the conditions; but as a rule, range from four to five dollars per ton, often less, sometimes a little more. These figures are, however, the result of the experience of a number of workings, embracing, at least, several large mines in the great Ottawa District. The cost of the mineral laid down in Montreal may be estimated at from \$7 to \$9 per ton. Freights to New York may be had at from \$3 up by boat, and for long contracts easy railroad rates may be secured directly from the mine to destination. Prices this season in Montreal have ranged from \$18 to \$22 for choice shipments.

The quantity of this material which our market can deal with will depend mainly on the cost of our sulphuric acid. Already a great change has recently taken place in the plant of several American manufacturers and acid has occasionally touched very low figures. Among manufacturers of acid, opinion has changed in regard to the economy of pyrites over brimstone. Some of the best known pyrites contain in average samples about as follows:

	Virginia.	Capelton, Canada.	San Domingo.	Spanish.
Sulphur ..	47.50	46.60	49.00	46.00
Iron.....	44.00	45.00	43.50	43.50
Copper.....	2.60	4.10	3.20	3.10

Hitherto, the extraction of copper was the basis of operations at Capelton, and the sulphur was allowed to diffuse itself as dioxide (SO₂) for miles around, injuring vegetation and otherwise damaging property. If the process were reversed, and the ores were worked for their sulphur, the by-product would become a snug little profit, as it is in Europe. The

Capelton District could supply a very large demand for sulphur for some time to come, and its ores could be worked either in the immediate locality, or at some other point more convenient for coal and distribution of the raw material.

It is an immense economy to erect fertilizer-works alongside the acid chambers, as it saves the cost of concentrating the acid required for superphosphate manufacture. As is known to practical men, the acid is used at chamber strength of 1.20 sp. gr. As the competition in the manufacture of fertilizers increases, it will become necessary for almost every maker to manufacture his own acid, to secure his full share of profit. Inability to supply one's self with acid of home make has knocked many a British manufacturer out of the market in his own country. The conditions of a trade do not always remain the same; and if American manufacturers have been able to make a decent profit on well made fertilizers, it is because the amount of capital in the business was not so large that competition became ruinous. As capital increases and the consumption of fertilizers becomes more general, competition will be keener, and every source of economy, whether it promises much or little, will be squeezed to yield its best results. A few years ago, a prominent statistician gave the consumption of fertilizers for a few of the Southern States, which ran somewhat as follows:—

State.	Acres.	Fertilizers in tons per year.
Georgia.....	6,000,000	100,000
North Carolina.....	4,663,000	80,000
Virginia.....	3,500,000	40,000

If the other States could be added, it would soon be found how large is the consumption of manufactured fertilizers. If the home work be taken at twelve hundred thousand tons, then fully a half million tons of sulphuric acid would be required to treat the raw material producing the manufactured articles and subsidiary purposes. The large deposits met with between New York and Montreal might be used to satisfy the entire wants of this business. Whether any changes are made in the tariff or not, Americans would not be prevented from drawing supplies of sulphur from Canada. Should any alteration be made in the direction of free importation of sulphuric acid, then new circumstances may arise which may render it desirable to make the acid where the raw materials are found. Those found in Canada are likely to receive an increased share of attention from year to year, both because of their proximity and high value.

Those who have watched the quiet revolution which has taken place in the flour milling trade during the last five years, must have noticed not merely the rapid reduction of the buhrstones and the substitution of rollers; but the very large increase of capital, which has been attracted to the business. Important as flour milling is to a country, and the adoption of the new methods, so rapid a change was not more needed in the miller's trade than it is in the manufacture of acids. If ever the United States becomes great as a manufacturing nation, it will be largely the result of cheapened sulphuric acid. So manifold are its uses apart from the fertilizing trade, that one can scarcely think of an industry which can be carried on without its aid in some one or other of its operations. Cheap acid is the basis of all chemical industry, and to be in the front rank as a manufacturing nation has long been the wish and aspiration of the country. For several years, railroad activity has not been less than it is now. There is less competition for money for this purpose than there has been for some time. Taken up by manufacturers, there is less likelihood of such a scheme falling through after a flush of excitement. With the steady growth in the fertilizer trade, and the lessened demand for capital out west for the next few years, there will undoubtedly be a larger share of it for employment east. If the home proportion of the manufacture is to increase, acid must be as cheap here as it is in Europe. The quantity of acid a country consumes is often assumed as a test of progress in the manufacturing arts and of its position in the commerce of the world. The consumption is determined by the cost of the article, and this again may be governed by the people themselves. Not consumption only, but the amount which a country can manufacture, may also be rightly regarded as a proof of its civilization.

J. C.

The author of the foregoing intelligently written article has made one or two incorrect statements to which attention should be directed. In giving the percentage of tribasic phosphate of lime, contained in the raw phosphate of various parts of the world, he credits Canada apatite with but 72.94 per cent. whereas it actually contains 89.91 per cent. tribasic phosphate of lime according to the most authentic analysis that we have on record, made from hand picked sample selected from the heap as being the most free from admixture with foreign mineral matter. Cargo samples, analyzed in England, have returned 85 to 86 per cent. for shipments from certain Canadian mines, which result has been attributable to the careful cobbing of the mineral.

Again the amount of apatite shipped from Canada during last year aggregated but 17,840 tons instead of 23,000 tons as stated. The annual output of the Canadian phosphate mines during the past six years has been as follows:—1878, 3,701 tons; 1879, 11,927 tons; 1880, 7,974 tons; 1881, 15,601 tons; 1882, 17,181 tons; 1883, 17,840 tons, and it is not unreasonable to expect that the output for the present year will reach quite 24,000, probably 25,000 tons.—[Ed.]

The Reciprocity Movement by United States Citizens with Canada on Coal and Iron Ore.

The Association for Reciprocity in Coal and Iron Ore held its second meeting at the Windsor Hotel, N.Y., the afternoon of January 24th. The association was formed at the Fifth Avenue Hotel on January 3rd, to secure, if possible, a reciprocity treaty between Canada and the United States, by which coal and iron ore would be placed upon the free lists of the two countries. E. N. Frisbie, of New York, was elected President; W. C. Andrews, Treasurer; and C. J. Pusey, Secretary. Gentlemen were present representing the coal and iron interests of Cleveland, Youngstown, Toledo, and other points. A committee was appointed which, with one from the Board of Trade of Montreal, came to Ottawa, and on Saturday, 19th January, held a conference with Sir Leonard Tilley, Minister of Finance, and the Hon. Mr. Bowell, Minister of Customs. In their report to the association at the meeting on the 24th January, the committee stated that it found the Canadian Ministers anxious to have lumber and salt included in the proposed treaty, but the New York committee was not prepared to give any encouragement on that point. The committee had every reason to believe that the Dominion Government was very favorably disposed to the proposed treaty, and that, if Congress should place Canadian iron ore and coal on the free list, the Dominion Cabinet would exercise the power vested in it and place the same products of the United States on a similar list. A committee headed by the Hon. Galusha A. Grow was appointed to press the matter of a treaty at Washington.

Mr. Charles J. Pusey, the secretary of the new organization, has made the following statement concerning its objects:

"A committee, consisting of E. N. Frisbie, James Tillinghast, John Moulton, H. C. Roberts, Samuel Thomas, W. C. Andrews, and Charles J. Pusey, was appointed to visit Ottawa and ascertain the disposition of the Canadian Government toward such a movement. This committee has been at Ottawa, in consultation with the Ministers of Finance and Customs, and was assured by them of the favorable action of the Canadian Cabinet."

"A wrong impression is abroad that this movement originated in Canada. It had its origin in the United States. The fact that a delegation from the Montreal Board of Trade accompanied our committee to Ottawa may explain the mistaken impression. We propose to ask the present Congress to pass an act allowing Canadian coal and iron ore to be entered here free of duty, provided that the Canadian Parliament will also pass a similar act in regard to our iron ore and coal. Efforts will be made to urge immediate action on the part of Congress, and I may say, without mentioning names, that we have several Congressmen pledged to support our movement at the proper time. Should such legislation be obtained as desired, both here and in Canada, the greatest benefit will be ours; for Canada will be giving up revenue to the amount of about \$1,000,000, while the United States will have to give up only about \$250,000 in revenues. The amount of coal imported into Canada from the United States for the year ended June 30th, 1883, is shown here:"

To Provinces.	Anthracite.	Bituminous.	Coke.	Total.

"The amount of coal and iron ore exported from Canada to the United States for the year ended June 30th, 1883, was as follows:

From.	Coal.	Iron ore.
Ontario.....	42,745
Quebec.....	2,120
Nova Scotia.....	110,150
New Brunswick.....	17,670
British Columbia.....	172,863	1,890
	302,803	44,635

"It will be seen that Canada gives up much more at first than the United States does; but Canada looks forward to the development of her

iron mines, whose ores are especially adapted to making Bessemer steel, and in the long run the advantages will undoubtedly balance."

The producers of bituminous coal in Northwestern Pennsylvania, who seek a market in and through Buffalo and Rochester, held a meeting on January 25th, to consider the annual production and to consult with the agents of the railroads leading to these points, as to the freight rates on their products during the year, and as to the general interest of the bituminous coal trade. The meeting was largely attended by prominent gentlemen representing different companies. Hon. Galusha A. Grow was elected chairman, and A. Dowdell secretary. A committee was appointed to report on the annual production of bituminous coal for the Buffalo and Rochester markets and the best method to regulate the output. The following resolution was unanimously adopted, on motion of E. N. Frisbie:—

Resolved, That we are in favor of reciprocity with Canada on coal and iron ore, and we heartily approve of the efforts making by the "Association for Reciprocity on Coal and Iron Ore" to secure the necessary action by the governments of the United States and Canada to obtain such a result.

The committee on coal production reported in favor of appointing a committee representing the railroads and the producers of bituminous coal, which should have power to regulate the annual production.

THE IRON DEPOSITS OF CENTRAL CANADA.

(Continued from Page 5, Vol. 2, No. 1)

Every indication points to the fact that the ore was originally deposited in beds in open cavities and subsequently buried under a mass of material. The series of upheavals, has brought ore to the surface in positions which simulate the form of metallic veins. But they are evidently true beds and of remarkable extent and purity.

A few miles north of Madoc village is a hematite mine from which many thousands of tons of first class ore have already been taken, nearly exhausting the open pit from which the ore has been mined. But the ore passes from this pit under the highway and a shaft sunk on the opposite side of this highway has struck ore of a high grade, while the horizon of the ore can be traced for a long distance by numerous outcrops in both directions. It is probable that this locality will furnish much more ore than has been already mined.

The most important deposits are the magnetic ores found at varying distances north of this mine. The first of these on the line of the Railroad on which any work has been done is

THE EMMA MINE.

This is on lots 6, 7 and 8 of the 19th Concession of Tudor Township where the ore is shown on the slopes and crest of a ridge rising about 180 feet and can be traced by debris of the ore and by the needle for a horizontal distance of some two thousand feet, the needle indicating an ore body from 80 to 100 feet or more in thickness. The upheaval has produced here an anticlinal and on a ridge a little to the south, this mine is duplicated by a body of ore dipping in the opposite direction called the Robinson mine. On the latter a pit has been sunk into the ore which is of excellent quality and appears to be in bed. The thickness here has not

yet been determined. On the highest part of the ridge of the Emma were large angular masses of very pure ore protruding from the surface which were supposed to be in their natural bed, but a cut into the slopes shows that at the time of the upheaval they were torn off from the mass of the ore and elevated above it. Their size proves that they come from a large body and their angular form that they have not been carried far from their parent bed. A careful study of the succession and dip of the strata and the indications of the dipping needle warrant the conclusion that there is here, just below the cut already made into the hill, a body of ore at least about 80 feet thick, and extending a long distance along the ridge. It should be remarked that in all parts of this territory examined, except one, there is a sharp transition from the ore bodies to the including rocks, none of the latter being magnetic, so that the indications of the needle are unusually reliable. A sample of this ore was analyzed by Professor E. J. Chapman, of University College, Toronto, with the following results:

Ferrous oxide.....	28.32
Ferric oxide.....	63.24
Chromic oxide.....	trace
Titanic acid.....	none
Phosphorous.....	trace
Sulphur.....	0.02
Silicious rock matter.....	8.36

Mr. H. M. Curry, of the firm of Carnegie Brothers & Co., of Pittsburgh, also made analyses of specimens taken by him from the mine, with the following results:

	Hard ore.	Soft ore.
Silica.....	5.370	5.080
Iron.....	65.194	65.604
Phosphorous.....	.051	.009
Sulphur.....	None	None

These indicate an ore of unusual excellence, and it may be regarded as certain that in extent the Emma and Robinson combined will take a rank among the largest iron ore mines known.

THE BAKER MINE.

The next in order along the line of the road, and about four miles from the Emily is the Baker mine.

Here glacial action has stripped much of the ore leaving it uncovered along a crescent like ridge, the whole length of which is considerably over one mile. The outcrops are not continuous, and there are breaks in the line of magnetic attraction, so that until further explorations are made, it might be proper to speak of the three Baker mines on their crescentic ridge. Enough is, however, disclosed to prove they contain a very large amount of ore. A horizontal cut has been made in one place through 30 feet of solid ore; and enough can be seen to show that it has a similar thickness in other places. Two analyses of this ore have been made, the first by Professor Chapman of the University College, Toronto, and the second by Mr. H. M. Curry, of the firm of Carnegie Bros. & Co.

No. 1.

Ferrous oxide.....	29.18
Ferric oxide.....	64.95
Titanic acid.....	none
Phosphorous.....	trace
Sulphur.....	0.13
Silicious rock matter.....	5.66

No. 2.

Silica.....	5.500
Phosphorous.....	0.088
Sulphur.....	0.000
Metallic iron.....	66.288

These indicate an ore of remarkable excellence, indications which have been fully sustained by the cut into the solid body of the ore except in one particular. The ore contains much more sulphur than disclosed by these analyses, so much as to render it probable that the bulk of the ore will have to be roasted before it is introduced into the smelting furnace. The great abundance of hardwood on that property and in the immediate neighborhood will make this inexpensive, and as an immense amount of ore can be taken out above drainage, the cost of mining and of roasting will for a long time be less than the cost of mining alone at most mines.

THE COE HILL MINING CO. MINE.

This mine, formerly called the Batchelor mine, is in Wallaston Township, and about 20 miles in a northwest direction from the Baker. It is a double mine on an anticlinal, one part already opened and worked and the location of the other disclosed by the dipping needle. At the mine now opened a cut was originally made into the hill on the level of the space selected for the dump which passes through a horizontal thickness by careful measurement of 68 feet of solid ore, with but slight intrusion of rock matter, the bottom of this cut was from 20 to 25 feet below the top of the ore; and from the bottom a shaft has been sunk in solid ore to the depth of 40 feet. The ore has also been

pierced by the Diamond drill at the depth of 230 feet from the surface, disclosing 70 feet of solid ore. The testimony of all who have examined this property is that, considering the quantity and quality of the ore and the small amount expended in development, no more promising mine has ever been found upon the continent.

The following analyses will indicate the character of the ore:—

BY PROFESSOR CHAPMAN.

Ferrous oxide.....	26.12
Ferric oxide.....	65.20
Titanic acid.....	none
Phosphorous.....	0.02
Sulphur.....	0.07
Silicious rock matter.....	8.48

BY MR. CURRY.

Silica.....	5.770
Phosphorous.....	trace
Sulphur.....	0.238
Metallic iron.....	63.554

SECOND SAMPLE.

Silica.....	8.320
Iron.....	60.611
Phosphorous.....	trace
Sulphur.....	0.440

Mr. Rattle, of the Cleveland Rolling Mill Company, has also made an analysis of a sample from this mine with the following results:—

Iron.....	68.180
Silicon.....	3.200
Sulphur.....	0.000
Titanium.....	0.000
Phosphorous.....	trace

It should be said, in regard to the varying amounts of sulphur shown by the analyses of the ore of the Batchelor mine, that it does contain visible pyrites, but so segregated and separated from the mass of the ore that the great bulk of it can be sorted out in mining; while compared with the mass of the ore, the quantity is so small as not materially to detract from its value.

THE ARTHUR MINE.

This is a new mine in Chandos township about 6 miles southwest of the last, and to which it is proposed to extend the railroad. It illustrates the advantage of that absence of ore in the ordinary rock strata referred to above, making the indications of the dipping needle more than ordinarily reliable. A month ago a careful examination was made of this property. Along a ridge in a dense forest rising steeply to the height of about fifty feet there was a very strong attraction of the needle, the limits of which were clearly defined. The hill was covered with forest trees with a thin covering of soil and the debris of the ordinary wall rocks of the ore of this neighborhood, and some fragments of ore. After a careful investigation the conclusion was reached that the stripping of the hill would disclose a body of ore denuded of the wall rock. This work of stripping has now been carried over the hills from one base to the other for a breadth of about 20 feet. It discloses a verticle

height of 50 feet of solid ore with no indications of sulphur and without any rock covering, the base of the uncovered part having a thickness of about 70 feet. The indications point to a deposit of ore fully equal in quality and in quantity to that in Wallaston.

(To be continued.)

DIVIDENDS DECLARED.

The Quincy Copper Mining Company, of Michigan, will pay a dividend of \$4.50 per share on 20th inst., aggregating \$180,000. Total dividends \$3,790,000.

The Central Copper Mining Company, of Michigan, paid their annual dividend on 1st inst. of \$2.00 a share, aggregating \$40,000. Total of dividends to date, \$1,710,000.

The Atlantic Copper Mining Company, of Michigan, paid a dividend of \$1.00 a share on 1st inst., aggregating \$40,000.

The Hecla Consolidated, of Montreal, has paid dividend No. 2 this year of 50c. a share, aggregating \$15,000 each. Total \$30,000.

The Ontario Silver Mining Company, of Utah, on 31st January, paid a dividend of 50c. a share, aggregating \$75,000. Dividends to date, \$5,225,000.

The Standard Consolidated, of California, on the 12th inst., paid a dividend of 25c. a share, aggregating \$25,000, making \$50,000 already paid this year.

The Horn Silver Mining Company, of Utah, have declared a dividend of 75c. a share, aggregating \$300,000, payable on 15th inst., thus swelling the total of dividends to \$3,100,000.

For the information of those of our readers who have invested in U.S. Mining Stocks we publish the following:

MACHINERY for SALE

Milling Machinery that has been
in use at a gold mine is offered for
sale. The entire machinery referred
to is said to be in good order and
will be sold at a bargain to anyone
having use for it. Particulars can
be obtained on application to the
publishers of the CANADIAN MINING
REVIEW.

**MAIL CONTRACT.**

SEALED TENDERS, addressed to the Post-
master General, will be received at Ottawa
until noon, on FRIDAY, the 22nd February,
1884, for the conveyance of Her Majesty's
Mails, on a proposed Contract for four years,
eighteen times per week each way, between

NEW EDINBURGH AND OTTAWA

from the 1st April next.
The conveyance to be made on foot or other-
wise.

The Mails to leave New Edinburgh Post
Office daily, Sundays excepted, at 8 a.m.,
1 p.m. and 7 p.m. and to arrive at the Ottawa
Post Office at 8.20 a.m., 1.20 p.m. and 7.20 p.m.
respectively.

To leave Ottawa Post Office immediately
after each exchange of mails and to return to
New Edinburgh Post Office within twenty
minutes afterwards.

Printed notices containing further informa-
tion as to conditions of proposed Contract
may be seen, and blank forms of Tender may
be obtained at the Post Offices of New
Edinburgh and Ottawa, and at the office of
the subscriber.

J. P. FRENCH.

P.O. Inspector.

Post Office Inspector's Office,
Ottawa, Jan. 17th, 1884.

**ESQUIMALT GRAVING DOCK,**
British Columbia.

The time for inspection of plans and speci-
fications for the completion of the Graving
Dock at Esquimalt, British Columbia, is
extended to Thursday, the 17th day of Janu-
ary next, inclusively, and for receiving
Tenders to Friday the 27th day of February.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 20th Dec., 1883.

**NOTICE TO CONTRACTORS.**

SEALED TENDERS, addressed to the un-
dersigned and endorsed "Tender for Drill
Hall, Quebec," will be received at this office
until WEDNESDAY, the 5th day of MARCH
next, inclusively, for the erection and com-
pletion of

DRILL HALL, QUEBEC.

Plans and Specifications can be seen at the
Department of Public Works, Ottawa, and at
the Dominion Public Works Office, Post Office
Quebec, on or after Friday the 15th instant.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied, the blanks properly
filled in, and signed with their actual signa-
tures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honorable the Minister of Public
Works, equal to five per cent. of the amount of
the tender, which will be forfeited if the
party declines to enter into a contract when
called on to do so, or if he fail to complete the
work contracted for. If the tender be not ac-
cepted the cheque will be returned.

The Department will not be bound to accept
the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 4th Feb., 1884.

**Notice to Contractors.**

SEALED TENDERS addressed to the un-
dersigned, and endorsed "Tender for
SOUTHAMPTON WORKS," will be received
until FRIDAY, the 29th day of February, in-
stant, inclusively, for the construction of an
addition to the Landing Pier at Southampton,
Bruce County, Ont., according to a plan and
specification to be seen on application to Mr.
James T. Conway, Town Clerk, from whom
forms of tender can be obtained.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied, the blanks properly
filled in, and signed with their actual signa-
tures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honourable the Minister of
Public Works, equal to five per cent. of the
amount of the tender, which will be forfeited
if the party decline to enter into contract
when called on to do so, or if he fail to com-
plete the work contracted for. If the tender
be not accepted the cheque will be returned.

The Department will not be bound to accept
the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 4th Feb., 1884.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the
3rd range. Some excellent surface
shows have been uncovered on these
lots and only require capital for de-
veloping. Price and particulars
given at the office of the MINING
REVIEW.

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and
outcroppings of fine quality of Graphite.
Price \$1,000. Further particulars to be
had at the office of the MINING REVIEW.

TIMBER LIMIT

ON LAKE WINNIPEG

FOR SALE.

50 Square Miles.

This limit will be very valuable.
Apply at the office of the MINING
REVIEW for price and particulars.

FOR SALE,**White Marble Quarry on Calumet Island.**

At this quarry there is an inex-
haustible supply of most beautiful
white marble. Price \$800. Sam-
ples to be seen and information ob-
tained at the office of the MINING
REVIEW.

**PHOSPHATE PROPERTIES
FOR SALE**

IN THE TOWNSHIP OF WAKEFIELD.

Mining Rights on S $\frac{1}{2}$ of Lot No. 16, in
the 1st Range
" " on Lot No. 23, in the
2nd Range.
" " " No. 26, in the
4th Range.
" " " No. 20, in the
5th Range.

The fee simple of Lots Nos. 22
and 23, in the 4th range, (400
acres). All these lots have been
carefully explored by experts and
very favourably reported on; they
are virgin properties and in the
heart of the Phosphate Belt. For
further particulars and price apply
at the office of the MINING REVIEW

VOL. 2.—No. 3

Canadian Mining Review.

OTTAWA.

PUBLISHED MONTHLY.

ANNUAL SUBSCRIPTION - - - \$1.00
ADVERTISING RATES—15c. per line (12 lines to 1 inch).

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

The various mining industries throughout Canada, from Nova Scotia to British Columbia, have been given practical and substantial impetus during the past few months through the investing of capital, varying in amounts, by syndicates and private companies organized in the United States, England and this country. This has been the long sought and necessary assistance that has occupied the attention of owners of mineral deposits in the country, and now that it has been forthcoming in so many instances there is likely to follow an era of prosperity for Canadian mining industries. In Nova Scotia,

coal mining has for years been a source of large revenue to the Province, and the development of her gold fields is now going ahead with most satisfactory results. In New Brunswick, numerous recent discoveries of economic mineral deposits have been reported, and attention is being drawn to others long since known to have existed, but which, through want of enterprise, have been allowed to continue in their virgin state. In the Province of Quebec, large forces of miners are now engaged in the successful developing of the asbestos mines, and this industry has grown into one of much importance. In the Beauce district, of the same Province, the alluvial gold deposits are being vigorously worked and are yielding gold so freely as to warrant the investment of further capital for more extensive operations. The phosphate mines of Ottawa County continue very productive, and many of the owners of undeveloped properties are awaiting the disappearance of snow to organize for active operations. In Ontario, the phosphate mines, though not of so much importance as those of Ottawa County, are returning handsome profits, and the iron deposits of the central portion of the Province are attracting much attention, and capital is coming from the United States for their development. Some of the mines in operation have become very valuable, owing to the ore-beds having greatly increased in extent, and to the improved quality of the ore, as lower levels have been reached. Encouraging reports have come recently from the Lake Superior Native Copper Company's Mine, and the Huro-

nian Mine is said to be developing to the satisfaction of the stockholders, and at the Lake of the Woods Gold mines, work will be resumed in the spring on a more extensive and substantial basis than formerly. In the North-West Territories, coal mining has, in some instances, been successfully continued during the winter, but all other mining has been suspended for the past four months, owing to the severity of cold and depth of snow, against which miners had not had the opportunity to provide themselves. A great rush is expected to the Rocky Mountain District in the spring, and it is said that in the vicinity of Kicking Horse Pass, British Columbia, the excitement in mining circles is growing intense and that the late gold discoveries at Canyon Creek, opposite the mouth of Kicking Horse, are very rich. The Selkirk and Maine Ranges, it is stated, will prove exceptionally rich, and will, in course of time, yield a mineral output that will equal that of any territory of the United States. Mining in Canada is surely growing in importance. Let miners see to it that the industry is established on an honest and practical basis.

It was with much regret that we learned that Mr. A. A. Humphrey, so well known in Canadian mining circles, had been the victim of an accident, at his Beauce gold mine, by which his leg was broken. Mr. Humphrey's numerous friends will rejoice to know that he is rapidly recovering from the injuries he received, and that he will soon be sufficiently convalescent to attend to his important duties.

A movement is on foot which, if brought to a successful issue, will be the means of attracting more attention to the apatite deposits of Canada than they have ever before received outside of the immediate districts where the deposits exist. The first step taken was in the form of a letter received during the present month by a gentleman of Ottawa known to be largely interested in the phosphate mining industry of Ottawa County, as follows:

MONTREAL, March, 1884.

W. A. ALLAN, Esq.,
Ottawa.

DEAR MR. ALLAN,

I have suggested that the British Association should make an excursion next summer to the Emerald Mine, giving them interesting experience and knowledge which might prove directly or indirectly of value to Canada. My plan is that they should leave early in the morning by C. P. R. from Montreal, take steamer to the mine, towing barges if more room is needed, and get to Ottawa in time for dinner in the evening. Lunch could be served at a Buckingham hotel or at the mines.

I thought I would suggest to you the advisability of mentioning it to the proprietors if you are in contact with them and see what response they make, and if an invitation would be issued. It struck me it might be well worth their while to take the matter up handsomely.

Yours very truly,
ROBERT C. ADAMS.

We are informed by Mr. Allan that he has laid the matter before the Manager of the Emerald Mine, who has promised to contribute liberally towards entertaining the members of the Association in a manner that will make their trip to the mine one of enjoyment as well as of interest. With the co-operation of Mr. Allan, of Ottawa, and Mr. Franchot, of the Emerald Mine, there exists little doubt that Mr. Adams will be enabled to carry out his proposed programme.

CANADIAN PHOSPHATE TRADE.

For the past ten months a report of progress at the phosphate mines has been regularly published in the REVIEW, and as no change of any importance has occurred in the condition of the mines since the last report, it will, no doubt, be of greater interest to those engaged in the industry to learn something that bears more directly on the outlook for the future profitable working of the deposits. A movement has been afloat in Montreal to circulate exaggerated and incorrect statements concerning the present condition of the phosphate market in Great Britain and Europe, and by using the *press* for this purpose, the would-be manipulators hope to alarm producers to such an extent as to induce them to dispose of the output of their mines at a price much lower than they could get for it by shipping direct to buyers across the Atlantic. This movement has been inaugurated by a few of the middle men in Montreal, who played their first card in an article which they caused to be published in the *Gazette* of that city on the 8th instant, which read in substance as follows:—

"COMPLETE BREAKDOWN OF THE PHOSPHATE MARKET.—Latest cable advices report that the phosphate market is so overstocked that business is impossible at any price. Offers of Canadian phosphate of 80 per cent., at one shilling per unit had been declined by manufacturers; that continental orders have all been cancelled on this market, as English manufacturers are trying to dispose of their surplus on the continent, and a further decline is expected."

The incorrectness of the above statements were only too apparent to all those who had had an opportunity of posting themselves on the condition of the trans-Atlantic phosphate market. At the time of the publication of the article in the *Gazette*, from which we have quoted above, this office was in possession of the most recent information concerning the condition of the English market. A general

dullness characterized the fertilizer trade, but, notwithstanding this, there was no falling off in the demand for Canadian apatite, and the price quoted for it was more than sufficient to warrant owners of mines in working their properties to their greatest capacity. Though early in the season, one sale of 1,000 tons had been reported at 1s. 3d. for 80 per cent. mineral and a standing offer for 2,000 tons additional at same price was left with seller, who retains it under consideration. About the middle of the present month, a letter was received at this office from a firm in Great Britain, who deal extensively in Canadian phosphate, expressing a readiness to enter into contract to purchase 20,000 tons of our mineral, for delivery during the next twelve or fifteen months, and on the 14th instant, an offer was received by cable for 5,000 tons of 70 per cent. Canadian phosphate at 1s. per unit *with one-fifth of a penny rise*. These facts should be sufficient to completely upset the Montreal *bear* movement, and to prove that the statements made in the *Gazette*, in its issue of the 8th instant, and reiterated in the same paper on the 19th instant, are unfounded, and totally at variance with fact. Let the phosphate producers of Canada avoid middle men who thus attempt to bring about a serious injury to this important industry for their own selfish temporary benefit. It has been stated that the miners who can forward but a small output are at the mercy of buyers on this side, as they cannot ship direct in small quantities, but such need not be the case if the larger producers will but co-operate with them, and pool their outputs for direct shipment. A letter recently received from Montreal from a well-known authority on phosphate mining and shipping, contains the following:—"Our miners need to pay special attention to maintaining the quality of their product, and they should be cautioned not to ship it before sold, as open consignments have a bad effect on prices."

This is good advice, and we publish it for the benefit of the phosphate miners of Canada.

THE MINISTER OF AGRICULTURE

*In his Annual Report for 1883
thus speaks of*

CANADA'S PHOSPHATE INDUSTRY.

"It is not many years ago since Canadian phosphate began to attract notice in the United States and Europe. Of late years Americans have kept a steady lookout for property in Canada which they could work themselves for the requirements of their own factories. The importance of the fertilizer trade in its present condition, and the proportions it promises to assume in the near future, are the principal causes of this diversion of interest.

When Canadian phosphate first came on the market, some eight years ago, practical men shook their heads at the hard and unpromising looking material. Many of the mills then in use in fertilizer-works were the buhrstones used to pulverize coprolite and other comparatively soft material. The difficulty of grinding has now been overcome, and it is no longer a source of danger to workmen and of perplexity to manufacturers. Instead of using it as they did coprolite, it is mixed largely with other softer materials, which enables the operating chemist to first saturate the raw phosphate with sulphuric acid, and use Canadian phosphate as a drier.

Being a more concentrated phosphate than any other in the world, it has very naturally been sought for to bring up the acid phosphate fertilizer to high percentages of phosphoric acid.

The amount of phosphate shipped from the Port of Montreal during the past calendar year was, in round numbers, 19,000 tons. This industry, in its production, materially benefits the country generally, as the men employed at the mines, the teams that haul it from the place of production, the freightage of it by rail or boat, the transshipment at the seaboard and ocean freight, all represent a certain amount of capital expended by its agency. It is expected that 24,000 tons will be shipped from Canada to Great Britain during 1884.

I have in previous reports remarked that the removal by crops impoverishes the soil and prevents it from yielding as abundantly as formerly, unless the loss is compensated by supplying phosphate fertilizers. In the districts where cattle raising is not carried on the absence of ordinary manure must be compensated for by some artificial stimulant, and experience goes to prove that for the production of cereals of every description, as well as for the strengthening and renewal of worn out lands, no available fertilizer is known that can produce such beneficial results as phosphate when subject to a chemical process, and known to the trade as super-phosphates.

The grain exported from the Port of Montreal in a single year has been estimated to contain 2,574 tons of phosphoric acid, which implies the total exhaustion, so far as phosphates are concerned, of 75,000 acres, the renewal of which necessitates the application of some 6,000 tons of phosphates.

United States statistics of commerce and navigation for 1882-83 show that 1,264 tons of raw, and 7,766 tons of manufactured phosphate were imported into that country from Great Britain direct; whilst only 254 tons of raw phosphate were imported into the United States from Canada, and it is thought highly probable, by a mining engineer who has had long experience in the phosphate industry, that much of the material

which was mined in Canada and exported to Great Britain, is returned either in the raw or manufactured condition to the United States. This circumstance points to the fact that the utmost confidence is placed by American buyers in the thorough system of inspection of the raw material in England, which guarantees the standard by careful analysis, and is the only true means by which can be avoided the substitution of inferior for higher grades, when the raw material is purchased in bulk. A reliable authority on phosphates informs me that raw Canadian phosphates contain 89-91 per cent. of tribasic phosphate of lime, according to the most authentic analysis that we have on record from picked samples selected as being the most free from admixture with foreign mineral matter. Cargo samples analysed in England have returned 85 to 86 per cent. from Canadian phosphate mines. As capital increases, and the consumption of fertilizers becomes more general, competition will be keener and our phosphate bearing districts will be worked to a larger extent than at present, naturally tending to further cheapening of production. In a comparative table of the analytical composition of phosphate from the various countries producing it recently published in the *New York Mining Journal*, with the exception of three deposits in the West Indies and one in Spain, Canada ranks the highest. Such a fact as this should have the effect of causing our phosphate producers to open up a direct trade for the raw material with the United States, and shows the advantages which would accrue from the establishment in our country of works for the manufacture of super-phosphates."

Phosphate Quotations.

The existing state of the market in England and Europe renders it difficult to quote any definite value, at present, for Canadian phosphate, though the most recent advices from the former country are of an encouraging nature. The latest sale reported is 1000 tons, at 1s. 3d. per unit for 80 per cent. mineral, with one-fifth of a penny down, and an offer from same buyer for 2000 tons additional at same price, which is yet under consideration of seller. An offer was received by cable from England, on 14th inst., for 5000 tons of 70 per cent. mineral, at 1s. per unit with one-fifth of a penny rise; this is equivalent to about \$28.25 per ton for 85 per cent. phosphate in Liverpool, or \$23 in Montreal, with latest reports that the market is strengthening. One thousand tons have been placed at last mentioned figures, and miners should be cautioned not to dispose of their output until they are made aware of the tendency of the market abroad during the next two weeks.

Riviere du Lievre Improvements.

The plans for the lock and other works to be constructed at the Little Rapids have been completed and are in the hands of the Chief Engineer for approval. They have been designed so as to provide for the ample accommodation of such vessels as the navigation of the river will demand, and all necessary facilities for the driving of saw-log

and square timber have been carefully considered and supplied. Tenders will shortly be invited for the construction of the lock, etc., by the department of Public Works, and work will be begun thereon as soon as the ice leaves the river, and the spring freshets will have subsided. This will certainly, when completed, prove a great boon to the du Lievre district, and of invaluable importance to phosphate miners, as it will enable them to ship their ore during the summer months at a very much reduced cost from formerly.

Sale of a Phosphate Mine.

The most recent sale that has been reported took place during the month, when Mr. W. A. Allan, of

Ottawa, purchased the phosphate lot number seven, in the first range of the township of Portland East, adjoining the "Rapids Mine," formerly known as the "Watt Mine." This recently acquired mine will be a valuable addition to the many phosphate properties owned by Mr. Allan, and in purchasing it he has displayed his usual good judgment and foresight. The openings on the lot expose extensive deposits of mineral of high grade, and the convenient location of the property is an important advantage. Being situated within a quarter of a mile of the Rivière du Lièvre, at the Little Rapids, the ore can be transported at small cost both winter and summer, an advantage possessed by but few other mines in the Ottawa district.

THE OCCURRENCE OF PHOSPHATE DEPOSITS.

Abstract of a Lecture delivered before the Ottawa Field-Naturalists' Club on the 28th February last, by
Geo. W. Dawson, Esq., D.S., F.G.S.
Assoc. R.S.M., etc.

Specially reported for the MINING REVIEW.

This gentleman, one of the best known and most efficient officers of the Geological and Natural History Survey of Canada, made a valuable addition to the literature of the subject of phosphate in his lecture.

He was introduced by the President of the Club, Dr. Small, and began by showing that phosphatic materials were essential to the life of both plants and animals, and that the natural cycle of rotation of these substances was interrupted by man, who withdrew from the soil, and transported to other places, large quantities of matter which would, if undisturbed, return to it. The removal of crops impoverishes the soil and prevents it from yielding as abundantly as when first cultivated unless the loss is compensated by supplying phosphatic fertilizers. The grain exported from Montreal in a single year has been estimated to contain 2,574 tons of phosphoric acid—a quantity implying the total exhaustion, in so far as phosphates are concerned, of 75,000 acres, to renew which would require the application of some 6,000 tons of apatite manufactured into super-phosphate. Under these conditions there must always be an extensive demand for phosphatic materials, and it becomes necessary to enquire where specially concentrated natural sources of supply may be found.

The occurrence of such deposits was then traced from the most recent in geological time to the oldest formation known—the Laurentian. First comes the accumulation of guano now going on wherever the climate is sufficiently dry to prevent the washing away of the bird excretions, notably on the Pacific coast of South America where rain never falls, and where not only the phosphatic, but also the nitrogenous constituents of the excrements are preserved. Next we find extensive beds of mussel shells in the estuaries of the Prince Edward Island rivers, where the deposits are known as mussel mud, and are extensively excavated by the farmers and spread without preparation over their lands. If this mud became part of a stratified deposit in the course of geological changes phosphatic nodules would be found amongst it, resulting from concretionary action, a slow process of drawing together of like particles in the mass, which is not in all cases fully understood. When the material is abundant, such concretions frequently form almost continuous layers.

In North Carolina are beds of shells, bones, and other organic remains, referable to the Tertiary period, in which this concretionary action has occurred. In some places these beds have been lifted above the level at which they were deposited, and are worked by a system of trenching and washing; in others they are yet below water, and are obtained by dredging.

Still going back in geological time, we find the coprolite beds of the South of England, in the cretaceous rocks, with new associations of animal remains. These are extensively worked, and furnish 25,000 tons of phosphate annually.

In the yet older rocks of Canada, nodules occur in the strata of the Silurian period in the Quebec group of rocks, and nodular masses are found in the primordial shales, and although these are not of economic importance in Canada, beds of similar age are worked in other countries, as Poland and Wales. These instances go to show that in whatever age large quantities of organic materials were accumulated phosphatic deposits were made from them. Following this analogy into the Laurentian series, we find vast beds of sediment deposited as in more modern formations, but these have since been so completely metamorphosed that they have entered into new chemical combinations among themselves, and become entirely crystalline—limestones crystalizing into marbles, coally materials into graphite, and phosphatic, coprolitic, or nodular layers into calcic phosphate or apatite.

Some of the Laurentian beds are found to be comparatively rich in apatite, and particularly those containing the pyroxenic rocks, in which it seems generally distributed, while certain layers, almost like beds, of nearly pure apatite occur. In other places, distinct veins and fissures are filled by processes of segregation, and frequently in connection with crystals of other substances.

The exportation from these Canadian deposits, although not fully developed, has attained considerable proportions. Dr. Sterry Hunt states that 17,840 tons were shipped from Montreal in 1883, of which the greater part went to British ports. 15,000 tons of this were mined in Quebec, the remainder in Ontario. The shipments for this year Dr. Hunt estimates will reach 24,000 tons.

The most striking fact developed in the mining of our apatite is the great irregularity of the deposits, which is easily accounted for by the extremely disturbed character of the Laurentian rocks, deposits once horizontal being folded and twisted in all directions, producing large pockets and masses of apatite, connected only by narrow and twisted seams, or entirely isolated.

Can, then, a geological survey aid in tracing these deposits? It has already been found that large tracts or zones (principally shown by Mr. Vennor) contain most of the large deposits, while intervening bands are comparatively barren, and much can yet be done in defining and mapping them down, while the further work of utilizing special deposits thus defined must always remain the work of enterprising and skilled private parties desiring to utilize them.

In the discussion which followed the lecture, Mr. Fraser Torrance, being called upon by Dr. Dawson in consequence of his long experience as a mining engineer in the neighbourhood of Ottawa, gave a very interesting description of the Ottawa Valley workings, endorsing the lecturer's statements respecting the irregularity of the deposits. He described the most productive belt as following the banks of the des Lièvres, and stated that the apatite occurred in large irregular masses, generally in connection with pyroxenic rocks, that no true veins or beds could be said to exist, the apatite in pseudo-veins gradually changing from masses to crystals scattered amongst pyroxene, while apparently well-defined beds and veins joined together to form one irregular pocket, the one passing into the other without any regular transition. No systematic attempt by sinking shafts, driving adits, or diamond-drill boring had yet been made with a view of testing the presence or extent of lower deposits, and the manner of conducting the present surface workings was calculated to throw serious difficulties in the way of any future mining of lower deposits, literally threatening to fulfil the famous prophecy of Louis XV, "Après moi le déluge."

Mr. Torrance stated, on the authority of Mr. Nimmo, Chief of the Bureau of Statistics, that during the past year the United States had imported from Canada 254 tons of apatite, from Great Britain 1,264 tons (much of which probably came originally from Canada), from Germany 44,000 tons, and 7,766 tons of super-phosphate. The speaker had some years ago examined super-phosphate manufactured in Canada, and considered that the failure of the industry was due to the lack of technical skill evinced, no thorough chemical analysis of the ingredients being made, and the products consequently varying so greatly in quality as to destroy all confidence in them. Tests with super-phosphate at the Agricultural College, Guelph, showed, he understood, great pecuniary advantage from the use of a good article.

Mr. H. B. Small stated that experiments were being made in the direction of applying, as a fertilizer, apatite and nodular phosphate, ground to an impalpable powder, without chemical preparation, and, he understood, with favourable and lasting results.

Dr. Dawson thought the experiment would not succeed, as the apatite was insoluble under ordinary conditions in soil, and that at best the method would be wasteful.

Mr. F. D. Adams, of the Survey, stated that he had detected, attached to a specimen of apatite received from Arnprior, a species of hornblende rock, which was so intimately associated with the apatite deposits of the Laurentian rocks of Norway and Finland as to be known as the "apatite-bringer," and which had never previously been found on this continent.

GOLD MINING IN BEAUCE.

At the alluvial gold diggings in the County of Beauce, Province of Quebec, the result of last summer's work, which was carried on but to a limited extent, was so satisfactory that the coming season will, doubtless, be one of unusual activity. The ground now being worked by Messrs. Humphrey and Allan, in St. George Concession, promises to yield gold in large quantities. From the bottom of their shaft, now about 140 ft. in depth, according to the most recent reports received, pay dirt is being raised, although the level is some 8 or 10 ft. above the gravel. Steam-pumps and hoists have been recently erected at the shaft, and work, henceforward, will advance more rapidly. In the spring they will begin to wash up, and the value of the dirt will then be ascertained. That the gravel above the bed-rock carries gold in large quantities there is no reason to doubt, and the opinion expressed by miners of long experience in the placer mines of California, is that this property will prove to be of greater value than its owners dare to hope for. In the St. Charles Concession, the Gilbert River Gold Mining Company are carrying on operations, under the superintendence of Capt. Richards, with a force of 28 miners, and their property has yielded a large amount of gold per man employed. During the months of July, August, September, part of October, and fifteen days in November, of last year, the wash up, according to sworn testimony of superintendent, returned eighteen thousand dollars, the biggest day's work amounting to thirty-two and one-half ounces—equivalent to about \$585. The company have two shafts sunk on this property, this winter's output from which will be washed in the spring.

NOVA SCOTIA GOLD FIELDS.

The "Mount Uniacke," "Lake Catcha," "Oxford," and the "Salmon River" mines are producing gold in large quantities and at a fair profit—the yield per man varying from three to seven dollars per day. The result of the past year's development has been of such an encouraging nature that the various companies engaged in active operations are erecting modern machinery of the most suitable design for crushing the quartz and abstracting the gold therefrom. In days gone by gold mining in this province was carried on on very primitive principles, and in a great many instances valuable properties were abandoned, after much money had been unprofitably expended through mismanagement, extravagance and absolute want of experience and knowledge on the part of the owners. Many of these properties are now falling into the hands of practical men, and in

almost every case where mining operations have been resumed the work has returned a large percentage of profit. Within the past year some new and important discoveries have been made in different localities in the province—notably the "Millesegate Gold Field," in Lunenburg County, which derives the name from a lake in the vicinity, on the borders of which gold-bearing quartz has been discovered by Micmac Indians. The existence of gold in the numerous quartz veins distributed through Lunenburg County was made known some twenty years ago, but before any practical development of the lodes had been accomplished mining operations ceased, owing to the causes already hinted at. In this recently discovered Millesegate district, mining operations were begun a few months ago, by some gentlemen of Bridgewater, N. S., and have been continued up to the present time with encouraging results. A shaft is being sunk at the "Owen" mine, cutting three distinct veins of quartz, measuring five, nine, and fifteen inches in width respectively, and through which coarse free gold is plentifully disseminated. No machinery has, as yet, been erected on this property, but we are informed by a gentleman recently from the mine, that about six tons of selected quartz taken from the shaft had been crushed, and produced no less than within a fraction of one hundred ounces of gold. If the quartz was all as rich as specimens from the mine forwarded to this office and said to be fair average samples, such a result might not unreasonably be expected.

On the opposite side of the lake, about three-quarters of a mile from the "Owen" mine, on a property known as the "Birch Brook," several openings, of about eight feet in depth, have been made at intervals on a lead extending over a distance of some eight hundred feet. The vein shows from two to three feet in width, and free gold is to be seen in all of the pits. Work on this property was suspended last autumn, pending the erection of crushers and other machinery in the spring, when it is expected that mining operations will be vigorously resumed, and it is predicted that as greater depth is reached at "Birch Brook" and the "Owen" mines they will develop into very valuable properties, capable of yielding gold in large quantities at small cost. It is not improbable that the "Millesegate Gold Field" will rank high among the gold producing districts of the Province of Nova Scotia.

Periodical information concerning the condition of the Nova Scotian Gold Mines will be thankfully received by the publishers of the CANADIAN MINING REVIEW. The names of parties forwarding such information should be attached to their reports.

ASBESTOS MINING

IN THE EASTERN TOWNSHIPS.

This industry is growing in importance year by year, and, although the output of the mines at present in operation is by no means insignificant, there exist numerous undeveloped properties throughout the district capable of yielding a very large quantity of excellent asbestos. That part of the Province of Quebec known as the Eastern Townships is the only locality in Canada where asbestos mining has as yet been carried on. In the Township of Thetford, the Boston Asbestos Packing Company's and the Johnston mines are the most productive, in fact, with the exception of a limited quantity taken from the Ward mine, near by, these properties made up all of last year's output from that immediate district. At Danville, the Jeffery mines are very rich in mineral, but are not so vigorously worked as those first mentioned. In Broughton, the asbestos that has been mined is of a very superior quality, both as regards texture and length of fibre, and a property in this township, recently purchased by the Chalmers, Spence Co., of New York, will be actively worked during the approaching summer.

Asbestos mining is not followed as is the mining of other mineral deposits—it is not mining, but quarrying, and the peculiar nature of the mineral and its associated rocks renders it unprofitable to proceed with operations during the winter months, the cold and depth of snow in the Eastern Townships being excessive. Labour in the district is plentiful and wages run at about one dollar per day for labourers and \$1.25 to \$1.50 for experienced quarrymen or drillers. The output from the mines above mentioned during the summer of 1883 aggregated about 1,100 tons, about 200 tons of which brought \$50 to \$60, the balance \$75 to \$80 per ton, and a small quantity from another section was sold for \$100 per ton. The Quebec Central Railway affords easy communication to and from the most important mines in operation, they being situated within a few hundred feet of the line and are connected with it by short tramways, over which the output is forwarded to the Q. C. R. cars for transportation.

A Gold Medal to the Asbestos Company.

A gold medal has been received by the Quebec Asbestos Company, as a first-class prize, for the finest specimen of crude and manufactured goods shown at the late Boston Exhibition. The medal bears several inscriptions and a picture of the Exhibition buildings. The company has its works on St. Charles street, and will, no doubt, earn laurels in

the markets of Europe, through this success. The manufacture of asbestos is steadily increasing.

A London, England, journal contains the following advertisement of one of the largest asbestos goods manufacturing companies in Great Britain:—"Important notice. We now supply, but do not recommend packing, millboards, etc., made from Canadian asbestos, as a second class article, at low prices. Italian asbestos is the best." There appears to be a desire on the part of English manufacturers to cry down the Canadian asbestos, but as the Italians are bidding for the product of the Canadian mines it is not at all improbable that, if exported to that country, it would find its way to England as the best Italian article, and the above announcement, which appeared in the *Quebec Telegraph* of a recent date, is conclusive evidence of the superiority of Canadian asbestos.

MINING REGULATIONS.

To govern the disposal of Dominion Mineral Lands other than Coal Lands.

The full text of these Regulations was published in the *Canada Gazette* on the 10th inst. They apply to all Dominion lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, or other mineral deposits of economic value, with the exception of coal. Any person may explore vacant Dominion lands, not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting, for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode, or deposit of mineral or metal within the limits of the claim. Any person, having discovered a mineral deposit, may obtain a mining location therefor, under the Regulations, and the conditions under which such locations may be held are clearly set forth.

Quartz-mining, Placer-mining, Nature and Size of Claims, Rights and Duties of Miners, Leave of Absence, Administration, Bed-Rock Flumes, Drainage of Mines, and Ditches are all provided for in the Regulations, and the *General Provisions* thereof embody the *Hearing and Decision of Disputes, Forfeiture* and miscellaneous clauses defining the power of the local agent.

The patent for a mining or mineral location shall reserve to the Crown, for ever, a royalty of two and a half per cent. on the sales of the product of all mines therein, and returns shall be made by the grantee, sworn to by him, or by his agent or other employé in charge of the mine, at monthly, or

such other intervals as may be required by the Minister of the Interior, of all products of his mining location, and of the price or amount he received for the same.

CORRESPONDENCE.

To the Editor CANADIAN MINING REVIEW.

SIR,—Allow me a few comments on the Mining Regulations recently issued in the *Gazette* by the Department of Interior.

One would think that with the immense mineral tracts in the States in immediate competition with our own, the mining policy of our Government should be at least as liberal as that of the Americans, but I find the lately issued regulations calculated in many ways to strongly discourage the prospectors who have, as a class, been the direct cause of the wonderful development of the mineral interests across the line. Among the sections more particularly inimical to the interests of the prospector (who is generally a poor man) are sections 5, 6, and 7, wherein it is laid down that a miner must expend during the first year \$500 in actual operations on his claim, pay \$55 in fees, and \$200 for a patent, a total of \$755; now this is an impossibility to the vast majority of prospectors, so that they must sell out at ruinous sacrifice (which will be difficult of accomplishment within a year), or forfeit their rights. Surely it will be admitted that the system common in the States of requiring an annual expenditure on the mine of one hundred dollars is fairer to the struggling miner, for then he can manage to earn sufficient, by working in other mines for wages, to fulfil the requirements, and he has time to look for a purchaser, or, by a gradual development of his claim, to become himself an independent operator (a common thing in the States).

Then in sections 79 and 80, it is provided that the Minister may declare any region a "Mineral District," and sell the claims therein to whom he may see fit; and it is elsewhere provided (section 8) that he, the Minister, may so sell claims forfeited by the first discoverers or claimants. Now, under these sections, what is of more likely occurrence than the following suppositious case? I, a prospector, having spent my last dollar on my season's outfit, strike a rich lead, say in May; I do not reach the Local Agent to file my claim till sometime in August; I proceed to look up a purchaser; I find a capitalist willing to send a trusted expert to examine the location, but, under various pretexts, more or less reasonable, the expert's report is not made until my year is almost up; then I am completely at the mercy of the purchaser; I must sell at his price or forfeit, for I cannot cause competition between buyers, as they will not send experts to examine my claim unless I bond

it to them for a certain time. If I refuse to sell at the buyer's price, I have no time to look up another purchaser, and must forfeit. Then the capitalist, by a little clever management, may buy from the Government for \$200 what it cost me a year's labour and \$1,000 to find. Is not such a case more than possible? Will any sensible man deny that these sections place the prospector completely in the hand of the capitalist; and will any one for a moment hold that it is wise thus to discourage the prospector?

Much might be said of the difficulties in connection with the administration of mining affairs by the Local Land Agent, but I will conclude with the question of "Royalty." The two and a-half per cent. is sufficiently absurd and out of date as applied to quartz mining, but it will be simply impossible to collect it from placer miners; this fact must be evident to anyone who knows the way in which gold miners work and live; if a miner washes out \$50 worth of gold dust in a day and gambles it away at night, who is to know it or collect the royalty? Clearly not the Local Agent; so that only the hard working, saving and scrupulously honest miner would be taxed.

Yours, etc.,

PROSPECTOR.

CALGARY March, 1884.

MINING NOTES.

Work at the Allan & Humphrey Gold Mine in Beauce, Province of Quebec, goes ahead apace. A large quantity of pay-dirt, raised from the shaft during the winter, awaits washing, and the manager is very sanguine of what the result will be. Rich gravel has been struck some feet above bed-rock.

Reports have been circulated that recent developments at the Canada Consolidated Gold Mining Company's Mine, in Hastings County, Province of Ontario, have been of a satisfactory nature, and that their property will prove valuable under good management. This fact might have been ascertained long ago at a great saving of expense.

The Mica Mine in Burgess Township, Province of Ontario, owned and operated by Mr. Allan, of Ottawa, is becoming more and more valuable as the output improves in quality and increases in quantity month by month. Already a large quantity has been exported to the United States and some sold to dealers in Canada.

The Millepsegate Gold Mine, in Lunenburg County, Province of Nova Scotia, is developing well, and it is stated on good authority that the gold recovered during the past winter in prospecting new ground will more than cover expenses. The owners are preparing for

active mining operations and will proceed with them early in spring.

A full report of the present condition and past history of the Lake Superior Native Copper Company's Mine has been received at the office of the *Review*. It is replete with interesting information concerning the company's experience in preparing for mining operations, their determination to thoroughly test the value of their property, their expenditure and the result of their labour. Want of space necessitates holding over, until next edition, the full text of the report.

THE IRON DEPOSITS OF CENTRAL CANADA.

(Continued from Page 6, Vol. 2, No. 2)

THE LOUISA MINE.

The following is a brief description of this mine made by Mr. Chapman. "This property comprises Lots 55, 56 and 57 of the Free Grant District, Township of Tudor. It is very densely timbered throughout its whole extent, and is held in fee simple. The main outcrops of ore occur upon a thickly wooded slope, and indicate without question a very large supply, apparently forming an imbedded mass or "stock," the principal axis of which extends in a general east and west direction, and is traceable throughout a length of at least 1,400 feet. Seven or eight trenches have been opened across the face of the slope, in very solid ore, from the base to within a short distance of the summit, in lengths of from 60 to about 160 feet, but outlying exposures show the mass of ore to extend much beyond these limits. The ore is strongly magnetic, and holds over 60 per cent. metallic iron, but unfortunately contains titanium. The amount of the latter is said to be quite low in samples obtained from some of the exposures; but in the samples analyzed by the writer 8.08 titanic acid was obtained, equivalent to 5 per cent. titanium. The complete analysis yielded:

Ferrous Oxide.....	25.85
Ferric Oxide.....	57.51
Titanic Acid, 8.08 = Titanic Sesquioxide.....	7.30
Phosphorous.....	0.01
Sulphur.....	0.06
Silicious Rock-matter.....	9.31

100.04

Metallic Iron—60.36 per cent."

This mine has been condemned because of the amount of titanic acid in the ore, but ores containing much more than this percentage of titanium are successfully worked in Europe, by mixing them with other ores, and Dr. Hunt, of Montreal, one of the best authorities, asserts that when the mixed ores do not contain in all more than eight per

cent. of titanic acid they can be successfully worked and without any impairment of the value of the product. It is confidently believed that by mixing 50 per cent. of this ore with that from Wallaston there will be no difficulty in working it, and that the very small amount of phosphorous and sulphur will render it one of the most valuable ores to be used in combination with other ores. It should be added that the company does not intend to work this mine, and do not regard it as of any value.

Mr. Chapman also furnishes the following description of

THE BENTLIFF MINE OF THE TOWNSHIP OF MARMORA.

This property—held in fee simple—forms the west half of Lot 13, in the 10th concession of Marmora. It comprises 200 acres, partly cleared, but consisting in chief part of richly timbered land, lying about six miles from the present terminus of the North Hastings Railroad, and two miles from a projected line of railway. Its distance from Madoc (by road) is about eleven miles, and from Marmora, six miles. With the exception of five or six trial pits at considerable distances apart, this property remains undeveloped; but as all the pits show ore, there is evidently a considerable amount upon the lot, although this is more or less thickly capped by quartzite in most places. But the ore itself is of so remarkably a fine quality that any expenditure in opening up the ground would be warranted. It consists of an almost chemically pure hematite or specular iron ore, holding, according to my analysis, 69.30 per cent. metallic iron, with less than one per cent. of intermixed rock-matter, mere traces of sulphur and phosphorus, and no traces of titanium. It presents a steel-grey color and dark-red streak, and its structure under the microscope is seen to be finely porous. The ore is thus more or less permeable to gases, and would work kindly in the furnace. My analysis yielded:

Ferric oxide.....	99.07
Manganese oxide.....	trace
Titanium.....	none
Phosphorous.....	trace
Sulphur.....	trace
Silicious Rock-matter.....	0.89

99.96

These constitute but a small part of the known locations of ore on the property opened up by the O.C.R.R. Widely separated as they are, and yet all plainly connected by the geological formations, it is fair to assume that they constitute but a small fraction of the valuable deposits of ore; that when the territory is fully developed it will not be excelled in mineral wealth by any other territory on the continent, not even by the wondrously rich deposits of the Lake Superior region.

Manitoba Penitentiary," will be received at
this office until MONDAY, the 17th March
next, inclusively, for the erection and com-
pletion of

**ADDITIONAL CELL WING, BOILER HOUSE,
&c., AT**

Manitoba Penitentiary.

Plans and specifications can be seen at the
Department of Public Works, Ottawa, and at
the Dominion Public Works Office, Winni-
peg, Manitoba, on and after MONDAY, the
11th February next.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied, and signed with their
actual signatures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honourable the Minister of
Public Works, equal to five per cent. of the
amount of the tender, which will be forfeited
if the party decline to enter into a contract
when called on to do so, or if he fail to com-
plete the work contracted for. If the tender
be not accepted the cheque will be returned.
The Department does not bind itself to ac-
cept the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, Jan. 9th 1884.

NOTICE.

TENDERS will be received by the under-
signed until Tuesday, the 8th April,
prox., from persons desirous of leasing the
privilege of ferrying across the River Ottawa
between the Village of St. Thomas d'Alfred
in the County of Prescott, in the Province of
Ontario, and Montebello, in the County of
Ottawa, in the Province of Quebec, subject to
regulations approved of by Order in Council
of the 3rd March, inst., copies of which can
be procured on application to the under-
signed, or to M. Battle, Esq., Collector of In-
land Revenue at Ottawa.

Each proposal must be accompanied by a
cheque marked good on one of the chartered
banks doing business in Ottawa for one-half
the amount of one year's rent. In the case of
the accepted tender this cheque will be de-
posited on account of the first year's rent.
The cheques accompanying all unsuccessful
tenders will be returned, but in the event of
the withdrawal of any tender the amount will
be retained.

E. MIALL,
Commissioner of Inland Revenue.
Department of Inland Revenue,
Ottawa, March 14th, 1884.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the un-
dersigned and endorsed "Tender for Drill
Hall, Quebec," will be received at this office
until WEDNESDAY, the 5th day of MARCH
next, inclusively, for the erection and com-
pletion of

DRILL HALL, QUEBEC.

Plans and Specifications can be seen at the
Department of Public Works, Ottawa, and at
the Dominion Public Works Office, Post Office
Quebec, on or after Friday the 15th instant.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied, the blanks properly
filled in, and signed with their actual signa-
tures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honourable the Minister of Public
Works, equal to five per cent. of the amount of
the tender, which will be forfeited if the
party declines to enter into a contract when
called on to do so, or if he fail to complete the
work contracted for. If the tender be not ac-
cepted the cheque will be returned.

The Department will not be bound to accept
the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 4th Feb., 1884.

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

During the past month mining operations in Canada have, to a certain extent, received a check on account of the breaking up of winter and the consequent inconvenience occasioned by surface water from the melting snow. The snow has now quite disappeared from about the mines, and does not any longer interfere with actual mining, but the roads leading to the mines are not yet in a fit condition for comfortable travelling, and the water routes are blocked with ice. By the close of the coming month, however, the communication by land and water will be open and

mining operations will be engaged in more vigorously than ever before. In Nova Scotia work will be begun on some recently discovered gold locations, and mining will be resumed on properties that for years have been abandoned. According to the annual report of the inspector of mines for the Province of Nova Scotia, the production of minerals during 1883 was in excess of 1882 in every instance with the one exception of manganese ore, which fell off 55 tons, and it is expected that the production for the present year will show a still further increase. Very little information has reached us regarding mining operations in New Brunswick, but in the Province of Quebec mining is rapidly becoming an important industry. As far east as Beauce County gold mining is making rapid strides and the success which has attended the operations of the Gilbert River Gold Mining Company, in St. François, and of Messrs. Allan & Humphrey, in St. George's Concession, has attracted much attention, and the result of the "wash up" at these mines is anxiously awaited. In the Eastern Townships of the same Province, asbestos mining will be resumed immediately and development work begun on some locations recently acquired by an American company. Some of the copper mines in the vicinity of Sherbrooke have been continuously worked during the winter, and with satisfactory results. Proceeding westward, the phosphate mines of Ottawa County are giving work to an increased number of miners, and during the winter about 200 teams were

steadily employed in forwarding the mineral to points on the line of the C. P. Railway; up to the present time the output is considerably in excess of what it was at the same date last year, and the mines have greatly improved with development. The phosphate that has been forwarded is of a much higher grade and mining is being conducted on more systematic principles. In Eastern Ontario, in the Perth District, a fair quantity of phosphate is ready for shipment, and a good quality of mica is being shipped from Mr. Allan's mine in North Burgess. The iron mines to the North of Kingston and Belleville have been increased in value during the past year by the construction of the Kingston and Pembroke, and the Ontario Central Railways, and the mines in the last mentioned locality are yielding high grades of hematite and magnetic ores. The Lake Superior Native Copper Company is doing good work at Mamainse, Algoma District, and much is expected from the Rabbit Mountain and Huronian Silver Mines, also in the District of Algoma. It is expected that work will be resumed almost immediately at the gold mines of the Lake of the Woods, and in Manitoba mining operations will be carried on to some extent during the approaching summer. In the North-West Territories and the Rocky Mountain section of British Columbia, much excitement has been occasioned by the discovery of gold, silver, copper and coal in rich deposits, and miners are preparing for active and extensive operations at an early date. Some of the mines in this locality have been worked all winter,

but no authentic reports have reached us during the past month of the value of the output, though there is reason to believe the mines have been worked at a profit. The present year promises to be one of unusual activity in the mining centres throughout the Dominion.

The *Halifax New Era* of April 5th contains a column of "mining matters," relating to the Nova Scotia gold mines, but the editor has omitted to give credit to the CANADIAN MINING REVIEW, from which the articles have been copied. The *New York Mining Record* of April 12th reprints one of the articles, and, owing to the omission referred to, credits *New Era* with its authorship.

CANADA'S PHOSPHATE TRADE.

Much has been said during the past few weeks concerning the outlook for this trade for the coming season of navigation, when the output of the mines will be offered in England and on the continent. Reports have been set afloat that prices had suddenly and seriously declined, and that the foreign markets were overstocked. Such, we are happy to say, is not the case, and we are in a position now to reiterate what was stated in last month's number of the REVIEW, that in England, especially, Canadian apatite is in good demand. Enquiries are also coming from manufacturers of fertilizers in the United States, who are seriously considering the advantages of importing our phosphate to be used in the manufacture of super-phosphate in connection with the American

mineral and other phosphates, and it is not at all unlikely, that within a very short time, a new market will there be opened for the product of Canadian mines. As may be seen by our "quotations," there is no truth whatever in the reported drop in prices, and the number of enquiries that have reached us within the past few weeks from abroad is evidence that there is no falling off in the demand. Producers will be wise to consider well before placing their output at reduced prices with buyers who, though anxious to buy, are endeavouring to bear the market by circulating ridiculous reports that our mineral is becoming unpopular with manufacturers abroad. Nothing could be more incredible to those who are informed on the trans-Atlantic phosphate trade. Our mines are producing a high grade of mineral in large quantity and the output for shipment this year will exceed that of 1883 by several thousand tons. At the present time, as nearly as can be estimated, there has been forwarded to various points of shipment already from the mines in Ottawa County, 12,950 tons of first quality, and 1,300 tons of second quality. It is estimated that about 9,500 tons additional will be forwarded before the close of navigation, which will make a total of 22,450 tons for the year's output of first quality, and 1,300 tons of "seconds," or about 6,000 tons more than last year's shipments amounted to from the same district. From the Perth and Kingston mines, the output will probably reach 2,500 tons.

THE MINES.

Without one exception the phosphate mines of Ottawa county have improved during the past few months and are now capable of yielding a larger output than ever before.

In the Township of Portland West the *High Rock* mine gives employment to about 75 miners and work has been resumed in some of the old pits with astonishing results. In places where it was thought the deposits had given out, a small amount of dead work has exposed other extensive ore beds. The *Union Phosphate Mining and Land Company's* mines, in the same

Township, have steadily increased in value with development. This property is now thoroughly equipped for permanent operations, and, with proper management, it cannot fail to return a handsome annual profit to the company. The deposits are almost innumerable and are of a character indicating that they will become more extensive as work progresses. From 60 to 70 men are employed by this company and the quantity of phosphate that has been forwarded from its mines is of a very high grade and shows that attention has been given to careful dressing.

In Portland East the *Dominion Phosphate Company* is raising a fair quantity of very high grade mineral from its North Star Mine which is developing well and shows signs of becoming very productive. Mining operations are conducted by this company in a workmanlike manner that reflects credit upon the manager, Mr. W. H. Smith. The next mine of importance in this Township is the *Rapids* mine, owned by Mr. Allan, of Ottawa. All the shafts on this property show large bodies of phosphate at the bottom, and, where new ground has been opened, some fine deposits have been exposed. The property adjoining this mine, recently purchased by Mr. Allan, promises to become very valuable with development.

The *Emerald*, in Buckingham Township, the property of the Ottawa Phosphate Mining Company, is acknowledged the most valuable mine yet discovered in the district; the vastness of the deposits on this property cannot be realized but by personal observation. The entire mountain appears to be charged with mineral, and the ore beds are apparently inexhaustible. This mine will contribute largely to the annual production of Canadian phosphate.

In the Township of Templeton, McLaurin & Blackburn, Jackson Rae, Gillespie, Moffatt & Co., and J. H. Post have forwarded a fine lot of phosphate to the front and the mines are all looking and doing well. The Templeton, P.Q., Phosphate Mining Company, an American organization, have purchased property in this township and will begin operations on an extensive scale almost immediately.

In Wakefield, the mines have been yielding liberally. The *Gem-mill*, the *Haldane* and the *Moore* have been greatly improved by the past winter's work, and are capable of producing a large quantity of high grade phosphate. Mr. Harris is also mining in Wakefield and has forwarded several hundred tons to Ironsides during the winter.

Phosphate Quotations.

Although the market price for Canadian apatite has not yet been definitely agreed upon, it is reasonable to base quotations on the most recently reported transaction. Three thousand eight hundred tons have been placed

in London during the past month at 1s. 3d. for 80 per cent. *with a fifth of a penny rise*. Later advices report buyers offering one shilling and two pence three farthings per unit for 80 per cent. There is steady demand in England, and the market is strengthening.

Opening of Navigation.

The ice has moved from the Riviere du Lievre and the steamboats are now plying between the landing at Buckingham Village and the Phosphate Mines adjacent to the river. This is unusually early for the opening of navigation, and will be a great convenience to mine owners and those who have occasion to visit the phosphate mines in the du Lievre section of Ottawa County.

It has been definitely decided by the Chief Engineer of the Department of Public Works to construct the lock at the Little Rapids of stone instead of timber as originally designed. This is a wise decision and will give a structure of an ornamental and permanent character. Work will be started early in the season and hurried on to completion.

BEAUCE GOLD MINES.

Reports recently received from the district go to show that gold mining is not unlikely to become of as great importance in Beauce as it has been at any time in the history of the Californian and Australian diggings.

The Gilbert River Gold Mining Company is doing good work and raising gold in quantity at large profit.

At the Allan and Humphrey Mine, in St. George Concession, the prospects are very bright. The dirt now being raised from the shaft carries gold plainly visible to the naked eye, and as the level is yet some feet above gravel, it is a certainty that when the gravel is reached gold will be found in large quantities. A rumour came to us last month that the miners had already struck rich gravel, but that is incorrect, as they are yet a few feet above it. A large quantity of dirt will be washed in the spring, and its value, which is known to be high, will be established. The present appearance of this mine promises a rich harvest to its owners, and the excitement already created by the prospects threatens to bring a large influx of prospectors and miners to the district during the approaching summer. Messrs. Allan and Humphrey have been fortunate in securing extensive additional areas adjoining their original property and on the same lead. The pluck and perseverance they have displayed in pushing ahead with mining operations under adverse circumstances deserves to be richly rewarded, and there is no doubt now that it will be.

ROCKY MOUNTAIN MINES.

(Special to the CANADIAN MINING REVIEW.)

SILVER CITY, N. W. T.,

April 5th, 1884.

Some of the silver mines are being continuously and vigorously worked. The "Queen of the Hills," the "Home Stake," and the "Healey" work day and night shifts with most satisfactory results, and operations are about to be started at the "Hetherington," which, if report be correct, is likely to develop into a mine of great value. The provisional directors of the company owning this last mentioned property are: Hugh J. Macdonald, President; W. Scott, Vice-President and General Manager; C. G. Ballentyne, Secretary; Hon. C. P. Brown, T. G. Orton, M.P., J. Stewart Tupper, J. F. Field, L. L. Bedson, Wm. Clougher, Wm. Paisley, John Hetherington. The charter will shortly be issued.

A miners' protective union is to be formed here in a few days, with Mr. Bleecker, of Calgary, as its solicitor. The objects of the union will be the discussion of the mining industry of the district, mutual improvement and protection, assisting the Government in matters affecting the interests of miners, and, by co-operating with the agents and other government representatives, establishing mining in the North-West Territories on a practical and equitable basis. Such an organization is invaluable to any mining community, and the people of Silver City are not slow to act in matters which are likely to advance their prosperity.

The latest despatch received from Silver City announces a rich gold discovery quite near the town, and that great excitement prevails in consequence.

BRITISH COLUMBIA.

In the vicinity of Kicking Horse Pass, to the east of the Cascade range, and that portion of the province contiguous to the Valley of the Fraser River, miners and prospectors report the recent discovery of valuable deposits of gold, silver, copper, iron, coal and other economic minerals. The cost of transporting provisions into the interior has prevented rapid development and location of mining camps, but the opening of the railway to the summit of the Rockies on the east, and to the head of Kamloops on the west, will have the effect of stimulating the mining industry to a wonderful degree. Already extensive preparations are being made by miners and prospectors in Victoria to prepare the mountains as soon as the season is sufficiently advanced. For admit of their so doing. The Legislature at its recent amended the mining laws,

are pronounced by miners to be liberal and to suit the requirements of the country.

The Rocky Mountains of British Columbia are rich in mineral wealth, which would long ago have been developed could facilities have been provided for importing provisions and machinery and exporting the product of the mines. The construction of the Canadian Pacific Railway will remove the difficulty, and an influx of prospectors, miners, and speculators will follow. At Quartz Creek, about forty miles from Kicking Horse, B.C., placer diggings have been discovered which, it is thought, will pay from \$10 to \$20 per day, per man. These diggings were worked many years ago and abandoned on account of their utter inaccessibility.

GEOLOGICAL SURVEY.—The investigations of Mr. A. Bowman in the interior of British Columbia last summer embraced an area of about 30,000 square miles, lying between the 118th and 120th degrees of longitude and the 49th and 52nd degrees of latitude. Through this region the Canadian Pacific Railway will pass, and the geological surveys will, therefore, become increasingly interesting. Preparations are now being made to issue a new map of this region, in which will be shown the results of the labours of Mr. Bowman last year, and the survey

made in 1882. The report of the Minister of the Interior says: "The researches made in the vicinity of the Rocky Mountains prove the existence of large tracts of coal-bearing cretaceous rocks in the very heart of the range, of which the anthracite region of Devil's Head Creek is a special development."

NORTHERN CANADA.

Captain William Kennedy, of St. Andrew's, an Arctic explorer, in a lecture delivered at Winnipeg, drew attention to a region near Lake Arthabasca, into which the Peace River flows, where he stated that petroleum springs had overflowed, covering a section of country forty miles in extent, and after having been carried down the river the oil floats on the surface of the lake. At present the Indians, who are its only consumers, boil it down to the consistency of pitch and apply it as a coating to their canoes, etc. Captain Kennedy also stated that in the same region salt is abundantly found, fine and brilliantly white, and that a variety of economic minerals have been met with in large quantities, notably—sulphur, coal, copper and asbestos. He expressed the opinion that the Arthabasca district, with its vast mineral wealth, would shortly become a point of attraction for capitalists and settlers.

capitalists found the money to carry on work for the summer to test the value of these deposits, and Mr. Ingall once more took charge of the work.

Shafts were sunk upon the two veins to test their continuity in depth and further explorations of the rest of the location carried on.

One of the veins, a promising lode of rich argentiferous sulphuret of copper, was found not to continue down, but the other, a strong well defined fissure vein, carrying native copper, got richer as depth was attained and retained its definite character. Further evidence was also obtained as to the general mineralization of the district, and other veins were found worthy of further attention.

These favourable results induced the syndicate to put up a further sum to enable work to be continued during the winter of 1881-82, and it was decided to sink another shaft further inland on the course of the vein at such a distance that a drift could be run and the two connected before spring so as to secure good ventilation for continuing the work during the ensuing summer should it be decided to do so. This was done, the two trial shafts having been connected at a depth of sixty feet, although, on account of having cut heavy water, great difficulty was experienced in completing the work in time.

This work was considered to have been attended with such satisfactory results that the company was finally organized on a permanent basis in the spring of 1882, and started with a share capital of £100,000, of which the vendors took £25,000 fully paid shares in payment for the property. The board of directors decided then to at once equip the mine with a full plant of dressing and developing machinery.

This of course entailed an enormous amount of work in order to convert a barren shore, covered with second-growth bush, and with only a couple of shanties on it, into a prosperous and busy little village in one short season between the opening and close of navigation on the lake, which period is also shortened by the stormy weather of the spring and fall, rendering it impossible at those seasons to utilize the lake communications more than about one-third of the time. During the whole summer, large quantities of materials, supplies, tools and machinery were poured in and the force was gradually augmented as housing accommodation increased, until some 150 men of various callings were employed, and by the end of the season, most of the necessary buildings were up and the rest well forward or started. Most of the machinery was also on the ground, the saw-mill, hauling engine, air compressor and mine pump being in place.

The worst part of the surface work having been got over by the fall of 1882, when Mr. Ingall was obliged to resign from ill-health, the actual work of underground development was able to be vigorously prosecuted under the direction of the present manager, Capt. Williams, and with the help of compressed air drills, good progress was made, so that the state of things was as follows to October 1st, 1883:

The two main shafts of the mine, some 450 feet apart, were at the respective depths of 221 feet (No. 1), and 152 feet (No. 3). The first level had communication through between Nos. 1 and 3 shafts, and had been extended a considerable distance N. of No. 1 shaft (*i.e.* out towards the lake), and S. of No. 3 shaft (*i.e.* inland), and work had been done on the outcrop of a vein 3,000 feet inland from No. 3 shaft supposed to be the continuation of this vein.

The second level had been driven from each shaft towards the other, and only wanted some 60 feet to communicate, and was also driven a considerable distance N. of No. 1 and S. of No. 3, whilst the third level was driven some distance N. and S. of No. 1. The total length of these drifts amounted to some 1,800 feet, and they, in conjunction with the shafts, proved the vein for some 800 feet in length by about 200 feet in depth.

The plant at that date consisted of a Reliance air compressor capable of working ten Eclipse power-drills, hauling engine and direct acting Northey steam pump at No. 1 shaft, also a diamond drill, saw-mill, stationary engine, to bring up freight from the dock, etc.

The dressing machinery is housed in a building 160 feet long, whose greatest width is 95 feet and greatest height 45 feet. It consists of one head of Ball's stamps capable of putting through 145 tons of this ore per day, the copper being extracted by four jigs and four round briddles. The ore is raised to the top of this building up an incline from No. 1 shaft, worked by an engine which also works the Blake stone breaker, from which it passes down a long incline to the stamp, from thence through the jigs, etc. The necessary water is delivered to the floors from the lake through a seven-inch main by a direct acting steam pump. There are also a fine boarding house capable of holding 100 men or more, a well built and roomy store, the usual repair shop, smithy and carpenters' shop, and stable for twenty-four horses which are chiefly used to bring in cordwood from the bush. There is also a dock within 100 yards of the mine at which, in settled weather, light draft propellers can unload.

The floors commenced running on the 3rd of October last, and at the close of navigation last fall an instalment of some three barrels of dressed metal, about 85 per cent. fine, was shipped to England. Up to the 1st of April last the Manager estimated the amount of ore opened up at some

The Lake Superior Native Copper Company's Mines.

This company's property is situated at Mamainse on the Canadian shore of Lake Superior, in the District of Algoma, and is some sixty miles from the village of Sault Ste. Marie.

Until quite recently no other means than by water existed of communicating with the outer world, which entailed an immense amount of trouble and delay. When the company started mining operations, everything—coal, provisions, machinery and a large quantity of building material of all descriptions, now to be found on the spot, had to be brought from Batchewana Bay, over a stretch of water which, for a great portion of the season, was dangerous and uncertain. The nearest doctor, the nearest post office and stores, could only be reached by travelling these sixty miles in an open boat, so that communication with civilization during stormy weather was impossible, and rendered tedious under the most favourable circumstances.

In the winter, even, this means of communication was absent, and the mail had to be carried over a round-about snow-shoe trail through the bush. Now, however, the continued operation of the mines has brought about a happier state of things. The company has a steamer which, in summer, plies between Sault Ste. Marie and the mines, and in winter a road lately completed by the Ontario Government serves to keep up communication. Around the mine itself has grown up a busy little village which forms quite a feature in the landscape as seen from the lake. It has also a post office and a Government school, whilst anyone being so unfortunate as to meet with an accident, need not, as formerly, have to wait for fine weather and then take two or three days to get to the doctor, but receives prompt attention from the resident medical man, Dr. Peters.

The location now worked by the Lake Superior Native Copper Company, belonged formerly to the Quebec and Lake Superior Mining Association, who held it for some thirty years and did nothing with it until July, 1880, when they employed Mr. E. D. Ingall to examine the tract and report upon the mineral capabilities. Some seven weeks' exploration of the approachable portion of the ten square miles, composing the property, proved to be widely mineralized and that there were two veins worthy of further work being done on them. During the winter of 1880-81, nothing was done, but in the spring of 1881 some English

17,136 tons, which, he thought, would yield 428 tons of copper, and by the end of August, 1883, he expected to have enough ore in reserve to run the present mill for two years. The Company intends, next year, to double the capacity of their dressing floors.

The most serious difficulty met with in opening up this property was that of the great uncertainty of the means of communication, but the facilities in this respect are increasing rapidly, as evidenced by the opening of a line of telegraph to Sault Ste. Marie lately and the cutting through of a road from there to the mines, and when the long promised railway to that place is completed the chances of carrying on successful mining in the district will be greatly enhanced.

Calumet and Hecla Copper Mining Company.

The mining public has been startled by the announcement that the directors of the Calumet & Hecla Mining Company have decided to pass their May dividend. It is the most successful mining enterprise in America, with a record of dividends of \$24,850,000, the annual payments for a number of years having been \$2,000,000, and therefore it has been a rude shock to the many whose faith in mining has suffered under a long series of collapses. In this case, there is no reason for being frightened. The mine, so far as we can learn, is as good now as it ever was; in fact, the management is credited with adhering to the rule of having five years' work developed. Its production the last month is greater than it ever was—2,620 tons of mineral—and it is likely that the cost of production has, if anything, slightly declined. The main reason given for the passing of the dividend is, that the surplus funds are locked up, practically, in the copper now waiting for the opening of navigation to be carried to the seaboard markets. To provide for contingencies, the Company has brought overland about 2,000,000 pounds of copper; but this method of transportation involves an additional expense of upward of one half of one cent per pound. Navigation is closed from five to six months in the year, and the copper companies enter the new season therefore with a very large proportion of their annual output on their hands. In past years, this has not, apparently, hindered the directors of the Calumet & Hecla Mining Company from paying a dividend a short time before the opening of the new season. That they did not do so this year merely shows that their surplus was not so great as formerly, or that a larger amount is in the form of finished product. We understand that the directors were averse to borrowing money to pay the dividend, pending the arrival and marketing of their copper. The company has invested and is still paying out vast sums of money for the completion of the greatest mining and milling plant, designed by Mr. E. D. Leavitt, jun., that any mine in the world possesses. This may have proved a greater drain on its resources, being provided for out of current earnings, than was expected, and the decline in copper has, undoubtedly, contributed its share. With an annual product of 33,000,000 pounds of ingot, a decline of one per cent. means a fall off of revenues of \$330,000, which is probably a minimum. We have no knowledge of what the cost of production of the Calumet & Hecla is; but by inference from the known returns of a much smaller mine, the Quincy, working poorer rock, which show a cost of 9 cents, it is not rash to state that it must be less than 7 cents. Let that figure be assumed, and let it be assumed, further, that the average price realized in 1884 will not be more than 14 cents, which will be considered conservative, even taking into account that a large percentage of the product has been sold abroad at a price said to be about 13 cents New York, then the profit per pound is 7 cents, or \$2,310,000 per annum. A decline of one cent per pound would still leave an excess of income over expenditures for the production of \$2,000,000. We are, therefore, far from regarding the action of the directors in any serious light, though its wisdom has been questioned by many.

There is one point repeatedly raised during the last few days, against which we must energetically protest. It has been urged that the effect upon the market might be a serious one; that it shows that the lake companies are carrying an unusual load of copper; and that the price cannot be maintained. The fact is, that the stock of lake copper is very little if any greater than it always is at this time, and that the statistical position of the metal is very much better to-day than it was a year ago.—*Engineering and Mining Journal*.

Coxheath Copper Mining Company.

During last summer this company did a great deal of work at its mine near Sydney, Cape Breton. Leads were extended, and a good deal of ore stoped out, from which a few tons were handpicked and sent away for testing. Experiments were made on the low grade ores, and it is stated that preparations are being made for the erection of a large concentration plant this spring. Some of the copper was found to carry eighty ounces of silver to the ton.

CANADA'S IRON INDUSTRY.

ITS DEVELOPMENT IN EASTERN ONTARIO.

In the January number of the REVIEW an article appeared under the heading "The Iron Deposits of Central Canada," and was continued in the February and March numbers. Since then, efforts have been made to complete a railway system through the mineral section of the Midland district with a view to encouraging the development of the iron deposits by providing further facilities for the transportation of ore and fuel. The Central Ontario Railway Company made application to the Dominion Parliament for a charter for an extension of its road north, to intersect the line of the Canadian Pacific Railway, and in discussing the bill before the Railway Committee, Mr. J. S. McCuaig, of Picton, thus referred to the importance of granting a charter for the proposed extension:—

The Central Ontario Railway Co. have completed their extension from Benton northward to the Wallaston Mine, a distance of about eighty miles and without government or municipal aid in any form, and in addition have now under contract and in process of construction, at Weller's Bay, in the County of Prince Edward, large and extensive docks for shipping, at a nominal cost, into Lake vessels, the iron ore brought from the mines situated along their railway extension north of Trenton, and intended for export to the iron smelting works of the United States, to supply the demand for mixing with the native ores of that country for smelting purposes. The substantial and extensive dock accommodation in connection with the required dredging at Weller's Bay has already entailed an outlay of over one hundred thousand dollars and is intended to give improved facilities for the shipment of the company's ore and greatly lessen the cost of the transshipment of imported coal, intended as a return cargo. This evidence of the good faith of the proprietors of the Central Ontario Railway, and of their financial ability to carry out the proposed extension from the Wallaston Mine north to intercept the Canadian Pacific Railway, and giving the County of Prince Edward and the Town of Picton, Trenton and the County of Hastings, an all rail route connection with Winnipeg and Manitoba, the Northwest and British Columbia, for passengers and freight, aside from the still more important advantage to the whole Dominion which must result from the development of an extensive iron industry and which must establish beyond controversy the superiority of Canadian ore over even Spanish, Sweden and African ores, and which have been largely, of late years, imported into England and America to mix with the native ores of both countries for smelting purposes, together with the additional fact that already the company have disbursed in construction over two millions of their own money. I say for all those reasons united, I may be permitted to express an earnest hope to the hon. members of the committee, that they will be pleased to pass the charter of the company without amendments and protect it against the imposition of any conditions, save and except those provided for by the General Railway Act and passed in the public interest. Experience in the establishment of smelting works has demonstrated beyond all controversy, that they usually begin their growth at a point or junction where iron ore and coal centre in transportation. And reasonable hopes are entertained that the proprietors of the Central Ontario Railway may, in the prosecution of their enterprise, if clothed with the reasonable powers solicited in their charter and now before the committee be induced, and find it in their interest, to establish smelting works at their mines and also at Weller's Bay. At the risk of intruding on the indulgence of the committee, I beg respectfully to call their attention to the important advantages the establishment of iron smelting secures to any country possessing the ores. I admit it is better for Canada to mine and sell her iron ore than allow it to remain permanently unused and that to that extent the finding of a market for her ores is a legitimate source of satisfaction. And I also contend that it is equally certain that to merely mine and sell our ores is the poorest use we can make of them. Mr. Birkenbine, a gentleman of unquestioned authority, gives the cost of labour per ton as follows:—

	Days' Labour.
Digging ore.....	1
Making pig at furnace.....	1½
Making charcoal from wood.....	1¼
Cutting wood.....	1
Limestone.....	¼
Total.....	5
Charcoal iron, pig, is of the value of say:	
	Per Ton.
In New England.....	\$56
Pennsylvania.....	55
Maryland.....	60
Baltimore.....	65
Lake Superior hot blast.....	52

Canada imported during the years 1870-71 to 1879-80 (10 years), \$125,435,161 worth of iron and manufactures of iron.

Of iron.....	\$33,704,154
Of steel..	5,408,121
Rails and plates, etc., for railways.....	31,357,532
	\$70,469,807
Machinery, hardware, and iron manufactures generally.....	54,965,358
	\$125,435,165

A calculation of the number of days' employment Canada has given to foreign countries by the importation in value of \$70,469,807, in the ten years I have named, of iron in its raw state and exclusive of the additional value of \$54,965,358 of machinery, hardware, and iron manufactures generally for the same period, will enable the members of this committee to more intelligently understand and appreciate the necessity—I might say the national and imperative necessity—of encouraging and fostering so valuable an iron industry and in the development of which the proprietors of the Central Ontario, most of whom are American capitalists, ask this committee, not for money aid or subsidy, but for a charter with such powers only as the general railway act of Canada provides for the protection of the public interest. Spain and Norway exported large quantities of ore to England to keep the Bessemer furnaces going. The United States imported for several years past from Spain and Africa from seven hundred thousand to eight hundred thousand tons of iron ore sawn. The latter country had invested of capital in the iron industries and manufactures in 1880, \$230,971,884, and wages were paid to her workmen same year, \$55,476,786. The United States produced in 1871, 1,911,608 tons, and consumed 3,190,573 tons; and in 1880 she produced 4,295,414 tons, and consumed 6,407,754 tons. Such facts seem to be lost sight of in Canada nearly altogether; we allow ourselves to be frightened by fear of distance, and come to the slothful man's conclusion with regard to iron making at home, while our more enterprising neighbours take the precious ore, with which we can do nothing, and carry it hundreds of miles to their furnaces, almost as far as we would have to carry the coal to ours. The mineral treasures with which Providence has endowed the Dominion are almost worthless to us, just because we have not the energy to use or the enterprise to develop their wealth. A civil engineer exclaims: Why has Canada, and especially Ontario, its richest and most populous province, hitherto failed to utilize to any large extent those vast stores of God-given wealth? Why have the bounties lavished upon us by Providence been hitherto so little used? Canada has within herself all the requirements to make her one of the largest iron producing countries in the world, and at such a cost as will defy competition. There now exists but one cause requiring removal that retards the development of iron manufacture, and that is the apathy of Canadians, an apathy the most extraordinary, affecting their vital interest, the one which must flourish for Canada to become a great nation, for iron manufacture has been rightfully termed the mother and the mistress of all other manufactures, for what is it but the rendering fit for use the raw material of all our tools and implements and machinery, without whose aid no other industry could ever exist. The Central Ontario Railway Company have purchased and paid for the right of way and they have built a railway extending north from Trenton, a distance of eighty miles to the iron fields or deposits of iron ore in the county of Hastings. They are asking the Dominion Parliament for a charter authorizing them to extend their railway further north to form a junction with the Canadian Pacific Railway. They have already embarked in the enterprise of their own money upwards of two millions of dollars. They have in addition commenced the construction of extensive docks, &c., at Weller's Bay, for the shipment of their ores into lake vessels and for the landing of coal, and having in view the establishment of extensive smelting works at an estimated cost of two hundred and fifty thousand dollars, and on which they have already disbursed over one hundred thousand dollars. In the prosecution of this work, which will be one of great public advantage in many ways, and more particularly in the development of our own mines and the encouragement of the establishment of iron smelting works, they have not received in aid of this vast enterprise from the Dominion Government, or from any of the municipalities benefited locally by its construction, any subsidy in money or in land. And they now ask that the charter now before this committee be allowed to pass without amendment, subject, however to any and all the conditions of the general railway act of the Dominion and passed for the protection of the public interest.

THE CANADIAN MINING REVIEW

IS THE ONLY EXPONENT OF THE MINING INDUSTRIES IN THE DOMINION.

THE HAYCOCK IRON MINE.

This valuable property has been the subject of several articles in the REVIEW, and at one time, within the past six months, it was generally understood that work at the mine would be resumed by a company composed of English capitalists. Negotiations have, however, not yet been completed, and, in the absence of any satisfactory explanation of the cause of delay, it has created some disquietude to those who are most deeply interested. The reports on the property made by well known experts, after careful examinations, are of a flattering character. Foremost among those experts who have reported upon the Haycock Iron Mine is Professor Chapman of Toronto, and, notwithstanding that Dr. Selwyn, Director of the Geological Survey of Canada, has undertaken to say that Professor Chapman's report is entirely misleading, such men as Mr. Birkenbine, of Philadelphia; Mr. Josiah Robbins, of Ohio; and Mr. Richard Howson, a well known Mining and Furnace Engineer of Middlesboro', England, endorse Professor Chapman's opinion that the mine is one of great value. Mr. Howson made a personal examination of the entire property a year ago, and his report, dated Middlesboro', 21st May, 1883, is a verification of the most favourable reports of Professor Chapman and Mr. Birkenbine. In concluding his report he states that he had several interviews with these gentlemen, and found them to be men of high character, and that he agrees with them that by prompt and energetic action, combined with good management, the property of the Haycock Iron and Steel Company will prove to be a source of considerable profit.

MINING NOTES.

At Smithville, Colchester County, Nova Scotia, Mr. H. Clarke has proved the existence of a valuable deposit of galena, and has been joined by Mr. D. L. Philips and Mr. D. L. V. Browne, M.E. These gentlemen will co-operate with Mr. Clarke in developing the property without loss of time. It is said that the cre-bed is of some extent, and that some of the ore carries gold and silver to the value of \$100 to the ton.

The Canada Consolidated Gold Mining Company are proceeding with mining operations on their property in Hastings County, Province of Ontario, and it is reported that the vein has much improved with recent development. More attention is now directed to the treating of the ore, and we are informed that with proper management and studied economy this property may yet be profitably worked. We will be obliged for full particulars as work progresses.

Now that the snow has nearly disappeared from the mountains, Mr. Allan is making preparations to begin mining operations at an early date on his mica location in Ottawa County. The specimens of mica brought in last autumn were of very fine quality, perfectly white and clear and of good size. The property will, it is thought, develop into one of great value.

The Huronian Mine, in Algoma District, is being actively worked, and developments have successfully proved its value. The company has a ten stamp mill in operation, and the ore is treated by free milling and concentration of the gold and silver it contains. A large force is employed in forwarding supplies for next summer's operations. The company values this property at an almost fabulous price, and the indications are that it will become a source of large revenue to the stockholders.

The Rabbit Mountain Silver Mine, also in the District of Algoma, has recently been sold to a syndicate of American capitalists, who have already begun active mining operations on an extensive scale. The sum paid for this property by the syndicate is said to have been very large, but we have not yet ascertained what the exact amount was.

LATER.—We are informed that Oliver Daunais, who lives at Prince Arthur's Landing, is in St. Paul, and has effected the sale of four mining locations at the Rabbit Mountain Mines, two of them to a syndicate for \$200,000, and the others to Chicago and Milwaukee capitalists for a like sum.

It is estimated that the deposits of anthracite coal in Pennsylvania amounted originally to 6,000,000,000 tons; of this, from the commencement of mining, 62 years ago, 499,010,887 tons have been disposed of as marketable coal, also during that period there has been wasted 998,021, 774 tons in and at the mines.

NOVA SCOTIA.

The Inspector of Mines in his annual report says that the following summary shows, so far as he has been able to learn, the mineral production of the Province of Nova Scotia during the year 1883 as compared with that of the previous year:

	1882.	1883.
Gold, ounces.....	14,107	15,446
Iron Ore, tons.....	42,135	52,410
Manganese Ore, tons.....	205	150
Copper Ore, ".....	06
*Coal raised ".....	1,365,811	1,422,553
†Gypsum ".....	133,426	144,668
†Building Stone, ".....	4,357	181
Coke made ".....	26,731	44,189
†Grindstones, &c. ".....	2,450	155
Limestone ".....	16,584	26,477

*Ton of 2,240 lbs.

†Quantities shipped. Returns not completed. Amounts used in Nova Scotia not known.

**NOTICE.**

SEALED TENDERS, addressed to the un-
dersigned, and endorsed "Tender for Indian
Supplies," will be received at this office up to
noon of THURSDAY, 1st May, 1884, for the
delivery of the usual Indian Supplies, duty
paid, in Manitoba and the North-West Terri-
tories, consisting of Flour, Bacon, Groceries,
Ammunition, Twine, Oxen, Cows, Bulls, Ag-
ricultural Implements, Tools, etc.

Forms of Tender and full particulars, rela-
tive to the Supplies required can be had by
applying to the undersigned, or to the Com-
missioner of Indian Affairs at Regina, or to
the Indian Office, Winnipeg.

Parties may tender for each description of
goods separately or for all the goods called
for to the Schedules.

Each tender must be accompanied by an
accepted Cheque of a Canadian Bank for at
least five per cent. of the amount of the ten-
ders for Manitoba, and ten per cent. of the
amount of the tenders for the North-West
Territories which will be forfeited if the party
tendering declines to enter into a contract
when called upon to do so, or if he fails to
complete the work contracted for. If the
tender be not accepted the cheque will be re-
turned.

Tenderers are required to make up and
attach to their tender the total money value
of the goods they offer to supply, or their ten-
der will not be entertained.

The tender for beef must be a separate ten-
der: if it includes any other article it will
not be considered.

The lowest or any tender not necessarily
accepted.

[No newspaper to insert without special
authority from this Department through the
Queen's Printer.]

L. VANKOUGHNET,

York.

**TENDERS.**

SEALED TENDERS marked "For Mounted
Police Provisions and Light Supplies," and
addressed to the Honourable the President of
the Privy Council, Ottawa, will be received
up to noon on THURSDAY, 1st May.

Printed forms of tender, containing full
information as to the articles and quantities
required, may be had on application at the
Department.

No tender will be received unless made on
such printed forms.

The lowest or any tender not necessarily
accepted.

Each tender must be accompanied by an
accepted Canadian Bank Cheque for an
amount equal to ten per cent. of the total
value of the articles tendered for, which will
be forfeited if the party declines to enter
into a contract when called upon to do so, or
if he fails to complete the service contracted
for. If the tender be not accepted the
cheque will be returned.

No payment will be made to newspapers
inserting this advertisement without au-
thority having been first obtained.

FRED. WHITE,
Comptroller.

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

Canada is becoming an important field for miners, and the development of her mineral resources from the Atlantic to the Pacific coasts is revealing the fact that emigration to foreign countries by Canadians who desire to engage in mining pursuits is foolish and unnecessary. If prospectors could be induced to explore the mineral bearing belts of this Dominion as carefully and assiduously as those of other countries have been prospected, they would, without question, meet with equally good success as has rewarded the searcher in any other part of the world, and, further, it capitalists in this country were less pre-

judiced against investing money in mining enterprises at home they would not be so easily persuaded to speculate in wild cat ventures in distant countries, where manipulation and scheming is unblushingly resorted to by operators over whom they can have no control. There appears to be a disinclination on the part of the wealthy men of Canada to foster and encourage the mining industries of their own country, and the consequence is that foreigners, especially Americans, are piece by piece, becoming the owners of our richest mines and mineral deposits, and the profit derived from them finds its way out of the country. For the past quarter of a century mining has been retarded by want of capital to develop the industry, and the numerous valuable deposits, long ago discovered, have been allowed to remain as nature formed them, unnoticed and untouched. When capitalists in England, on the continent of Europe and in the United States were invited to advance money for the development of our mineral resources, they, quite naturally, became skeptical as to the likelihood of such investment proving profitable, knowing, as they very well did, that there were wealthy men in the country who had money to invest in anything that would yield fair returns. These foreigners know us better now than they did some years ago, and have discovered that the cause of our mineral wealth having been so long neglected has been due to lack of enterprise on the part of those who possessed the means of developing it. In Nova Scotia the best

paying gold mines have fallen into the hands of Americans, and a large proportion of her coal area is owned and worked by foreigners. In the Province of Quebec the richest asbestos mines, with one exception, and some of the best gold mining privileges in the Beauce and Chaudiere districts are controlled by Americans, and all of our richer phosphate mines, in the same province, are owned by American and English organizations. In Eastern Ontario the gold and iron mines that are now attracting so much attention have become the properties of our enterprising neighbors, or controlled by them, and are being developed with their capital. Those copper mines on the north shore of Lake Superior that are now being worked are owned by English companies, and Silver Islet, from which millions of dollars in profit were derived, was allowed to fall into the hands of American capitalists, and they are rapidly acquiring the most valuable of the mineral locations and mines in the vicinity of the "Rabbit Mountain" and "Huronian." Further westward, at the Lake of the Woods, and beyond, in the Rocky Mountain district, Canadians have shown rather more enterprise than elsewhere, and yet, even here, they would rather sell than work the mines. In British Columbia the mines are owned and worked by people of various nationalities.

A misfortune which has long been felt in this country is that the enterprising Canadian has not the means to advance and develop our mining industries, and the capitalists have not the enterprise to come to his assist-

ance, consequently we have been, and are now depending on capital coming in from other countries, and, though it is coming freely, we require much more if justice is to be done to our mineral resources.

The lecture delivered by Dr. Dawson, of Montreal, on his Winter's geological work in Egypt and Syria, before a crowded meeting of Victoria Philosophical Institute, held at the Society of Arts House, has been printed. Diagrams of the caves and a collection of flint instruments and bones, the latter classified by Professor Boyd Dawkins, F.R.S., were exhibited. As to the Syrian caves, they afforded a remarkable evidence of being inhabited by men of splendid physique, at a time when the Mediterranean must have been a small sea and one could pass from Syria to Greece on land. Between these and the modern or Phœnician inhabitants there was evidently a break.

MINING REGULATIONS FOR THE NORTH-WEST TERRITORIES.

These regulations, published during last session of Parliament by the Dominion Government, have been the subject of much comment and correspondence in the press of the North-West since they came into force. Many of the clauses have been severely criticised and exception has been taken to the terms exacted for the securing of certain mining claims. It must be admitted as an impossibility to frame any rules and regulations that would meet the views of everybody, and it will be necessary to patiently await the result of time and experience, which will, doubtless, bring about modifications and amendments that will be acceptable to the majority at least, if not to all. Notwithstanding the many letters and newspaper articles that have been written on the subject, in not a single inst-

have we seen a suggestion offered as to what changes are desired. It would be a wise move on the part of those who are most interested in the section of country most affected by the regulations, and who have practical knowledge of such matters, if they were to meet together and formulate their complaints and forward them in a businesslike and proper manner to the Minister of the Interior, pointing out to him the objectionable clauses and the nature of the modifications wished for. Such a communication would doubtless be carefully considered by the authorities at Ottawa and acted on.

DISTINGUISHED VISITORS.

Vice-Regal Excursion

TO THE

RIVIERE DU LIEVRE PHOSPHATE DISTRICTS.

On Monday morning, the 12th inst., His Excellency the Governor-General and suite, accompanied by Dr. J. A. Grant, left the Union Station, Ottawa, on the 8.30 train for Buckingham, and on arrival there found carriages awaiting them to convey the party to the village. Without loss of time they proceeded to the wharf on the Riviere du Lievre, where the *Rocket* was in readiness to receive the distinguished passengers.

Shortly afterwards the tidy little steam yacht, owned by Mr. W. A. Allan, of Ottawa, and used by him in connection with his phosphate mining, steamed off on her journey up the river.

The weather, fortunately, was all that could be desired for such an auspicious occasion, and all being in the best of spirits the voyage was indeed an enjoyable one. The natural beauties of the winding river, with its bold and wild scenery, gained frequent bursts of admiration from the entire party. Indeed, with every turn or bend in the river, a new vista was opened up, the effect being quite panoramic.

As the little craft sped on up the stream, time seemed to fly, and soon a point was reached where the miners were at work, and here the occasional blasts had a curious meaning, sounding indeed as a royal salute, though we are not prepared to say we actually counted 21 explosions. Though told that dynamite

was used in this district, it did not appear at all to terrify the guests of the day.

As the yacht crept up the river still higher the scenery became more imposing, and when High Falls appeared in sight, only those who have been fortunate enough to have seen them, can well imagine how His Excellency and party were impressed.

Here a delay was made in order to allow the tourists ample opportunity of viewing the Falls and admiring the whole scenery, here so grand. The *Rocket* was started on her return trip, and with the current, seemed to fly down the river. In due time Buckingham was reached and the party proceeded to Ottawa by C.P.R. train, arriving at the station at 6.30 p.m.

His Excellency and party thoroughly enjoyed the trip, and were loud in their expressions of gratitude to all those who were instrumental in rendering the whole day such a delightful one, and the object of the trip so successful. We are quite sure it will be long remembered.

Mr. Baker, Superintendent of the C.P.R., kindly placed the President's private car at the disposal of His Excellency for the occasion, and provided a special train from Buckingham.

Mr. McLaren and Mr. Benardin, of Buckingham, very kindly provided the carriages used to convey the party to and from the Buckingham station.

Mr. G. Smith, Manager of Mr. Allan's *Rapids* Mine, acted as skipper of the *Rocket* on the auspicious occasion. His Excellency's only regret was that time did not permit of his landing at some point on the river and witnessing some of the phosphate mines in actual operation. A second trip with such an object in view will be a pleasant anticipation.

Mr. Childers, of the British House of Commons, has computed the gold coinage of England, since 1817, at £300,000,000.

Gold was first discovered in California in 1848, and during the eight years following, that State and the colony of Australia sent \$800,000,000 in gold to Europe.

During the past fiscal year Canada imported coal and coke valued at \$6,389,804 and manufactures of iron and steel to the value of \$13,714,636, the largest items in her imports.

THE ROYAL SOCIETY OF CANADA.

Some Interesting Papers Read at the Recent Meeting.

This Society, founded by the Marquis of Lorne, held its third meeting at Ottawa during the present month. Some of the prominent members who were unable to be present forwarded papers which were read during the meeting, and a large number of contributions came from outside sources.

The Marquis of Lansdowne accepted the position of patron and honorary president, and the officers elected for the ensuing year were as follows:—President, Dr. T. Sterry Hunt; Vice-President, Dr. D. Wilson; Honorary Secretary, John George Bourinot (re-elected); Honorary Treasurer, Dr. J. A. Grant (re-elected).

Dr. T. Sterry Hunt read an interesting paper, "The origin of Crystalline Rocks." He remarked that the problem of the origin of those rocks, both stratified and unstratified, which are made up chiefly of crystalline silicates, is essentially a chemical one, and traced their origin, elements and processes of decay and disintegration.

Professor E. J. Chapman laid two papers on the table, "Contributions to our knowledge of the Iron Ores of Ontario," and "Some deposits of Titaniferous Iron Ores in the Counties of Haliburton and Hastings." Some portions of these papers corroborated many of the statements made in a *continued* article in the *January, February* and *March* numbers of the *REVIEW* entitled "The Iron Deposits of Central Canada."

A paper of Mr. Edwin Gilpin, of Halifax, "The Manganese Ores of Nova Scotia," was read, in which the author, after remarking on the localities yielding the more common variety of manganese ore, takes up the best known of the manganese ores, *prolusite*. He states that Hants, Pictou, Colchester and Cape Breton Counties seem to yield it most abundantly, and minutely describes its occurrence at Panny Cape. The writer also gives analyses of the ores of these localities as well as of those of the Cape Breton and Magdalen Island deposits.

As the result of his surveys and investigations, Mr. Gilpin gives it as his opinion that the manganese ores of Nova Scotia occur low down in the carboniferous limestone, below the gypsum deposits characterizing that horizon, and that they are

connected with limestones frequently manganiferous and usually so magnesian as to approach dolomites in composition, and submits several analyses of these limestones. The paper forms the first detailed description of the manganese ores of Nova Scotia, which are of unusual purity, and is of practical value to those engaged in mining them, as the writer points out the geological horizon carrying them most abundantly.

NORTH CAROLINA PHOSPHATE.

Much importance is now being attached to the comparatively recent discoveries of phosphate rock in North Carolina, and, notwithstanding the low grade of the mineral itself and the peculiar nature of the beds, as compared with our Canadian apatite deposits, these discoveries are looked upon as of the greatest value to that State. The *New York Engineering and Mining Journal*, quoting from a report of Dr. Charles W. Dabney, Jr., Doctor of the Agricultural Experiment Station at Raleigh, says: "Dr. Dabney states that the phosphatic rock is found in two different relations in this field, the lower country yielding worn nodules imbedded in comminuted shells, forming a conglomerate; while in the upper country it is found in larger nodules, cakes, or slabs imbedded in sand. In the former district, the conglomerate crops out in places, while in other localities it is covered by limestone, the thickness of the phosphatic bed reaching four feet. Analyses of samples of the nodules yielded from 14 to 42 per cent. of phosphate of lime, equivalent to about from 6.25 to 19.25 per cent. of phosphoric acid. It has been suggested that a good plan to treat the conglomerate rock would be to burn it, so as to slack the lime and thus reduce it to powder, while the nodules remain comparatively unaffected, so that they can be screened out. In the up-country, embracing Sampson, Duplin, and Onslow counties, the rock, which occurs in a horizontal bed from 6 to 20 inches thick, is covered by marl and sand sometimes to the depth of 20 feet. This rock yields, according to a number of analyses made, from 32.5 to 50.5 per cent. of phosphate of lime. From a test pit near Warsaw, three-quarters of a mile from the railroad, 46 tons of workable phosphate, running nearly 40

per cent., were taken from 0.11 acre, or at the rate of 418 tons an acre, at a cost of only \$3 a ton on cars, in spite of necessarily crude arrangements. A portion of the rock was experimented with at the works of the Navasse Guano Company, and it was found that 1000 pound charges required only from 600 to 650 pounds of acid, as compared with 900 pounds for South Carolina phosphate, the product containing from 10.78 to 11.63 per cent. of soluble phosphoric acid, from none to 0.67 per cent. of reverted phosphoric acid, and up to 1.35 per cent. of insoluble phosphoric acid. The crude rock treated was not even thoroughly treated. These results are certainly very gratifying, and give promise of the development of an industry very important to North Carolina, and are highly creditable to the vigilance and enterprise of those in charge of the Experiment Station."

When it is considered how vast are the apatite deposits in Canada, and how low is the cost of mining, together with the fact that the mineral will assay 80 to 85 per cent., in cargo lots, if carefully pressed, compared with 32.5 to 0.5 per cent. as above, increased demand for phosphate locations is not to be wondered at.

PHOSPHATE MINING IN OTTAWA COUNTY.

At the mines east of the Gatineau and on the east and west sides of the Riviere du Lievre, operations are going ahead with more than ordinary activity, and mineral is being raised in great quantity. During the past year important improvements have been made on any of the locations in the form of comfortable and substantial buildings, erected for the accommodation of the miners, suitable stables, blacksmith shops, engine houses, and neat cottages, the latter being occupied by the managers of the mines as dwellings and offices. Steam drills, hoists and pumps are now in use where a year ago all work was done by hand power. Ramways have been laid from the mines to the dumping grounds, over which the ore and waste can be readily removed in cars which now take the place of wheelbarrows that were used a year ago; good summer roads are graded from the mines to the Riviere du Lievre which afford facilities for forwarding the ore during the summer to the river bank, from whence it is carried in scows to Buckingham and there transhipped and forwarded to the point of shipment. Formerly it was necessary to allow the ore to accumulate at the mines

until such time as winter transportation should be rendered practicable. All of these changes have taken place during one short year, it may be said, and are due to the introduction of capital, practical ability and an element of enterprise, which have given an impetus to the industry and supplied a want long felt in the district. It is now less expensive to raise the ore, the output is rapidly increasing and the cost of transportation has been materially reduced. In short, the phosphate mining industry of Ottawa County has a most promising future, and was never in such a flourishing condition as it is to-day.

THE MINES.

In the Township of Portland, West, the *High Rock* mine, the property of the Phosphate of Lime Company, and the Union Phosphate Mining and Land Company's *Star Hill* mine are each giving employment to a large force of miners, and phosphate is coming to the surface in large quantity. So much has already been said of these mines in the REVIEW that their value must be well known. They are thoroughly equipped and well managed.

In the Township of Portland East, the *North Star* mine, owned by the Dominion Phosphate Company, has much improved during the past few months and an abundance of high grade ore is daily raised, mining operations are systematically conducted, and the mine is supplied with every facility for carrying on work to advantage. Last year's output from this property is now being shipped to Hamburg, and there is no doubt the whole will return 84 per cent. The ore has been carefully dressed and is of a high grade.

The *Rapids* mine, owned by Mr. W. A. Allan, has been put in good shape during the past few months by Mr. George Smith, Mr. Allan's manager, and a quantity of very fine ore has been piled up. Actual mining on this property has been retarded by a delay in getting the machinery on the ground. It has been recently delivered, however, and is now in course of erection, and when this has been completed, active operations will be proceeded with.

The *Lansdowne*, adjoining the *Emerald*, now the property of the Dominion Phosphate Company, is being thoroughly prospected under the personal supervision of Mr. W. H. Smith, the company's manager, and many valuable deposits have already been exposed. On the west side of the property, facing the Riviere du Lievre, a large body of ore has been uncovered, and the indications are that it will prove to be of vast extent. The company is to be congratulated on its purchase of this location.

In the Township of Buckingham the *Emerald*, belonging to the Ottawa Phosphate Company, is the pride of the County. The mine itself appears to be in a body of phosphate, the extent of which has not yet been defined, capable of yielding many thousand tons annually for years to come. The mining captain in charge is a man of wide experience, as his work has shown, and Mr. S. P. Franchot, the genial business manager, and one of the directors of the company, has so systematized each department that everything goes ahead apace without hindrance and like clock work.

The force employed at the mines above mentioned and the daily output of each has not varied since our last report.

In the Townships of Templeton and Wakefield the mines are producing a large quantity of mineral, and preparations are being made to open new ground almost immediately.

TRANSPORTATION OF ORE.

From the *High Rock*, the *Star Hill*, and the *Emerald* mines, phosphate is being forwarded daily to the points of shipment, and the large piles which have accumulated at the railway stations and at points on the Ottawa River since the close of navigation last year are being reduced by shipments to Montreal, by rail and barge, respectively; from which port the ore will be forwarded across the Atlantic.

Phosphate Quotations.

The market continues dull and buyers are not offering such liberal prices as producers have been looking for. Nevertheless several sales have been recently reported at prices in lots that will establish a price for this season's shipments at one shilling a unit for 70 per cent. mineral, with one-fifth of a penny rise. For those who ship direct this, with the ruling low rates of freight, is quite equal to 1s. 3d. per unit for 80 per cent. with freight at past years' rates.

FREIGHTS.

Owing to the scarcity of outgoing freights this season the phosphate shippers are deriving the benefit of unusually low rates. For some seasons past the rates have ruled at from ten to fifteen shillings, from Montreal to Liverpool. Shipowners are now offering tonnage to Liverpool and London by steamship at from three to six shillings.

At Tunora, New South Wales, a gold nugget was recently found which weighed 183 ounces and was valued at about \$3,300.

APPOINTMENT OF A SUPERINTENDENT OF MINES IN THE NORTH-WEST TERRITORIES.

Owing to the threatened influx of prospectors and miners to the mineral sections of the Rockies, and the probable impetus it will give to mining in that district, the Government has appointed a Superintendent of mines, and we understand that Mr. W. Pearce, Inspector of Dominion Land Agencies, has been selected for that position. The Superintendent of mines, under the new mining regulations, will be vested with authority to adjudicate all disputes that may arise among mine owners and will have a general supervision over all mineral locations.

MICA MINING IN CANADA.

During the past year some important discoveries of this valuable mineral have been made in Eastern Ontario and in Ottawa County, Province of Quebec. In the township of Loughboro' mining has been started on a property that, it is said, will yield fair merchantable mica. Mr. Allan's mine in Burgess has turned out a large amount, some of which has been cut into plates 10x6, and the mine is capable of yielding an almost unlimited quantity. The output of the mine is being regularly shipped to the American market and to dealers in Canada. Mr. Allan has some men engaged in opening up a property in Ottawa county, discovered late last autumn, which promises to develop into a mine of great value. The crystals are large and the quality of the mica is equal to any that has ever been mined in North Carolina or New Hampshire.

Phosphate of lime (apatite) was first discovered in Burgess, Ontario, in 1847. In 1860 the first shipment of the mineral was made, amounting to about 100 tons.

The earliest discovery of apatite in the County of Ottawa, was made in 1829, by Lieut. Ingall of the 15th Regiment, while engaged in certain geological explorations. Mining operations were not engaged in until 1873.

The entire phosphate beds of South Carolina, so far as discovered and defined, have been estimated to cover an area of 240,000 acres; it was not known that the rock possessed any commercial value until the year 1865.

Mineral Wealth North of Lake Superior.

A correspondent of the *Chicago Mining Review* has recently written a letter to that journal under the above heading, and, at the request of some of our subscribers in the West, we take pleasure in re-printing it, as follows:—

"PORT ARTHUR, ONT.—The successful working of the Huronian Mining Company's gold and silver mine at Jack Fish Lake; the continuous production of both high and low grade ore at that mine; the satisfactory tests by its own mill, and the elaborate preparations for the continued working of both mine and mill in the future on a large scale, the recent purchase by the Vice-President of that company of the two adjoining localities, one on either side on the same lode, equally promising, for a large sum of money, the very recent developments at the Rabbit Mountain silver mine which showed it wonderfully rich and which produced many large nuggets of silver, some weighing as much as six pounds, the shipment of a car-load of \$645 per ton surface ore taken from the first ten feet of the shaft as it came, without selection, the agreements for the sales of the mines comprising four one hundred and sixty acre locations on that lode to two American syndicates for \$400,000, and of 96 T., another 160 acre location on another vein in the vicinity, for \$60,000, to an American capitalist, and of 97 T., of similar size on still another vein in the neighborhood, for \$60,000 to another American capitalist, the negotiations in progress for the purchase of other properties in that region of country, the arrangements made for active work on the opening of navigation by a strong Canadian company, at the Partridge Lake gold mines, the refusal of \$20,000 offered for the Slate River mine, the arrangements being made for the Laurentian Mining Company to commence explorations on their gold, silver, copper and other mining properties in this district, the organization of a new, strong company to handle the old Thunder Bay Mining Company's extensive properties, the developments made by Mr. Hasting in the silver slates on the north side of the Traministiguia River, the continued large workings of the copper mines at Michipicoten and Mamainse and the explorations being made at various points along the lake coast, are facts among the results of the winter's work which can now be pointed to with satisfaction as bringing into prominence the North Shore of Lake Superior as a desirable and convenient mining field.

And why should this not be so? The above references are practical instances of accomplished facts. Let us examine further. Enough has appeared in the columns of the *Mining Review* of the geology of the country, to show that in this mining field we are surrounded by the mineral-bearing rocks so highly prized by the miner and which ought to produce the economic minerals in paying quantities. Enough has also appeared to establish the fact that these rocks are traversed by many dykes and numerous true veins. The instances which have been given of the mineral-bearing qualities of some of these veins are genuine evidences of their value, and they point to the advisability of their further development and to the advisability of further explorations to find and locate others. A very small portion of the country has been explored, and yet some very valuable mines have been discovered. Are there not others just as good? Believing as we do in the old saying that "there are as good fish in the sea as ever were caught," may we not expect by applying the fisherman's doctrine to mines, to hear of other discoveries of equal and perchance of greater value, as the explorers get over the ground? There is a great field for practical explorers, but in this country they require some capital.

The mineral bearing country extends a long distance. The varieties of minerals to be found are numerous. The Indians, who know the country best, could, if they would, point out many valuable mines but they have a superstition on this subject and as a rule they will not divulge what they know. It is a well-known fact, however, that the best mines on the main land have been pointed out by Indians. Notable among these are the Huronian, the Rabbit Mountain, the Partridge Lake, and the Zinc mines. The Christian and better civilized Indians can sometimes be prevailed upon for a consideration to show a mine, but they will more often deceive and disappoint an explorer, occasionally in consequence of their greed, but more generally on account of their fear.

The Indians in their time have been badly fooled by the white men. Extravagant promises have been made them which have never been fulfilled, or when promises made have been partly fulfilled their bounty has been purloined from them. Great and often unnatural mining stories frequently come from far off lands, and by some people are believed. It is more difficult for capitalists and every class of men to realize that such treasures as are to be found in this district are so near and convenient to their homes. If the stories were told which could be told of this region of country they would not be believed because they did not come from some fanciful distant El Dorado, and yet probably finer specimens of gold bearing quartz, native silver and silver ore, besides copper and copper ore,

iron ore, galena, zinc blende and baryta, have come from this district than from any other on the American Continent, if we except the native copper specimens of the South Shore. Finer *free* gold specimens may be shown from other mining fields, but we challenge comparison with the rich sylvanite ore which the Huronian mine produces. The sylvanite ore of this mine is one of the rarest and most valuable minerals known to miners. The free gold specimens from the Partridge Lake mine taken to the Centennial Exhibition compare favorably with those of any country. The native silver which was taken from Silver Islet cannot be excelled by any mine's production. We doubt if any silver mines ever surpassed in richness the nuggets of the black sulphide of silver which came from the Rabbit Mountain mine and the mines we have referred to in that neighborhood. Our copper ore was thought worthy for the Paris Exposition. Our specular iron ore has not been surpassed to our knowledge, and a man would have to go far to find finer specimens of galena than have been found in this district. We know of no better zinc blende ore on the American Continent than is to be found here, nor have we seen in the manufactories where baryta is used such specimens as can be procured from our veins. These instances are of known deposits. As to the unknown, it is no new story in this district when an Indian speaks of a mountain of iron, or vein of silver from which he can cut silver bullets for his rifle, but it is another thing to get him to show it. Our few mining men are old soldiers in mining discipline and have been "under fire." They do not easily get excited. They have been accustomed to seeing and handling both the precious and base metals, and mineral bearing veins do not unnecessarily excite them. Hence it is that the country is not subjected to a wild and extravagant excitement. That period has passed over this district and it is fortunate that it has, because we are now getting down to solid, practical work, and beginning to compare the size of our veins with those of other countries, to estimate the cost of mining by the ton, and to calculate the value of our yield by large mill tests. We can afford to let the raw recruits of the army of mining speculators go to the Rockies or other distant lands where the first discoveries of the precious metals create undue excitement, and a rush of fortune seekers who know not a true fissure from a gash vein, or the average value of a lode when found, or the proper methods and cost of working the different kinds of ore. This district has had all that excitement. What we now need is more practical mining men and capital to make productive our veins of low grade ore. It has been in the past the misfortune of this district that several promising properties have been held by speculators or land owners who neither know the real value of their holdings, nor would take the necessary steps to ascertain it. But now parties who have been holding properties expecting others to make them valuable by developments in their neighborhood, are awakening to the knowledge of the fact that as every tub must stand on its own bottom, so must every mining venture, and that therefore some development is essential to every mining property having any promise. The time for selling a mine in this district on a pocket specimen has passed away, and men are not now so easily misled by assays. If people are inclined to compare this country with those from whence come stories of new fields of silver ore assaying from ten to fifteen thousand dollars per ton, we can point them to the mines in the Rabbit Mountain district, and to many veins from which assay samples can be had which will far exceed that by having only a rich nugget specimen assayed.

We have seen in the public press statements that new gold discoveries have been made where the ore assays from twenty to thirty thousand dollars per ton. It would be an easy matter to get assay samples from either the Huronian or Partridge Lake mines, which would assay over one hundred thousand dollars per ton. Yet instances like these are no indications of the value of the lodes. The Huronian mine is a reliable steady producer. It is a large well defined lode with clean cut walls, having the gold evenly disseminated throughout the veinstone. Its average mill work does not yield over \$35 per ton, yet it is considered a most valuable mine. Dr. Selwyn, the Director of the Geological Survey of Canada, visited it last summer and pronounced it, in reporting to his government, the most promising mining venture of the district. It is but fair to say, however, that although at that time he had visited the Rabbit Mountain mine he had no opportunity of expressing his opinion on the more recent developments made at it and on the other veins in that region. The car load of surface ore from the Rabbit Mountain mine recently shipped, averaged to the smelters in Newark, N. J., and realized to the owners, \$645.41 per ton. This speaks volumes for this mine, especially when it is known that ore averaging \$10 per ton from its large vein, if concentrated and treated on the spot would pay handsomely. The 96 T. and 97 T. veins are equally promising, although not quite so large. They have each produced ore assaying over \$250 per ton. The instances given of other veins in former articles which appeared in the *Mining Review* have resulted in enquiries being made about them from various practical and experienced quarters, thus demonstrating that this country is beginning to possess the attractions of a legitimate and profitable mining field. Other instances could be given, but those which have been mentioned are

sufficient to invite curiosity and bring the country into notice. Every mining venture in this district cannot be expected to be a success, but the ones referred to are very likely to be. It is a wonder that a country so conveniently situated to the markets for bullion and base metals, and possessing such an admirable mining law, where land not already taken up can be purchased from the Government by either a citizen or a foreigner for \$1 per acre, where there are no royalties or other crown dues on the minerals, where labor is so cheap, mining timber and water so abundant, and where the climate is so healthy and invigorating, should have remained so long but partially explored and almost wholly undeveloped."

The "Huronian" Mine, at Jack Fish Lake, is owned chiefly by gentlemen of Ottawa. (Ed. C.M.R.)

CANADA CONSOLIDATED GOLD MINE.

This property is situated in the County of Hastings, Province of Ontario, and has been the subject of frequent enquiry for some time past by people who are more or less inquisitive as to its industrial condition. The opinions which have been expressed by Mineralogists, Mining Engineers and other scientific men would lead to the conclusion that the mine is capable of producing ore in abundance, carrying gold in paying quantities, but, strange to say, although an incredible amount of money has been expended on its development and equipment the property has been a source of heavy loss to its owners. Some months ago the company leased the mine to a syndicate who have ever since been working it at a loss, and who are naturally enough becoming dissatisfied with the results, and it is therefore not unlikely that a change will take place in the near future and work will be proceeded with under some new organization. The true secret of the trouble, up to the present time, has been mismanagement, for, although there is abundance of ore that, as scientific men have invariably pronounced, can be profitably worked, those who have conducted operations have failed to realize any profit. Recently the monthly expenditure has reached \$7,000 and the returns \$4,000, shewing a monthly loss of \$3,000, and it is to be supposed that the present lessees are incapable of overcoming the difficulty. During the present month Mr. Eugene Coste, M.E., a graduate of the National School of Mines, Paris, and a gentleman of recognized ability, visited this mine and, on his return to Ottawa, expressed himself very favourably impressed with the property as regards the amount of ore that can be mined. Mr. Coste has given it as his opinion that the mine is a very valuable one, capable of yielding gold in paying quantity, but that up to the present time a proper method for treating the ore has not yet been adopted. He has returned to Hastings to further investigate the mines in the district for the Geological Survey, and while in the neighborhood it is to be hoped he will find an opportunity to visit the Canada Consolidated and offer to those in charge such advice as his scientific knowledge and experience may suggest.

GOLD MINING IN NOVA SCOTIA.

The total yield of gold for the year 1883, according to the official report of the Department of Mines, was 15,446 oz., 9 dwts., 23 grs., being, with the exception of the year 1877, the largest return since the year 1871, when a production of 19,227 oz. was recorded. In the year 1865 there were 24,423 tons of quartz crushed, yielding 25,454 oz., 4 dwts., 8 grs., equivalent to 1 oz., 20 grs. per ton, the average earnings per man amounting to \$2.15 per day; whereas, during the past year, there were 25,954 tons of quartz crushed, which returned 15,446 oz., 9 dwts., 23 grs. of gold, equivalent to but 10 grs., 21 dwts. to the ton, while the average earnings per man amounted to \$2.84 per day, showing that, while the quartz mined in 1865 was one hundred per cent richer in gold than that mined during 1883, the men employed during the past year actually earned more money individually for the owners of the mines. This is, of course, attributable to the increased facilities for mining and treating the quartz advantageously and to the value of experience. The richest returns last year were made by the Gallagher Gold Mining Company, in Stormont, and the Oxford Gold Mining Company at Chezetcook; the former extracted 1,917 ounces from 551 tons of quartz; and the latter 2,494 oz., 5 dwts. from 1,475 tons of quartz, an average yield of 1 oz., 13 dwts., 10 grs.

The result of last year's operations in the gold districts of the Province goes to show that by employing suitable mining plant and machinery best adapted to treating the ore, and by studying economy in the management of mining and milling, the numerous mines of Nova Scotia can be made to yield profitably.

The stock of the Calumet and Hecla Mining Company has declined to \$172 per share.

The first discovery of gold in Hastings County, Ontario, was made by Mr. C. Robb, M.E., in 1864, while engaged in a mineral exploration for the Canada Company. The specimens were assayed by Dr. A. A. Hayes, of Boston, Mass.

NOVA SCOTIA MINING NOTES.

In the matter of the Salmon River Gold Mine entitled on the docket *Manley & Fielding vs. Mott et al*, Judge Thompson last week gave judgment in favor of the defendants, thus confirming them in possession of this valuable property. It is rumored that the plaintiffs intend taking out an appeal, but the general opinion among mining men is that the matter had better be allowed to rest as it is. There is a feeling that this decision will benefit our mining interests by putting mining claims on a more secure basis than heretofore, and that thus investors from abroad will be more ready to put their money into our mines.

The Salmon River Gold Mining Company of Nova Scotia has just added eight more stamps to its mill, increasing the number now running to forty-three stamps. This company started about three years ago with five stamps, and has been steadily increasing its crushing power as the mine has developed. The main vein is from 2½ to 9 feet in width, and mills from \$10 to \$100 per ton; the cost of mining and milling is \$2.50 per ton. All machinery is driven by water power.

Some five years since a prospector discovered in the Cariboo district, Moose River, a number of boulders that gave indications of coming from some rich lode in the vicinity. He proposed calling the lode, when it should be discovered, the Lake lode. Search has been carried on more or less vigorously, but persistently, during the intervening period but without success, till a few days since when it was found. The surface indications are that it will yield at least two ounces to the ton of ore.

Mr. William Bruce, the lessee of Mr. Torquay's mine at Moose River, Cariboo, came to Halifax on Monday, May 12th, bringing with him a brick of gold from that mine weighing 49 ounces and valued at \$930. It was the result of the work of seven men during April, and was extracted from about 60 tons of ore. —*Halifax New Era*.

Promising gold discoveries have been recently made in Hants County, N.S. A gentleman was in Ottawa not long since and exhibited some very handsome specimens of quartz which he had brought with him from the district.

A recent examination of the Coxheath ore (copper) by a New York mineral expert has led him to make a most favorable report to the company.

Holt City is said to be the headquarters for the Rocky Mountain prospectors, and parties are daily leaving there for the mineral districts. Others are organizing, and the mining fever is at its height.

GENERAL MINING NOTES.

The main shaft at the "Pine Portage" mine, Lake of the Woods, has reached a depth of about 70 feet, and a six stamp mill is at work. The quartz is yielding gold in paying quantity.

It is reported that in the vicinity of Silver City, N.W.T., there are excellent indications of alluvial gold and that placer mining will, in all probability, be proceeded with vigorously.

From 1858 to the close of 1883 the province of British Columbia produced \$47,935,963 in gold. In 1864 the yield was \$3,735,850, the highest in one year since gold was discovered in the province, while the lowest yield was that of 1883, which only reached \$794,252.

We have not received our monthly report from the Beauce gold mines, but were pleased to learn from a gentleman who was in Ottawa recently and had just come from the district that work was progressing satisfactorily and that the mines in operation were paying handsomely.

Mining operations at the Lake of the Woods are at a standstill. This district is rich in ore, and would compare favorably with some of the best known mineral regions of the United States, but owing to the lack of the necessary capital miners have been unable to work their claims continuously or to advantage.

A telegraph despatch from Winnipeg states that samples of silver ore from the Rabbitt Mountain mine have been received at the C. P. R. Land Commissioner's Office. The largest specimen contains, according to the assay, \$10 worth of silver, and would yield \$4,600 per ton. The silver is mixed with 13 per cent. of sulphur. There are also specimens of silver-bearing rock which would yield \$3,600 per ton.

Sierra Nevada Gold and Silver Mine.

An interesting illustration of how the value of mining stocks in the United States has been affected by manipulation is contained in an article which has appeared in the *New York Mining Record* as follows:—

"In September, 1879, the stock of this company (Sierra Nevada) was sold up to \$270 per share and at prices ranging between \$68 and \$270.

no less than 53,644 shares changed hands. During the following month as many as 28,613 shares were sold at prices descending from \$260 to \$135, while during November, 1879, as many as 161,052 shares were sold in San Francisco at prices ranging between \$200 and \$38. During May the same year the same stock had sold as low as \$2.75, and 49,715 shares had changed owners at prices ranging between that and \$5, while during July, 1879, as many as 157,703 shares had sold for prices ranging between \$5.12 and \$11.12, and during August sales were made as low as at \$10.87. This appreciation of the stock within forty or fifty days of \$259.13 per share was manipulated in a manner and by means and methods the immorality, or rather criminality, of which was greater or more harmful, under every aspect, than the acts of the highwayman or of the burglar; for at bottom, the appreciation of the price of the stock in a few weeks of some \$250 per share which was known to be valueless to those who effected the appreciation was as much a planned robbery of those duped into the purchase as if the same men had conspired to acquire the same money by the robbery of the several banks in which it may have been deposited immediately previous to being withdrawn for payment for Sierra Nevada stock during September, 1879.

Be this as it may, since September 1879, when the stock was thus inflated by carefully contrived false representations, reports of an uncovered bonanza—not as much as \$250,000 have been extracted (during 1880 and 1881) from the mine in gold and silver while no less than \$2,150,000 have been extracted from the pockets of the stockholders upon the pretext of searching for the bonanza which, we repeat, was asserted positively to have been found at least as early as the middle of September, 1879. Under such circumstances we can imagine nothing more fatuous, nothing more unjustifiable, than the further expenditure of one cent of money in the hunt for ore at any such depth as 3,100 feet. No fact can be more unquestionable than this, that at no time since 'labor's thousand arms of sinew and of metal all-conquering' have been wisely exploring the recesses of all parts of the earth for gold and silver, no amount of either metal worthy of note has been taken from below 2,000 feet; and for that matter, the greater part of both as yet won from the earth, have come from a depth above 1,000 feet."

PERSONALS.

Mr. S. P. Franchot, a Director of the Ottawa Phosphate Company, has recently returned from New York, after an absence of nearly three weeks, and is now attending to the Company's interests at their famous *Emerald* mine.

Mr. Pickford, President of the Phosphate of Lime Company, London, England, was in Ottawa during the month, en route to the Company's *High Rock* mine in the Township of Portland West. Great changes have taken place in this phosphate mining district since Mr. Pickford's last visit to Canada.

Mr. W. H. Williams, President of the Union Phosphate Mining and Land Company, was in Ottawa in the early part of May and proceeded to the Company's property in Portland West. Mr. Williams had not long returned from England, having gone there to dispose of last year's output of the mines.

Mr. F. J. Falding, of New York, who has for some time been identified with Canada's phosphate industry, returned to Ottawa during the month, after an extended trip through the phosphate district. He gave it as his opinion that the mines were never looking more promising than at the present time.

PROTECTING IRON ORE

IN THE UNITED STATES

In connection with the effort that has been made by the iron manufacturers of the United States to have foreign ore placed on the free list, in opposition to the wishes of the ore producers, the *N. Y. Mining Record*, in a late issue has the following:—

"Perhaps there is no man in this country more thoroughly conversant with the needs of the iron mining industry than Hon. Geo. H. Ely, of Cleveland, who was invited to make an argument in behalf of that interest before the Ways and Means Committee of the House. His views on the Morrison tariff bill, which proposes putting iron ore on the free list, are given below, as expressed to a correspondent of one of the Cleveland papers:—

"I consider that such an abolition of the duty would irreparably injure the very extensive, intimately connected, and interdependent industries now based on the Lake Superior iron ore production. Morrison considers iron ore raw material. So it is, dormant in the mine, but the moment you apply labour and capital to it, it is a product of industry as much entitled to protection as steel rails or woollen goods. The Marquette and Menominee districts alone have \$51,000,000 employed in mining ore, and both districts support 50,000 people, and the capital employed in railroads and steamers for transporting ore to our furnaces and mills amounts to over \$30,000,000 more. American miners receive over two dollars per day; Spanish miners forty-five cents. To place foreign ore on the free list would be to strike a blow at American labour and American industries. The United States contains every variety of iron ore, favourably distributed and in inexhaustible quantities.

American labour and American capital should be protected in the process of utilizing these enormous values, which otherwise would be useless under our soil. Of course it would be supreme folly to depend on any foreign nation in the remotest degree for a product lying at the basis of American iron and steel industries, now so large as to almost control the industrial and financial affairs of our country. The North-West and Cleveland should be alive to the threatened disaster."

Cost of Producing Pig Iron.

The *Iron Trade Review*, of Cleveland, O., quoting from a letter of Mr. J. B. Moorhead to the Ways and Means Committee, of Washington, and from Mr. Joseph D. Weeks' series of articles, which appeared in the *Philadelphia Press*, has drawn some interesting comparisons concerning the cost of producing

pig iron in the Cleveland district of England and in the Lehigh Valley of Pennsylvania, as follows:—

Raw Material.	England	Lehigh Valley.
Ore	\$4 09	\$9 10
Coke and Coal.	3 20	5 50
Limestone	45	1 00
Labour, Running Repairs, etc.	2 25	2 70
Total cost per ton..	\$9 99	\$18 30

And adds that probably the divergence in the above figures would be still greater were the items of renewal of plant and interest on investment added to the totals. It should be remembered, however, that there are other localities in this country more favourably located for iron manufacture than the Lehigh region; nevertheless the fact remains that, because of cheap labour and exceptionally favourable facilities, English manufacturers stand as a constant menace to the iron furnaces east of the Alleghanies.

For the information of those of our readers who have invested in U.S. Mining Stocks we publish the following:

ASSESSMENT DIRECTORY.

(N.Y. Mining Record.)

This table is prepared from the official advertisements published by the organ of the San Francisco Stock Exchange.

[Stocks are sold in New York with assessments paid fifteen days anterior to the date of delinquency at office of the Company, as given in the table below.]

159 LA SALLE St. Chicago, Ill., U.S.A.

TENDERS.
COAL.

Are requested for the undermentioned description of coal, to be supplied for the use of Government House, Ottawa,

Tons
Bituminous or soft coal, per ton of 2,000 lbs. 206
Anthracite, hard do. 180

Samples of each coal, and each size of hard coal, with the name of the mine, to be sent in with tender. This coal before acceptance to be screened, either at the Wharf or Railway Station, in the city of Ottawa, through a 2 inch screen, at the expense of the contractor.

The screenings and dross will neither be accepted nor purchased, and must be removed, if on any Government property, within the week from date of screening.

The probable quantities will be:

Tons
Hard coal, size 180
Bituminous coal, size 2.6

The contractor, for any or all of the above mentioned kinds or descriptions of coal, to state his price delivered in the coal sheds at Rideau Hall grounds, or such other premises within the city of Ottawa, or Village of New Edinburgh, as may later be pointed out.

The contractor to deliver before 1st August next the whole quantity of both hard and soft coal contracted for. Any delay in the delivery of the same after the above date, will subject the contractor to a penalty of 10 cents per ton for each day's delay, which sum will be deducted from final estimate.

All coal to be free from rubbish or dirt and to be weighed, at the expense of the contractor, in the presence of Mr. Wm. Hutchison, Clerk of Works, Rideau Hall, on such scales as will be named at time of delivery. All coal will also be subject to inspection of Mr. Hutchison, and must be approved of by him before acceptance.

If the quantity and quality is not in accordance with the terms of the contract and quality is not equal to sample, the Governor-General's Secretary shall have power to cancel and annul the same, and reject or grant the contract, or any part thereof, to another party, at the expense of the contractor, and this without previous notice, protest, advertisement or suit at law; nor shall the contractor be thereby entitled to any compensation, indemnity or damage whatever, but will be subject to pay and reimburse the Governor-General's Secretary any extra sum or sums paid out over and above contract agreed on: this to be recovered by usual course of law, if led to.

Separate tenders will be received for hard and soft coal.

All tenders will be considered as Customs duties paid by contractors as no "free entry" will be entertained.

The name of the party or parties tendering with their address in full, must be attached to the tender.

Each tender for coal to be accompanied by an accepted bank cheque of \$250, payable to the order of the Governor-General's Secretary, which cheque will be forfeited if party or parties tendering fail to sign contract in one week after being notified of acceptance of tender.

(Signed)
MELGUND,
Governor-General's Secretary.
Ottawa, 25th May, 1884.

"The undersigned hereby agrees to furnish and deliver the following coal strictly in accordance with the terms of the annexed specification, and for the price per ton set opposite each kind, viz:—

	Rate per ton	Total amount
Anthracite (name of mine)	\$	\$
Tons of 2,000 lbs. of "Furnace"		
Tons of 2,000 lbs. of "stove"		
Bituminous (name of mine)		
Tons of 2,000 lbs. of

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

International Geological Congress at Berlin.

The following is the substance of a circular which has been forwarded by the Committee of Organization for the above Congress to the scientists throughout the world, dated at Berlin, May 15th:

"The International Geological Congress decided at its meeting on October 2nd, 1881, at Bologne, that the third session should be held at Berlin in 1884."

"The Committee of Organization, formed in Germany, has appointed the 25th of September for the opening of the session. The meetings will occupy from the 25th till the 30th of September, and geological excursions will take place between the 1st and 5th of October."

"An exhibition of geological collections and charts will be held during the session."

"The programme in detail of the meetings and excursions will be distributed in good time before the opening of the Congress."

The circular contains a request that those who desire to take part in the transactions of the Congress will, as soon as possible, forward their application for membership to the Secretary of the Committee of Organization at Berlin, giving name in full, vocation and address.

THE LATE HENRY G. VENNOR.

On the morning of the 9th of June it became the painful duty of the Press of this continent to announce the death of Henry G. Vennor, Esq., scientist and weather prophet, whose name had been made famous during the past few years of his life, and had become known throughout the entire civilized world. The fact that Mr. Vennor had been ill for some time had been generally known, and it had become apparent that there was little hope of his recovery. He passed away on Sunday evening, the 8th inst., and his death will have been a sad surprise to many. Mr. Vennor was born in Montreal, on December 30th, 1840, of English parentage, his father being a member of the firm of Budden & Vennor, an

old established hardware house. He was educated at Philip's School and the High School there. During his boyhood that preference for natural science which led to his celebrity of late years manifested itself, and while yet at school he collected and exhibited specimens which gained honourable mention at a provincial exhibition, and which is now in McGill College University. After a course in the zoological and geological classes of McGill, and a session of the classes in provincial land surveying and civil engineering, Mr. Vennor tried, in the year 1860, mercantile life in the wholesale warehouse of Frothingham & Workman. After five years, however, he gave up that and received an appointment as assistant to the late Sir W. E. Logan, taking part in all the surveys of the geological commission for fifteen years after his appointment, serving directly under Sir W. E. Logan, Dr. T. Sterry Hunt and Dr. A. R. C. Selwyn. In 1870 he was elected a fellow of the Geological Society of England. Mr. Vennor's revised classification of the old Laurentian Rocks of Canada, which were his especial field of survey, gained him a reputation as a scientific observer, and in 1872 his ability gained further recognition by his researches into the phosphate resources of Ottawa County. In 1880 Mr. Vennor resigned his position on the survey, having during his connection with it rendered the country and science at large valuable service. But useful as these services were, and stamping him as they did, as a man of marked ability in his profession, it is rather to his prognostica-

tions regarding the weather that Mr. Vennor owed his fame which dated from the correctness of a prophecy that the Christmas of 1875 would be a green one, followed by a muddy New Year's Day. Following up his success and adding to his celebrity, he published the first of *Vennor's Almanac*, since then published yearly, which among other kindred matter, contained, as is of course well known, monthly forecasts of the weather for the entire year, and which he supplemented with the *Monthly Weather Bulletin*. Mr. Vennor was also widely known as a student of ornithology; his work on "Our Birds of Prey," published in 1875, is a valuable one, and his collection of *raptores* (birds of prey) is one of the most complete on the American continent. Born, as above stated, in 1840, Mr. Vennor had reached but the age of 43 years and 6 months at the time of his death. The sad result removes from our midst a thoughtful student of science, whose work will live after him.

In the May number of the REVIEW attention was called to the dissatisfaction which some of the clauses in the Dominion Mining Regulations had created among miners and others interested in mining industries in the North-West Territories. We took occasion at the same time to point out the advisability of the representative mining men in the North-West meeting together and formulating their objections to the clauses in the regulations, forwarding the same to the Minister of the Interior for his consideration, and pointing out to him wherein they are distasteful, and the nature of

the alterations that would make the regulations generally acceptable to the miner and at the same time be reasonable in the interest of the Government. Since the publication of the article referred to, Mr. Burgess, Deputy Minister of the Interior, on the 3rd instant, left Ottawa for Winnipeg, and being most anxious that all dissatisfaction among the miners of the North-West should be speedily dispelled, he proceeded on the 16th inst. to Calgary, where he is now in conference with the leading practical mining men, with whom he will engage in an exhaustive discussion of the various points at issue, and there exists no doubt that Mr. Burgess, who is invariably disposed to act impartially, will agree to any feasible and advisable alterations in the regulations that will have a tendency to encourage the prospectors and miners and to advance the mining industries of the North-West, which promise to become of so great importance in the country.

In the Rocky Mountain district mining matters are rather quiet, pending the return of the army of prospectors who are at present exploring the Purcell and Selkirk ranges. The latter range is considered to be the richer in mineral, probably because it has been more explored, and years ago a considerable amount of mining was carried on there, but, on account of the great distance from other mining centres, it was abandoned, as less than "ounce diggings" did not pay. The western slope of the Rockies is the objective point for the majority of prospectors who have flocked from British Columbia and from the East in hundreds since the opening of spring; nevertheless a fair force of miners and prospectors will operate on the eastern side in the foot hills.

In the September, 1883, number of the REVIEW we published the opinion of Mr. J. S. Phillips, Mining Engineer and Metallurgist, of New York, respecting the mineral wealth of

our north western country. Among other important remarks made by Mr. Phillips he gave expression to the following:

"The trans-continental railway of Canada will enter into and cut its way across—or in a mining manner, costean—the whole mountainous portions of the country, and will soon enter the wide and most interesting mineral zones of the Rocky and Wasatch mountains, where intelligent observations and explorations will, in my opinion, cause Old England to be once more proud of Colonial wealth.

"This field for mining, with mountains running over 1,000 miles northerly, the whole breadth of the Canadas, will probably extend across the longitudes of Western Dakota, Montana and Idaho, of the United States of America, but for lode or vein mining will not reach so far west as Cariboo in British Columbia, as the Sierra Nevada chain of mountains is thereabout broken and detached for a few hundred latitudinal miles. This does not prevent the possibility of auriferous discoveries in gravel formations, which are very likely to be found in many valleys that have received the water washed debris from the western declivity of the previously named mountains along the route. I have been frequently questioned by letters from England: Where is the best place to explore for minerals? and I answered both Englishmen and Canadians—Prospect the breadth of the Canadas on either side of the advancing railway, but more particularly opposite to Western Dakota, Montana and Idaho, for vein mining, and thence westward for gravel and placer gold, where vast mineral areas lie unexplored.

"When this railway is sufficiently far advanced, the north and south branches of the Saskatchewan River, the Athabaska, and Peace Rivers, and the Rivers Liard, Peel, and McKenzie, will be found also convenient for both prospection and power for mining this 1,000 miles long of the east slope of the Rocky Mountains, whilst the five branches for mining the head waters of the great Yukon River may be utilized for the north-western slope with its spurs and parallel range. A few brave and strong men may make immense fortunes along this range of mineral-bearing strata. I know of no other unexplored belt in North America that ex-

poses superior inducements, and there is probably nothing on this continent but the unexplored eastern slope of the mighty Andes, which extends 4,000 miles from north to south through the several rich countries of Columbia, Ecuador, Peru, Bolivia, the Argentine Republic, and Patagonia; but Canada has the great advantages of your own language, laws, and flag; whilst these are mostly inaccessible, and more particularly so to foreigners."

CANADA'S PHOSPHATE TRADE.

The reports that have reached us from the mines during the month are of a most satisfactory nature, and the managers of the different properties predict a very large output for the year. Besides the more extensive mines in operation many smaller ones have been opened since the snow left the mountains and new ground is being broken daily throughout Ottawa County, revealing the fact that the Townships of Buckingham, East and West Portland, Derry and Bowman are likely, for the future, to be the chief phosphate producing localities. Some of the mines in Templeton and Wakefield, whose reputations have already been established, will, in all probability, continue productive for years to come; notably, those owned by Messrs. McLaurin & Blackburn, J. A. Gemmill and M. Haldane & Sons. The industry has been placed on a more permanent basis than formerly, and proper attention is now being directed to practical mining and to shipping the output of the mines in as pure a state as possible, by separating the mineral from foreign matrix so far as it can be done by hand manipulation. Some of the large producers contemplate the erection of suitable machinery that will supersede hand cobbing and bring the output of their mines up to a high state of purity at a much reduced cost.

It was expected by some that the reduced value of raw phosphate rock that ruled in the English market at the beginning of the year would have had a tendency to discourage the miners, but such has not been the case, and the mines have been as actively worked during the past six months as at any time since this industry was started in the country. Those who availed themselves of the low rates of freight from Montreal at the opening of navigation were en-

abled thus to realize almost as good a price for their shipments as was obtained last year. Assuming that the present price of phosphate in England and on the continent of Europe should not vary, and that freights should continue to rule at the average for the past five years, it would be difficult to point out any industry or mining venture that will return a handsomer profit than phosphate mining when directed by good management and economy. According to the present English quotations for Canadian apatite, 80 per cent. mineral is worth, say at Buckingham Station, eighteen dollars per ton, and the average cost of mining and delivery at this point, from all the mines in the Rivière du Lièvre district of the County of Ottawa does not exceed ten dollars per ton; thus returning to the miner the very handsome profit of \$8 per ton, equivalent to 80 per cent. on his outlay. The experience of the past few years has proved these figures to be practically correct, and the owners of mines are thus enabled at the close of each day's work to estimate to a nicety the result of their operations.

THE MINES.

High Rock Mine.—Since the arrival of Mr. Pickford, President of the Company that owns this valuable property, from England, last month, important changes have been made at the mine, and an entirely new management organized; steam-drills, hoists, etc., have been introduced, and it is thought that a larger quantity of phosphate will henceforth be raised, and at a reduced cost. Some extensive deposits have been discovered on the property during Mr. Pickford's visit and are being opened up. Under the new organization Mr. P. H. Smith controls the Mining Department, and Mr. S. Hicks has the general superintendence of transportation from the mine to Buckingham Railway Station, from which point the output of the mine is consigned to Messrs. Wilson and Green, of Montreal, the appointed general managers and agents.

Star Hill Mine.—Mr. W. H. Williams, of New York, President of the Union Phosphate Company, recently returned from the company's property and reported everything going ahead to his entire satisfaction. This company began work about a year ago, and up to the present time the operations have been confined to a very limited space, within an area of about two acres, from which upwards of 3,500 tons of excellent phosphate have been raised and the deposits are becoming more productive. The Union Company owns 1,300 acres of

valuable phosphate land, and has thoroughly equipped its property. We are informed that the President, during his recent visit, signed a contract for the construction of a tramway from the mine to the River du Lievre which will greatly facilitate the transportation of ore.

The *North Star Mine*, belonging to the Dominion Phosphate Company, continues very productive and the quality of the phosphate is of a higher grade than that of any other mine in the district; when separated from the gangue rock the mineral is found to be quite free from refractory matter, and little dressing is required. This mine will be a steady producer for many years to come.

The *Little Rapids Mine*, owned by W. A. Allan, Esq., of Ottawa, is turning out a quantity of excellent phosphate that will compare favourably with that from the *North Star* mine. At the bottom of one of the shafts, down about 135 feet, a body of solid phosphate stretches from side to side and from the surface down, for the full distance, broad views of mineral are visible on each side of the shaft. At two different levels stoping has been begun in the veins and the phosphate that is being produced is of a pale bluish-green colour, apparently free from objectionable foreign matter.

The *Emerald Mine* gives employment to a large number of miners and other workmen, and the output of the mine depends entirely upon the force employed. The mineral is there in sight in thousands of tons and powder and fuse is all that is required to convert it into a merchantable commodity. Several of the stock holders and directors of the Ottawa Phosphate Company visited the mine during the present month, and those who had not seen the property before were much surprised at the sight that met their eyes and congratulated each other upon the prospective handsome profits from their investment.

The *Lansdowne Mine*, adjoining the *Emerald*, the property of the Dominion Phosphate Company, is developing well, but as the miners have been, up to the present time, engaged in stripping, there is nothing more to report than was published in the May number of the REVIEW. This property is certainly a very valuable one and will improve with development.

The mines above named give employment to about 375 men, all told, and the output aggregates, as nearly as can be estimated, 100 tons daily. The output from the *High Rock*, the *Star Hill* and the *Emerald* mines is being forwarded in scows to Buckingham landing and thence in waggons to the Railway Station.

Four hundred and fifty car loads of Phosphate were shipped over the Canadian Pacific Railway from Buckingham to Montreal during May, aggregating 7,000 tons.

PHOSPHATE QUOTATIONS.

The most recent London quotation for Canadian apatite is 1s. 1½d. for 75% mineral, with one-fifth of a penny rise, with advices that the market is stiffening. A London, England, correspondent writes: "As regards Canadian Phosphate of Lime, one shilling per unit for 75% is the lowest price we have seen. Charleston, S.C., people are combining to raise their prices, in which we think they will succeed to some extent, as it has been mainly their pushing to sell on a rather weak market that brought prices down all along the line." Better prices will doubtless be obtained later in the season.

Facilitating Transportation of Phosphate.

Improvements on the du Lievre.

Short Line Railway from Buckingham Village to connect with the C. P. R.

Engineers, employed by the Department of Public Works, have completed the necessary survey for a lock at the Little Rapids on the Riviere du Lievre, and when the detail plans have been prepared tenders will be invited for the construction of the work. The drawings are now being made, and, in all probability, the contract will be given out in time for the contractor to proceed with the work when the water in the river has sufficiently receded to enable him to put in the foundations for the masonry. The lock will be built of stone and should be completed by the opening of navigation on the river next year. This will be a great convenience to the phosphate miners as it will afford sufficient water for large vessels to ply between the High Falls and Buckingham landing, the northern terminus of the proposed

SHORT LINE RAILWAY

to connect with the Canadian Pacific Railway at Buckingham station. That this connecting link will be constructed is now an assured fact. Mr. W. H. Williams, President of the Union Phosphate Company, has stated that he is co-operating with a few other capitalists who purpose building these four miles of railway as a private enterprise, and that work will be begun by them within a month or so. The officials of the Canadian Pacific Railway Company inform us that Mr. Van Horn, the General Manager, has carefully considered the feasibility and advisability of constructing this branch and that he has decided to begin work on it almost immediately in order that the line be in running order for the accommodation of phosphate shippers during the autumn, when the bad condition of the waggon road

between Buckingham Village and the railway station renders the transportation of ore so difficult. There now exists little or no doubt that this work will be proceeded with during the summer either by Mr. Williams and his associates or by the C. P. R. Co., and of the two it would be more desirable that the line become the property of the latter corporation than that of private individuals. The present road over which the output of the mines has heretofore been hauled has been a serious obstacle to the phosphate producers in the du Lievre district, and the progress of construction of a railway will be eagerly watched by them.

MICA IN CANADA.

Systematic searching during the past year has resulted in the discovery of many important deposits of this valuable mineral and the quality of some of the specimens received at this office is equal to any that has been mined in the United States or in any other part of the world in point of clearness and its resistance of heat. As to the size of crystals many of the surface specimens will yield perfect plates measuring as large as 5x9. It is a true *muscovite* and was not known to exist in Canada in economic size or quantity until within the past year.

One of the most important discoveries yet made is in the Township of Villeneuve, Ottawa County, within two and a half miles of the Riviere du Lievre, and the quantity of merchantable mica visible on the surface, imbedded in a gangue of quartz and feldspar, is sufficient to make the property one of great value. A party of miners have begun to open up one of the veins, and we are informed it is developing most satisfactorily.

In the Township of Palmerston, County of Frontenac, some extensive deposits of very fine mica have been found, and we have received some beautiful specimens of *muscovite* from the Nipissing district, with a report descriptive of the deposits, and showing that it exists there also in paying quantity and in merchantable size.

At Sydenham, Province of Ontario, a fair quantity of mica, of an amber or wine colour, is being mined and Mr. Allan's mine in Burgess, County of Lanark, has produced a large quantity of excellent mica. From the mines at present in operation, and from those that are now being opened the Canadian market can be supplied and dealers will not, henceforth, be compelled to import their stock from the United States.

Applications will be received by the Michipicoten Copper Company, Michipicoten Island, Lake Superior, from miners and mine labourers for contract work.

Lake Superior Silver Mines

SATISFACTORY WORK AND RICH ORE AT THE RABBIT MOUNTAIN.

THE TWIN CITIES MINE.

THE HURONIAN WORKING IN 8 FEET OF PAY ORE IN BOTH DRIFTS.

WORK AT LAMBERT ISLAND.

The Zinc Mines to be Opened up.

During the past few months much attention has been directed towards this rich mineral district which has been visited by a number of practical mining men and experts who have been unanimous in predicting a brilliant future for the industries already established. The *Lake Superior Mining Journal* of a recent date publishes an article under the above headings and remarks that the Rabbit Mountain and Huronian districts are attracting most of the visitors on account of there being about \$100,000 worth of silver ore now lying in the bins and on the dumps of the two mines.

Several of the owners of the *Rabbit Mountain Mine* were on their property during the present month and have expressed themselves well pleased with their venture. A new shaft has been started and from it wonderfully rich ore is being taken.

The *Twin Cities Mine* is progressing with the greatest satisfaction to the owners. Their vein is well defined and they are taking out very rich high grade silver ore and native silver, associated with zinc blende, which also assays very high in silver. The assays of this have gone from \$400 to \$2,600 per ton.

Arrangements have been concluded for the working of other mines in the Rabbit Mountain region in which silver has been found. This section of country has evidently been the centre of several violent disturbances of the earth's crust, as unlike other parts of the country where the veins run parallel, the fissures are here found to run in every direction, with the formation, diagonally and directly across it, and running with and cutting the numerous trap dykes which intersect that part of the country. These dykes have had a great influence on the mineral bearing features of the district.

A party of miners in charge of Capt. Wm. Wheeler have started for Lambert Island in Thunder Bay to commence work there.

Arrangements have also been made which will result in the immediate working of the zinc mines on the north shore. The zinc blende, the black jack of the miners, taken from a wonderfully large deposit yielded

to the Assayer for the Dominion Geological Survey 54 per cent. of metallic zinc.

The famous Huronian is a steady, reliable producer of both gold and silver ore. The mill is doing splendid work. The shaft is down

over 70 feet and there are over 100 feet of drifts. The miners are working in 8 feet of pay ore in both drifts and the sylvanite seems more plentiful and the vein looks even better than the splendid showing it made at surface.

Gold Mining in Beauce.

Although mining has been going on in this section of Canada, more or less, during the past thirty years, few people have any idea of the richness of many of the gold bearing localities in that portion of the Province of Quebec known as the County of Beauce. Owing to the great uncertainty heretofore existing as to the validity of the mining rights held by miners in the territory of Rigaud-Vandreuil, mining operations have been very seriously retarded. A recent judgment of the court, however, in the *DeLery patent case*, a test case, has removed this uncertainty and Col. Duchesnay, Government Inspector for the Chaudière Mining Division, in his official report for 1883, has expressed it as his opinion that the mining industry will now assume a flourishing condition and even attain great importance in the district. Col. Duchesnay also remarks that the conviction appears to be more firmly held than ever that the gold and silver mines of Beauce are as valuable as those of any other country. The thousands of dollars which have been already collected from alluvial workings, of the most primitive and insufficient description, are a proof of this; and the numerous quartz veins discovered in these alluvial workings, and at many other places, prove, through the frequent assays that have been made, that rich results may be expected from operations in this branch of mining. The preliminary expenses of this latter industry are very great, and, therefore, the proprietors of the soil did not dare to incur them before knowing that they could continue the work, a question which has been settled by the *DeLery* judgment referred to.

Some important work is at present being done at various points in the district by chartered companies and by individuals. The

CANADA GOLD COMPANY (LIMITED),

up to the close of 1883, had not resumed its ordinary operations since the destruction of its shafts in the fall of '82; it has only employed a few men to wash over the tailings of previous years; but this work, which is generally profitable, could not be so for this company, as it uses pulverizing machines before the first washing. The quantity of gold obtained was, however, more than sufficient to cover expenses. At the close of last year it was the intention of this company to have resumed work this season with a force of several hundred men, but to what extent operations have been resumed we have not yet learned.

NORTH EAST RAPID COMPANY.

In October last this company re-opened some old workings that had been abandoned for nearly twenty years, and though they had been, up to the close of 1883, only making repairs and explorations, they had the good fortune to meet with some nuggets of considerable size, and the best possible indications of gold bearing quartz as well as alluvium.

THOMAS RICHARDS & CO.

are working in St. Charles concession, River Gilbert, and give employment to an average force of forty men. In the spring of 1883 they constructed a long aqueduct which crosses the valley of the Gilbert on trestles and furnished the necessary supply of water for washing, after driving an immense water wheel which assisted a steam pump in draining the underground workings. A nugget, weighing nearly twenty-two ounces was recently found on this claim, which is one of the richest in the district, and its yield, especially during the last few months of the past year has been quite a fortune. A number of rich quartz veins have been crossed by the galleries, and it is proposed to work them during the present year.

MESSRS. ALLAN & HUMPHREY

During last autumn these gentlemen reached the bottom of a second shaft at a depth of one hundred and seventeen feet, and found enough gold to show that they had fallen upon an alluvial deposit. As this shaft appeared, however, to be on the very edge of the deposit, they found it necessary to sink another more towards the centre. In this shaft (No. 3) they have struck the gravel at a depth of about one hundred and forty feet, and about three feet above bed rock. For some distance above the gravel they penetrated a heavy layer of fine sand which, when washed for test, was found to carry gold in paying quantity, a certain indication that the gravel will prove to be very rich.

The only work hitherto done at the Ruisseau d'Ardoise has been of a superficial character. This stream flows near the workings of Messrs. Allan & Humphrey, and the discovery lately made by these gentlemen has opened

to the mining industry an immense field, extending over the whole valley of the Famine. "Gold has been found at several places on the Famine" is stated in the Canada Geological Report for 1866. Since that date there has been but little done in the way of exploration, but the precious metal has always been found, especially on the river Veilleux, one of its tributaries, though scattered through the gravel, and not in compact deposits as on the Gilbert. The result of the recent workings of Messrs. A & H., leads to the supposition that the searches heretofore made on the Famine had been confined to the unproductive side of the valley, and that by following the natural lay of the land from their claim upwards, along the left bank of the river, there would have been a greater probability of success.

GOLD MINING ASSOCIATION OF CANADA.

This wealthy English Company, which owns a large extent of gold bearing lands on the River du Loup, was enabled to wash uninterruptedly during last summer by means of its hydraulic power. The richness of the du Loup has long been established by the product of the mining operations which have been going on since 1850, but the bed of auriferous gravel being nearly all above the level of the present flow of water, the hydraulic power cannot be made to work upon it with all the advantage that was expected.

The total product of gold in the Chaudière mining division during last year was larger than usual in proportion to the amount of work performed.

From the 1st of April, 1879, to the 30th of September, 1883, there had been collected on the left bank of the Gilbert alone, in the space of a mile long by one hundred feet wide, 7902 oz., 2 dwts., 4 grs. of gold, worth, @ \$17.75 an ounce, \$140,262.30, according to the sworn monthly reports furnished by the miners. In view of the small number of men employed, and the loss of at least thirty per cent. by a defective system of washing, this is an excellent result, yielding a reasonable profit to those engaged in the work after paying all expenses.

It is generally admitted, however, that alluvial gold mining, especially on the Gilbert, will soon be superseded by quartz mining, of which so many rich veins have been found. This will give employment to a much larger number of men, and will be the means of introducing greater activity into a district which has not, heretofore, received the attention from miners that it has deserved.

The Central Ontario Iron Mines.

On the morning of the 4th instant a special train left Trenton for a run over the line of the Central Ontario Railway, having the following gentlemen on board: Senator Payne, of Cleveland, Ohio, a director of the Central Ontario Railway and the Coe Hill Mining Companies; Mr. James McLaren, of Ottawa, who is largely interested in both companies; Mr. S. J. Ritchie, of Akron, Ohio, President of the Railway, and also largely interested in the Coe Hill and other iron mines contiguous to it; Mr. Wm. Chisholm, of Cleveland, Ohio, President of the Coe Hill Mining Company; Mr. Samuel Mitchell, of Marquette, Mich., an iron operator in the Lake Superior district, and interested in the Coe Hill Mine; Mr. F. A. Bates, a mining expert of Cleveland, Ohio, who has assumed the management of the Baker Mine, a portion of the C. O. Railway Company's property; Mr. Preston of Pittsburg, Ohio, another mining expert representing Pittsburg capitalists; Messrs. Arthur Coe and Geo. W. McMullen, Directors of the C. H. Mining Co., and Mr. James B. McMullen with others interested in the railway and the mines.

After leaving the G. T. R. Junction at Trenton the train proceeded to Weller's Bay, the shipping port for the railway on Lake Ontario. Here the company owns a water front of over 150 acres, bordering the entire deep water on the north-eastern shore of the bay, thus giving it access to one of the most desirable harbours on the lake, covering upwards of four square miles of deep water.

The party first visited the new dock, a portion of which will soon be in readiness for the reception and discharge of freight, and when completed will be 2,000 feet in length by 28 feet wide, covered with a massive superstructure, the crest of which will be 36 feet above the water. This superstructure will consist of a deck with double tracks and openings between the rails, communicating with 150 ore pockets, from which the ore can be dropped directly into the holds of vessels lying at the dock. After a careful inspection of this terminus of the railway and a visit to the roundhouses, at Weller's Bay and at Trenton, and the locomotive repairing and car shops, the party reached Picton towards evening, and on the following morning the journey was commenced over the newly constructed portion of the road. The line of the railway follows the valley of the River Trent as far as Chisholm's Rapids. From this point it takes a northward direction and traverses the townships of Sidney, Rawdon, Marmora, Madoc, El-dorado, Tudor, Limerick, and, entering Wallaston, the road terminates for the present, at the

COE HILL MINE.

Arriving at this point the excursionists were greatly astonished at the sight it presented. On the hill over-looking the ore platform were no less than 50,000 tons of carefully selected rich magnetic iron ore, neatly piled, and beyond this the workings on the vein. These extended some 2,000 feet in a broad irregular gash along the course of the vein, which appears to have an average of about 40 feet in thickness from wall to wall. The stopes are not steep, and one can only account for the enormous stock pile that has been taken from them by the fact that almost every pound that has been taken from them is good marketable ore. Three shafts have been sunk to a depth of 55, 58 and 68 feet respectively, and these indicate that the vein is becoming thicker as lower levels are reached. Several prospect holes have been sunk by the diamond drill, the deepest of which has cut the iron at a depth of 280 feet from the surface. At this depth the vein still carries its full thickness, and it is fair to assume that this enormous deposit will prove persistent to as great a depth as that to which it can be worked at a profit. But even assuming that the vein were cut off short at the depth to which it has been tested, and that the strong indications shown east and west of it, which have not been tested, should prove valueless (two well nigh impossible contingencies) there would still remain practically in sight not less than 2,000,000 tons of good ore.

The expense of putting this ore on the market may be estimated as follows, care being taken to put the cost of every item at the highest figure:

	per ton.
Mining and delivering on cars.....	\$1 00
Freight to Weller's Bay and delivery on vessels.....	1 00
Freight to Cleveland and Lake Erie ports.....	75
Duty.....	75
Insurance and commission.....	15

Total cost per ton delivered in U.S. market.... \$3 65

The lowest rate for this grade of ore during the past ten years at Cleveland has been \$6 and the highest \$12 per ton. Thus, judging by the past 10 years, \$2.35 per ton profit on this enormous quantity of ore in sight is about the most unfavourable estimate that could be made, while \$6 per ton is quite within the range of possibility, and an average of \$3 per ton may safely be counted on.

The following analysis of the Coe Hill ore was made by the chemist of the Cleveland Rolling Mills:

Phosphorus.....	0.023
Silica.....	3.70
Sulphur.....	0.91
Metallic Iron.....	66.40

It will thus be seen that the success of this mining venture is well nigh established, and that, in the face of a specific duty of 75c. per ton, these railway and mining companies (the proprietorships of which are for the most part identical) have expended over \$2,000,000 with a view to recouping themselves by the sale of Canadian iron ore in the American market.

The party next visited the

BAKER MINE

where very little work has been done beyond mere prospecting. That this deposit is an extensive one there exists no doubt. The needle attractions indicate the presence of a body of ore varying from 40 to 70 feet in thickness, extending without a break, for fully a mile. A strong outcrop of excellent ore is traceable for the whole distance, and each of the numerous test pits which have been sunk along the vein has uncovered a large body of it.

The following is an average of the analysis made of the samples of the ore taken from different portions of this vein:

Silica.....	5.50
Phosphorus.....	0.08
Sulphur.....	1.00
Metallic iron.....	66.28

It has been feared that the amount of sulphur might possibly interfere with the value of this ore for shipment in its raw state, but from statistics obtainable regarding the treatment of poorer ores (carrying a similar percentage of sulphur) in Pennsylvania it is evident that in a country like this, where supplies of firewood and charcoal are practically unlimited, this will not prove a serious obstacle. In fact it is probable that the cost of desulphurization would be more than balanced by the reduction in the cost of carriage of the ore thus treated as compared with raw ores.

At the Cornwall Mines, in Birks County, Pa., the cost of roasting, in the leading furnaces, magnetic hematite ore carrying in iron from 40 to 46 per cent., and from 3 to 5 per cent. of sulphur, varies from 18c. to 30c. per ton.

In the case of the Baker ore (should it need roasting) charcoal would be used which, under existing circumstances, would render the desulphurizing process less expensive.

Mr. F. A. Bates has just assumed the management of this mine, and in a short time it will no doubt be sending out large quantities of ore. He also contemplates the erection of charcoal reduction works in this region, and when these are in running order much of the ore, which is now useless, as being of too low a grade for shipment and for the payment of specific duty, can be worked at the pit's mouth at a fair profit.

THE EMILY MINE,

which is only a few miles from the Baker, is quite as promising as either of those already described, and besides these there are many others in the townships of Tudor, Limerick, Wollaston, and Chandos that only await development to prove their value. In fact the iron industry of North Hastings has now obtained such a footing that its speedy development into a lasting source of revenue to the Province may be counted on. Much of the credit due to the accomplishment of this very desirable consummation must attach to Mr. Wm. Coe, of Madoc, who in spite of all sorts of discouragements has stuck steadfastly for the past fifteen years to his purpose of developing the iron interest of North Hastings.

After devoting two days to this pleasant and interesting excursion the entire party returned to Trenton in high glee over the prospects for their enterprises.

The Geology and Economic Minerals of Hudson's Bay and Northern Canada.

In reporting the valuable memoir on the above subject, read by Professor Bell, Assistant Director of the Geological Survey, at the meeting of the Royal Society lately held in Ottawa, we propose to give principally our notes on the portion of the paper which referred to the economic minerals. We understand that the article will be published at length in the Transactions of the Society. Dr. Bell has devoted so much time and attention to investigating the geology and minerals of Hudson's Bay and our northern regions generally, that whatever he says on these subjects is of interest. He illustrated his remarks by a large geological map of Northern Canada, which he said extended into the polar regions of North America, or to the most northern points explored. A description was given of the character and distribution of each of the groups of rocks as far as they are yet known in these territories. They embraced the following, in ascending order: The Laurentian, Huronian, a pre-Cambrian formation, the Animikie and Nipigon series, the Silurian, Devonian, Carboniferous, Liassic, Cretaceous, Tertiary and post-Tertiary. In regard to the Laurentian, Dr. Bell said that the great area which it occupied in Northern Canada and Greenland, had a somewhat circular outline, with patches of newer rocks in the centre or around Hudson's Bay. The Huronian was the great metal-bearing formation of Canada. It was intimately associated with the Laurentian and was mostly found within the same general limits. Speaking of the Devonian, he said that although it extended through an immense distance in the North-West Territories, it did not appear to occupy so great an area as had been supposed, as much of the rock which had been taken for Devonian had been found by Dr. Bell to be really Cretaceous. Referring to the post-Tertiary period, he thought that in some part of our northern territories we might find stores of fossil ivory like those of Siberia, as he had obtained the remains of both the mammoth and the mastodon around Hudson's Bay; and the tusks of elephants were not uncommon in the banks of the Rat River in the far North-West.

A great variety of rocks and minerals of economic value had been already noted in the regions referred to. Among those of a non-metallic nature were limestone, dolomite, granite, slate, flag-stone, marls, clays, ochres, cement stone, gypsum, stone and sand for making glass and porcelain, soapstone, mica, plumbago, asbestos, phosphate of lime, common salt, etc., etc. Fine dolomites and quartzites and limestones were abundant on the Eastmain coast of Hudson's Bay, and limestone was found on the islands in its northern parts. Gypsum formed the banks of the Moose River about forty miles up and was said to occur between Moose Factory and Albany. It was also met with near the Slave River. A pure quartzite, like fine white marble, occurred on Marble Island and to the west of Hudson's Bay. Soapstone was found near Mosquito Bay and used by the Eskimo for making their lamps, kettles, etc. Mica was reported as abundant in Chesterfield Inlet and Hudson's Strait. Specimens of pure plumbago had been brought on board ships passing through the Strait by the Eskimo. Lumps of it had also been picked up on Athabasca Lake. Phosphate of lime had been found near the Coppermine River, and Dr. Bell had also discovered it to the north of Lake Superior. Pure salt, ready for use, was found in great quantities on the surface at one place on the Slave River, and salt springs were common on the Athabasca and the Mackenzie. Dr. Bell had found some rare minerals and a number of ornamental stones around Hudson's Bay. Among the former were lazulite, axinite, etc. The lignites of the North-

West extend throughout the great valley of the Athabasca-Mackenzie and were abundant along the shores of the Arctic sea between the Mackenzie and the Coppermine River. Lignite had been found by Dr. Bell on the Moose and Albany Rivers, and it was also said to occur near Cumberland Bay. Bituminous coal was reported by the Arctic explorers on Bathurst, Melville and Prince Patrick's Islands and Bank's Land. Anthracite existed on Long Island in Hudson's Bay, but the quantity might not be great. Petroleum promised to be one of the most abundant mineral products of the North West. It was found at the surface in a more or less thickened condition along the Athabasca, Peace and Mackenzie Rivers and around Great Slave Lake, as well as at several localities in the interior. Dr. Bell considered that it was derived from the Devonian rocks, which constituted the great petroleum-producing system in Ontario and the United States, and he had no doubt but that good oil wells would be found by sinking down to these strata. The overlying sands and marls, of cretaceous age, were saturated with immense quantities of inspissated petroleum, even to a thickness of 150 feet. This mass would burn like coal, and it yielded large quantities of oil on distillation. The world might be supplied from these very extensive asphaltic deposits.

As to the metallic ores, those of iron were first noticed and the inexhaustible stores of carbonate of iron and manganese of Hudson's Bay were described. The ore is spread over the surface of thousands of acres on the Manitoulin Islands, which are close to the east coast. Dr. Bell had also found a great deposit of spothic iron with limonite at the surface, on the Mattagami River and another of magnetic on Knee Lake. He had induced the Indians of Athabasca Lake to search for iron ore, the result being the discovery of a mass of magnetic ore of fine quality. Captain Dawson of the circumpolar commission, at Dr. Bell's request, had looked for minerals on Great Slave Lake and had found a vein of specular iron. Massive iron pyrites, suitable for the manufacture of sulphuric acid had been discovered at Inari on Hudson's Bay. Copper pyrites had been met with on the east coast and near Lake Mistassini at the head of the Rupert River. The native metal was known to be abundant on the Coppermine River in rocks like those which contain it on the south shore of Lake Superior. Galena was found in masses, some of them of large size, disseminated through a bed of limestone, thirty feet thick, at Richmond Gulf and Little Whale River. Antimony had been noted by Richardson in the north, and zinc, manganese and molybdenum had been found by Dr. Bell on Hudson's Bay. He had also discovered traces of gold and silver in veins on the Eastmain coast. The extensive mountainous region between the mouth of the Mackenzie River and the Pacific Ocean, bordering on Alaska, was spoken of as a very promising one for the precious metals. Gold had been already discovered there. The conditions resembled those of Nevada and Colorado, and this great territory might one day become to Canada, as a mining region, what these States are to the American Union.

GENERAL MINING NOTES.

The Tolima gold mine of the Republic of Colombia, owned by an English company, is reported as having a gross product of \$88,847 for March of this year, at a cost of \$35,287, leaving a clear profit of \$52,500. At this rate the product for the year should be at least \$1,000,000, with a profit of about \$625,000.

The Ellen Harkins gold mine of Gympie district, Queensland, Australia, recently yielded in five weeks work from 71 tons of ore as much as 4,468 ounces of gold or about \$89,000 from which a dividend was paid of \$74,200.

El Callao, the famous gold mine of Venezuela, is reported as having produced and remitted to London for the month of April 18,038 ounces of gold worth about \$360,000 from which a dividend of \$6 per share was paid.

Investments in California gold mines are estimated at \$150,000,000; it is further estimated that up to January, 1884, the value of the total amount of gold mined has reached upwards of \$1,200,000,000.

Favourable news has been received from the lead and silver mines at Placentia, Newfoundland, which are said to be in a promising condition, the quality of the ore being excellent.

It is said that the Lake Superior region, embraced within the boundaries of the State of Michigan, has mined iron and copper to date to the value of \$370,000,000.

BRITISH COLUMBIA.

NANAIMO GOLD MINES.—Last fall a number of Chinamen were engaged in mining on the Nanaimo River and its tributary Boulder Creek. Last week Messrs. L. Page and J. Allen of Nanaimo visited the head waters of the River and its tributaries. They found that the Chinese had abandoned the diggings, apparently leaving in disgust. On Boulder Creek they had done but little work, while on Nanaimo River work was of an extensive character. There they had erected two large and substantial log houses, packing the timber at a depth of a half a mile. On the gravel bank they had sunk ten or

twelve prospect holes down to the bed-rock, through tightly packed gravel and large boulders. The Chinamen had also run a tunnel a short distance into the hill. In neither place did they meet with any satisfactory results. Messrs. Page and Allen saw the rockers, long toms and sluices left by the Chinamen, also a pick stuck in a prospect hole.

This gravel bed is about a mile above Nanaimo River Falls and consists of packed gravel and boulders, while on the opposite bank of the river are high, almost perpendicular, bluffs of conglomerate rock.

Page and Allen did considerable prospecting but could only find the colour of very fine gold, which it would never pay to mine in such hard ground.

The Mongolians were led away by finding a good pocket or two when they first commenced operations, and consequently went into operations quite extensively. From the work done it is estimated there must have been from twenty to thirty working for several months.

The general impression is that paying diggings will yet be found on the Nanaimo River, and even now men are out there prospecting.

NOVA SCOTIA.

NOVA SCOTIA CONSOLIDATED GOLD CONCENTRATING COMPANY.—The work at Montague and Waverley will start up this month. This company was formed with a capital of \$100,000, by the consolidation of the interests of the Nova Scotia Gold Concentrating Company and of J. G. Foster & Co, for the purpose of working the quantities of rich mill tailings which abound in the various gold districts of the province. At present, the company has a concentrating plant at both Waverley and Montague, and chloridizing-work will be established on tide-water, at Dartmouth, during the summer. The Company is putting in two Golden Gate concentrators, five of the Embrey pattern, and two of Browne's patent. It has already bought upward of 100,000 tons of tailings.

WEST GORE ANTIMONY MINES.—Parties interested in these mines are trying to effect a sale. The mines, which up to the present time have been operated only in a small way by private means, are not yet developed sufficiently to demonstrate the character and probable extent of the vein, and a large quantity of ore being already exposed, the property has a present as well as a prospective value. The vein is a true fissure. As far as developed in the mine, or prospected on the surface, it shows an average width of thirteen inches solid metal. Two shafts, 120 feet apart, have been sunk on the vein to a depth of 110 feet, and short drifts of from 20 to 30 feet have been run east and west on the 60-foot level, while the two shafts are

connected by a drift at the bottom. Returns from three shipments of ore, aggregating 100 tons, made to Bath & Son, London, Eng., show 60 per cent. pure antimony, and netted a profit of \$30 per ton. From twenty to thirty tons a day can be mined with the present facilities, and the capacity of the mine can easily be increased by further development and improved methods of working. The mines are situated in Rawdon Township, Hants County, about fifteen miles distant from stations on either the Intercolonial or Windsor and Annapolis railroads. —(*New York Engineering and Mining Journal*).

EXPEDITION TO HUDSON BAY.

All arrangements for this important expedition have been completed and the *Neptune*, a wooden sailing steamship of about 600 tons, has been chartered from Job Bros., of St. John, Newfoundland, for the purpose. The vessel will sail from Halifax on or about the 15th of July and after coaling at Pictou will sail north. The expedition will be under command of Lt. Gordon, R. N. who will establish observatories and locate the parties, about six in number, at different points, the object of the expedition being to examine into the condition of the Hudson Straits during the winter months. Dr. Bell of the Geological Survey will accompany the party in the capacity of scientist and surgeon and will take assistants with him to aid in examining into the geological formation and mineral resources along the coast of Hudson Bay. This party will constitute a distinct branch of the expedition and will return about the end of October. The other six parties attached to the expedition will winter in the north and the *Neptune* will return for them in the spring.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Wilson's Rock Works," will be received until Monday, the 30th day of June next, inclusive, for the construction of a block and beacon on Wilson's Rock, so called, River St. Mary, Georgian Bay, Ontario, according to a plan and specification to be seen on application to Adam Dudgeon, Inspector of Harbor Works, Collingwood, and the Department of Public Works, Ottawa, where printed forms of tender can be obtained.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the Honourable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

**NOTICE TO CONTRACTORS.**

SEALED TENDERS, addressed to the un-
dersigned, and endorsed "Tender for Coal,
Public Buildings," will be received until
MONDAY, 21st JULY next, for Coal supply,
for all or any of the Dominion Public Build-
ings.

Specification, form of tender and all neces-
sary information can be obtained at this
Department on and after the 24th instant.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied and signed with their
actual signatures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honourable the Minister of
Public Works, equal to five per cent. of the
amount of the tender, which will be forfeited
if the party decline to enter into a contract
when called upon to do so, or if he fail to
complete the work contracted for. If the
tender be not accepted the cheque will be
returned.

The Department will not be bound to
accept the lowest or any tender.

NOTICE TO MINERS.

POWDER, DUALIN, FUSE, DETONATORS,
STEEL, IRON, CHAIN, ROPE,
SHOVELS, PICKS, WHEELBARROWS,
And all Miners' Supplies For Sale at

THOS. BIRKETT'S,
Rideau Street, - - - Ottawa, Ont.

**ADVERTISEMENT.**

TENDERS will be received by the under-
signed up to the hour of 12 o'clock
noon on FRIDAY, the 14th day of July next,
for the purchase of what is known as the

**Pincher Creek Indian Supply
Farm**

situated some 30 miles south-west of Fort
McLeod, in the district of Alberta, North-
West Territories, containing about 3,000 acres.
The farm has been occupied and cultivated by
the Indian Department as a supply farm for the
Piegan Indian Reserve, and will be sold in
one block, with the improvements thereof.

During the past year it was leased by the
Halifax Ranching Company. The soil is de-
scribed by the surveyor who laid out the farm
as being of superior quality, the herbage rich,
and the water abundant and good.

The grain crops upon the farm are stated by
the farmer of the Indian Department in
charge, to have been excellent and to have
ripened well.

There are upon the land a dwelling-house,
granary, blacksmith's shop, cattle and hay
corrals, sheds, barbed wire fence enclosing
fifty acres, a deep well, and the land is par-
tially drained.

Payment will be required to be made one-
fourth in cash, and the remainder in three
equal annual instalments with interest upon the
unpaid balances at the rate of six per cent.
per annum.

Each tender must state clearly the amount
per acre offered, and must be accompanied by
a cheque marked good by one of the chartered
banks of Canada for 10 per cent. of the
total amount of the price offered, the difference
between 10 per cent. of the purchase
money and the first instalment of one-fourth
to be paid to the credit of the Minister of the
Interior, on or before the 15th day of Sep-
tember next.

The lowest or any tender not necessarily
accepted.

A. M. BURGESS,
Deputy of the Minister of the Interior.
Department of the Interior, }
Ottawa, 6th May, 1884. }

**NORTH-WEST MOUNTED
POLICE.**

SEALED TENDERS marked "Tenders for
Hay and Straw," and addressed to the
Hon. the President of the Privy Council,
Ottawa, will be received up to noon on WED-
NESDAY, the 28th day of JUNE next, for
furnishing Hay and Straw to be delivered at
the Mounted Police Barracks, at the follow-
ing places.

Regina200 tons hay, 150 tons straw.
Fort Calgary	300 " " " "
Fort McLeod	300 " " " "
Maple Creek	75 " " " "
Medicine Hat	75 " " " "

Printed forms of tender, containing full
information as to the articles and quantities
required, may be had on application to the
Department.

No tender will be received unless made on
such printed forms.

The lowest or any tender not necessarily
accepted.

Each tender must be accompanied by an
accepted Canadian Bank Check for an amount
equal to 10 per cent. of the total value of the
articles tendered, for which will be forfeited if
the party declines to enter into a contract
when called upon to do so, or if he fails to
complete the service contracted for. If the
tender be not accepted the cheque be return-
ed.

No payment will be made to newspapers in-
serting this advertisement without authority
having first been obtained.

OFFICE:
UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

The Directors of the *Austin Mining Company*, whose head office is at Ottawa, have recently employed Mr. E. D. Ingall, M.E., to examine the Company's property at Echo Lake. The full text of Mr. Ingall's report is to be found in this number of THE REVIEW, and it should be gratifying to the stockholders to learn that it coincides in its main features with Professor Chapman's report, made before the Company had accomplished the present developments to which Mr. Ingall refers, and which have enabled him to arrive at conclusions with comparative certainty. The position of the mine is most accessible,

and its situation affords unusually favourable shipping facilities, advantages which, together with the richness of the lode, should render it a very valuable property. We hope to hear at an early date that work has been resumed at this mine.

The Cleveland, Ohio, *Iron Trade Review*, referring to African iron ore, says:

"The shipment of iron ore from Africa to the United States is no new thing, but its present extent and future prospects present some new features of interest. From the consular reports made to the Department of State it appears that there were declared for the United States from Africa during 1883, 46,543 tons of iron ore. While this does not equal one-third of the average *weekly* receipts of Lake Superior ore at the single port of Cleveland, it is still of importance, since, according to these same reports, the exports from Africa last year to the United States exceeded those reported from our near neighbour, Canada, by 20,113 tons, being also in excess of our reported receipts from Spain and Portugal combined."

And continues:

"While under our system of Protection the importation of foreign ores must necessarily be restricted, a considerable increase may be looked for from Canada and Cuba, while Africa will doubtless play an important part in the world's production."

The iron ore deposits in Canada are in no wise inferior to those of Africa. On the contrary, the ore from some of our mines is used by American manufacturers in preference to that from any other quarter of the globe. African mine owners have the same duty to pay, while the difference in cost of

transportation to the iron manufacturing centres of the United States must be greatly in favour of Canada, and yet the amount of ore exported to the United States from Africa last year was nearly double the quantity exported from this country. Canadians might find it profitable to seriously consider the practicability of reversing the situation.

Dr. Selwyn, Director of the Geological Survey, has sent an expedition to explore the almost unknown country lying between the mouth of the Bersimis River and James Bay. Mr. A. P. Low is in charge as geologist with Mr. Bignell, of Quebec, as surveyor. Supplies are being forwarded *via* Lake St. John to the Hudson Bay post at Lake Mistassini, where it is expected the party will arrive by the close of the season. Exploration will be continued until the snow renders it impracticable, and during the winter the surveys will be proceeded with. It is expected that the section of country lying between the mouth of Bersimis River and the height of land will be gone over this year, and that by the close of 1885 this work will be completed through to Fort Rupert on James Bay along the course of Rupert River.

ENGLAND IMPORTING AUSTRALIAN COAL.—The recent arrival in Liverpool of several cargoes of gas coal from Australia, has excited a good deal of comment in the public press, and the matter has been made to assume an importance which it certainly does not possess. These cargoes can only be shipped profitably from the colonies when vessels going over are so absolutely short of freights that they have practically nothing else to carry, and the coal can consequently be

exported to England at almost a nominal cost; but that a regular competing trade could be established is out of the question. The coal itself is, however, remarkable for its gas making properties; it is extremely light, and is so full of gas that it could almost be forced out by the pressure of the hands, but it is altogether useless for any other purpose, it does not make a particle of coke, and it has to be largely mixed with other fuel.

Referring to an article which appeared in the MINING REVIEW in May last, wherein we found fault with Canadian capitalists for so persistently standing aloof from the mining industries of the country and thus permitting our most valuable mineral deposits to fall into the hands of our more go-ahead friends across the border, the *Iron Trade Review*, of Cleveland, Ohio, remarks:

"This is certainly a tribute to the enterprise and liberality of American capital that is worth having. What the outcome of this amalgamation of American enterprise with Canadian conservatism will be is one of the interesting problems for the future to decide."

The article in question was written more in the hope of stirring up the monied men of Canada to a sense of what their country reasonably expects of them than with intention to eulogize the liberality of American capitalists. While we greatly admire our neighbours for their enterprise and so-called liberality, we do not fail to observe a certain intermingling of shrewdness and caution which will, in all probability, protect them against ill-advised investments.

A blasting operation of unusual magnitude was conducted at the Pwllpant quarries, Caerphilly, Wales, on the 7th instant. A charge consisting of 16 cwt. of gunpowder was deposited in a hole 50 feet deep. The powder was ignited, and after a lapse of twenty minutes an explosion occurred which displaced an immense head of rock. In rolling down the great height, from the top to the bottom of the quarry, the rock was broken into pieces varying in weight from half a ton to five tons. The quantity of rock brought down by the blast is estimated at 10,000 tons.

The annual meeting of the stockholders of the Dominion Phosphate and Mining Co. was held at the office of the Company, 22 St. John Street, Montreal, on the tenth instant.

From what we can gather, the report of the Directors was of a satisfactory character. The expenditure hitherto has been made less with the view to extract large quantities of phosphate than to develop the mines and place them in such a condition that they can be worked henceforward economically and scientifically. This condition has now been attained, and the ore is now being extracted in large quantities from both mines, with the prospect of remunerating the shareholders amply for past delay. The purchase by the Company of the mine now known as the "Washington" is likely from present appearances to prove a most lucrative investment. Not only is the ore in great abundance, but the quality is of the highest standard. Altogether the prospects of the Company are very flattering.

THE PHOSPHATE INDUSTRY.

Each month brings fresh evidence of the rapid increase to the phosphate mining industry in the County of Ottawa. On the fourth of the present month, as will be seen by reference to another column, letters patent issued incorporating the "Lièvre Land and Phosphate Company," an organization whose operations will be watched with interest. The land owned by this Company is situated, for the most part, in the Township of Portland West and Templeton, in Ottawa County, and upon which some mining and a great deal of prospecting has already been done with encouraging results. In the Township of Bowman important discoveries have been made since the spring,

proving the existence of extensive deposits of apatite in this township. In the absence of railway communication, however, transportation from these deposits will be more expensive than from the mines in the district that are at present in operation, and yet a careful estimate of the cost shows that if the mineral can be cheaply mined there would remain a handsome margin of profit to the miner after defraying the cost of transportation from this isolated section, even at the present comparatively low value of phosphate.

The Dominion Phosphate Company held its annual meeting in Montreal on the 10th inst., and the directors' report to the shareholders was received with much satisfaction. Work on this Company's properties is progressing with most favourable results, and the quantity of phosphate that is being raised is daily increasing.

Mr. Allan's *Little Rapids* mine is yielding a quantity of excellent mineral. In the main shaft they are stoping in solid mineral at two levels, and each day's work adds to the body of phosphate in sight. This mine is capable of yielding a large annual output, and mining operations are being carefully conducted.

At the *High Rock*, the Union Phosphate Company's mines, and the *Emerald*, no change has been reported during the month. They are producing immense quantities of phosphate, and are continually increasing the facilities at the mines for mining and handling the output. The mines in Templeton and Wakefield are being steadily and profitably worked.

Phosphate Quotations.

Our London quotations have not varied since last month, and it is now thought that the present price for Canadian phosphate will rule for this season's shipments. 1s. 1d. is still quoted for 75 per cent., with a fifth of a penny rise, and it is confidently predicted by those who are familiar with the English market that miners will receive much better value for next season's output.

FREIGHTS.

For some weeks past very little tonnage from Montreal has been offered at rates to suit phosphate shippers. Six to ten shillings have been the prevailing rates, which is quite double what was paid earlier in the season, and as the principal producers availed themselves largely of the cheap spring freight they can now afford to carry their balance and await a drop from present rates when the autumn fleet will be going out.

Another Company Incorporated

To Operate in the du Lièvre Phosphate Region.

Under the "Canada Joint Stock Companies Act, 1877," letters patent have issued, bearing date the 4th July, 1884, incorporating Walter Richard Elmenhorst, John H. R. Molson, Robert C. Adams, James P. Cleghorn and William Costigan, of Montreal; Charles H. Trask, of New York; Amos W. Stetson, A. Forbes Freeman, John C. Haynes, and George W. Heard, of the City of Boston, for the purpose of mining, extracting, working, selling and shipping phosphates and other minerals in the Provinces of Quebec and Ontario, with power to purchase, acquire, retain, mine and dispose of lands and property yielding such minerals, and with power to acquire, construct and operate all manufactories, mills for grinding or otherwise treating such minerals, and generally such other works and undertakings as may be necessary or expedient for the mining, selling and transportation by land and water of such minerals, by the name of "THE LIEVRE RIVER LAND AND PHOSPHATE COMPANY (LIMITED)," with a total capital stock of seventy-five thousand dollars, divided into seven hundred and fifty shares of one hundred dollars.

Capt. R. C. Adams, of Montreal, having, during the past few years, acquired extensive areas of well selected phosphate lands in the neighborhood of Perth, Ontario, and in the Rivière du Lièvre district, Quebec, thought it expedient to organize a company for the purpose of developing his locations on an extensive plan, and with this object in view, he issued a prospectus some months ago; the incorporation of the Lièvre River Land and Phosphate Company has been the result. Capt. Adams is well and favourably known to the phosphate dealers in Canada and abroad; he has had many years of useful experience in mining phosphate in this country, on his own account, and, in his capacity of a shipping broker in Montreal, has enjoyed the benefit of being able to forward the output of his mines free of commissions on this side of the Atlantic. These are no insignificant advantages for a company to possess at the outset, and, according to the prospectus, Capt. Adams, who will, in all probability, be the managing director, agrees to devote his undivided attention to the company's affairs, and mining operations, as well as the handling of the output, will, therefore, be conducted under a system of economy and good management. The Lièvre River Land and Phosphate Company has our best wishes for a successful career.

The gold and silver product of California in 1883 is valued at \$15,752,750.

VILLENEUVE MICA MINE.

During the past month a force of miners have been engaged on this property, and the mine is developing into one of great extent—the crystals of mica are increasing in size as greater depth is reached and are more free from fracture—in fact the proportion of waste in the output up to the present time is comparatively small. Those who have had experience in mining this mineral are aware that but a small per centage of what is mined is capable of producing sheets of merchantable size. At this mine in Villeneuve, however, the crystals appear to lie in a less distorted form than elsewhere, and to be more free from twists and other damaging features. A large quantity of excellent mica has already been mined, most of which has been cut into sheets, ready for market, and when the mine has been further developed it will be capable of producing sufficient to supply a large demand.

Gold Mining in Beauce.

Messrs. Allan & Humphrey are now working in pay gravel at a depth of 150 feet in their mine near Slate Creek. Pan washings from the dump, taken out about six feet above bed rock, have proved very rich in fine gold, and the gravel below this no doubt carries coarser gold in large quantities, many nuggets, weighing an ounce and over, have already been found. Water for sluicing purposes is being brought from Slate Creek, about three-quarters of a mile, past the mouth of the shaft; sluices are in course of erection, and washing will be begun at an early date, the returns of which will be likely to astonish those who have had no faith in profitable mining in this section of country. The old river bed, where this shaft has been sunk, is a very large one, and the pay gravel will be proportionately abundant. In our next issue we hope to be able to give our readers the result of the first month's wash-up, and we venture to predict such rich returns as will induce thousands of miners to flock to the Beauce district and develop what is likely to prove one of the richest gold fields in America. Having seen the result of one day's pan-washing, we know whereof we speak.

According to the statement of Mr. Hayter, Government statist of Victoria, the total yield of gold in all the Australasian colonies, since its discovery in 1851, up to 1881 inclusive, has reached a value of \$1,446,247,255. Of this total Victoria, the smallest of the Australian colonies, has contributed \$1,010,111,340.

REPORT ON THE AUSTIN COPPER MINE.

To the Directors of the Austin Mining Company,
(Limited) Ottawa, Ontario.

SIR,—Having proceeded to your company's mine at Echo Lake, in the Garden River Indian Reserve, and spent several days there surveying and examining it, I beg herewith to submit my report of the results of the examination.

SITUATION AND COMMUNICATIONS.

These two features can be well understood by reference to Mr. Austin's map of the property and the locality. Sault Ste. Marie is the nearest place of any size, and is distant about 25 miles by water down the Sault River to Lake George (or the mouth of the Echo River could be reached by driving from the Sault), up Echo River about three miles, and about three miles across Echo Lake to the mine dock, from which there is about a mile of well graded road to the mine. This route could be rendered available for craft drawing 6 or 8 feet of water by doing a slight amount of dredging at the mouth of Echo River, and about 100 feet where the lake discharges into the river. Were this done the communications would be excellent and the ore from the mine could be readily and cheaply brought down from Lake George, from whence it could be shipped through to Chicago or any points on the lakes, or to England. A light draft tug makes occasional trips at present up as far as the bar at Echo Lake. In winter communication would also be good. From Sault Ste. Marie to the mouth of Echo River on the Bruce Mines Road, up a winter road which has been cut to Echo Lake, and thence across the ice to the mine dock. There is a mail three times a week, or oftener, to a post-office at the mouth of Echo River, which would, no doubt, be improved were the mines working, and communication could also be made at this point with the C. P. R. telegraph system, were it necessary. The summer route by water is all sheltered, so that shipments need never be delayed by bad weather. A good location could be found for a tramway to the dock at Echo Lake down a gully that runs directly from the mine. By putting in a suitable track the full car descending from the mine could, I think, be made to draw up the empty one. Ore bins could be erected here, from which the barrels could easily be filled, and into which self dumping cars could dump the ore which would reduce the cost of handling and tramming to a minimum.

DEVELOPMENTS.

The vein on which work has been done is a strong and well defined lode, carrying sulphides of copper and iron in a quartz gangue. It is very favourably situated for testing cheaply and also for working. It runs into the side of a hill with an average strike, as far as shown by the present developments, of about N. 35° W., although it varies considerably from this at different points. In dip it also varies much, but averages about S. 55° W. In places it is 8 feet thick and in others it gets much broader, appearing from the surface croppings to widen out to 20 or 25 feet. *The accompanying map and section of the mine will show you the position and relative level of the various openings made on the vein which I now propose to describe more in detail.

THE TUNNEL.

This is a drift on the course of the vein at a point some 250 feet below its highest level on the property. It has been driven for a distance of 85 feet. The lode here is not so productive as at the other openings, and seems much disturbed, but, as the end has only some 25 feet of vein above it, it will most likely improve much as it reaches deeper ground and approaches the better portions of the vein at 1 and 2 shafts. It has, however, yielded occasional good stones of ore as evidenced by the dump and breaking rock right along the level. The vein dips here about 65° and is 8 to 10 feet wide.

NO. 1. SHAFT

is a small exploratory shaft about 6x6 and some 25 feet deep. From this point croppings show for about 100 feet down towards the tunnel. This opening turned out a good quantity of ore. An examination of the dump shows the vein to have been much improved in yield, settled and without the admixture of country rock found in the tunnel.

POINT W

is a small hole showing no ore, but the quartz here is white and opaque and similar to that found on the foot of the vein at opening Z, which, with other evidence, leads me to believe the real vein lies to the west of this spot in a hollow filled with soil.

*The map and section referred to can be seen at the Company's Office, Ottawa.

POINT X.

Here a trench has been excavated across the outcrop of the vein, about 20x5x5 ft. deep. It shows much ferruginous gozzan from atmospheric action on the back of the lode. In the E. half iron pyrites appears to predominate, but the W. half shows the regular copper bearing quartz of the lode. Notwithstanding atmospheric alterations, the trench has turned out some good ore and the vein looks promising.

POINT Y.

A trench about 20x5x8 ft. deep, excavated across the run of the vein. No definite hanging or foot walls shown as vein rock appears to be still standing to east of trench. The lode is about 25 ft. thick here and shows the same ferruginous gozzan as at X. This opening has yielded quite a quantity of good ore and the vein looks well. A band of iron stained croppings extends on a course of S. 15° E. from here towards X for 30 or 40 feet.

NO. 2 SHAFT.

About 10x12x32 feet deep. It is sunk on the foot wall which is here well defined and dips 52° from the horizontal, whilst the strike approaches a more E. and W. direction.

The vein looks well at this point, and there is a good showing of ore on the dump, which occurs in large and stronger masses in the vein matter. There is still vein standing to the hanging of the shaft.

OPENING Z.

A small pit 10x10x6 ft. deep which appears to be in the middle of the vein as neither foot nor hanging wall shows. The width would be about 15 to 20 feet here. Three bands show here: on the foot wall side is white opaque quartz, as in opening W., above which lies some 6 feet of looser rock stained with iron oxide and copper carbonates (from atmospheric action on the other ores of copper and iron) whilst above this the pit is 4 feet in a band of quartz with disseminated ore and occasional large pieces. The vein looks very well also at this point.

SITE FOR FLOORS.

An excellent site could be selected for dressing floors near the mouth of the tunnel where the ground drops away at a good angle to arrange them advantageously, so that the ore would pass through with the minimum of handling, whilst water could be supplied from the little creek running past the place and from the small lake above in which it takes its source.

SUMMARY.

On your property you have a good, large, and well defined vein which is very favourably situated for testing and working. The underground developments are, as far as they have gone, satisfactory in their results and would encourage and justify a further expenditure which, from present appearances, would open up a large quantity of good ore and enable the erection of dressing machinery to be proceeded with with confidence. I would suggest that the tunnel be continued on and that both shafts be sunk to meet it. The sinking of No. 1. would be necessary on account of ventilation, and would be advantageous as giving another point at which to start stoping.

The proposed work would require a force of 30 to 35 men, for whose accommodation very little addition would be required to the present boarding-house. A small steam hoist would be required for the shafts, which, with another steam drill, air compressor and tank for the two, would be the chief additions necessary to the present plant. A couple of teams would also be required, but these could probably be hired from the surrounding farmers.

With this force, at the end of about a year, or little more, you would have a large stock of ore opened up and the ground well proved, and should these developments prove as satisfactory as the vein now promises you would be able to direct all your attention to the erection of dressing machinery, which could be supplied with ore immediately on completion.

A great deal of surface work has been done on the property, such as is always necessary in like districts before one can commence mining work, such as clearing bush, making roads, erection of buildings, &c., &c., so that there need be little delay on that account in starting work again on the mine as advised. The details of these surface improvements are given in the accompanying appendix.

I remain, sir,

Your obedient servant,

(Signed) ELFRIC DREW INGALL,
Associate Royal School of Mines,
London, England.

APPENDIX.

SURFACE IMPROVEMENTS.

The position of the buildings, etc., is shown on the plan. They are all well built and in good order. They are as follows:

No. 2 Shaft House: A small plank building 15 x 10. No. 1 Shaft House: A small log building about 12 x 10.

Smith Shop: Built of logs, 18 x 10, contains forge, bellows, anvil, hammers, etc., ready for use, and a great many other tools in fairly good order.

Engine House: About 20 x 15, built of logs, contains 6 x 3 vertical boiler complete and in apparent good order, one steam drill and drills, tunnelling shaft, about 70 feet of steam hose, small portable forge and about 200 feet of iron pipe.

Stable: A log building 28 x 18, with half storey loft above.

Office and Manager's House: A good building, built of hewn logs, 25 x 22, three rooms on ground floor and a half storey loft above.

Boarding House: Good hewn logs, 30 x 25, large dining-room, kitchen and pantry on ground floor and half storey sleeping room above. This house could accommodate 20 to 35 men.

Store Shanty: Built of rough logs, 17 x 14.

Cordwood: Near the houses there are about thirty cords of good stove wood.

Clearing: There is a clearing round the houses of some four or five acres in extent, of which about an acre is fenced in, which produces good hay.

Warehouse: Situate near the dock at Echo Lake, about 20 x 25, built of frame and plank, with shingle roof.

Dock: A small temporary dock, about 30 x 15. A good dock could easily be built here. Neither of these two latter are on your property.

Cordwood Supply: I think some could still be gathered handy to the mine, and in winter further supplies could be teamed across the lake from any point where it was handy, or brought by scow in summer.

Average Sample: The barrels of rock sent you represent the average of the vein as proved at two representative points, viz., Nos. 1 and 2 shafts. Of course in actual work a certain proportion of poor rock could be selected out and thrown away at the shaft mouth. At each place some 5 or 6 cwt. of rock was selected from all parts of the dump, so as to represent in due proportion each class of rock there. This was spalled down, thoroughly mixed and the sample taken from it. Eventually all the rock was taken.

Materials: Besides the plant already mentioned, there were in various buildings 4 heating stoves and 1 cooking stove (No. 9), with pipe and many utensils, small hand pumps, 2 iron kettles, about 70 feet of good windlass rope, 2 windlasses, dirt and water buckets, some drill steel, a large sleigh, some cross-cut saws, and various other tools, and about 200 to 300 feet of good tarred 1-inch hemp rope.

(Signed) E. D. INGALL.

KAOLIN.

Discovery by the late Mr. William L. Holland.

A few years ago two valuable deposits of kaolin were discovered by the late Mr. Holland, of Ottawa, on the Gatineau River, in the Township of Low. They had been known by the settlers and lumbermen for many years as "The Paint Mines," and were supposed to be ochre. While passing down the river in a bark canoe Mr. Holland noticed the clay, procured samples of the four colours that he found there—yellow, red, bluish grey and white—and had them tested and found that they were kaolin of a very good quality. He sent a sample to Mr. Livesley, of the St. John's Pottery, who worked some of it into a small piece of white ware which he forwarded to Mr. Holland with a letter in which he stated he had the pleasure of sending him the first piece of white ware ever made in Canada from native clay. Mr. Holland, son of the late discoverer, Mr. Brennan, of Ottawa, and a gentleman of Toronto have recently purchased the property on which the deposits occur, and are now the owners

of the only beds of kaolin of any extent known to exist in Canada. With the construction of the Gatineau Valley Railway there will be a grand opening afforded here for the manufacture of vitrified tiles, fire-brick and pottery. Firewood is abundant in the immediate vicinity and magnificent water-power is within a few yards of the clay beds.

Kaolin is a name applied to a pure white clay which forms an important ingredient in the manufacture of porcelain, and which is therefore known as *china clay*. Large quantities are raised in Cornwall, England, where it is frequently termed *Cornish clay*. This clay was first sent to Europe from China under the name of kaolin in the early part of the last century. A similar white clay was soon afterwards found in Saxony and was used in the manufacture of porcelain, thus laying the foundation of the factory at Meissen for producing the famous Dresden china. It was first detected in Cornwall in 1755, a discovery which resulted in the manufacture of a hard paste china at Plymouth and Bristol. Kaolin is found in Nebraska and in several of the eastern States of the American Union. It is almost invariably a product of the alteration of feldspar, and is therefore

always found in association with feldspathic rocks, usually granite. The china clay rocks of Cornwall and Devon are simply granites in which the orthoclase-feldspar has become decomposed or kaolinized. The localities from which kaolin is obtained in Great Britain are all situated in Cornwall and Devon. In the former county the workings are principally in the neighbourhood of St. Anstell, St. Stephen's and Breague, while in Devon they are situated at Lee Moor and Meavy, on the south of Dartmoor.

China clay, *kaolin*, is not only used in the manufacture of pottery, but is also extensively employed by the paper maker and the calico bleacher. It is likewise used to a small extent in the manufacture of alum, artificial ultra-marine and some other chemical products. In 1880 the quantity of china clay raised in Cornwall amounted to 278,572 tons, and in Devon to 25,370 tons.

STRONTIA.

We observe it noted in many of the mining journals that there has sprung up a considerable demand in England for this article among the manufacturers of fire-works, by whom it is very extensively used. We are not aware of its occurrence in Canada.

Strontium is one of the metals of the alkaline earths, occupying an intermediate position, as regards many of its properties, to calcium and barium, the other members of the group. It is less abundant in nature than barium, and occurs as a constituent in the minerals strontianite and celestine, which are respectively the carbonate and sulphate. In the metallic state it is usually white, heavy, oxidisable in air, and decomposing water at ordinary temperatures. The most important compound is *strontia*, from which the metal was first obtained in 1808 by electrolysis. It resembles baryta, forming a white soluble hydrate, which is the compound formed when the metal decomposes water. Strontium and its components burn with a very characteristic crimson flame, which gives a well marked line or banded spectrum.

THE MINING REGULATIONS.

The Deputy Minister of the Interior, Mr. A. M. Burgess, has returned to Ottawa after a month's absence, during which time he paid an official visit to Manitoba and the North-West Territories with a view to acquainting himself with the country and the requirements of its settlers. Mr. Burgess was unfortunately the victim of a serious accident during his trip, from the effects of which he is yet suffering,

but, notwithstanding the inconvenience to be experienced from a broken arm, a disabled leg and a general shaking up, he succeeded, in a great measure, in accomplishing the object of his mission. Since the publication of the mining regulations many complaints have been made by miners in and about Calgary, and farther to the westward, on account of the supposed severity of many of the clauses. Deputations waited on Mr. Burgess at various points along the line of the C.P.R. where he stopped, and the many points at issue were carefully and exhaustively discussed. The Deputy Minister is satisfied that he has successfully set aside all misapprehension and dissatisfaction that had existed among miners and prospectors, as regards certain clauses which will remain unchanged, and after considering the objections to certain other clauses he has decided to recommend modifications which cannot fail to remove all ground for complaining in the future. The clauses which Mr. Burgess proposes to amend are No. 3, sub-section C. of Clause No. 4, and Clause No. 5, of which the paragraphs to be amended at present read as follows:

No. 3.—"Its surface boundaries shall be straight due north and south and east and west lines not more than four in number."

Sub-Sec. C. Clause No. 4.—"This receipt shall authorize the claimant, his legal representatives or assigns, to enter into possession of the location applied for, and, during the term of *one year* from its date, to take therefrom and dispose of any mineral deposit contained within its boundaries."

Clause No. 5.—"At any time before the expiration of *one year* from the date of his obtaining the agent's receipt as aforesaid, it shall be open to the claimant to purchase the location, on filing with the Local Agent proof that he expended not less than *five hundred dollars* in actual mining operations, etc."

AMENDED—*Clause No. 3.*—"Its surface boundary lines shall not be more than four in number and opposite sides shall be parallel."

Sub-Sec. C.—"And during the term of *five years* from its date, etc."

Clause 5.—"At any time before the expiration of *five years* from the date, etc., on filing with the Local Agent proof that he has expended not less than *two hundred dollars*, etc."

These modifications are all in favour of the prospector, and, if approved of by the Minister, will be made with a view to encouraging exploration and prospection. Those

clauses which Mr. Burgess insists shall remain as they have been framed after careful enquiry into the effect of similar regulations in force in other countries, and any departure therefrom has been made for the mutual benefit of miners and the Government to the exclusion of litigation and the legal profession.

THE BRITISH ASSOCIATION

ITS MEETING IN MONTREAL.

The Mines to be Visited

On Saturday, the 19th inst., the first contingent of members of this important scientific organization, including Capt. Trevelyan Pim, R.N., with their wives, daughters and other ladies, left London for Liverpool en route to Canada to attend the annual meeting of the Association, to be held in Montreal on the 27th of August. The British Association for the Advancement of Science is unquestionably the most important scientific organization in the world, and, as the date appointed for its annual meeting draws near, the people of Canada, especially the citizens of Montreal, begin to have some appreciation of the great honour that has been conferred upon us by the selection of Montreal as the place where the members of the Association are to assemble for their session of 1884. Among its eight hundred members the Association boasts of men eminent in science, literature and the arts, whose names are familiarly known the world over, and as many important discoveries have been announced at their annual gatherings, the meetings attract the attention of the scientific world, and the proceedings are watched with profound interest. Prominent amongst the members of the Association are the following distinguished gentlemen: The Right Hon. Lord Raleigh, M.A., D.C.L., F.R.S., F.R.A.S., F.R.G.S., the President-elect; Capt. Trevelyan Pim, R.N., to whose persistent efforts the decision to hold this meeting in Montreal is mainly due; Sir William Thomson, LL.D., D.C.L.; Sir Joseph Dutton Hooker, K.C.S.I., M.D., C.B., F.R.S., F.L.S., F.G.S., D.C.L., LL.D.; Sir John Lubbock, Bart.; Sir Lyon Playfair, K.C.B., M.P., LL.D., F.R.S.; Sir Richard Temple, Bart.; Henry Morley, Esq., Henry Enfield Roscoe, F.R.S., LL.D.; Lieut. General Sir John H. Lefroy, C.B., K.C.M.G., R.A., F.R.S., F.R.G.S.; Leone Levi, F.S.A.; Edward Joseph Lowe, Esq.; Dr. Henrici, of Heidelberg University; James Glaisher, Esq., the famous aeronaut; John S. B. Sanderson, M.D., LL.D., F.R.S.; Vice-Admiral Sir Erasmus Ommaney, C.B., F.R.S.; Edward

Frankland, M.D., D.C.L., Ph.D., F.R.S., F.C.S., of the Royal School of Mines; John Hall Gladstone, Esq.; George H. Darwin, M.A., F.R.S., F.R.A.S.; William Boyd Dawkins, M.A., F.R.S., F.G.S., F.S.A., the eminent geologist; John Church Adams, F.R.S.; Henry Bastian, M.D., M.A., F.R.S., F.L.S.; William Carruthers, F.R.S., F.L.S., F.G.S.; James Dewar, M.A., F.R.S.; Robert Stawell Ball, LL.D., F.R.S.; Dr. John Ball, M.A., F.R.S., F.L.S., M.R.I.A.; Joseph Henry Gilbert, Ph.D., F.R.S., F.C.S.; the Earl of Rosse, B.A., D.C.L., LL.D., F.R.S., F.R.A.S., M.R.I.A.; J. F. Latrobe Bateman, M. Inst. C.E., F.R.S., F.G.S., F.R.G.S.; H. Baneriman, F.G.S.; Rev. J. F. Blake, M.A., F.G.S.; W. T. Blanford, F.R.S., F.R.G.S.; Rev. Thomas G. Bonney, D.Sc., F.R.S., F.S.A.; A. G. Vernon Harcourt, M.A., F.R.S., F.C.S.; Capt. Douglas Galton, C.B., D.C.L., F.R.S., F.G.S., F.R.G.S.; William L. Carpenter, B.A., B.Sc., F.C.S.; Rev. W. H. Dallinger, F.R.S., F.L.S.; Lieut.-Col. John Herschel, R.E., F.R.S., F.R.A.S.; Thomas Rupert Jones, F.R.S., F.G.S.; William H. Perkin, F.R.S.; Robert H. Scott, M.A., F.R.S., F.G.S., F.R.M.S.; W. Chandler Roberts, F.R.S., F.G.S., F.C.S.; Sir F. J. Bramwell, F.R.S., M. Inst. C.E.; George F. Fitzgerald, M.A., F.R.S.; R. T. Glazebrook, M.A., F.R.S.; G. D. Liveness, M.A., F.R.S., F.C.S.; Rev. S. J. Perry, F.R.S., F.R.A.S., F.R.M.S., and others.

That the scientific men of Canada, and others, are to be given an opportunity of personal intercourse with such gentlemen as those we have named, who are numbered among England's most prominent men, is an event that is not likely to occur again for many a long day, and it is to be hoped that this visit of the members of the Association will be a permanent benefit to the Dominion. During their stay in Canada, Ottawa will be visited by a very large number of the members, and it has been arranged that those who are interested in such matters will be given an opportunity to visit the mineral bearing sections of the Ottawa district and the mines that are in operation. No amount of newspaper advertising could so effectively attract the attention of the outside world to our phosphate and iron deposits as a personal visit of these scientists. It behoves owners of mines to afford these distinguished gentlemen every facility to carefully examine the properties they will visit, and to see that they are received in a manner that will do credit to Canadian miners and will render their visit enjoyable and interesting. After visiting the phosphate mines in the du Lièvre district it is expected that the party will proceed to the iron mines of Central Canada.

LAKE OF THE WOODS GOLD MINES.

Most recent advices from Rat Portage report that the interest in the Lake of the Woods mines is steadily and rapidly increasing. Miners, prospectors and capitalists, or their agents, are daily arriving, and all are apparently anxious to at once engage in the mining enterprises of the district. As the mineral veins are more thoroughly prospected and tested, confidence in their permanent value becomes more firmly established, and it is expected that the capital required for their development will be forthcoming in the near future. The "Winnipeg Consolidated" is spoken of as a property of great promise, and it is to be deplored that lack of capital should retard active operations at this mine. Its owners are wasting valuable time this summer in not resuming work. A mine capable of producing ore that will pay from \$50 to \$200 a ton should not be idle.

Pine Portage mine is working night and day crushing high grade ore, which is yielding beyond all expectations.

It is reported that negotiations are in progress for the sale of the Sultana location. This property, when opened up, will probably develop into a mine that will compare with the Keewatin and Pine Portage.

An inspection of the Paragon location has been made, and about 200 pounds of quartz taken from the lode, which is being tested, and if the result is satisfactory steps will be taken to open the mine at once.

The Lake of the Woods Company's stamp mill at the Argyle location has been kept going pretty steadily of late, and about twenty tons of Keewatin ore has been crushed. From this amount of rock about \$100 amalgam was taken from the plates, leaving nearly \$2,000 in the concentrates. This showing gives a result of over \$100 to the ton, which, considering it is all surface ore, is exceedingly rich and gives great promise for the future.

MINING IN NEWFOUNDLAND.

Latest advices from Placentia report that Mr. C. S. Fowler, of the Anglo-American Telegraph Co., an expert in mining, after disposing of a valuable property, known as the Cliff Silver Mine, to a London syndicate, has been developing other properties in the neighbourhood of Placentia. Black Point has an immense deposit of gold, silver, lead and blende, with thousands of tons in sight. Ship Harbor has a very fine prospect of gold, silver and lead, with good ore streaks. Block House Mine, Great Placentia, vein assays eight and one-sixth ounces gold, same quantity silver, with magnificent lode on same property

of 22 feet in width, containing gold, silver and lead. At Cape St. Mary's two fine ore streaks, 12 inches wide each, rich in gold, silver and lead, have been discovered. Also several other prospects, all owned by Mr. Fowler, not yet developed. Messrs. Henderson and Sinnott recently discovered at Little Placentia Sound an extensive galena mine. The Cliff Silver Mine is exceedingly rich in gold and silver, highest silver assay 400 ounces with \$50 worth of gold. Mr. Fowler has shown wonderful perseverance in opening up this property, which promises to make him a bonanza king.

GENERAL MINING NOTES.

Arizona will probably produce, during the present year, 20,000,000 pounds of copper.

The Lake Superior, U.S., mines have produced copper and iron, from 1856 to 1883 inclusive, valued at \$370,000,000.

The total annual American product of gold and silver is \$80,000,000. The entire world's annual product is \$160,000,000, or double that of America.

The Director of the Mint, in his last annual report of gold and silver production in the United States, mentions that the product of Colorado for 1883-84 is nearly \$25,000,000.

The value of the minerals exported during 1883 from New South Wales was £2,438,826, the metals included gold, silver, silver-lead ore, copper, tin, iron, coal, bismuth, manganese, kerosene shale, pyrites, and antimony.

An explorer has recently returned from Victoria, B. C., and states that the reported mica deposits in that province are very small and of no commercial value. Another explorer, after searching for this mineral for fifteen days on Battle River, met with no practical encouragement.

It is reported that work has been resumed at the Coxheath Copper Mines, near Sidney, Cape Breton, N.S. The Inspector of Mines for the Province of Nova Scotia, in his official report for 1883, says: "During the past summer the Coxheath Copper Mining Company did a great deal of work, their levels were extended and a good deal of ore stoped out. A few tons of this were hand-picked and sent away for testing. Experiments were made on the low grade ores, and it is stated that preparations are being made for the erection of a large concentrating plant in the spring. Some of the copper was found to carry 80 oz. of silver to the ton."

**NOTICE TO CONTRACTORS.**

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Coal, Public Buildings," will be received until MONDAY, 21st JULY next, for Coal supply, for all or any of the Dominion Public Buildings.

Specification, form of tender and all necessary information can be obtained at this Department on and after the 24th instant. Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order

**NOTICE.**

TENDERS will be received by the undersigned, until Friday, 1st August prox., from parties desirous of leasing the privilege of ferrying across the river Ottawa between the Township of Clarence, in the Province of Ontario, Dominion of Canada, and Thurso, in the Province of Quebec, Dominion of Canada, in accordance with the terms and under the conditions set forth in the Regulations—copies of which can be procured at the Department of Inland Revenue, Ottawa, or from the Collector of Inland Revenue at Ottawa.

Each tender must state the amount which the party tendering is willing to pay per annum for the privilege referred to, which amount will be payable in advance, the terms of the lease being for five years from the 1st August, 1884.

Each tender must be accompanied by a cheque marked "good" on one of the chartered banks, doing business at Ottawa, for one-half the amount of the per annum tender. This amount will be credited on account of the first year's rent in the case of the accepted tender, and all other cheques will be returned except in the event of withdrawals, in which cases no refunds will be made.

All communications must be addressed to the undersigned and endorsed on the envelope "Tender for the Thurso and Clarence Ferry."

THE MINING REVIEW,

—CHICAGO, ILLS.—
DUFF PORTER, Editor.

The acknowledged authority on MINING and the LEADING REPRESENTATIVE EXPONENT of the MINING INDUSTRY.
SUBSCRIPTION \$3.00
THE MINING REVIEW CO. CHICAGO, ILLS.

**ADVERTISEMENT.**

TENDERS will be received by the undersigned up to the hour of 12 o'clock noon on FRIDAY, the 14th day of July next, for the purchase of what is known as the

Pincher Creek Indian Supply Farm

situated some 39 miles south-west of Fort McLeod, in the district of Alberta, North-West Territories, containing about 3,000 acres. The farm has been occupied and cultivated by the Indian Department as a supply farm for the Piegan Indian Reserve, and will be sold in one block, with the improvements thereof.

During the past year it was leased by the Halifax Ranching Company. The soil is described by the surveyor who laid out the farm as being of superior quality, the herbage rich, and the water abundant and good.

The grain crops upon the farm are stated by the farmer of the Indian Department in charge, to have been excellent and to have ripened well.

There are upon the land a dwelling-house, granary, blacksmith's shop, cattle and hay corrals, sheds, barbed wire fence enclosing fifty acres, a deep well, and the land is partially drained.

Payment will be required to be made one-fourth in cash, and the remainder in three equal annual instalments with interest upon the unpaid balances at the rate of six per cent. per annum.

Each tender must state clearly the amount per acre offered, and must be accompanied by a cheque marked good by one of the chartered banks of Canada for 10 per cent. of the total amount of the price offered, the difference between 10 per cent. of the purchase money and the first instalment of one-fourth to be paid to the credit of the Minister of the Interior, on or before the 15th day of September next.

The lowest or any tender not necessarily accepted.

A. M. BURGESS,
Deputy of the Minister of the Interior
Department of the Interior, }
Ottawa, 6th May, 1884. }

**MAIL CONTRACT.**

SEALED TENDERS, addressed to the Postmaster-General, will be received at Ottawa until noon, on Friday, 29th August, 1884, for the conveyance of Her Majesty's Mails, on a proposed Contract for four years, three times per week each way, between Dunrobin and South March from the 1st October next.

The conveyance to be made on horseback or in a suitable vehicle, via the Postoffice at Dunrobin when going, and by the direct route when returning. The mails leave South March every Tuesday, Thursday and Saturday as soon as possible after arrival of mail from Ottawa, and to perform the journey to March and back within three and three-quarter hours.

Printed notices containing further information as to the conditions of proposed contract may be seen, and blank forms of tender may be obtained at the Postoffices of Dunrobin, March and South March, or at the office of the subscriber.

J. P. FRENCH,
P. O. Inspector.

Postoffice Inspector's Office,

Title direct from the Crown.

For price and field notes apply at
the office of the MINING REVIEW.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the
3rd range. Some excellent surface
shows have been uncovered on these
lots and only require capital for de-
veloping. Price and particulars
given at the office of the MINING
REVIEW.

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and
out-croppings of fine quality of Graphite.
Price \$1,000. Further particulars to be
had at the office of the MINING REVIEW.

TIMBER LIMIT

ON LAKE WINNIPEG

FOR SALE.

50 Square Miles.

This limit will be very valuable.
Apply at the office of the MINING
REVIEW for price and particulars.

FOR SALE,

White Marble Quarry on Calumet
Island.

At this quarry there is an inex-
haustible supply of most beautiful
white marble. Price \$800. Sam-
ples to be seen and information ob-
tained at the office of the MINING
REVIEW.

The Harbert Telephone

(FOR PRIVATE LINES.)

Sold outright. No
renting. Just the
thing for use in Mines
or Mining Districts.
Over 5000 in use. Pat.
Nov. 30, 1880. Late
improvements. Send
for descriptive cir-
cular.

EDW. HARBERT & CO.,
159 LaSALLE St. Chicago, Ill., U.S.A.

GRAPHITE.

Wanted, fair average
samples of about 1 lb. each,
with prices, F.O.B. Address
J. S. Merry, Assay Office,
Swansea, Wales.

lines to 1 inch).

OFFICE:
UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

Much has been accomplished during the past two years towards developing the mining industries of Canada. From ocean to ocean prospectors have been busy, and they have not laboured in vain. Rich deposits of gold, silver, copper, iron, coal, mica, phosphate and asbestos have been discovered, and mines of all these minerals are now being vigorously and profitably worked. Gold mining in Nova Scotia is now on a paying basis, and it is expected that the mines of British Columbia will return a larger profit during the present year than they have done for some years past. In Beauce, Province of Quebec, gold mining is paying

handsomely, and new ground is being opened that is pronounced very rich. At the Lake of the Woods, gold mines have been opened within the past two years of which most favourable reports have been made as to the richness of the quartz, but unfortunately lack of capital has retarded operations at some of the most valuable locations in this district. Important discoveries of silver have been made by the Silver Islet Company on their property on the north shore of Lake Superior, which will, in all probability, lead to the resumption of active operations by this company at an early date. Further inland, in a north-westerly direction, the developments at the Rabbit Mountain and Huronian mines have proved that region to be rich in silver; and, in fact, it would be difficult to name any silver mine in America that produces ore carrying a larger percentage of precious metal than either of these mines. Mica mining in Eastern Ontario has become a steady industry, and is rapidly increasing in importance, and in Villeneuve Township, County of Ottawa, a mine of this mineral has been opened that promises to become an abundant producer of mica equal in quality to the product of the New Hampshire and North Carolina mines. A large amount of asbestos, of superior quality, is being profitably mined in the Eastern Townships by Canadian and American mine owners. In Central Ontario some of the iron mines have been vigorously worked during the past year, and heavy shipments of the ore are now being made over the Central Ontario Railway to Weller's Bay, on Lake Ontario, from

which point it will be forwarded to Cleveland. At the phosphate mines in Ottawa County there is probably more activity than in any mining district in the Dominion. This industry has become one of great importance in the country, though it may be said to be yet in its infancy, and the annual output of the mines is steadily increasing. The mines are capable of yielding a much larger output, which fact is now being demonstrated by the introduction of steam drills and other machinery. Mining in Canada is making steady progress.

Referring to the discovery at Silver Islet, the Thunder Bay *Sentinel* remarks: "While not wishing to cause any undue excitement in the matter, we can hardly refrain from regarding the discovery of silver at Silver Islet on the mainland as a very important event. The nature of the surface ore taken out at present is of precisely the same character as that originally found upon the Islet, and it is to be hoped that the labours of the men now employed in making further investigations will bring results similar to those which induced the owners of the mine there (now closed) to sink so many thousands of dollars in developing it. Should further investigation justify the company in sinking a shaft and working it, the operations would, of course, be carried on at a much less expense than was the case at the Islet mine. The latter being entirely under water, considerable expense and trouble was always more or less a drawback to the success of the work, and had the vein not been of a

singularly rich nature this fact alone would long since have caused the owners to abandon it."

British Association.

The programme of the Citizens' Committee for the reception of the members of the British Association for the Advancement of Science visiting Ottawa on Saturday, 30th August, will be as follows:—

Upon the arrival of the visitors there will be an informal reception at the railway station. Carriages will be in readiness to convey the party to the Drill Hall, Cartier Square, where an address will be presented to the visiting members and a reception will be tendered them by the citizens. The party will afterwards be driven to the Russell, where luncheon will be served at one o'clock. After luncheon the visitors will be shown through the Houses of Parliament, the Library of Parliament, the Departmental buildings, the Geological Museum, the National Art Gallery, etc. The party will then be driven through the Major's Hill Park, Government House Grounds, thence to the Waterworks, the Timber Slides, the Chaudiere Falls and the Sawmills. Factories and other places of interest will also be visited if time permits. The visitors will be driven to the railway station in time for the departure of the train.

It is not improbable that a number of the members of the Association will visit the Phosphate mines in the vicinity of Buckingham, but it will be necessary to consult individual members, after their arrival at Ottawa, before any definite arrangements can be made with this object in view. Such an addition to the programme is most desirable and it is to be hoped the committee will succeed in carrying it out.

CANADA'S PHOSPHATE TRADE.

Phosphate mining in the County of Ottawa assumes larger proportions month by month. The mines, during the past year, have developed so satisfactorily that their owners have been encouraged to introduce machinery

and to thus adopt a new system of mining. The force of miners employed at the present time is greater than at any earlier period since this industry was started, the mines are much more productive, the output is more economically handled, facilities for transporting the ore have been greatly increased, freights to Montreal have been reduced and the importance of shipping the mineral in a high state of purity is now well understood by the mine owners. Since the opening of navigation this year, phosphate shippers have been particularly favoured by low freights to British and European ports, and already a large amount of ore has gone forward. In Montreal, at the various shipping points along the line of the Canadian Pacific Railway, and at the mines, there is a large quantity awaiting transportation, and the amount is being daily added to.

A number of prospectors have been out during the summer exploring the phosphate bearing district, and important discoveries have been made. Many of the recently discovered deposits have been partially opened up for the purpose of testing the properties preparatory to mining operations being engaged in on a permanent basis, and by next season some of these locations will, no doubt, yield abundantly and help to swell the annual output of the county. At the beginning of the year we predicted that about twenty-three thousand tons would probably be the total amount of phosphate to go forward before the close of navigation. The shipments will certainly aggregate 23,000 tons from the Ottawa district alone. This will be in excess of former shipments made in any one year from all the Canadian mines combined, and the quality of this year's output is of a higher grade than any that has ever before been shipped.

THE MINES.

High Rock Mine.—Of the mines in the Rivière du Lièvre district this one has been worked more steadily and has produced more phosphate than any other now in operation. For some years past the annual output has been increasing and this season the owners expect to forward not less than 6,500 tons. The daily yield of this mine has been increased by the introduction of steam power and the adoption of an entirely new system of mining. Steam drills and hoists are now in use where hand power alone had been employed; new

ground has been broken during the summer, which promises to lead to rich deposits; the force employed is greater than ever before, numbering 110 men, and the daily output averages about 30 tons.

Star Hill Mine.—Work was first started on this property by the Union Phosphate Mining and Land Company in May of last year, and for some months afterwards the attention of the company was directed chiefly to the erection of buildings and machinery, the opening of roads and in making other necessary preparations for permanent work. All this was thoroughly done, and mining operations have since been conducted on businesslike principles. A very small portion of this company's territory has yet been opened up, and, to judge from the appearance of present developments, it is not likely that it will be found necessary to break new ground for some time to come. The openings that are now being worked are yielding abundantly, and the amount of phosphate that will have been shipped from this mine during the present season will aggregate about 6,000 tons, a portion of which was mined last year but not forwarded. This, in addition to the erection of buildings, the construction of a tramway and other improvements on the property, and taking into consideration the fact that the company broke ground but a little more than a year ago, is certainly a most satisfactory showing and speaks well for the future of *Star Hill*. This mine gives employment to an average force of 80 men.

North Star Mine.—The result of the past year's operations at this mine has been most satisfactory to its owners, the Dominion Phosphate Company, who have saved no expense in thoroughly equipping the property and opening the mine in such a manner as to admit of permanent operations being carried on to best advantage. The force employed at present averages forty men, and the daily output varies from 10 to 12 tons. The product of this mine has the reputation of being of a very high grade not excelled by that of any other phosphate mine in the country. This company has 30 men employed at its "Washington" mine, and work is progressing very satisfactorily. The mine is developing into a valuable property.

Little Rapids Mine.—During the past two months a steady improvement has been noticeable in the principal shaft, and some new ground has quite recently been opened, exposing an extensive deposit of mineral. In the shaft the body of ore continues to increase in size, and in the drifts the men are working in solid mineral. The phosphate that is being raised from this mine is quite equal to that of the *North Star* if not of a higher grade.

Emerald Mine.—From the main body of ore at this mine the output is now being handled at a much reduced cost to formerly. Hoisting has been dispensed with, and both the mineral and refuse are now run out on a tramway through a tunnel. Everything connected with the management of the Ottawa Phosphate Company's mining operations is being thoroughly systematized with a view to raising and handling the product of this valuable mine at a minimum of cost. The body of mineral now exposed on the property is enormous and apparently inexhaustible. The average force of men employed does not exceed 65, and during the month of July the output was upwards of 600 tons of high grade phosphate, dressed and deposited in the ore bins. The company proposes extending operations, and is now making preparations for the accommodation of a larger number of miners. A new boarding house is in course of erection capable of sitting one hundred men in the dining room, and additions will be made to the other buildings on the property. The shipments from this mine for this season will aggregate about 5,000 tons.

Numerable less important mines than those mentioned are being worked in the Du Lièvre district, and are contributing largely to the general output. The mineral that has been forwarded from these mines is of a very fair quality and gives evidence of careful clobbering.

The Lièvre River Phosphate and Land Company, incorporated on the 4th July of this year, has already begun operations on some of its property, and we understand that good results have been attained. We are not in possession of any particulars of this company's operations to date, but hope to be informed in time for our next issue.

McLaurin Mine, in the Township of Templeton, continues to be as productive as at any time since the mine was opened and the mineral at the present level appears to be of a more solid character than it was nearer the surface. The force employed on this property is not so large as at the other important mines to which reference has been made, but the deposit is very productive and the mineral raised is of a very high grade. This year's shipments have amounted to about 2,500 tons, and the number of men employed averages 30 to 35.

The Gemmill Mine, in Wakefield Township, has produced more phosphate this season than last, and some new openings that have been made give promise of yielding large quantities of high grade ore, in fact the mineral that has been shipped from this property during the past five or six years has invariably assayed, in cargo lots, above 82 per cent.

The total amount of Phosphate forwarded from the mines in the Rivière du Lièvre district since the close of navigation of 1883 has amounted to 16,590 tons. About 75 tons are now being forwarded daily to the C.P.R. station at Buckingham and to the shipping point on the Ottawa river.

Phosphate Quotations.

Latest advices from Liverpool, London and Glasgow report Canadian Phosphate firm at 1s. 1½d. per unit for 75 per cent., with a fifth of a penny rise. Sales have been made at this price during the month of lots consigned early in the season when freights were low and returns have been satisfactory, showing the shipments to have run 82 per cent. and higher.

FREIGHTS.

Although rates are much higher than at the opening of navigation, a fair amount of tonnage is offering at reasonable rates. To Liverpool, London or Glasgow, sailing vessels are carrying phosphate at 6s. to 7s. 6d., and steamers at 10s. per ton. A quantity has recently gone forward at these figures.

MICA IN CANADA.

Until within the past two or three years it had been thought that mica, of good quality, did not occur in economic quantity in Canada, but the constantly increasing demand for it has encouraged prospectors to search diligently, and the result has been the discovery, in many localities, of deposits that are capable of producing this mineral not only in large quantities, and in plates, or sheets, of merchantable size, but equal in quality to that found in any part of the world. In the United States it has been found in some of the Western Territories, though not of a high grade in its colour or transparency, and it occurs more or less in some of the Atlantic States. In Maine and New Mexico, a small quantity has been mined, while New Hampshire and the State of North Carolina have been the principal sources of supply for the American and Canadian markets for many years past. The best quality of mica that has yet been produced in America comes from New Hampshire, while a much larger quantity has been mined in North Carolina, and an excellent quality. A great variety of mica is known to occur in various parts of Canada, and for some years past a fair quantity, of a second or third quality, has been mined and sold to stove manufacturers and dealers to be used chiefly in repurifying. At Sydenham, to the North of Kingston, a mine is being vigorously worked, and is producing an enormous quantity of amber, or wine coloured, mica which finds a ready sale both in Canada and in the

United States' market. The product of this mine is very large and the deposit is said to be capable of yielding an unlimited output for some time to come. Mr. W. E. Brown, of Ottawa, recently purchased a mica mine in the Township of Palmerston from Mr. Wm. Sheppard, of Aylmer. Specimens that we have seen from this mine are of a very excellent quality, but the work that has been done on the property, up to the present time, has been insufficient to prove the nature of the deposit or its productiveness.

In the Nipissing district, and at Mattawa, mica occurs of a very good quality, and, though no development work has yet been done in either of these localities, we have seen crystals, of many pounds in weight, capable of producing sheets of clear, white mica in sizes varying from $2\frac{1}{2} \times 5$ to 3×6 inches. In the Township of North Burgess, the *Pike Lake* mine has been very productive, having furnished many thousand pounds of white mica of excellent quality, and in sheets of unusually large sizes. There are several openings on this property, the deepest of which is but forty feet, and in each of them large bodies of crystals are exposed. Some of the crystals found in these openings have yielded, individually, upwards of 1,000 pounds of mica, cut and dressed, ready for shipping. On the bleak shores of Labrador, a fine quality of mica occurs, and a deposit is about to be tested at Chateau for the purpose of ascertaining if it can be obtained in sufficiently large crystals to render it of commercial value. The most important discovery yet made in Canada is the *Villeneuve* deposit, in the County of Ottawa. The crystals are well formed and very numerous and the mica is of a quality unexcelled in any part of the world. The micaceous vein extends for upwards of 300 feet in length and has a width of about 80 feet exposed. During the past two months Mr. W. A. Allan, of Ottawa, has had a small force of men at work on the property and, although more attention has been given to erecting buildings than to actual mining, a quantity, several thousand pounds, of magnificent mica has been taken out. The small amount of work that has been done on the surface has exposed upwards of one hundred well formed crystals embedded in quartz and feldspar gangue. A short tunnel has been driven from the base of the hill towards the vein, and the body of mica has been reached at this level, which shows that the crystals improve in size and compactness as depth is attained. From some of the crystals taken from the end of the tunnel, sheets of perfect mica measuring as large as 6×9 inches, and in quality equal to any that has been produced from the New Hampshire or North Carolina mines, have been received at this office. This is, without doubt, the most important and the most

valuable discovery of mica in Canada, and the deposit is capable of yielding a large annual output.

Gold Mining in Beauce.

The latest advices received from the *Allan & Humphrey* mine in St. George Concession are most satisfactory so far as they relate to the working in the shaft, but we regret to learn that, owing to the continuance of dry weather, the water fell so low in Slate Creek that the sluices which had been constructed have had to be extended for a distance of half a mile so as to catch a sufficient supply of water for washing. This has caused some delay and we are not yet, therefore, in a position to give our readers the result of the first wash up, as promised in last month's issue. The ground that is now being raised from the shaft is richer than any that has been met with, both in fine and coarse gold. This property is turning out a genuine *bonanza* and its owners are jubilant over their prospects. Their success will no doubt be the means of attracting a large number of miners and speculators to the district, and the ground along State Creek is likely to prove as rich in gold as that of any other gold producing region in America.

We are indebted to Dr. Reed, who has given much attention to mining in the Eastern Townships, for the following facts relating to gold mining in the County of Beauce: "Gold has been found in the Famine River from its mouth to above the great falls in the Township of Watford. Nuggets, four ounces in weight were found in 1865, and desultory mining in the bed of the river has always yielded good pay. Many large quartz veins traverse the river bed, but there has, as yet, been no practical mining engaged in. Sir William Logan, in the Geology of Canada, 1863, refers particularly to the alluvial gold in the Famine. The recent discoveries by the St. Onges, now the *Humphrey & Allan* mine, about thirty arpents from the Famine, on Slate Creek, are the result of practical workings by experienced men, backed by capital, and show conclusively that the reports of the late eminent geologist are correct, and that gold is to be found in the alluvions and banks of the river as well as in the river bed.

The Dominion Government having voted \$3,200 a mile to the Quebec Central Railway, from Beauce Junction to the Province Line, it is expected that the road will be ready for traffic this fall to the Famine River, nine miles from its present terminus in St. Francis. This will give increased facilities to gold mining in the district."

Central Ontario Mines.

(Special to the Review.)

At the *Coe Hill* iron mine, in Wallaston, work is being pushed vigorously and in a more systematic and mining-like manner than at any time since the mine was opened. Three shafts, with their respective wings, are being sunk and an average depth of 50 feet has already been reached. When this mine gets into thorough working order the owners will ship about 400 tons of ore daily. At present the daily shipments amount to about 300 tons, a portion of which is being taken from the stock pile, the balance being the daily output of the shafts. Powerful hoisting machinery is in course of erection on this property, and whilst excavating for the foundation on which the machinery will stand another large vein of iron was uncovered, about one hundred and fifty feet to the north of the main vein and running parallel with it. A theory has been advanced by a local geologist of an anticlinal axis making it but one vein with different dips, the main, or first discovered vein, dipping to the south with this newly discovered vein dipping to the north, but no work has yet been done whereby the correctness of this theory could be proved, and there are people who do not believe in anticlinals in a granite formation. Several new buildings are in course of construction at the *Coe Hill* mine and contracts have been given out for the erection of sixteen dwelling houses for the accommodation of the workmen.

The *Nugent* mine, situated about two miles to the west of *Coe Hill*, is now being thoroughly prospected. A vein of ore has been discovered that runs the full length of the lot. This property is owned by Messrs. Brown & Gaujot.

The *Baker* mine, in Limerick, is now being prospected with a Diamond drill.

At the *Arthur* mine, in Chandos, mining operations had been suspended for the purpose of testing the property with a Diamond drill. The tests, it is to be presumed, have resulted satisfactory as the mining has since been let to some American contractors.

The last two mentioned mines are owned by the Central Ontario Railway Company.

In the Madoc district there is no iron mining at present, but the water is now being pumped from the Walbridge Hematite mine and other preparations are being made for the immediate resumption of active mining operations.

At the *Canada Consolidated* gold mine, in Hastings County, a new revolving roasting furnace is nearly completed, and the owners of the mine are sanguine of favourable results. Other gold mines in Madoc, Marmora and Kaladar are now attracting the attention of capitalists, and the old *Richardson* mine is

likely to come to the front again. The chancery suit which has long since hindered mining operations on the last mentioned property has been finally disposed of and the owners, Messrs. Kelso & Brown, are now free to resume work.

Bessemer Steel.

The production of Bessemer Steel for the year 1883 was divided between the several steel countries as follows: Great Britain, 1,553,380 tons; United States, 1,119,576 tons; Germany, 995,000 tons; France, 440,000 tons; Russia, 340,000; Belgium, 220,000; Austria, 175,000 tons, and Sweden, 50,000 tons, making in all 4,892,956 tons.

Lake Superior Silver Mines

THE "HURONIAN" YIELDING ABUNDANCE OF RICH ORE.

Satisfactory Work at the "Rabbit Mountain."

Important Developments by the St. Paul Mining Company.

Specimens of rich ore have been received at Port Arthur during the month from a new discovery on location 39 T., owned by the St. Paul Mining Company. The specimens were taken from the shaft, at a depth of 68 feet, where several off-shoots are branching from the main vein. The shaft now shows large quantities of native silver and silver sulphate, and the company looks upon this recently discovered feature as a decided proof of the increasing richness of the mine. There are only twenty men at work at present, but this force is to be much increased as soon as miners can be secured.

The *Rabbit Mountain* mine is developing most satisfactorily, and rich ore is being taken from the new shaft that was started this spring. The ore continues of the same character as at the mouth of the shaft, but appears to carry more silver as lower depth is reached.

The *Huronian* continues to produce abundance of ore, rich in gold and silver, and the pay streak is steadily increasing in width. Systematic mining is carried on by this company, whose property is well equipped with machinery and general mining plant. The mill is kept busily employed, and the ore in the vein continues very rich. Of the actual result of the milling for the past month we are not yet informed. Messrs. C. T. Bate, Hiram Robinson and W. A. Allan, all of Ottawa, with some other shareholders, are now en route to the *Huronian* mine for the purpose of making themselves familiar with a property in which they are personally interested. On their return we hope they will be able to report favourable progress.

MINING IN THE ROCKIES.

(Special to the REVIEW.)

Silver city, which for some time, especially during the past winter, had been the headquarters of miners and prospectors, is now what might be styled, "a deserted village," some members and officials of the Alberta Mining Company being among the very few inhabitants left.

The *Queen of the Hills* mine, where active work was carried on during last winter, has been abandoned, and those who have been induced to invest money in this *quasi* bonanza are reticent as to future movements. The popular opinion is that mining will not be resumed.

Some work has been done at the *Alberta* mine, but being isolated from the line of travel, and so difficult of access at present, few people, apart from those directly interested in the property, have visited this mine during the summer. The ore is said to carry about eight dollars in silver to the ton, and a paying percentage of copper. Mr. O. G. Dennis, who resides at Silver city, is watching the interest of the shareholders and managing the company's affairs. A small force of miners is employed and due caution is being observed in performing the preliminary development work.

There are no other mining ventures in progress on the Eastern Slope of the Rockies, and prospectors have all found their way beyond the summit. There exists no doubt in the minds of people out here, who are capable of judging, that the Pacific side of the Rockies is the mineral bearing region of the North-West Territories, and that little attention will be given by mining men to any point lying to the east of the summit.

Coal in the North-West.

Copies of a pamphlet have been received containing a paper on the geology of the line of the Canadian Pacific Railway read by Dr. Dawson before the Geographical Society, during his recent trip to Europe. Describing a coal-bearing stratum near Medicine Hat, Dr. Dawson stated that about 90 feet from the base of the section is a bed of coal three feet thick, and covered with a shale rock, or parting, of two feet six inches, above which is another stratum of coal, four feet thick, with a shale roof. For about 50 feet above this, the cliff is occupied with shales holding several thin coals, and on this rests another bed of coal 3 feet 10 inches thick, with a roof of shale 3 feet thick, and over this a small coal stratum 10 inches thick. Above this, shales again occur, and, near the top, a bed of ferruginous and pebbly sandstone. The less pure coals in this section are brown coals, composed of leaves and vegetable debris compacted together. The better coals, including

the thicker beds, are apparently composed principally of coniferous wood, having the texture of a bright, hard lignite approaching to the character of true bituminous coal, and affording a valuable fuel. Beds of this character are very extensively distributed over the region. Beds of coal, some of them supposed to overlie those seen at Medicine Hat, occur at Maple Island, Blackfoot Crossing, and elsewhere near the base of the mountains. West of Calgary, as the Cretaceous and Laramie beds enter the Rocky Mountains and approach the junction with the Paleozoic rocks, they become much folded and disturbed, and the coals contained in them become harder and drier in quality, in some places approaching to anthracites.

A Melancholy Accident.

Gold Prospectors Drowned in the Kootenay River.

On the 13th inst., James Bracken, Judson Bartlette and Geo. Dean, a party of gold prospectors, were capsized while attempting to run dangerous rapids in the Kootenay River, British Columbia, near where the stream empties into the Columbia.

Bracken and Bartlette were sucked under and drowned. Dean managed to retain hold of the boat, drifted a long distance in an unconscious condition, and was finally thrown on a pile of drift. The bodies of his companions were not recovered.

The party had been prospecting far up in the mountains, and constructed a small skiff to descend to Kootenay Junction. They had successfully shot a hundred dangerous rapids and had nearly reached their destination when the fatal accident occurred.

The party had been, until recently, in the employ of the Columbia & Kootenay Railroad and Transportation Company in the capacity of surveyors.

A Modern Curiosity.

The Florence (Arizona) *Enterprise* says: "An Indian recently came to a couple of gentlemen there and said he knew where there was a gold mine in a cave, and that he would go and bring them some of the ore if they would outfit him. They did so, and after being gone two weeks he returned, bringing with him a piece of black oxide of copper as large as a tea cup. The rock contains a large cavity lined with water crystals studded with shot gold. The crystals are a beautiful sky-blue, and make a handsome setting for the gold. The specimen is as rare as it is beautiful, and if the Indian does not exaggerate, this cave is the greatest curiosity of modern times."

Gold Mining as an Investment.

(By Thomas Cornish, M.E., to the London M. Journal.)

Our gold supply in the future, as in the past thirty years, must be dependent on the results of gold mining as a profitable industry, and it may not be uninteresting to draw attention to the question of gold mining as an investment, or the means by which the gold supply can be permanently and profitably maintained. Gold mining must be classed as one of the most important industries of the present day. The industry is based upon such reliable facts, and built on so solid a foundation, that its importance cannot be denied.

The addition to the world's wealth through the enterprise of the gold miners of America and Australasia since the discoveries of gold in those countries in 1849 and 1851 has been nearly £800,000,000 sterling in gold and nearly half that amount in silver, or upwards of £1,110,000,000 sterling in gold and silver. This vast, real and solid wealth has been raised by a comparatively small section of the community, and distributed throughout the channels of finance, trade, commerce and industries, to the benefit of all who came within its widespread influences.

Our gold supply may be termed a true barometer of the prosperity of the countries in which it is being produced or in which it becomes absorbed by the current of trade and commerce. As population increases, trade, commerce and industries expand; so it is necessary, for financial purposes, that a proportionate supply of gold should be produced to meet the increasing demands.

Gold mining as an investment, where the operations are conducted economically under the control of practical men, has in the past and is now at the present time proving itself the most profitable of any. It is not of the visionary or shallow character that many of the people in Great Britain are led to believe it to be, in consequence of the disastrous failures of the many companies lately formed with the ostensible object of gold mining in India and Africa, through mismanagement and want of practical experience in directing the financial and mining operations.

It is not possible to obtain the returns of the profits made in gold mining generally, but they may be approximately estimated at from 25 to 50 per cent. on the output where the operations have been conducted without waste of labour; but the absolute results of some of the mines now in operation in America and Australia may be taken as a fair criterion of what can be and is being accomplished under efficient local management.

The yield of gold in the colony of Victoria has been about £205,000,000 sterling since 1851, and as one-half of the amount was raised during the first ten years, the profits might be fairly taken during that period at nearly half of the amount raised, while during the latter period the profits might be estimated at from one-fourth to one-third the product, or in round figures, say, from £50,000,000 to £60,000,000 may be estimated as profits on labour and capital judiciously invested in gold mining in that colony.

In the year 1882 the yield of gold was given as 889,535 ounces at £4 per ounce, equal to about £3,594,140; dividends from public gold mining companies amounted to nearly £800,000, or about double that of all the dividends from banks, insurance and other public companies in the colony, while a number of mines are held by private owners, where the dividends are not made public, would probably bring the amount of dividends from gold mining in Victoria to nearly £1,000,000 sterling for the year.

As a further proof of profitable gold mining in that colony. I enclose you a list of twenty-one gold mines whose dividends have not been less than £50,000 in any case, which in the aggregate have amounted to about £6,000,000, while a large number of very profitable mines are on the list of dividend-paying mines under the amount of £50,000.

While a list of forty gold and silver mines in America, whose dividends also exceed £50,000, amounts in the aggregate to nearly £10,000,000 sterling.

The following are the yields and dividends from the six principal alluvial gold mines in the Creswick division of the Ballarat district, Victoria, for three months ending June 30, 1883:

Name of Company.	Yield.		Dividends and Royalty.
	ozs.	dwt.	
Ristori	5,540	5	£17,022 8s 6d
Madame Berry ..	7,067	18	20,221 10 0
Lone Hand	4,357	11	6,484 1 0
Loughlin	1,621	3	1,702 17 6
Dyke's Freehold ..	1,360	0	2,222 0 6
New Australasian	4,008	19	3,750 0 0
Total	23,955	16	£51,402 17 6
	£95,823	4	

The above returns show the profitable nature of gold mining where there is a good supply of wash-dirt, and the water not too heavy, and as two of the companies are only lately in gold, their profit will increase as the ground gets more fully opened out. The first two companies have

been working in wash-dirt for some few years, have their mines well opened up, and may be deemed good examples of practical and profitable mining management of the Ballarat system. The Ristori Company, with an original capital of £12,000 has already paid in dividends and royalty over £100,000, and, as shown by the quarter's returns, June 30, 1883, on a yield of 5,540 ounces 5 dwts. gold, equal to £22,160, paid in dividends and royalty £17,022 8s. 6d., or nearly 75 per cent. on the output of gold has been profit; or showing an annual interest on the original capital at the rate of 700 per cent. per annum. Some of the quartz mining companies have been even more successful, paying dividends to the extent of from £250,000 to £800,000 on small capitals from £12,000 to £37,000, while the list under those sums is a very long and respectable one.

Gold mining is a business that to be made successful, must be managed by practical men who have had opportunities of gaining experience in the various phases of the industry at the mines. The results of the late furore in the so-called attempts at gold mining in India and Africa have resulted in a miserable fiasco, as was only to be expected from the manner in which the business and mining operations were conducted.

I have occasionally drawn attention to the deplorable waste of capital and labour in gold mining through the assumption of knowledge by amateurs who imagine themselves competent to advise on the investment of capital in gold mining or the management of mines. Their excited and fanciful imaginations lead them and their friends who are foolish enough to be guided by their judgment into error and serious losses, for which the mining industry gets blamed instead of the reckless indiscretion of the adviser and adviser.

What are termed losses in gold mining are more imaginary than real. Speculation in high-priced or inflated stock above legitimate value of a mine must, as a natural consequence, end in loss. So also with mines under defective management and extravagant expenditure in paying for the privileges of prospecting for gold. They also will surely come to grief.

The value of a gold mining property may be appraised by competent authorities in such a manner as to prevent any great loss on the investment, although no set rule can be laid down to guide men's judgment as to their estimate. It is questionable whether any gold mine should ever be valued at more than from two to five years' purchase, thus taking a mine well developed and paying good average dividends, according to the nature of the matrix operated on; for the mine to be worth a three years' purchase it is necessary that there should not be less than five years' work fairly in sight of a similar quality ore, or the lodes so opened that it affords a fair presumption that such a quantity of matrix can be obtained.

Mines vary so much at times in value and yield that the investor has a right to the chances of improved prospects as may arise, just as he is liable to the reverse by loss. Some of the considerations that should guide the investor in gold mines are, good climate, stable government, liberal laws, accessibility, ample supply of water and wood, and last but not least, the prospects of a fair quantity and quality of matrix to operate on. With these considerations, under careful management, gold mining is at the present, as in the past, proving itself to be the most profitable industry in the world.

The fields for legitimate and profitable investment in gold mining are, practically speaking, inexhaustible and afford ample scope for enterprise, and by judicious investment of capital under experienced direction, there need be little fear of loss, while the profits are likely to be large, as the gold supply can be materially increased by the development of the resources at hand.

Product of the Mines of New South Wales during 1883.

According to the official report of the Under-Secretary for Mines of New South Wales for 1883, the result of all the mining operations in the Colony during the year was as follows:—

	1882.	1883.
Gold, ounces.....	140,469	123,806
Silver ".....	38,618	77,066
Coal tons.....	2,109,282	2,521,457
Shale ".....	48,065	49,250
Tin ".....	8,669	9,125
Copper ".....	4,958	8,957
Iron ".....	7,476	3,434
Antimony ".....	1,068	375
Lead ".....	11	30
Asbestos ".....	7	..
Bismuth ".....	2 14	3.7

The falling off in the gold production has been great as compared with the yield in former years, as the following table shows:

PRODUCTION OF GOLD.

	Ounces.		Ounces.
1874.....	270,823	1879.....	109,650
1875.....	230,883	1880.....	118,690
1876.....	167,412	1881.....	149,627
1877.....	124,111	1882.....	140,469
1878.....	119,665	1883.....	123,806

On the subject of gold the Under-Secretary states: "It is clear that the continued drought has had the effect of preventing the prosecution of prospecting operations during the year, and has seriously retarded the working of older fields. Whether the falling off in the yield of gold can be accounted for by the absence of sufficient water to carry on the usual crushing and washing operations, or whether the decline is not in some degree due to the gradual exhaustion of such of the deposits in the older gold-fields as are capable of being profitably worked without the aid of steam, hydraulic, or other power, it is difficult to determine with any degree of certainty. It is quite certain that in the absence of new discoveries it is only a question of time, and that comparatively limited, before those deposits which can be worked by the individual miner must be exhausted; but with the breaking up of the drought, we may reasonably expect that prospecting operations will be resumed and new ground opened. Of course, there is an unlimited extent of auriferous country within the older gold-fields of this colony, which, worked with proper appliances on a large scale, would yield satisfactory profits and give steady employment to a large body of miners for many years to come. But until the necessary capital and skill is brought to bear on these deposits, or some new discoveries be made, we cannot hope to see any large increase upon our output."

THE WORLD'S GOLD PRODUCTION.

It has been shown by several writers, says *Chamber's Journal*, that up to the year 1848 the world had outgrown its supplies of precious metals, and that commerce was languishing for the want of the wherewithal to adjust the exchanges of communities. Previous to that year, the principal sources of supply were South America, the west coast of Africa, Russia in Europe and Asia, and the island of the Malay Archipelago. According to the calculations of M. Chevalier, the total production of both gold and silver from these sources, between 1492 and 1848, was equal in value to £1,740,000,000. The importation of gold, however, was small; and the total stock of the metal in Christendom in 1848 is estimated to have been only £560,000,000. The production since that time has been very remarkable. Let us look at the figures. In 1848 California gold began to come forward; in 1851 the Australian fields were opened. Between 1849 and 1875 the production of the world is estimated at £616,000,000, so that in twenty-seven years the stock of gold was more than doubled. The average annual supply previous to 1848 was £8,000,000; in 1852 the production was £36,500,000. An Australian authority estimates the yield of the colonies from 1851 to 1881 as £277,900,000; as Mr. Hogarth Paterson gives the total production of the world between 1849 and 1880 as £710,000,000.

The statisticians of the United States mint estimate that the total production of gold in the world during the 400 years ending in 1882 was 10,394 tons, equal in value £1,442,359,572. During the same period the production of silver was 101,731 tons, of the value of £1,716,463,795. On the basis of the last three years, the average annual production of gold in the world is now £21,500,000. Taking 1881 as an illustration, the largest contributors were:

United States.....	£6,940,000
Australasia.....	6,225,000
Russia.....	5,710,000
Mexico.....	197,000
Germany.....	48,200
Chili.....	25,750
Columbia.....	800,000
Austria.....	248,000
Venezuela.....	455,000
Canada.....	310,000

LAKE SUPERIOR GOLD.

The *Economist*, N.Y., August 16th, contains the following: "Among the rich mining industries of the Lake Superior peninsula, a new one promises to come in. Three years ago Postmaster Ropes, of Ishpenning, was prospecting in an unused marble quarry about four miles north of the town. Mr. Ropes added to his duties as postmaster the business of assaying, so that he was an expert. While he was putting in his pick here and there he struck gold-bearing quartz. Subsequent examinations revealed the mother vein, and the result was the formation of a company, to which was sold the option, which expires the 1st

of November, of taking the property. The company pays \$6,000 for the privilege of working the mine till November, and it is thought that the results obtained establish the fact that the Marquette district possesses a profitable gold mine. A shaft has been sunk and a fine stamp mill erected for the purpose of experimenting with the ore, which is obtained in sufficient quantities to keep busy a mill five times as large as the present one. The Colorado expert who is superintendent of the mill thinks that the ore can be mined at a cost of \$3 a ton. The ore obtained from the shaft which has been struck yields, on an average, from \$6 to \$9 a ton in gold, and from \$2 to \$3 in silver. Some ore has been taken out which yields as much as \$300 a ton."

MINING STOCKS.

New York Mining Stock Markets.

Except for one or two stocks, the activity developed towards the close of the week ending August 16th has not since then been maintained, and while a fair amount of trading has transpired the market cannot in any sense be described as active, still a very steady tone has prevailed, and in several instances a higher range of prices has been established. Beyond these features, however, the dealings have not presented any points of special interest. The outside public still refuses to speculate in mining stocks but regular traders are evidently more inclined to operate and it would seem as though the general improvement gradually developing in railroad securities, as well as in commercial affairs, was in some degree being reflected in the mining stock market and that a more hopeful as well as cheerful feeling was slowly extending its influence. The stocks most actively dealt in upon this market certainly appear to have worked up to a higher plane of values compared with the lowest point touched during the recent depression, and to have maintained the advantage in consequence of a strong undertone that still prevails, and this is by far the most satisfactory as well as substantial kind of advance that could be experienced. No more booms either in mining stocks or any other department of business activity are wanted just at present; business men have had enough of the last picnic to last them for some time to come and do not care to repeat the experience right away, but what is wanted is a healthy spirit of speculative activity and a moderate advance in the price of many good mining stocks that on their merits are now considered abnormally low. It cannot be denied that among the stocks regularly dealt in, both here and in San Francisco, a good deal of chaff exists, but it is likewise true that among this chaff there is more or less sound grain, consisting of mining properties that are being successfully and profitably worked and that are returning handsome dividends to their owners. This week no less than three announcements of this character have been made; Ontario, Homestake, and Father de Smet, each making a return to their shareholders, the first two companies having already paid in dividends the large sum of over eight millions of dollars. These are by no means isolated cases, as our readers are well aware, but at the moment they serve to bear out the truth of the above remarks.

The most prominent features of the market this week have been Consolidated Virginia and one or two of the Tuscorora group. With respect to the first, the dealings have been large at steadily advancing prices, which singularly enough have been kept considerably above the parity of San Francisco. For this reason the firmness of this stock has been a puzzle to many, especially as nothing has transpired at the mine so far as the public are advised, to warrant an advance. Nevertheless, there have been steady buyers and in all about 15,606 shares have been traded in at from 33 which was the lowest point on Saturday last up to 47, the closing figures yesterday being 42. Other Comstocks have not received much attention, but Sutro Tunnel has ruled moderately active and firm, about 5,700 shares selling at 17 up to 21. Small sales of Sierra Nevada have transpired at 1.70 to 1.75 and then down to 1.50 in sympathy with a similar drop at San Francisco; and occasional transaction in California at 17 completes the list.

The Tuscorora group have ruled firm, and although but a moderate business has been accomplished prices show quite an advance. Navajo has sold at 4.25 to the extent of 500 shares. The company report a good surplus and bullion shipments that ought soon to yield a dividend. There has been a further advance in Belle Isle, which has sold as high as 1.00, and at the higher range of prices thus established displayed a good deal of strength. The improvement is said to be due to the development of good ore. About 1,100 shares have changed hands at 85 to 1.00, the closing price yesterday being 93.

Silver King has continued to rule firm at 5.12, and Horn Silver quiet but strong at 5.75 to 6.00. Eureka Consolidated has sold at 2.65 to 2.70. Green Mountain a shade easier, at 1.90 to 1.95, and Alice steady at 2.75. The Bodie group has remained quiet and without special feature, the only business comprising a few shares of Bulwer at 60 and of Standard Consolidated at 1.50 to 1.70, the latter showing an advance since last week. Consolidated Pacific steady at 55 to 59.

Colorado stocks have been inactive but steady, transactions including moderate sales of Chrysolite at 75 to 80, Leadville at 35, Little Chief at 30 to 31, Dunkin at 28 and Amie at 9.

The State Lines have displayed some signs of life, Nos. 1 and 4 being traded in to a moderate extent at 3 to 4 and Nos. 2 and 3 at 6 to 7. Oriental Miller has fluctuated between 14 and 16, Rappahannock in some request at 16 to 18, Central Arizona quiet at 22, Castle Creek at 18 and Sonora Consolidated at 3 and Harlem at 3.

The total sales for the week have been 23,800 shares on Saturday, 3,300 do. on Monday, 7,800 do. Tuesday, 16,500 do. Wednesday, 6,575 do. Thursday, 7,400 do. yesterday.—*New York Mining Record, Aug. 23rd.*

Cape of Good Hope Copper Mines.

Two of the wonderful copper mines of the world are the Speek-takel and the Ookiep, Cape of Good Hope, belonging to the Cape Copper Company. Year after year these mines have turned out large quantities of very high-grade ore, and have paid to their fortunate shareholders, on a capital of £160,000, profits aggregating £1,152,500, or roughly \$5,600,000. Since 1880 they have made annually 5,000 long tons of copper, from ore that in 1882 averaged 28.63 per cent. and in 1883 29.5 per cent. of metallic copper. With a reserve in the Ookiep, the principal mine, of 42,113 tons, it does not look as though low prices would in any way cause a reduction in the product. The mining cost was only 3s. 9½d. per unit; the profit was 11s. 11d. per unit, the company having its own railroad and its own smelting works in England, where 11,273 tons of ore were treated in 1883, at a profit of £9,150. The decline in values, of course, affected profits, the falling off in the average of prices in 1883 against 1882 being computed at £32,193. Still the company was able to make a net profit in 1883 of £101,131, against £145,464 in 1882 and £131,712 in 1881.

IMPORTANT TO BOATMEN.

GOOD BOATMEN

Required to accompany

The English Expedition up the Nile,

To Steer Boats Through the Rapids and do all Necessary Portaging.

Engagements to be for six months from September 1st, 1884.

Pay to be at the rate of from \$30 to \$40 per month, according to efficiency of each man.

Each man will be provided with an outfit, free rations, and all expenses paid from and back to place of his engagement. The men to be subject to the authority of their foremen and the officers under whose charge they may be sent out; such officers to have power of punishing insubordination or irregularity by stoppage of pay and, if necessary, by dismissal.

Men to report at Ottawa, 6th September, 1884.

Only thoroughly good and active boatmen will be engaged.

Married men to have the privilege of allowing their family to draw — per cent. per month of their pay.

All information in connection with the above can be had at the office of J. T. Lambert, 110 Wellington street, Ottawa.

By command, MELGUND,
Governor-General's Secretary.

SEALED TENDERS, addressed to the un-
designed, and endorsed "Tender for Post
Office, etc., Winnipeg, Man.," will be received
at this office until **TUESDAY**, the 2nd Sep-
tember next, inclusively, for the erection and
completion of

POST OFFICE, ETC.,

—AT—

Winnipeg, Man.

Plans and specifications can be seen at the
Department of Public Works, Ottawa, and at
the Dominion Clerk of Works Office, Win-
nipeg, on and after Monday, the 18th inst.

Persons tendering are notified that tenders
will not be considered unless made on the
printed forms supplied and signed with their
actual signatures.

Each tender must be accompanied by an
accepted bank cheque, made payable to the
order of the Honorable the Minister of Public
Works, equal to five per cent. of the amount
of the tender, which will be forfeited if the
party declines to enter into a contract when
called upon to do so, or if he fails to complete
the work contracted for. If the tender be
not accepted the cheque will be returned.

The Department will not be bound to accept
the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.Department of Public Works,
Ottawa, Aug. 9th, 1884. [36-3]

Special Contracts made for time and
space.**CANADIAN MINING REVIEW.**Union Chambers, 14 Metcalfe St.,
OTTAWA.**MAIL CONTRACT.**

SEALED TENDERS, addressed to the
Postmaster-General, will be received at
Ottawa until noon, on Friday, 29th August,
1884, for the conveyance of Her Majesty's
Mails, on a proposed Contract for four years,
three times per week each way, between
Dunrobin and South March from the 1st
October next.

The conveyance to be made on horseback
or in a suitable vehicle, via the Postoffice at
Dunrobin when going, and by the direct route
when returning. The mails leave South
March every Tuesday, Thursday and Satur-
day as soon as possible after arrival of mail
from Ottawa, and to perform the journey to
March and back within three and three-
quarter hours.

Printed notices containing further informa-
tion as to the conditions of proposed contract
may be seen, and blank forms of tender may
be obtained at the Postoffices of Dunrobin,
March and South March, or at the office of the
subscriber.

Postoffice Inspector's Office,
Ottawa, July 26th, 1884.**MAIL CONTRACT.**

SEALED TENDERS, addressed to the Post-
master General, will be received at Ottawa
until noon, on FRIDAY, the 29th AUGUST,
1884, for the conveyance of Her Majesty's
Mails, on a proposed contract for four years,
twelve times per week each way, between
CUMBERLAND and BUCKINGHAM RAIL-
WAY STATION, from the 1st October next.

The conveyance to be made on horseback or
in a suitable vehicle, and in a boat across the
Ottawa River.

The mails to leave Cumberland Post Office
twice daily (Sundays excepted) at such hours
as may be necessary to connect at Bucking-
ham Railway Station with mail trains pass-
ing east and west respectively. Exchange
mails with said trains and return to Cumber-
land Post Office within 30 minutes.

Printed notices containing further informa-
tion as to conditions of proposed contract
may be seen, and blank forms of tender may
be obtained at the Post Office of Cumberland
or at the office of the subscriber.

Department of Public Works,
Ottawa, 8th Aug., 1884. [36-3]**MAIL CONTRACT.**

SEALED TENDERS, addressed to the
Postmaster General, will be received at
Ottawa until noon, on Friday, the 29th August,
1884, for the conveyance of Her Majesty's
Mails, on a proposed Contract for four years,
Six times per week each way, between South
March and Stittsville Railway station from the
1st October next.

The conveyance to be made in a suitable
vehicle, via Post Office at Carp, March-Hurst
Huntley, and Stittsville. The mails to leave
South March daily (Sundays excepted) at such
an hour as will enable Courier to reach
Stittsville Railway Station in time to make
connection with mail train passing to Ottawa
at about 1.00 p.m. To leave Stittsville Post
Office as soon as possible after the arrival of
said train, and to arrive at South March
within three hours afterwards.

Printed notices containing further informa-
tion as to conditions of proposed Contract
may be seen, and blank forms of Tender may
be obtained at the Post Office of South March
Carp, March-Hurst Huntley and Stittsville, or
at the office of the subscriber.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 5th of the month it is to appear.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

In another column we reprint an article from the *Victoria, B.C., British Colonist*, which has recently appeared in that journal under the heading "Provincial Rights to the Minerals." It would appear from the tone of this article as well as from the public notice of Mr. Vowell, the Gold Commissioner at Shuswap, that the Province of British Columbia will consider itself untakenly dealt with if the Canadian Pacific Railway Company, through the Dominion Government, does not reconvey to British Columbia all the valuable mineral deposits that may be found to occur, within the railway belt, on territory of

which the C. P. R. Co. is now the owner. In conveying to the Dominion Government these lands along the line of the railway, to be appropriated in such manner as it might deem advisable in furtherance of the construction of the railway, no reservation of the minerals was made. The C. P. R. Co. now holds the lands without any such restriction and it will be difficult to make good a claim of the Province to the mineral wealth within the belt.

Sir John Laws, and his practical chemist, Dr. Gilbert, of London, England, have brought out several new and important facts in connection with phosphate as a mineral manure which cannot fail to become a great source of revenue to Central Canada, and especially to the Province of Quebec.

The Lord Bishop of Ontario on his return home from the Rockies, expressed a high opinion as to the future of that great country, which is in itself a vast kingdom. Its agricultural, mineral and commercial prospects have impressed most favourably the large body of British Scientists, who formed the party with His Lordship. This meeting of the British Association in Canada will tend greatly to bring our country to the front in many respects, and the Bishop of Ontario is to be congratulated in being the prime mover in bringing to a successful issue this vast scientific gathering in our Dominion. Our resources, our people and our country will now be warmly discussed in the homes of our brethren across the sea, and the interest aroused will greatly advance the prospects of Canada.

The trip made by these scientific gentlemen to the Rocky Mountains was unattended by accident or casualty to cause a moment's inconvenience or discomfort, or to mar, in any

manner, their enjoyment of so extended a journey. The displacement of rock which occurred in the C. P. R. tunnel at the Rockies, when the visitors were examining it, might have proved more serious than it did. As it was, Dr. Selwyn, Director of our Geological Survey, narrowly escaped severe injuries; he, however, received nothing more than some bruises, to which he attached little importance.

Mr. J. F. Carll, State Geologist, of Pennsylvania, returned to his home during this month after having spent some weeks among the phosphate mines of Ottawa County. Mr. Carll came to Canada for the express purpose of thoroughly investigating our phosphate deposits in the interests of a party of American capitalists whose intention it is to acquire mining rights in the country, upon his favourable report, and to engage extensively in mining. Mr. Carll has carefully looked into everything connected with this mining industry, and the result of a still more careful examination of the mines in operation, as well as some undeveloped properties, has led him to express a very favourable opinion of the productiveness of the phosphate deposits of the district.

Mr. J. G. Miller, who for many years was identified with phosphate mining in Canada, was in Ottawa during the month. Mr. Miller has been engaged for the past three years in phosphate mining in the vicinity of Porto Rico. He was struck with the marvellous development of the industry in Ottawa County during the few years he had been away.

Mr. A. A. Humphrey was in Ottawa recently and gave a most interesting account of the gold mining operations which he is so successfully conducting in Beauce in Mr. W. A. Allan's interest and his own. He reports that the present prospects are more encouraging than he had dared to hope for.

The Harbert Telephone for private lines, advertised in another column, promises to be a useful instrument to miners. One has been erected at the the "Little Rapids" phosphate mine and saves the manager many tedious trips between the office and the works.

OUR PHOSPHATE TRADE.

The phosphate shipping season of 1884 is nearing its close, and when the balance of the output of the Ottawa county mines will have been forwarded across the Atlantic it will be found that the total shipments during this season of navigation will exceed, by several thousand tons, the output of any former year, and the quality of the phosphate already forwarded, and awaiting transportation, is of a much higher grade than that which our mines have ever before produced. As we showed, by a report of the mines in the last number of the REVIEW, the chief contributors to the general output this year have been the "High Rock" and the "Union Phosphate Company's" mines in Portland West, the "North Star" in Portland East, the "Emerald" in Buckingham Township and the "McLaurin and Blackburn" mine in the Township of Templeton. It is estimated that before the close of navigation these mines will have sent forward about 20,000 tons, and the probable output of the County of Ottawa will aggregate 23,000 tons. Of the mines in the du Lievre district none have developed more satisfactorily than has the "Little Rapids" mine in the First Range of Portland East. This property has been carefully and thoroughly worked into shape during the past few months for permanent mining on a mining-like system. Drifting has been started on the veins at different levels in the shafts with most encouraging results. Extensive bodies of phosphate of a superior quality have been exposed which more resemble the form of fissure veins

than anything that has been met with in the history of phosphate mining in the district. A hitherto undiscovered deposit of mineral has recently been uncovered on this property and has been partially opened up, and its further development will unquestionably add to the value of what is already a very valuable property. The "Little Rapids" mine will certainly be one of the large producers of the future. Each of the other mines above mentioned continue to yield an average daily output about as reported last month, and the superintendent of the Dominion Phosphate Company reports satisfactory progress at the company's "Washington" mine in Buckingham Township. In short nothing could be more encouraging than the reports received from the mines during the month. Mine owners have reason to be satisfied with the result of the year's operations, for, although prices have not ruled as high this season as they might have wished, the low rate for ocean freights at the opening of navigation, and for the past few weeks, has enabled shippers of phosphate to realize \$17 to \$18 per ton at Buckingham station, equivalent to one hundred per cent. profit all round on the cost of mining and transportation to that point.

The shipments of phosphate from the Perth and Kingston districts show a slight falling off from former years, and will probably not aggregate more than 2,500 tons, of which Capt. R. C. Adams' "Otty Lake" mine, in the Township of Burgess, has contributed about 800 tons.

The prospects for next year are very bright for Canada's phosphate industry. Many valuable properties in the County of Ottawa have been prospected during the past few months and their owners are making preparations for permanent mining in which they are justified by the flattering reports forwarded to them by their prospectors. It is not improbable also that before next year's output begins to move a large amount of foreign capital will have been invested in this industry. Our phosphate deposits are attracting the attention of English, European and American capitalists and hardly a day passes that does not record the arrival of some foreigner in our phosphate district, the object of whose mission is to thoroughly investigate with a view to acquiring mining rights. Numerous letters have

been received at this office from abroad asking for information concerning our phosphate deposits, and if property owners who have not the means to engage in mining will be but reasonable in their demand, there is no reason why a very large amount of foreign capital should not be available for the more rapid development of the phosphate industry. The following extracts from a report of Major Edward Willis, of Charleston, on this industry in South Carolina, which has appeared in the *N. Y. Mining Record* will serve to give our readers some idea of the magnitude and importance it is possible for phosphate mining to attain in the hands of an enterprising people.

"The importance of the phosphate business to Charleston cannot easily be overestimated. It has grown to such proportions that it has been felt necessary by the miners to form an exchange for the better regulation of the business. As an outcome of this feeling, the Phosphate Miners' Exchange was formed in March last, all of the miners of land rock in this vicinity, with unimportant exceptions, being members, and the plan has worked very satisfactorily.

The following table shows the value of the phosphate business, the shipments and consumption in the year just closed (September 1st), as compared with the preceding year, this year's being the largest on record and representing at the rate of \$6.50 a ton, a gross sum of \$2,659,169 for 1883-84.

Phosphate Quotations.

Latest advices quote Canadian phosphate in the English market at 1s. 3/4d. for 75 per cent. with a fifth of a penny rise. At this season of the year no advance is looked for over this price.

FREIGHTS.

Shippers of phosphate have secured tonnage during the past month at nominal rates. Ship owners have been offering as low as 1s. 6d. by steamer to London and Liverpool, and some contracts were made at 3s. 6d. per ton to each of these ports. Unfortunately a large portion of the year's output had gone forward at much higher rates during the summer.

A NEW INDUSTRY

IN CONNECTION WITH OUR PHOSPHATE TRADE

For the past year or more the feasibility and practicability of shipping the output of our phosphate mines, or a portion of it, in a ground state has been discussed, and it is apparent that this can be done to advantage from the fact that, after thorough investigation, two parties of American capitalists, who are each of them interested in phosphate mining in the du Lievre district, have simultaneously decided to engage in this new industry of grinding the phosphate rock, and for this purpose are now making the necessary preparations. The Union Phosphate Company have purchased a small mill on the du Lievre River, immediately south of the C.P.R. crossing at Buckingham, which they are fitting up with suitable machinery. Mr. G. H. Bacon, now of Ottawa, associated with some gentlemen of Boston and Charlestown, S. C., has leased some ground with the water privileges, known as the Bang's property, also to the south of the railway crossing of the du Lievre, and will engage extensively in this business. This venture, if it proves a success, should stimulate the phosphate mining industry, and doubtless it will, as it is the intention to utilize the low grade of rock for which there is at present no market in its unground state. The output of the mines situated in Templeton and Wakefield can be delivered in barges at a point near the mills.

A MONSTER CRYSTAL.

A phosphate crystal weighing eight hundred pounds has been presented to Mr. W. A. Allan, of this city, by the owners of the famous "Emerald" mine. It is a rare specimen and is the largest phosphate crystal known to have been discovered in Canada. Mr. Allan has had it placed in our office, where it may be seen by those who take an interest in such curiosities.

The Ontario silver mine, Utah, has shipped bullion amounting in value to \$1,128,067.64 during the twelve months ending August 31st. The receipts of bullion at Salt Lake City for the first eight months of the present year have amounted to \$3,647,332.48.

Distinguished Visitors

—AT—

OUR PHOSPHATE MINES.

Prof. W. BOYD DAWKINS, of Owens College, Manchester, England; WILLIAM TOPLEY Esq., of the Geological Survey of England, and H. BAUERMAN Esq., Royal School of Mines, both of London, England, visited the "Little Rapids" and the "Emerald" mines, and were very favourably impressed with the fine display of high grade mineral which met their eye in the bins and in the mines. These gentlemen are members of the British Association for the Advancement of Science, and it is fortunate that they were enabled to find an opportunity to examine these properties before returning to England. Prof. Dawkins has expressed himself, not only much interested by what he saw, but very much pleased, as well, to find that Canada possesses such extensive deposits of so valuable a mineral. His opinion, based chiefly on what he saw at the "Little Rapids" mine, is that mining has not yet reached a depth at which even much larger bodies of phosphate than what he saw might reasonably be looked for. Prof. Dawkins is one of England's greatest geologists and much value and importance is attached to his opinions, by the people of England, on all matters relating to geology and practical mining. That he should have formed so favourable an opinion of the prospects for the future of our phosphate mining industry is most gratifying to those engaged in it. In his trip to the mines Prof. Dawkins was accompanied by Dr. J. A. Grant and Mr. W. A. Allan, of Ottawa.

Ottawa Colonization Railway.

The "Short Line" to be Built.

The construction of this railway has been, for the past two years, a subject of much interest to the phosphate mine owners in the du Lievre district, and, although the holders of the charter have repeatedly asserted that work was to be at once begun on the line, up to the present moment not a sod has been turned. It was at one time supposed that the President of the company had overcome all monetary difficulties when he induced a party of American capitalists to take up this enterprise, together with the construction of the Gatineau Valley Railway. Shortly after this was accomplished the company started grading northward on the last mentioned road, and after a few miles had been graded operations were suspended. Since then there appears to have been a mystery hanging over the movements of those who are behind the scenes. When it was found that the con-

struction of the Ottawa Colonization Railway from Buckingham northward was likely to be indefinitely delayed, the phosphate shippers made a request that the company should build that portion of the line which would connect Buckingham village with the Canadian Pacific Railway at Buckingham station, to enable them to forward the output of the mines direct from the landing on the du Lievre River at Buckingham village to Montreal, and thus save the expense of transshipping in waggons over three miles and a half of road, almost impassable at any season of the year, and altogether impassable during the spring and autumn months. This request having been stubbornly disregarded by the company, some of the enterprising phosphate miners offered to construct these three and a half miles of roadway under the Ottawa Colonization Railway charter, and to agree to hand over the same to the company when it should find itself in a position to reimburse them the actual cost of construction. This offer has been made by two distinct parties of mine owners and rejected. A gentleman of this city, who is deeply interested in our phosphate industry and is an extensive owner of phosphate lands in Ottawa county, and who has already invested a large amount of money in the O. C. R. made the proposition to construct this *short line* himself on equitable terms. His offer has also been disregarded. The time has

now arrived when we may ask, where lies the mystery? Judge Sypher, of Philadelphia, representing the supposed American capitalists, was in Ottawa recently. What was the object of his visit? and did he accomplish it if he had one? It is certain that he studiously avoided meeting the very men who ought to be consulted before any new movements were decided upon, and from what we can learn, some arrangement has been entered into between this company and the Canadian Pacific Railway Company. It is now a settled fact that the C. P. R. Co. are to construct the *short line* and work will be begun thereon at once. A game of bluff has been going on between the Sypher party on the one hand and Mr. Van Horne on the other, and it would appear that the latter has *drawn* most successfully. It is natural to suppose that Mr. Van Horne will build this branch line under the Occidental Railway charter, and, if such is the case, can it be that Judge Sypher and the American capitalists associated with him will have permitted this to come to pass without receiving some substantial consideration from Mr. Van Horne? And why have Mr. Mackintosh, the President of the Ottawa Colonization Railway, and Mr. Allan, the Vice-President, been kept in ignorance of this deal? That there has been intriguing at the expense of some one, there can be no doubt, but the road is to be built and phosphate shippers will be glad to know it.

city of Mexico, are as direct consequences of the production of so much gold and silver from the mines of this country since 1848, as is the existence of such a city as San Francisco upon the shores of the Pacific. Even the fact that California has at present fully 125,000 acres of lands planted in vineyards worth on an average at least \$200 per acre, and that the State possesses fully *one-tenth* of all the sheep in the United States, and produced 40,840,000 pounds of wool in 1883, may be rightly ascribed to the production previously of so much gold from its teeming placers. To the same cause, also, may be attributed such commercial results as the shipment from San Francisco during the nine months ending the 31st of March, 1883, of wheat and flour to the value of nearly \$22,000,000. But independently of these and many other as remarkable agricultural results incident to or consequences, as we maintain, of the gold and silver output of our Pacific Coast mines, the actual dividend results, which were reported in the *Mining Record* during the calendar year 1883, make a most satisfactory showing, as may be seen from the following extract of them:

	Mines.	Amount paid.
Arizona	4	*\$1,162,500
California	11	1,119,976
Colorado	16	†1,323,250
Dakota	3	665,000
Georgia	1	28,000
Idaho	4	85,000
Michigan	5	2,670,000
Montana	5	†513,824
Nevada	8	856,000
New Mexico	1	500,000
Utah	5	1,582,000
Total		\$10,505,550
Sonora, Mexico		200,000
Nova Scotia		15,000
Total		\$10,720,550

Subtracting from the foregoing the product of the copper mines of Michigan and of the quicksilver of California, in the aggregate \$3,130,000, as also \$215,000 derived from the gold mines of Sonora and Nova Scotia, and we have \$7,375,550 as the dividend result of mining corporations, upon a total product for the year 1883, reported by Mr. J. J. Valentine, of the States west of the Mississippi and of Missouri, as follows:

Gold	\$27,816,640
Silver	42,975,101
Lead	\$8,163,550
Copper	‡5,683,921
Total	\$84,639,212

The dividends thus aggregating \$7,375,550, and constituting $8\frac{3}{4}$ per cent. of the whole value of the copper and lead as well as the gold and silver mined in the Western States, we repeat, were paid exclusively by incorporated mining companies, while much the larger part of that product was derived from mines not owned by corporations but by individuals or by private companies that have made no report of dividends or profits.

To sum up, we may state that for the six years ending December 31, 1883, the dividends reported by those incorporated companies, and the product of the Pacific Coast mines annually, have been about as understated:

	Amount of reported dividends.	Product.
1878	\$21,100,000	\$ 78,277,000
1879	9,200,000	72,689,000
1880	9,500,000	77,233,000
1881	12,675,000	81,299,000
1882	10,950,000	89,208,000
1883	10,690,000	84,640,000
Total	\$75,115,000	\$483,246,000

That is to say, the shareholders in incorporated companies have received as much as $15\frac{5}{8}$ per cent. of the amount won from the mines for the period in question. And in the face of such facts and figures, there should be less gabble about the alleged precariousness and unprofitableness of the business of mining for the precious metals.

*This does not include the dividends which were paid to the extent probably of \$200,000, we are very sure, by the Grand Central of Tombstone.

†Does not include dividends probably paid by the R. E. Lee mine of Leadville during 1883.

‡Does not include dividends paid by several important properties at Butte of which we could elicit no report.

\$This lead was derived from silver bearing ores.

||This does not embrace copper from the mines of Michigan.

The Dividend Results of the Mining Industry for 1883.

(N. Y. Mining Record.)

The industrial and economic importance to the country of its mines, of the money metals and of copper and lead, and in fact of coal and iron, is by no means to be measured by the mere sum total of dividends or profits that have accrued to their owners year by year from their exploitation. Far from it. The production of gold from the mines of California to the amount of say, \$1,175,000,000 between 1848 and 1883 is in nowise to be gauged in its economic consequences to the people of the country by the actual share of it that went into the pockets of those who either by their labour or capital extracted it from the earth. Nor is the product of the Comstock lode, variously estimated at from three hundred to three hundred and fifteen millions of dollars, to be considered from the point of view of the profits which accrued to the shareholders of various corporations. The consequences of our production of the money metals since 1848 reach immeasurably beyond any totality of actual profit derived by individuals or corporations engaged directly in the industry of their extraction and to an extent not approached, even approximately, by the product of any other industry whatsoever.

Imagine the commercial and industrial condition of our country, and indeed of the world at large, at the present writing, without having had during the last thirty-five years the steady stimulus of the immense amount of gold furnished in the aggregate from the placers of the Pacific Coast States and Territories together with that of the mines of Australia, the discovery of which, unquestionably, was a direct consequence of the finding of gold in California in 1848. These discoveries, be it remembered, happening as they did, at a time of world-wide industrial and commercial adversity and indeed of a *money famine*, immediately served to restore life and health in every workshop of Europe and America. It opened new homes for the starving people of Europe and new regions for human intelligence and energies to develop with a profitable scope and reach hitherto wholly unknown in the history of the earth. The three or four railways which to-day stretch across our national territory from the Atlantic to the Pacific, with another extending from our southern border to the

LAKE SUPERIOR MINES.

The Huronian Takes the Lead,

AND MAKES ANOTHER SHIPMENT OF BULLION.

A ZINC MINE

—AND—

OTHER VALUABLE MINERAL DEPOSITS.

MORE IMPORTANT DISCOVERIES.

During the past month we have been able to collect some reliable information relative to the mining industries on the north shore of Lake Superior and the present condition of the mines that are now being developed. From what we have learned there can be no question that the developments, up to date, at the famous "Huronian" have placed it far in advance of all the mines in the district, and have established its reputation as a gold and silver producer. A ten stamp mill is in operation on the company's property, which turns out a ton of concentrates daily, besides the metal which is saved in the amalgamated copper plates. The ore is partly free milling, and what is not caught in the plates is concentrated over a Freu Vanner. It has been decided to treat the concentrates at the mine by the chlorination process, and for this purpose works will be at once erected. The main shaft is down 100 ft., and 100 ft. of drifts have been run on the vein, which is 6 ft. to 8 ft. in width, and has been prospected for 2,000 ft. in extent. It is a true fissure vein, drifting to the north-west at an angle of about 70°, and carrying gold and silver in large quantity. The average surface ore has yielded \$36.30 in gold and \$13.00 in silver, while an assay of some of the high grade ore returned \$5,971.60 per ton, of which \$4,652.03 was gold and \$1,219.57 silver. The vein occurs in a formation of semi-crystalline, greenish slate, in the Huronian series. Specimens of the quartz from the vein have been forwarded to this office, in which free gold can be seen with the naked eye to be well distributed. The company does not look for profit from the very high grade ore so much as from the entire vein-stone, every pound of which yields gold and silver in paying quantities. This vein carries sylvanite, a compound of gold, silver and tellurium, a mineral never before met with in any mine in the Dominion. In addition to other plant, the company has a separate hoisting engine at the main shaft and a tramway from the shaft to the mill; also a saw-mill attachment for cutting lumber, etc. The mine, which is situated about 100 miles from Port Arthur and 50 miles from Savanne, a station on the C. P. R., was visited recently by Messrs. Hiram Robinson and W. A. Allan, of Ottawa, stockholders in the company, and Mr. Alexander Fraser, one of the Directors. These gentlemen returned to Ottawa very much pleased with what they had seen, and bringing with them a handsome bar of gold, weighing about 20 ounces. As soon as the heavy expenditure necessary to equip the mine ceases the Huronian company will unquestionably pay large dividends. Several shipments of bullion have already been made, and one of concentrates. The last bullion shipment was forwarded from the mine at the beginning of the present month. The company is a strong Canadian organization, as the following names of the Directors will show: James MacLaren, President Bank of Ottawa, President; Thomas A. Keefer, Esq., Port Arthur, Vice-President; Charles T. Bate, Mayor of Ottawa, Secretary-Treasurer; Hugh McKay, Esq., Montreal; Alexander Fraser, Esq., Westmeath; Peter McKellar, Esq., Manager at the mine; Robert Blackburn, Esq., New Edinburgh, Francis Clemow, Esq., Ottawa, and Alexander Johnston, Esq., Strathroy. Adjoining the "Huronian" property is the "Highland" location, on which some development work was done during the past summer. This mine, as well as the "Huronian," was visited by Professor Selwyn in 1883, and, as the following letters will testify, his observations lead him to form a very high opinion of the value of these properties.

Department of the Interior (No. 95),

Geological and Natural History Survey,

OTTAWA, Feb. 22, 1884.

Thos. A. Keefer, Esq., Port Arthur, Lake Superior :

MY DEAR SIR,—I have pleasure in transmitting you herewith Mr. Hoffman's analysis of the samples of quartz which I collected from the openings made on the extension of the Jackfish (Huronian) vein. The

average result gives 6.497 oz. of gold and 26.129 oz. of silver to the ton of 2,000 lbs. This must be regarded as an exceedingly satisfactory showing, and fully justifies further judicious expenditure in opening up the vein and having a practical test made of larger parcels of the quartz.

I am, my dear sir,

Yours faithfully,

(Signed)

ALFRED R. C. SELWYN.

OTTAWA, April 29, 1884.

Thos. A. Keefer, Esq.

MY DEAR SIR,—I am in receipt of your letter of the 20th inst. I am sorry I have no time to write you a report on the Highland mining location, which I visited and examined last summer. I can, however, state that it is, I consider, the continuation of the vein which traverses the adjoining Huronian, or old Jackfish, property, already proved to be exceedingly rich in sylvanite and gold. Both these properties are exceedingly favourably situated for working. From the five small openings made on the vein in the Highland property I took samples which appeared to represent the average character of the vein through a length of 300 yards. These were carefully assayed in the geological survey laboratory, with the very promising result given you in my letter of 22nd February last. There can be no doubt that this is as rich a gold-bearing vein, indeed the richest and most promising gold-bearing vein I have yet seen, in the Huronian rocks, and the country rock, a rather soft chloritic schist, will greatly diminish the cost of extracting the vein. The greatest difficulty I should apprehend is in the separation and the saving of the whole of the gold contained in the ore, and very great care will have to be exercised in this respect.

I am, my dear sir,

Yours faithfully,

(Signed)

ALFRED R. C. SELWYN.

The "Rabbit Mountain" silver mine has produced some very rich ore, some of which, taken from the vein within ten feet of the surface, has yielded as high as \$852.50 per ton. Up to the present time the owners have done very little actual mining but the services of Captain John Tretheway, the late Superintendent at Silver Islet, have been secured, and he will undertake the management of the company's operations in the future, and will no doubt do justice to the property. The owners of this mine are to be incorporated the "Rabbit Mountain Mining Company of Ontario," with the following gentlemen as the first directors: Maurice Auerbach, Esq., Hagbarth Shalgaard, Esq., J. H. Burwell, Esq., D. H. Moon, Esq., G. V. Bacon, Esq., of St. Paul, Minn., Marcus Johnson, Esq., of Atwater, Minn., and Gen. E. A. Wild, Oliver Daunais and Thomas A. Keefer of Port Arthur. The capital stock is to be \$2,000,000.

A zinc blende mine, situated about fourteen miles inland, north east from Neepigon Bay, promises to become an important feature in the mineral development of the Lake Superior district, and it is to be hoped that the very flattering report on the deposit made by Mr. E. Hindman, who is connected with the Matthiessen and Hegeler Zinc Company, of LaSalle, Illinois, may be borne out as mining proceeds.

The Arctic Mining Company is opening up a vein of argentiferous galena on the north shore of Black Bay with gratifying results, it is said.

On the main shore, about three miles inland, the "Gold Lake" mine has been partially opened. It produces copper pyrites ore carrying from 4 to 13 per cent. in copper and \$35 in gold and silver to the ton. A shipment of the ore, it is stated, has been tested at Swansea and yielded \$33 per ton, with the market price of copper very low.

Several new discoveries have been made during the past summer of mineral deposits in the Lake Superior region that are not unlikely to prove very valuable. Oliver Daunais, the discoverer of the "Rabbit Mountain" mine, came upon another silver deposit which is said to be of equal importance, and Mr. E. Emmons, an explorer of long experience in the district, is reported to have discovered a rich deposit of native silver among the same black silver slates in which the "Rabbit Mountain" vein occurs.

Now that the fact has been established that the mining industries on the north shore of Lake Superior will play an important part in the future development of that portion of the Province of Ontario, the time has arrived when the Provincial Government should adopt active measures towards building colonization roads to facilitate access to the several townships that have been surveyed. Up to the present time the mine owners have been obliged to open roads at a very heavy expense, and the Government should now come to their assistance in this respect.

GOLD MINING IN BEAUCE.

The Gilbert River Gold Mining Company, operating on the Gilbert River in St. Francois, Beauce, has had a successful season and has washed more gold than in any former year. The reports that have reached us from the district are, however, of a general character and do not mention the value of the gold that has been mined. Other less important operators in the district, it is said, have washed gold in sufficient quantity to pay a handsome profit on their expenditure, notwithstanding that their operations have been conducted on very primitive principles. During the past month a fair amount of work has been accomplished at the Allan and Humphrey mine on Slate Creek, in St. George Concession. A temporary suspension of work has, however, been occasioned at this mine in consequence of a flow of water coming into the shaft when the gravel was reached close to bed-rock. The water came in so rapidly, carrying with it sand in such quantity as to impede the working of the pumps. Resumption of mining in the shaft will be delayed until some work has been completed that will effectually prevent any inconvenience in the future that might be occasioned by water. Within a short distance from the shaft Messrs. Allan and Humphrey are boring by means of an eighteen inch auger, worked by steam power, which will be driven down to bed-rock. As the auger descends, tiles, manufactured for the purpose, will be let down, forming a pipe, through which the water will be continuously pumped, thus keeping the shaft perfectly dry. This delay in their operations is very annoying to the owners of the mine, happening, as it has, just at a time when their most sanguine expectations were about to be realized. The sand and gravel raised from the shaft, for some days before the water made its appearance, was richer in gold than any ground that has ever before been met with in the district. The sluices are now about completed and it will not be long before we will receive a report of the first wash-up. The opinion of men of long experience in the placer mines in Australia and California, who have visited this mine during the past few months, predict that the result of the washing will be a surprise to many who are now skeptical, and the opinion of such practical men can be relied on.

The pool of Lake Superior copper producers, of which the Calumet and Hecla is the chief constituents, has sold to New York brokers, for American manufacture, 20,000,000 pounds of ingot copper, to be delivered by the 5th of January, 1885. The contract price is 13 cents.

Asbestos Mining in Canada.

In the Township of Thetford, asbestos mining has become an industry of much importance to that section of the Province of Quebec. This mineral has been found to occur in nearly all of the Provinces of the Dominion, but as yet no mining has been done outside of the eastern townships. In the Townships of Thetford, Broughton, Coleraine and at Wolfstown and Danville, mines have been opened and a large quantity of mineral has been taken from them. The Thetford mines are, however, the principal producers, and their output is rapidly gaining favour in the American and European markets, so excellent is the quality of the asbestos mined. The Boston Asbestos Packing Co. are carrying on extensive mining operations on their property in Thetford, and employ 80 miners and workmen, the monthly output averaging about 75 tons. King Brothers employ 40 hands at their mine in the same township and produce about 35 tons monthly. The Johnson's Company's mines, in Thetford, are yielding a very superior quality of asbestos and in fair quantity. The force employed does not exceed 60 hands, and the output averages two tons daily. The veins of asbestos on this company's property are of a most superior quality, and a large proportion of the product of its mines is shipped throughout the year to all parts of the globe, especially to the European market where the demand is beginning to overrun the supply. One of the firms in Europe who have been using this company's asbestos, has secured the contract for supplying Her Majesty's navy with asbestos goods, and has further obtained orders from the Indian State Railways, and from many of the most important railway companies in Europe; the leading European Iron and Steel Manufacturers, Engineers and Steamship Companies are also supplied with asbestos goods by the firm referred to. The mill-board, manufactured from the Johnson's Company's asbestos, has been tested, both in England and Scotland, before government officials and managers of public works, by steam, boiling water and blowpipe, and has, in every instance, withstood the tests most satisfactorily.

It is not unlikely that many new mines will be opened, and that a greatly increased quantity of asbestos will be produced in Canada during the next few years.

During the fiscal year ending 30th April, 1884, the Calumet and Hecla mine produced no less than 35,414,007 pounds of ingot copper.

The Horn silver mine of Utah shipped for the week ending September 3rd, bullion to the value of \$57,000, making the total shipments for the year to that date \$1,669,000.

THE MICA MINES.

A fine quantity of excellent mica is being produced at the mines in operation. In Villeneuve the crystals are increasing in size as depth is reached, and are, if possible, improving in quality. This mine is developing most satisfactorily and will supply a large proportion of the demand in Canada. The Sydenham mine has produced abundantly during the past summer and continues to be very productive; the quality of the mica is, however, much inferior to that from Villeneuve and is amber in colour. The output of the mine has been shipped largely to the United States. Several other deposits in Eastern Ontario have been partially developed and promise to yield a good quality of mica in large quantity. We have received from the Villeneuve mine, during the past month, slabs of crystals that have cut into perfect sheets, without a speck or flaw, measuring 6 x 9, and the quality is equal to the North Carolina mica.

St. Onge Gold Mining Company to be Incorporated.

Notice has been given in the *Canada Gazette* that application will be made to His Excellency the Governor General in Council, for a charter of incorporation by letters patent under "The Canada Joint Stock Companies Act, 1877," incorporating the applicants and such other persons as may hereafter become shareholders in the said company, a body politic and corporate for the purposes following, that is to say:—

1. The proposed name of the company is the "St. Onge Gold Mining Company (limited)."

2. The purposes for which incorporation is sought are as follows:

(1) To carry on the business of exploring for, mining and gathering gold, silver and other precious metals, minerals and ores in such form as the same may be found in the Province of Quebec and elsewhere throughout the Provinces and Territories of the Dominion of Canada.

(2) To crush, smelt, reduce and manufacture such metals, minerals and ores, and forward, ship or sell the same, either in crude or other form throughout the Dominion of Canada and elsewhere, and for such purposes to establish works, wharves, factories, warehouses, and acquire real estate for the purpose of erecting and establishing the same thereon.

(3) To purchase, take on lease or exchange, take, acquire, own and hold under any legal title either in the name of the company, or as trustee or trustees therefor, for them, their successors and assigns any real or personal property, and such lands, premises, easements,

claims and mining locations, limits and rights as shall be necessary or desirable for the workings and purposes of the company, with power to pay for any of such, in whole or part, by the issue of shares of capital stock of the company and to declare such shares fully pay up and unassessable; to sell, lease assign and transfer the same, in whole or part, and to work and develop such mines and mineral deposits as may exist thereon.

(4) And generally to do all such other things as are conducive or incidental to the attainment of all or any of the objects aforesaid.

4. The chief place of business of the said company is to be at the City of Quebec, in the Province of Quebec.

4. The intended amount of the capital stock of the said company is ninety thousand dollars, divided into nine hundred shares of one hundred dollars each.

5. The names in full, addresses and callings of the said applicants are as follows:—

Louis St. Onge, of the Parish of St. George, in the County of Beauce and Province of Quebec, miner; Antoine St. Onge and Noel St. Onge, both of the same place and occupation; Albert Alexander Humphrey, of the same place, Esquire, and William Anderson Allan, of the City of Ottawa, contractor, the first one and last two persons named to be the first of provisional directors of the company.

The Gold Mining Association of Canada.

Reports have been published in the Canadian press during the present month, relative to the industrial condition of the above named corporation, the truth of which we have been unable to substantiate. The Company's Managing Director was in Ottawa since the circulation of the reports referred to, and assured us that mining operations are yet being carried on, and that the result of last year's work was most satisfactory, gold having been washed in sufficient quantity to defray expenses, and a great deal of work was done exclusive of actual mining. This Company's property is situated on the Du Loup River, in the County of Beauce, and the ground carries gold in paying quantity. A system of hydraulic mining has been adopted, in preparing for which the expenditure of a vast amount of capital has been necessary. The future success of the Company's operations will only be secured by a strict observance of economy in the management by the superintendent. The prospects of the mine have warranted the outlay, as last year's operations proved, and as it was the intention of the company, from the outset, to mine on an extensive scale, the expenditure, thus far, has been one of necessity. It has been stated that the Marquis of Lorne was among the most liberal

subscribers to the capital stock of the Gold Mining Association of Canada, but this has been emphatically denied.

The mines in Beauce, now being so successfully operated by Messrs. Allan & Humphrey are situated many miles from this company's property, and are in no way connected with it. We mention this so as to correct an erroneous impression that these properties and their owners are closely allied.

Provincial Rights to the Minerals.

Some disquietude has for a long time existed among British Columbians from the fact that a large portion of the mineral deposits in that Province comes within the railway belt, and it has been feared that the Canadian Pacific Railway Company would gobble it up. In commenting on the subject the *Victoria British Colonist* remarks:—

"The public may rest secure in the assurance that the rights of the province to the minerals within the railway belt will be conserved by the Government. It is now no secret that the Dominion Government have laid claim to the rich deposits of future wealth and greatness comprised within the belt. By the 109th section of the British North America Act, all lands, mines, minerals and royalties belonging to the several provinces are secured to them in the following terms:

"109. All lands, mines, minerals and royalties, belonging to the several Provinces of Canada, Nova Scotia and New Brunswick at the Union, and all sums then due or payable for such lands, mines, minerals or royalties, shall belong to the several provinces of Ontario, Quebec, Nova Scotia and New Brunswick, in which the same are situate or arise, subject to any trusts existing in respect thereof, and to any interest other than that of the province in the same.

"And section 11 of the terms of union the province agrees 'to convey to the Government, in trust, to be appropriated in such manner as the Dominion Government may deem advisable in furtherance of the construction of the said railway, a similar extent of public lands along the line of railway * * * as may be appropriated for the same purpose by the Dominion Government from the public lands in the North-West Territories and the Province of Manitoba.' There is nothing in the extract quoted conveying the mines and minerals which by section 109 of the B. N. A. Act are specially reserved for the use and enjoyment of the several provinces. To our mind the title of the province seems clear, and the Government would fail in their duty should they neglect to enforce the rights of the province."

In connection with this difficulty

the Gold Commissioner at Shuswap, B.C., has published the following:

"Public notice is hereby given that the Provincial Government of British Columbia have not recognized the claims advanced by the Dominion Government of Canada to the precious metals within the 20 mile belt on each side of the line of the Canadian Pacific Railway through British Columbia. The provision of the mining laws now in force through the Province of British Columbia, will be enforced within the railway belt, as well as in all other places in this district, by the undersigned until such time as official instructions are received to the contrary. All persons interested must govern themselves accordingly.

(Sd) A. W. VOWELL
Stipendiary Magistrate
and Gold Comm'r.
Shuswap, B.C., Sept. '84."

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

The great event of the year 1884 in the Dominion of Canada has been the 54th annual meeting, held in Montreal, of the British Association for the Advancement of Science, at which 1,500 members, home and foreign, were in attendance. The sessions were devoted to the reading of papers on scientific subjects and to discussions amongst the scientists present. The meeting was divided into sections as follows:

- A—Mathematical and physical science.
- B—Chemical science.
- C—Geology.
- D—Biology.
- E—Geography.
- F—Economic science and statistics.
- G—Mechanical science.
- H—Anthropology.

As Professor C. D. Wilber, who was present at the meeting, has stated, "these are convenient divisions of the whole field of human investigation. The practical intent of the British Association is simply to 'post the books' of the toilers in these fruitful fields during the past year, and with auguries and divinations cast the horoscope of discovery and invention for the coming year.

The importance to Canada of this meeting of the British Association for the Advancement of Science cannot be overestimated when it has been the means of bringing to the country a thousand scientists, among whom were numbered many of England's most learned men. Since the close of the meeting in Montreal the members of the association have been travelling in detachments over the length and breadth of the Dominion, and will return to their respective homes more familiar with Canada and possessed of more reliable information as to her natural resources than they could have gathered in

years through any other channel than personal observation. A very large number of the visitors have been to the Rocky Mountains, and the unanimous opinion they have formed of the North-West Territories is a most flattering one, and will doubtless be the means of advertising the country as a suitable and attractive home for British and European emigrants. Of our mineral resources time did not admit of such a thorough investigation as could have been wished; nevertheless many of the scientists attached to the geological section found an opportunity to visit some of our mines in operation, and in the vicinity of Ottawa the phosphate mines appeared to possess an especial interest for those who examined them. At the meeting in Montreal, in the course of a review of our numerous rich mineral indications, a serious defect was brought to light by one of the leading geologists and mining authorities in England—namely, that Canada, of all the colonies, is the most destitute of information concerning mineral reports and statistics available for reference. The fact was brought out in the discussion that followed Mr. W. Hamilton Merritt's paper on the "Occurrence, locations and output of the economic minerals of Canada." In the course of the paper the lack of reliable statistics on the above was alluded to, as there exists no department for the collection of reports and statistics on mining under the Dominion Government. In the discussion following, the president of the section spoke very strongly on the necessity of mining encouragement and successful development by the existence of some such department. Mr. Clement Le Neve Foster, F.G.S., of Wales, stated that it was first at a meeting of the British Association and in this section, that the collection of mining statistics in England was suggested, and that he considered the visit of the Association to Canada would not be thrown away if it had for its outcome no other result than the establishment in Canada of some system for collecting reports and statistics relating to mining and mineral development. Mr. Foster considered the Government would do well to take some steps in the matter, and suggested the English system as a basis. The same gentleman also brought before the section the unpleasant fact that the Committee of Inspectors of Mines, in preparing last year, for the Home Office, a report of the mineral statistics of the British colonies, when they came to Canada, experienced great difficulty in securing information. All sorts of sources had to be resorted to, and the result was very imperfect and unsatisfactory. This being the state of things, it would appear that, in the interest of what should be one of our greatest natural sources of wealth, the advisability of taking some steps in the matter cannot be questioned.

Much is done for agriculture and

forestry, and it is evident that in our country, so full of valuable mineral indications, from Nova Scotia to British Columbia, more attention should be given to mining.

MINERAL GEMS.

Mr. Willimott, a member of the Geological Survey, has had a most successful season in his researches through Central Canada for mineral specimens. He has succeeded in adding to the collection in the Museum many gems in the form of crystals, spheens and zircons, and some of the garnets he has recently collected excel in beauty anything ever before found in Canada. Mr. Willimott is a painstaking and efficient officer, and is to be congratulated on the present appearance of the Museum. The classification and arrangement of the specimens have had his personal supervision, and the result is evidence of his skill in such work.

Ancient Method of Washing Gold.

The gypsies of the Bannat, in Austro-Hungary, in washing the gold from the sands of the rivers and plains, still use a very antiquated system, out of which, no doubt, the modern systems have grown. It is practised now by the gypsies, as it was by the Romans in the same country. It consists in nothing more than pouring the sand, mixed with water, over an inclined plane, the heavier particles of the gold remaining upon the surface, while the light impurities are washed away. Sometimes the inclined plane is covered with woollen cloth, to which the gold adheres; wanting the cloth, the Gypsies now and then use for the same purpose the more ancient substitute of a fleece. The manner of collecting gold dust on sheep's fleeces, upon inclined planes, is represented in the curious old works of Agricola.

In the rivers of Colchis the custom is still retained of placing sheep skins in the beds of the Phasa and other auriferous streams to collect particles of gold; hence, the dedication of such fleeces to the gods, and the fabulous history of the Argonauts, as far as it related to the Golden Fleece.

The more common manipulation among the gypsies of Bannat, as far as the gold washing is concerned, is performed by means of a plank of lime tree, six feet long and an inch and a half thick. At the upper extremity is a small trough, and across the board are about a dozen grooves or furrows cut in the wood. The plank is set at an angle of forty-five degrees. The sand is put into the trough at the upper end, and thence, by plenty of water, washed down the sloping board. The gold dust falls into the grooves, whence it is scraped or brushed off. It might be supposed that a great

deal of gold is lost by the careless method, but long experience has made the gypsies very expert; they know how to distinguish the rich and poor sand, and a careful examination of the tailings proves that hardly a particle of gold escapes them during the operation. The gold is in the form of a fine dust; the sand containing it is mixed with black particles of highly magnetic iron, garnets and mica.

WANTED.

A second-hand "Ingersoll" Rock Drill, three inch cylinder, with couplings, &c. Any person having one for sale will please communicate with the publishers of the CANADIAN MINING REVIEW.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Post Office, &c., Orangeville, Ont.," will be received until Thursday, the 23rd day of October next, inclusive, for the erection of

Post Office, &c.,

AT

ORANGEVILLE, ONT.

Plans and specifications can be seen at the Department of Public Works, Ottawa, and at the Post Office, Orangeville, on and after Monday, the 6th day of October next.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, Sept. 8th, 1884.

PERKINS' FOUNDRY OTTAWA.

FORGINGS AND CASTINGS
OF EVERY DESCRIPTION, TRUE
TO PATTERN.

Wheels and Axles for Tram
Cars, Derrick-fittings, Hoisting
Gear, Shoes, Dies, Hammer-
heads, Iron Pipe and Gearing
of all kinds. Also Boilers and

DYNAMITE

TO
MINERS, QUARRYMEN
—AND—
RAILWAY CONTRACTORS

We have been appointed Agents for the sale of the **Celebrated Explosives** manufactured by **The Nobels Explosives Company, Limited**, of **Glasgow, Scotland**, and we are prepared to supply from **Stock** their

No. 1 Dynamite

—§ AND §—

Patent Blasting Gelatine

In quantities as may be required.

—ALSO—

NOBELS' TREBLE DETONATORS

Suitable for use with the above.

Our **No. 1 Dynamite** contains **Seventy-five per cent. Nitro Glycerine** and our **Patent Blasting Gelatine**, the **Strongest and Safest Explosive** known, is **fully Fifty per cent. stronger.**

The Nobels Explosive Co. have sent to Canada, **Mr. Robert Bell**, one of their practical instructors, who will, at any time, be prepared to demonstrate the **Superiority** of their **Explosives** over any other offered, and to show how they should be used to obtain the greatest effect.

We specially solicit orders, to import, at special prices.

All particulars can be obtained from

B. & S. H. THOMPSON,
Montreal.

NOTICE TO CONTRACTORS.

SEALED SEPARATE TENDERS (including plans and specifications), addressed to the undersigned and endorsed respectively: (1) Tender for Heating Apparatus, Three Rivers, P.Q., Post Office; (2) Tender for Heating Apparatus, Sherbrooke, P.Q., Post Office; and (3) Tender for Heating Apparatus, Cornwall, Ont., Post Office, will be received at this office until **FRIDAY**, the 16th October next, for the completion of the above works.

Copies of plans of the buildings proposed to be heated and a memorandum of requirements will be furnished to those desiring to tender, who will be required to indicate the arrangement, &c., of their apparatus and furnish a fully detailed specification.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to 5 per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or, if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

PHOSPHATE CRYSTALS.

Farmers, Miners and Prospectors, having unbroken
Phosphate Crystals for Sale, can find a cash
purchaser by applying at the Office of

THE CANADIAN MINING REVIEW,

Union Chambers, 14 Metcalfe Street, Ottawa.

Parties offering crystals for sale will please mention the
colour, length and diameter—large ones preferred.

MINES AND MINERALS.

Developed and Undeveloped Mines and Minerals of Commercial Value
BOUGHT AND SOLD.

PROPERTIES EXAMINED AND ANALYSES MADE OF ORE OF EVERY DESCRIPTION.

A Competent Expert is permanently engaged for the purpose of making Unprejudiced Reports on all Mines placed
in our hands for Sale, such reports being at all times open to intending purchasers for examination.

Phosphate, Iron, Iron Pyrites, Copper, Asbestos, Mica, Plumbago,
Gold and Silver Mines, and Marble and Sand-
stone Quarries, For Sale.

MINERAL LANDS EXAMINED AND REPORTED ON BY OUR EXPERT; ALSO, ANALYSES OF MINERALS
OF EVERY DESCRIPTION MADE BY A COMPETENT ASSAYIST.

**Correspondence with Owners of Mines and Capitalists desirous of
investing is most respectfully solicited.**

Address all Communications to

The Publishers Canadian Mining Review,

Union Chambers, 14 Metcalfe Street, Ottawa, Canada.

ERNEST GAUJOT,

MINING AND MECHANICAL ENGINEER,

And Expert in Milling and Smelting.

Will examine and report on Developed Mines
and Mineral Lands.

Address:

Belleville, Ont., or Buckingham, P.Q.

J. F. McANDREW.

Expert in Gold, Silver, Copper, Iron,
Plumbago and Phosphate Mining.

ORES ANALYSED.

Mineral Lands examined and reported on.

OFFICE:
UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

Beginning with the December number the CANADIAN MINING REVIEW will be published on the first of each month, and for that reason we issue this October-November edition.

The meeting in Canada of the British Association for the Advancement of Science will have no insignificant effect upon the future development of our mining industries. From Nova Scotia to British Columbia the mining sections were visited by some of the members of the Association, and many of the mines examined by scientific gentlemen, who, as geologists and mining engineers, have attained the highest positions in

their respective professions in England and on the continent of Europe. The universal opinion expressed by these gentlemen was to the effect that Canada had a great future before her as a mineral producing country. In the magnitude and variety of her mineral deposits nature has been liberal indeed, and this being the case it can be but a question of time when the necessary capital will find its way from the money centres of the world to aid in their development. The Nova Scotia gold mines; the gold and asbestos mines of Beauce, in the Province of Quebec; the copper mines of the Eastern Townships; the phosphate mines of Ottawa County; the iron mines of Eastern Ontario; the coal mines and extent of the coal beds in our easternmost and westernmost provinces; and the great variety of building stone available from one end to the other of the Dominion, quite surprised these learned men from the older world, and opened their eyes to the fact that outside of Canada our great natural resources have been, to a great extent, unheard of. The holding of the meeting of the Association for the Advancement of Science in Montreal will, therefore, afford us many advantages that, otherwise, could not, or might not have been procurable. The many letters that have appeared in the English press from the pens of these scientists, descriptive of what they saw, and repeating what they heard while they were visiting Canada, are evidences that they had been more than favourably impressed, and that their desire is that the world should know it.

In our next number we will publish a full and correct statement of the year's output of the Canadian phosphate mines, together with a statement showing to what ports it was consigned.

Mr. A. C. Lawson, employed on the staff of the Geological Survey of Canada, has completed his operations, for this season, in the Lake of the Woods District. He expresses the opinion that the section of the country examined by him during the past summer is rich in mineral.

The Phosphate Trade.

The shipping season for this year is closed and mine owners are now turning their attention to preparing for the winter's operations. Since phosphate mining was first started in this district the industry has never given such promise of rapid growth as it does to-day. The mines that have been in operation during the past few years are now supplied with machinery and other plant necessary to proceed with mining on a large scale and to the best advantage, and the mines are capable of yielding an annual output nearly double what has been produced, heretofore, in a single year. In addition to those mines that have already been developed there are many promising properties being opened and the outlook for a largely increased production is very encouraging.

The past season has seen many important changes at the mines, notably at "High Rock." Mr. Pickford, President of the Phosphate of Lime Company, of London, England, owners of this valuable property, has been at the mine for some time this autumn, where he has personally directed important reforms. Steam power was introduced at High Rock during the summer, and has, quite recently, been added to; a systematic principle has been laid down for future working, and with these addi-

tions and improvements Mr. Pickford is sanguine that, before the close of the shipping season of 1885, he will be able to mine and ship quite 10,000 tons of phosphate, or about double the past year's output of this mine.

No change of any importance has been made in the plant of the Union Phosphate Company, whose property was thoroughly equipped when work was started, about eighteen months ago. The development of this company's mines has been very satisfactory, and there should be nothing to hinder the manager from producing a largely increased output during the next twelve months.

The Dominion Phosphate Company's "North Star" mine continues to yield about 10 tons daily, and the phosphate, as we have frequently stated, is of a very high grade.

The "Little Rapids" mine has improved during the past few months more than any mine in the district, and in all the openings and shafts large bodies of bright green ore are exposed. Some new openings have been made within the past month that have uncovered very large beds of mineral. The deposits on this property have the appearance of fissure veins more than in any other section of the phosphate district, and the mineral has been followed to a greater depth than at any other phosphate mine in Canada.

At the "Emerald" mine another commodious boarding-house has been erected for the accommodation of the miners, and it is the intention of the manager to employ a largely increased force. As it only requires labour to produce mineral from this mine, it is to be expected that the output will be increased correspondingly with the extra force of miners employed.

At the "Lansdowne," adjoining the "Emerald," a great deal of dead work has been accomplished during the past six months, and the miners are now

working on mineral. The owners of this property, the Dominion Phosphate Company, are well pleased with the way it has developed, and are sanguine that it will yield abundantly when thoroughly opened up.

The Lièvre River Phosphate Company, incorporated in July last, are now engaged in active mining operations. At their "Battle Lake" mine, in Templeton, 23 men are employed, who are turning out a fair quantity of high grade phosphate, and at their "Prospect" mine, in Portland East, 9 men have begun to open up some promising deposits from which they extracted from the surface a ton a day per man; this average is, however, not likely to be maintained as they sink deeper.

The Templeton and Wakefield mines will continue to contribute their quota to the output of the County of Ottawa.

The complete returns of the year's shipments of phosphate from Ottawa County has not yet reached us, but we have no reason to think that 23,000 tons, the amount we mentioned as the probable total output, will be much astray. The Perth and Kingston districts have contributed about 2,000 tons additional.

Phosphate Quotations.

At this season of the year there is little or no movement in Canadian Phosphate abroad, and late sales are, therefore, not an indication of the general market. Our latest advices quote one shilling for seventy-five per cent. mineral with one-fifth of a penny rise.

Facilitating Transportation of Phosphate.

RIVIERE DU LIEVRE IMPROVEMENTS.

Short Line Railway from Buckingham Village to C.P.Ry. Depot under Contract.

There has been an unaccountable delay in beginning work on the Little Rapids Lock, but the surveys have been made by the Engineers of the Department of Public Works, and the plans are completed. The Government have not, as yet, invited tenders for its construction, but it is not unlikely that this will be done shortly and that work will be begun on the lock before the close of the year. That it should be built is very important to the phosphate miners in the Lièvre district as it will enable them to float their mineral down the river in large vessels for transhipment to the

SHORT LINE RAILWAY

at its terminus at the landing, north of Buckingham Village, and thus connect with an all-rail route over the Canadian Pacific Railway from this point to Montreal. This branch railway will be built by the C.P.R. Company under its charter for the Northern Colonization Railway and the contract has been awarded to Mr. Thos. Raeside, who has already a force of men employed clearing the right-of-way, and it is expected that he will put a sufficient force to work at the grading to have the road-bed ready to receive the rails by the first week in December. This branch line will be a boon indeed to the phosphate men, and by the time the output will have begun to move in the winter the necessity of hauling their phosphate from Buckingham Village to the railway station will be a disadvantage of the past.

With the lock completed at the Little Rapids, and this short line railway constructed to the landing, the transportation of ore from the mines to Montreal, both in winter and summer, will be greatly facilitated.

A New Mining Company Organized.

A meeting of the shareholders of the Lièvre River Land and Phosphate Company (Limited), recently incorporated, was held at the company's office, No. 41 St. Francois Xavier Street, Montreal, on the 14th of October, and the following gentlemen were elected directors: Robert C. Adams, W. R. Elmenhorst, Wm. T. Costigan and Peter Lyall, of Montreal; Charles H. Trask, of New York; and A. F. Freeman, of Boston. At a subsequent meeting of the directors Robert C. Adams was elected President; W. R. Elmenhorst, Vice-President; Wm. T. Costigan, Treasurer; and J. Keith Reid, Secretary. As has been stated in a former issue of this journal, the L. R. L. & P. Company, limited, has acquired extensive areas of phosphate lands in Ottawa County, in the townships of Templeton, Portland west and Portland east. The company is now engaged in active mining operations.

THE MICA MINES

It is gratifying to hear the satisfactory reports that reach us almost daily from the mica mines that are in operation. The mines are improving with development in a marked degree, not only as concerns the increase in the quantity of mica obtainable, but the mineral in all cases has improved in quality as lower depths are reached. Near the surface the leaves of many of the crystals were discolored and thus impaired in market value; but it would seem that these defects almost entirely disappear at a depth beyond atmospheric influence. At one

mine in particular, where the mica was very generally discolored by oxide of iron, it is only in exceptional cases that crystals thus affected are now met with. In the township of Loughborough, Province of Ontario, a mine, producing mica of an amber shade, is being profitably worked, and from mines in North Burgess a quantity of excellent mica is being shipped each month. In the townships of Palmerston and Miller a fine quality of mica occurs but as yet the deposits are quite undeveloped. In the township of Villeneuve a very valuable mine is yielding mica in large quantity and in quality unexcelled on this continent: this mine, when more developed, will be a heavy producer, as the deposit is very extensive and the crystals well formed.

Asbestos Mining in Canada.

An article under the above heading appeared in the last number of this journal, and we are now in receipt of a communication, from a gentleman residing in the district where the industry is being so vigorously developed, requesting us to add the following facts: The Megantic mines have produced, up to Oct. 1st, one thousand tons of asbestos, the principal operators being—The

Boston Asbestos Packing Company, The Johnston Company, King Brothers, J. G. Ross, Senator and Wards, whose mines are in the township of Thetford; L. A. Senecal, Charles Lyonais and James Reed, in Coleraine; and the Chalmers Spence Company in the township of Broughton. The yield from all these mines has been most satisfactory to their owners, and the output has been disposed of at such prices as to leave a large margin of profit. The late discoveries on the property of Mr. Lyonais, in Coleraine, are said to be of much importance to mine owners in that section, and our correspondent adds that facilities for mining in Coleraine are all that can be desired, and that this township will, with the further development of its mines, contribute largely to the general output of this asbestos producing district. The mines have been visited during the season by a number of scientists and experts from Europe and the United States, all of whom were most favourably impressed. Strange to say that, up to the present time, no officer of the Geological Survey has visited these mines this year, and it is to be hoped that before the mining season closes some one of the staff will be sent through the district to collect complete information and to report progress in this important industry.

LAKE SUPERIOR MINES.

NEW DISCOVERIES REPORTED.

MINING OPERATIONS ACTIVE.

In an effort to boom the mines in Port Arthur District, the reports that have been circulated, respecting the richness and inexhaustible quantity of the ore that is being raised, sound like wild romance to the practical miner and the cool and collected, calculating capitalist. That the discoveries made during the past eighteen months are of much importance no one can question, and the result of the development work that has already been done, up to the present time, on some of the lodes, has been such as to warrant preparations for permanent mining operations; but any attempt to mislead the public by foolishly exaggerated reports will serve no good, practical purpose to the district, though it may be the means of putting money into the pockets of a few speculators.

The Rabbit Mountain Silver Mining Company are at work again on its location, and if the miners should be fortunate enough to work into a series of pockets of rich ore, such as the one that was first met with, the property must yield a handsome profit to its owners. From this one pocket, which occurred quite near the surface, the original proprietors of the mine extracted upwards of \$100,000 worth of silver, chiefly in the form of black silver nuggets, at small cost, and on which the reputation of the mine was established. We now hear that at the depth of 80 feet, in a drift, the miners have come upon another body of rich ore. The excitement of the moment has led people to circulate the report that this new pay-streak measures two feet in width and yields ore assaying 4,000 ounces of silver to the ton. This is certainly a wonderful strike, if report be true. Referring to the "Rabbit Mountain," the N.Y. *Mining Record*, in its issue of October 18th, remarks that "this Canada silver mine was referred to not many months ago, by one of the remarkable people who purvey editorial matter for the leading daily newspapers of this city (New York), as likely to increase the already too large output of silver in the United States." This property is now in the hands of men who are amply capable of providing all the facilities necessary to proceed with active operations to the best advantage, and with Captain John Tretheway, formerly of Silver Islet, as superintendent, there exists no reason why the mine should not, henceforth, be worked in a thoroughly mining-like and practical manner, and the public will, at all times, be pleased to hear sensible reports of satisfactory progress.

A new discovery of silver is now reported to have been made within seventeen miles of the "Rabbit Mountain Mine," which has been styled SILVER MOUNTAIN, and if the description of the location be correct it deserves the title, for we are told that in richness it excels the famous "Rabbit Mountain," and that the lode is sending forth nuggets of black silver weighing sixteen pounds and upwards, while the ore is streaked with silver, native and black.

It is also reported that yet another discovery has been made quite recently within easy distance, by rail, from Port Arthur, and that the ore assays upwards of \$80 in gold, over \$20 in silver, to the ton, and carries free gold.

It is also stated that native mercury has been found in the same district.

Summing up all the general information and actual facts that we have been able to gather from time to time, and from various sources, we cannot but be convinced that the Port Arthur District is destined to develop into one of the richest mining regions in the Dominion. Up to the present time, however, we do not hesitate to say that in our opinion the "Huronian Mine," though not quite so accessible as some of the others, is the most valuable mine that has yet been opened in the district, for the work that has already been accomplished on the lode has been sufficient to prove that, for many years to come, it can be, if carefully managed, a steady producer of ore carrying gold and silver in sufficient quantity to leave a large margin of profit to the shareholders. This company is well organized and controlled by steady-going, practical business men, who are offering no stock for sale and consequently are not desirous of *booming* the property.

NOVA SCOTIA MINING NOTES.

BLUENOSE GOLD MINING COMPANY.

This company, whose property is situated in the Montague district, opened a promising lead last fall, and erected an engine, pump, and other machinery necessary to thoroughly test it. The concentrating mill, which had been burned down, was rebuilt, and experiments were made with a set of Embrey concentrators which solved the problem as to the practicality of re-working Nova Scotia quartz tailings. The workings which have been re-opened by the Bluenose Company are on the site of the old De Wolf Mine, and, after nine months of unsuccessful prospecting and mining, they cleared out the old shaft, eighty feet deep, and sunk it thirty-five feet farther, but it is only within the last three months that paying leads have been worked. Of these there are three running parallel and nearly together, one about three inches, another six inches, and a third over eighteen inches wide. Another shaft has since been sunk, and is now about thirty feet deep, and in a third the lead has been struck a short distance from the second. The property is equipped with an eight-stamp mill and a regular series of attachments, quicksilver plates, etc. The *Bluenose* Mine was visited by a number of the members of the British Association for the Advancement of Science, when the lode was showing some handsome nuggets. They were much interested in the company's method of crushing the ore, and expressed themselves highly pleased with what they had seen.

COXHEATH COPPER MINING COMPANY.

At this mine, situated near Sidney, Cape Breton, a vein of good ore has been struck in the 190-foot level of shaft No. 2, and, together with the ore already in sight on the 140-foot level, the ability of the mine to permanently keep reduction works supplied with pay ore is considered settled. The company has adopted the same process for leaching all its ore under 6 per cent. copper as is in profitable use at the Tharsis and Mason & Barry mines in Spain, whose product, in the form of precipitate, is sent to the same market at Swansea, Wales, as the product of the Coxheath mine will be shipped to. The company proposes to erect leaching-works, and is in the market for funds. Up to September 1st, 1884, there had been expended in the enterprise \$141,564.13. July 1st, 1883, the company authorized the issue of \$100,000 first mortgage bonds, bearing 8 per cent. interest. Sixty thousand dollars of these bonds have been placed for cash at par, and the remaining \$40,000 are now to be placed. A stock bonus of 10 shares is to be given with each \$100 bond. Besides the accrued interest on the bonds from July 1st, 1884, the company claims to be able to produce copper at a profit with copper at even a lower price than the present.

BRITISH COLUMBIA MINING NOTES.

On Sunday morning, 12th Oct., an explosion of gas took place in No. 2 mine, Southfield, in that part of the mine known as the level, and which is being driven for the purpose of connecting No. 2 with No. 1 mine. From what can be gleaned it appears that on the morning in question David Morgan proceeded into the mine and down the slope as far as the entrance of the level, which is covered with a curtain,

when he sat down and awaited the arrival of the fireman, M. J. Price, who arrived shortly afterwards. The fireman was about lighting his safety lamp prior to testing the level for gas when from some cause or another the gas in the level took fire and exploded with considerable violence. Price, Morgan, Macfarland and a Chinaman were knocked down and severely hurt. Dr. Walkem, of East Wellington colliery, and Dr. Davis, Dr. Chinross' assistant, were sent for, by whom the wounds of the unfortunate men were dressed.

The Southfield Mine is a new mine started by the Vancouver Coal Company, about four miles to the south of Nanaimo.

News from the gold mines on Lorne Creek, Skeena River, is very encouraging. Mr. E. W. Washburn, who arrived at Victoria, B.C., from that district on the 16th instant, says that himself and a party of four took from their claim \$3,000 worth of gold in one month. Six or seven claims have been thoroughly worked, and all are doing well, from \$3,000 to \$7,000 being taken out of each claim during the past month. Mr. Washburn has exhibited some nuggets, to the value of \$250, which were coarse pure gold, showing that Lorne Creek is not as worthless as some people predicted it would be. Those claims that have not as yet been properly worked are not doing so well, but still the output is anything but discouraging.

The Indians are still in a troublesome state, but the miners fear no harm from them, as they, the miners, are well armed and prepared to maintain their rights. Mr. Washburn holds the opinion that Lorne Creek abounds in mineral wealth and that a great future is in store for the country thereabouts.

Advices to the *British Colonist*, from Lorne Creek, Skeena River, state that miners are doing well in that region. Forty or fifty men arrived from Victoria during the months of August and September, and a good deal of excitement is felt along the creek. One of the first locators writes that his claim is panning out about an ounce a day to the man. Other creeks in the same region look very favourable and the country will be thoroughly prospected.

For eighteen months the tunnel of the Burns Mountain Mining Company has been steadily progressing and when work was stopped had penetrated 820 feet into the mountain. The object of the tunnel was to strike what is known as the "Luck Cap" ledge from which, in former years, a large amount of gold is said to have been taken by means of a shaft sunk on the ledge for 45 feet, but the shaft had to be abandoned on account of water and the tunnel above referred to was undertaken. A survey just completed shows that the tunnel has reached the distance of the shaft at a depth of 170 feet below. The ledge is said to dip away from the tunnel at 18 feet per hundred, so that, at most, another 50 or 75 feet would decide the question. We would bespeak for this enterprise the attention of those of our fellow citizens interested in one of our great future industries—quartz mining—and wish the Burns Mountain Company that success which energy and perseverance commands.—*British Colonist*.

GOLD MINING IN BRITISH COLUMBIA.

A valuable paper on the Gold Mines of British Columbia was lately read by the Hon. H. Holbrook at Liverpool, his object being to draw attention to the gold mining industry, more especially, also, to the hydraulic gold washing resources, their great extent, and the profits derived from similar undertakings in California; to the quartz leads and their extent, and to gold mines generally. The chief want of the district is a white population to settle on the lands and white labour on the railroad works. Great advantages are offered to both, as well as to capital for the mining industry. The climate is good and corresponds with that of Kent. Railroad communication is rapidly extending, and British Columbia is now confederated with Canada. Upon the progress of the territory the author waxes eloquent; "The colony was first created by revocation of the crown grant to the Hudson Bay Company on the 3rd of November, 1858, succeeded by a proclamation issued by the Governor, Sir James Douglass, on the 19th November, 1858, providing for the Government of British Columbia, and declaring English law in force in the colony. From 1858, the progress of the country was brilliant, resembling the marvellous career of California and Australia after the discovery of gold in those countries. Thousands upon thousands flocked to these golden shores to improve their condition. The original deposits of gold, however, from which the shallow bars and benches of the Fraser River were fed, were not discovered then, nor indeed have they, in the opinion of many scientific men and experienced miners, been discovered yet. The mines on the Fraser were, therefore, soon exhausted; and being unable to sustain the multitudes flocking to them, were to a great extent deserted." Mining was begun on Fraser River at Hope, a place ninety-six miles from its mouth. The nature of the deposit and the character of the gold were invariably the same; that

is, the deposit was shallow and the metal light, or what is commonly called "float gold." Gold in paying quantities was found along the Quesnelle River. Roads were constructed into the interior at immense cost of time and money; and public works on a large scale were constructed and carried on. He describes the yield of gold from the mines as something wonderful. Up to 1862, he says, it is safe to say, there never could have been at any one time over 5,000 miners engaged (and the returns say only 4,000) in working the mines, and yet the annual yield was nearly £1,000,000, including, over the bank returns, the estimates of the gold taken away in private hands, a *per capita* average without parallel in the world. Taking the period from 1858 to 1882, he has prepared a table showing the actually known and estimated yield of gold, the number of miners employed, and average earnings per man:

YEAR.	Amount received by Banks and Private Hands.	Number miners employed.	Average earnings per man.
1858 } 6 months }	\$ 520,000	3,000	\$173
1859	1,615,072	4,000	403
1860	2,228,543	4,400	506
1861	2,666,118	4,200	634
1862 }	4,246,266	{ 4,100	517
1863 }		{ 4,400	482
1864	3,735,850	4,400	849
1865	3,491,205	4,294	813
1866	2,662,106	2,982	893
1867	2,480,868	3,044	814
1868	2,372,972	2,390	992
1869	1,774,978	2,369	749
1870	1,336,956	2,348	569
1871	1,799,440	2,450	734
1872	1,610,972	2,400	671
1873	1,305,749	2,300	567
1874	1,844,618	2,868	643
1875	2,474,904	2,024	1,222
1876	1,786,648	2,282	783
1877	1,608,182	1,960	820
1878	1,275,204	1,883	677
1879	1,290,058	2,124	607
1880	1,013,827	1,955	518
1881	1,046,737	1,898	551
1882	954,085	1,738	548
	\$47,141,711		

Williams Creek is estimated, in a territory of $2\frac{1}{2}$ miles, to have yielded five millions sterling. The Black Jack, in the Cariboo District, realized in two years £40,000, with an expenditure of £10,000; the Cunningham in four years gained £1,000,000, at a cost of £20,000; the California, the same; and the Steel Company gained £150,000 at an expense of about £50,000. All this, it should be borne in mind, was obtained without science or machinery, and with only the gold prospector's skill. On the Antler Creek, at a depth of less than five feet, men made from £10 to £50 a day regularly. What is now wanted is machinery, science and skill. It is also necessary to explore and thoroughly prospect the country for new diggings, or rediscover the old deposits in the surrounding hills.

NORTH-WEST COAL.

A very interesting article, entitled "King Coal," from the pen of Professor C. D. Wilber, formerly State Geologist of Illinois, has appeared in the *Chicago Mining Review*. Professor Wilber is personally known to us and has been a frequent visitor at our office. He bears the reputation of being one of the recognized authorities in the United States on coal; he is an able statistician and a powerful writer. During the past year he has directed some attention to the mineral resources of Canada and has carefully investigated the coal beds of our North-West Territories. After dwelling upon the development and distribution of coal in the Western and North-Western States and Territories, the sources of supply for the great agricultural areas destitute of coal, the relation of low coal rates on railroads to immigration and the recent discoveries of coal in Dakota, Wyoming and Colorado, he proceeds to speak of coal in the British possessions north of the 49th parallel, in terms as follows:—

"Taking our course north from Mexico, and comparing each political division or territory with the one south of it, we are certain to notice the

great preponderance of coal north of the 30th parallel. Large deposits of coal from 10 to 15 feet in thickness are found 400 and 500 miles north of Montana and Idaho. It is probable, however, that in the extreme north, bordering on the Arctic Ocean, we shall find a corresponding limit of coal, the cause of which is referable, as before stated, to the climatic conditions of vegetable growth.

"It will be interesting, especially to Canadians, to know the sources of coal for the vast region now intersected by the Canadian Pacific Railway. This area comprises the Provinces of Manitoba, Assiniboia, Alberta, and British Columbia. Here is an immense wilderness of both flat and rolling prairie, of grassy plains and magnificent rivers, having a soil both capable of husbandry and herding, as is proven to-day by thousands of new farms where so recently prevailed the wild and hopeless monotony of Nature.

"Into this unmeasured domain nearly 2,000 miles in length, east and west, by at least 500 in width, north of the 49th parallel—the international boundary—are coming, with the facilities of this new trans-continental railway, now being constructed by the Government, hundreds of thousands of the more hardy populations of northern latitudes—of Ontario, Quebec and Northern Europe, already accustomed to long winter terms.

"A colony of families from Iceland,' says a Winnipeg paper of recent date, 'have settled in Manitoba, and are so delighted with their new summer-land that they have sent greetings to their friends, with advice to come and possess the fertile acres of Manitoba, 'without money or price.' It is pleasant to anticipate them and their cousins, the Greenlanders, removing from the 75th to the 50th parallel, and rejoicing in the sunshine of a warmer climate, where even 40° below zero is to them a foretaste of ethereal mildness.

"Coal supplies for the eastern portion of this new region will come from the Souris River lignites already referred to. The middle region can be supplied from the Medicine Hat and Belly River coal districts which also afford lignites. The last named coals are inferior in quality, i.e., not compact, having a heavy per cent. of ash and moisture, and easily disintegrated in the open air. But notwithstanding they are the lowest order of cretaceous coals, yet the necessities of a six months' winter will compel their use and distribution by rail on an extensive scale.

"Beyond Calgary, which is destined to become the leading city of the North-West Territory, coal is found of a quality far superior to the lignite of the plains just referred to.

"A field of anthracite coal has recently been found near Cascade Mountain on the Canadian Pacific Railway 900 miles west of Winnipeg. It has been traced in a direct line, on its outcrops, for several miles, and at intervals pits or shafts have been dug to prove the regularity and persistence of this anthracite stratum. About 300 tons have been mined and shipped to the East, and from this amount, sufficient tests have been made, to prove not only its great value, but also its identity, as a true anthracite coal.

"In the Western States and Territories it is a universal fact that the grade of coals, in quality or value, increase towards the Rocky Mountains as follows:—

"1. We have loose or spongy lignites; 2. Compact or solid lignites; 3. Semi-bituminous; 4. Anthracite.

"A correct outline map of the productive coal limits of the Western States and Territories must be vague and uncertain especially on the south. Western Texas, New Mexico and Arizona should have areas indefinitely shaded with frequent doubtful signals—thus (?)

"But the coal area rapidly enlarges with every succeeding parallel going north. This area is over 200 miles wide in Southern Colorado. While in northern Colorado from Greely westward, across North Park to the coal fields of Utah in Great Salt Lake region, the width of the coal area is nearly 600 miles.

"Through Wyoming, beginning in the Black Hills Region, the coal area extends into Idaho, and includes several deposits of great size and value, notably one near Evanston on the Union Pacific Railway, having a thickness exceeding 40 feet; easily traceable several miles northward in the Bear River Valley. But, on the other hand, it is quite contrary to expectation, yet a fact, that the country nearly 900 miles west of Ogden, including both Nevada and California, is almost, if not quite destitute of coal.

"We find the greatest width of coal area is spanned by the 49th parallel, or the international boundary, reaching from the Souris River coal system to the Pacific coast, with considerable areas intervening that are destitute of coal, both in northern Idaho, Montana and Manitoba.

"North of this line we have already followed the route of the Canadian Pacific Railway, with results as above stated. Still further to the north-west, 200 miles north of Calgary, in the vicinity of Edmonton, are found large areas of excellent coal, exceeding 12 feet in thickness, extending thence west to the head waters of the Athabasca, and across again to the Pacific coast.

"So varied are the above described coal areas, in their quality, quantity and surroundings, that the man who reads the mute but sure

prophecies of nature can readily locate the future great centres of those industries that are based upon coal and iron."

In concluding his "King Coal" article, Prof. Wilber, worked up to a high pitch of enthusiasm by his review of long study and personal observation, finds expression for his feelings in the following words:—

"Based upon the facts that faithfully describe these resources of the Great West, undeveloped and unlimited, no speech can be considered extravagant that sets forth the possibilities of ultimate America.

"Even here is the grandest arena on earth for realizing the beautiful vision of the Apocalypse.

"And the City lieth four square, and the length of it is as large as the breadth. And he measured the city with a reed, 12,000 furlongs (or 1,500 miles square). And the nations of them which are saved shall walk in the light of it, and the kings of the earth do bring their glory and honor into it."

FOREIGN SOURCES OF LEAD PRODUCTION.

Numerous applications have reached us during the past few months, from people who are the owners of, or are interested in Galena deposits in various localities in the Dominion, for statistical information respecting the lead production in foreign countries, and as there appears to be a disposition on the part of these gentlemen to develop their galena deposits, we reprint, for their information, an interesting article which has recently appeared in the *New York Mining Record* bearing on the production of lead outside of the United States, as follows:—"Our production of lead, especially from argentiferous ores, is so steadily increasing in commercial importance that it becomes of immediate interest to our readers to have at least an approximate knowledge of the production of other countries, and especially of Great Britain, at once a considerable producer as well as importer of lead. According to the *London Mining World*, the total output of lead by the mines of the United Kingdom, for 1883, was 39,190 tons, of the aggregate value of \$2,527,000. This was a considerable falling off in the number of tons produced, as will be seen from the following statement of the quantity of lead produced in the United Kingdom for the ten years ending 1883, the quantities imported and exported and the amount left for home consumption:—

Year.	Produced from British ores. Tons.	Imp't and lead obtained from foreign ores. Tons.	British and foreign lead exported. Tons.	Available for home consumption. Tons.
1874.....	58,777	74,351	41,321	91,807
1875.....	57,435	89,705	38,624	108,516
1876.....	58,667	91,010	42,685	106,992
1877.....	61,403	105,472	47,785	118,990
1878.....	58,020	112,977	36,478	134,519
1879.....	51,635	117,014	36,776	131,873
1880.....	56,949	107,211	33,551	130,609
1881.....	48,587	106,593	43,109	112,071
1882.....	50,328	100,331	37,375	113,784
1883.....	39,190	118,521	59,287	118,424

Thus, the amount produced during 1883, was 11,138 tons short of the output of 1882, and 16,563 tons less than the average annual product for the preceding nine years. At the same time, however, the amount of lead imported or extracted from foreign land ores is 18,199 tons greater than for 1882, and 18,003 tons greater than the average yearly imports for the preceding nine years.

As for the exports of lead for 1883, they exceed those of 1882 by 1,912 tons, but were only somewhat greater than the yearly average exports for the preceding nine years, while the amount left available for consumption in the British Islands, only exceeding by 4,640 tons that for 1882, fell below the average yearly amount. The lead product in the ore treated was thus distributed as to sources, for 1883:

	Tons.	Cwts.
England and Wales.....	35,217	1
Scotland.....	3,613	12
Ireland.....	358	18
Total.....	39,189	11
Silver ounces.....		344,052

The highest price for English pig during 1883 was \$70 and the lowest \$59. The quantity of pig lead exported was 23,583 tons, the most of which went to China and Russia, but only 326 tons to the United States. The chief imports of lead ore into the United Kingdom during 1883, were from France, 2,763 tons; Spain, 2,906 tons; Italy, 5,386 tons and Peru 141 tons. For the last five years included in the

first table given above, we are able to give the chief quarters to which the lead was exported from the United Kingdom, namely:

	1879. Tons.	1880. Tons.	1881. Tons.	1883. Tons.
Russia.....	10,487	7,318	8,355	5,702
China.....	5,879	10,011	12,824	11,704
Australia.....	3,133	1,929	4,715	5,226
France.....	3,384	2,417	3,390	1,046
British India.....	3,282	2,589	3,349	3,116
Germany.....	1,171	1,069	1,041	1,236
United States.....	1,022	258	598	517
Other Countries....	8,418	7,966	8,837	8,468
Totals.....	36,776	33,551	43,109	37,375

But while, as appears in the foregoing, Germany has been importing yearly about 1,090 tons of lead from England during the four years ending with 1883, she has also been a heavy producer of lead, or to the understated extent:

	Tons.
1880.....	85,928
1881.....	86,729
1882.....	85,860
1883.....	94,930
Yearly average.....	88,361

The product for 1883 was not only larger than for any one of the four years, but 6,568 tons greater than the yearly average product for the four years. At the same time, there was a production of litharge to the understated extent:

	Tons.
1880.....	3,923
1881.....	4,514
1882.....	4,170
1883.....	5,044
Yearly average.....	4,413

As valued at the spot lead and litharge together, we have the following figures:

1880.....	\$6,310,213
1881.....	6,006,736
1882.....	6,207,040
1883.....	5,647,275

Thus we see, that although the production in 1883 was actually greater than that of 1880, by 9,000 tons, its money value was \$662,938 less, because of the fall, meanwhile, in the market price of lead.

But the largest foreign source of lead production and exportation in Spain, as may be seen from the following statement of her exports for the ten years and her estimated total product for the ten years ended with 1883:

	Exports tons of 2,240 lbs.	Estimated amount consumed at home.	Estimated product tons.
1874.....	84,384	10,210	94,600
1875.....	91,733	10,962	102,700
1876.....	98,705	11,790	110,000
1877.....	110,051	13,148	123,200
1878.....	88,068	10,432	98,500
1879.....	106,830	12,770	119,600
1880.....	92,399	10,901	103,300
1881.....	110,420	13,180	123,600
1882.....	116,132	12,868	130,000
1883.....	*123,000	14,000	137,000

In the absence of any present information as to the domestic consumption of lead in Spain and her colonies which must be material for a nation that has so considerable an army and navy† with large colonial possessions as Spain, and having a merchant marine of 2,236 vessels including 347 steamers in 1881, we have felt justified to add to the amount of lead exported every year a fraction under 12 per cent. to reach the total product of the lead mines of Spain, which rationally would seem rather under than over the product in view of the exports.

Now for the last four years the product of Great Britain, Spain and Germany has been, say as follows:

	Great Britain. tons.	Germany. tons.	Spain. tons.	Total tons.
1880.....	56,950	86,000	103,300	246,250
1881.....	48,600	86,800	123,600	259,000
1882.....	50,400	86,000	130,000	266,400
1883.....	39,230	95,000	137,000	271,250

During the last ten years the ancient silver-lead mines of Laurium, in Greece, have been contributing lead to the European supply and Italy has exported a good deal of lead ore doubtless included in the lead and ores embraced in the first of the foregoing tables of this article. As yet, we have found no data about either the production or the consumption of lead in France.

*For eleven months exports reported at 116,341, have estimated last month.

†124 steamships of war of all class s with 462 guns and an army of 90,000 men.

OUTLOOK FOR THE IRON TRADE.

The tone recently adopted by the leading authorities on iron and steel manufacturing in the United States points to the theory that this important industry has already begun to revive, and that the almost unprecedented stagnation which has characterized the iron trade during the past year is likely to be followed, in the near future, by a more encouraging condition of things. That the prospects are brightening is evidenced by the following article which has appeared in a recent number of the *Iron Trade Review*, of Cleveland, Ohio:

"Last week we printed a list of 26 iron concerns throughout the country at which reductions in wages, varying from 4 to 20 per cent., had been made on or about October 1. Like all pictures, however, there are two sides to this one as well, and this week we propose giving some facts on the more encouraging side. In the first place, we notice that the following works, which have been shut down for a longer or shorter period, have, within the past week, resumed work with full complements of men. The Fort Pitt Iron and Steel Works, Pittsburgh, employing several hundred hands; the Sharon Iron Co., of Sharon, Pa., employing several hundred men; Oliver Bros. & Phillips, Pittsburgh, 3,000 men; and Dilworth, Porter & Co., Pittsburgh, also a very large establishment. In the two latter instances, a notice of reduction of wages amounting to 12½ and 10 per cent. respectively, had been given, but was afterwards withdrawn. It is, of course, to be presumed that none of these works would have resumed had not the receipt of sufficient orders justified such action; and this surmise is borne out by the fact that several large contracts have been placed the past week with other parties, among which we may mention a \$4,000,000 contract with a Buffalo manufacturer for 50,000 tons of steel pipe; the sale of 13,000 tons of car wheel iron at Chattanooga, and a large sale of pig iron at Birmingham, Ala., at 50 cents advance on prices previously prevailing, coupled with the fact that every furnace in that region is expected to go into blast within the next four weeks. With such indications as these, business would not seem to be in the desperate straits that some would have us believe.

Calumet and Hecla.

It will be learned with surprise by those who, for many years, have been familiar with the phenomenal success of this world renowned copper mine, that the company has determined to pass the November quarterly dividend. The effect of this decision by the management must inevitably be a still further reduction in the market value of the

company's property. It will be remembered that no dividend was paid in May last, and but one half of the usual quarterly dividend was declared in August, the consequence of which was a rapid depreciation in value of the stock. At the close of 1883 the stock of *Calumet and Hecla* was quoted at 240 and in May, 1884, it had fallen to 170; in consequence of this latest decision of the management of the company, its stock sold down to 120 on October 20th. Where this downward course will stop is a matter for the future to decide.

Silver in the Selkirks.

It is reported that Dr. Dawson has examined and pronounced a favourable opinion on a quantity of specimens of silver ore brought into Calgary by Mr. Broderick and his party who went out prospecting in April last and have lately returned. He has taken up, it is reported, a number of claims, which are alleged to be situated about twenty-two miles south of the main line of the Canadian Pacific Railway.

A Marvellous Feat in Unloading.

What is said to be the greatest feat in unloading ever performed has been accomplished on the docks of the North Chicago Rolling Mill Co., at South Chicago. Work was begun at 6 o'clock a.m. on the steamer *Massachusetts*, and at 12 o'clock precisely her cargo of 1,618 gross tons, Ludington ore, was all on the dock. After an intermission of half an hour for dinner, the same gang went into the steamship *Merrimac*, and at 7 p.m. her cargo of 1,581 gross tons, Cleveland, ore was all out, and she was ready for her return trip. Allowing half an hour for supper, each boat was unloaded in six hours, making a total of 3,199 gross tons in 12 hours. This gives an average of 266½ tons per hour.

A ROMANCE IN MINING HISTORY.

Under the Spanish regime in Peru, as far back as 1660, one of the richest silver mines was that known as the Manto, owned by two Andalusian Spaniards, the brothers Jose and Gaspar Salcedo, and the mineral was found in large deposits of virgin silver which was sent directly to the Mint at Arequipa just as it came from the mine. Quite a large city, San Luis de Alva, soon grew up around the habitations of the Salcedos, to which resorted the wild, adventurous spirits from all quarters of Peru in quest of some share of the wonderful output of silver, whether by craft or force. Soon a feud broke out between the Andalusians and the Biscayans who had come to outnumber the former.

Bitter conflicts took place, and in one of these it is said, as many as a thousand men of the two parties were left on the field of battle. These incessant bloody disturbances finally provoked the Spanish Vice-Roy, Don Pedro, Fernandez y Andrade Conde de Lemos, to go to the scene with a considerable force in June, 1868. He burned San Luis de Alva to the ground and took away from it the title of City, which was transferred to the neighbouring village of San Juan Bautista, with the name San Carlos de Puno. Don Jose de Salcedo sought to placate the Vice-Roy by the present of the bars of silver with which he had paved the pathway from San Luis to his own house, for the Vice-Roy to walk upon, but while the silver was accepted, the unfortunate Salcedo was placed in irons. The same night there was affixed to the door of the lodgings of the Vice-Roy these words:—

Conde de Lemos	Count de Lemos.
Amainemos.	Abate your zeal.
O si no veremos.	Or if not we shall see.

This pasquin, so to speak, having been carried to the Vice-Roy, he wrote beneath it:—

Mataremos.	We shall kill.
Ahorcaremos.	We shall hang.
Despues veremos.	Afterwards we shall see.

This was then reattached to the door, the chiefs of both parties were hung, and Don Jose de Salcedo was strangled at the mouth of his rich silver mine which was confiscated to the Crown of Spain.

The other brother, Don Gaspar, who meanwhile had fled to Spain, demanded restitution of the property and justice before the Council of the Indies, for the execution of Don Jose, by whose death he declared the Spanish Crown was a great loser, inasmuch as the mine when worked by them had paid to the King, in the preceding two years and a half, as much as \$1,774,000 as the Crown's share of the whole product of \$8,760,000. After seven years of solicitations he gained his suit and recovered possession of the property. But, meanwhile, all his fortune had been spent in Spain, the mine having been left unworked was filled with water, consequently, he was wholly unable to meet the heavy expense of reopening and working it. So he died in poverty after having been possessed of an enormous fortune. Subsequently, others were ruined in the effort to rid El Manto of the water, until it fell into possession of English parties who have managed to work it profitably again.—*N. Y. Mining Record*.

It has been stated that the Roberts' Iron Company, which has, for some years, been engaged in iron mining at Robertsville, Frontenac County, Ontario, has purchased an iron property in the Township of Bristol, County of Pontiac, Quebec, and has already begun mining operations. We will be pleased to receive more definite information on the subject.

General Mining Notes.

Fifty-six incorporated gold, silver, lead, copper and mica mining companies of the United States paid dividends this year, up to the close of September, aggregating \$7,171,797.

THE INTERCOLONIAL COAL MINING COMPANY (limited) paid a dividend on October 15th of seven per cent. on the preferred stock; and a dividend, in preferred stock (acquired), at the rate of four per cent. on the ordinary stock.

The mines of Guanajuato, Mexico, are estimated to have produced, since the year 1827, about \$260,000,000, coined in the same city, to say nothing of the unworked ore and bar silver exported; and from the time of the conquest to the present time the total amount is calculated at the enormous figure of \$900,000,000, of which the famous Valenciana mine, situated on the Veta Madre, has contributed about \$160,000,000.

EL CALLAO.—This celebrated Venezuelan gold mine produced 15,735 ounces of gold during July of this year, worth about \$270,000, and making a total product for seven months of 1884 of about \$2,175,000. The monthly dividend paid was \$5.50 per share, aggregating \$177,100. The product of this wonderful mine for the month of August was 15,594 ounces valued at \$307,000. The August dividend was \$5.60 per share, aggregating \$180,000.

THE COMSTOCK LODGE.—The work of delving into the bowels of the earth to the depth of 2,800, 3,100 and 3,200 feet is still continued on the Comstock. It is a conundrum as to what it is done for, as it has been demonstrated that the deeper this work is carried down the less prospect there is of developing a body of paying ore. Before the workings in the mine had gone below, say, the 1,700 foot level, it was a mooted question whether it would be possible that bonanza bodies of ore would be discovered at greater depths. Now, as the fact has been fully demonstrated by continuing the work, until the present lowest records have been attained, it seems that to continue to sink further is the height of folly, so far as any favourable results are concerned. It has been stated that the managers of the mines are doubtless of the same opinion, but that they are working in the interest of the "Gold Hill and Virginia Water Company," who supply water and ice, and also the railroads drawing a large business from the transportation of wood, timber and other supplies. However, as long as outsiders will continue to pay assessments the work will go bravely on. Thus writes an authority of Virginia City.

NOTICE TO CONTRACTORS.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Post Office, &c., Orangeville, Ont.," will be received until Thursday, the 23rd day of October next, inclusive, for the erection of

Post Office, &c.,

AT

ORANGEVILLE, ONT.

Plans and specifications can be seen at the Department of Public Works, Ottawa, and at the Post Office, Orangeville, Ont. and after Monday, the 6th day of October next.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS, Secretary.

Department of Public Works,
Ottawa, Sept. 5th, 1884.

PERKINS' FOUNDRY
OTTAWA.

FORGINGS AND CASTINGS

OF EVERY DESCRIPTION, TRUE
TO PATTERN.

Wheels and Axles for Tram Cars, Derrick-fittings, Hoisting Gear, Shoes, Dies, Hammer-heads, Iron Pipe and Gearing of all kinds. Also Boilers and Steam-fittings.

ESTIMATES FURNISHED.

ADDRESS:

E. L. Perkins,
314 SPARKS STREET,
OTTAWA.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Timber," will be received at this office until Monday, the 17th day of November next, inclusive, for the supply of timber required in connection with the Dredging Plant of the Department, according to a specification to be seen at the Department of Public Works, Ottawa, where printed forms of tender may be obtained.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, for the sum of \$150, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS, Secretary.

Department of Public Works,
Ottawa, Oct. 28th, 1884.

DYNAMITE

TO

MINERS, QUARRYMEN

—AND—

RAILWAY CONTRACTORS

We have been appointed Agents for the sale of the Celebrated Explosives manufactured by **The Nobels Explosives Company, Limited,** of Glasgow, Scotland, and we are prepared to supply from Stock their

No. 1 Dynamite

—\$ AND \$—

Patent Blasting Gelatine

In quantities as may be required.

—ALSO—

NOBELS' TREBLE DETONATORS

Suitable for use with the above.

Our **No. 1 Dynamite** contains **Seventy-five per cent. Nitro Glycerine** and our **Patent Blasting Gelatine**, the Strongest and Safest Explosive known, is fully **Fifty per cent. stronger.**

The Nobels Explosive Co. have sent to Canada, **Mr. Robert Bell**, one of their practical instructors, who will, at any time, be prepared to demonstrate the **Superiority** of their **Explosives** over any other offered, and to show how they should be used to obtain the greatest effect.

We specially solicit orders, to import, at special prices.

All particulars can be obtained from

B. & S. H. THOMPSON,
Montreal.

Notice to Contractors.

SEALED SEPARATE TENDERS (including plans and specifications), addressed to the undersigned and endorsed respectively: (1) Tender for Heating Apparatus, Three Rivers, P.Q., Post Office; (2) Tender for Heating Apparatus, Sherbrooke, P.Q., Post Office; and (3) Tender for Heating Apparatus, Cornwall, Ont., Post Office, will be received at this office until FRIDAY the 10th October next, for the completion of the above works.

Copies of plans of the buildings proposed to be heated and a memorandum of requirements will be furnished to those desiring to tender, who will be required to indicate the arrangement, &c., of their apparatus and furnish a fully detailed specification.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to 5 per cent. of the amount of the tender, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS, Secretary.

Department of Public Works,
Ottawa, 8th Sept., 1884.

LAND & PHOSPHATE CO.

(LIMITED),

Offers For Sale some of the best located and
most promising

PHOSPHATE LANDS

In the Townships of

BUCKINGHAM, TEMPLETON, PORTLAND
EAST AND PORTLAND WEST.

Phosphate Bought and Sold.

Advances made on Phosphate to be shipped and
Sold abroad on
Commission.

Address: **ROBT. C. ADAMS,**
PRESIDENT,
41 ST. FRANCOIS XAVIER ST.,
MONTREAL.

GRAPHITE.

Wanted, fair average samples of about 1 lb. each, with prices, F.O.B. Address J. S. Merry, Assay Office, Swansea, Wales.

MILLER BROS. & MITCHELL

Manufacturers of
MINING AND CONTRACTORS' PLANT,
LATEST IMPROVED STEAM ROCK DRILLS,
HOISTING ENGINES,
AIR COMPRESSORS,
ELECTRIC BLASTING APPARATUS,
IMPROVED PATENT STEEL WIRE ROPE,
&c., &c., &c.

SEND FOR PAMPHLET—
Miller Bros. & Mitchell,
Works, 110 to 120 King St. Office, 30 William St.
MONTREAL.

ROCK DRILLS, AIR COMPRESSORS,

General Mining Machinery,
WIRE ROPE and CONTRACTORS' SUPPLIES.

FOR CATALOGUES, ESTIMATES, ETC., ADDRESS:

INGERSOLL ROCK DRILL CO.

(LIMITED)

44 FOUNDLING ST., MONTREAL.

PHOSPHATE CRYSTALS.

Farmers, Miners and Prospectors, having unbroken
Phosphate Crystals for Sale, can find a cash
purchaser by applying at the Office of

THE CANADIAN MINING REVIEW,
Union Chambers, 14 Metcalfe Street, Ottawa.

Parties offering crystals for sale will please mention the
colour, length and diameter—large ones preferred.

MINES AND MINERALS.

Developed and Undeveloped Mines and Minerals of Commercial Value
BOUGHT AND SOLD.

PROPERTIES EXAMINED AND ANALYSES MADE OF ORE OF EVERY DESCRIPTION.

A Competent Expert is permanently engaged for the purpose of making Unprejudiced Reports on all Mines placed
in our hands for Sale, such reports being at all times open to intending purchasers for examination.

Phosphate, Iron, Iron Pyrites, Copper, Asbestos, Mica, Plumbago,
Gold and Silver Mines, and Marble and Sand-
stone Quarries, For Sale.

MINERAL LANDS EXAMINED AND REPORTED ON BY OUR EXPERT; ALSO, ANALYSES OF MINERALS
OF EVERY DESCRIPTION MADE BY A COMPETENT ASSAYIST.

**Correspondence with Owners of Mines and Capitalists desirous of
investing is most respectfully solicited.**

Address all Communications to

The Publishers Canadian Mining Review,

Union Chambers, 14 Metcalfe Street, Ottawa, Canada.

ERNEST GAUJOT,

MINING AND MECHANICAL ENGINEER,

And Expert in Milling and Smelting.

Will examine and report on Developed Mines
and Mineral Lands.

Address:

Belleville, Ont., or Buckingham, P.Q.

J. F. McANDREW,

Expert in Gold, Silver, Copper, Iron,
Plumbago and Phosphate Mining.

ORES ANALYSED.

Mineral Lands examined and reported on.

ADDRESS:

Buckingham, Province of Quebec.

McIntyre & Lewis,

BARISTERS, SOLICITORS & NOTARIES PUBLIC.

Conveyancing of Properties and Mineral
Rights.

OFFICES: **Union Chambers, Ottawa**

(adjoining Canadian Mining Review Office.)

ALEX. F. MCINTYRE. TRAVERS LEWIS.

JAS. H. REIFFENSTEIN,
SURVEYOR

FOR PROVINCES OF ONTARIO AND QUEBEC

ALSO FOR DOMINION LANDS.

Residence, No. 128 Crichton St. New Edin-
burgh; Post Office, Ottawa, or
New Edinburgh.

The Harbert Telephone

(FOR PRIVATE LINES.)

Sold outright. No
renting. Just the
thing for use in Mines
or Mining Districts.
Over 5000 in use. Pat.
Nov. 30, 1880. Late
improvements. Send
for descriptive cir-
cular.

EDW. HARBERT & CO.,

159 LaSalle St. Chicago, Ill., U.S.A.

FOR SALE,

**White Marble Quarry on Calumet
Island.**

At this quarry there is an inex-
haustible supply of most beautiful
white marble. Price \$800. Sam-
ples to be seen and information ob-
tained at the office of the MINING
REVIEW.

Canadian Mining Review. OTTAWA.

PUBLISHED MONTHLY.

ANNUAL SUBSCRIPTION - - - - \$1.00
ADVERTISING RATES—15c. per line (12 lines to 1 inch).

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

OUR attention has been called by a London, England, correspondent to numerous attempts that have been made during the past year to dispose of worthless mining properties to confiding English capitalists. It would appear that during last winter London was visited by certain speculators armed with bogus reports and false statistics concerning certain phosphate locations in the Perth district and in Ottawa County, and their method of offering these properties for sale on the London market was ingenious and well calculated to deceive the unwary. Skilfully executed maps of the country, where these imaginary phosphate mines were said to exist, were exhibited, accompanying which were most exaggerated and untruthful reports, signed by some audacious individual styling himself "Mining Engineer and Expert," setting forth the enormous value of the properties that were being offered for sale, and giving estimates of the cost of production and delivery from the mines to point of shipment. As a matter of fact these very

properties are known to be worthless, by those who are familiar with their location, and the figures given in the reports, as the cost of mining and transportation, are studiously cut down quite two-thirds, with a view to showing a fictitious margin of profit on an annual output which was represented absurdly in excess of anything that has yet been accomplished in this country. Neither pains nor expense was spared in preparing the maps, the plans of the mines and the reports, and had these people succeeded in accomplishing the object of their mission among English capitalists they would have been handsomely repaid for their trouble and outlay; but, so far as we can learn, the properties in question have not, as yet, changed hands. Such attempts, as the one we have just quoted, to bring our mining industries into disfavour, should be frowned down and exposed whenever they come to the knowledge of those who are interested in the future of Canadian mines. Capital is the one thing we are in need of for the development of our mineral resources, and it is our duty to prevent, so far as it lies within our power, its being invested in wildcat and bogus enterprises. The only way to encourage capital into the country is by guiding it at the outset into channels where it will be certain to find profitable investment. At once, when we have established a value for our mineral deposits and mines, ample capital is available for their development, but to induce capitalists, by misrepresentation, falsified statements and bogus reports, to invest money in Canadian mines, is to deal a death-blow to the country's enterprises. Such a calamity we will do all we can to avert.

It is, perhaps, a natural thing that the more successful a mining company is, the briefer becomes its annual or semi-annual reports. Shareholders, content with their profits, do not care for, nor do they need, elaborate explanations on technical points, says the *New York Engineering and Mining Journal*, and that this is strikingly shown in the case of the Callao mine, of

Venezuela, which can justly boast of being the most profitable gold mine in the world, now working. From 1871 to 1883, both inclusive, this mine produced from 169,955 tons of rock, 619,506 ounces of gold, valued at 59,648,821 bolivares or francs, out of which 20,447,000 bolivares of dividends were paid. The mine is now under technical management of American engineers, Mr. H. C. Perkins being superintendent, and Mr. Hamilton Smith, Jr., consulting engineer, whose reforms are beginning to tell handsomely in increased dividends. Working 3658 hours during the six months, the 60-stamp mill, the stamps dropping most of the time 65 times a minute, crushed 14,223 tons of rock, which, together with the product of some sulphurets and concentrates, produced 96,276 ounces of gold, valued at 9,269,311 bolivares, or roughly \$1,850,000, the dividend paid out of this product being 5,280,000 bolivares, or roughly \$1,050,000, equivalent to an annual net return of 32.8 per cent. on the nominal capital of 32,200,000 bolivares. Besides the dividends thus distributed, the company paid out 800,000 bolivares for the machinery for a new 40-stamp mill purchased in the United States, and now on the ground ready to be put up, and for sinking a new shaft, and 680,069 bolivares for the machinery of the Union mine. The result of operations at El Callao during the month of September, 1884, will be found reported in another column:

A SHORT-SIGHTED POLICY.

In the Kingston, Ontario, news items of 12th November we noticed that the County Council had on that day decided to memorialize the Government to legislate so that Canadian mines can be assessed beyond the assessment of the land. This would certainly be a short-sighted policy for any municipal corporation to pursue, as it is much more to the benefit of a municipality that mining industries should be fostered and encouraged in the immediate locality than that they should be thwarted and hampered by an imposed taxation, as any revenue derived therefrom would be a mere drop in the bucket as compared with the advantages to a community that are always to be had from the employment given and the money circulated by miners. In the phosphate districts of Ottawa County the

great benefit the mining industry has been to that section of the county is made apparent by the present easy circumstances of the farmers, among whom hundreds of thousands of dollars have circulated in payment for labour and farm produce during the past two years. They are now enabled to buy and sell for cash instead of dealing with the village storekeeper on the barter system as in former days when money was to them a curiosity. Any attempt to tax the mineral in our Canadian mines will be a mistake and should receive no encouragement from parliament.

THE PHOSPHATE TRADE.

The last shipment of phosphate for this season left Montreal on the 20th of November, for Liverpool, per s.s. *Ontario*. The total shipment for the season of 1884, from the port of Montreal, aggregated 21,243 gross tons, in addition to which it is estimated that 200 tons was sent into the United States and about 700 tons consumed in Canada, making a total, for the year's output, of 22,143 tons, 1,790 tons of which came from the mines in the Perth and Kingston districts, leaving 20,353 tons the product of Ottawa County as against 15,166 tons for the previous year.

Although the average price at which the past year's output has been disposed of was not by any means as high as it has been in former years, yet the season just closed has been one of marked prosperity to mine owners. The unprecedented continuance of wet weather beginning as it did early in October, caused the breaking up of the road from Buckingham Village to the railway depot, and the consequent discontinuance of the delivery of phosphate at point of shipment quite a month earlier than would have been necessary under ordinary circumstances; and this has been the means of reducing the total shipments from the Buckingham district quite 2,500 tons. At the *High Rock* mine alone 1,100 tons has been held over and at the Union Company's and the *Emerald* mines a large quantity of phosphate, which might have gone forward this season, has been held over owing to the impassable condition of the road from the landing to the railway depot. Had this hindrance not arisen the year's shipment from Ottawa County would have aggregated very nearly 23,000 tons, the amount estimated by the REVIEW, during the summer, as the probable output for 1884. In December, 1883, we predicted that Ottawa County would forward 21,000 tons during 1884, in which we were not far astray, as is shown by the following statement:—

PHOSPHATE SHIPMENTS FOR 1884.

The total quantity of phosphate shipped from Canada during the season of navigation of 1884, to foreign ports, is as follows:—

To Liverpool.....	8,557 gross tons
" London.....	4,389 "
" Glasgow.....	3,083 "
" Hamburg.....	2,970 "
" Bristol.....	1,824 "
" Dublin.....	210 "
" Penarth, for orders....	100 "
" Sunderland.....	60 "
" Bristol Channel.....	50 "
Total.....	21,243 "
Shipped to United States.....	200
Consumed in Canada.....	700 900
Total output shipped from the mines.....	22,143

Contributed by the mines in the Perth & Kingston district. 1,790 gross tons

Forwarded from Ottawa County mines.....	20,353 "
Total output for 1883.....	17,840 "
" " 1884.....	21,243 "
Increase for 1884.....	3,403 "

A NEW ENTERPRISE.

We understand that some of the owners of the pyrites mines at Capelton, in the Eastern Townships, have under consideration a proposal to erect sulphuric acid works in the phosphate region of the County of Ottawa, possibly at Buckingham Village, to which a branch of the Canadian Pacific Railway is now being built. As long ago as 1865, Professor Bell pointed out the advantages which might result from the establishment of such works if the apatite could be found in any part of the country in sufficient quantities to guarantee a permanent supply of the mineral. The developments in the valley of the Lièvre, having now removed all doubts on that head, we trust it may not be long before the proposed works go into operation. The government might very properly offer encouragement in some form to an enterprise so eminently calculated to benefit the mining and agricultural interests of the country.

THE C. P. R. BRANCH LINE AT BUCKINGHAM.

The phosphate miners of the du Lièvre district are to be congratulated on having, after a long and determined struggle, succeeded in inducing the Canadian Pacific Railway Company to construct a short branch road from the landing on the du Lièvre River, north of Buckingham village, to connect with the main line at Buckingham station. The distance is not more than three and a half miles between these points, but the waggon road leading from the village to the railway has been so systematically neglected by the township corporation that for many months in the year, especially in the spring and autumn, it is practically impassable. This has for some years been a serious drawback, and has added much to the expense of the transportation of phosphate from the mines to the point of shipment, so much so that this autumn hauling had to be suspended quite a month before the close of navigation, and shippers were thus prevented from availing themselves of a low rate of ocean freight for a large percentage of the season's output of the mines. This serious impediment to the phosphate industry is now removed, or will be before the close of the year. Mr. Rae field, the contractor for the construction of the branch line, has had a force of 200 men employed on the road-bed, and by the end of the first week in December the entire distance will be graded and ready to receive the ties and rails. By the 1st of January the line will be ballasted and opened for traffic. Mr. Rae field deserves credit for the energetic manner in which he is pushing this work towards completion, and the Canadian Pacific Railway Company, in providing this facility for the transportation of phosphate, has wisely considered its own interests as well as those of the mine owners of the Lièvre valley. The road will be a paying institution, and henceforth the transportation of phosphate will be made easy as compared with former years.

GRAPHITE.

The Deposits of the Ottawa Valley—Their Origin and Extent.

In referring to the deposits of graphite found in this section of the Dominion, known as the Ottawa Valley, it will not be going beyond the limits of the subject if, at the outset, we give a momentary glance at the formation and character of the rocks in which they occur.

The Archean era in geology includes the oldest rocks known to that science,—rocks which are supposed to have been formed from the original rocky crust produced by the cooling of the earth. They are easily seen to be the result of the disintegration of an older series, and frequently contain pebbles unlike any rocks now known.

In Canada, where these rocks are very fully represented, they are divided into two periods,—the Laurentian and the Huronian,—the latter being considered the oldest. The long chain of mountains, of which a portion is visible across the Ottawa, is composed of the Laurentian rocks, the estimated thickness of which is 30,000 feet, consisting, with few exceptions, of metamorphic, or crystalline rocks.

These rugged, broken hills contain mineral deposits of graphite, associated most frequently with the limestone. In this series of rocks there are three great limestone layers, separated by gneissoid rocks, aggregating not less than 3,500 feet in thickness. The limestone of each of these layers is often mixed with, or passes into rocks which consist largely of pyroxene, or hornblende, and those portions abound frequently with valuable minerals, among the most common of which is graphite.

As to the probable origin of graphite in these rocks, Dr. Dawson remarks that—"It may fairly be assumed that in the present world, and in those geological periods with whose organic remains we are more familiar than with those of the Laurentian, there is no other source of unoxidized carbon in rocks than that furnished by organic matter, and that this has obtained its carbon in all cases, in the first instance, from the deoxidation of carbonic acid by living plants. No other source of carbon can, I believe, be imagined in the Laurentian period."

When we come to consider the enormous deposits of carbon held by the Laurentian rocks, it will easily be seen that immense periods, even of a most prolific vegetation, must have been necessary for these formations. The atmosphere of that period must have contained a great amount of carbonic acid, and the seas been charged with abundance of carbonate of lime, and have contained, in common with the land surface, enormous expanses of vegetable life. The amount of carbon, in the form of graphite, in the Laurentian system is considered by Dr. Dawson to be equal that of equal areas in the Carboniferous.

In the Township of Buckingham a band of limestone, with some interstratified bands of gneiss, about six hundred feet in thickness occurs, and is filled to such an extent with veins, or disseminated crystals or scales of graphite that the mineral is estimated to constitute one-fourth of the whole in places, and allowing for the poverty of some portions, the total vertical thickness of pure graphite cannot be less than from 20 to 30 feet. It occurs in equal abundance at several other horizons in beds of limestone, estimated by Prof. Logan to have an aggregate thickness of 3,500 feet, and the total quantity thus contained can readily be seen to be enormous.

Unlike beds of coal, which occupy the place where the forests which produced them formerly flourished, graphite has been disseminated through the rocks by changes therein. In some places, to be sure, beds are found so regular and pure that they may fairly be compared to deposits of anthracite; but these are the exceptions, the great bulk of the mineral is scattered in scales, lumps, or thin veins. Many of these veins are mere shrinkage cracks traversing in countless numbers the containing rocks, and so in size as to often resemble strings of nodular masses.

The graphite contained in these is supposed to have flowed into them in the form of hydrocarbon; or it may have been in a state of agneous solution at an enormous heat. It is indirectly derived from the rocks traversed by the veins, and has deposited with it sediments from these beds. Hence there is no occurrence of fossils as in coal, and the vegetable origin of graphite can only be inferred from analogy, and from the fact of a few scanty organic remains, as those of Eozoon, having been found in the containing rocks.

Dr. Dawson sums up his argument in the following statements:—"First, that somewhat 'obscure traces of organic structure could be detected in the Laurentian graphite; secondly, that the general arrangement and microscopic structure of the substance corresponds with that of carbonaceous and bituminous matters in marine formations of more modern date; thirdly, that if the Laurentian graphite, has been derived from vegetable matter, it has only undergone a metamorphosis similar in kind to that which organic matter in metamorphosed formations of later ages has experienced; fourthly, that the association of graphite matter with organic limestones, beds of iron ore and metallic sulphides greatly strengthens the probability of its vegetable origin; fifthly, that when we consider the immense thickness and extent of the Eozoal and graphite limestones and iron ore deposits of the Laurentian, if we admit the organic origin of the limestone and graphite, we must be prepared to believe that the life of that early period, though it may have existed under low forms, was most copiously developed, and that it equalled, perhaps surpassed, in its results, in the way of geological accumulation, that of any subsequent period."

The graphite of the Buckingham district occurs in three distinct forms, always in, or in close proximity to bands of crystalline limestone, gneiss, pyroxine, or quartzite, and sometimes even in iron ores, as is the case at Hull; secondly, in distinct imbedded masses, or pockets in the limestones; thirdly, in veins traversing in every direction the containing rocks.

The first form is most common and occurs in greatest abundance in the limestones, often forming such large deposits as to possess great economic value, as at Buckingham.

The second form is also of common occurrence and has been worked in Buckingham and Lochaber, where the deposits are considerable. In the latter township the bed which has been opened is over ten feet in thickness and yields about 20 per cent. of pure material.

The last, or fissure graphite is not so common, and though of much greater purity and brightness cannot, in general, be worked to such profit.

It is said that plumbago was mined in a desultory fashion some thirty years ago in the vicinity of Grenville, and that the farmers around Buckingham were accustomed to use the purer specimens, which they picked up, for polishing their stoves. More recently, how-

ever, plumbago mining was engaged in by a New York company, the Dominion of Canada Plumbago Company, and the Montreal Mining Company, who carried on operations in the Townships of Lochaber, Buckingham and Templeton, respectively; but, through bad management, want of experience and a reckless expenditure of money, operations had to be suspended and the industry has not since been revived.

The Graphite obtained from the deposits of the Ottawa Valley is, from its purity and other qualities, eminently adapted to all the uses to which plumbago has been applied. Granular graphite, such as was formerly obtained in Cumberland, and has been mined in other European countries, is suited chiefly to the manufacture of pencils, and for stock where strength is not needed, but it is almost useless for crucibles; while the foliated graphite of Ceylon is used entirely for the latter purpose. The plumbago of this country, consisting as it does of both varieties, can be used for all the numerous forms in which this valuable mineral is employed.

ANALYSES OF CANADIAN AND CEYLON GRAPHITES.

LOCALITY.	Specific gravity.	Volatile matter.	Carbon.	Ash.
	Pr.ct.	Pr.ct.	Pr.ct.	Pr.ct.
Canada, Buckingham: vein graphite; variety, foliated	2.2689	0.178	99.675	0.147
Canada, Buckingham: vein graphite; variety, columnar	2.2679	0.594	97.626	1.780
Canada, Grenville: vein graphite; variety, foliated	2.2714	0.109	99.815	0.070
Canada, Grenville: vein graphite; variety, columnar	2.2659	0.108	99.757	0.135
Ceylon: vein graphite; variety, columnar	2.2671	0.158	99.792	0.050
Ceylon: vein graphite; variety, foliated	2.2664	0.108	99.678	0.213
Ceylon: vein graphite; variety, columnar	2.2546	0.900	98.817	0.283
Ceylon: vein graphite; variety, foliated	2.2484	0.301	99.284	0.415

These analyses prove the oft repeated claim that Canadian Graphite is equal to the best Ceylon.

The present commercial depression and the consequent diminished production of iron has caused a temporary decrease in the demand for plumbago crucibles for steel smelting, but appearances point to a decided revival of the iron industries, and when we know that one firm alone in England has been accustomed to use from 800 to 1,000 tons annually in the manufacture of crucibles, we may hope yet to see a resumption in plumbago mining in the Ottawa Valley. With the benefit of past experience, and the increased facilities for transportation, there exists no reason why this enterprise should not become a most important industry in the district if fostered and encouraged by capitalists and conducted under practical and economic management.

KINGSTON RED GRANITE.

The Red Granite property on the east side of the harbour at Kingston, which belonged to the estate of the late Hon. John Young, has lately been acquired by parties in Ottawa, who are about to work it on a considerable scale. The granite, which is of a good medium sized grain in point of crystalline texture, is sound and uniform and of a beautifully rich flesh or salmon-red colour. It rises to a height of 90 feet from the edge of the water in Deadman's Bay, the eastern arm of Kingston Harbour. The position offers unusual facilities for working the quarry and obtaining a reliable supply of labour for dressing the stone. Vessels employed in the grain trade, which are now obliged to return in

ballast, can carry the granite either in the rough or in finished blocks and paving stones to the western cities. At Kingston Mills, on the Grand Trunk Railway, within two or three miles of the quarry and connecting with it by sheltered navigable water, the falls of the Catarqui River offer an unlimited and never-failing water power which may be taken advantage of for sawing, turning and polishing the stone. It is expected that this granite will command a high price on account of its very pleasing colour and the fine polish of which it is susceptible. The opening of the quarry and works will be a boon to the old "Limestone City," which may hereafter become known as the *Granite City*.

OXFORD GOLD MINING COMPANY.

Lake Catcha District, Nova Scotia.

At the close of last year the President of this company presented his first annual report to the stockholders which showed that during the year the company had been able to pay dividends aggregating \$30,000 and to expend as well a large sum of money, out of profits, in machinery and other plant. We are now indebted to the company's secretary for a full and comprehensive report of the active continuance of mining operations during the year which is just closing. The company has during the year made some very important accessions to, and improvements of, its plant. Early in the year it was found necessary to have increased power for hoisting and pumping purposes, and also to use this power in the most advantageous and yet simple manner. The number of workings on the various lodes that would be required from time to time in the future, showed the necessity of electing either a system of independent machinery, more or less separated, or a system of concentration of power at the mill. Again if the latter were adopted, what method of power transmission would be the best. It was determined to concentrate the power all at the mill, and distribute it, as required, by means of wire rope transmission. To this end an additional engine and boiler was placed in the mill to act in conjunction with the engine and boiler already in use. This with two engines and boilers only the *destruction of the mill* could interfere with continuous work. Then on the main counter shaft, revolving 60 times a minute, was placed a 2 ft. bevel wheel that transmits the power to an upright shaft by means of a 1 ft. bevel wheel. On the upper end of this upright shaft (in the top floor of the mill) was attached several sheaves 7 ft. in diameter grooved to take a $\frac{7}{16}$ in. wire rope. These sheaves make 120 revolutions a minute. As they revolve in a horizontal plane it will be seen that the wire ropes leading on and off these sheaves can be made to carry the power in any direction of that plane. The wire ropes are supported on 1 ft. guide wheels to the place where power is to be utilized. Here is erected a frame of sufficient substantiality to carry a horizontal shaft $3\frac{5}{16}$ in. diameter; on this is a 45 in. bevel wheel connecting with a 9 in. pinion on an upright shaft, which latter again carries on its upper end a 7 ft. sheave similar to those in the mill and which receives the wire rope. From this gearing it will follow that the horizontal shaft revolves 24 times per minute. On one end of this latter shaft is a pump disc connected with the pump rod. On the middle of the shaft is a drum 10 ft. in diameter on which is wound the hoist rope. This drum is loose on the shaft; on one side of it is a friction wheel

on a feathered key that by means of a lever worked by the deck hand carries, when desired, the drum with it, thus hoisting at a speed of 240 ft. per minute. Such is a general description of the system of power transmission. The most notable feature is the use of horizontal sheaves. In the same way is the power carried to the pump at the lake, 500 ft. away, from where the water is brought to the mill for battery and boiler use. In the same manner power is transferred to the blacksmith shop where it runs the fan.

Also a tramway has been built leading from the principal workings up to the top floor of the mill where the ore breaker is. A car of the capacity of an ordinary cart is loaded at the mouth of the shaft directly from the hoist buckets and then pulled by a rope along this tramway up into the mill where it dumps automatically, descending again to the shaft by its own weight.

The additional engine and boiler necessitated the enlargement of the mill which was made in the shape of an annex.

The company has just built on the grounds for the superintendent a commodious and handsome house which is now occupied by him and the assistant superintendent.

The Provincial Government together with private subscription of mine owners has completed a road from Chezzetcook harbor to the mine and will probably extend it to Petpiswick harbor on the other side, thus supplying a much needed want of good and direct transportation.

A steam drill is now being put in operation on the Coleman lode that the superintendent reports will make a great saving in the cost of mining ore from that lode.

All these improvements, though lately curtailing to some extent the dividends, are now enabling the company to prosecute its mining work in the most satisfactory and economical manner.

The underground work has been confined principally to the mill and Coleman lodes. Since the annual report of the company, in December last, there has been mined and milled of the mill lode 398 tons, and of the Coleman lode 1,906; giving a result of 1,939 ounces of gold. The whole product of bullion to date (November) has netted the sum of \$103,943. From this has been paid \$36,000 in dividends to the stockholders.

GOLD MINING IN MARMORA.

For some time back the Gatling or Canada Consolidated Mine, which is under lease to Messrs. Stephens and Newberry, has been worked with a force of about 35 men, of whom a dozen or so are miners, the rest being underground labourers, mill and surface hands. The Deep Shaft is now down 135 feet, and the General Tuttle Shaft, to the south of it, 100 feet. From the Deep Shaft the levels run 340 feet south and 100 feet north, while from the other they extend through about an equal length on the vein, so that nearly 1,000 feet of ground have been proved. It is said that up to the 1st of June last, the gold actually obtained from this mine amounted to about \$10,000, and since that time to \$3,500 more. The difficulties in the way of extracting the gold from the obstinate arsenical ore of this mine are reported to be at last overcome, and with the stock of ore on hand and the large quantity in sight, there is a good prospect for the future.

MICA MINING.

This industry is likely to become one of much importance in Canada, owing to the many valuable discoveries of extensive deposits of mica of a good quality in various localities in the Provinces of Ontario and Quebec, and to the rapidly increasing demand for the mineral by stove manufacturers and for other purposes. For the benefit of those who have engaged in mica mining in Canada, we quote from an article which has appeared in the *Chicago Mining Review*, bearing on this industry in the State of North Carolina, as follows:—

"Just as surely as 55,000,000 people use more stoves than did half that number, so surely is mica of good pattern for the purposes of stove manufacture in far vaster and sharper demand than was that mineral fifteen years ago, when North Carolina first brought itself into notice as a mica bearing country. It is therefore not a very surprising fact that in the mica belt, 'cut glass,' as the product is called, to-day fetches rather more than five times the price it did when first marketed. Not only are more stoves made now than formerly, but the numbers in use are vastly increased, and they are of greater capacity and more ornamental than were those of any past period. Besides this, the mica plates of old, well used stoves often need renewing, as they get crushed or worn out by careless firemakers, so that from the stove industry of the United States alone a demand for clean, well cut mica, varying in size from 2 inches by 2 to 7 by 20, is constantly assured, a demand rising with the advent of every winter, and likely to continue as long as the nation itself. At the present day not less than 275,000 lbs. of the finished article are needed for the United States supply, and some of the finest quality is taken up for export."

Mica is found in North Carolina wherever the huronic slates (ponderous, non-lamellar shales) come in contact with, or are intersected by quartz, gneiss, granite, or feldspathic seams. These run almost invariably from northwest by north to southwest by south, and are clearly traceable for miles until the end of the highlands is reached, and the lower levels of North Carolina attained. Mica seams almost invariably dip at about 60°, and when lost or nipped out are usually sought for and refound by striking backwards through the north slate or boundary, or other solid containing rock.

The mines are of two sorts, soft mines, called locally "fluking," and rock mines, the distinction between them being that the soft mines exist where, from natural causes, the feldspar has become degraded, leaving the mica comparatively free and unbound; and hard mines are, as a matter of course, those where the surface mica was bounded by gneiss, which remains harsh and massive. The mica found in these latter mines is, as a rule, of better quality than that found in the fluking, but the soft mines are easy of access, and so long as no great depth is attained, requiring as they do no heavy driving and blasting, are workable by a few hands.

Fluking mines, however, when followed downward change to rock mines or give out altogether at from forty to sixty feet.

The best mines open at the present day are the *Clarissa*, 3¼ miles from Bakersville, Mitchell County and the *Ray* mine, in McDowell. It is said that "more mines than miners" is true of the mica industry in North Carolina and that there are but two instances on record of professional miners having engaged in this profitable branch. As a consequence unskilled labour has played the very deuce with the best mines and even the *Clarissa* and *Pisgah* mines, two of

the most famous in the district, are "hogged" to such an extent as to present rather the appearance of chance excavated pits than of regularly worked adits, shafts and drives. The *Clarissa* is, for this reason, to-day a monument of shameless want of foresight and ridiculous grasp-at-everything-in-sight-and-lose-the-future, greediness and ignorance. It is, in its deepest hole, nearly 340 feet deep, but has been so irregularly excavated that it cannot be pumped; so that now, when it should be paying cent per cent, it is abandoned, filled with water, an eyesore, and an unprofitable one at that. The driving of a single regular shaft to a proper well, at low water level, would have saved the mine to its owners, but they were too careless to prepare for the advent of water in quantities greater than could be hauled out with buckets on a rope. This mine just previous to its abandonment was running at \$100 per day, and yielding cent per cent.

In Mitchell county, where the best mica is found, but two mines at this time are in a marketable state. One of these is the *Pine Mountain* mine, a deep rock vein on the *Clarissa* lead, but fortunately for its owners nearly 900 feet higher than its water-logged neighbour. This is one of the most characteristic properties in the county. It was opened at the surface in February last by Colonel Borden, a miner of skill and experience, who was since shot dead, in a trespass trouble, by a party of opposing claimants to the *Hoppe A* and *Franklin* mines some 9 miles farther down the country.

At 25 feet Col. Borden got the lead open and found some 2,500 lbs. weight of rough mica, yielding 241 lbs. of fine glass. Then his death took place. This was on May 31st, and in June a splendid block of mica measuring 34 inches through was got out, then a horse of feldspar cut out the vein. This is invariably looked on as an occurrence of the best omen, and work was rapidly prosecuted with a double staff of hands. The feldspar was so hard that the work took thirteen steel to the foot in driving, and the blasting lasted for no less than thirty-five working days. The supporters of Colonel Borden, men who knew nothing of mining, and who had only entered upon the enterprise for relationship sake, soon got tired and actually quitted work, directing their local agent to sell out on the very day that the pay seam was again reached.

This mine, during the few days it was worked after the pay streak was regained, paid hugely.

As stated above 2,500 lbs. of solid mica yielded but 241 lbs. of merchantable, the causes for which are explained as follows:—The masses or lumps of mica have to be split into plates. These are sorted out into sizes and resplit into fine thin sheets, which in turn have to prescribe into regular patterns, mostly of an oblong shape and running at every variety of dimensions, from 2 inches by 2½ to 7x9 inches. In cutting off excess, shaping down the sheets to patterns, getting rid of spots, cracked, stained, and unsightly places, much waste occurs, and 10 per cent. is accounted a good yield from fine mica in the block.

This mica cutting is an industry in itself, requiring experience. It is mostly done by females at from 50 to 75 cents per day, and costs, as a rule, 13 cents per pound of prepared merchantable mica.

The other marketable mine is a "fluking" mine called "The New Sinkhole." It yielded \$6,000 worth of the product since its discovery in July last, and has been taken by a New York company at a long-lease (9 years) on a royalty. For the lease the New Yorkers paid a fee of \$12,000. They are making progress

but are likely to be obstructed by surface water, and possibly by difficulties in the way of timbering up soft clays, mostly Kaolin, through which their seam leads. The produce of mica is now not equal to the demand, and mines are getting scarcer and dearer.

Canadian mine owners will do well to see to it that their properties are properly opened and that mining operations are proceeded with in a systematic manner with a view to permanent work.

LAKE SUPERIOR MINES.

ACTIVITY AT THE RABBIT MOUNTAIN MINE.

RESUMING WORK AT THE TWIN CITY, AND THE BEAVER MINE TO BE OPENED.

The *Sentinel* informs us that Mr. H. H. Miller, Superintendent of the Twin City Mining Company, and Mr. Thos. A. Keefer, arrived in Port Arthur Saturday, 25th October, from Twin City Mine with the first load of high grade silver ore from that property. It is the intention of the company to make a consignment to the smelters before the close of navigation. Messrs. Miller and Keefer report considerable activity in the Rabbit Mountain Mine making things look happy and cheerful around there.

The new find at Silver Mountain is attracting a great deal of attention. The road is cut through to the new mine from the Twin City location, so that now there is direct communication from Port Arthur via the working mines in the Rabbit Mountain district. The Silver Mountain location is owned by Oliver Daunais, Capt. John and Richard Trethewey.

The Twin City Mining Company is organized and Mr. Miller, the Superintendent, has made arrangements to resume work on 96 T at once. The silver ore taken from this mine is as fine as from any in the district, and the prospects of the company are most encouraging.

The Beaver mine, on mining location 97 T, is another silver vein which is spoken of very highly. It is a strong vein, boldly cutting a mountain several hundred feet high. The vein and silver in its outcrops shows on both sides of the mountain. It will be an easy mine to work, like the Twin City, as the ore can be taken out without hoisting or pumping. Arrangements have been made to cut out a road to this mine and build cabins for the winter's work.

The roads are in a bad condition, although considerably improved by the late frost. When good sleighing comes, there will be more activity in the district.

THE IRON ORE DEPOSITS OF CENTRAL ONTARIO.

IMPORTANT DEVELOPMENTS THIS SEASON.

A correspondent of the *Iron Trade Review*, Cleveland, O., has written an interesting letter to that journal descriptive of a recent trip made by him over the line of the Central Ontario Railway and a visit to the iron mines owned by the Railway Company. This line of railway was completed last spring from the company's docks at Waller's Bay, on Lake Ontario, to the Coe Hill Iron Mine and the last rail laid on May 31st. The first cargo of iron ore went over the line on June 2nd, and the road was opened for passenger traffic on September 1st. The ore trains consist of 12 to 16 flat cars, each

carrying 15 to 17 tons of ore. The total quantity of ore shipped this season from the company's docks to Cleveland, O., up to the 20th October, amounted to 40,000 tons, of which 15,000 tons were mined during last winter, the balance, 25,000 tons, having been mined during the past summer. On that date about 2,600 tons remained on the stock pile at Coe Hill, and about 80 tons of ore was then being mined daily. This would seem to indicate that about 50,000 tons of ore would be shipped before the close of the season. After giving a description of the country traversed by the C. O. Railway, the railway itself, its grades and curves, etc., the *Review's* correspondent refers to what has been accomplished at the mines during the past season in the way of development, as follows:—

ORTON MINE.

This comparatively new development lies in Tudor Township, about two miles west of the main line of railroad. It probably presents the largest showing of any of the properties now being developed, being apparently about a mile in length. There is a very large surface exposure, but unfortunately the first specimens mined showed about 7 per cent. of titanium; otherwise the ore was found to be very pure. A diamond drill is at present in operation on this property, and it is claimed that specimens of ore taken from this same body, some 200' down, show no trace of titanium. This appears improbable, but it was the report made to the company last week, with further tests yet to be made. At the

EMILY AND ROBINSON MINE,

six miles north, a large surface opening has been made, though no definite results have been arrived at as yet. The outcroppings as shown at the Emily Mine are very large, but the vein has not yet been located. A diamond drill is at work here, and it is expected to do considerable work this winter by way of development. Analyses show from 68 to 69 per cent. of metallic iron. Considerable ore will probably be taken out this winter, preparatory to being shipped next spring over the branch road which is to be built.

BAKER MINE.

At this mine a number of test-pits have been sunk, showing a formation about three-quarters of a mile in length and in shape like a horse shoe. The surface ore shown is of good quality. This mine will probably be developed on an extensive scale next season. Nine and a half miles southwest of the northern terminus of the road is the

CHANDOS MINE.

Here a cut has been made across the vein showing a width of from 50' to 60' at the top. This vein is traceable for a half mile. The ore is, to all appearances, entirely free from sulphur. The prospectors have bored with a diamond drill to a depth of 260', going through two veins, one 40' the other 18' in width—all good Bessemer ore, analysing from 65 to 69 per cent. of metallic iron. A company to be known as the Arthur Mining Co. is now being incorporated to develop this vein, and work will be vigorously pushed next season.

There are two or three other developments in this range, but nothing has been done at them this season.

COE HILL MINE.

The most important work in developing the new region is in connection with the Coe Hill Mine, at the northern terminus of the railroad. Evidences of hard work and liberal expenditure

are to be seen on every hand. Coe Hill, a rocky eminence some 850' above Lake Ontario, has been transformed from a bleak and barren exposure, to a veritable hive of industry. Dumping chutes have been put up, tramways laid, a hoisting plant put in position, a town laid out, and boarding and dwelling houses erected. Twelve tenement houses are in process of erection, besides two large boarding houses. Upon the crown of the hill is the hoisting apparatus, consisting of a 350 H. P. engine built by the Globe Iron Works, of Cleveland; a battery of boilers made by the Weddell Foundry, of Trenton, and one of the well known hoisting drums of the Webster, Camp & Lane Machine Co., of Akron, O. Over this apparatus is to be erected a \$2,500 building 34x60', with an L 20x60'.

In the way of development the following work has been done: At the extreme east end of the works is Shaft No. 1, so numbered from its position, not because it is the oldest. In this shaft a depth of 40' has been reached, after going through 3' of soil, but no rock. A width of from 28' to 30' is shown in the ore vein, all of Bessemer magnetic quality, the needle showing a dip of from 95° to 100°.

Shaft No. 2 is down to a depth of 75', and a companion shaft has been sunk to a depth of 80'. These are to be connected by drifts. From present appearances, the rock seems to have been split, and the belief is that it is pinched out and that the two parallel veins will be found to come together below, with a combined width of 65' to 68'. Of course this is by no means demonstrated as yet, but the indications appear to point that way.

Shaft No. 3 is down about 85' showing the vein to be of continuous formation. On the surface the vein shows an average width of 50' to 60'.

Much work has also been done in stripping and in sinking test-pits, all of which show that the course of the vein is almost due east and west and with an ascertained length of 1,300'. The course of the vein, even from the surface, is quite distinct beyond Shaft No. 3. In digging for the foundations of the engine-house, a parallel vein was unexpectedly struck, compelling a change in location. An examination of these two veins would appear to carry out the idea of the proprietors that the rock is pinched out and that the two veins come together below. Opinions vary, however, as to whether their surmises are likely to prove correct.

A mistake has been made in opening up a considerable portion of the vein from the surface, instead of sinking shafts and drifting under, thereby leaving the workings exposed; but Capt. James, an experienced Lake Superior mine captain, has taken charge of the works and is now conducting the developments on more approved principles.

CANADA AS A COMPETITOR.

Concerning the future of these developments opinions vary with the predilections of the observer. Certainly the work of prospecting has been thorough, the showing of ore is flattering; the analyses are all that could be desired, and the arrangements made for getting the ore out and delivering it on board the vessels are complete and ample. The projectors of the enterprise are all skilled men-of-affairs, with plenty of capital and an abundance of energy. Whether the outcome of all this expenditure will meet their expectations remains yet to be seen. The indications point strongly to such a result; only opinions are offered to the contrary. As to the cost per ton at which these ores can be laid down on the docks in Cleveland, in competition with Lake Superior ores, the

following comparative estimate is submitted in each case taking the figures of the parties interested:—

	Canada	Lake Superior
Mining.....	\$ 1.00	\$ 2.00
Railroad freight.....	1.00	.45
Lake freight, tripping and unloading....	.94	1.10
Duty.....	.75
Insurance.....	.03	.03
Total.....	\$ 3.72	\$ 3.58

This, of course, is putting the two regions on an equality in the matter of ownership and not allowing for any royalty. If this were taken into the account, it would probably be offset by the increasing cost of mining which will be experienced in Canadian mines as compressed air plant, pumps, &c., have to be added to their outfits.

BRITISH COLUMBIA MINING NOTES.

Many of the creeks emptying into the Skeena will be prospected in the spring.

This year has not been a prosperous one for the gold miners in Cassair district, the outputs being below the average of other seasons.

The output on Quartz Creek has been good, one man having taken out \$6,000. Others located on the creek have also done fairly well.

About twenty-five white and a number of Chinese miners have been engaged during the past season on Thibert Creek and have done fairly well.

Summing up the information which has come from the northern mines it would appear that the Lorne Creek diggings are paying from \$7 to \$10 a day per man and some new claims have been found on some of the adjacent creeks.

Conflicting reports come from Lorne Creek, while the total amount of gold mined may not be large quite a number of individuals have put together \$800 to \$1,400, the result of their season's work, which, in the light of the golden days of Cariboo, does not seem large though it is much better than empty pockets.

On Dcase Creek there have been five white miners and twenty Chinamen during the past season. One who has been in the Cassair district for the past ten years reports that little money has been made this season, though a few have done moderately well and one has done excellently.

The shipments of coal to foreign ports (exclusive of amount furnished foreign steamers at Victoria) from Nanaimo and Departure Bay for the month ending October 31st, amounted to 36,824 tons, valued at \$147,295. This is the largest foreign shipment for a single month in the annals of coal mining on Vancouver Island.—*Victoria British Colonist*.

Some prospectors who have been on Kitsini Kaline River report having struck diggings on that stream where they have taken as much as \$5 to the pan. Many of the miners think of going to this place in the spring, and, if the reports are found to be true, there will likely be a rush to that point. The river empties into the Skeena, but is got at from the Naas.

GENERAL MINING NOTES.

The deepest gold mine in the world is the Eureka, Nevada County, California.

Twenty thousand tons of Canadian iron ore had been shipped this season, up to the end of October, from Kingston, Ont., to Fairhaven and Cleveland.

The daily output of the Vancouver Coal Company, it is reported, has reached over 600 tons and with the assistance of the steam engine placed underground at the Esplanade shaft, the management anticipates raising the output, within a very short period, to 1,000 tons a day.

The Essex Gold Mine, Tangier district, Nova Scotia, has lately started up under a new organization and has made its first shipment of bullion. The old *Tupper* shaft has been cleaned out and shows a rich vein. The *nugget* lode maintains its reputation and the management is much pleased with results and prospects for future working.

The Ophir, Mexican and Union Consolidated Mining Companies have jointly sunk a winze 3,300 ft. into the bowels of the earth for exploration purposes, and it is still going down. It is said that if a much greater depth is reached it will puzzle the inventive genius to devise a steel wire that will be strong enough to carry its own weight.

The product of the famous CALUMET and HECLA for the four fiscal years ending 30th April, 1884, in copper 77½ per cent. fine, as also of ingot copper, has been as follows:—

1881.....	20,300.1147	1881.....	15,979.1300
1882.....	20,905.1187	1882.....	16,094.1985
1883.....	20,392.1480	1883.....	15,714.258
1884.....	22,956.155	1884.....	17,707.07

Letters patent have been issued by the Government of Ontario for the incorporation of the "Rabbit Mountain Mining Company of Ontario," with a capital stock of \$2,000,000 divided into 200,000 shares of \$10 each. The company will operate the Rabbit Mountain Silver Mine, and other mines on the north shore of Lake Superior, with its head office at Port Arthur.

EL CALLAO. This famous Venezuelan Gold Mine produced 14,102 ounces of gold during the month of September, 1884, remitted to the Messrs. Baring Brothers, of London. Estimated at the usual value of such gold per ounce, such produce was worth \$273,000. The dividend paid for the month was one of \$4.80 per share, aggregating \$154,560. The product this year to the close of September aggregated about \$2,775,000, of which shareholders have received \$40.80 per share.—*N.Y. Mining Record*.

A resident of Calgary, N. W. T., Mr. McRae, has returned to that town from British Columbia where he has located some valuable gold placers. He reports that a quantity of gold has been taken from the small tributaries to the Columbia River. From Canon Creek two men took \$200 in one week. Mr. McRae expresses the opinion that very rich placers are likely to be discovered next year. He has had a successful season in the district, but, on account of the snowslides, he has been compelled to suspend operations until next spring, by which time he will have had an opportunity to prepare for active mining on an extensive scale.

MINING HISTORY.

The history of British lead and silver mining reaches back into the realms of tradition. The mines at Combe Martin and Beer Alston, in Devonshire, are said to have enriched Edward the First and Edward the Second, and were re-opened by Queen Elizabeth, Combe Martin being discovered years before the reign of Henry the Seventh. The mines in the Mendip Hills were known in the reign of Edward the Fourth, a rude map, drawn about 1480, being still extant, together with a curious copy of the laws governing the district. The famous lead mines of the Alston Moor district, in Cumberland, had royal protection in 1233, and Richard the Second granted privileges to Nicholas Veteripont, which was confirmed to his son by Edward the Third. In 1620 the mines were reported exhausted; but in the eighteenth century they were re-opened. The Cardiganshire mines were certainly known in the time of Henry the Seventh. In 1690 they were "boomed" by the owners, and in 1698 the public was favoured with a highly coloured prospectus, which reads curiously like some of the modern documents of that kind. Thus, "with a stock of £20,000 and good management, the said mines would yield a yearly profit, over and above all charges, of £171,970 19s. 9d. for lead, besides the silver, which it is believed will yield, one ton with another, about £14 in silver per ton of metal, and may, in all probability, double the valuation of these mines." In 1700 the company was regularly formed under the title of "The Government and Company of Mine Adventurers in England." About 650 shareholders took the bait, embracing people of every class, but they never realized anything, and the mines which started with such brilliant prospects collapsed amid a flood of papers and pamphlets of accusations and vindications.—*Chicago Mining Review*.

THE METAL MARKET.

Messrs. E. W. Carling & Co., 16 Philpot Lane, London, Eng., report under recent date:—

Metals have shown a better tendency during the week, iron being generally in improved demand both for pig and manufactured sorts at hardening prices:—

IRON.—Scotch pig, @ £42 7½s. to £43 4½s. cash; Welsh bars, £5 10s. to £5 15s.; nail rods, £6 to £7; Hoops, £6 17s. 6d. to £7 10s.; sheets, £7 17s. to £9.

TIN.—Steady, dearer and in more demand @ £74 5s. to £74 15s.; for fine foreign Australian, £74 5s. to £74 15s.; English bars, £81 10s. to £82; plates I. C. coke, 14 x 20, £15; charcoal I. C., £18.

COPPER.—Firm, Chili bars good ordinary brands, cash, £53 10s. to £53 12s. 6d.; English tough ingot, £58; best selected, £59; sheets and rod, £64 to £65.

YELLOW METAL.—Sheets, 5½d.; sheeting, 5½d.

LEAD.—Steadier @ £11 to £11 5s., although little business passing; bars, £11 15s. to £12; patent shot, £13 15s.; sheet, £11 15s.; pipe, £12 7s. 6d.

ZINC.—Usual gauges, £18 5s. to £18 10s.

WIRE.—Fencing, rolled, No. 4, £6 15s. to £7; annealed drawn, No. 6, £8 5s.; No. 7, £8 5s.; as No. 8, No. 9, £8 15s.; No. 10, £9 5s.; galvanized drawn, Nos. 4, 6, £11 10s.

BRASS.—Wire, Nos. 1, 2, 6½d.; rolled brass, 6½d.; sheet, 6½d.

NAILS.—Wrought strong rose, 1½ to 3 in., 6d. to 8d., discount 40%; 3½ to 6 in., 35% discount; pointed, 30%; cut nails, £10 to £15 according to gauge.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Post Office Letter Box Fronts," will be received until Monday, 15th proximo, inclusive, for the supply of about 10,000 post office letter box fronts.

Parties disposed to submit tenders may obtain forms of tender, specification and any further particulars at this Department.

Parties tendering will be required to submit with their tender a sample of the box they are prepared to provide.

Tenders will not be considered unless made on the printed forms supplied, and signed with the actual signatures of the parties tendering.

The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, Nov. 17th, 1884.

NOTICE TO CONTRACTORS.

SEALED Separate Tenders (including plans and specifications), addressed to the undersigned, and endorsed, "Tender for heating apparatus, Port Hope, Ont.," will be received at this office until Friday, the 5th December next.

Copies of plans of the building proposed to be heated and a memorandum of requirements will be furnished to those desiring to tender, who will be required to indicate the arrangement, etc., of their apparatus and furnish a fully detailed specification.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned. The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, 8th Nov., 1884.

Notice to Contractors.

SEALED Separate Tenders addressed to the undersigned, and endorsed "Tender for Heating Apparatus, Hamilton, Ont.," will be received at this office until Thursday, the 11th December next.

Plans and specification can be seen at this Department, and also at the Clerk of Works Office, New Public Building, Hamilton, on and after Thursday, 27th instant.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, Nov. 24th, 1884.

GRAPHITE.

Wanted, fair average samples of about 1 lb. each, with prices, F.O.B. Address J. S. Merry, Assay Office, Swansea, Wales.

DYNAMITE

TO
MINERS, QUARRYMEN
—AND—
RAILWAY CONTRACTORS

We have been appointed Agents for the sale of the Celebrated Explosives manufactured by The Nobels Explosives Company, Limited, of Glasgow, Scotland, and we are prepared to supply from Stock their

No. 1 Dynamite

—S AND S—

Patent Blasting Gelatine

In quantities as may be required.

—ALSO—

NOBELS' TREBLE DETONATORS

Suitable for use with the above.

Our No. 1 Dynamite contains Seventy-five per cent. Nitro Glycerine and our Patent Blasting Gelatine, the Strongest and Safest Explosive known, is fully Fifty per cent. stronger.

The Nobels Explosive Co. have sent to Canada, Mr. Robert Bell, one of their practical instructors, who will, at any time, be prepared to demonstrate the Superiority of their Explosives over any other offered, and to show how they should be used to obtain the greatest effect.

We specially solicit orders, to import, at special prices.

All particulars can be obtained from

B. & S. H. THOMPSON,
Montreal.

NOTICE TO CONTRACTORS.

SEALED Tenders addressed to the undersigned, and endorsed "Tenders for Hydraulic Elevator, New Public Building, Hamilton," will be received at this office until SATURDAY, the 13th day of December next, inclusive, for the placing of a Hydraulic Passenger and Freight Elevator in the above building.

General conditions, form of Tender, and all necessary information can be obtained at this Department on and after Monday, the 22nd instant.

Tenders must be made on the printed forms supplied.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent of the amount of the tender, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, Nov. 18th, 1884.

CANADIAN MINING JOURNAL

Published weekly by the Industrial and Educational Publishing Company, Limited, at

THE GARDEN CITY PRESS

Toronto Ont., and Gardenvale, Que.

Gardenvale, Que.,

Dear Sir:

Your name has been given to me as one intimately associated with prospecting. The "CANADIAN MINING JOURNAL" aims to be the organ of Canadian prospectors and is doing all within its power to further their interests, and wishes to make you a proposition.

During the past two years, the editor (who has himself been a prospector for years) has shaped the policy of the "Journal" with a view to providing the prospector with the information he requires in his search for minerals, and has tried to influence others to do likewise. He realizes that the prospector is the corner-stone of the mining edifice and has tried to convince others of this fact.

The "Journal" has gone farther than this. Finding that there was no suitable book for the instruction of prospectors it has made arrangements with Dr W. L. Goodwin, formerly head of the School of Mining, Queen's University, to write a book for prospectors. Thousands of prospectors in Ontario have attended Dr. Goodwin's lectures in the mining camps and know the value of this work. His book is just as good as his lectures.

Our proposal is this: We know that Dr Goodwin's book, as well as the weekly issues of the "Journal", will help you in your work of prospecting, or if you are not actively engaged in prospecting, they will interest you vitally. We therefore offer you the book (Price \$3.00) and a subscription to the "Journal" for one year (Price \$5.00) for Five Dollars. Just fill in the enclosed form and mail it to me, and the book will be sent to you as soon as it is off the press. The weekly issues of the "Journal" will be sent on to you immediately. If for any reason you should be dissatisfied with either, we shall refund your money.

If at any time you have a problem we can assist in solving, or desire information that we are in a position to give or procure, do not hesitate to write the "CANADIAN MINING JOURNAL".

Yours truly.

W.M.G.-S.

Editor.

NOTICE TO CONTRACTORS.

SEALED Separate Tenders (including plans and specifications), addressed to the undersigned, and endorsed "Tender for hot water heating apparatus, Brockville, Ont.," will be received at this office until MONDAY, the 16th proximo.

Plans, specifications, &c., can be seen at this office, and at the Clerk of Works' office, new Post Office building, Brockville, on and after Monday, 2nd proximo.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 29th Jan., 1885.

SITUATION WANTED.

A YOUNG CHEMIST, graduate of Germany, who speaks German, English and French, and who has worked at furnaces and steel works in Belgium and England for several years, desires a similar position in this country. The highest recommendations given.

Address,
FELIX BECKER,
ARLOW,
BELGIUM, EUROPE.

NOTICE TO CONTRACTORS.

SEALED Separate Tenders (including plans and specifications), addressed to the undersigned and endorsed "Tender for hot water heating apparatus, Kingston, Ont., Post Office," will be received at this office until MONDAY, 16th proximo.

Plans and specifications can be seen at the Department of Public Works, Ottawa, and at the office of Messrs. Power & Son, Architects, Kingston, on and after Wednesday, 25th instant.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, Jan. 24th, 1885.

PHOSPHATE CRYSTALS.

Farmers, Miners and Prospectors, having unbroken Phosphate Crystals for Sale, can find a cash purchaser by applying at the Office of

THE CANADIAN MINING REVIEW,
Union Chambers, 14 Metcalfe Street, Ottawa.

Parties offering crystals for sale will please mention the colour, length and diameter—large ones preferred.

MINING STOCK FOR SALE.

MR. R. C. W. MACQUAIG, Auctioneer, will offer by Auction, if not previously sold by Private Sale at his Office No. 45 Elgin Street Ottawa on Wednesday, 24th February, 1885, at one o'clock,

Twenty Shares of \$100.00 each fully paid and unassessable stock in the Ottawa Phosphate Mining Co., formerly known as the Emerald Mine, Buckingham.

TERMS CASH.—The fame of this Mine is fully established. It is yielding large results, and is considered the **Bonanza of Phosphate Deposits** by those who know.

Mr. McCuaig is open meanwhile to offers for the stock by Private Sale.

NOTICE.

TENDERS will be received by the undersigned until MONDAY, 16th February, prox., from parties desirous of leasing the privilege of ferrying across the River Ottawa, between Papineauville Wharf in the Township of St. Angelique, in the County of Ottawa, in the Province of Quebec, Dominion of Canada, and Brown's Wharf, in the Township of Plantagenet, County of Prescott, in the Province of Ontario, Dominion of Canada, in accordance with the terms and under the conditions set forth in the Regulations—copies of which can be procured at the Department of Inland Revenue, Ottawa, or from the Collector of Inland Revenue, at Ottawa.

Each tender must state the amount which the party tendering is willing to pay per annum for the privilege referred to, which amount will be payable in advance, the terms of the lease being for five years from the 1st May, 1885.

Each tender must be accompanied by a cheque marked "good" on one of the chartered banks, doing business at Ottawa, for one-half of the amount of the per annum tender. This amount will be credited on account of the first year's rent in the case of the accepted tender, and all other cheques will be returned except in the event of withdrawals, in which cases no refunds will be made.

All communications must be addressed to the undersigned and endorsed on the envelope "Tender for the Papineauville and Brown's Wharf Ferry."

E. MIALL,
Com. of Inland Revenue.
Department of Inland Revenue,
Ottawa, January 24th, 1885.

Mica for Sale.

ABOUT FOUR HUNDRED POUNDS

GOOD QUALITY, DARK MICA

has been consigned to us for sale. It is cut into sizes 2 1/2 x 6 to 5 x 9 inches (the larger sizes predominating) and is offered at a very low price.

Also, ABOUT 2,500 LBS. OF SAME QUALITY IN THE ROUGH SLAB, OR CRYSTAL.

Apply at this office.

Cook Wanted

FOR A STEAM DREDGE on the St. Lawrence. A good Man Cook, for the season of 1885—beginning 1st April next.

Apply at this office.

TO ICE CONTRACTORS.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tenders for Ice, Public Buildings, Ottawa, and Government House," will be received at this office until TUESDAY, the 17th February, for filling the ice house at the Old Military Store Building, Rideau Canal Locks, Ottawa, and that at Government House.

Tender to state price per block of the following dimensions, viz.: 3 ft. by 1 ft. by 1 ft., which price must include cost of packing and of the saw-dust required for that purpose.

The ice to be measured before being packed in the ice-house and payment to be made accordingly.

N.B.—The ice must be taken from the Ottawa River, above the Chaudiere Falls.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 3rd February, 1885.

INTERNATIONAL AND COLONIAL EXHIBITIONS.

ANTWERP IN 1885—LONDON IN 1886.

It is the intention to have a Canadian representation at the International Exhibition at Antwerp, commencing in May, 1885, and also at the Colonial and Indian Exhibition in London in 1886.

The Government will defray the cost of freight in conveying Canadian Exhibits to Antwerp, and from Antwerp to London, and also of returning them to Canada in the event of their not being sold.

All Exhibits for Antwerp should be ready for shipment not later than the first week in March next. These Exhibitions, it is believed, will afford favourable opportunity for making known the natural capabilities, and manufacturing and industrial progress of the Dominion.

Circulars and forms containing more particular information may be obtained by letter (post free) addressed to the Department of Agriculture, Ottawa.

By order,
JOHN LOWE,
Secy., Dept. of Agric.
Department of Agriculture,
Ottawa, December, 19th, 1884.

Wanted.

A second-hand "Ingersoll" Rock Drill, three inch cylinder, with couplings, &c. Any person having one for sale will please communicate with the publishers of the CANADIAN MINING REVIEW.

PUBLIC NOTICE.

ALL persons, including Lessees of grazing lands, are hereby required to take notice that the cutting of timber on the public lands without authority from the Minister of the Interior, or the Local Crown Timber Agent of Dominion Lands for the District, is forbidden by law, and all timber so cut without authority is liable to seizure and to be dealt with as the Minister of the Interior may direct.

Each settler on a homestead quarter section not having timber on it, may, on application to the Local Agent of Dominion Lands, purchase a wood lot not exceeding twenty acres in extent, at five dollars per acre.

Any person, other than a homestead settler desiring permission to cut timber, must make application therefor to the Minister of the Interior, who will deal with such application according to law.

Persons who have already cut timber without authority, must pay the dues thereon to the Crown Timber Agent at his office, on or before the 1st of May, 1885; otherwise the said timber will be confiscated under the provisions of the Dominion Lands Act.

(Signed),
A. M. BURGESS,
Deputy of the
Minister of the Interior

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

The intention of the Commissioner of Crown Lands for the Province of Quebec to cancel the sale of certain lands in the County of Ottawa, public notice of which has appeared in the Quebec Official Gazette, has elicited much correspondence on the subject from parties who consider themselves aggrieved by the action of the Government in cancelling the sale of a number of lots within the phosphate belt, owing to the settlement duties not having been performed in compliance with the regulations of the Crown Lands Department, said lots having, meanwhile, fallen into the hands of other parties who had purchased the settlers' rights in good faith. So far as we can judge from the correspondence which has appeared in public print, directed at the Commissioner of Crown lands, and the Hon. Mr. Lynch's replies to the same, we must, in fairness to the Commissioner, say that, in our opinion, he has vindicated the Government in so far as its actions relate to the cases which have been brought to his notice.

There are, however, instances which we could cite where settlers, who had taken up locations, and had made payments to the Government on account of same, had afterwards discovered it to be practicably impossible to cultivate a farm of sufficient extent to yield them a living on the lots they had selected, nine-tenths of the area being bare rock. In some cases, such as these, deposits of phosphate were discovered on the locations, and the settlers transferred their claims to miners for certain considerations.

The Government at Quebec accepted the transfers, together with the balance of the money due, and in so doing become a party to a contract which, according to Justice Macdougall's judgment in the case of Holland Bros., could not be violated, and the power to cancel was no longer vested in the Commissioner of Crown Lands.

In such cases as we refer to the hardship is not with the settler, but with the miner, whose interests it is our duty to protect as far as it lies within our power. It is a somewhat remarkable fact that all the lots in certain townships which have reverted to the Government, through cancellation of sale by order of the Commissioner of Crown Lands, are those upon which phosphate deposits have been discovered, and where improvements for agricultural purposes could not reasonably be expected; yet the neglect of the settler to make the improvements in strict conformity to the regulations, has been the plea for cancellation. The lots, so cancelled, have in nearly every instance been re-sold by the Government as phosphate lots, some at private sale, and others at public auction. The Commissioner of Crown Lands may not be personally cognizant of it, but it is nevertheless true that, in almost every instance, where properties have been acquired in this manner, they have fallen into the hands of speculators—the very thing he claims it is the desire of the Government to guard against. The term speculator we infer to apply to individuals who acquire phosphate lands from the Government, and hold them in an undeveloped state until such time as the more enterprising class (the miners), by working their mines and developing deposits in the district, will have enhanced the value of the lands acquired for speculative purposes. If the Government of the Province of Quebec desires to develop the phosphate industry in the county of Ottawa, and in other parts of the province, it would be a wise policy to encourage the enterprising miners, who have already done so much towards opening up the mineral resources, and, by so doing, making heretofore worthless lands of great value to the Government. Where patronage or favour can be bestowed, those who have advanced the mining industry by engaging in active operations have the first claim to it. Mining is acknowledged by everyone to be speculative, but active mining men are not speculators in the sense the term has been applied in the discussion which has arisen out of the late decision of the Commissioner as expressed in the notice in the Gazette above referred to.

By REFERENCE to an advertisement in this issue, for miners in Nova Scotia for the Oxford and the Essex Gold Mining Companies, it appears that the supply of mining labor in that Province is not equal to the demand there. We understand that mining labor is quite uncertain owing, to a great extent, to the fact that a large number of the miners are also fishermen, and during the fishing season desert the mines to take their chances on the water. Also, the supply of labor does not keep pace with mining development. At present the following Gold Districts exhibit a very active appearance: Lake-Catcha, Carribou, Darr's Hill, Tangier, Lunenburg, Stormont, Montagu, Fifteen Mile Stream, and the Rawdon District; the latter only now opening up.

TWENTY shares of the stock of the Ottawa Phosphate Company are offered for sale, as will be seen by reference to another column. If not disposed of at private sale before the 24th of February, they will be sold at auction on that day by Mr. R. C. W. MacCuaig, at his office on Elgin St.

DR. G. T. ORTON, M.P., who has resided for some time past in Manitoba, is giving much attention to the mineral resources of that province and the North-West Territories. Being the medical attendant to the Canadian Pacific Railway employees, he has occasion to make repeated trips to the Rockies, and has thus been afforded facilities for collecting information concerning the mineral resources of the North-West that must prove valuable to him. Dr. Orton is already interested in several mining enterprises in that locality, and it is to be hoped that his investments have been judiciously made.

The New York mining stock and National Petroleum Exchange has decided to deal in railway securities of all descriptions—bonds as well as stock. This decision has been arrived at on account of the Stock Exchange having departed from the terms of an agreement by which it was bound not to deal in other mining stock than those that were "listed" at the time the agreement was entered into. The public will, by this new departure of the Mining Stock Exchange, be enabled to buy or sell or hold railway securities with so small a unit for transaction as *ten shares*, or \$1,000 par, which is the same as 1,000 barrels of oil, the unit for dealings in petroleum.

The number of new mining companies registered in England in 1884 were 148, with a nominal capital of £14,952,207, as compared with 151 in 1883, with £14,712,398 capital.

The largest emerald in the world has been found in the celebrated Muzo Emerald Mines, in the State of Boyaca, United States of Columbia. The largest specimen of the gem, heretofore known to lapidaries, is in the collection of the Duke of Devonshire, and weighs between eight and nine ounces—it came from a mine in the same neighbourhood.

OUR PHOSPHATE INDUSTRY.

Another year has opened in the history of phosphate mining in Ottawa County, and the present appearance of the mines leads to the conviction that a much larger quantity of mineral will go forward during the shipping season of 1885 than was shipped last year. The mines which have been the chief contributors to the general output of recent years are better equipped, and are showing more mineral now than at any former period, and those two facts are sufficient reasons why we should expect an increased annual production. Nothing has tended to stimulate this important industry so much as the investment of foreign capital and the organization of powerful companies composed of men of practical business ability, of intelligence and of means. This combination of three important qualifications has been the means of overcoming difficulties by which the smaller operators in the early history of phosphate mining were beset, and which rendered the industry unprofitable to many of them. One by one these hindrances have been removed by the introduction of steam power, modern machinery and increased facilities for transporting the product of the mines. The study of economy in the business management of every branch of the industry, and the recognized necessity of shipping the mineral in a high state of purity, are rapidly having the effect of placing the phosphate mining industry of Canada on a sound and permanent commercial basis; and now that our mine owners have succeeded in establishing an indisputable value for their properties, and by the judicious investment of capital have placed themselves in a position to supply a large annual demand, they find themselves face to face with a serious problem, and one that is of vital importance, viz.: What is the most advantageous means of reaching the consumer? From the inception of phosphate mining in Canada up to the present time, producers have been very lax on this point, and have left themselves at the mercy of middle-men in Montreal and abroad. The profits derived from their operations have been so largely in excess of those obtained from any ordinary investment that they were willing to accept the result, without criticising how it came about, and to leave the employed agent with unrestricted control of their interests. The inexpediency of such a course has naturally been suggested to the stricter business men who have invested their capital in this enterprise, and who are watchful of every minutiae connected with its management. A more careful scrutiny during the shipping season of 1884, of transactions between principles and agents, has brought to light gross irregularities, redounding to the disadvantage of the former, and swelling the coffers of the latter by amounts in comparison with which the legitimate commissions are insignificant; and this will always be an insuperable drawback to the success of our phosphate mining industry, until mine owners have been induced to co-operate and agree upon a system of purchase and sale that will afford them proper protection. The establishing of a central assay and shipping office in Montreal, and appointing a trustworthy receiving agent in each of the principal cities abroad, where Canadian phosphate is most in demand, to whom shipments could be assigned, would be

the most economical means of insuring full value to producers for the output of their mines, and we venture to predict that some such reform will be adopted in the near future.

THE MINES.

High Rock Mine.—This valuable property is owned by the Phosphate of Lime Company, whose head office is in London, England, and has been the most productive phosphate mine in Canada. Since it fell into the hands of its present owners not less than 20,000 tons of high grade mineral has been its production, and notwithstanding the fact that \$32,500 was the price paid for the land now owned by the company, apart from the cost of the machinery and plant, with which the mine is equipped, the profits of the past three years' operations have been sufficient to recoup the shareholders all their outlay, and to admit of a dividend being declared at the close of last year of twenty-five per cent. on the capital stock, besides which \$10,000 was set apart as reserve. This mine is in excellent shape now for producing mineral, and to judge from the quantity that has been raised during the past year, it is not unlikely that its output will reach 7,000 tons for shipment this year, being 2,000 in excess of any former year's production.

Star Hill Mine.—The Union Phosphate Co. has every reason to be satisfied with the result of last year's operations at its mine, known as Star Hill, but the developments that have been made on this property, and the increased facilities afforded for handling ore, will enable this company to largely increase the output this year over that of 1884. At this mine, as well as at High Rock, the boarding-house accommodation has been extended during the past twelve months, and is sufficient now to provide for the employment of as large a force of miners as can advantageously be employed on the ground that has been opened. The Union Company has ample territory, rich in phosphate, to warrant extensive preparation for vigorous mining for many years to come.

North Star Mine.—The present condition of this mine should be highly gratifying to its owners, the Dominion Phosphate Company, who have adopted a system of mining which is thoroughly proving the value of the property. The manager, Mr. W. H. Smith, acting under instruction of the directors, has been engaged for some time past in sinking a shaft in the centre of the location, without reference to the mineral in sight, to practically test the depth to which the phosphate deposits extend, in that particular locality, in paying quantity. Acting under these instructions Mr. Smith caused a shaft to be started at a point where a small string of mineral, about three inches wide, appeared on the surface. At a depth of 100 feet this small exposure has increased five feet in width, and now extends from end to end of the bottom of the shaft. At this level drifting will be commenced and a large and steady output may be looked for. This affords one more positive proof that the phosphate deposits increase in volume as lower depth is attained, and that the mineral improves in point of purity. The Dominion Company has now upwards of 2,000 tons raised, a portion of which has already been forwarded to the bank of the Riviere du Lievre for shipment when navigation opens.

Little Rapids Mine.—The developments of this mine during the past few months have proved it to be one of the most valuable properties in the entire phosphate region. It has been visited by such men as Prof. W. Boyd

Dawkins, of Manchester, England; Prof. G. A. Kinalhan, of the Geological Survey of Ireland; Dr. T. Sterry Hunt, of Montreal, and by the majority of the practical miners in the phosphate district, all of whom have been most pronounced in expressing the opinion that this mine is one of great value. At no other phosphate mine in Canada have such well defined veins of mineral been met with, nor has the phosphate been followed elsewhere to such a depth as at the Little Rapids. The quality of the mineral is of the highest grade and is brought up to a standard of 85 per cent. by hand cobbing. Its convenient situation to the river and proximity to railway communication is also greatly in its favour. The mine is well equipped with suitable machinery and comfortable buildings of a substantial character have been erected on the property. A large quantity of excellent mineral is now being raised.

Mr. W. A. Allan, of Ottawa, owner of the Little Rapids Mine, purchased the adjoining property about a year ago, and is now opening it up. It is the continuation of the same band, but at a lower elevation, and innumerable outcroppings are noticeable leading from the vein on which the deep shaft of the Little Rapids Mine is located. An opening has been made, at about two hundred feet lower elevation, that has exposed a large body of very excellent phosphate, similar in colour and texture to that which has been raised from the deep shaft on the adjoining property. The supposition is that this is a continuation of the same vein, and if the theory is correct it not only establishes a high value for this new mine, but is strong evidence that the value of the *Little Rapids* has not been overestimated.

The Emerald Mine.—The reputation that this mine bears is so widely known that no newspaper criticism can serve any purpose. It continues to yield abundantly, and that it will do so for years to come is not questioned. The property is now thoroughly equipped with suitable plant, and large additions have been made to the buildings. Phosphate is coming to the surface rapidly and the output of the mine that will go forward this year will exceed that of 1884, but it is rather early in the season to form an estimate of what it will actually amount to. The Ottawa Phosphate Company, who purchased this property some eighteen months ago, has good reason to be pleased with its investment. The result of the first season's operations has been very gratifying to the shareholders who attach a high value to their property.

The Washington Mine.—adjoining the Emerald—is another property owned by the Dominion Phosphate Company. It was formerly known as the *Lansdowne*, but as the company is chiefly composed of American capitalists the mine was re-christened. Since it fell into the hands of its present owners a quantity of dead work has been done, and deposits of mineral of considerable extent have been developed on the property. The amount of phosphate mined will not be sufficient to cover the outlay for work done, but under the careful management of Mr. Smith, the company's superintendent, the expenditure has been judiciously made. He looks for satisfactory results from this year's operations.

Battle Lake Mine.—The Lievre River Phosphate Company is working a deep shaft at this mine with encouraging results. The vein on which the shaft has been sunk to a considerable depth holds out very strong, and has the appearance of a well defined fissure. Although it was late in the season when the company began operations on this property there is already a fair quantity of mineral raised and awaiting

transportation. Later in the year extensive mining will be carried on at other locations in the phosphate district owned by this company, and under the able management of Captain R. C. Adams, the business manager and President of the Company, all operations are likely to be successfully conducted.

With the exception of the mine in Templeton, owned by Messrs. McLamin & Blackburn, those we have mentioned are of the most importance in Ottawa County, and are the chief producers. From all of these mines large quantities of phosphate are being forwarded to the bank of the Rivière du Lièvre and being piled there at convenient points from whence it will be forwarded in scows, during the season of navigation, to the Canadian Pacific Railway at the landing north of Buckingham village, and thence to Montreal to await ocean transportation. The force employed at the mines above-mentioned aggregates about 300 men.

PHOSPHATE QUOTATIONS.

The most recent European advices quote, for Canadian Phosphate, thirteen pence half-penny for 80 per cent. mineral, with one-fifth of a penny rise, but as no phosphate is offering at present it is difficult to arrive at a market value. We are informed that producers are not attempting to make contracts and will hold out for higher prices than have yet been spoken of.

SHORT LINE RAILWAY.

Before the close of last year the Canadian Pacific Railway Company completed the grading of the branch from the main line at Buckingham Station to the landing on du Lièvre river, north of the village, a distance of about three and a half miles. As soon as the frost leaves the embankments in the spring the rails will be laid and ballasting proceeded with, so that the company will be ready to carry passengers and freight over this branch on the first of May. The transportation of phosphate from Buckingham Village to the Railway Station, a distance of only three miles, has always been a serious drawback to the industry, owing to the bad condition of the road at all seasons, and to its being practically impassible during the spring and autumn months. The construction of this branch line will be a boon to phosphate miners, as it will afford them facilities for shipping at all seasons of the year, and will reduce the cost of transportation quite seventy-five cents per ton. To the C. P. R. Co. it will surely be a profitable investment, as by its construction the entire output of the mines contiguous to the Rivière du Lièvre will hereafter be carried by rail to Montreal, whereas thousands of tons have heretofore been sent each year to the Ottawa River and forwarded thence in barges to Montreal. The railway Company is now erecting receiving bins at the landing for the accommodation of shippers, in which the ore will be deposited before being put on board the cars. It is understood that it is the intention of the company to have steam cranes at convenient points, by means of which phosphate can be transhipped in the summer season direct from the scows to the cars. Such facilities for handling ore are very desirable. With the construction of the Lock at the Little Rapids all obstructions to the cheap transportation of phosphate will have been removed, and larger profits will accrue to mine owners.

The first copper mine worked in the United States was in Connecticut in 1709.

NEW USE FOR PHOSPHATE.

A portion of last year's output of the Canadian phosphate mines was purchased by a firm in England and employed in the manufacture of phosphorous. The gentleman who made the sale to this firm asserts that a large quantity would be consumed for this purpose if high grade mineral, running 80 per cent. and upwards, could be assured to the manufacturers. This should have the attention of miners.

MICA MINING IN CANADA.

This is rapidly developing into an industry of much importance in the country, and is assuming larger proportions each year. Since our last article appeared on this subject some significant discoveries have been reported of mica veins and deposits that promise to yield a very fine quality of the mineral, in fair merchantable sizes, and of superior quality. One of these locations has been purchased by a gentleman of this city, who is organizing a joint stock company with a view to beginning mining operations at the close of the present winter. The sample plates we have seen from this property, and the flattering reports we have read, are evidences that the deposit to which we refer will become an important producer.

M. Allan's Pike Lake mine is yielding very excellent mica in large quantity and in sizes to supply any demand, the crystals being of unusually large dimensions, and exceptionally perfect in their formation. The yield of merchantable mica from this mine is an unusually large percentage of the crystals actually mined, and commands a high price.

Mr. Allan's Villeneuve mine is producing a very fine quality of muscovite, equal to any that has been mined in any part of the world, in point of clearness and its resistance to heat, and the crystals are capable of being cut into plates of the ordinary sizes used by stove manufacturers, and running as large as 6 x 10 inches. The body of crystals in sight at this mine is very extensive and the micaceous vein, in white quartz, is traceable for several hundred feet, shows a very strong lead at the surface.

The mine being worked by Smith & Co., in the Township of Loughborough has yielded a large quantity of an amber coloured mica, and continues to be very productive. The crystals are massive and in most cases regularly formed. Several thousand pounds of merchantable plates were shipped from this mine last year, and a portion of the output was sold in the United States. The owners of the property have realized large profits from their operations.

Another mica location in the township of March was prospected late last autumn, and several openings that were made in the vein showed it to be a strong one and of some extent. The development, however, up to the time work was suspended on account of frost and snow, was insufficient to enable us to speak positively of the yielding capacity of the deposit, the crystals near the surface, though well formed, being too small to produce merchantable plates in any quantity. The quality of the mica is very fair, it stands heat well and is perfectly clear. One peculiarity of this mica is that portions of crystals, one half inch in thickness, are quite transparent.

When the mines above referred to have been more developed they will be capable of supplying the entire Canadian demand, and will have a surplus to ship to foreign countries. At

present, however, better prices can be obtained from home consumers than from foreign markets, and until the production increases none will go abroad.

A NEW USE FOR MICA.

Experiments have been made lately for transforming mica into brocades or bronze colors, whereby a new field is opened to the utilization of this mineral. To this end the mica is well crushed, boiled in muriatic acid, washed and separated according to the size of the scales thus obtained. The obtained lamina exhibits a beautiful glass-like lustre of silver white appearance, and are denominated in commerce, brocades, crystal colors, or mica bronze. The four kinds of silver white, or color brocades, which are met with in commerce, are sorted according to the size of the laminae.

They possess the following advantages over the ordinary lubricants:—First, they do not contain any ingredients injurious to health. Second, they possess the metallic lustre of the metal brocades, and even surpass them in brilliancy of color. Third, brown, black, blue, green and rose are represented in a rare lustre, which is not the case with metallic brocades. Fourth, they deport themselves perfectly indifferent towards sulphurous exhalations; they retain their lustre in moist air; have small specific weight, and possess more body. These fabrics might find application on metal, bristol board, wood and glass, consequently they may be adopted for the manufacture of these and other fancy articles, for coloring artificial flowers, wall paper, sealing wax; in short, in all technics where colors are employed. In applying them, it is to be recommended to cover the articles with a paint similar in color to those of the brocades. For silver, for instance, white lead; for blue, ultramarine. In using blue color the paint is ground with a mixture of four parts of glue and one of glycerine, upon this field, when hard, the brocade is spread. The most suitable binding material for the last mentioned, is a paste composed of four parts of starch and one of glycerine. In using oil paints as ground color, a good dammar or pale copal varnish is more suitable than the paste described. When finally coated with a proper spirit or turpentine varnish these articles take a lustre far surpassing in splendor and durability those ordinarily obtained. Articles coated with asphalt varnish, and afterwards spread over with silver brocade, take a granite-like appearance. If employed in the preparation of isinglass, magnificent crystallizations are obtained, well suited for inlaying in buttons and other articles. Furthermore, they recommend themselves for imitating gold, rain and snow in theatres, on account of their small specific weight and cheap price. Finished porcelain and glassware might be coated with the above brocades, if brought again to the heat of their melting point.

Mica was first used as a substitute for glass in windows, then, on account of its durability when exposed to high temperatures, it came to be extensively used for stoves, and for this purpose it was largely imported from Europe up to the year 1855, when the beds in the United States were first taken advantage of. Mica is also made into reflectors, sea compasses, inlayings for wood instead of enamel, and many other articles. But one of the most important uses is a substitute for glass in spectacles, which are intended to protect the eyes of fire and metal workers against sparks and fragments of metal and rock.

Minerals of the Ottawa District.

Abstract of a paper read before the Ottawa Field-Naturalists' Club on the 15th January, 1885, by Charles W. Willmott, Esq.

Specially reported for the MINING REVIEW.

Mr. Willmott, of the Mineralogical Staff of the Geological and Natural History Survey of Canada, in the valuable paper which he presented, gave an extended account of all the minerals which he had personally observed in portions of the Townships of Templeton, Hull, and Wakefield, in the County of Ottawa, and we regret that want of space prevents us from reproducing his remarks in full. His notes upon the economic minerals met with are, however, given at some length.

Native Gold was reported by the late Mr. Vennor, who obtained a specimen from Captain Cates, of the Pêche Village, said to have been picked up by him during a journey through the neighboring woods, on the east side of the Gatineau River in Wakefield. The specimen was seen by the lecturer, and consisted of fine visible native gold in a ferruginous quartz, associated with green apatite. It assayed 11.725 oz. gold and 52.323 oz. silver to the ton.

Lead and Zinc. The only representatives of these metals observed in our district are the two sulphides, galena and blende, which are found associated in a greyish-white crystalline garnet that occurs in lenticular masses in a crystalline limestone on lot 6, Range 1, of Wakefield. The blende, which is in black, shining, cleavable masses, is often so intermingled with the galena as to give apparently more prominence to the latter mineral, a feature that must ever be guarded against by speculators.

Copper. The only mineral representing this is the yellow sulphide (Chalcopyrite) found in small imperfect crystals in some veins of apatite.

Iron. The magnetic oxide, or magnetite, is found in all three townships, but the most workable deposits yet discovered are in Hull Township, where mining has been carried on for the last thirty years. The ore from the mines here is coarse in texture and often traversed by veins of red hematite, besides occasionally enclosing scales of graphite and mica. Lenticular patches of the ore occur in a dark green pyroxenite on the south half of lot 7, Range 1, of Wakefield, and on the north half of the same lot it fills a vein in limestone. Here the outcropping portion is highly crystalline, and good crystals, often variously modified, may be obtained in consequence of the crumbling nature of the walls.

Specular Iron Ore occurs at the Haycock location in Templeton and Hull, in parallel beds in a highly feldspathic gneiss. This ore is often mixed with the magnetic oxide, frequently to such an extent as to almost wholly replace it. A white granular apatite and a translucent variety of greenish fluor are often associated. The finest crystals of specular iron ore found in Canada come from this location.

Limonite occurs in a vein about a foot wide, resulting from the alteration of iron pyrites, and flanked by a less altered pyritous substance enclosing black shining crystals of tourmaline. It is probably not in sufficient quantity to be of economic value.

Boj Iron Ore is found in several places in Templeton and Hull but the extent of its distribution is not known.

Of the two sulphides of iron, *Pyrrhotite* and *Pyrite*, the former is uncommon, but occurs in small veins and masses in some of the apatite mines, while the latter is widely distributed and

is rather an objectionable substance. It frequently permeates apatite deposits to such an extent as to detract greatly from their value. In some places it occurs in large bedded masses, enclosing various minerals, of which the most noticeable are crystals of apatite and scapolite with their angles somewhat rounded; in other places it is evenly distributed through large deposits of apatite.

Molybdenum. The sulphide of this metal (Molybdenite) has been detected in small foliated masses at McBryde's mine in Wakefield. Until within the last few years this mineral commanded a price ranging as high as \$4 a pound, being employed for the production of a blue dye for calico printing, but since the substitution of aniline colors it is scarcely saleable at any price.

Graphite or Plumbago bears a strong resemblance to the last named mineral, but is scarcely as bright in lustre, and does not give the peculiar greenish streak of molybdenite on porcelain; but to be certain of its identity chemical tests are necessary. Graphite occurs in disseminated foliae throughout the bands of limestone and pegmatite that traverse the three townships, but not in paying quantities. On lot 7, R. 1, of Wakefield, lenticular masses of serpentine enclose graphite in foliated masses as well as disseminated foliae. On the same lot a fine granular variety, somewhat similar to the Cumberland plumbago, occurs in pockets of a crystalline limestone.

Apatite. Outcropping veins or beds are by no means so conspicuous as freshly broken specimens, being usually indicated merely by a whitish weathering that might easily pass unnoticed. Its resemblance to pyroxene has often caused much annoyance to pseudo-miners. This mineral, locally known as phosphate, is found of almost all colors, from white to almost black, passing through various shades of green, red, yellow and blue, this last being the most uncommon. The green and red varieties predominate, and in many mines are interblended. At the Jackson Rae mine in Templeton and at the Spring mine a quantity of beautiful transparent sea-green apatite has been extracted, comparatively free from foreign inclusions. A very pure reddish mineral, assaying as high as 86 per cent. tribasic phosphate of lime occurs in bedded masses at Gemmill's mine in Wakefield. A block, estimated to weigh four tons, was blown out by a single blast from one of these masses. Moore's mine, in the same township, is remarkable for the abundance of crystals extracted during the past four years. Huge crystals, hundreds of pounds in weight, have been met with, imbedded in a pink cleavable calcite. At this mine two years ago a beautiful vein of inter-locking crystals of a transparent sea-green color had been developed. The gangue had been dissolved to the depth of a foot, giving great prominence to these forms, which, owing to their fragility could rarely be removed intact. The rounding of the angles of apatite crystals has drawn forth many theories, fusion being offered as an explanation by some mineralogists, whilst others attribute the disfigurement to solvent action. Whichever theory we adopt serious objection may arise, as minerals easily fusible are found preserving their sharpness of outline, associated with rounded crystals of a less fusible apatite; and again rounded crystals of pyroxene are met with, though much more rarely, imbedded in limestone, also enclosing rounded crystals of apatite. It is hard to understand how the apatite and pyroxene alike should be attacked by a solvent while the latter is almost insoluble. (Some aluminous varieties are decomposed with great

difficulty with sulphuric acid at a temperature of 250° C.) It frequently happens that crystals of apatite having sharp angles are imbedded in the same limestone with others that have been rounded. On the other hand it rarely happens that crystals lining the walls of fissures have their angles rounded, although one or more of their faces are frequently obliterated or otherwise contorted, probably in consequence of interrupted crystallization. Bent or broken crystals that have been re-cemented are of common occurrence. The same crystals often enclose calcite, and others again have cavities extending the whole length of the crystals, with sometimes a rounded pebble of cleavable calcite contained in them.

At an opening known as the Gow Mine, in Hull, a pit has been sunk 150 feet in limestone, parallel to the wall of a large fissure which may be said to characterize this band for miles, it being made the more conspicuous by the abundance of crystals everywhere adorning its walls. Several mines have been established on this band with gratifying results. The apatite, which is chiefly of the greenish variety, runs in most cases conformably with the limestone, although some small veins were seen intersecting it. The aggregate yield of this band in the Township of Hull may be roughly placed at 4,500 tons.

We also find this mineral an ingredient of the orthoclase band running through the same township, and likewise characterized in places by a contact wall covered with crystals of pyroxene, apatite, phlogophite, &c. No remunerative mines are reported in this band, though many attempts have been made to work the small veins that occurs.

At Haldane's mine in Wakefield a pit has been sunk 125 feet on what appears to be a vein, cutting the stratification of a dark green granular apatite, impregnated with pyrites and often enclosing epidote, scapolite and pyroxene. This last is frequently of a cavernous nature, the cavities being filled with chabazite and a silky fibrous mineral resembling natrolite.

At Wilson's mine, in the same township, a fine granular strongly coherent reddish apatite, mixed with a green, cleavable variety, filled a vein 12 feet wide in gneiss, which however soon became "nipped."

In following some of the crystal beds at Moore's mine, large cavernous "vugs" were struck, walled with beautiful crystals of pyroxene, phlogophite and apatite. One of these caves was 30 feet long, 6 feet wide and 8 feet high, roofed with a pink crystalline limestone, studded with green crystals of apatite standing out in relief on its partly dissolved surfaces.

The comparative dullness of the phosphate trade has caused a partial cessation of mining operations, especially noticeable in the western parts of the apatite region during the past twelve months, and has tended to concentrate and systematize the work, and to restrict success to those having practical experience. In Hull, up to date, 5,000 to 6,000 tons have been obtained; Wakefield has probably afforded between 8,000 and 9,000 tons, and Templeton between 16,000 and 17,000 tons. The total output of all the mines in Canada for 1884 is 22,143 tons; and if we deduct 1,790 tons obtained from the Perth and Kingston districts, the remainder, 20,353 tons, represents the product of Ottawa County for one year.

Wallastonite, a fibro-tabular mineral, occurs on lots 7 and 11, R. 1, Wakefield.

Pyroxene, in its various forms is the most common associate of apatite.

Uralite, found in Templeton, apparently forms a transition mineral between pyroxene and hornblende.

Hornblende is of course found in all the townships in many forms, including *actinolite* and *tremolite*.

Garnet. One variety was mined to the extent of about two tons on lot 18, R. 2, Wakefield, being mistaken for red apatite. An amber colored variety, probably *Essonite*, occurs on lot 14, R. 1, Wakefield. This, too, was mined for apatite, but has since been sold in the States, and the locality has been visited by dealers from Philadelphia and New York, who have now almost exhausted the mineral.

Handsome crystals of a *Lime Garnet* are found a few miles farther west, and *Chrome Garnet* on lot 29, R. 4, Wakefield.

Zircon is found in the development of the apatite deposit. A crystal 15 inches long and worth \$200 was found on lot 23, R. 13, Templeton, and destroyed by a miner ignorant of its value.

Idocrase is found in Templeton and Wakefield.

Caenoclase is the name given to a mineral described by Prof. Lewis, occurring on lot 7, R. 1, Wakefield, in square prisms with their solid angles unsymmetrically truncated. Color, white, generally stained with oxide of iron; lustre, resinous, sometimes inclining to pearly, opaque. Mr. Willmott claims that the name, which implies poor cleavage, is misleading, inasmuch as the mineral has no cleavage, and that the phosphoric acid given in Mr. Lewis' analysis is due to contained apatite prisms.

Scapolite may be regarded as one of the most constant associates of the apatite deposits, and generally occurs in bedded masses.

Wilsonite is believed to be an altered scapolite.

Epidote occurs in the stratified rocks and as crystals in mixed veins.

Mica is a name which includes a number of doubtful minerals, all having one perfect basal cleavage. Besides being disseminated through the schistose and gneissic rocks it often constitutes large volumes in some of the phosphatic veins, either distributed in small scales through extensive masses of apatite and pyroxene or forming large aggregations, sometimes affording plates two feet square, in a calcareous gangue. The mica fever, encouraged by flattering reports of irresponsible persons, will always be regarded with suspicion by shrewd capitalists. The existence of the mineral in unlimited quantities in the neighboring townships is undeniable, but with few exceptions the plates are unmarketable in consequence of dark color, inclusion of minerals, or contortion. On the south half of lot 10, Range 10, Templeton, plates two feet square were taken out during the development of an apatite deposit, which were perfectly free from folds, inclusions or opacity, and yet were unsaleable because they would not stand the New York fire test. This same mica has been exposed to the heat of an ordinary stove for two years, and although it became slightly discolored, it compares favourably with some grades of the commercial article. At Chitty's mine in Wakefield great quantities of this mineral were met with, capable of supplying very large plates, though occasionally marred by lateral joints. What this mineral lacks in a commercial point of view is counterbalanced by the magnificent prisms available to the scientific world, the crystals lining the walls of fissures or enclosed in limestone being for symmetry unrivalled in the Dominion.

Oligoclase is found on lot 16, Range 12, Hull.

Albite is mentioned by Dr. Harrington as occurring in Templeton.

Orthoclase is found in all the Townships.

Titanite or *Sphen* is a common associate of apatite veins.

Tourmaline is met throughout the neighborhood. The finest crystals occur on lot 15, Range 12, Hull.

Talc, or something having its aspect, occurs at McLaurin's mine, Templeton.

Steatite is found in small bedded masses in all the townships.

Serpentine occurs in the limestone bands. No mention is made of any workable location.

Chrysotile, or serpentine asbestos occur near Chelsea, forming concentric veins in a serpentine limestone, with fibres sometimes $1\frac{1}{2}$ inches long, but rather too strongly coherent to be of commercial value. Other localities near Templeton have afforded asbestos with more separable fibres. A quantity was mined from this locality some years ago.

Ripidolite is found on the west half of lot 18, Range 9, Templeton.

Prehnite was noticed at Post's mine, Templeton.

Stilbite, *Chabazite*, *Natrolite* and *Heulandite* are four representatives of the zeolite group which have been noticed.

Barite, or sulphate of barytes, is the only sulphate which has been found in these townships. It is used extensively for the adulteration of white lead in consequence of its high specific gravity and cheapness, often replacing 75 per cent. of the lead. A vein of this mineral was worked some years ago in Hull. There is another deposit on lot 12, Range 12, Templeton, in white lamellar bedded masses in gneiss.

Calcite is the only representative we have of the carbonate group. Extensive beds of amorphous and crystalline calcite or limestone characterize this neighborhood, more especially the western portion.

Fluorite or fluor spar is amongst the associated minerals of the apatite veins.

Spinel and *Rutile* represent the anhydrous oxides in addition to the members of this group included with iron ore.

Quartz is one of the commonest constituents of our rock masses and fills many of the veins.

Jasper occurs in a bed 2 feet thick, overlain by gneiss, on lot 15, Range 10, Hull.

Agate in the form of chalcedony is found on lot 17, Range 9, Templeton.

In the discussion which followed the conclusion of the paper Mr. Lawson stated that he had not quite caught the lecturer's idea respecting the rounding of angles of pyroxene and apatite. Mr. Willmott again pointed out that as pyroxene and apatite occurred together it was strange that the agent, whether it were fire or water, that had power to dissolve the angles of the very refractory pyroxene should not entirely dissolve apatite crystals. Mr. Lawson thought water at very high temperatures, would dissolve almost anything.

Mr. W. P. Anderson understood that the inferior quality of our mica was a result of its being phlogopite, a mineral containing a small percentage of water, whereas the best commercial mica was muscovite, which contained no water. He had been informed that workable deposits of muscovite had been found in the Perth district, and asked if it were the case. The lecturer stated that muscovite was undoubtedly found in this locality; and also in answer to questions, that the New York fire test was recognized throughout Canada, and that muscovite was not affected by the blow-pipe.

In reply to Mr. Small the lecturer stated that his apatite statistics had been taken from the export returns, and, therefore, were exclusive of the quantities mined but yet in the country, and also exclusive of the 800 tons used last year by the Brockville chemical works.

During the discussion it was elicited that whereas now it did not pay to mine anything

poorer than 70 per cent. apatite, arrangements had been made for shipping 65 per cent. stuff for treatment by a new process. Members of the British Association had told Prof. Macoun that some of the refuse of the Templeton mines was superior to anything worked in England, and that in the future middlings would be of great value.

Mr. Lawson, Geological Survey, said that untreated ground phosphate was proving better for fertilizing than superphosphate, and asked if any official statement to that effect had been made.

The lecturer thought there was no such statement, but agreed in the superiority of untreated apatite, which would resemble ground bone in its action.

Mr. Small instanced the report of the Department of Agriculture, which gave the results of tests by the Agricultural College at Guelph. There the untreated fertilizer was found to have good effects on root crops in the third year after application, but not on cereals. He added that Scotch authorities were endorsing this view, also that there was a large demand for the ground mineral in Belgium for fertilizing sugar beet districts.

Mr. Fletcher thought that under these circumstances the farms in the apatite districts should be particularly fertile, which did not appear to be the case.

Rev. Prof. Marsan said that on the Upper Gatineau were many particularly fertile patches which he attributed to the existence of apatite deposits in the vicinity. He thought that the theories of those who contended for the use of superphosphate were quite reconcilable with those of the advocates of the raw material, as in spring all the phosphorus was in the roots of cereals, in July in the straw, and at harvest in the fruit; and as cereals required the phosphorus quickly, superphosphate would show the best results on them, while roots required it more gradually, and had time to absorb it from the slowly disintegrating rock.

In the reports of the French agricultural schools superiority was given to the raw material, and the French newspapers were advising its use.

He endorsed the lecturer's remarks as very exact in every point. He had studied the minerals near the Desert, where the geological formation is very similar to that of Chelsea, no tract being so uniform as the crystalline limestone band. The survey had gone 60 miles north of Ottawa; 90 miles farther the same formation continued.

He had found gold on Trout Creek, which empties into Eagle River. When he first heard of it, although the formation is a favorable one for gold deposits, he paid little attention to the report, as the farmers often mistake pyrites and mica for the precious metal, and would show him great finds of these glittering particles; but having a favorable opportunity he brought a sample of sand to the college and found traces of gold in it, but has since been unable to obtain a further supply in consequence of the water being too high when he was there.

A Peace River pioneer states that gold is now being discovered in good paying quantity along the various tributaries of the great Unpyah.

The Edmonton *Bulletin* speaks very encouragingly of the prospects for alluvial gold mining in the vicinity of Point le Pied, on the Saskatchewan, and states that Mr. Jerome Boudrea, formerly of New Brunswick, is preparing for active operations next spring.

THE OUTLOOK FOR COPPER.

Commenting on this important subject the *Engineering and Mining Journal*, (N.Y.), states that—"The disturbing element in the world's copper market is undoubtedly the production of the United States. From every other quarter, England's importations show only moderate fluctuations; a falling off from Spain of 2,600 tons, despite the promise of increase; a gain of 3,800 tons from Chili, despite the prediction of the total extinction of her copper industry by low prices; 1,100 tons increase from Australia, compensated for by a decline of 1,000 tons from Newfoundland. But the record of the United States for the last three years is startling: 745 tons exported to England in 1882, 9,410 tons in 1883, and 17,309 tons in 1884. And this from a country which, in 1880, in order to meet an extraordinary demand of its home market, had to import Chili bars.

Such a sudden addition to the world's supply has of necessity checked speculation by introducing a new and uncertain factor into the calculations on which speculation is based, while the steady decline in price has induced manufacturers to run on low stock. And yet the world's consumption has kept pace so closely with the world's production that the average visible supply for 1884 was 3,865 tons less than in 1883, and 17,199 less than in 1880. It is, therefore, the anticipation of a still larger production from North America that alone depresses prices in the face of reduced stocks. If we should continue to increase our output at the rate of the last few years, the balance between supply and demand would undoubtedly be seriously disturbed. If, on the other hand, the tide of our copper production is at its flood, we may expect the tide of prices to rise; and there is reason to suppose that possibly the maximum of production and probably the minimum of price have been reached."

After referring to the copper producing districts and the mines throughout the United States, and to the rapidity with which some of the more recently developed mines have become enormously productive, the *E. and M. Journal* adds, "that every mineral deposit in the west is worked on a high-pressure system that aims at making output great, no matter at what waste, and no matter how much more economically the work could probably be done in the future. The result is that the practical capacity of a mine or district is rapidly reached. It must also be remembered that all the work heretofore has been done on the rich, partially decomposed sulphurets, which overlie the unaltered ores; and that the percentage of the ores now treated is probably so much higher than those the company will have to handle before many years have passed, that the plant, now capable of producing from 20,000 to 25,000 tons a year, will have to be greatly augmented in size to turn out a like quantity from the deep, leaner ores.

There still remains to consider the course of the Lake Superior companies. At the present price of copper, there are probably only four or five mines that more than cover expenses. These, if they deem it best, can increase their mechanical appliances so as to handle a greater quantity of ore; but only one at the present time, the Calamet & Hecla, expresses the intention of adopting this policy of making these light profits heavier by largely increasing the output. Any gain, however, from this quarter will be nearly balanced by loss of production through the closing of a number of smaller mines, should the depression last. No new mining enterprise of any consequence now

under way in the Lake District will add to this year's production, and the times are not propitious for the starting of fresh ventures.

We believe, therefore, as we have already remarked, that in the United States, the largest producing market of the world, the maximum of production has been nearly reached, and if so, it almost follows that the lowest limit of price has been touched; for, even more remarkable than the rapid production of the past four years, has been the complete absorption of the enormous surplus. If, therefore, this growing source of supply be checked, and the new industries that have absorbed it continue to grow, the inevitable result must be a rise in price."

Taking into account the present condition of the market, and the outlook for copper mining in North America for some time to come, it would be unwise just now to open new mines.

COPPER EXPORTS.

During the fiscal year ended June 30th, 1884, there was exported, in ore, to the United States, from the copper mines of the Eastern Townships 2,234,642 pounds of fine copper. This was the actual quantity of copper contained in the pyrites shipped, chiefly from the Capelton mines, for the manufacture of sulphuric acid and the subsequent extraction of the metal.

The total amount of copper exported from Canada during the period above mentioned amounted to 3,589,135 pounds, as follows:—

	Pounds.
Fine copper (in ore) exported to the United States.....	2,244,685
Fine copper (ingots and old copper) exported to the United States....	248,846
Fine copper (chiefly regulus) exported to England.....	1,095,604
Total.....	3,589,135

LAKE SUPERIOR MINING NOTES.

The Town Council of Port Arthur has endorsed a petition from the mine owners of the district to the Commissioner of Crown Lands, praying that the Ontario Government will construct a bridge over the Kaministiquia River, between Murillo Station on the C. P. R. and Rabbit Mountain. Such an improvement would greatly facilitate access to the mines.

It is reported that the Silver Mountain Mining Company has received an offer from the Silver Islet Mining Company to purchase the property known as *Silver Mountain*. The price offered is said to be \$300,000—\$50,000 to be paid in cash and the balance within one year. It is thought, however, that the sale will not be completed as the company prefers to work rather than to sell the mine.

W. H. Furlonge, Mining Engineer, who has made an examination of the Beaver Mine, states that he gathered five samples of ore which represented the average of the vein, as then exposed for thirty feet in perpendicular height, and that these samples yielded to Mr. Chas. Kreissman, assayer, an average of \$995.75 in silver to the ton of 2000 pounds; the assays yielding \$660 at the outcrops on the top of the hill, and \$2,749.47 thirty feet below. We question very much that this is the average of the vein.

Mr. Furlonge also reports, after visiting the localities, that rich silver ore is now being taken

from the drift and cross-cut at the Rabbit Mountain mine, and that he saw fine native silver being blasted out at the Twin City. He is of opinion that the whole vein stone of both these mines is good stamp-rock.

A valuable discovery of gold bearing quartz has been made by the veteran explorer J. McKellar, of Fort William, District of Lake Superior, in a new locality. Specimens are now in the hands of Prof. Hoffman, of the Geological Survey, for full and complete analysis. Application for the location was duly made and has been granted by the Ontario Government, who show a much more liberal spirit than the Quebec Government in their disposal of mineral lands. A number of Ottawa capitalists have undertaken the developing of this latest find of Mr. McKellar.

GENERAL MINING NOTES.

NOVA SCOTIA.

The Hall-Anderson company began to ship bullion before the first of the year.

The Salmon River gold mining company will, if report be true, increase its milling capacity by twenty stamps.

The Superintendent of the Essex gold mine reports that early in December he had extracted 58 ounces of gold from 51 tons of quartz.

There has been recently received at this office a very handsome specimen of gold quartz from the Oxford Gold Mine, Lake Catcha District, Nova Scotia. We hope the vein, from which it was taken, carries similar quartz in quantity.

According to the official returns to the Commissioner of Mines for Nova Scotia, there was raised in that Province during 1884: 1,389,295 tons of coal, and 16,079 ounces of gold, against 1,422,553 tons of coal, and 15,456 ounces of gold in 1883.

QUEBEC.

Iron mining in the Township of Bristol is being prosecuted with vigour. The ore is being conveyed by teams to Braeside, and thence by Canadian Pacific Railway to Renfrew, from which point it is forwarded to Kingston over the Kingston and Pembroke Railway.

A new company, under the name of Johnson & Co., has been organized in the Province of Quebec for the purpose of working Asbestos mines in the Eastern Townships, and carrying on other mining operations, with headquarters in the Township of Thetford, county of Megantic. The capital stock is \$250,000.

Prospecting for silver is being vigorously proceeded with by Messrs. Ross & Torrance on a property owned by them, situated about 25 miles from the village of St. George, county of Beauce, Province of Quebec, and not far from the border line of the State of Maine. Mr. Torrance was formerly engaged on the Geological Survey, and is a mining engineer of some skill; he is personally superintending operations, and has 15 to 20 competent men employed. Galena, carrying silver in paying quantity, has been met with, and Mr. Torrance is sanguine that the property will develop into a mine of great value.

ONTARIO.

A small force of miners is employed at the *Coe Hill* iron mine for the winter months. It will be increased again in the spring.

The Cleveland Mining Company, (limited), has been incorporated for the purpose of carrying on operations in the Counties of Hastings and Peterboro', Ontario, with head quarters at Trenton. The capital stock is \$750,000, divided into 7,500 shares of \$100 each.

A good quality of lithographic stone is being quarried in Hastings County, but the sizes of the blocks are of too small dimensions to command a high price. The quality is so good that the owners are encouraged to proceed with quarrying and are hopeful that more solid beds will be met with at a greater depth from the surface.

Work has been again suspended at the Canada Consolidated Gold Mine, in Hastings County, Ontario. The cause for the suspension is attributed to a disagreement between Mr. W. H. Stevens, consulting manager, and Mr. R. P. Rothwell, active manager. It is understood that Mr. Stevens has been advancing the money to carry on mining operations, and having become dissatisfied with the results has stopped the supplies. According to the Secretary's report, this Company's indebtedness is \$300,000.

BRITISH COLUMBIA.

The Burns Mountain Quartz Company continues to drive the tunnel.

Coarse gold diggings have been discovered on Forty-nine Creek, a tributary of Columbia River, and miners are at work.

The Yellow Lion Company have been prospecting during the winter, in order to ascertain where the best pay is, and to be ready to wash in early spring.

In the Cariboo District there has been almost too much water in the creeks for winter mining. The Barber, the King, and three other companies have, however, been working on William Creek and are taking out pay.

A large vein of silver-bearing quartz has been discovered near 108-mile house, 61 miles above Clinton, on the Cariboo wagon road. The discoverer is Wm. Walker, the telegraph operator, and the vein is said to assay quite rich.

About twenty miners are making preparations to visit Lorne Creek mines as soon as the weather is favourable. Some of them are among the number who were in during the first year, and are very sanguine of large returns during the coming season.

The miners of Lillooet district have taken out \$108,000 during the past season—rather more than is expected of Cassair. It is \$40,000 more than Lillooet yielded the previous year, and the miners are hopeful of making a still better showing this year.

Fine specimens of silver ore have been brought from Kootenay Lake. It is said that about fifty companies have taken up claims and intend to work the mines vigorously. A New Haven company has secured mineral land on the lake and, if they can hold the claim, speak of putting up smelting works in the spring.

On Antler Creek the Nason Company has sunk a shaft fifty feet, and will drift one hundred feet in rock to reach the channel. It has no doubt been reached by this time. This company has used 59,000 feet of lumber in constructing a flume 3,400 feet long by four feet wide. If the Nason Co. is successful, other portions of the creek will be prospected.

It has been decided to flood Nos. 3 and 4 shafts, at the Wellington Collieries, high enough to close the connection between the two mines, and by this means it is hoped the fire will be extinguished and an opportunity afforded to work the upper portion of No. 3 mine. Mill-stream will be turned into the shafts and it will take a week to flood them.

The returns from the three principal fields of gold production are in, and, considering the limited number of miners engaged in the industry, the results are gratifying. A total output of \$691,000, although small when compared with the great returns of 1862 and 1863, still, when taken into account with the other productions of the province, it is by no means to be despised. During the year just closed the yield was as follows:—

Cariboo.....	\$124,000
Lillooet.....	108,000
Cassiar.....	103,000
Kootenay.....	56,000
Total.....	\$691,000

UNITED STATES.

Thirty-one million dollars worth of gold was obtained from the United States mines last year.

The cost of strikes in the Hoching Valley coal mines for the last six months of 1884 amounted to \$4,000,000.

It is expected that the Calumet and Hecla alone will shortly be crushing at the rate of 3,300 tons of rock a day equivalent to 50,000,000 pounds of copper yearly.

The shipment of iron ore from Lake Superior mines, including the Menominee district, amounted to 2,455,924 gross tons in 1884, showing an increase of 103,636 tons over the shipments in 1883.

The Calumet and Hecla Copper Mining Co. will pay a dividend of five dollars per share on the 2nd of February, aggregating \$500,000. A year ago the stock of this company was selling at \$234. The present price is \$153.

The money value of the output of the gold and silver mines of the state of Colorado for 1884, will aggregate about \$20,750,000, or \$5,500,000 less than last year's, due to the depreciation in the price of silver, lead and copper.

The production of the precious metals in the States and Territories west of the Missouri River during 1884, was as follows:—Gold, \$26,256,542; silver, \$45,799,069; copper, \$6,086,252; lead, \$6,834,091—aggregating \$84,975,954.

The money value of the product of the Comstock mines for 1884, was as follows:—Andes, \$1,722; Ophir, \$81,841.77; Potosi, \$200,000; Savage, \$13,058.88; Union Consolidated, \$5,065.13; Gould & Curry, \$19,206.18; Hale & Narcross, \$102,712.62; Mariposa Mill, \$21,-

\$90.30; Belcher, \$386,243.73; Crown Point, \$539,522.73; Kentuck, \$370,364.37; Yellow Jacket, \$656,915; Monte Cristo, \$28,356.34; Lady Bryan, \$9,934.58—aggregating \$2,436,833.33, being the largest product in any one year since 1879.

The discovery in California lately of considerable quantities of the peculiar stone used by lithographers is the subject of much remark in papers of that State. Heretofore the best lithographic stones have been found at Kelheim and Solenhofen, near Pappenheim, on the Danube, in Bavaria; but they have been found also in Silesia, England, France, Canada and the West Indies. They are found in beds, commencing with layers of the thickness of paper till they reach the dimensions of one and several inches in thickness, when they are easily cut, being yet soft in the quarries, to the sizes required for printing purposes.—*N. Y. Mining Record*.

REDUCED WAGES.

Early on the morning of January 19th, writes a correspondent of Medicine Hat to the *Nor'-Wester*, the miners employed in the Saskatchewan coal mine went, as usual, down the incline, and were about to enter the mine, when the pit foreman asked if there was any loose coal in, and those who had some got to work and had it up by noon. The other men were told to see well to the propping of the passages, and to bring out all their tools. These orders were all carried out, the men not knowing what was going to happen, until the following morning, when the general manager informed the men that all the miners could get for their work was 60 cents per ton, and the men to sign articles making a large deduction from each small car of coal, for dust in slack, also that if miners wished to leave the Coal Co's. service they were to give two weeks' notice, etc. Most of the disgusted miners left the town next day, and are now located in the "Hat" waiting for something to do. Many would return east to their families if they had the means to purchase tickets. On the night of January 20th about sixty miners from Pittsburg arrived at Medicine Hat by a special train, a passenger coach being attached for their convenience. The train went through and disembarked its passengers at Stair, one mile and a half from the mines. These men are under engagement to work in the Saskatchewan mine. Whether they will work for the new price, 60c. per ton, remains to be seen. In the meantime about seven score of the old miners who last week were getting 90c. per ton have remained to work at 60c.

A Mountain of Silver.

An interesting exhibit has been sent from Mexico to the New Orleans Exposition. It consists of a cast of a mountain, made of silver, resting upon a base about five feet long, three and a half feet wide, and eight inches thick. This base is of solid silver, and bears upon each side a medallion of Hidalgo and the words in Spanish: "From the State Ohihuahua to the New Orleans Exposition." The cast of the mountain, which is hollow, but nevertheless massive, is about three and a half feet high. It has two peaks, is quite natural in appearance, is covered with cacti and other Mexican vegetation, and has a party of soldiers sealing its sides and an Indian shooting a deer with a bow and arrow at its base—all cast in silver. This beautiful display of workmanship weighs about three tons, and is valued at \$92,000.

The "Sierra Nevada."

In all the history of human folly in our belief, says the *N. Y. Mining Record*, rarely has anything gone farther in that direction than has the expenditure made by the shareholders of this property since September 1878, when by some inexplicable jugglery, the management at that time succeeded in running up the price of the stock from \$68 to \$270 per share. At that time the sum total of assessments upon the property was \$2,100,000 the fruits of fifty-five swiftly following levies, increased to \$2,400,000 on the 22nd October, 1878. Since that date, no less than forty-five assessments have been levied, aggregating \$3,550,000, which have been drawn from the pockets of the shareholders, making the sum total levied \$5,650,000 to be expended in as bootless and foolish a pursuit as that of the endeavor to square the circle—at least for the stockholders.

THE TOLIMA.—A silver mining company, the stock of which is owned in England and the property of which is in Tolima, one of the States of Columbia, has yielded during the thirteen months ended June 30, 1884, 1,552 $\frac{2}{3}$ tons of silver ore estimated to be worth \$620,313; the ore was shipped to England; cost extraction and exportation was \$371,410. This ore as exported ranged from 373 to 261 ounces the ton; average was 298.08 ounces per ton. Of course, this property pays dividends regularly on 20,000 shares; one dividend, \$1.25 per share, was paid in September and another of the like amount was paid on the 15th of December.

GOLD MINES IN INDIA.

Interest in the India gold properties, which thus far have proved such a lamentable failure, has revived in consequence of the success of the Mysore Gold Company in the Mysore gold-field. From June to November, both inclusive, the Mysore Company crushed 622 tons of rock, which yielded 907 ounces of gold, the result of stamping 121 tons in November being 3 ounces per ton. Several defunct companies in the district, the Ooregum, Nundrydroog, and Madras companies, are making preparations to reorganize, and it almost looks as though, after all, something might come out of the great bubble so disastrously pricked two years ago.—*N. Y. Engineering and Mining Journal*.

A \$50,000 AUSTRALIAN NUGGET.—At one of the tents sat four men—the 10th of June, 1858—talking earnestly of their future and bemoaning the past. For several months these four men had worked together in the same claim, sometimes getting barely sufficient for daily wants; sometimes not even that. For several weeks, indeed, they had labored without any result. Not a speck of the precious metal had they seen. Their credit was stretched to the utmost limit; but until this evening they had hoped, as diggers do hope, that on the morrow something would turn up. Now they had ceased to hope; the storeman had refused further credit, and here they were without either bread or tobacco. "This," said one, "is the last straw." "True," replied another; "we cannot work with empty pipes." "I vote," said a third, "that we go down in the morning for our tools and peg out in some other quarter." After a long and serious discussion this suggestion was decided upon; and early next day, long before the camp was astir, three of the

men descended the old mine, the fourth remaining at the windlass. Down in the mine, the three looked gloomily around, with a kind of sulky regret at having to leave the scene of so much useless toil. "Good-bye," said one, "I'll give you a farewell blow." And raising his pick he struck the vauz, making splinters fly in all directions. His practised eye caught sight of a glittering speck in one of the bits at his feet. Stooping, he examined it and the place he had struck, when, with a loud exclamation, he knelt, and satisfied himself that it was gold! He then commenced picking vigorously. His mates caught the meaning and followed his example. In dead silence they worked on—they had discovered a monster nugget! Then a wild, glad shout sounded in the ears of the one at the windlass, who had sunk into a half dose, feeling, probably, the want of his breakfast. To his inquiry, "What is going on?" the cry came "Wind up" and as he did so there rose to the surface a huge mass of virgin gold. When fully exposed to view, the men were almost insane with joy. After watching it through the day and live-long night, they had it conveyed in safety to the bank. It was named the Welcome stranger, and yielded the fortunate discoverers of it \$50,000. On the site of that spot—within a few yards of which the writer resided—we now find a broad and busy street, a noble temple dedicated to public worship; a free library; and monster marts and warehouses, containing vast stores of the old world's merchandise. The forest and the scrub have disappeared and their place is occupied by the finest city on the celebrated gold fields of Victoria.—From *Cassell's Saturday Journal*.

GOLD NUGGETS.—The largest gold nuggets ever found were said to be as follows:—The Sarah Sands nugget, found at Ballarat, weighed 130 pounds Troy, or 1,560 ounces. This, at £4 pounds per ounce, would be worth £6,140. The Blanche Barkly nugget, dug up at Kingower, weighed 145 pounds, and was worth £6,960. The Welcome nugget, found at Ballarat, weighed 184 pounds and was sold for £9,325. This latter is the largest ever found—a model of the same can be seen at the Geological Museum in Ottawa.

A GOLD FIND.—A story comes from Nottawa, Ontario, to the effect that Mr. Taylor of that place has discovered in the Collingwood mountain what is likely to prove the best gold mine in America, and that he has been offered \$20,000 by a Californian to show him where it is, but he declined, as \$20,000 is nothing to be compared to the wealth that is within his grasp.—*Exchange*.

We are in receipt of a letter from Nottawa on this subject to the effect that Mr. Taylor claims to have discovered gold in the locality above referred to, but owing to the depth of snow he has been unable to make an extended examination of the ground, and is, therefore, unable to say if the gold occurs in paying quantity. It is Mr. Taylor's intention to thoroughly prospect the locality in the early spring, and to test the richness of the vein he has already found.—*Ed.*

The Cleveland Gem.

It is stated that Mr. S. Dessau, of New York, has cut a diamond weighing seventy-eight carats. It has been named "The Cleveland gem," and is said to be the largest diamond ever cut in America. The diamond was found in one of the mines at Kimberly, South Africa, but by

whom is not known. It was smuggled into London and purchased by a syndicate that held it for eight years, until it was purchased by Mr. Dessau. Upon leaving the polisher's hands it will be considered worth \$50,000.

The full text of a paper by Prof. W. Boyd Dawkins, M.A., F.R.S., on the Phosphate Deposits of the Ottawa District, read before the Manchester Geological Society, has just reached us. We regret that want of space has rendered it impossible for us to publish this valuable paper in this issue, but it will appear, *in extenso*, in our March number.

THE METAL MARKET.

Messrs. E. W. Carling & Co., of 16 Philpot Lane, London, England, report under recent date:—

METALS.—There has been little animation in this market except in copper and tin, the former showing increasing business.

COPPER.—Firm, Chili bars, good ordinary brands, cash £48 15s. to £49. 2s. 6d., three months £49 7s. 6d. to £49 15s.

YELLOW METAL.—Sheets, (4x4 ft.) for India, 4 $\frac{1}{2}$ d. to 5d.; sheathing 4 $\frac{1}{2}$ d. to 5 $\frac{1}{2}$ d.

TIN.—Steady, fine foreign, cash; straits, £74 12s. 6d. to £75 2s. 6d.; Australian, £75 2s. 6d. to £75 12s. 6d.; three months, £75 2s. 6d. to £75 12s. 6d.

LEAD.—Flat; English ordinary brands, £11; Spanish, £10 15s.

IRON.—Scotch pig, 42s. 2d. cash; Staffordshire f. o. b.—Bars in London, £6 to £7; nail rods, do., £6 to £7; hoops, do., £7 to £8; sheets, do., £7 10s. to £9.

TIN PLATES.—Charcoal, I C (f. o. b. London), 17s. to 22s.; coke, I C do., 14s. to 17s.

SPELTER.—Foreign, ordinary brands, ex. ship, £14 to £14 5s.

QUICK SILVER.—£6 15s. per bottle.

AUTIMONY.—Regulus, f. o. b., £40.

For the information of those of our readers who have invested in U. S. Mining Stocks we publish the following:

ASSESSMENT DIRECTORY.

(N. Y. Mining Record.)

This table is prepared from the official advertisements published by the organ of the San Francisco Stock Exchange.

[Stocks are sold in New York with assessments paid fifteen days anterior to the date of delinquency at office of the Company, as given in the table below.]

COMPANY.	When levied.	Delin- qu'nt in Board.	Delin- qu'nt in office.	Day of Sale.	Am't.

McIntyre & Lewis,
BARISTERS, SOLICITORS & NOTARIES PUBLIC.
Conveyancing of Properties and Mineral Rights.

OFFICES: **Union Chambers, Ottawa**
(adjoining Canadian Mining Review Office.)
ALEX. F. MCINTYRE. TRAVERS LEWIS.

ERNEST GAUJOT,
MINING AND MECHANICAL ENGINEER,
And Expert in Milling and Smelting.

Will examine and report on Developed Mines and Mineral Lands.

Address:
Belleville, Ont., or Buckingham, P.Q.

J. F. McANDREW.
Expert in Gold, Silver, Copper, Iron Plumbago and Phosphate Mining.

ORES ANALYSED.
Mineral Lands examined and reported on.
ADDRESS:
Buckingham, Province of Quebec.

JAS. H. REIFFENSTEIN,
SURVEYOR
FOR PROVINCES OF ONTARIO AND QUEBEC
ALSO FOR DOMINION LANDS.

Residence, No. 128 Crichton St. New Edinburgh; Post Office, Ottawa, or New Edinburgh.

A YOUNG CHEMIST, graduate of Germany, who speaks German, English and French, and who has worked at furnaces and steel works in Belgium and England for several years, desires a similar position in this country. The highest recommendations given. Address, Felix Becker, Arlow, Belgium, Europe.

**THE LIEVRES RIVER
LAND & PHOSPHATE CO.**
(LIMITED),

Offers For SALE some of the best located and most promising

PHOSPHAT LANDS
In the Townships of
**BUCKINGHAM, TEMPLETON, PORTLAND
EAST AND PORTLAND WEST.**

Phosphate Bought and Sold.

Advances made on Phosphate to be shipped and Sold abroad on Commission.

Address: **ROBT. C. ADAMS,**
PRESIDENT,
41 ST. FRANCOIS XAVIER ST.,
MONTREAL.

TIMBER LIMIT
ON LAKE WINNIPEG
FOR SALE.
50 Square Miles.

This limit will be very valuable. Apply at the office of the MINING REVIEW for price and particulars.

PLUMBAGO LOT FOR SALE
IN THE TOWNSHIP OF BUCKINGHAM,
On which are extensive surface shows and out-croppings of fine quality of Graphite. Further particulars to be had at the office of the MINING REVIEW.

FOR SALE.
ASBESTOS MINES

—ON THE—

Township of Coleraine, P.Q.

One Mile and a Half from Black Lake Station, Quebec Central Railway. Address

JAMES REED,
Inverness, Megantic, P.Q.

**PHOSPHATE PROPERTIES
FOR SALE**

IN THE TOWNSHIP OF WAKEFIELD.

Mining Rights on S $\frac{1}{2}$ of Lot No. 16, in the 1st Range.
" " on Lot No. 23, in the 2nd Range.
" " " No. 26, in the 4th Range.
" " " No. 20, in the 5th Range.

The fee simple of Lots Nos. 22 and 23, in the 4th range, (400 acres). All these lots have been carefully explored by experts and very favourably reported on; they are virgin properties and in the heart of the Phosphate Belt. For further particulars and price apply at the office of the MINING REVIEW.

**PHOSPHATE PROPERTY
FOR SALE.**
In the Township of Portland West,

Lots 25, 26, 27 and 28, in the 3rd range. Some excellent surface shows have been uncovered on these lots and only require capital for developing. Price and particulars given at the office of the MINING REVIEW.

MINERS WANTED.
50 Good Miners 50
Wanted.

Wages, \$1.25 per day; regular board, \$3.00 per week.

For further particulars apply to
A. H. DeCAMP,
Supt. Oxford Gold Mines,
MUSQUODOBIT HARBOR,
NOVA SCOTIA.

WANTED.
FIFTY EXPERIENCED MINERS.
Wages, \$1.25 to \$1.35 per day; board, 3.00 per week.

For further particulars apply to
M. R. DISOSWAY,
Supt. Essex Gold Mining Company,
TANGIER,
NOVA SCOTIA.

FOR SALE.
**DEVELOPED
PHOSPHATE MINE**

ADJOINING THE FAMOUS LITTLE RAPIDS MINE IN PORTLAND EAST.

THIS location has been pronounced by experienced practical miners one of the most promising apatite producing properties in the district. There are over TWENTY SURFACE EXPOSURES OF GOOD PROMISE, and one deposit now being worked that proves an extensive body of phosphate AT A DEPTH OF FIFTY FEET. Price reasonable and satisfactory reasons given for selling. Full particulars obtainable at this office.

FOR SALE,
White Marble Quarry on Calumet Island.

At this quarry there is an inexhaustible supply of most beautiful white marble. Samples to be seen and information obtained at the office of the MINING REVIEW.

MINES AND MINERALS.

**Developed and Undeveloped Mines and Minerals of Commercial Value
BOUGHT AND SOLD.**

PROPERTIES EXAMINED AND ANALYSES MADE OF ORE OF EVERY DESCRIPTION.

A Competent Expert is permanently engaged for the purpose of making Unprejudiced Reports on all Mines placed in our hands for Sale, such reports being at all times open to intending purchasers for examination.

**Phosphate, Iron, Iron Pyrites, Copper, Asbestos, Mica, Plumbago
Gold and Silver Mines, and Marble and Sand-
stone Quarries, For Sale.**

MINERAL LANDS EXAMINED AND REPORTED ON BY OUR EXPERT; ALSO, ANALYSES OF MINERAL OF EVERY DESCRIPTION MADE BY A COMPETENT ASSAYIST.

**Correspondence with Owners of Mines and Capitalists desirous of
investing is most respectfully solicited.**

PHOSPHATE CRYSTALS.

Farmers, Miners and Prospectors, having unbroken Phosphate Crystals for Sale, can find a cash purchaser by applying at the Office of

THE CANADIAN MINING REVIEW,

Union Chambers, 14 Metcalfe Street, Ottawa.

Parties offering crystals for sale will please mention the colour, length and diameter - large ones preferred.

Mica for Sale.**ABOUT FOUR HUNDRED POUNDS**

GOOD QUALITY, DARK MICA

has been consigned to us for sale. It is cut into sizes 2½x6 to 5x9 inches (the larger sizes predominating) and is offered at a very low price.

Also, ABOUT 2,500 LBS. OF SAME QUALITY IN THE ROUGH SLAB, OR CRYSTAL.

Apply at this office.

**NOTICE TO CONTRACTORS.**

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Firewood," will be received at this office until Wednesday, the 8th day of April next, at noon, for the supply of Firewood for the use of the Public Buildings, Ottawa, according to the specification to be seen at this office, where forms of tender can also be obtained.

No tender will be considered unless made strictly in accordance with the printed forms, and, in the case of firms, except there are attached the actual signature, occupation and place of residence of each member of the same.

The tender to have the actual signatures of two solvent persons, residents of the Dominion, and willing to become sureties for the due performance of the contract, and to be accompanied by an accepted bank cheque for the sum of five hundred dollars, payable to the order of the Minister of Public Works, Ottawa.

The Department will not be bound to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 11th March, 1885. }

**INTERNATIONAL AND COLONIAL EXHIBITIONS.**

ANTWERP IN 1885—LONDON IN 1886.

It is the intention to have a Canadian representation at the International Exhibition at Antwerp, commencing in May, 1885, and also at the Colonial and Indian Exhibition in London in 1886.

The Government will defray the cost of freight in conveying Canadian Exhibits to Antwerp, and from Antwerp to London, and also of returning them to Canada in the event of their not being sold.

All Exhibits for Antwerp should be ready for shipment not later than the first week in March next. These Exhibitions, it is believed, will afford favourable opportunity for making known the natural capabilities, and manufacturing and industrial progress of the Dominion.

Circulars and forms containing more particular information may be obtained by letter (post free) addressed to the Department of Agriculture, Ottawa.

By order,

JOHN LOWE,
Secy., Dept of Agric.

Department of Agriculture,
Ottawa, December, 19th, 1884. }

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

The mining localities in Canada which are attracting the most attention at the present time are: The Beauce gold district and asbestos mines of the Eastern Townships; the phosphate deposits of the County of Ottawa, and the mica mines, of which special mention is made in this issue; the iron deposits of Central Ontario, and further west in the same province, on the north shore of Lake Superior, the rich gold and silver mines are attracting the attention of capitalists. Capital is being liberally invested in the coal mines of the Northwest Territories and in the petroleum fields contiguous to the Red Deer and Lesser Slave Rivers. Much attention is also being directed to the mineral resources of the Kootenay District in British Columbia where eastern capitalists have already taken up claims with a view to commencing active mining operations in the spring.

The present year promises to be one of unusual activity in the mining centres above referred to—many new and influential companies have been organized to operate the mines and a fair amount of capital is available for that purpose.

In this issue we publish the full text, with illustrations, of a paper by Wm. Boyd Dawkins, M.A., F.R.S., on the Phosphate Deposits of the Ottawa District, read before the Manchester Geological Society. Professor Dawkins is a geologist and mineralogist of high repute in England, and during his visit to Canada last summer with the British Association he took occasion to visit our phosphate mines and devoted

some time to a careful examination of the extent and the nature of the deposits. His opinions, therefore, expressed in the paper referred to, will be of interest to those who are engaged in the industry of phosphate mining.

A variety of mineral specimens collected in the vicinity of Ottawa has been received by Dr. Selwyn, Director of the Geological Survey of Canada, for the International and Colonial Exhibition, which opens at Antwerp in May. A fair representation of the product of the phosphate mines will be exhibited, and an apatite crystal, pronounced by Dr. Selwyn to be the largest ever discovered, has been forwarded by Mr. Allan, of Ottawa. Some very fine plates of Canadian mica, from the Pike Lake and Villeneuve mines, are also among the exhibits.

Lt.-Col. H. Dachesnay, Inspector of Mines for the Chaudiere District, and J. Obalski, Esq., mining engineer for the province, have devoted careful attention during the past year to the mineral products and the occurrence of economic minerals in the section of the country under their supervision. Their official returns are embraced in the annual report for 1884 of the Commissioner of Crown Lands of the Province of Quebec, from which are published extracts in this issue referring to the occurrence of gold, asbestos and petroleum.

The annual report of the Minister of Agriculture for 1884, extracts from which are published in another column, contains special reference to the phosphate industry. It is strongly advocated in the report that the manufacture of super-phosphate should be engaged in in Canada, and in this we firmly concur.

THE *Iron Trade Review*, Cleveland, O., in a recent issue, calling attention to the United States foreign ore competitors, remarks that Canada, as yet, does not appear as a formidable competitor, her shipments for the fiscal year under review being 29,125 tons, though for the calendar year they were about 50,000, but adds that it would not be surprising if Canada's shipments of iron ore into the United States during the fiscal year 1884-5 advanced to 200,000 tons.

Dr. Bell, Assistant Director of the Geological Survey, has been elected a member of the American Institute of Mining Engineers.

Prospecting continues at the Marlow silver location in the Province of Quebec. Four good veins have already been struck ranging from 10 to 20 inches thick, from which samples have been taken that have assayed 20 ounces up to 250 ounces of silver per ton.

The machinery for the Winnipeg and Northwestern Petroleum Company is lying in Winnipeg awaiting transportation to the wells. This machinery is suitable for boring to a depth of 2,800 feet.

Canada's Phosphate Industry.

The activity which has prevailed at the phosphate mines in Ottawa County during the past year continues unabated, and notwithstanding that the market abroad has been more or less sluggish for the past six months or more, there is no disposition on the part of mine owners to check the output of the mines—on the contrary, they are working their properties, in most cases, to their utmost capacity and many thousands of tons of mineral are awaiting transportation. Owing to the construction of the Buckingham branch of the Canadian Pacific Railway, but a small quantity of mineral has been forwarded during the winter months. At the terminus of the railway commodious ore-bins have been erected on the bank of the Du Lievre River to receive the phosphate which will be carried in scows from various points on the river, contiguous to the mines, and with the opening of navigation there will begin a busy scene between the High Falls and the railway terminus. Mr. Lomer, of Montreal, with his usual enterprise, has built a suitable steam tug, which will be available by the time the ice has disappeared from the river, and two scows of seventy-five tons capacity each, to be used exclusively for the transportation of phosphate. Mr. Lomer has contracted to carry the output of the principal mines, adjacent to the river, to the railway at a rate per ton that will greatly reduce the cost of transportation as compared with what it has been formerly. The facilities now offered for forwarding the output of the Du Lievre district from the mines to Montreal are such as to render winter hauling practically unnecessary, and will insure its transportation, irrespective of broken and unfavourable weather, from the opening until the close of navigation, and the cost of delivering phosphate in Montreal is now reduced to a minimum.

It is expected that the quantity of phosphate that will go forward this year will be several thousand tons in excess of last year's production and the quantity that has already been mined, and the present appearance of the mines, justifies such a conclusion. The chief contributors to the general output, and the approximated contribution of each, are:—

The Phosphate of Lime Company, 7,000 tons; Union Phosphate Company, 4,000 tons; Dominion Phosphate Company, 3,000 tons; W. A. Allan, 2,000 tons; Ottawa Phosphate Company, 5,000 tons; Du Lievre River Phosphate Company, 1,500 tons; and Messrs. McLaurin & Blackburn (Templeton), 3,000 tons. If this estimate is approximately correct, with the addition of the output of the less important mines, the production of phosphate in the County of Ottawa for 1885 will doubtless aggregate 28,000 tons. Year by year more attention is being given to careful cobbing, and this season's shipments are likely to be of a higher standard than those of any former year. It is quite certain that a large proportion of the output will run over 80 per cent., while some will go as high as 84 and

85 per cent., notably that from the Little Rapids mine. That this careful dressing of the ore should be kept up is very important, and as mine owners have had sufficient experience now to know how necessary such precaution is, if they wish to secure high prices for their shipments, it is not likely that they will become again careless on this point as they have been in the past.

PHOSPHATE QUOTATIONS.

The most recent advices from abroad quote Canadian phosphate at 1s. 1½d., per unit for 80 per cent., with a fifth of a penny rise, but as there is none offering at these figures this can hardly be quoted as the market price. It is thought that prices will improve with the opening of navigation when phosphate begins to go forward.

ANNUAL MEETING.

The annual meeting of the shareholders of the Intercolonial Coal Mining Company (Limited) took place at the company's office, 199 Commissioner street, Montreal, on the 4th inst. The statements of account for the year ended December 31st, 1884, were submitted to the meeting and considered as very satisfactory. The quantity of coal marketed during that time was 114,882 tons. The following gentlemen were elected directors of the company for the ensuing year:—Messrs. Gilbert Scott, H. A. Budden, Robert Anderson, D. L. Macdougall, James P. Cleghorn, Peter Redpath, Alexander Gunn, Henry J. Tiffin, and W. M. Ramsay. At a subsequent meeting of the board Messrs. Gilbert Scott and Henry A. Budden were re-elected president and vice-president, respectively, and Mr. W. J. Nelson reappointed secretary of the company.

Huronian Mining Co.

A directors' meeting of above company was held at their office in this city on Monday, the 23rd inst., Jas. McLaren, Esq., President, in the chair. The question of continuing or suspending work was discussed. It was finally decided to place the property and plant in the market, not for want of faith in the productiveness of the mine, but for the reason that the distance to the property was too great to enable the directors (all being residents of this city) to give its working the personal supervision necessary to a mine's success.

We look upon this property as one of the most valuable in the Lake Superior district, and already we hear of a syndicate of American capitalists bidding for it.

St. Onge Gold Mining Co.

An organization meeting of above company was held at their offices in Quebec on Thursday, the 26th inst. W. A. Allan, of this city, was elected President. The properties acquired by this company in the Beauce district are being thoroughly and practically developed. Already three shafts have been sunk and the gravel washing at 150 feet from surface has proved very rich. It is the intention of the company to put a large force of men on when the season for washing begins, and we predict ere many months a boom for that district such as California and Australia had in their early gold discovery days.

On Some Deposits of Apatite Near Ottawa, Canada.

By PROFESSOR W. BOYD DAWKINS, M.A., F.R.S.

Read before the Manchester Geological Society, December 2nd, 1884.

1. DESCRIPTION OF MINES VISITED.

The Apatite Mines of Canada deserve more than a casual notice, not merely on account of their economic value, but because of the interesting facts which they yield, throwing light upon the history of mineral veins in general. It was my good fortune in September last to have visited, in company with the Bishop of Ontario and Messrs. Allan, Smith, McIntyre, and Grant,* some of those in the district of Buckingham and Portland, and the following communication to the Society is the result of my observations, combined with those published by Dr. Harrington in the *Report of the Geological Survey of Canada, 1877-78*.

The district to which it refers is that known as the North Ottawa Phosphate Region, and those parts of it which I have examined consist of a cluster of mines on the Rivière du Lièvre, about eighteen miles above Buckingham, a station on the Canadian Pacific Railway to the east of Ottawa.

On getting out of the train at Buckingham, a drive of four miles along a road almost impassable from the depth of the ruts, took us to a tiny wharf and we embarked in a little steam yacht, which swiftly carried us up a noble river, about as broad as the Thames at Richmond, and flowing between bold rocky hills covered with trees glorious in the bright colours of autumn. We land and make our way along a track leading up to one of the wooded spurs, which showed as we left the river behind us, in the large blocks of vein stuff and mica lying in the ruts, that we were approaching the mines. The first vein which we examined is exposed in a shallow working at the outcrop and is filled with massive apatite containing bunches of black mica of the species known as phlogopite. The mine in work some three-quarters of a mile higher up is situated in a vein from twelve to fourteen feet wide, (Fig. 1, No. 3 of the following list), and filled with various materials, apatite, mica, pyroxene, calc-spar, &c., the apatite varying in thickness from two to fourteen feet. The sides of the vein are in some parts clearly defined

FIG. 1.
Mr. Allan's Mine, No. 3 of list.
A. Apatite and other minerals. B. Mica (Phlogopite).

* I take this opportunity of thanking the three first of these gentlemen for their courtesy in arranging for me to visit the mines and to obtain specimens.

from the surrounding rocks, while in others they shade off into the pyroxenite rock of the district. It is a true fissure vein with a hade of 57° to the East. The workings had been carried on to a depth of about 140 feet from the surface, a greater depth than any other similar mine in the country. They were wet in some places, and the apatite was so decomposed as to take the form of pure sea-green sand, soft enough to be dug out. After examining the outcrop of another vein close by (No. 4 of the subjoined list) we visited the Emerald Mine some two miles away, where open workings had been carried on on a large scale, and galleries had been driven to some distance into the rock. The vein here was from twelve to thirty feet thick, and filled with various minerals, among which apatite and calc-spar predominate. In Fig. 2 a portion of the vein is represented about thirty feet thick, as it appeared on our visit, one side of it being filled with massive apatite, and the rest with calc-spar, in which crystals of apatite, some of gigantic size, were scattered irregularly. Most of the largest and most perfect crystals of

apatite have been obtained from this mine, some weighing, as Mr. Allan informs me, as much as 1,000 lbs. In one place the vein is intersected by a dyke of igneous rock, probably of dolerite, which is of later age than the vein, since it fills a fault by which the vein has been dislocated.

2. THE DIRECTION OF THE VEINS IN THE NORTH OTTAWA PHOSPHATE REGION.

The apatite veins which I examined, Nos. 3, 4, and 9 of the following list, do not agree in the direction of their strike or bearing, and when they are compared with others in the North Ottawa Phosphate Region described by Dr. Harrington in the Report above quoted, page 6, it will be seen that in the district generally they have no uniform direction. The predominant strikes are East and West, N.E. and N.W. by W.

3. THE VEINSTUFF.

The apatite occurs in the veins generally in a massive crystalline form, green, blue, or brown, and sometimes glassy, or granular. It also occurs as large independent crystals shooting from the side of the vein. Sometimes, as in the Emerald mine, the crystals are large, perfect at both ends, and completely enveloped in calc-spar. It contains, according to Mr. Hoffman's analysis, tribasic phosphate of lime, 85.241* to 89.810; fluoride of calcium, 5.860 to 7.929, besides other constituents, for which reference may be made to the *Report of the Geological Survey of Canada*, 1877-8, p. 10 B. In comparison with European apatites it stands thus:—

Tribasic Phosphate of Lime, Arendal, Norway.....	92.189
" " " Greiner, Tyrol.....	92.160
" " " Murcia, Spain.....	92.066
" " " Tokovaia, Ural.....	9.668
" " " Studianka, Russia.....	91.646
" " " Ottawa, mean of 7 analyses.....	87.521
" " " Estremadura, Spain, mean of 2 analyses.....	81.593
" " " Staffel, Nassau.....	70.273

It is, therefore, a high-class and valuable mineral, and, in my opinion, is one of the most important of the mineral resources of Canada.

The calc-spar is coarsely granular, white or flesh-coloured, and intimately associated with the apatite, sometimes completely surrounding the crystals, and at others forming alternate layers. In some cases, as in the specimen on the table, it has a stalagmitic surface, and in others has been deposited along with quartz and other minerals in drusy cavities.

The mica, of the phlogopite species, and dark in colour, is also intimately associated with the apatite, sometimes being in large masses in the centre of the vein, or in others lining the sides of the vein, or coating the crystals of apatite. Among other minerals which I observed in the vein-stuff were pyroxene, zinc-blende, and pyrite both in cubes and in octohedra. For further details as to the minerals associated with apatite, reference may be made to Dr. Harrington's admirable essay.

4. THE ROCKS TRAVERSED BY THE VEINS.

The rock (Pyroxenite of Hunt=Hypersthenite of Dana) traversed by the veins which I examined consists of a bright crystalline and massive schist, composed to a large extent of pyroxene (augite), more or less altered, mica, orthoclase, trichite feldspar, and apatite. It contains, according to Dr. Harrington, subordinate layers of quartz. Were it not that it is bedded it would pass muster as an eruptive rock.

Looking, however, at that fact, and the further consideration that it is associated with quartzites and altered limestones, it is, in my opinion, an altered rock belonging to the Archaean (Laurentian) series, which ranges over the vast region north of the Lakes and of the St. Lawrence River, and which, according to Sir W. Dawson, is not less than 30,000 feet in thickness. In classification it goes with the Laurentian hornblende gneisses. According to Dr. Harrington, both limestones and quartzites are traversed by veins of apatite in the North Ottawa Phosphate Region at Templeton, which I had no time to visit.

5. HISTORY OF THE VEINS.

In dealing with the very much debated question as to the history of the apatite veins, the following points seem to me the most important:—

(a) The veins are in some cases sharply defined, and have evidently been deposited in a series of irregular fissures striking across the rock in various directions. (See Figs. 1 and 2.) Sometimes the vein-stuff shades off in the pyroxenite, as it might reasonably be expected to shade off on the hypothesis that the deposit took place under conditions of heat and enormous pressure in the presence of water. These conditions are proved to have existed from the profound alteration of the Archaean rocks from the fragmental to the crystalline state.

(b) The character of the vein-stuff is such as is usually found in fissure-veins. In Fig. 3 it presents a banded structure, formed by alternate layers of apatite and pyroxene. In other

FIG. 3.
Vein stuff from No. 3, nat. size, Portland.
A. Apatite. B. Pyroxene.

cases layers of apatite and of a stalagmitic calcite alternate, and in one specimen on the table an angular fragment of quartzite is enveloped in vein-stuff composed of mica, pyroxene, and apatite. These two characters are found together, so far as I know, only in true fissure veins, and are well known to practical workers in mineral veins generally.

(c) The apatite occurs disseminated through the pyroxenite rock in minute granules, and it is therefore argued that it has found its way into the veins by a mere process of segregation. It seems to me more probable that both rocks and veins have received their charge from some

common deep-seated source by hydrothermal action, while both were sunk deep beneath the surface, and the heat and pressure were sufficient to allow of apatite and the other minerals in the vein being deposited by water.

(d) The surfaces of some of the crystals of apatite present traces of hydrothermal action in their rounded angles and honeycombed surfaces, as in the specimens on the table. Solution might very well go on in one place while deposition was going on in another. The presence, too, of perfect crystals of apatite completely embedded in calc-spar, as in Fig. 2, can only be accounted for on the hypothesis that the vein was filled with a pasty mixture of apatite and calcite which allowed of the former developing a perfect crystalline form, the calc-spar matrix being sufficiently compact to keep the growing crystal from sinking to the bottom of the fissure. Had the fissure been empty the apatite crystals in this case, as in most others, would have been imperfect, and would spring from the side of the vein. This pasty condition of the vein-stuff is only explicable, in my belief, by hydrothermal or aqueo-igneous action.

(e) Nor are we without proof that the vein-stuff itself has been in a state of movement while it was in a pasty state in the crumpling and distortion to which the crystals of mica have been subjected. The specimens on the table have been obviously distorted by the movement of the surrounding matrix after their development as crystals.

From these facts it may be concluded that the veins of apatite in this district were formed in fissures in the Archaean rocks by hydrothermal or aqueo-igneous action under conditions of heat and pressure of the same general sort as that by which the rocks themselves have been affected, and by which the sandstones have been converted into quartzites, the muds and sandy clays into schists and crystalline rocks and the limestones into crystalline calcite associated with serpentine.

These impressions of a hasty visit to the district in question are laid before the Society not merely because they relate to a large and rapidly developing mining industry in Canada—the export last year being 14,478 tons, and the estimate for this being 23,000 tons—but because they are of local interest, since the products are largely used in Lancashire.

The following note relating to the physical characters of this important mineral, and the localities where it occurs in the British Isles, is added for the information of those who may seek for it:—"Apatite, crystalline phosphate of lime. Hexagonal, often hemihedral, occurs in six-sided prisms terminated by one or more planes, or the prism is terminated by a six-sided pyramid, and the lateral edges are sometimes replaced. Colours usually pale, and most commonly white, yellowish white, wine yellow, green, blue, or bluish green, and red, which are sometimes intermixed in the same crystal.

* The lower percentage, 74.241 of his analysis, No. 7, seems to be taken from an impure sample, and to be an exception to the rest of his results.

Externally it is splendent; internally the lustre is shining and resinous, approaching to vitreous. Transparent to opaque: cross fractures uneven, approaching to small conchoidal. Hardness, 5. Specific gravity, 3.25.

Blow-pipe.—Fusible with difficulty on the edges: with borax forms a clear globule, and in salt of phosphorous dissolves in great quantity, affording a transparent glass, which, when nearly saturated, becomes opaque on cooling, and presents crystalline faces."

Localities.—*English:* Cornwall, of a greyish-blue, at Stenna Gwynne, near St. Austell; St. Michael's Mount; Huel Kind, near St. Agnes; Fowey Consols and Huel France, near Tavistock. Cumberland, at the foot of Brandygill, Carrock Fells. Devonshire, at Bovey Tracey, in crystals sometimes two inches long, associated with black tourmaline. *Scotch:* Dee side, in Aberdeenshire. *Irish:* Near Kilroot, Co. Antrim, in granite; near Hilltown, Dublin; and at Killiney Hill, in limestone. *Bristow's Glossary of Mineralogy.* It has not yet been discovered in paying quantities in the British Isles.

The Late Sir William Edmond Logan.

On the 26th of March Dr. Bell, assistant director and the senior geologist of the staff of the Canadian survey, delivered a lecture before a large audience in Montreal on "Personal Reminiscences of the late Sir W. E. Logan." Dr. Bell had been obliged to postpone the lecture, which was one of the Somerville course in connection with the Natural History Society, on account of a severe cold, and in the meantime he kindly gave a rehearsal of it in St. James' hall in Ottawa on the 10th instant, at the request of the staff of the survey and other citizens. As the subject is one which we are sure interests our readers we give the following report of the lecture:—The history of the Geological survey of Canada was inseparably connected with that of the life of Sir William Logan. This survey owed its origin to representations made by the Natural History Society of Montreal and the Literary and Historical Society of Quebec. Acting on these, the first Parliament of the united provinces of Upper and Lower Canada voted £1,500 sterling to commence the work and Mr. Logan was appointed Provincial Geologist in 1842. Subsequently the grant was increased to £2,000 annually, but it was not till near the close of Logan's administration that the amount exceeded \$20,000 a year, and the average annual grant during his time may be said to have been only about \$15,000. This fact should be borne in mind when we consider the great things which Logan accomplished.

The lecturer did not propose to give a history of Logan's life, which had been well done by Dr. Harrington, nor did he intend giving a description of his personal qualities, but would relate a series of incidents and anecdotes illustrative of the principal points in a man's character, and leave each to form his own judgment. Dr. Bell's connection with the survey began early in 1857, and he was associated with Sir William from that time until the latter left the country, a period of 17 years, during which he had opportunities of seeing him under a great variety of circumstances.

Logan's ardent devotion to duty both in the office and the field were well calculated to inspire enthusiasm in others, and thus a large amount of work was performed by the small staff. Even in the city he commenced his labors early in the morning, and after a short interval for breakfast continued without intermission till six in the evening, when he dined, returning to the office again and working till past midnight. In addition to his daily or more frequent round of visits to every member of the staff, he kept all the accounts with his own hand, carried on an extensive correspondence, plotted the surveys he had made during the summer, and constructed his own original maps, wrote his reports, revised those of his assistants, examined all the fossils, minerals and rock-specimens collected during the year, studied the reports of other geological surveys and the new geological books generally, while the interruptions caused by visitors, to whom he was always accessible, occupied a considerable part of every day. For a number of years four manuscript copies of the various annual reports required to be made in order to comply with the requirements of the time, and all these Sir William Logan wrote out with his own hand, a task requiring the utmost patience to endure.

The room in the survey building in Montreal in which most of Sir William's work was performed, and which also served him for a bedroom, was plainly and scantily furnished. It had no carpet on the floor, no screen or curtain at its single window, while his camp blankets, spread on a folding chair, served him for a bed. Some of his field instruments and the clothes he wore in camp might be seen hanging on pegs around the wall. He paid little attention to dress even in the city, and he made the same coat and waistcoat wear for so many years that they seemed as familiar to his friends as the man himself. Owing to his unpretending dress and style he escaped recognition even by many old citizens of Montreal. When working in the country he put up at the farm houses and wayside taverns and paid so little attention to his personal appearance that strangers would scarcely believe he was Sir William Logan at all. Several very amusing anecdotes were here related by the lecturer, showing the mistakes and inconvenience which arose from his "seedy" appearance. These stories will not bear condensing, and we only regret that we have not space to give them at length. Some laughable accounts were next given of how, on various occasions, he had been treated as a lunatic from ignorant people not comprehending his motives and actions.

Wherever he walked in the country (and he seldom hired a conveyance) he counted his steps and took bearings of the road or of his track by compass, and in this way surveyed thousands of linear miles more accurately than would be supposed possible. His field books show the great care with which he noted and sketched the features he would represent on his maps. His instrumental surveys were models of accuracy, and several instances were given of the great care with which he performed these surveys. He was not only a first-class topographical surveyor, but a very neat and skilful draughtsman, as proved by his maps. Among the surveys which he performed were that of the Ottawa river, a traverse of the Gaspé peninsula, a great part of the county of Argenteuil, the region opposite the city of Quebec, the neighborhood of Missisquoi bay, the townships around Richmond and Danville, two whole summers having been spent in a single township. These and other surveys which were referred to, combined both the topography and the geology, and the great pains which Logan always took to

secure accuracy, gives everyone the fullest confidence in his results. In 1862, when a person by the name of Marcon called in question the work of some of Sir William's assistants, he took up the cudgels in their behalf, as he always did, and effectually repelled the accusation. This was one of the causes of the noted *esprit de corps* of the survey in Logan's time. Other causes of this feeling were his sense of justice, the care with which he kept his word, and the pride he took in his staff, simply because they were his own men. He did all he could in their behalf, and they in return supported him and aided very materially in building up his great reputation. A number of instances were given of Logan's carefulness in matters of detail and in looking after the welfare of his assistants. He took pleasure in giving them full credit for their labors and was lenient to their failings.

In the field, whether in settled districts or in the woods, the amount of physical labor which Logan underwent was very great. When working miles away he never thought of his boarding place or his camp until compelled by the darkness to close his note-book and walk back to his supper and bed. After his evening meal, instead of taking his much-needed rest, he would spend hours plotting his maps.

As to religious matters, Logan made no parade of piety, although his everyday life was an exemplification of practical religion. He treated the clergy of all denominations with much respect and among them were many of his principal friends. His parents belonged to St. Gabriel (Presbyterian) church and Sir William used to tell an amusing story of how, when a very small boy, he grabbed the coppers on the collection plate the first time they took him to that place of worship. Logan did not believe in indiscriminate generosity, but the lecturer mentioned several instances proving that he was kind hearted and a gentleman of refined feelings. He was not a time-server nor a respecter of persons, but observed the same respect for the feelings of all. On the occasion of Her Majesty's visit to the Canadian section of the International Exhibition of 1855, the Queen was much pleased with his charming conversation, and his sincere and independent manner, and shortly afterwards she conferred on him the honor of knighthood for his great services to science and his native Canada.

Sir William remained a bachelor, although from the anecdotes related by the lecturer of the interest the ladies took in him, it would appear that he might have found a wife had he desired to do so. He was not, however, by any means unsociable, and his good stories, songs and jokes always made him the centre of attraction. He was as ready-witted as Sir John Macdonald, and had something appropriate to say for every occasion. No one enjoyed a little harmless fun more than he, nor sympathised more heartily with the youthful frolics of his assistants or men, as we may judge from the illustrations recited by the lecturer. His keen sense of humor induced him occasionally to participate in practical jokes at his own expense.

During Logan's lifetime, Marcon was his chief detractor, but since his death Whitney, Wadsworth and others have assailed his reputation. If some who might take his part seemed indifferent, he had in the lecturer one witness, at all events, ready to stand up for him. While multitudes of "self-seeking" reputation hunters went to their graves "unwept, unhonored and unsung," Sir William Logan's death was keenly felt by thousands, and his memory would be ever green in the hearts of those who knew and loved him.

PHOSPHATE OF LIME.

FROM THE ANNUAL REPORT OF THE MINISTER
OF AGRICULTURE FOR 1884.

In my report last year especial attention was directed to the importance of the phosphate trade, and the proportions it promised to assume in the near future. Attention was called to the fact that Americans were carefully looking after property in Canada where they could obtain the raw material, and this desire on their part is being still more strongly evidenced. Canadian phosphate maintains its position in the markets abroad, and the output during the past year has been large. Some 23,000 tons of this material were shipped from Montreal in 1884, against 19,000 tons in 1883. Of this amount, the mines of Ottawa County furnished 20,353 tons, whilst the balance went from the section of country lying north of Kingston, the only two localities in which this mineral is worked. The season has proved favorable to those engaged in the phosphate trade. Prof. Boyd Dawkins, an eminent geologist, who, when out here with the British Association, visited the Ottawa County mines last autumn, stated, in a paper read by him at Manchester, on his return, that in his opinion phosphate was "one of the most important resources of Canada." The effects of this industry on the country generally, and especially those districts where its mining is carried on, are most beneficial, as the capital expended by its agency is considerable.

The use of this material as a fertilizer, when converted into superphosphate, cannot be too strongly urged on our farming population, and the advantages it offers in renewing lands worn out by perpetual cropping, in the absence of ordinary manure, the want of which is too often apparent in districts where cattle raising is not carried on, cannot be too often impressed. In those parts of Europe where the sugar beet is largely grown—Belgium and Denmark, for instance—no fertilizer has been found equal to phosphate, and the same remark might well be applied to the grain producing farms of our older Provinces. The rigid inspection to which the crude material is subjected in England tends greatly to keep up the standard of our shipments, and the high percentage of Canadian phosphate will always secure for it a foremost place and an eager demand. Prof. Dawkins, comparing the phosphate obtained from various countries, states the percentage that Canada yields out of a mean of analyses, is 87.52 of tribasic phosphate of lime.

The question has not yet been solved whether the raw material pulverized will give beneficial results to the soil by its application, and till this fact has been ascertained the crude phosphate will continue to be shipped to the place of manufacture. The establishment of works for its conversion into superphosphate, contiguous to the natural deposits, would prove of immense advantage, as the material thus converted would be far more likely to be made use of by our resident agriculturalists, and the transport of bulky phosphate would be resolved into shipment of a substance commanding a far higher price. The advantages obtained by foreign manufacturers would in that case be gained by Canada, and an industry might be added to those already existing, which would materially add to our prosperity.

From information obtained, it is expected that the output of phosphate in 1885 will be much larger than in any previous year, as great improvements have been made at the mines,

and appliances have been brought to bear by the various companies working them which will materially aid their efforts, and add largely to the products hitherto obtained by imperfect means.

It seems to me a matter of regret that no definite action has yet been taken in regard to the conversion of crude phosphate into superphosphate ready for use. If the manufacture of the prepared fertilizer was carried on in Canada, much larger returns would be obtained for the shipments of it made to Europe, and a considerable saving would occur in the cost of freight, as under the present conditions, however carefully the system of collecting the crude material is carried on, there are still quantities of foreign matter associated with it, which are valueless when separated by the manufacturer. I have ascertained that the mineral from which the acid requisite for the converting of phosphate into superphosphate could be extracted, is present in proximity to the phosphate itself, but no steps appear to have been taken towards the manufacture of this commodity, either for home use or for foreign export. I am, however, in hopes that with the attention the phosphate mines have received within the past year, both from members of the British Association who visited them, as well as from capitalists with a view to investment, and as the output of the crude material increases with the development of new mines, this important question of its conversion into a form ready at once for the use to which it is to be applied, will occupy the serious attention either of those at present engaged in phosphate mining, or of those who might make its manufacture a separate branch of industry. It is almost needless for me to add that the establishment of such works amongst us would further recommend itself as being another means for furnishing employment to the labour of our own country.

APPENDED TO THE MINISTER'S REPORT IS THAT OF THE GOVERNMENT AGENT AT LIVERPOOL, from which we extract the following:

The quantity of mineral phosphates imported this season from Canada is estimated at 20,460 tons, which is an increase of 3,000 to 4,000 tons on last year, and exceeds that of any previous year since phosphates have been exported from Canada. The quality has also improved, although much more could be done in dressing at the mines to improve it. Prices have scarcely been maintained this year, 70 per cent. having touched 9½d. per unit, ex ship at Liverpool; 75 per cent., 11d., whilst 80 per cent. has not been offering. Other imports have been pretty equal to the previous year, especially Charleston land phosphates, which have been selling ex ship delivered U.K. port at 11d. Belgian phosphates have come in pretty freely and continue to sell at very low prices, both for present and next year's delivery. Spain has not forwarded so large a quantity this year, on account of temporary suspension of some of the mines, but it is expected that the imports from that quarter will be quite up to the average next year. Prices of phosphates are considerably low, notwithstanding the increased demand, therefore a decided improvement may reasonably be expected.

The total value of Canadian mine products in 1884 was \$3,247,092, while that of 1883 reached but \$2,970,886.

Lead veins are thickest in limestone, thinner in sandstone, and thinnest in slate. The latter, however, contains the greatest percentage of silver.

MICA MINING IN CANADA.

The most important mines in operation at present are the *Pike Lake* mine, in Burgess, and the *Villeneuve* mine in the county of Ottawa. The former is becoming more and more productive, and during the past month has yielded abundantly. The crystals at the *Pike Lake* mine are, in many cases, of enormous size, numbers of them being capable of producing plates twelve inches square. From some of them even larger dimensions have been obtained. Shipments are being made monthly from the mine, and although but a small force of miners is employed, the yield is sufficient to supply a large demand and the property is being worked at a large profit.

The *Villeneuve* mine has not yet been developed to the same extent as *Pike Lake*, but a large quantity of mica of very excellent quality is being taken out. As development proceeds the crystals are found to increase in size and to be more regularly formed. Several hundred pounds of merchantable mica have already been taken out and await transportation. The output is increasing daily, and the product of this mine will be sufficient to supply a fair portion of the demand for Canadian consumption.

These two mines are being steadily worked under the management of practical men, and shipments of mica, cut and ready for the market, will be made each month hereafter.

GOLD MINING IN BEAUCE.

During the past year there has been a marked revival of interest in the alluvial gold deposits in the Beauce district, and quartz mining has started up with encouraging results, both quartz and alluvial mining promising to become permanent and very remunerative industries. The annual report of the Commissioner of Crown Lands for the Province of Quebec, for 1884, embraces the report of the Inspector of Mines for this district, which contains interesting information regarding the operations of the several companies and individuals engaged in gold mining in the various localities in the Beauce district. The inspector reports that although the year 1884 has not witnessed any great revival of the mining industry in the Beauce gold region, those who have continued their operations have been much encouraged by the results obtained in the alluvial mines, while those who have begun the opening up of quartz veins have found immense beds containing both gold and silver in paying quantities.

The Canada Gold Company, for instance, spent the greater part of the season in sinking nine trial shafts in as many different veins of quartz, and with the knowledge so acquired can now proceed intelligently in the development of their immense property. The fact of their acting with so much precaution should not be regretted, for although the working of the mines in this part of Rigaud Vaudreuil has thereby been retarded for a year, it may prove to have been in the interest of the province as well as in that of the company. For if work had been begun without previous examination upon any quartz vein whatever and the result had proved unfavourable what a bad effect it would have had upon the character of their valley as a gold-bearing district!

Messrs. Fenton and Dupuy also devoted the whole of the summer and part of the autumn to prospecting operations in the upper quartz region, and say that they found some very rich veins in the high lands of the township of Cranbourne.

Captain Richards continued throughout the season to work upon his alluvial claim in the St. Charles concession of Rigaud Vandreuil, and was preparing to begin operations in January upon the quartz lode known as the Loubier vein in the first range of St. Francis. A specimen of the quartz from this vein sent to New York yielded, according to the official report of Mr. Michel, at the rate of \$15 in gold and \$22 in silver to the ton; and upon another assay by Mr. Calvin appeared to contain \$106 worth of gold per ton.

Several companies of miners had also been washing on the Gilbert last year; among others, McRae & Co., O. Dion, C. Corpal & Co., H. Powers & Co., and if they have not made fortunes, which would have been surprising with the means employed, they at least had many excellent days.

Messrs. McArthur Brothers, who for a long time worked with success upon the old St. Onge claim in the same St. Charles concession, but had suspended operations during the progress of the suit respecting mining rights, have passed a lease with the proprietors and will soon be at work again.

At the River des Plantes the "Canadian Co." did a large amount of work last summer, and are excavating a tunnel and drain which will enable them to reach and work the bed of auriferous gravel so deeply buried under the steep banks of this river, which flows entirely over rocks of the lower Silurian strata about a mile north of the limit of the upper Silurian formation, where the Gilbert has its course.

At St. George, Messrs. Allan & Humphrey, having acquired the property of Messrs. St. Onge & Brothers, had the misfortune to lose their third shaft, which, at a depth of 154 feet, had just reached the surface of the gravel. This loss is attributed to two thick beds of very fine sand through which the shaft passed. They have gone to work again upon a new system, and having already overcome all difficulty, expect to reach their goal within a short time. The new shaft is only a few feet distant from the old one, so there is no doubt it will strike the same bed of gravel, a single pan of which taken from its surface, on the very day the old shaft was abandoned, yielded thirty-six particles of gold.

About twenty miles from the last-mentioned workings is situated the famous Armstrong mine in the valley of the River du Loup. Assays of specimens from this mine made at Quebec, in France and the United States attribute to the mineral an enormous value both in gold and silver, some of them yielding at the rate of over seven hundred dollars a ton. Pieces of quartz taken from the vein contain gold visible to the naked eye. Prospecting operations were resumed at this mine in November last under the direction of Mr. J. Fraser Torrance, a competent mining engineer, on account of a Canadian capitalist whose purse is always open for the assistance of enterprises of a sensible and patriotic character.

ASBESTOS MINING IN CANADA

This industry is carried on to a large extent in the townships of Coleraine, Thetford and Broughton, in the county of Megantic. Asbestos was originally discovered in 1877, in the township of Ireland, and the first workings were begun in the following year by Messrs. Johnston and Irvine, in Thetford. This branch of mining has advanced since then with giant strides, and between May and November of last year over 1,200 tons of asbestos were taken out of the seven mines in operation in Thetford and Coleraine alone. An eighth mine, in the

seventh range of Broughton, was also successfully worked and disposed of at a high price; while yet another was opened late in the fall in the sixth range.

As many as five hundred men were employed during last summer in these different mines.

The Government Inspector of Mines for the district reports that the mines or quarries appear to be inexhaustible; that they can give employment to thousands of workmen, that they can be worked with small capital; and that they have hitherto paid at the rate of a hundred per cent.; also, that the market cannot be overstocked as the supply is not equal to the demand from England, France, Germany, Italy and the United States. The ruling price obtained for the output of these mines last year was \$80 per ton. New uses for asbestos are being found every day, and Mr. Montpetit, in his excellent pamphlet, "*L'amiante c'est le million*," mentions the following: cloth, cordage, thread, packing for steam engines, paint, paper, pasteboard; it is used, he says, for lining crucibles, blast-furnaces and safes. In addition to this long list, it may be stated that for joints in water-pipes, or covering hot air conductors, it has no equal; that it renders buildings comparatively fire-proof when woven into sheets only one twenty-fourth of an inch in thickness and spread over the floors and stretched on the partitions like paper-hangings;—that it would render similar service in theatres, and that a fireman, completely clad in asbestos, with openings for the eyes protected by mica, might defy the flames.

This industry in the Eastern Townships has become one of much importance and the extent of the deposits renders it susceptible of increasing into one of great magnitude. It is expected that the output of the approaching season will be greatly in excess of that of any former year and the mineral has gained a world wide reputation for its excellent quality as compared with that mined in any other part of the world.

GYPSUM IN CANADA.

It may not be generally known how largely this useful mineral is developed in various regions in the Dominion and Newfoundland. In the latter province it forms high banks at Great Codroy Harbor, near Cape Ray, and at several places on the shore of St. George's Bay, some of it being of a white color, suitable for making stucco. In Cape Breton it is found all around the shores of Bras d'Or Lake, and on the outer shores at Lennox Passage, as well as along the Strait of Canso in the southern part of the island. In the same island it is abundant on the Gulf of St. Lawrence side, at St. Ann's Harbor, Mabou, Margaree and other places. Heretofore it has been shipped principally from Plaster Mines on Bras d'Or Lake, Baddeck, Lennox Passage and St. Ann's Harbor, but formerly large quantities were sent from Mabou. Great quantities of gypsum occur on the mainland of Nova Scotia near the Minas Basin, and it is largely shipped from the Port of Windsor. Large deposits are also found in the eastern part of New Brunswick, the principal shipping point being Hillsborough, on the Peticodiac River. The mineral is common on the Magdalen Islands, which belong to the County of Gaspé, but it is mostly of a gray color. In all these localities in the Lower Provinces the gypsum occurs in strata belonging to the Lower Carboniferous series. Comparatively small deposits of gypsum are met with along the Grand River, in Ontario, in the Onondaga formation. Being in an agricultural region, where it is in demand for land plaster, it has

been mined more or less at Paris, York, Caledonia, Cayuga, Oneida, Mount Healy, &c. Much of it is white enough to be calcined for stucco, &c. Beds of gypsum have been found in boring for salt in the Kincardine and Goderich regions, where it occurs in the Onondaga formation also, but which is there overlaid by the Corniferous. Gypsum may be struck in borings anywhere in Ontario south-westward of a line drawn from the mouth of the Grand River, on Lake Erie, to the mouth of the Saugeen River, on Lake Huron.

To the north of the Great Lakes, gypsum is found in considerable quantities, at the White Banks on the Moose River; and it is reported to occur near the shore of James' Bay, between Moose Factory and Fort Albany. Traces of the mineral have been found near the south-west side of Lake Nipigon.

In the North-West Territories small quantities have been discovered in the Riding Mountains, and nodules and crystals may be found in the Cretaceous clays and marls in almost any locality throughout the North-West where these crop out. Ignorant people mistake the clear laminated crystals of selenite for white mica, and many a sensational story of mica discoveries has thus arisen.

At Peace Point on the north side of the Lower Peace River about 60 miles W.N.W. of Fort Chipewyan, on Athabasca Lake, the cliffs are about half composed of gypsum. Loose specimens of the mineral have also been picked up at the falls of Peace River, about 160 miles from its mouth.

Gypsum is also reported to be abundant just west of the great natural salt deposits of Salt River, on the west side of Slave River, about half way from Athabasca Lake to Great Slave Lake.

PETROLEUM.

INDICATIONS OF ITS EXISTENCE IN THE PROVINCE OF QUEBEC DESCRIBED BY MR. J. OBALSKI, GOVERNMENT MINING ENGINEER, IN HIS REPORT TO THE COMMISSIONER OF CROWN LANDS.

Mr. Obalski in referring to these very important indications says:

In my study of the mineral products of the Province of Quebec, I have had occasion to remark a fact which appears to me of great importance. In the district about Three Rivers, that is, in the south part of the counties of Champlain, St. Maurice, Maskinongé, Berthier, Joliette, &c., some very considerable emanations of combustible gas have been noticed ever since the country has been inhabited. The places where these have been known to occur are St. Maurice, Pointe du Lac, Louiseville, St. Léon, Epiphanie, St. Paul, l'Hermite, St. Henri de Masconche, &c., and on the south shore, St. Gregoire, county of Nicolet.

This gas has certainly some origin, which should be found in the petroliferous deposits existing in the subsoil. The country has been inhabited for over a hundred years, and it may be reasonably supposed that the same effects were produced long before. Dr. Dancé, of Louiseville, has collected at a single point, which he calls the St. Peter well, as much as 8,000 cubic feet in twenty-four hours; and the same may be done at a number of points within a comparatively small space. It therefore seems to be rational to suppose that there exist large quantities of petroleum from which this gas is continually being formed, if there are not immense accumulations of gas of undiscoverable

origin, unless, indeed, it arises from solid matter.

These facts acquire greater importance when it is considered that on the whole of the north shore of the St. Lawrence between Québec and Montreal, there exists a rocky formation called the Trenton limestone, and that wherever that limestone appears at the surface, as the *Pointe aux Trembles*, River à La Rose, Chateau Richer, &c., the cavities in it are seen to be filled with small quantities of veritable petroleum: that bituminous schists are found at River à La Rose, and other points; and finally that at certain points in a lower formation we find thin veins of a substance resembling anthracite, as at the Island of Orleans, Levis, St. Appolinaire, &c.

All these facts taken together tend to prove the existence in this region of substances whose base is carbon. Besides, the official geologists of the Federal government recognized the possibility, and even the probability of the existence of petroleum in this formation. Dr. Sterry Hunt, in his report for 1866, page 262, says: "The limestones of this formation may in some localities prove to be valuable sources of petroleum."

Sir W. Logan, in the *Geology of Canada*, 1863, page 136, says "the possibility of its occurrence in available quantities in some parts of the Trenton formation should not be lost sight of."

Considerable quantities of it have been found in the same formation in the Manitoulin Islands, province of Ontario.

It has been proved by investigation that petroleum can be found in considerable quantities only where the subterranean strata have been so folded or disposed as to form pockets or cavities in which it might accumulate. The incomplete study of the country yet made has not established the occurrence of such foldings in the strata, but in my opinion they may be presumed from the nature of the surface indications; and I consider that it would be highly advisable to have some borings made so as to discover the origin of the gaseous emanations above mentioned. It is possible that a cavity might be struck at the first attempt, but in any case it would be necessary to sink a certain number of trial wells, and a company spending about \$10,000 in this work would, I think, arrive at some definite result.

Attention is directed to another locality where Mr. Obalski observed strong evidences of the petroleum and on which he reports as follows:

Throughout the whole of the region comprised between *St. Paul l'Hermite*, *l'Epiphanie* and *St. Henri de Mascouche*, emanations of combustible gas have long been known to occur, often rising from the ground in the company of salt springs. These emanations are similar to those which I have mentioned on several previous occasions, and arise from the same source; that is to say, I believe they are all due to the presence of bodies of petroleum in the subterranean limestone. The conformation of the land and other indications are the same as those at the places previously examined.

At the place called *Cabane Ronde*, on the land No. 3 of the cadastre of St. Henri de Mascouche, Messrs. Renaud Brothers and Dubois, began a boring of three inches in diameter. They traversed a bed fifty-four feet thick of blue, yellow and red clay, then sixteen feet of black sand and coarse gravel, and finally struck the schist rock at a depth of seventy feet. During the whole of the time the work was going on the escape of gas was regular and abundant. Operations were begun in the autumn of 1883, and resumed in the spring of this year. A remarkable circumstance, worthy of being recorded, then occurred. At the beginning of

June, on inserting the drill, the workmen met with a resistance which the efforts of four men were unable to overcome, and withdrew the instrument, upon which a violent gush of matter from the opening took place. For forty-eight hours, as I was told by the witnesses of the scene, a column of liquid, gas and stones could be seen issuing to a height of over fifty feet. The gas was of the same character as that previously reported on; the water very salt; and the stones, some of which were half the size of a man's fist, were composed of quartzites, limestones, black bituminous schists, various kinds of granite, &c., and generally in the shape of rounded pebbles. I was further informed that at the beginning of the discharge, a score or so of oily drops of petroleum were observed to fall, but were not gathered, as it was hoped that a larger quantity would be forthcoming. The boring has since been continued, but more slowly on account of the hardness of the rock.

These facts are all very important and merit serious consideration, in connection, however, with my previous reports.

I encouraged the enterprising prospectors to persevere, and it is to be hoped that they will be able to continue their labor in boring to a greater depth, and ultimately see it crowned by a discovery which will be of the greatest importance to the country if a vein of petroleum be struck, as there is reason to expect will be the case.

The Mines North of Lake Superior.

There seems to be no doubt that Port Arthur is preparing for a mining boom on the opening of navigation. The reports coming from the working mines and recent discoveries in the new silver region, south and west of the township of Paipoonge, are certainly very encouraging. Several mines in that part of the country are in actual operation and producing some marvellously rich ore. Those adjacent to the township in the Rabbit mountain district have a large production considering the time they have been at work, and the difficulties they have had to contend with in the absence of a bridge across the Kaministiquia river and a proper wagon road. It is expected that these difficulties will be removed in the spring. If they are, the extensive working of the mines is assured, and access will also be given to a good agricultural and timber district as well. The Thunder Bay *Sentinel* points out that the construction of a proper wagon road and the Thunder Bay Colonization railway are much needed for the proper development of the country. The same newspaper in a recent issue refers to an examination which has just been made of the Silver mountain mine by three mining experts from Chicago. It is said that in the presence of these gentlemen a single blast put in a test pit upturned over \$6,000 worth of silver ore from less than a ton of the veinstone. Such ore is almost unprecedented and if the development continues as it has begun there is little doubt that the owners will receive the extraordinary prize of \$200,000 for which it is said the property has been bonded.

Log cabins are being erected on several localities in the neighborhood of these rich discoveries, teams are taking in supplies over the winter road before it becomes impossible, and preparations are being made for active development work in this region as soon as the snow goes off, on an extensive scale. The discoveries are not confined to any particular section of the new mining field, but they extend from the Kaministiquia and Slate rivers, where veins crossing them in the township of Paipoonge have been

found carrying silver, south to the international boundary and westward along it, a distance of over 40 miles. To the northwest of this silver region the gold formation adjoins that of the silver-bearing slates, and at various points valuable discoveries have been made.

Mines are at work on both sides of Pigeon river, the international boundary between the State of Minnesota and the Province of Ontario. On the Canadian side the Huronian Company has a very rich mine and a ten-stamp mill.

On this side of the boundary the gold is found in true fissure veins in the green slates of Huronian formation. The yield per ton is not claimed to be enormous but the gold is evenly disseminated in paying quantity throughout the veinstone and the veins are wide enough to admit of very large production. At the Huronian mine the vein measures from six to twelve feet wide and has been traced for a distance of half a mile on the company's property. Such properties are eminently suitable for companies with large capital.

In the silver district the Rabbit mountain, Twin City and Beaver mines have been worked all winter. The two former have made shipments of smelting ore and have a large amount of stamp rock on their dumps. The Twin City is ready to make another shipment of the same class of ore. Throughout this district the silver occurs in the black slates of Cambrian age.

Numerous discoveries of different kinds of minerals have been made on the north shore east of Port Arthur. Notably a zinc-blende deposit northeast of Neepigon bay, which will probably be worked extensively during the coming summer.

This whole mining country would be served with railway facilities by the construction of the Thunder Bay Colonization railway to connect with the Grand Maine and Vermillion Lake railway, and the Duluth and Iron Range railway, now in operation from the iron mines to the Lake Shore, and to be completed this year to Duluth, to connect there with the American system of railways.

The outlook of the mining industry in the district of Thunder Bay was never better than at present, and it should be encouraged in every legitimate way. Stock-gambling has now no foothold in the country, but practical men are becoming interested in the development of the mine. Let the work continue as it has begun and the value of this promising mining field will soon be established beyond any doubt.

CORRESPONDENCE.

PORT ARTHUR, Thunder Bay.
To the Editor CANADIAN MINING REVIEW,
Ottawa.

SIR,

I wish to correct a few statements which appeared about me in No. 1. Vol. 3., February, 1885, of your paper—for which, however, I suppose you are not responsible.

It is true that I examined and reported on the Beaver mine (in this district), but was not aware until to-day that this report had become public.

In the first place, the five samples of ore referred to by me were distinctly stated in my report not to represent the average of the vein, but to be average specimens of the different kinds of silver ore occurring in it. I presume that I could have secured specimens showing no silver, as I certainly could have secured specimens far richer than the richest that I assayed.

Next, the outcrop specimens assayed six dollars and sixty cents, which is slightly different from the \$660 that you have it.

Also, though \$995.75 certainly is the average of the results of these five assays, as I find on computation, still this fact was not mentioned by me—it is certainly misleading and has no value at all. Altogether, it seems to me to be an impossibility to obtain an average of a vein in five specimens.

Re the Rabbit Mountain mine, my report states that silver ore was showing in the drift and cross cut. I did not state that any of it was being extracted.

Yours, etc.,
W. H. FURLONGE.

March 23rd, 1885.

We regret that Mr. Furlonge should have been misrepresented in our notes on the Lake Superior mines, published in the last issue of REVIEW. These reports came to us, precisely as published, from an occasional correspondent of Port Arthur, and although we had misgivings as to the accuracy of the figures they contained, time did not admit of our waiting for their verification. We are indebted to Mr. Furlonge for his promptness in correcting these errors.—ED.

British Columbia Notes.

Mr. Baillie-Grohman has contributed an interesting paper to the *Canadian Gazette*, descriptive of the resources of Kootenay.

A petition addressed to the Lieutenant-Governor has been circulated in Barkerville for signatures praying that the geological surveyor employed in the province by the Dominion Government be requested to survey the district of Cariboo. There is a great deal of money and much energy expended annually in prospecting, and as very little is known regarding the extent of the gold-bearing belt, both money and energy are liable to be wasted in the absence of a geological survey.

The output of the several Nanaimo and Wellington Collieries for the year 1884 amounted to 395,900 tons, 87,388 tons of which was used in this province, and 308,512 was exported to the Pacific Coast States and Sandwich Islands and China. In 1883 the total output amounted to 216,184, and in 1882, the largest output of any year before 1884, it amounted to 282,000. In 1883 the home consumption was 64,786 tons, and in 1882, 56,161 tons as compared with 87,388 tons in 1884. The total output of 1884 is 179,184 in excess of 1883 and 113,900 tons in excess of 1882. To mine this 395,900 tons of coal it is estimated that 300,000 pounds of blasting powder was used. The material increase during 1884 was caused by the Vancouver Coal company energetically working their new mines on the Esplanade and at South Field. It is to be hoped that the year 1885 will show a material increase over 1884.

A meeting of miners was held in Victoria early in February with Mr. P. Smith chairman and Mr. R. Smith secretary. The following resolutions were adopted unanimously by the meeting: 1. That, owing to the insolvent conduct and threats of the Indians on Lorne creek last season, this meeting is of the opinion that the Government should take immediate action with regard to the protection of the life and property of miners situated in the aforesaid locality. 2. That this meeting deprecates the action of the Dominion Government in commuting the sentence of death passed on the murderer of Yoemans, as it will be the means

of inciting and encouraging the Indians to commit more murders and depredations. 3. That the protection of miners and their interests is urgently demanded, and if neglected by those who are in authority over them they alone must be responsible for the consequences of inaction and apparent partiality.

The mineral exhibits for the International and Colonial Exhibition at Antwerp, forwarded from the Province of British Columbia, are as follows:

Three blocks coal from Vancouver Coal Company mine, Nanaimo—4 cwt., 2 cwt., and 1 cwt.—to form a pyramid.

A block of Jarvis Inlet granite, Newcastle sandstone, and Beaver Cove Marble, to form another pyramid.

Specimen of Queen Charlotte anthracite.

Blocks of iron ore, magnetic and red hematite from Sooke.

Piece of Eureka mine silver ore from Hope.

Another piece from the Sterling mine, Cowichan.

Specimens of Jarvis Inlet copper.

Specimens of argentiferous galena from Kootenay.

Five specimens of Cariboo quartz from Burns' Mountain, supplied by Messrs. Oppenheimer Bros., of this city, and valued at \$250.

Petroleum in the North-West Territories.

The discovery of Petroleum in the Athabasca and Alberta districts is attracting a good deal of attention at the present time, and it is not unlikely that boring will be begun in the early spring. A strong company of capitalists of Minneapolis has been organized under the laws of the State of Minnesota, with a capital stock of \$1,500,000, to operate on the Lesser Slave and Red Deer rivers, where they have taken up extensive tracts of petroleum lands. This company, known as the Winnipeg and North-west Petroleum Company, have abiding faith in the value of the locations they have selected, and have given substantial evidence of it by shipping two car-loads of machinery, at a cost of over \$50,000, to Winnipeg to be forwarded to Sinclair on the line of the Canadian Pacific railway, and thence to their property on the Red Deer river, Alberta district.

It is stated that on this company's locations exist, probably, the most promising indications ever known where oil wells are not in actual operation. The crude petroleum exudes from the bank for a distance of half a mile and flows down the river, while similar indications are noticeable on the banks of the smaller streams, tributaries to the Lesser Slave and Red Deer, running through the companies locations. Petroleum gum and pools of oil on the surface of the ground occur in such quantity and of such a nature as to satisfy experts that extensive reservoirs of oil will be tapped by boring, and that flowing wells will unquestionably be struck. These locations have long been known by the North-west explorers as the "gum beds." The company is sanguine that oil will be obtained in paying quantities not far below the surface and at comparatively small expense.

Analyses of the gum taken from these petroleum fields have been made by Professor Chapman, of Toronto; Professor James A. Dodge, of the University of Minnesota; and by Ledoux and Richetts, of New York.

PROFESSOR CHAPMAN.

	Per cent.
Inflammable and volatile matter.....	94.53
Fixed carbon and ash.....	5.47
	100.00

PROFESSOR DODGE.

Volatile combustible matter.....	76.27
Coke.....	16.42
Ash.....	7.31

100.00

LEDoux AND RICHETTS.

Water.....	1.00
Oil.....	65.00
Coke.....	20.00
Light oil and Volatile matter.....	14.00

100.00

Professor Dodge gives the analysis of the oil as follows:—

	Per cent.
Water.....	54.8
Inflammable oil.....	26.2
Inflammable gasses.....	2.2
Non-volatile combustible matter.....	2.9
Incombustible matter, or ash.....	13.9

100.00

The developing of these oil fields will be watched with much interest, and if the expectations of the Winnipeg and North-west Petroleum Company are but partially realized this will become a most important industry in the North-west Territories. People having the enterprise to inaugurate an industry of such importance to the country should receive every encouragement at the hands of the Government, and it would not be more than should be reasonably expected if the machinery necessary to operate these oil fields were admitted into the country free of duty, or at least such of it as is not obtainable in Canada. In the case of the ranchers in the North-west they have been, and still are, permitted to bring their cattle in from the United States to stock their ranches, and if they are to be thus encouraged why should not the miners be dealt with as liberally, especially those who would develop such important deposits as those of coal and petroleum?

The Victoria (Australia) Gold Product.

As reported by a correspondent of the *London Mining Journal* of the 28th February, while the gold product of 1883 was 133,108 ounces less than 1882 that of 1884 was 33,957 ounces greater than 1883. According to the aforesaid correspondent, the product for the five years below was as follows:

	Ounces.	Our valuation.
1880.....	812,092	15,500,000
1881.....	886,416	16,840,000
1882.....	879,481	16,710,000
1883.....	740,378	14,067,000
1884.....	774,330	14,712,000

Total product 1880-84.....\$77,839,000
Yearly average.....\$15,567,800

That is, the product of 1883 was below the average of the period \$1,500,800 but that of 1884 was below the average but \$855,800. For the two years of 1883 and 1884 the gold exports and coinage of the colony were as understated:

	1883, ounces.	1884, ounces.
Minted.....	399,186	562,708
Exported.....	393,443	189,866
Exported coin.....	\$11,256,000	\$6,246,000

It may be safely estimated that the product of all the other gold fields of Australia did not exceed \$9,778,000 in 1884, and that the total gold product of all the Australian colonies did not exceed \$21,500,000.—*N. Y. Mining Record*.

The most disastrous colliery explosion of recent times occurred during the present month at the Camphansen pit, near Saarbrück, in Rhenish Prussia. Out of 218 men in the pit only seventeen escaped—the remaining 201 are supposed to have perished.

GOLD MINING IN CALIFORNIA.

We are indebted to Mr. W. Van Norden, President of the Plymouth Consolidated Gold Mining Company, for a copy of the annual report of the company's operations from the time of its organization up to the close of 1884. The report is convincing evidence of what can be done with a good property under careful and proper management. This company was organized June 1st, 1883, by the consolidation of the *Empire*, the *Amador Pacific* and the *Plymouth* companies, since which time the production of bullion, up to January 1st, 1885, amounted to \$1,714,008.65. The report shows that during the period mentioned (19 months) the operating expenses were \$541,158.75, and that \$148,554.85 had been distributed on construction account. Up to the close of 1884 dividends had been paid aggregating \$950,000, leaving cash on hand on January 1st, 1885, \$74,295.06. Since the report was published the company has paid \$150,000 in dividends, making a total of \$1,100,000 paid in dividends in somewhat less than two years.

The property of the company is located in the town of Plymouth, Amador county, California. The principal mine consists of an immense chimney of ribbon quartz from thirty to fifty feet wide and 315 to 450 feet long. The ore mills freely and contains one to two per cent. of sulphurets; the average yield of gold being thirteen dollars to the ton. There are two mills on the property, located about 1,000 feet apart, having an aggregate of 120 stamps, one with eighty and the other forty, the latter being the heavier, weighing 900 lbs. each. Both mills are crushing about 250 tons of rock daily; they were run with regularity during the past year and crushed in the aggregate about 80,000 tons of ore. Connected with the mills are forty Frue concentrators for saving sulphurets. The company has recently constructed chlorination works, and every department is conducted with economy and exactness, which accounts, in a great measure, for the marked success attending the operations at this mine.

A New and Remarkable Gold Deposit.

Through the courtesy of Mr. John Musson, of Sydney, New South Wales, we have received the report of Mr. R. L. Jack, of the Queensland Geological Survey, on the Mount Morgan gold deposit.

Mount Morgan is only twenty-two miles from Rockhampton, on the Fitzroy river, and not more than half that distance from the Central railroad. It is an isolated cone, rising from the plain through which runs the river Dee, the plain being flanked east and west by bluffs of Mesozoic sandstone, out of which the valley has evidently been carved down to the level of the primitive stratified rocks that now form its floor. These old shales and quartzites are riven by dikes of rhyolite; and through them have evidently come to the surface geyser springs, the deposit from which has formed the cone of Mount Morgan. The water has, besides gold, carried in solution silica, iron, alumina, etc. But the gold seems to have been precipitated chiefly in the cup of the geyser, and to be richest in a large mass of iron ore, which, in the form of an inverted cone, forms the vertical axis of the mountain, and in the nodules of iron ore that occur in certain soft cellular siliceous layers. These alternate with more or less ferruginous layers, all of which radiate, like the leaves of a fan, from the base of the cone, and inclose the iron ore. Gold occurs in all the layers, except

in a siliceous earth, and therefore its association with iron is certainly not accidental.

Mining is conducted by quarrying down the apex of the cone, and from an open cut 100 feet below the summit. The yield of the rock is almost fabulous. Working returns are not given; but fair samples selected by Mr. Jack gave from a quarter of an ounce to 10 ounces per ton, and others sent to the Sydney mint to be experimented on gave 85 ounces per ton. Some of the rock in these samples was selected.

Prolonged amalgamation extracts only about half the gold; but during the few months the mine was worked, prior to the publication of the memoir, the Sydney mint had received 10,000 ounces. It differed from any other gold known to commerce in that it was unalloyed with silver, assaying 99.7 per cent. of pure gold, the 0.3 per cent. being copper and iron.

A few more such mines would relieve the financial world of the apprehension it seems to be labouring under of a scarcity of gold.

It is worthy of note that the report was mailed in Sydney on January 28th, and received here on February 28th.

As might be expected, the wildest estimates of the value of this gold deposit or hill are circulating. One that we have seen gives it at about \$135,000,000.—*Engineering and Mining Journal*, N. Y.

GOLD NOTES.

The gold product of the Province of Nova Scotia from 1862 to the close of 1884 has aggregated 366,995 ounces.

The value of the gold production of the Province of British Columbia from 1858 up to the close of 1884 amounts to \$48,626,963.

Since the discovery of gold in California in 1848 up to the present time the production of that State and of Australia has been as follows: California, 1848-1884, 37 years..... \$1,200,000,000 Australia, 1851-1884, 34 years..... 1,350,000,000

In February, 1851, gold was discovered on the Macquarie River, New South Wales. This led to the working of the vast gold fields of Australia. The maximum was reached in 1852 when the Australian placers yielded \$102,000,000.

In sinking an artesian well at Savannah, clay was struck at a depth of 140 feet that yielded a large percentage of gold. Fine specimens of crystal quartz are brought up daily. A large lump of ore was found about the size of a hens' egg and containing fully 75 per cent. of silver.

Estimated stock of gold coin in the world at the time of the discovery of America in the year 1492..... \$ 140,000,000 Gold production of the world, 1493 to 1600 520,000,000 " " " 1601 to 1700 628,600,000 " " " 1701 to 1800 1,308,800,000 " " " 1801 to 1850 816,200,000 " " " 1851 to 1883 4,158,330,000 Total since discovery of America..... \$7,571,930,000 Estimated stock of gold in the world at the present time..... \$3,750,000,000

The El Callao Mine, of Venezuela, during 1884, shipped gold bullion to Barring Bros & Co., London, to the value of \$3,475,000, out of which the share-owners received in dividends \$56 per share of their holdings, aggregating \$1,800,000. In January, 1885, this famous mine produced 8,532½ ounces of gold and paid

a dividend of \$3.33½ per share, aggregating \$107,333. In January, 1884, 12,941 ounces of gold were shipped from this mine valued at \$233,000.

On the 19th of January, 1848, James W. Marshall, while engaged in digging a race for Sutter's sawmill, at Colonia, on the American fork of the Sacramento River, found some pieces of yellow metal which he supposed to be gold. This was the first installment of over twelve hundred millions of dollars which the placers and quartz mines of California have yielded to the world. The production reached its maximum in 1853, when \$65,000,000 was produced from placer mining.

Miscellaneous Notes.

Utah's mineral product in 1884 was \$7,389,836.

The State of Nevada produced \$7,000,000 of gold and silver in 1884.

The Russian platinum mines are said to be the most valuable mines in the world.

The Comstock mines, of Nevada, produced \$180,000,000 of silver and \$145,000,000 of gold in 20 years.

It is estimated that the gold product of Queensland during the past ten years has reached \$75,000,000.

The estimated amount of anthracite coal remaining in the fields of Pennsylvania is 23,300,000,000 tons.

For the fiscal year ending June 30, 1884, the export of precious metals from Mexico amounted to \$33,473,283 in value.

The official return of the exportation of rough and uncut diamonds exported from the Kimberly division of the Cape of Good Hope during November, 1884, states that their weight in carats was 212,098½, and their declared value £246,845.

ASSESSMENT DIRECTORY.

(N. Y. Mining Record.)

This table is prepared from the official advertisements published by the organ of the San Francisco Stock Exchange.

[Stocks are sold in New York with assessments paid fifteen days anterior to the date of delinquency at office of the Company, as given in the table below.]

(adjoining Canadian Mining Review Office.)
ALEX. F. MCINTYRE. TRAVERS LEWIS.

ERNEST GAUJOT,
MINING AND MECHANICAL ENGINEER,
And Expert in Milling and Smelting.

Will examine and report on Developed Mines and Mineral Lands.

Address:

Belleville, Ont., or Buckingham, P.Q.

J. F. McANDREW.

Expert in Gold, Silver, Copper, Iron Plumbago and Phosphate Mining.

ORES ANALYSED.

Mineral Lands examined and reported on.

ADDRESS:

Buckingham, Province of Quebec.

JAS. H. REIFFENSTEIN,
SURVEYOR
FOR PROVINCES OF ONTARIO AND QUEBEC
ALSO FOR DOMINION LANDS.

Residence, No. 128 Crichton St. New Edinburgh; Post Office, Ottawa, or New Edinburgh.

A YOUNG CHEMIST, graduate of Germany, who speaks German, English and French, and who has worked at furnaces and steel works in Belgium and England for several years, desires a similar position in this country. The highest recommendations given. Address, Felix Becker, Arlow, Belgium, Europe.

**THE LIEVRES RIVER
LAND & PHOSPHATE CO.**
(LIMITED),

Offers FOR SALE some of the best located and most promising

PHOSPHATE LANDS

In the Townships of

BUCKINGHAM, TEMPLETON, PORTLAND
EAST AND PORTLAND WEST.

Phosphate Bought and Sold.

Advances made on Phosphate to be shipped and Sold abroad on Commission.

Address: **ROBT. C. ADAMS,**
PRESIDENT,
41 ST. FRANCOIS XAVIER ST.,
MONTREAL.

TIMBER LIMIT
ON LAKE WINNIPEG
FOR SALE.

50 Square Miles.

This limit will be very valuable. Apply at the office of the MINING REVIEW for price and particulars.

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and outcroppings of fine quality of Graphite. Further particulars to be had at the office of the MINING REVIEW.

FOR SALE.

ASBESTOS MINES

—OWN IN THREE—

Township of Coleraine, P.Q.

One Mile and a Half from Black Lake Station, Quebec Central Railway. Address

JAMES REED,

Inverness, Megantic, P.Q.

**PHOSPHATE PROPERTIES
FOR SALE**

IN THE TOWNSHIP OF WAKEFIELD.

Mining Rights on S $\frac{1}{2}$ of Lot No. 16, in the 1st Range.
" " on Lot No. 23, in the 2nd Range.
" " " No. 26, in the 4th Range.
" " " No. 20, in the 5th Range.

The fee simple of Lots Nos. 22 and 23, in the 4th range, (400 acres). All these lots have been carefully explored by experts and very favourably reported on; they are virgin properties and in the heart of the Phosphate Belt. For further particulars and price apply at the office of the MINING REVIEW.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the 3rd range. Some excellent surface shows have been uncovered on these lots and only require capital for developing. Price and particulars given at the office of the MINING REVIEW.

MINERS WANTED.

50 Good Miners Wanted. 50

Wages, \$1.25 per day; regular board, \$3.00 per week.

For further particulars apply to

A. H. DeCAMP,
Supt. Oxford Gold Mines,
Musquodoboit Harbor,
NOVA SCOTIA.

WANTED.

FIFTY EXPERIENCED MINERS.
Wages, \$1.25 to \$1.35 per day; board, 3.00 per week.

For further particulars apply to

M. R. DISOSWAY,
Supt. Essex Gold Mining Company,
TANGIER,
NOVA SCOTIA.

**FOR SALE.
DEVELOPED
PHOSPHATE MINE**

ADJOINING THE FAMOUS LITTLE RAPIDS MINE IN PORTLAND EAST.

THIS location has been pronounced by experienced practical miners one of the most promising apatite producing properties in the district. There are over TWENTY SURFACE EXPOSURES OF GOOD PROMISE, and one deposit now being worked that proves an extensive body of phosphate AT A DEPTH OF FIFTY FEET.

Price reasonable and satisfactory reasons given for selling.

Full particulars obtainable at this office.

**FOR SALE,
White Marble Quarry on Calumet Island.**

At this quarry there is an inexhaustible supply of most beautiful white marble. Samples to be seen and information obtained at the office of the MINING REVIEW.

MINES AND MINERALS.

**Developed and Undeveloped Mines and Minerals of Commercial Value
BOUGHT AND SOLD.**

PROPERTIES EXAMINED AND ANALYSES MADE OF ORE OF EVERY DESCRIPTION.

A Competent Expert is permanently engaged for the purpose of making Unprejudiced Reports on all Mines placed in our hands for Sale, such reports being at all times open to intending purchasers for examination.

**Phosphate, Iron, Iron Pyrites, Copper, Asbestos, Mica, Plumbago,
Gold and Silver Mines, and Marble and Sand-
stone Quarries, For Sale.**

MINERAL LANDS EXAMINED AND REPORTED ON BY OUR EXPERT; ALSO, ANALYSES OF MINERALS OF EVERY DESCRIPTION MADE BY A COMPETENT ASSAYIST.

**Correspondence with Owners of Mines and Capitalists desirous of
investing is most respectfully solicited.**

FARREL FOUNDRY & MACHINE CO.,

SOLE MANUFACTURERS,

ANSONIA, CONN., U.S.A.**PHOSPHATE LANDS
FOR SALE.**

The Laurentian Phosphate Mining Company offers for sale upon advantageous terms the mining rights upon the whole or part of their valuable phosphate lands in the Township of Templeton, containing in all 1,300 acres.

Part of the property has been developed and proved to be unsurpassed in richness.

Most favorable reports by the late Henry G. Vennor, F.G.S., and other experts, may be seen upon application to the undersigned.

The principal shareholders now residing abroad, is the reason for wishing to realize and close up the business of the company.

To parties purchasing the whole of the company's interest, their Letters Patent would be transferred, thus enabling the purchasers to carry on the business as a company without loss of time or further expense.

For further particulars apply to

J. M. BROWNING,
99 St. James street, Montreal.

**MAIL CONTRACT.**

SEALED TENDERS addressed to the Postmaster-General, will be received at Ottawa, until noon, on Friday, 15th May, 1885, for the conveyance of Her Majesty's Mails, on a proposed contract for four years, six times per week each way, between

BILLINGS' BRIDGE

—AND—

OTTAWA,

from the 1st July next.

The conveyance to be made on foot or otherwise.

The Mails to leave Ottawa daily (Sunday excepted) at 10.15 a.m., and arrive at Billings' Bridge at 11 a.m.

TO LEAVE BILLINGS' BRIDGE AT 1.05 P.M., AND ARRIVE AT OTTAWA AT 1.50 P.M.

Should the tender of any one residing at Billings' Bridge be accepted the point of departure will be changed accordingly.

Printed notices containing further information as to conditions of proposed contract may be seen, and blank forms of tender may be obtained at the Post Offices of Billings' Bridge and Ottawa, and at this office.

T. P. FRENCH,

Post Office Inspector.
Post Office Inspector.
Ottawa, 15th April, 1885.

**GRAVING DOCK.****BRITISH COLUMBIA.**

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Caisson, Graving Dock, B.C.," will be received at this office until Monday, the first day of June, 1885, inclusively, for the construction, erection and placing in position of a

CAISSON FOR THE GRAVING DOCK

—AT—

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

It is gratifying to know that the mineral resources of Canada are receiving more attention than formerly and that the inactivity of the past in the mining districts of the Dominion is giving way to active mining operations. Capital is rapidly finding its way here for investment and through its agency our mines are being profitably developed. In the gold districts of Nova Scotia, where desultory mining has been carried on for many years, the investment of foreign capital has brought about a marked change in results. By the introduction of modern machinery at the gold mines, and by employing skilled labour, under practical and economic management, many properties in the province that had been abandoned are now made to yield gold in paying quantity and at large profit. The Nova Scotia coal mines are being more extensively worked than ever before, and in New Brunswick valuable manganese mines, and other mineral deposits, are being developed. The gold mines of Beauce, in the Province of Quebec, are being worked to advantage and some of them promise to become sources of great wealth to their owners, who are conducting operations with system and economy, with a view to permanent working. The asbestos mines of the Eastern Townships have been yielding abundantly for the past two years, and operations are now about to be resumed here, having been suspended during the winter months. The silver-bearing quartz ridges in the County of Beauce are being thoroughly prospected and with encourag-

ing results. Some of the copper mines in the Eastern Townships, notably the Capelton mines, are being extensively worked and are returning large profits to the owners who are engaged in the manufacture of sulphuric acid, to which the ore, pyrites, is eminently suited. In the County of Ottawa the phosphate mines are more productive than ever before, and the ore is being raised and carried to shipping point at greatly reduced cost, owing to the introduction of steam power and the increased facilities afforded for transportation. Mica is also being mined in the Ottawa district in large quantity and in quality equal to that produced in any other part of the world. In Pontiac County the Bristol iron mine is developing beyond the most sanguine expectations and promises to become a very important producer of an excellent quality of magnetic iron ore. Some of the iron mines of Central Ontario are also being extensively worked by a powerful organization of American capitalists, and further westward, in the Lake Superior and Lake of the Woods districts, the gold and silver deposits are being carefully developed, and the recent important discoveries in the Thunder Bay district have created quite a stir among mining men, and foreign capital is being liberally invested there. The coal mines in the Northwest Territories are being profitably worked, and one very important deposit of *anthracite* is about to be developed. From the Rocky Mountains westward, and to the southwest, in British Columbia, valuable discoveries of economic minerals are being daily reported, and the prospects for successful mining in that province during the present year are very bright. The success which is now attending operations at the gold mines in Nova Scotia, in Beauce, in the Thunder Bay district and at the Lake of the Woods is considered by mining men to be of great importance, as it is evident from the course of events that more attention will be given in the future to the development of gold properties. The *Engineering and Mining Journal*, N.Y., in a recent number says:

"Gold mining is attracting more and more attention everywhere throughout the civilized world. The production of gold is decreasing and the amount required is constantly increasing. The consequence is, that the purchasing power of gold is greater every year. Gold mining is almost the only industry whose product is more valuable the "harder" the times and the less it costs to produce. It is almost the only mineral product that never depreciates in value and that never overstocks the market."

Therefore, we add, develop your gold claims!

The Hon. John Norquay and others, of Winnipeg, give notice of application for incorporation as the Otter Tail Gold and Silver Mining Co., of Winnipeg; capital \$250,000.

Mr. J. Obalski, Government Mining Engineer for the Province of Quebec, and Professor at the Polytechnic School, will move his office on the 1st May from Quebec to the Government buildings on St. Gabriel Street in Montreal.

Canada's Phosphate Industry.

The phosphate mines in Ottawa county are attracting more attention at the present time than at any former period since they have been in operation. The many improvements that have been made at the mines by the introduction of steam drills and hoists and other machinery have so facilitated the raising of ore that owners of mines have been enabled to largely increase their output, and additional facilities for transportation having been provided during the past year, the difficulty of carrying the ore to the point of shipment, at Montreal, has thus been removed and the cost of transportation greatly reduced. There is no longer any necessity for winter delivery at Buckingham. Mr. Lomer, of Montreal, with his usual foresight and enterprise, now has a suitable steam-tug and sufficient scows ready for transporting ore when navigation opens in the Riviere du Lievre. There are other ore vessels on the river which, together with those owned by Mr. Lomer, will supply sufficient transport accommodation to deliver the entire output of the mines in the district at the railway terminus during the summer months. The branch line of the Canadian Pacific Railway from the landing to Buckingham station in the main line will be in running order before the shipping season from Montreal will have begun. The road-bed was graded last autumn and the rails have been laid over more than half the distance (two miles) since the snow disappeared. With the accommodation afforded by this branch line the phosphate shippers have been relieved of the annoyance, responsibility and expense of carrying their ore for three and a half miles over a road that has been almost impassable at all seasons, and quite so during the spring and autumn months. The ore that has been raised during the past six or seven months has accumulated and now presents an imposing sight. An inspection of the piles at the various mines cannot fail to convince buyers that the output to go forward this season is of a higher grade than that of former years, which is strong evidence that miners are giving more attention to the careful clobbering and cleaning of the ore so as to bring it up to a high state of purity. The condition of the foreign fertilizer markets is not yet as encouraging as might have been expected and but limited sales have been made at present ruling prices. From the prices of two years ago there has been a downward movement, but notwithstanding the present comparatively low quotations the margin of

profit to producers is upwards of one hundred per cent. Since the breaking up of winter roads the mines have been difficult of access and this will be the case until the ice leaves the river and navigation has opened, which is looked for any day. The past winter has been a very severe one, the most severe in fact in the recollection of old settlers, and yet mining operations have been in no wise checked thereby. Upwards of 18,000 tons of phosphate have already been raised since the close of navigation last year and the mines are in such condition now as to render them capable of yielding sufficient ore during the next four months to bring up the total year's output to the figures approximately estimated in our last issue.

The Phosphate of Lime Company, the Union Phosphate Company, the Dominion Phosphate Company, the Ottawa Phosphate Company, the duLievre River Phosphate Company, W. A. Allan, and Messrs. McLaurin and Blackburn are all turning out ore in large quantity, and their mines continue to improve with development. More attention is now given to deep mining and those who have so directed their operations, notably the Dominion Phosphate Company and Mr. W. A. Allan, have been much encouraged. The phosphate industry of the district was never more promising than now.

Phosphate Quotations.

The most recent quotations received from abroad for Canadian phosphate are 1s. 1d. for 75 per cent. guaranteed, straight, and 1s. 1½d. for 80 per cent. with one-fifth of a penny rise. Some contracts have been made at these figures with stipulations by sellers for Canadian analysis. In these cases assayers in Montreal, Toronto and New York have been selected.

Transportation of Phosphate.

The cost of transporting phosphate from the mines to Montreal has been reduced to a minimum. The scale of charges from High Falls to Buckingham landing by scow, after opening of navigation, will be from 60c. to 35c. per ton, according to location of mine. From Buckingham landing to Montreal per C. P. R. the rate has been made at \$1.40 per ton—a saving of quite \$1.25 per ton on former cost from the mines. Ocean freight rates will be uncertain until after the opening of navigation, but it is not expected that they will rise much higher than last year. If war should be declared between England and Russia ocean freights would probably be affected, and insurance will certainly be higher.

In Dr. Selwyn's last "Report of Progress" of the Geological Survey of Canada appears a report by Mr. J. Fraser Torrance on the apatite deposits of Ottawa County. After describing many of the most important mines, and referring to statistics of the trade, prices, &c., Mr. Torrance adds: "The question of appointing official inspectors and analysts to certify to the quantity and grade of every shipment from Montreal has often been agitated. The shippers are at present compelled to accept the certificates of the analysts employed by the purchasers as the basis of settlement. I hesitate to recommend any official action by the government in

this matter." This is a question of sufficient importance to call for the co-operation of phosphate shippers to effect a new and more equitable system of purchase and sale.

South Carolina Fertilizers.

STATEMENT OF THE SHIPMENT OF FERTILIZERS FROM CHARLESTON, S.C., DURING THE FIRST THREE MONTHS OF THIS YEAR, AS COMPARED WITH THE SHIPMENTS DURING THE SAME PERIOD OF 1884.

Major E. Willis, Charleston, S.C., has furnished us with the following statement, showing the shipment of fertilizers from Charleston during the months of January, February and March in 1884 and 1885. The statement shows that the shipments during the present year have been 11,952 tons in excess of the shipments made during the first three months of last year:—

NOTES ON PROFESSOR BOYD DAWKINS' PAPER, "APATITE DEPOSITS NEAR OTTAWA."

(Published in March number of Canadian Mining Review)

BY

MR. GERRALD H. KINAHAN.

Read before the Manchester Geological Society, February, 3rd, 1885.

I have read with considerable interest Professor Dawkins' valuable paper on the occurrence of the phosphate, but his remarks as to the origin of the deposits at the Emerald mine are, it appears, not quite conclusive. The precise origin of these deposits is difficult to conceive; they are not sufficiently regular in structure or direction for lode, or fissure deposits, nor are they continuous enough for bedded masses, unless it be that the original bed—of limestone say—became greatly contorted and broken up, or possibly pinched through in places, on the plication of the strata while undergoing intense metamorphism.

From a cursory examination of the deposit at the Emerald mine in the fall of 1883, it appeared to me that the phosphate occurred in a partially altered limestone bed; the alteration having been most complete on the upper side, but had gradually invaded its lower portion; atwart this bed there were apparently smaller veins of segregative or secondary origin.

The main bed had then essentially the same structure as described in the paper, except that the apatite crystals were more numerous towards the junction of the calcite and the massive

deposits of apatite. The bed dipped south at about 75°; on the south or hanging wall the apatite was massed; to the north lay the calcite or crystalline limestone; but about two feet beyond or under what appeared to be the foot-wall or base of the bed, phosphate was reported to occur again; this had not been opened upon.

The apatite crystals penetrating the limestone were very perfect; many doubly terminated, and some very massive; they appeared to have been introduced, or to have grown subsequently into the calcite, similar to the growth of magnetite crystals, or iron-pyrites crystals in fine slates and shales. Many of them contain enclosures of calcite, which are always more or less spherical, as though squeezed by the growth of the enclosing crystal. Almost perfect, large crystals of pyroxene also occurred in the calcite; one specimen measured 4 in. by 1½ in. by ¾ in. The bed appeared to be much wider in depth than at its outcrop, where apparently weathering had allowed the country rock to close in over it.

In a deep and wide cut run in from the west, to open up the deposit, a vein, about two feet wide, and dipping north (across the bed) at about 60°, showed in the face of the working; it had a "lody" structure, and contained specimens of galena, zinc-blende, copper and iron-pyrites. In the centre there was a rib of selenite two inches wide; on the upper side of this vein, phosphate was more plentiful than above.

It is difficult to correlate the phenomena at the Emerald mine with either ordinary segregation veins or true lode deposits. In segregation veins the filling materials are chiefly the constituents of the adjoining rocks, and largely crystallized. In this deposit the mica is almost the only mineral that can be said so to occur. From a deposit in a true fissure vein, that of the Emerald mine differs both in composition and structure.

The contents of the vein—exclusive of the apatite and calcite—both in quantity and variety of minerals, are comparatively limited; and except in the case of the metallic sulphides, are not those of true lodes. Quartz in particular is notably absent. Specimens do occur, but they are not abundant. The dearth of fluoride is remarkable; it occurs most intimately intermingled with the phosphate; but as a separate species it is not plentiful. The occurrences of calcite in these rocks in such quantities as a gangue is exceptional. Calcite as a gangue in fissure veins mostly accompanies lead ores, especially in limestone rocks. It does occur in fissure veins in other rocks—as granite—but is generally subordinate to the barytes, quartz, or spar gangue.

In structure the deposit does not resemble that of a true lode or fissure vein. There is an absence of continuity in any particular direction, and in cross section there is no correspondence between deposits on opposite sides, calcite occurs on the foot, apatite on the hanging wall. If these deposits occurred simultaneously, what could produce this separation? If at separate times, the first to deposit should occur on both walls.

On account of the absence of the more common phenomena of mineral veins, it appeared to me that this deposit had resulted from the action of a solution bearing fluorine and phosphorus (in what combinations it is impossible to say) on a bed of limestone, and that the "lody" previously mentioned was the channel through which this solution had access; and that the transverse veins were small fissures in which this solution re-acted upon a calcareous one. This latter phase (the transverse veins)

more marked at the Victoria mine (Gore); but there much of the phosphate appeared to occur in a large pegmatite dyke. The same is, I believe, the case at the High Rock mine.

In our next issue will appear a paper "On a possible Genesis of the Canadian Apatite," by G. Henry Kinahan, M.R.I.A., &c., which was read before the Geological Society of Manchester, February 3rd, 1885.

MINING IN NOVA SCOTIA.

GOLD.

By the last annual report of the Department of Mines of Nova Scotia it is shown that gold mining in the province, during 1884, was profitably carried on, and that the production for the year, though not large, exceeded that of 1883 by 633 ounces. The returns show that 118,087 days' labour were performed during the past year; that 25,147 tons of quartz were extracted and crushed, yielding 16,079 oz., 14 dwts., 10 grs. of gold—an average of 12 grs., 18 dwts., per ton—and that the average earnings per man, per day, were \$2.40.

The following mines worked steadily during the year: the Gallagher, Darr's Hill, Brunswick, Oxford and Empress, and have made satisfactory returns. Other mines were getting under way, with good promise of steady operations during 1885, among which may be mentioned the Bluenose, Montagu, Leipsigate, Rawdon and Fifteen Mile Stream mines.

Throughout the gold districts several large lots of low grade ore have been profitably mined; notably, 9,799 tons at Salmon River, yielding at the rate of 6 dwts., 20 grs., and 1,679 tons at Renfrew, yielding at the rate of 6 dwts., 18 grs., per ton.

The richest yield the returns show is 2,212 oz., 8 dwts., from 913 tons of quartz crushed by Gallagher Gold Mining Company, being an average of 2 oz., 8 dwts., 10 grs. to the ton.

In the Leipsigate Lake district the operations of Messrs. Hall and Owen show a return of 130 tons crushed last fall, yielding 410 ounces—fifty tons of which gave 250 ounces. It is to be hoped that this promising district will rank, this year, among the best of the provincial mines. A crusher of ten stamps, driven by steam, has been built near the cross-head.

In the Chezetcook district operations have been principally confined to the property of the Oxford Gold Mining Company. The returns of the Department of Mines show that 2,464 tons of quartz were crushed during the past year, and yielded 1,887 oz., 18 dwts., making the total returns 5,479 oz. from 4,550 tons of quartz. Mining has been carried on in the *Mill* and *Coleman* lodes to a depth of about 100 feet. Hoisting power, etc., is carried to the shafts by wire rope from the mill-house, where additional engine power has been put up. The surface arrangements have been improved, and additional accommodation provided for those engaged about the works. The property has now one of the best mining plants in the province, and its history has hitherto been a very successful record.

Mr. M. F. Hunt, President of the Oxford Gold Mining Company, in his annual report for 1884, which is now before us, addressed to the shareholders, shows that during the year 2,577 tons of quartz from the *Mill* and *Coleman* lodes, were crushed, and that the average yield per ton was \$16.84; and that the total number of tons crushed since the mill started amounted to 4,754 up to December 31st, 1884, yielding an

average of \$22.79 per ton. Also, that No. 4 shaft of the *Mill* lode was down 148 feet at the close of the year. These figures are somewhat at variance with those reported by the Department of Mines.

It is to be regretted that no regular work has yet been started on the other auriferous lodes of this district, as it promises to be one of the best in the province.

COPPER.

During last summer some prospecting was done on a copper vein at Scott's Hill, Pictou County. A little work was done at the Margaretville copper mine, Annapolis County. Here native copper and carbonate is found in the joints of the trappean ash, and the indications would appear to warrant further development. A few tons of copper is reported to have been extracted from one of the Pugwash deposits of grey copper ore. In this connection the development being made at Dorchester, in New Brunswick, lead to a hope that some of these upper carboniferous deposits may have value in Nova Scotia.

Near Antigonish a deposit of copper ore was said to have been found last fall. Some work was done near Whyhogomah on a vein of copper pyrites, in a diorite band.

In the Ohio district an opening was made on a deposit of yellow and grey copper ore, yielding 1,120 lbs. of copper, $6\frac{2}{3}$ dwts. of gold, and 3 oz. of silver to the ton.

At Coxheath, during the past year, about 275 feet of drifting were made to the north and south in the 190-foot level. During the progress of this work about 100 tons of 8 per cent. ore were taken out. In addition to proving the continuity of the vein of ore found in the 140-foot level, two new and promising veins were cut, which yielded about 10 tons of 10 per cent. ore from the exploratory drifts. One of the veins yielded some 30 per cent. ore. The result of the exploratory work carried on has been to expose about 1,000 tons of ore between the 140-foot and the 190-foot levels, running from 5 to 10 per cent. of copper, with good promise of continuity in depth.

The following estimate of Mr. Van Slooten, Superintendent of the Coxheath mine, would show that copper matte can be produced at Sydney under very favourable circumstances.

Assuming that 7 tons of 5 per cent. ore will make one ton of 32 per cent matte, and a daily output of 50 tons:

Mining, dead work and transport to tide-water of one ton of ore.....	\$2 50
Coke, $\frac{1}{2}$ of a ton, \$1.50.....	25
Iron ore, $\frac{1}{2}$ of a ton, \$2.00.....	67
Labor.....	25
Superintendence, oil, coal, &c.....	25
Freight to Swansea, $\frac{1}{2}$ of a ton of matte, @ \$5....	72
Port charges and storage, $\frac{1}{2}$ of \$1.75.....	25
Commissions, assays, &c.....	72
Total.....	\$5 61

which would leave a good margin even at the present low prices of copper.

IRON.

During last year the Steel Company of Canada continued working the East and West mines at Londonderry. Before the close of the year preparations were being made for sinking below No. 7 level, and it was planned to use an underground engine for raising ore from the deeper workings. The company finding that they had large quantities of "Spathic ore" available, in addition to the limonite, which has hitherto been exclusively smelted, are now using it in their furnaces.

This mineral, also known as Sideroplesite (classed by Dana as a variety of ankerite) is found in few places in quantities making it

valuable to the iron smelters. In general terms it may be described as ankerite with its calcic carbonate replaced by ferrous carbonate. Mr. Henry Louis, late analyst to the Steel Company of Canada, gives the following analysis of it, which shows that it is an important source of iron:

Insoluble silicious matter.....	47
Calcic carbonate.....	59
Ferrous ".....	69.20
Manganous ".....	1.37
Magnesian ".....	28.73
Ferrie oxide.....	.08
	100.44

At first this ore was found in the West mines mixed in strings and veinlets in ankerite; as the workings were deepened it became freer from ankerite, which at many points is present in very small amounts. The extensive deposits of this ore in the mine warrant the expectation that it will prove of much future economic value. Kilns have been erected for calcining it before it is introduced into the furnace.

The returns of the mine show that 54,885 tons of iron ore, and 5,799 tons of ankerite were extracted during 1884.

On the East River, and at other points in Pictou county some explorations were made, and the Inspector of Mines for the province remarks that it is greatly to be regretted that no successful attempts have been made to utilize the large and varied iron ore deposits of this county.

Discoveries of iron ore during last year were reported from Lorne, Pictou County; Whyhogomah, Inverness County; and Malvern, Annapolis County. Near Digby some prospecting was done in small veins of Magnetite in the Triassic Trap near its junction with the underlying substance. Analysis of the ore is said to show:

Iron.....	60.430
Silica.....	14.320
Phosphorus.....	.036
Sulphur.....	.046
Titanic acid.....	none

ANTIMONY.

During the past year a valuable mine of antimony ore has been opened out at Rawdon, Hants County. Two shafts, 120 feet apart, have been sunk about 175 feet, and levels driven, from which 600 tons of No. 1 ore have been raised. The vein, which is of grey antimony ore, is from 4 to 18 inches in width, cutting talcose slates. There is little impurity present beyond small amounts of quartz and calcspar. An analysis by Mr. H. M. Smith, made in Dr. Lawson's laboratory, Dalhousie College, showed the ore to be of almost chemical purity, having little beyond mere traces of foreign material.

This discovery has led to prospecting for other deposits of the ore, and it is probable that a large district here will be found to yield it. Similar ores have been reported from Upper Stewiacke.

Though new in Nova Scotia it is not unlikely that this ore will prove a source of profitable mining and smelting.

GYPSUM.

The total exports for 1884 amounted to 11,068 tons, against 144,688 tons during the preceding year. It is anticipated, however, that the exports during the present year will resume their normal volume.

At Windsor operations are carried on almost exclusively by Mr. Edward Dimock, who has combined the various quarries on the St. Croix River. During the past year he replaced a horse tramway from the quarries to the river

by a railway of standard gauge, equipped with a locomotive and a set of self-tipping 5-ton cars. The openings into the various quarry faces will allow readily of a daily shipment of 500 tons of gypsum. The amount shipped from Windsor during 1883 was 80,072 tons. The quality of much of the rock was very good.

The New York Plaster Company re-opened the old quarry at Grandique Ferry, Richmond County (said to have been worked by the French during the occupation of Louisburg), and built a wharf. It is expected that a considerable trade will be done by this company during the present year.

MANGANESE.

The total production of manganese ore during 1884 was 302 tons. Mr. J. W. Stephens continued working his mine at Tenny Cape, and small lots were mined at Cheverie.

At the East Mountain, near Truro, Messrs. Stevens and Carter took out about 30 tons of very good pyrolusite from the drift, and have, it is reported, found the vein which they consider to have yielded the drift ore.

At Loch Lomond, in Cape Breton, Mr. E. T. Moseley continued working the Moseley manganese mines, and states that he is prepared to supply high grade ore, guaranteed 90 per cent. of binoxide. He has put in machinery for hoisting and pumping, and has done preliminary work.

LEAD.

One hundred tons of ore, averaging about 40 per cent. of lead, were taken out last fall at Smithfield, and a small smelter was erected. The ore was burned in heaps, and it was found that calcination was not carried far enough. Calciners were then put up, and after proper roasting the ore was found to be self-fluxing. The inception of this undertaking is extremely interesting, as the establishing of lead smelting will mark a new departure in the mining industries of the province.

Mica in Canada.

In all directions in Canada where mining or quarrying is carried on, abundance of mica is to be met with, but in most instances it is unmarketable. In the majority of cases it is associated with a limestone formation, and this is pronounced of no commercial value. In some localities, however, as in the Ottawa valley, it occurs in regular veins lying between well-defined walls of feldspar and quartz, and in others the veins are hemmed in by granite. The mica found in these formations is of a very superior quality and, in clearness and the size of the sheets, it is equal to that imported from North Carolina and New Hampshire. On the north shore of Lake Superior and in the Lake of the Woods district some excellent mica has been discovered, but the only mines of importance that are being worked in Canada at the present time are the *Pike Lake* mine, in Burgess, and the *Villeneuve* mine, Ottawa County. From both of these mines regular shipments of excellent mica are being made, amounting to several hundred pounds monthly. At *Pike Lake* mine one shaft, now at a depth of 60 feet, is yielding abundantly, and the crystals are all unusually large, many of them being capable of yielding plates measuring 8 x 12 inches. The *Villeneuve* mine, which has been greatly improved by development, has been yielding abundance of large size mica of a quality equal to any that has been imported into Canada. A drift has been run into the face of the hill which has cut the lead at a depth of 40 to 50 feet

from the surface, exposing a great number of well-formed and large crystals, proving the continuity of the lead and that the mica improves as it becomes protected from atmospheric influence. The crystals of mica are here associated with tourmaline crystals in a gangue of feldspar and quartz.

Another mine is being worked in Loughborough, county of Addington, which produces a good quality of dark amber mica, and operations have been conducted successfully during the past year or longer.

Two promising deposits of excellent mica occur in the township of Miller, county of Frontenac, and in the township of Maison-Neuve, Birtwhistle county, respectively. Mining operations have not yet been started on these locations, but it is not improbable they will develop into valuable mines.

MINING ON LAKE OF THE WOODS.

The Lake of the Woods promises to become a mining centre of considerable importance. The explorations which were actively carried on in 1882 and '83 received a check from causes wholly unconnected with the natural prospects of the district, these being principally the question of territorial jurisdiction, which prevented the issuing of titles, and the stringency of the western money market; but as soon as these impediments shall have passed away, there is every probability that the development of the discoveries already made and the search for new indications will be resumed in a more thorough and scientific manner.

Besides gold and silver the following metals and economic minerals have been found: copper, iron, zinc, lead, antimony, arsenic, iron pyrites, mica, asbestos, plumbago, marble, granite and hone-stones. The copper occurs as pyrites in veins and in schists and has been found by explorers in several places, which they keep secret until titles can be obtained by the discoverers. There is a considerable quantity of this ore in one of the veins at the George Heenan mine. Iron pyrites is abundantly disseminated in many of the rocks and is especially noticeable at the Keewaitin mine. There is a good prospect that large deposits of it will be found, worth mining for the manufacture of sulphuric acid. Veins containing plates of mica occur in connection with the granites, and during the winter just past a discovery is reported to have been made near Falcon Island of one of these holding sheets of a good quality, upwards of six inches in breadth. Fine specimens of true asbestos were obtained in making railway cutting through hornblende schists at Rat Portage, and small quantities have been found at other localities, indicating that larger deposits may be looked for. The marble is white, mottled and veined with grey and occurs at the west end of Hay Island and in other places. Syenitic granite is very abundant and may be seen in the cuttings of the Canadian Pacific Railway for miles east of Rat Portage. It occurs in upwards of twenty different places around Lake of the Woods. A fine variety which might be easily quarried may be seen at Bell's Harbor on Painted Rock Island, near the steamboat channel between Rainy River and the North-west Angle. A glossy greenish yellow silicious schist, very suitable for fine hones, has been met with in a number of places in the northern part of the lake.

The rocks in the Lake of the Woods region have been examined and their outlines mapped out by Dr. Bell, Assistant Director of the Geological Survey, who devoted parts of 1872, '73, '81 and '83 to exploring this part of the

country. During 1883 he was assisted by Messrs. Coste, Lawson and Tyrrell, and in 1884 the work has been continued by the two gentlemen last named. The results of all these examinations is to show that the auriferous veins occur in massive dark green diorites, contiguous to the larger granite areas and on their western sides. Mr. Lawson has observed that the gold-bearing quartz veins follow slaty or soft streaks in this diorite. These rocks belong to the Huronian series which occupies the shores and islands of the northern part of the Lake and is represented by a great variety of crystalline schists, conglomerates, felsites, &c.

Assays have been made by Mr. Hoffmann, the pains-taking chemist of the Geological Survey, of a considerable number of samples of ore from different localities on the lake, which show that the richest veins are those around Bigstone Bay on the north-east side of its northern portion. The veins at the Pine Portage, Sultana, Winnipeg Consolidated and Keewaitin mines proved to contain rich ore. Three of the assays of that of the Pine Portage mine yielded respectively 12.77 ounces gold, 20.41 silver, 9.68 gold, 8.92 silver and 9.91 gold, 15.37 silver, to the ton of 2,000 pounds. This mine was worked steadily by a small force of men during the whole summer of 1884, and the ore produced, together with what had been previously mined, was sufficient to give pretty steady employment to the five-stamp mill at the mine, and no scarcity of water for its supply was experienced. In the autumn, a second battery of five stamps was placed on the same cam-shaft as the first, the engine being originally intended to drive ten stamps. As a good deal of secrecy was observed last summer about all the discoveries and the mining operations at the Lake of the Woods, it was impossible to ascertain the amount of gold produced at the Pine Portage mine, but it is believed to have been between 150 and 200 ounces or some \$3,500 worth. In addition to the free gold thus obtained, the sulphides were concentrated by two Frue vanners and will be either exported or treated in time on the ground.

The Keewaitin mine was the only other which was worked during 1884. Operations were kept up all summer with a few men and the ore was taken in barges to the crushing mill at the Argyle Mine on Clearwater Bay. The result was said to be satisfactory, but from the general observance of secrecy no particulars could be obtained.

Although the quantity of gold which has actually been produced at the Lake of the Woods is small, still the progress which has been made towards its establishment as a mining district has been considerable and important. We have witnessed all the usual stages. First, the original discovery of the precious metal, next a good deal of promiscuous hunting and exploring accompanied by many reported assays of very rich ore, then the commencement of mining and milling, partly judicious and partly injudicious. Finally the district is surveyed geologically and reliable assays and mill returns are obtained and actual facts enough become known to justify the commencement of systematic mining and milling. The geological position and relations of the gold-bearing veins being pretty well established, the search for new mines may now be confined to narrow limits, that is, to the dark green diorites near the contact of the granite. The principal unexplored region would thus lie along this line of junction, which, as shown on Dr. Bell's map of 1881, trends south-eastward from the head of Big Stone Bay towards the arm to which Dr. Bell has given the name of Long Bay and new discoveries

may, therefore, be looked for behind Yellow Girl point and in that vicinity.

The principal places at which any work has yet been done are described by our Lake of the Woods correspondent in the REVIEW for July 1883.

Bristol Iron Mine.

In addition to the mines in Central Canada, which have frequently been referred to in the REVIEW, and from which iron ore has for some few years past been shipped to the United States, a promising mine is now in operation in the County of Pontiac. The mine, known as the Bristol Iron mine, is situated in the township bearing that name, and comprises lots 21 and 22 in the 2nd range. There are two lodes on the property having a north-westerly and south-easterly course, the most northerly one of which is now being worked. At its east end two openings have been made and a slope started at a dip of 60°. Eight hundred feet westward on the lode a 12x30 ft. shaft has been sunk to a depth of 50 feet in very rich ore, from which two levels are being driven, one to the east and the other to the west, the former to connect with the slope, and it is expected the connection will be made by the end of next September. During the past winter 7,000 tons of excellent ore was raised, 3,500 tons of which was delivered at Braeside, a station on the line of the C. P. Ry., from which point it will be forwarded, via Kingston, to the company's works at Charlotte, N. Y. The force of miners and labourers engaged averages 40 men.

There are three steam-drill, suitable hoisting machinery and two boilers on the property. The company is determined to thoroughly equip this mine and has purchased an air compressor capable of working ten drills. A powerful hoisting engine 14x36 stroke is about to be erected to work from the shaft and slope. The shaft will have two cages, and the slope is to be double-tracked. It is expected that all the improvements will be in running order before the autumn, and that thereafter the output of the mine will be not less than 75,000 tons annually. The ore is a high grade magnetic, assaying 65 per cent. metallic iron. This mine will unquestionably be an important producer, and will contribute largely to the shipment of Canadian iron ore into the United States.

NORTH SHORE OF LAKE SUPERIOR.

ITS MINERAL RESOURCES.

In a recent number the Chicago *Mining Review* publishes an interesting letter from a Port Arthur correspondent, "North Shore," as follows:

In my last communication about the mines north of Lake Superior, which dealt chiefly with the mines to the west of Port Arthur and the mining district in the State of Minnesota, adjoining the Canadian border, I promised another, having reference to other portions of the vast mining field on the north shore, on the Canadian side.

Before proceeding to fulfill that promise a few words more relative to the new silver region, commencing at the Kaministiquia River and extending through the township of Paipoonge, the Rabbit Mountain and Silver Mountain districts to the international boundary, may be found to be of general interest, inasmuch as this is the section of country which is attracting

the most attention at present, and in which the greater development is in progress.

A letter which appeared in a recent number of the *Mining Review*, over the signature "Calcite," contains much valuable information respecting the silver slates of the Thunder Bay district, and it is specially applicable to the geological formation and the general character of the mineral veins which are to be found in what is now known as this new silver district. By it the writer gives some good reasons why the veins to be found in this portion of the country can be classed as true fissures, and he gives reasons to show that their mineral features may be relied upon in depth as well as at surface.

Whether the mineral properties of these veins came from great depth or from infiltration by minerals in a state of solution, that is to say, from the leakage from the rocks or the movement through the rocks and veins themselves of waters highly impregnated with mineral ingredients, whether from above or from the surrounding rocks, or from steam or vapor or influences from great depths and infiltration from above combined, are disputed theories. All geologists agree, however, that the trap dykes which cut the formation of this mineral region have had much to do with the mineral features of the veins, but exactly how their influence has been exerted has never been determined. The fact that these dykes are found to be mineralized to a much greater degree than the surrounding country rock, and the well-known affinity which minerals are known to have for each other, may account for the veins intersecting these dykes and along the line of their junction with the slates, making richer in, and in the neighbourhood of, the dykes than in other portions of the vein. At Silver Islet the richest ore was found in the dyke which its vein intersects. This dyke is highly mineralized. The same vein on the main shore in the slates contained no trace of silver; at any rate, it was not found rich enough here to pay to work.

There are other reasons than those given by "Calcite" which tend to prove the permanency of silver in depth in the veins of the Thunder Bay district. The development of Silver Islet exploded the theory once held that silver was only to be found at surface in this district. At this mine there was found very rich silver at surface, and also at various depths. At 960 feet, and even deeper, very rich ore was taken out. Again, allowing that "Calcite" is right in stating that the slates have a dip to the south-east, then it could be shown that the slates which outcrop in the Rabbit Mountain district, where such rich silver ore has been found at surface, would on their incline be found hundreds of feet below the surface at the Silver Islet mine, and particularly the islands and country west of it in the same formation. Again, silver is found at surface on different planes to the north-west of the Rabbit Mountain mine, at the Beaver mine, two miles distant, and to the west at the Twin City mine, three miles distant, and to the south-west at Silver Mountain, fourteen miles away. By allowing for the dip of the slates the same argument would apply to show that silver may reasonably be looked for at great depth at the Rabbit Mountain mine. And so on the argument can fairly be used to show that at no particular horizon of the silver slates does the silver only show. The line of slates to be found at surface in one locality would be hundreds of feet deep at other places in the same formation, and as silver was found both at surface and in depth at Silver Islet, the question of the permanency of silver in depth in the veins of this district may be considered settled, although as "Cal-

cite" says, it makes richer in zones or pockets than in the intervening veinstone. That is the case with all silver mines, the difference between the veins of the Thunder Bay district, and those of other countries being found chiefly in the fact that where the silver in the former makes rich, it is exceptionally so.

As to the kind and character of the veins, it cannot be doubted that the Silver Islet and Beaver veins which cut the formation and the dykes in their course are true fissure veins. They have actually disclosed the dykes, which they intersect, and made faults in the formation. The same may be said of other well known veins in the district which have the same evidences to prove them true veins. As to those running with the formation, their mineralization, length, regularity of course, their dip, cutting the formation at an angle, and their well-defined walls, where the depth has been reached, are evidences that they too are true fissures. Why the most of these veins make rich in places, producing a very high grade of smelting ore, and only stamp or very poor ore in other portions of them, is not for me to divine. It is sufficient to know that such is the case. "Calcite" points out certain conditions in the walls or country rock in the vicinity of these rich deposits which may account for them, but what caused these peculiar changes in the formation is a more difficult question.

Then as to the influence of the trap dykes on the mineral features of the veins, there has not been development enough in the country to lay down any general rule or law. In the veins in the slates which have shown silver away from a dyke the development has been very limited. Remarkably rich silver ore has been found in the Silver Islet and Beaver veins, which cut dykes, but in the Beaver rich ore is also found in the slates, disseminated all through the veinstone at considerable distances from the dyke, and as far away from it, and to as great a depth, as the vein has as yet been uncovered and cross-cut down the mountain side. It is true, too, that the Silver Creek mine or 95 T vein, on the location adjoining the Twin City mine, shows rich silver ore in its outcrop. This vein runs with a dyke which forms one of its walls—the silver slate forming the other wall. The development about to be commenced at this mine will doubtless prove it to be as rich as the Beaver, Rabbit Mountain and Twin City, the three working mines in its immediate vicinity.

On the other hand, the Rabbit Mountain mine, which produced such wonderfully rich ore at surface, and at a depth of 75 feet in another shaft, and the Twin City mine, from which such very rich ore has been taken, have not yet been proved to be dyke veins. The companies operating these have not had time to do development enough to settle this question. Notably among this class of veins is the Silver Mountain vein, farther to the south-west. It is not known to be a dyke vein, and yet a mine could scarcely produce richer silver ore than has been taken from the test pit on it. At the Rabbit Mountain mine solid nuggets of argentite (black silver) weighing as much as five, six, and up to eleven pounds, have been taken from near surface in one shaft, as well as ore going over \$3,000 to the ton at a depth of 75 feet in another. At the Silver Mountain mine there has been broken off in the test pit fragments of ore weighing sixteen pounds and upward, worth \$10 per pound, and it is said that during a recent examination of the mine by three experts from Chicago, one blast upturned over \$6,000 worth of ore from less than a ton of the veinstone. The Twin City mine produces a very high grade of smelting ore as well as stamp rock in quantity. Further devel-

opment only can prove whether these three mines will ultimately produce as good a yield as came from the celebrated Silver Islet dyke vein, which has a record in production of over \$3,000,000. The Beaver mine, although in a vein cutting a dyke, can be classed as a valuable producing mine from the ore opposite both the dyke and slates, but it has made no shipment of ore. Therefore its history, which is only a few months old, cannot as yet be taken to prove that the veins cutting dykes like the Beaver, or in contact with them, like the Silver Creek mine vein, will prove the greater producers ultimately.

What is most required is greater attention to the low grades of ore which all these mines and nearly all the veins in the district yield. When it is better understood that the low grade ores such as these veins produce can be mined, treated and converted into bullion at the mines for less than \$5 per ton by the latest improved methods of mining, handling and treating such silver ores, and when the large production to which the mines can be raised is figured out, the real undoubted value of the veins of low grade ore will be better appreciated and known. Were it not that such marvellously rich ore is to be found in places in the veins of the district, the owners of them would be forced to go to work at opening up their mines in a proper way with a view to mining on a large scale, mines properly opened up for large workings, instead of picking around, or "hogging" over the veins, trying to find and follow only the very rich leads of silver, as in most cases is done, regardless of the consequences and extra expense afterward attendant on an improper start and plan of development.

Around these mines, and in different localities in what is called the New Silver Region, there are very promising veins wholly undeveloped awaiting capital and experience to handle them. This country has but few practical miners.

As to the other portions of the vast mining field on the Canadian North Shore of Lake Superior, to which this letter was first intended to be confined, the developments are not sufficient to call "mines" which are now mere "prospects," except in the case of the Huronian mine, which is undoubtedly a good one, although it has been slow at getting down to practical business. Such a mine in the Western States would have been working at the rate of at least 100 tons per day production by this time, but here it can scarcely yet be said to be more than partially tested and in a position to start at real work. At this mine there is a fine mill and a splendid vein, highly mineralized throughout its entire length and with clean cut walls. It is capable of being made a large, reliable, steady producer, and yet it has made no headway worth speaking of in systematic mining and milling.

In the same geological formation as the new silver district are to be found veins cutting the same dyke as the Silver Islet vein on the islands west of it, and on the main shore running along and inland from Big Trout Bay, which should be explored and further developed. Some of them have never had any development work done upon them.

To the east of Port Arthur are the Beck or Silver Harbor and 3A mines, which, although now idle, would pay handsomely under proper management. The history of these two mines is not properly understood, or they would be at work. Of this fact there can be no doubt from the evidences to be had from various parties now living in the district. The question of title, if that is the cause of their remaining idle, is one that could be settled, no matter if at some expense and sacrifice, were prudence and

energy exercised. The Beck mine is in the same silver slates, and the ore on its dump today is said to be all good pay rock. It, too, has produced very rich ore. The same can be said of the 3A mine. It is a rich mine, although a small vein in the contact between the Cambrian and Huronian formations. As to those mines or holes in the rocks, which were once started only for stock-jobbing purposes, no references need be made. They died a natural death.

Silver has been found near Blende Lake in veins which development might prove lucrative mines. The same can be said of the veins west of Little Pic River and further east. The Heron Bay gold lode, which so much resembles the Huronian mine ore, the small gold vein at Jack Fish Bay, the veins in the gold formation of that neighborhood, are all sufficiently enticing to warrant exploration and development. Some of them have not been tested. Others are known to contain a grade of ore that would likely pay well under proper management.

The zinc blende property northeast of Neepegon Bay is one that promises well and will likely go to work during the coming summer.

The gold country in the Huronian formation, commencing above the Kakabeka Falls, on the Kaministiquia River, and extending in irregular shape to the international boundary and beyond the Height of Land, is but very partially explored. It is known to contain some veins of splendid promise. The Jack Fish Lake lode is a fine one in this formation with length, breadth and unknown depth, being a true fissure, sufficient for several mining companies. It produces both gold and silver, and in places the rare sylvanite ore. The Partridge Lake lode is one of good promise, and the country around it and the Huronian mine is geologically and in fact a gold-bearing district. The veins in the Huronian gold formation nearly all produce low-grade ores, but they are considered very reliable and constant in their average yield.

The unsettled state of the title to the land beyond the Height of Land, keeps that portion of the district back, but there can be no reason why work should not be commenced on the locations which were patented while the arrangements existed between the Dominion and Ontario governments which allowed grants to be made. There is no dispute about the whole of the new silver region and the vast mining district south and east of the Height of Land, and along the entire north shore of Lake Superior, where patents can be procured from the crown for ungranted lands for one dollar per acre and surveying expenses, which rarely exceed another dollar per acre, making the total cost of unpatented lands not more than \$2 per acre, with no royalties or other crown dues on the minerals. The Ontario mining law is a very liberal one, almost too much so.

The Canadian Pacific Railway has opened up a large portion of the country. The Ontario Government has given a grant to build a bridge across the Kaministiquia river opposite Murillo station, on the C. P. R., and toward the construction of a waggon road into the new silver region referred to. The Thunder Bay Colonization Railway has been chartered to serve this same district. The construction of the bridge and waggon road mentioned will be commenced this spring, and it is expected the railway will soon follow. The mining country is well watered and as a rule is surrounded with good mining timber. The climate, although severe in winter, is healthy and invigorating, and the mines can be worked with cheap labor the year round.

To such a vast mining district, with such a promise, explorers, mining men and capitalists

must soon come in numbers and with means. The opportunities now are great and are only excelled by the resources of the country. The coming summer will be an active one in the district. The opening of navigation will be the watchword and development and production the reply.

BRITISH COLUMBIA MINING PROSPECTS.

THE WINTER'S WORK AT GOLDEN CITY.

Golden City is situated at the junction of the Kicking Horse River with the Columbia just where the C. P. R. leaves the narrow canyon through which the former stream passes and enters on the broad and beautiful valley watered by the latter. On the east of the town are the Rocky cuts, and on the west the range of the Selkirks. As far as surface indications indicate, the mineral wealth near the place in the latter range could hardly be more satisfactory. There is every appearance of true fissure veins running across and slightly quartering the mountains. The latter have a general direction N.W. and S.E., while the leads seem to run slightly E. of S. and W. of N.

Mr. McConnel, of this place, has formed a company to work six claims about 12 miles south. They have been working all winter on one of their claims, which shows a well-defined lead of gold and silver bearing rock, and have made 65 feet of a tunnel into it.

At Canyon Creek, which runs into the Columbia, a company of Winnipeggers, which includes some men of good standing, is working at two large post holes in the bed-rock of the Creek, under the direction of Mr. Kelly. They have made a flume 136 feet long capable of carrying off 750 cubic feet of water a minute, and a pump which will carry off 18,060 cubic feet in 24 hours. They are putting the finishing touches to their dam and intend, shortly, to start sluicing, and will soon afterwards know what their claims are worth.

Mr. F. McGuire, an old timer both in this country and the N.W.T., has two claims on Fifteen Mile Creek, which empties into the Columbia above Canyon Creek. He has named them the Ureka and the Sierra Nevada. The foothills of both are granite, and the hanging walls slate. The Ureka, which is the richest, has a width from footwall to hanging of nine feet. The assays of these leads were made in London, England, and have been very satisfactory, and a mining expert is to be sent out from there in June to examine the claims. Besides these claims there are about fifty others of varying richness on the same Creek. Mr. McGuire intended to start operations on his location early in April, by which time there was every prospect that the snow would have disappeared from the lower levels.

There is a report that Mr. Dan Mann, who owns six claims on Fifteen Mile Creek, intends to cut a waggon road up there this spring.

At the north of the Spill Amichene, 60 miles above here, Mr. Jones has a big Galena lead with great quantities of ore in sight, which he has named after that river. He has already started out to begin operations. Besides this lead another of free milling gold quartz has been discovered up the same river, which in the opinion of old miners will go at least \$50 to the ton.

On Quartz Creek, about 85 miles below here, a company under the direction of Mr. Graham, has been putting in the winter developing a

lead, from which rock has been assayed at Salt Lake City, Utah, with the most favourable result.

In fact it may be said that unless the indications of mineral wealth which are visible in this section of the country are capable of attracting capital into it nothing will. Not only are the mining prospects most favourable, but this region affords advantages to the capitalist in every way. The timber is abundant, and of a kind peculiarly well adapted for smelting purposes. Water power can easily be obtained if required, and no lead has as yet been discovered within two miles of which a railroad could not be run with the greatest facility from the main line of the C. P. R. If the claims 'round here cannot find buyers this summer prospectors may as well quit on this side of the lines altogether. If capital does not come in there must be something wrong in the country, since it certainly is not the fault of the mineral prospects in it. At all events there have been before now big stampedes, and big money made too, on the other side on considerably slimmer indications than those which present themselves in this section of British Columbia.

PROFESSOR WILBER'S REPORT ON THE CANADIAN PACIFIC RAILWAY.

FUEL SUPPLY OF THE NORTHWEST TERRITORIES —BITUMINOUS, ANTHRACITE AND LIGNITE COALS.

Professor C. D. Wilber, of Aurora, Illinois, Inspector of Mines and Mining Lands, who last year made a geological survey of the line of the Canadian Pacific Railway, has made a lengthy report to the managers of the road. After showing the rich agricultural resources, he gives his views on the coal supply for the region of country contiguous to the line of railway, as follows:

"It will be interesting, especially to English and Canadian readers, to know the sources of coal for the vast region now intersected by the new Canadian Pacific Railway. This area comprises the Provinces of Manitoba, Alberta, and British Columbia. Here is an immense wilderness of both flat and rolling prairie, of grassy plains and magnificent rivers, having a soil capable of husbandry and herding, as is proven to-day by thousands of new farms, where so recently prevailed the wild and hopeless monotony of nature.

"Into this unmeasured domain nearly 2,000 miles in length east and west, by at least 400 in width north of the 49th parallel—the international boundary—are coming, with the facilities of this new trans-continental railway, now being constructed by the Government, hundreds of thousands of the more hardy populations of the northern latitudes of Ontario, Quebec and northern Europe, already accustomed to long winter terms. Coal supplies for the eastern portion of this new region will come from the Souris river lignites already referred to.

"The middle region can be supplied from Medicine Hat and Belly River coal districts which also afford lignites. The last named coals are inferior in quality, that is, not compact, having a heavy per cent. of ash and moisture and easily disintegrating in the open air. But notwithstanding they are the lowest order of cretaceous coals, yet the necessities of a six months winter will compel their use and distribution by rail on an extensive scale.

"Beyond Calgary which is destined to become the leading city of the Northwest Terri-

tory, coal is found of a quality far superior to the lignite of the plains just referred to.

"A field of anthracite coal has recently been found near Cascade mountain on the Canadian Pacific Railway 900 miles west of Winnipeg. It has been traced in a direct line on its outcrops for several miles, and at intervals pits or shafts have been dug to prove the regularity and persistence of this anthracite stratum. About 300 tons have been mined and shipped to the east, and from this amount, sufficient tests have been made, to prove not only its value, but also its identity as a true anthracite coal.

"In the western States and Territories it is a universal fact, that the grades of coals, in quality or value, increase towards the Rocky Mountains as follows:

"1. We have loose or spongy lignites; 2. Compact or solid lignites; 3. Semi-bituminous; 4. Anthracite.

"A correct outline map of the productive coal limits of the Western States and Territories must be vague and uncertain, especially on the south.

"But the coal area rapidly increases with every succeeding parallel going north. This area is over 200 miles wide in South Colorado. While in Northern Colorado from Greeley westward, across North Park to the coal fields of Utah in Great Salt Lake region, the width of the coal area is nearly 600 miles.

"Through Wyoming, beginning in the Black Hills region, the coal area extends into Idaho, and includes several deposits of great size and value, notably one near Evanston on the Union Pacific Railway, having a thickness exceeding 40 feet; easily traceable several miles northward in the Bear River Valley. But on the other hand, it is quite contrary to expectation, yet a fact, that the country nearly 900 miles west of Ogden, including both Nevada and California, is almost if not quite destitute of coal. We find the greatest width of coal area is spanned by the 49th parallel, or the international boundary, reaching from the Souris River coal system to the Pacific coast, with considerable areas intervening that are destitute of coal, both in Northern Idaho, Montana and Manitoba.

"North of this line we have already followed the route to the Canadian Pacific Railway, with results as above stated. Still further to the Northwest, 200 miles north of Calgary, in the vicinity of Edmonton, are found large areas of excellent coal exceeding 12 feet in thickness, extending thence west to the head-waters of the Athabaska, and across again to the Pacific coast.

Mining Notes.

NEWFOUNDLAND.

A statement just issued by the St. John's Chamber of Commerce for the year ended July 31st, 1884, shows that 9,536 tons of copper ore and 133 tons of copper regulus were exported.

Owing to the unprecedentedly low price of copper, all mining operations at the Betts Cove mining district have been indefinitely suspended. These mines were formerly owned by a Boston and New York syndicate. The output of ore within a few years has been over \$6,000,000.

NOVA SCOTIA.

The fire that had been burning for some time in the Sydney, Cape Breton, coal mine was extinguished towards the end of March and the mines are now in operation. All hands have been working on the south side, double shifted.

The largest output ever made at any colliery in Canada has been attained at the Spring Hill collieries. Three slopes are now working and an average of fifteen hundred tons of coal is being raised daily. Sixteen hundred and ninety-three gross tons were shipped by rail April 7th.

A dispatch from the superintendent of the Oxford gold mine, Lake Catcha district, dated April 13th, says that the plates will probably be in place and running on the 13th. Every available space is now filled with ore. They were obliged to stop mining until the mill was ready. Meantime, they have sunk shafts Nos. 12 and 13 on Coleman lead, each 12 feet deeper, showing vein 2 feet wide and increasing with depth both in quality and width. As soon as the snow disappears, it is the intention to open new leads that are known to be on the property.

The new steam-hoisting works on the Orion lead at the Hall-Anderson mine started up on the 7th of April. The vein is showing well and is opened for 100 yards at a depth of 80 feet, averaging 3 feet wide, the pay-streak being about 2 feet wide. The most important strike ever known in the district was made April 9th on a cross cut at a depth of 70 feet, 40 feet north from the Island lode; a lead was cut 3½ feet wide of solid quartz showing free gold throughout. The value of this discovery can only be ascertained by developing the lead, which will be done at once. The company has only a ten stamp mill at present, but intends increasing to 20 stamps immediately, and later on to 40 stamps, as the ore is there to supply even a greater number of stamps. The ore is of low grade, running from \$10 to \$25 a ton.

NEW BRUNSWICK.

The Brunswick Antimony Company gave shareholders whose stock was sold for non-payment of the \$1 assessment on March 31st, the privilege of redeeming it at \$1 a share until April 15th.

QUEBEC.

The Villeneuve mica mine is improving noticeably with development and is yielding abundantly. The quality and size of the plates shipped from the mine during the past month cannot be excelled at any mine in the world.

Activity at the phosphate mines in Ottawa County continues unabated, and with the opening of navigation on the River du Lièvre, which is expected during the first week in May, the output of the mines, which has accumulated during the past six months, will begin to move.

The Bristol iron mine, in Pontiac County, is becoming a large producer of very fine ore. Seven thousand tons were mined during the past winter, and with the machinery now being erected, and when more ground is opened, the annual output of this mine will reach 75,000 tons. The ore is shipped to Charlotte, N. Y.

Mr. J. Frazer Torrance is continuing to prospect what is known as the Armstrong location, about 25 miles from the village of St. George, county of Beauce, and is meeting with success. He has already located some extensive leads of argentiferous galena, carrying silver in paying quantity, and sufficiently rich to warrant systematic mining operations.

The Capelton copper mines in the Eastern Townships have been worked at large profits for the past three years or more, and continue

to yield abundantly. The ore is chiefly pyrites and is shipped to New York and Brooklyn to be smelted. This ore is very valuable on account of the quantity of sulphur it contains and is worked chiefly for sulphuric acid.

Work has been resumed at the Asbestos mines in the Eastern Townships. It is expected that several undeveloped properties will be worked during the coming summer. A large force of miners will be employed at the mines in Thetford, Coleraine and Broughton Townships, and at Danville. The Johnson and Boston Asbestos Companies expect a very large output from their mines this year.

The Beauce gold mines are being vigorously worked and very satisfactory results are looked for from this season's operations. The Canada Gold Company is prospecting its territory systematically and has proved several quartz ridges to be rich in gold. Good work is being done on the Gilbert river, and Messrs. Allan and Humphrey have sunk their new shaft to within a few feet of the gravel. They have now reached a depth of 155 feet and for some distance have raised ground carrying several colours to the pan. The gravel at *bed-rock* is unquestionably very rich and there is no doubt that these gentlemen will be handsomely rewarded for their pluck and perseverance.

ONTARIO.

The outlook in the Thunder Bay mining district was never brighter than now.

It is stated that three new mining and manufacturing companies have been organized with large capital to operate in the Thunder Bay district.

On the north shore of Lake Superior the recent discoveries of various economic minerals is attracting the attention of mining men and capitalists.

The Ontario Government is about to build a bridge across the Kaministiquia river for the accommodation of miners to whom it will be a great boon.

Three silver mines are now being developed in the Rabbit Mountain district, namely: the Rabbit Mountain, the Twin City and the Beaver mines.

There has been considerable prospecting and active mining in the gold formation and the silver bearing district north of Lake Superior, and with satisfactory results.

It is the general impression in Duluth that with the opening of navigation will come a rush of mining men from the western states to operate on the north shore of Lake Superior.

Mr. Ryan, the millionaire hotel man of St. Paul, is looked upon as a likely purchaser of the Silver Mountain mine, owned by Messrs. Daunais and Trethewey. The price for the property has been set at \$300,000.

The Huronian mine is said to be one of the most valuable gold properties of the Thunder Bay district. The vein has an average width of 6 to 7 feet and has been traced for three quarters of a mile in length. The quartz carries free gold throughout.

Mr. Keefer, of Port Arthur, who has recently returned from New York, reports that

the last car-load of ore shipped to that city from the Rabbit Mountain mine was divided into four grades. No. 1 yielded 3,374 oz., No. 2, 1,251 oz., No. 3, 184 oz., and No. 4, 133 oz. of silver to the ton.

A number of valuable discoveries have been made in the new silver region in the district of Thunder Bay, commencing at the Kaministiquia river and extending through those portions of the country known as the Rabbit Mountain and Silver Mountain districts, on to Whitefish Lake, Arrow river and Pigeon river, the international boundary between the Province of Ontario and the State of Minnesota.

BRITISH COLUMBIA.

On 26th March a young man named James Blair was killed by a *cave in* on the Mason claim, Antler Creek. The body has not yet been recovered.

The Lorne Creek miners sailed from Victoria on 26th March on the steamer "Barbara Boskowitz." They were heartily cheered as the vessel moved off.

Gold diggings have been struck on Beam Inlet which give promise of richness. The quartz mill on Douglass Island is nearly completed and crushing will soon begin.

Mr. Smith, Superintendent of the Irondale Works, left Victoria at the end of March for Texada Island. He took with him a gang of men and supplies and is now engaged in preparing for mining operations. Mr. Smith speaks very highly of the excellent quality of the Texada iron ore, which he says is superior to any on the coast.

John Morrison, who has returned to Victoria from a prospecting tour through the Pitt river mountains, brought with him some fine specimens of iron, copper and marble. He also has some quartz which is supposed to contain gold and silver. He says that the mountains are full of mineral wealth and predicts a great future for the mining interests of the Province.

Messrs. J. L. Ferguson, P. Cran, B. Carter, S. Hughes and two others have started from Desolation Sound for the mainland, on a prospecting tour for minerals and timber. They expect to be absent about six weeks. Mr. J. L. Ferguson of the Britannia hotel, Victoria, several months ago visited that Sound, and found fair prospects of gold, silver and coal.

Wm. Kemp and M. Hilton, two well-known miners who went to Kootenay about ten months ago to prospect, were not heard of until, during the past winter, their horses were found in the woods along with a human skeleton. Among papers found on the clothing was a miner's certificate with Hilton's name. Without doubt these two enterprising prospectors have met with a horrible fate.

Messrs. W. F. Murray and C. D. Grant, of New Westminster, who have been prospecting for the past several months in the New Westminster district, report the discovery of a rich lead of silver a short distance from Fraser River near the Mission. The lead extends for about two miles, from 10 to 40 feet wide and in sight to a height of 100 feet. There are a series of veins of the galena ore in the same vicinity.

Mr. Murray has proceeded to San Francisco for the purpose of having a sample of the ore

assayed. He has been a prospector in Arizona and New Mexico for several years and states that the ore is as rich as any he has met with. Mining experts to whom the specimens have been shown pronounce them exceedingly rich. In the same neighborhood was found a lead of gold quartz, the specimens in Mr. Murray's possessions showing considerable gold. A vein of zinc was also noted.

The Consolidated Monarch Mining Company, who own the claim at Tunnel Mountain, will soon begin operations. The lead consists of galena, and the ore, which has been assayed at Minneapolis, Chicago and Salt Lake City, goes 34 oz. of silver and 65 per cent. of lead. Mr. Biscoe, the agent of an English company, which intends taking over these claims, has gone to England to make arrangements for getting the ore smelted at Swansea.

Parties who have recently arrived at Victoria from the upper country report having passed a couple of men with pack animals near the Salmon arm, bound for Kamloops. The animals were laden with quartz, which the men stated was rich in silver, and, while not giving much information about it, claimed that they had struck a rich lead and were bringing a sufficient quantity for the purpose of having it properly assayed. From what is told it would seem that the *find* was made in the gold range near the Salmon Arm and the line of railway, and in a line with the old Cherry Creek mine.

Reports from the mines in the Cariboo district are encouraging, good pay being taken out all winter on Lightning creek from the Ross and Van Winkle claims. On Slough creek the Chinese also have been very successful. The unfortunate *cave in* of the Mason claim on Antler creek may possibly have the effect of the abandonment of that shaft. The accident was a most peculiar one. When the mass fell the force sent huge pieces of timber to the mouth of the shaft and threw mud to the roof 30 feet above. The man killed came up feet first and again sank, while the one saved luckily came up head foremost and seeing daylight threw his hands out and grasped the ladder.

Work is not now being prosecuted on the Burns mountain tunnel, but will be resumed when the season advances. The tunnel is now 750 feet in length, and another 50 feet will bring it to the point where the ledge is supposed to be. Mr. Wm. W. Dodd, who has recently arrived at Victoria, brought with him a piece of gold quartz taken from the tunnel, a very rich and pretty specimen. He has still unbounded confidence that the final result will handsomely pay the plucky promoters of this novel mining scheme.

UNITED STATES.

Last year the dividends derived from gold, silver, lead and copper mines in the United States aggregated \$8,472,896.

The result of the past twenty-three months' operations of the Plymouth Consolidated Gold Mining Company, California, is evidence of what can be done with a good mine under proper management. During the period mentioned this company has paid to its shareholders \$1,150,000 in twenty-three consecutive monthly dividends of \$50,000 each, equivalent to \$11.50 per share.

The most important dividend-paying mines of the United States are: The Homestake Mining

Company, Dakota, has paid, up to the 25th March, 1885, no less than seventy-eight successive monthly dividends, aggregating \$2,637,500; the Ontario Mining Co., Utah, to the same date has paid \$6,275,000 in one hundred and five monthly dividends; the Small Hopes Con. Mining Co., Colorado, since February, 1884, has paid \$1,037,500 in fifteen dividends; the Idaho Gold Mining Co., California, has paid one hundred and eighty-one successive monthly dividends, aggregating \$3,667,300; the Father De Smet Con. Gold Mining Co., Dakota, has paid \$980,000 in forty-three successive monthly dividends; the Jocuistita Mining Company Mexico, has paid \$1,200,000 in fifteen quarterly dividends, and the Hecla Consolidated Mining Co., Montana, has paid six dollars per share yearly for several years. The Horn Silver Mining Co., Utah, paid in quarterly dividends up to 15th November, 1884, \$4,000,000.

Australian Gold Notes.

The yield of gold from mines in the Ballarat district, 2,079 oz., 17 dwts.; from the Creswick district, 2,507 oz.; from the Sandhurst district, 6,919 oz., 1 dwt.; from other districts 4,961 oz., 10 dwts. Total yield for the week from the returns sent in (Feb. 7), 16,469 oz., 10 dwts., value about \$150,000.

Dividends for the week (February 14) from ten Victoria gold mines were £12,244, or \$61,000. The Victorian yield of gold for 1884, calculated on the usual basis, shows an increase over that of 1883 of 43,957 oz. In 1883 there was a falling off after three years of high production; but gold mining is again in the ascendancy, and the outlook for this year is very hopeful.

The following are the returns from the under-mentioned mines during the four weeks ending Saturday, February 7: New North Clunes Company, 309 oz., 11 dwts., 12 grs.; New Yankee Company, 82 oz., 1 dwt.; South Clunes Company, 405 oz., 4 dwts., 12 grs.; Port Phillip Company, 455 oz., 19 dwts., 12 grs.; Bute and Downs Company, 404 oz., 4 dwts.; New Lothair Company, 40 oz., 8 dwts.; other sources, 150 oz.; making in all 1,845 oz., 8 dwts., 12 grs., value \$36,500.

Asbestos, its Manufacture and Uses.

Asbestos mining having become such a very important industry in Canada, and as the product of the mines in the Eastern Townships is now admitted by manufacturers, the world over, to be unexcelled in quality, we publish, for the benefit of those of our readers who are not informed as to the variety of uses to which this valuable mineral is put, the following very interesting article which has appeared in the *Engineering and Mining Journal*, N.Y., of a recent date:—

"Asbestos is a fibrous variety of actinolite or tremolite, and consists of silica, alumina, magnesia, oxide of iron, and water. It has been known for many hundreds of years, and indeed it is reported that asbestos cloth was used on the funeral pyres of the ancients. Whether that be true or not, it is certain that until recent years asbestos has been regarded merely as a kind of scientific curiosity, valuable as an illustration of the wonderful diversity of nature, but of little practical use in the world. A few years ago, almost simultaneously, a movement was set on foot in England, Scotland, and Italy,

and asbestos began to be mined and to be manufactured, at least in an experimental way. The time was opportune for the new venture. For years, steam pressures had been gradually rising, and whereas 30 pounds to the square inch at sea, and 50 pounds on land, had hitherto been the average, these pressures were now beginning to be doubled, and the old forms of packing for joints and glands showed great distress. Gasket rings and hemp gland packings had both been superseded by more durable and compact appliances; but these were far from perfect, and when exposed to the higher temperature that was evidently coming it was certain that they would give trouble.

In the year 1879, three firms that had entered into the mining and manufacture of asbestos formed themselves into one company, and a rigorous search was made through the region of the Italian Alps, where asbestos was known to exist, to discover all the sources. The result of several surveys was the discovery of about 180 valuable mining properties, covering 80 square miles of land, in districts about 80 miles from Milan. All these mines were secured by the company.

The Italian asbestos lies in beds and pockets, which are mostly reached by open quarrying, dynamite being largely employed in this operation. The lumps, as they are taken from the mine, consist of bundles of hard fibers, lying parallel with one another, and strongly bound together. They vary in color from light gray to brown, and the general appearance of a fine sample of asbestos is suggestive of the interior of the riven trunk of a tree. By the exercise of a little care threads may be separated many feet or even yards in length, the continuity being perfect from end to end, the general appearance and strength being very similar to those of flax. It is this quality of length and strength of fiber, and its chemical purity, that distinguish Italian asbestos from all other. The mineral is pretty widely diffused; it is found in Canada, Corsica, the United Kingdom, and in many other places, but in most of these countries it presents a very different appearance from that we have already described. Instead of the bundles of fibers being several feet in length, they are broken up into short pieces of only from 1 inch to 3 inches, and are bound together with such rigidity that the woody appearance of the fracture is nearly lost. Another peculiar characteristic of the Italian asbestos is the greasy feeling that it possesses, resembling that of French chalk or soapstone. When the material is manufactured into gland packings, this quality becomes valuable, as it prevents the necessity of introducing any foreign substances, and permits a perfectly pure packing of asbestos, through which the rod will slide with light friction, and with less oil than other kinds.

The manufacture of asbestos is carried on in several places in England. The chief seat of the industry, is, however, at Harefield, near Rickmansworth. All the asbestos goods used by engineers may be classed, as regards their process of manufacture, under two heads—paper and yarn. The paper may be worked up in various ways, and the yarn may be twisted, plaited or woven, but the crude material is made to assume one of these two forms before it is worked into the finished article.

There are several other branches of manufacture, such as boiler covering, putty, cement, patent fire-proof paint, etc.

The crude asbestos is brought from Italy in bags containing from 1 cwt. to 2 cwt. each, in pieces of all sizes, from that of a man's hand to such as a man can scarcely lift. These have first to be opened out to free the fibers from one

another and from the non-fibrous material by which they are bound together. For this purpose, two rollers covered with teeth of pyramidal form are used. These revolve, as a rule, at equal peripheral speeds, and at the same time have a sideways motion in relation to each other, so that the asbestos, which is fed in with the fibers lying parallel to the line of motion, is both crushed and separated at the same time. By the direct pressure, the binding agents are separated, and then the loosened fibers are combed apart by the reciprocating motion, which, however, is not sufficiently great to interfere with their parallelism. The lower roller is driven directly from the prime mover, while the upper is operated by a train of gearing that allows the distance between the two to be adjusted. Each roller shaft is connected by a collar and a connecting rod to a reciprocating beam, which receives its oscillation from an eccentric driven by a pulley and belt. Thus, when the machine is at work, the rollers are both rotated and drawn backward and forward at the same time. The toothed wheels are, of course, secured by feather keys, to render this possible.

Three machines of this kind, but of gradually reduced sizes, are employed to open the asbestos, and then the portion with the longer fiber is taken to the boiling-tanks, to be softened by heat and moisture. Each tank is provided with a rotating beater, which maintains a thorough circulation, taking up the fiber, opening and drawing it out, and then sending it forward to be soaked for a time until it comes around again to the beater. The short fiber is taken to edge-runners and ground, and prepared for the beating-engines, where the binding material is added and thoroughly incorporated: the whole is drawn off into a receiving-tank in the mill-board machine-room. From the tank, it is conveyed to the mill-board machine, to which agitators are attached to keep the fiber from settling. The water is drawn off through a fine wire gauze on a revolving cylinder, leaving a thin coating of the asbestos pulp in the cylinder. This is then taken off by an endless band and transferred to a second solid rotating cylinder, where it steadily accumulates until the desired thickness has been reached. It is finally cut across and removed in the form of a square sheet of millboard or paper.

The sheets, as they come from the machine, contain a large percentage of water, which is removed partly by pressure, and partly by drying. They are first laid between sheets of zinc in a powerful hydraulic press, and much of the water is forcibly expressed, and then they are hung up by spring clips in a steam-heated drying-room, to complete the desiccation. When the process is finished, the sheets are again pressed to render them flat and to improve the surface, the edges are trimmed and their manufacture is then complete. The sheets ordinarily measure 40 inches by 40 inches, while their thickness varies by thirty-seconds of an inch, from $\frac{1}{32}$ inch to $\frac{1}{4}$ inch. The millboard is cut into shapes suitable for the purposes for which it is intended; pipe-joints are made with rings, valve-chest joints with rectangular shaped washers, and other joints with appropriate forms. The value of the material lies in its indestructibility; it is a pure mineral substance, and suffers no change from contact with heat, steam, or grease, and exercises no chemical influence on the metal with which it lies in contact, so that when the joint is broken the surfaces are found to be uncorroded and to have suffered no change. A finer description of asbestos paper is made for electrical work, as it forms a very efficient non-conductor.

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and out-croppings of fine quality of Graphite. Further particulars to be had at the office of the MINING REVIEW.

Canadian Pacific Railway

Tenders for Engine Houses at North Bend and Port Moody.

SEALED TENDERS, addressed to the undersigned, and endorsed respectively: "Tender for Engine House at North Bend," and "Tender for Engine House at Port Moody," are invited from persons wishing to furnish and erect Engine Houses at these points on the Canadian Pacific Railway in British Columbia, and will be received at the office of the Secretary of the Department of Railways and Canals, until noon, on the 24th day of May, 1885.

Plans and specifications may be seen and forms of tender obtained at the office of the Chief Engineer of the Canadian Pacific Railway, Department of Railways and Canals, and in Victoria, Vancouver Island, at the office of the Dominion Government Agent, on and after the 1st of May.

Separate tenders must be made for each Engine House and be in separate sealed envelopes, addressed as above directed.

Each tender must be accompanied by a deposit equal to five per cent. of the amount of the tender. This deposit must consist of cash, or a bank cheque marked good by the bank, and it will be forfeited if the party tendering neglects or refuses to enter into a contract when called upon to do so, or if after entering into the contract he fails to complete the work satisfactorily according to the plan and specification.

If the tender be not accepted the deposit will be returned. Tenders must be made on the printed forms supplied.

The Department will not be bound to accept the lowest or any tender.

A. F. IRADLEY,
Secretary.
Dept. Railway, & Canals.

IMPORTANT**Auction Sale**

OF

VALUABLE**Mineral Lands**The undersigned has received instruction
from the Montreal Plumbago Mining Com-
pany to sell by public auction at the Russell
House, Ottawa, on**THURSDAY, the 18th day of June,**At the hour of 2.30 o'clock p.m., the Plum-
bago Mine and the entire property of the
Company, comprising the following valuable
mineral lands:—1st, Lot 28, in the 6th range, Township of
Buckingham, County of Ottawa, containing
100 acres of land in addition to the salina of
the lake.2nd, north half of Lot 23, in the 5th range
of said Township of Buckingham, containing
100 acres.3rd, nine acres of Lot No. 28, in 5th range
of Buckingham, with water privilege thereto
appertaining, being site of company's mill
dam, etc.The Company's mill was destroyed by fire
but the mill dam remains uninjured, and
there are on the property several houses,
sheds, etc., built for various purposes, when
mining operations were carried on. Mica
has been found in quantities, and the lands
are in the phosphate region, and phosphates
have been found though no phosphate mining
work has been done. As to the quality of the
plumbago it has been extensively used in the
manufacture of crucibles, lubricating leads
and stove polish and given unbounded satis-
faction. This is established by the experience
of consumers and by a certificate from the
celebrated Battersea Crucible Works, London,
a copy of which is open for inspection.There are unrivalled facilities for transport
to and from the mine by the Ottawa River and
C.P.R. Railway.All that is required to amass a colossal for-
tune is a little enterprise and capital as any
person taking the trouble to examine those
mines will say for themselves.For further information apply to the Secre-
tary of the company, G. B. Cramp, Esq., No
13 Hospital street, Montreal, or to the under-
signed.**I. B. TACKABERRY,**
Auctioneer.
Ottawa.**PHOSPHATE LANDS
FOR SALE.**The Laurentian Phosphate Min-
ing Company offers for sale upon advan-
tageous terms the mining rights upon the
whole or part of their valuable phosphat
lands in the Township of Templeton, con-
taining in all 1,300 acres.Part of the property has
been developed and proved
to be unsurpassed in rich-
ness.Most favorable reports by the late Henr
G. Vennor, F.G.S., and other experts, may
be seen upon application to the undersigned.The principal shareholders now resid-
ing abroad, is the reason for wishing to realize
and close up the business of the company.To parties purchasing the whole of the
company's interest, their Letters Patent would
be transferred, thus enabling the purchase
to carry on the business as a company with-
out loss of time or further expense.

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

With the opening of the present season a marked interest is being manifested by the mining community at large in the developments that are now going on in the gold and silver regions on the north shore of Lake Superior. The mines that have for the past year been successfully operated, and other mining localities that have been taken up, and are now being prospected, are so accessible and so conveniently situated to the base of supplies, as compared with those of the far Western States and Territories, that the time has arrived when approved methods for permanent mining should be inaugurated. Until this has been done profitable development will be delayed. The manner in which mining operations are to be conducted in this new field will, in a great manner, be determined by the methods adopted by those who have been the first to engage in mining industries in the district. Not only should modern machinery be erected, but good judgment should be exercised in selecting such machinery as is most suitable to the ore on which it is to be employed. The employment of skilled and experienced workmen under proper and economical business management are cardinal features to be observed in all mining industries. Mistakes will occur, but they are to be corrected, not repeated. The Lake Superior district is among the most inviting mining centres of the Dominion, its mineral resources are varied, and its gold and silver ores are rich in these precious metals. The

value of the deposits having been assured, there should be a liberal and careful use of capital in developing them, and a prosperous future will be the result.

The Assistant Director of the Geological Survey of Canada, Dr. Robert Bell, sailed from Halifax on Wednesday, 27th May, on the *Alert*, in charge of the geological branch of the Hudson Bay Expedition. He will not return to Ottawa until late in the autumn.

Mr. William Pickford, London, England, President of the Phosphate of Lime Company, arrived in the city on 1st instant. Mr. Pickford had for some days previous been superintending the company's operations at its *High Rock* mine in Portland West.

Professor Edward J. Chapman, of the School of Natural Science, Toronto, paid us a visit a few days ago and expressed himself much gratified with the advancement in the mining industries of this district. Professor Chapman was in Ottawa attending the sessions of the Royal Society.

Mr. W. de L. Benedict, M.E., of the firm of Benedict & Cole, New York, paid us a visit last week. He was en route to New York, after having made a professional examination of the Fitzroy lead mine. Mr. Benedict has had much experience among the mineral deposits of Central Canada.

A special meeting of the shareholders of the Dominion Phosphate and Mining Company will be held at the office of the company, No. 8 Custom House Square, Montreal, on Tuesday, the 9th of June, proximo, at noon, for the purpose of considering, and if thought advisable, of increasing the capital stock of the company, or of authorizing the Directors to issue bonds of the company, as they may be required, for raising the means for contemplated increased operations, as authorized by the company's charter.

Many points of interest were touched upon by Professor Wm. Boyd Dawkins in the able address on the Canadian North-West which he delivered early in May before the Manchester Geographical Society. From his eminence as a geologist, most importance attaches to his remarks upon the undeveloped mineral wealth existing on the northern bank of the St. Lawrence. Gold, silver and copper, he believed, were to be found in this region in valuable quantities, and in his opinion these deposits could, ere long, be fully worked, and the country peopled by large numbers of Englishmen.

MINERALOGICAL SOCIETY.—The science lecture room of the College of Ottawa was filled on the evening of May 7th, the occasion being the last regular meeting of the Mineralogical Society. The work of the year could not have been better completed than by the essay of Alf. Lussier, on the "Formation of Mineral Veins." He introduced his subject in a very lucid manner,

exposed the various facts revealed by observation, and the many theories devised to explain them. The style contributed much to make the lecture interesting even to the most indifferent in the audience. A plan was afterwards devised for a scientific excursion to Buckingham, which has since taken place, on the 19th of last month.

The Hudson Bay Expedition, under command of Lt. Gordon, R.N., sailed from Halifax, N.S., on Wednesday, 27th May, on board the *Alert*. The expedition comprises five parties to be located at the stations which were established in the Straits last season. Dr. Bell, Assistant Director of the Geological Survey, has accompanied the expedition and will explore the geological and mineralogical features of the east coast of Hudson Bay, which are already known to be of interest and importance, and will return with the ship in the autumn. The *Alert* is particularly adapted to this class of navigation and was presented some years ago to the United States Government by the British Government to assist in the search for Greeley. She has recently been transferred by the United States to the Canadian authorities for service in the expedition in which she is now engaged.

The *Canadian Gazette*, London, England, in a recent number says: "Among the minor industries of the Dominion none has had a more rapid growth than phosphate mining. It is still in its infancy, but seems certainly to have a very satisfactory future before it. The deposits in the Ottawa district are of the chief importance, and some details of their development may be of interest. It is only a few years since the first mine was opened up: now, on the Lievre River alone, seven or eight are being worked. And whilst the export of phosphate in 1878 was only 3,700 tons, this year the total will be at least 24,000 tons. The introduction of improved machinery, as English, Canadian and United States capital has been attracted to the industry, has not only increased the output, but has also diminished the cost of production. Little doubt is felt as to the demand for phosphate keeping pace with any reasonable increase in the supply."

A very interesting article by Dr. Bell, Assistant Director of the Geological Survey, "on the mode of occurrence of Apatite in the Laurentian system in Ontario and Quebec," has appeared in a recent number of *The Engineering and Mining Journal*, N.Y. The article contains a vast amount of valuable information bearing on the apatite deposits in the phosphate belt, of which Dr. Bell says: "In the county of Ottawa is the most productive phosphate belt as yet known, running northerly and following the general course of the Rivière du Lièvre. It has been traced through the townships of Templeton and Buckingham, Portland, Bowman, Bigelow and Wells, and I have been credibly informed that the mineral has been found in places in this direction to a distance of 100 miles north of the Ottawa river. In the Perth and Kingston regions the phosphate belt runs from the township of North Elmsley, south-

ward through North Burgess, North Crosby, Bedford, Storrington, and into Loughborough."

His Excellency the Governor General with his Aides-de-Camp, accompanied by Dr. T. Sterry Hunt, of Montreal, and Dr. Grant, of Ottawa, visited the *High Rock* phosphate mine on Saturday, 30th May. The distinguished visitors were received by Mr. Pickford, of London, England, President of the Phosphate of Lime Company, and Mr. F. Hilton Greene, the company's Montreal agent. Flags were flying at the mine and in anticipation of the visitors' arrival some blasts were prepared and fired for their benefit. His Excellency and party were conveyed over the C. P. R. to Buckingham station and thence over the new branch line to the landing on the river, where they embarked in the steamer *Buckingham* owned by the Phosphate of Lime Company, and enjoyed a pleasant trip up the Du Lièvre, which has become noted to tourists for its picturesque scenery. The distinguished party returned to Ottawa the same evening much pleased with the day's excursion and greatly interested with what had been witnessed at the mines. The passenger car which conveyed His Excellency and party from Buckingham station to the village was the first that had been over the new branch.

Dr. Selwyn, Director of the Geological Survey, has completed arrangements for the distribution of his staff of surveyors and field geologists for this season. Fifteen parties will be engaged in exploring and surveying, and the field of operation will extend from the Atlantic to the Pacific oceans. It is expected that this season's work will supply much valuable information and will enable the Director to complete many of the geological maps that are at present in an unfinished and imperfect condition. The parties will be distributed as follows:—Two in British Columbia, in Vancouver and Cariboo districts, under Dr. Dawson and Mr. Bowman, respectively; one, under Mr. McConnell, on the east flank of the Rocky Mountains; one on the plains, between Calgary and Edmonton, under Mr. Tyrell; one party, under Mr. Lawson, in the Lake of the Woods district; another, under Mr. Ingall, on the north shore of Lake Superior, in the White Fish River silver region; Mr. Coste will have charge of a party in the gold and iron districts of the County of Hastings, Ontario; two parties will be engaged on the frontier of the Eastern Townships under Mr. Ellis and Mr. Adams, respectively; Mr. Lowe has already started out in charge of a party to continue the survey at Lake Mistassini; two parties are to survey in New Brunswick, one of which, under Mr. Chalmers, will work on superficial geology; and in Nova Scotia one party will be engaged in Pictou, Antigonish and Guysboro' counties, with Mr. Fletcher in charge. It is the intention of the Director to keep two parties employed during the summer in examining mines and collecting mineral specimens for the London exhibition, to

take place next year, and his entire arrangements for the present season's operations of his staff have been carefully and thoroughly systematized.

ROYAL SOCIETY.

The fourth annual meeting of this distinguished body opened on Tuesday, 26th May, in the Railway Committee room of the House of Commons. The President, Dr. T. Sterry Hunt, occupied the chair and called the meeting to order. His Excellency the Governor-General, Honorary President of the Society, was present at the opening. Dr. Hunt, in his opening address, alluded briefly to the history of the Society since its foundation and to the services of its founder the Marquis of Lorne. The vice-President, Dr. Daniel Wilson, next addressed the meeting, and was followed by Dr. Chauveau, one of the ex-Presidents of the Society. A vote of thanks to His Excellency for his attendance at the meeting, and his having consented to occupy the chair, was then moved by President T. Sterry Hunt, seconded by Vice-President Wilson, and carried unanimously amidst applause. In reply His Excellency delivered an eloquent and appropriate speech, touching briefly on the various subjects for study and research which should occupy the attention of members of the Society.

The Society held regular daily sittings, commencing at 10 o'clock in the morning, including Friday, 29th May, the last session, at which the election of officers for the ensuing year was proceeded with and resulted in the following gentlemen being elected:

President—Dr. Daniel Wilson, of Toronto.

Vice-President—Very Rev. Rector Hamel, of Laval University, Quebec.

Hon. Secretary—Mr. J. G. Bourinot, Clerk of the House of Commons.

Hon. Treasurer—Dr. J. A. Grant, of Ottawa.

The papers on geology and mineralogy read before the Society during the meeting was as follows:—

"On a new Mesozoic Flora discovered by Dr. G. M. Dawson in the Rocky Mountains," by Sir Wm. Dawson.

"Illustrations of the Fauna of the St. John Group (No. 3), by G. F. Matthew.

"On the Geology of Cornwallis or McNab's Island in Halifax Harbour," by Dr. D. Honeyman.

"Notes on the Economic Minerals of New Brunswick with revised list of mineral localities in the Province," by Prof. L. W. Bailey.

"On the Geology of South Eastern Quebec," by Thos. McFarlane, and "On the Geology of Thunder Cape, Lake Superior," by the same author.

"On the Wallbridge Hematite Mine, as illustrating the mode of occurrence of certain Ore Deposits," by Prof. E. J. Chapman.

"On the Fossil Plants of the Trias and Permian of Prince Edward Island, collected by Mr. Francis Bain," by Sir Wm. Dawson.

"On the Cambrian Rocks of the Rocky Mountains," by Dr. G. M. Dawson.

The full texts of the above papers will be published by the Society for presentation at its next annual meeting.

El Callao: The product of this famous Venezuelan gold mine, we notice, has been gradually falling off during the last five months. It amounted to but 7,640 ounces, or \$150,000, during March. The dividend was \$2 per share, or \$64,000, in the aggregate.

THE PHOSPHATE TRADE.

Since our last report of the phosphate industry of Ottawa county the ore has begun to move from the mines towards shipping point, and already a quantity has been forwarded to Montreal and some shipments have been made from that port to London and Liverpool. Since the ice left the Rivière du Lièvre steam tugs have been busily engaged in towing scows loaded with phosphate from the mines to Buckingham, and the Canadian Pacific Railway Company is carrying it thence to Montreal as rapidly as rolling stock can be provided and the unfinished condition of the Buckingham branch of the line will permit. This additional facility afforded to mine owners for the transportation of ore to point of shipment is a great improvement on former years, and although some delay has been occasioned, by the unusually late season, in ballasting the new branch line, it is well understood to be only temporary. The additional ore-crafts and tugs that have been put on the river since last season have been the means of reducing the cost of transportation to Buckingham fifty per cent., and the extension of the railway to that point has effected a still further reduction, so that the extreme cost of delivering phosphate from the most distant mines in the du Lièvre district does not now exceed \$2.15 per ton, including hauling from the mines to the respective landings on the river bank where the ore is put on the scows. This represents a saving of quite \$1.50 per ton as compared with the cost a year or two ago. The mines in the district were never more productive than they are to-day and the quality of the phosphate to go forward this season is of a higher grade than heretofore. As one year has succeeded another, so has it been one pleasant duty to record some improvement in the method of carrying on this important industry. The investment of foreign capital has done much to bring about changes that had been needed and to place phosphate mining on a more businesslike basis; but time and experience have shown where this capital was to be used to best advantage, and to-day we find that our phosphate industry has been almost thoroughly systematized so far as it extends on this side of the ocean. As to how the product of the mines can be most advantageously disposed of in the various markets abroad still remains an unsettled question and is a matter of too grave importance to be treated with indifference. It is admitted that under the existing system of purchase and sale a large margin of profit is returned to the mine owner, but under a better organized system his profits might be much increased. We have already offered suggestions on this point in the columns of the REVIEW, and we have learned that some contracts for this season's delivery have been made subject to conditions more favourable to the shipper. A satisfactory solution of this vexed question can only be arrived at by the concerted action of those who are most interested in the future of our phosphate industry.

phate mines, and until this has been achieved there will exist more or less dissatisfaction among shippers of ore.

THE MINES.

The present condition of the mines is most satisfactory and since our last report there have been many important developments. The force of men employed has not varied since the winter and mining is being proceeded with with the same activity and engery which has been noticeable for the past twelve months. Additional machinery has been erected at some of the mines during the past few weeks, and provision is being made for the transportation of ore to the river bank. In one instance it is in contemplation to construct a tramway, about $4\frac{1}{2}$ miles in length, to enable the owners of the property to forward ore more rapidly and at reduced cost. Such substantial improvements as these are only decided upon after the deposits have been found to be of a permanent character, and the developments of the past year have conclusively proved this to be the case at all the mines in operation in the district.

The *High Rock*, *Star Hill*, *North Star*, *Little Rapids*, *Emerald* and *Battle Lake* mines have more ore in sight at the present time than ever before and are yielding abundantly. In no individual case, however, have so important developments been made as at the *North Star*. Some months ago the owners of this mine decided to test the depth of the deposits on their property and instructed their superintendent to put down a shaft with this object in view. Starting on a narrow string of phosphate, not more than 3 or 4 inches in width, he proceeded to sink and, irrespective of mineral, has continued his downward course until a depth of 165 feet has been reached. At a depth of 30 feet the vein had increased to about two feet in width, and from this level it varied between one and four feet wide until it was nearly lost sight of at a depth of 80 feet. Continuing down, with the one object in view, more or less phosphate was met with and at 120 feet below the surface the vein was again intercepted, measuring about one foot wide, from which point it gradually increased in width, and at the present depth of 165 feet the shaft is penetrating a body of phosphate, the dimensions of which cannot be ascertained. On all sides of the shaft, which is 20x8 feet, and the entire floor, is solid phosphate. The ore is of a dark green shade and perfectly free from foreign matrix, as was shown but a few days ago when one blast removed nine tons of phosphate, every pound of which was placed on the ore heap without cleaning or cobbing. This, together with the developments at the *Little Rapids* mine at a depth of 180 feet on a true fissure vein, has exploded the theory that Canadian Apatite is only to be found in pockets near the surface.

Reports have reached us that some virgin properties have been successfully prospected since the snow disappeared and extensive deposits uncovered. A few undeveloped lots have changed hands since the beginning of the year and will be prospected this season. Mining will be engaged in during the pres-

ent summer by the *Glasgow Canadian Phosphates Company*, composed of Glasgow capitalists, who have acquired some property in Ottawa County, and we are informed of their intention to carry on extensive operations. We trust that good locations have been selected for this company and that the gentlemen whose money has been invested will realize the results which have been promised to them.

PHOSPHATE QUOTATIONS.

There has been little variation in the market abroad since our last report. Most recent advices from London and Liverpool quote one shilling for 75 per cent., with a fifth of a penny rise, and some contracts are reported at these figures. We are also informed of contracts having been made on Canadian weights and analyses, with moisture taken from weight, and this we consider to be the most desirable contract that shippers can make.

We are aware of one firm in England bidding for an annual contract for 10,000 tons of high grade. There is an expression of opinion abroad that the market will stiffen as the shipping season advances.

OCEAN FREIGHTS.

Tonnage has been freely offered since opening of navigation from Montreal to Liverpool and London at 3s. to 4s. 6d. per ton, and there is every indication that rates for this season will not rule higher than last year. This, together with the reduced cost of transportation from the mines to Montreal, will, to some extent, compensate phosphate shippers for the fall in the market value of the mineral.

The first phosphate shipment of the season from Montreal was made by Messrs. Wilson & Greene, Montreal, from *High Rock* mine, on 23rd May, on S. S. Oxenholme, to the Phosphate of Lime Company, London, England.

The first shipment of phosphate from Buckingham, over the new branch line of the Canadian Pacific Railway and thence, via main line, to Montreal, was made on the 22nd of May by the Ottawa Phosphate Company. The Phosphate of Lime Company, London, England, followed with the second shipment on the 23rd.

MOVEMENT OF FERTILIZERS FROM CHARLSTON, S.C.

	Tons, 1884.	Tons, 1885.
January	33,202	36,598
February	49,762	47,384
March	32,776	43,710
April	8,755	8,190
	124,495	135,882

Large deposits of tin ore have been discovered in Virginia; the veins are of great width and of richness. The United States is paying about \$30,000,000 yearly for foreign produced tin. Americans hope that this great outlay will be made in the purchase of American tin in the near future.

The Origin of Phosphatic Mineral Deposits.

The following notes by a gentleman engaged in the shipping of guano and phosphatic rock from one of the West Indian Islands will doubtless prove interesting and instructive to those who have been studying the Laurentian apatite deposits in our neighborhood. Our correspondent states:

"On every one of the deposits so far worked a central hard rock has been found of a very high grade which has always been worked down to the sea level, and in the case of Sombrero and Pedro Keys, but more particularly the former, it has been mined below the sea level, and at Sombrero it is now being worked by divers—a sea wall having been built—and is being blasted considerably below the level of sea. These rocks I claim to be an original geological deposit of the Silurian period of the same age as the Laurentian range of mountains of Canada, which contains the apatite, the singular flags of Wales and the fossilized marbles of New Brunswick. In every instance mica is found in the neighborhood. These old rocks have a small quantity of free phosphoric acid attracted to the limestone and coral formations which invariably remain in them after the said limestones and coral have parted with their carbonic acid gas by the action of fresh water, fresh air and vegetable causes, forming, as a matter of course, a firm tri-calcic phosphate.

As a positive proof that birds have nothing to do with this formation, I am now digging on land which has been in cultivation 100 years, have dug to the depth of 14 feet, swept the holes out with a broom, leaving exposed the whole limestone rock or matrix, and in three months after showers, and where birds never go, I can again gather a considerable crop of phosphate, so much so that I consider five years will now replace all that I have taken away. The growth is quite perceptible; but to quote one instance, the Pedro Keys were entirely worked out in 1856, were taken hold of again in 1862 and '63, and worked till 1867, again in 1872, and worked till 1875, again in 1878 and are still being worked. While I was there I had one piece of perfectly flat coral rock, about one eighth of a mile square, which I used to sweep once in four months and it gave me each time about 400 tons. This change was more rapid in the wet season than in the dry. It was on a part of the Key where no birds ever stayed, and on these grounds I have long since given up the idea that the bird deposit had anything to do with the present deposits in the West Indies. I consider all West India phosphate deposits come under two heads, the original geological deposit, as a Silurian strata, and the metamorphic rock, which has been changed in times past and is being changed now."

CANADA'S MICA MINES.

The increased demand for mica which sprung up some two years ago, and the advance in price, consequent thereto, did much to stimulate prospectors and explorers in their search for deposits of this mineral. The result of these explorations has been the discovery of mica deposits in various parts of North America, where its existence had not been previously known, and in no part of this continent have such valuable discoveries been made as in Canada. Though by no means numerous, the deposits that have been located in this country are extensive and of much importance, and the quality of the mica

has been pronounced by the best authorities of Europe and the United States as inferior to none that has ever been offered to mica dealers. Selected samples of East India, ruby and white, and New Hampshire and North Carolina mica have been forwarded to us for comparison with some that has been produced at a Canadian mine, and the result has been most favorable to the latter, after submitting samples of the five different specimens to the various tests by which the quality of mica is determined. In point of resistance to heat, cleavage and transparency, the Canadian samples stood the most crucial tests equally with any of those from the other localities above referred to, and much more satisfactorily than some. In fact the experiments to which it has been subjected have proved it to be of the very highest standard—and the crystals are of large sizes.

At the *Pike Lake* mine, in the township of N. Burgess, county of Lanark, a very excellent quality of white mica is being produced, and the sizes of the plates that are being shipped from this mine are considerably above the average of shipments from other mines.

In the township of Loughborough, county of Addington, there has been a large production of mica, of a dark amber shade, which appears to have found favour among certain dealers and stove manufacturers both in Canada and the United States.

The *Villeneuve* mine, situated in the township of Villeneuve, county of Ottawa, is, beyond any question, the most valuable and important mica property yet discovered in Canada. During the past eight months it has been undergoing development and is now a steady producer of the best Canadian mica we have seen. The samples that were tested for comparison with East India, North Carolina and New Hampshire mica, to which we have referred, were forwarded to us from this mine. Several tons of crystals of various sizes have already been taken from the tunnel and shaft, and a large number are now exposed, some of which are quite two feet square. Within the past few days we have received a number of plates, measuring 12x12 inches, of as beautiful mica as has ever been produced, which can at any time be seen at this office. This mine is destined to become a very heavy producer and is an exceedingly valuable property.

As stated in our last number, two important deposits of excellent white mica occur in the township of Miller, county of Frontenac, and in the township of Maison-Neuve, county of Berthier, respectively, on which, however, no development work of any consequence has yet been done.

BEAUCE MINES.

We have not been officially informed recently of what progress is being made in the Beauce gold fields. The latest report that has reached us bears date May 9th and gives an encouraging account of what has been done on the Gilbert River and on Slate Creek since the snow and frost disappeared. In the last mentioned locality some good work had been done at the *Allan & Humphrey* mine, and the shaft was penetrating rich ground a short distance, it was supposed, above bed-rock, but at the time our correspondent wrote washing had not begun. A fair quantity of coarse gold was being taken from the alluvial washing on the Gilbert, and the Canada Gold Company was continuing to prospect the quartz veins in Rigand-Vandrenil. In the parish of Linier exploration continues among the silver-bearing ridges and a vein, on which Mr. Torrance was working last autumn,

has been thoroughly prospected and its continuity for some miles has been established. Already a number of claims have been located along the bearing of the lead and rich ore has been taken out, samples of which we have seen. It is not unlikely that this season will witness considerable activity in the district and that several companies will be organized for permanent mining.

ASBESTOS MINING.

Towards the end of April work was resumed at the Asbestos mines of the Eastern Townships and has since been proceeded with vigorously. The *Johnson* and the *Boston Asbestos Packing* companies have put on an additional force of workmen and look for a corresponding increase to this season's output of their mines in Thetford over that of last year. Before mining was begun in the spring the entire output of the *Johnson* mine had been contracted for ahead, and we are informed that other mine owners have already disposed of all they can produce up to the close of the season, and at same prices as last year. This is attributed to a sudden demand having sprung up during the Anglo-Russian crisis, and it still continues. From the mines of Thetford, Coleraine, Broughton and Danville, it is expected that the shipments this season will exceed those of any former year, and as many undeveloped properties will be opened during the summer the Canadian Asbestos mines are destined to contribute largely towards supplying the world's demand in the future.

FITZROY LEAD MINE.

This mine has been actively worked during the past eighteen months and is now fairly developed. The mine is situated on an island formed by two branches of the Mississippi River at their junction with the river Ottawa, and about two miles from the village of Galetta, in the township of Fitzroy and county of Lanark, N.R. A shaft has been sunk on a vein of galena, in limestone formation, to a depth of 45 feet, and the continuity of the vein, which is about six feet wide, has been proved.

The vein matter yields from 15 to 20 p.c. of galena carrying about 3 oz. of silver to the ton. The mine is worked exclusively for lead and the ore is forwarded to Kingston for smelting. About 25 miners are employed and it is expected that a large amount of ore will be shipped during the present season.

IRON MINING.

With the exception of the *Coe Hill* mine, situated at the northern terminus of the Central Ontario Railway, and the *Bristol* mine in Pontiac county, there was little activity at the iron mines of central Canada during the past winter. At *Coe Hill* 75 miners have been employed since ore shipments ceased last autumn, whilst the *Bristol* mine gave employment to about 40 men. At both of these mines the force of miners is now greatly increased, nearly doubled, and during the present season of navigation it is to be expected that large shipments of ore will be made to the United States—that from *Coe Hill* to Cleveland, Ohio, via Ontario Central Railway to Weller's Bay, where the company has extensive docks and ore-pockets, and thence across Lake Ontario; and that from *Bristol* mine over the Canadian

Pacific and Kingston and Pembroke Railways to Kingston, from which point it will be forwarded to the company's works at Charlotte, New York State.

Other mines contiguous to the Ontario Central Railway will be actively worked during the present season, we are informed, and we hear of another property in Pontiac, not far distant from the *Bristol* mine, on which, in all probability, development will soon begin.

In the section of country now penetrated by the Kingston and Pembroke Railway large deposits of excellent magnetic and hematite ore abound, and with the facility for transportation now afforded by this railway, recently completed, there exists no reason why development work should not be proceeded with forthwith. The only reason we can think of why such a move has not already been reported to us is that the best properties have fallen into the hands of people who have not sufficient capital to develop them, or that they are being held by speculators. That these deposits could be profitably worked and would become important producers of iron ore there is no doubt; that they should be allowed to continue in their present undeveloped state is to be regretted.

Plymouth Consolidated Gold Mining Company.

We have on several occasions referred to the successful operations of this company at its mines in Amador county, California, and are indebted to the president, Mr. VanNorden, for a copy of the company's quarterly report, dated April 1st, which reached us immediately after the publication of our last number, on May 1st. It gives evidence of this company's continued prosperity and of the intelligence and economy with which its operations are conducted. The report reads as follows:

Gold Bullion produced January, 1885..	\$85,721 99
February, 1885..	80,974 87
March, 1885 ..	80,135 03
Total product for three months, 1885.	\$246,831 89
Operating expenses for same period..	81,930 90
Profit	\$164,900 99
Cash on hand, January 1st, 1885.....	74,295 06
Amount applicable to dividends.....	\$239,196 05
Paid dividends for quarter, Nos. 20, 21 and 22, \$50,000 each.....	\$150,000 00
Construction Account, three months ..	5,639 58
	\$135,639 58
Cash Surplus, April 1st, 1885.....	\$ 83,556 47

The cash on hand, \$83,556.47, is *actual surplus*, the company having no indebtedness whatever.

Since the annual report was issued, the main shaft has been sunk for a new level, No. 5. Drifting for the ore was commenced at a point 100 feet below No. 4. The ore will be reached early in May.

The tunnel running south on No. 2 level, is 766 feet long, measuring from the Pacific shaft.

The new Woolford shaft is down 233 feet, with a body of ore seven feet wide, milling about nine dollars per ton, including sulphurets. This vein is 600 feet east of the main mine, and is slowly improving as greater depth is reached.

The mother of the first child born in Eagle City, Arizona, received a present of \$5,000 in gold dust from enthusiastic miners of that region.

Burchard's special report on the output of United States mines during the year 1884, places the total amount of gold product at \$30,800,000 and the total of silver at \$48,800,000.

GOLD MINING IN INDIA.

The India gold mines created quite a "boom" in London some four or five years ago, and vast sums of money were invested in the wildest manner on mere "prospects." There was in fact not a single paying or developed mine in the gold district when the boom was at its height. It is almost needless to say that the "prospects" in very few instances only found any gold, and the crazy investments in worthless property and impossible mills were almost all lost. A year ago, a single company, the Mysore Gold Mining Company, was at work, for it alone had an unexpended balance of working capital of £13,000 (\$65,000), and since it had never paid any thing, there was every probability that it too would stop, and that India gold-fields would sink out of sight until the next mining craze in London. It appears that the Mysore Company has at last struck "pay," and has obtained 1,887 ounces of gold from 1,318 tons (2,240 pounds) of ore, or nearly 1½ ounces per ton. The cost of obtaining this is not stated, but the effect of its production is a sudden movement to reconstruct the moribund companies that have mines in India, and more capital is going into other properties on this slender basis. We hope the Mysore Company will make a great success; but if it should, it would be none the less true that the original investment in the India gold-fields, and even in the Mysore Company's undeveloped property, was of the wildest and most irrational kind, and the greater part—we hope not all—of it will naturally and inevitably be permanently lost.—*E. & M. Journal, N.Y.*

GOLD MINES OF AUSTRALIA.

The Victoria gold mines are in a prosperous condition, though no remarkable discoveries have been made during the past year. From the Mining Registrars' reports for the quarter ended December 31, 1884, we learn that the gold yield for the year 1884 was 778,618 oz. 7 dwt. 22 grs., or about \$15,572,367, counting the gold at \$20, or £4, per ounce. During the last quarter of the year, the yield was 200,788 oz. 16 dwt. 13 grs., say \$4,015,796, which was a considerable increase on the corresponding quarter of 1883. The registrars report the mining industry as prosperous, and that the production will probably increase during the coming year. Seventy-eight gold mines paid during the quarter \$1,132,895 in dividends, equal to about 28 per cent. of the entire production.

The mining population of Victoria is estimated at 28,430, of whom 12,988 miners were employed in quartz mining and 15,442 in alluvial mining. Of the total mining population, 5,369 were Chinese.

The value of all the machinery employed in the various mining operations in the gold field was estimated at £1,888,214, or \$9,441,070. A large number of diamond drills are now in use.

The three deepest shafts in the colony at the end of 1884 were, Magdala Company, 2,409 feet; Lausell's 150 mine, 2,041 feet; Victory & Pandora Company, 1,940 feet.

The Victoria gold fields appear to have a permanent future in quartz mining, for a vast number of reefs of low grade but paying ore have been found, and though the operations are in general on a small scale, they have, as above mentioned, been attended with profit.

The average yield of certain lots, amounting to 223,691 tons of quartz milled in the last three months of 1884, was 10 dwt. 5.96 grs., say \$10.30 per gross ton.

The Late Sir William Edmond Logan

In March number of THE REVIEW we published some reminiscences of this distinguished scientist, and we take much pleasure now in presenting to our readers a portrait of the great geologist, produced from a photograph taken in the year 1870, and which will be more readily recognized by his host of friends than those of him which have been published from photographs taken at a more recent date.

Sir William was born in the city of Montreal on the 20th April, 1798, was educated in Scotland, at the Edinburgh High School, and in 1817 he entered his uncle's counting-house in London, England. Dr. Harrington, in his "Life of Sir William," says: "For about ten years the great and busy metropolis was Logan's home, and it is to this period that we must look if we would obtain a view of many of his traits of character, which in later life only came to the surface at intervals. If, like his four brothers, he never married, and if for years he lived much in the seclusion of his study, or far away from the busy haunts of men, often with Indians as his sole companions, it was not from any want of appreciation of domestic comfort or happiness, not that to him society was devoid of charms. He was no misanthrope.

The Late SIR WILLIAM EDMOND LOGAN, Knight,
F. R. S., F. G. S., L. L. D.
(Born 20th April, 1798, died 22nd June, 1875.)

But as he advanced in life, the cause of science, which he had espoused, became more and more a ruling passion, and often masked his true nature and disposition." In 1831 he removed to Wales where he engaged in copper smelting at Morriston, near Swansea, and it was there he began the study of mineralogy and geology. In 1837 he was elected a Fellow of the Geological Society. In 1842 he was appointed to the position of Provincial Geologist of Canada and assumed the duties of office at Kingston in August of the same year. This appointment was the origin of the present Geological Survey of Canada. In 1851 Logan was elected Fellow of the Royal Society, in 1855 he was presented by the Emperor of France with the Cross of the Legion of Honour, and on the 29th January, 1856, was knighted by the Queen at Windsor. About this time he was awarded the Palladium or Wollaston medal—the greatest honour the Geological Society has to bestow.

From the day of his appointment to the office of Provincial Geologist, up to the time of his death, Sir William's life was one of untiring devotion to his labours in the field of science. He identified himself with the interests of his native country, and endeared himself to all who had come into personal contact with him. To testify their appreciation of the valuable services he rendered to Canada, his fellow-townsmen of

Montreal presented him, in 1856, with a testimonial in the shape of a massive silver fountain bearing the following inscription:

In commemoration of
His long and useful services as
PROVINCIAL GEOLOGIST IN CANADA,
and especially his valuable services in connection with the
EXHIBITION OF ALL NATIONS
in London in 1851, and in Paris in 1855, by which he not
only obtained higher
honour and more extended reputation, but largely
contributed in
making known the natural resources of his native country.
This Testimonial was
PRESENTED TO
SIR WILLIAM E. LOGAN, Knight, F.R.S., F.G.S., L.L.D.,
by many of the inhabitants of Montreal,
desirous of marking their respect and esteem for one
of the most distinguished of their
fellow-citizens.
Montreal, July, 1856.

Beset on all sides by difficulties and disadvantages Sir William continued to prosecute the work of the Survey with that zeal and energy which had ever characterized the man, and after serving the country for upwards of a quarter of a century his resignation was tendered to the Government in January, 1869. It was with feelings of deep regret that the public received the announcement of Sir William's retirement, and never was the press of any country more unanimous in its expressions of approval at the career of a public servant. After his retirement from active employment Sir William made frequent trips between Canada and Great Britain and in August, 1874, he sailed from Canada for the last time and went to visit his sister at Castle Malgwyn, Wales, where he died on 22nd June, 1875.

Logan was not only a Fellow of the Royal Society of London (1851), the Royal Society of Edinburgh (1861), and the geological societies of London and Edinburgh (1867), but also a member of the geological societies of France (1842) and Belgium (1874), of the Imperial Leopoldo Carolinian Academy of Germany (1857), the Philadelphia Academy of Natural Sciences (1846), the Marine Historical Society (1847), the Academy of Sciences of St. Louis (1857), the American Academy of Arts and Sciences, Boston (1859), the State Historical Societies of Wisconsin and Iowa (1859), the American Philosophical Society (1860), the Buffalo Society of Natural Sciences (1863), etc. He received the honorary degree of Doctor of Civil Law from the University of Lenoxxville in 1855, and that of Doctor of Laws from McGill University in 1856. He was also the recipient of more than twenty medals, awarded to him on various occasions as a recognition of his scientific work.

BRITISH COLUMBIA.

MINING NOTES.

Reports from Lorne Creek are encouraging. Fifty-seven miners are on the creek, and others are prospecting in the neighborhood.

An extensive discovery of silver has been made at Yam Creek, Northern Territory. There is ample wood and water on the ground for machinery.

Explorers and prospectors who have spent year after year in the province have discovered unmistakable indications of silver, all of which remain quite undeveloped.

Capt. McFarland and Mr. Caulfield arrived in Victoria on 7th May from the north, having come down for the purpose of procuring the requisite machinery for hydraulic mining.

There are reports to the effect that rich gold diggings are a certainty in the Kitsum-Kayhun country, and that white and Indian miners are making preparations to thoroughly work the new find.

Mr. McCullough, of Victoria, a short time since sent three specimens of silver ore from the interior to San Francisco for assay, and has received returns from two of the specimens assayed, \$28.27 and \$29.85 to the ton, respectively, and the third \$461.85 in silver.

Mr. H. B. Dart, of Boston Bar, has picked up a nugget of pure gold weighing about 6½ ounces. While walking over his ranche he noticed a piece of quartz slightly above the ground, and hammering out the rotten quartz he found a large irregular piece of gold, which now looks like a honeycomb with the quartz separated from it.

It is stated that two French gentlemen, M. Gérard and M. Péande St. Giles, will explore a portion of the Rocky mountains and the Selkirk range during the coming summer. They are on a mission of scientific enquiry, and will probably issue a report to the French Geographical Society on the mineral wealth of the province. After visiting Cariboo and the other mining centres they will descend the Fraser, examine the copper veins on the Semilkameen, and arrive in Victoria about July. They will then proceed to the coal district, and will also examine the iron deposits on the islands. M. Gérard is a mining engineer and it is to be hoped that his visit will result in the introduction of French capital into the province.

A large number of miners started north on 15th May for the mines on Lorne Creek, and those on the newly discovered creek in the same neighborhood, and the recent strike on Kitsum-Kayhun. Mr. J. S. Graaf, an old California miner, who spent the whole of last winter at the mines states that they are far richer than has been reported, and fully 2,000 men could go in and make good money. The late strikes would seem to fully endorse this statement, and probably such success will be met with this year that there will be a boom in the northern mines next season. They are easily and cheaply reached; supplies are also reasonable, and operations may be carried on during the greater part of the year, there being only five weeks of severe weather in December and January to contend against. The reports from the miners have been few, but all are favorable, and treble the number have already gone in this year. The prosperous days of the past may be repeated at the rich diggings that are being developed on the northern coast.

Mr. B. Bailey, in a letter to the *Colonist*, Victoria, says that the company of which he is a member, after prospecting for five years, has struck a well defined lode of silver ore sixteen feet in width and traceable by outcroppings 4,500 feet. So far as Mr. Bailey is able to judge from experimental results, he says that galena, gold and silver predominate. He adds that the lode is so extensive and rich that it will soon attract the attention of the world. The company is now running a tunnel and expects to strike the lode in three weeks. The locality is on Scott river, eight miles from Shuswap lake, in the mountains. A wagon road can be made from the steamboat landing to the road. Writing two days subsequently, Mr. Bailey says:—"We have broken through the outer crust and come upon a black seam of

ore some two feet in width which resembles oxide of silver. Above, or between the outer and lower seam, was a six-inch stratum of honeycombed quartz thickly coated with chloride. I am well convinced in my own mind of its worth; but will wait patiently for a test, and shall forward samples to California for assay."

On the 1st March, Messrs. Donohue, Roundy, and McArthur, with some half dozen other white miners, and ten Indians started on a prospecting tour. Following up the Sheeaxe river from the Naas to the lakes, they discovered two creeks, which they prospected with success. These creeks empty into Kitsum-Kayhun lake. Three weeks ago a long letter was received from the miners, stating they had good prospects—and would take up claims. The Indians came for a new supply of provisions, and brought some of the new gold with them; they returned and will take up claims. The white miners would not advise any great rush until they have further prospected the surrounding country. News will be given in a short time in regard to it. These creeks are easy to reach; the Indians walked out in two days—the white men call it 50 miles starting on a trail commencing 10 miles above tide water on the Naas, following the stream, and then crossing three lakes. Boats can be placed on these a distance of 17 miles, so that supplies can be freighted in. The men believe they have struck a rich country. It is reported 10 cents a pan is being panned out. It is near where Mr. W. Madden discovered gold lost fall.

LAKE SUPERIOR MINING NOTES.

As stated a month ago, arrangements have been made for starting three new mining and manufacturing companies. Two of them will begin operations this spring in the Rabbit Mountain district and one on the main shore at Port Arthur.

Parties who have recently come in from the Silver Mountain region are a unit in their opinion of the richness of that section. Several new discoveries have been made since the snow left the mountains which are reported to be of importance.

Capt. Wheeler has proceeded to the Zenith Zinc mine with a party of thirty miners, and a number of Indians to man the canoes and pack in supplies. Work was commenced at this mine last year and prospects were sufficiently encouraging to warrant these preparations for permanent mining.

Those who have been watching with interest the development of the Twin City mine are pleased to know that the result of the past year's work has so encouraged its owners that they have decided to erect and equip a stamp and concentrating mill, arrangements for which were expected to have been completed by the end of May.

The result of the winter's work at the Beaver mine is said to have been very encouraging, and satisfactory progress continues. The Superintendent boasts that the vein has never "gone back on him" since he opened it, and that it is a steady producer of silver ore. New roads are being made to the mine which will shorten the distance between it and Port Arthur.

Messrs. C. G. Kimball and John McGuire, of St. Paul, arrived in Port Arthur last month en

route to the silver region. The object of their visit was to inspect the mines in operation through the district, the owners of which are much gratified with the developments of the past six months and are anxious to have them examined by practical miners whose opinions would be of value.

At the Rabbit Mountain mine work has advanced through pay ore to the boundary line of the company's property. A shaft is also down as far as the engines now in use can take it, and pending the result of negotiations now in progress for the purchase of the adjoining property the company has decided to confine its operations to surface prospecting. If the purchase be made, new engines and a stamp mill will be erected without loss of time, the capacity of which will depend on the result of the negotiations referred to. The company has been collecting its smelting ore for shipment, a consignment of which will shortly go forward to New York.

The Huronian mine at Jack Fish Lake is unquestionably the most important and the richest gold location in the Lake Superior district. The vein on this property has been exposed for a distance of over 2,000 feet and measures from 4 to 12 feet in width. It is a true fissure vein of gold-bearing quartz in a gangue of talcose slate and has been thoroughly prospected. A shaft has been put down to a depth of 150 feet and drifting has been carried for about 100 feet, also on the vein. There is a ten stamp-mill, a steam hoist, saw mill and blacksmith's shop on the property, and their plant is quite inadequate to the capacity of the mine. Some of the ore has yielded as high as thousands of dollars to the ton, but the vein matter taken from the shaft and drift, all the way from the surface to the lowest point reached, has returned \$20 to the ton, and there can be no doubt a large percentage of the gold was not secured, owing to the imperfect machinery in use. Such a property as this should be in the hands of a strong company with ample capital to proceed with mining operations on an extensive scale, and to work to the best advantage. Under such conditions it would pay enormously.

Does mining pay? This question may to some extent be affirmatively answered by the fact that \$5,000,000 were received during 1884 as dividends by those engaged in gold mining in the colony of Victoria.

A MONSTER GOLD NUGGET.—A nugget of gold weighing 21 pounds (about \$5,000) has been found at the Berlin diggings, Victoria, and brought into Dunolly by two miners. The gold field was celebrated for nuggets some years since, and the present year will no doubt lead to the discovery of others.

Idaho mines produced nearly \$9,000,000 in gold and silver during 1884. The product for 1885 will exceed that amount. The mineral field in this territory is above 8,000,000 acres. This includes gold, silver, copper, iron, lead, antimony, mica, cinnabar, tin, soda, salt and other products.

The copper products of the United States were 30 per cent. more in 1884 than in 1883. The largest gain was in Montana, which territory produced 44,500,000 pounds against 24,000,000 in 1883. In Arizona the increase was 2,700,000, and in the Lake Superior country 8,800,000.

THE GREAT FOREIGN COPPER MINES.

The influence of the decline in the price of copper upon the profits of the small number of mines that control the market for this metal is a subject of great interest; for it shows approximately the limit of profitable price and the cost of production. This information concerning our great foreign rivals is still more interesting and important.

The following table we have condensed from the London *Mining World*, and have added the quotations of the shares of the companies at the beginning of the present month. Under the recent advance in Chili Bars, a corresponding advance has taken place in the shares:—

YEAR.	THARSIS.		RIO TINTO.		MASON & BARRY.		PANULICILLO.		Price of copper.	
	Dividend per cent.	Shares Par £2.	Dividend per cent.	Shares Par £2.	Dividend per cent.	Shares Par £10.	Dividend per cent.	Shares Par £4.	Chili Bars.	L.
1879	16½	21½	5	10	1	3½	5½	66½	53½
1880	20	34½	8	19½	9½	3½	73	56½
1881	25	48½	14	23½	10	4½	71	58½
1882	27½	45½	14	31½	15½	15½	15	5½	71	63½
1883	27½	71	14	25½	13	13	12½	7	64½	58
1884	20	5½	8	21	8	8	mill	5½	58	47½
May, 1885	4½	8	7½	7½	2	44	43

* Rio Tinto has also £2,500,000 of 5 per cent. mortgage bond.

last year was 3.23 per cent by wet assay; but the company expects to receive from 2¼ to 2½ per cent. on the 400,000 tons sold for the sulphur. This, at present prices, would amount to about 18s. per ton, and the sulphur is worth about as much more.

According to the president's report, the Rio Tinto expects to produce about 59,000,000 pounds of copper this year. Of this, 15,000 tons of 2,352 pounds will be produced by the company at the mines, and about 10,000 tons will come from the 400,000 tons of pyrites already contracted to acid-works.

We glean from the president's address that the cost of the 15,000 tons of copper produced at the company's works, delivered in London, will be about five and one half cents per pound. This, however, does not include "interest and sinking fund expenses for bonds," nor "expenses of administration." We may add to the list of companies cited above, the Cape Copper Company, which has 20,000 shares with £8 per share paid in, and which was quoted in London at the beginning of the present month at £30 to £31.

The Calumet & Hecla, with its capital of \$2,500,000, say £500,000 of capital, in \$25 shares, worth \$16 per share at the beginning of the month, holds its own well with its foreign rivals. This company expects to produce from 46,000,000 to 48,000,000 pounds of copper this year from a 4½ per cent. ore yield.

The great Anaconda, with its immense deposit of ore, which is yielding on an average say 10 per cent., and with its magnificent works, will probably produce 35,000,000 pounds of copper this year.—(*Engineering and Mining Journal*, N.Y.)

COPPER MARKET REPORT.

BY

S. RAUNHEIM,

224 Pearl Street, New York, May 14th.

The condition of the copper market since my last report has improved; in fact, more copper was sold to consumers in the last three weeks than during three months before.

The price of Lake copper is firm at 11½ cents: of other brands, about 10¾@11 cents, according to quality. At the same time, the price of Chili Bars has advanced in London from £43 to £45½, and a further advance would not be surprising, when the facts of the decrease of the American production become generally known, or should the manipulations of the European contractors for American copper and furnace material cease or be defeated by a counter move.

It is remarkable that a lot of Lake copper was sold in London at £55, two weeks ago, while Chili Bars were held at 43½, equal to a difference of £11½. This constitutes a handsome profit to the French syndicate, whose purchase price for May delivery is about £48. I am positively informed that the current price for Lake copper in Europe is £55½. Any returns of such copper from Europe to this country are hereby prevented. Furnace material at the disposal of our refineries remains scarce. The production of such material in Arizona is a very small one. Reports concerning the Copper Queen mine are not favourable. The Old Dominion Company has closed its works. This relieves the market of one million pounds copper annually—to be regretted in the interests of the shareholders. The Globe mine shows large reserves of ore, and, according to the statement at the last meeting of the shareholders, the copper laid

down here costs 6¼ cents per pound (of pig-copper), a profit of about \$25,000 a month.

The management in such hands as Professor Trippell and A. Harnicknell was an excellent one, and no doubt was entertained as to their ability to pay off the most pressing floating debt of the company during the next six months by actual profits made on the run of the furnaces. Unfortunately, the creditors, Pope, Cole & Co., of Baltimore, had to go into liquidation. The financial mismanagement of a former board weighs upon the present administration, chiefly composed of parties representing the Simpson estate at Boston, which owns \$568,000 mortgage on the Old Dominion Company's properties. Should the large shareholders be unwilling to render assistance, the mines may come under foreclosure and shareholders be frozen out. It would lead me too far to dwell on the reasons that have brought about such a result in a good mine. It is the old story: too much water in a mine may be overcome, though expensive to get out; but too much water in the stock is simply ruinous, even if applied to the best mine.

The Montana production during the first four months of this year, already fallen off three million pounds, will of course remain below the estimate; but, as principal mines run again in full blast, this year's production will come up certainly to last year's.

The same may be said about the Lake companies, the increased output of the Calumet & Hecla and others coming up to the falling off from the closing of several other Lake mines.

Exports from the United States to Europe during the first three months of 1885 were:

6,786 tons of ore and matte, valued officially at.....	\$ 831,000
5,410 tons of ingots and bar copper, valued officially at.....	1,257,000
Total.....	\$2,088,000

Corresponding to about nineteen million pounds of fine copper contents, or more than one half of our entire production. This statement confirms my latest reports, and proves our copper market to be in a very healthy condition.

New Copper-Manganese Alloy.

Engineering says: The French "Société d'Encouragement pour l'Industrie Nationale," at its meeting on December 26th, 1884, offered a prize of 1,000 francs for the discovery of a "new alloy useful in the arts." This prize has been awarded to M. P. Manhès, now so well known for his successful application of the Bessemer process in the metallurgy of copper, on account of his discovery of the value of an alloy of copper and manganese for improving the quality of commercial copper. It is stated that copper always contains more or less sub-oxide of copper irregularly disseminated throughout its mass, and that in consequence of this it loses some of its tenacity. M. Manhès prepares an alloy of 75 per cent. copper and 25 per cent. manganesc, and adds it in small quantities to the molten copper after refining, and just before casting, stirring the bath of metal at the same time. The manganese of the alloy is stated immediately to combine with the oxygen of the dissolved cuprous oxide, forming a manganiferous slag which is easily removed. The operation is cheap, and very much improves the quality of the copper so treated. Also several of the principal alloys of copper, bronze, gun-metal, and brass are of superior quality when prepared with copper purified in this manner. It is stated, too, that a series of experiments has proved that copper so treated

The decline in profits is not, however, to be counted as varying in direct proportion to the price of copper; for as prices decline, many economies are introduced and the cost of production per pound of copper declines. The production has been greatly increased by most of these companies, and a still heavier increase is promised.

The Rio Tinto is undoubtedly the greatest, though perhaps not the most important, factor in this question. The most important factor is the great company nearest the stopping limit.

This, the greatest mine in the world, is estimated, according to the president's address at a recent meeting of the stockholders, to have reserves of ore amounting to 150 million tons, and its dumps are stated to contain 46,000 tons of 2,352 pounds, or 108 million pounds of copper. This stands the company in £6 7s. 6d. per ton, or about one cent per pound. The cost of extraction by the company's lixiviation process is small, and it has already extracted 33,000 tons of copper from these dumps. It is not, of course, to be expected that the entire contents will be saved; but the process, though a slow one, extending over years, extracts finally a very high percentage of the metal, and at a low cost. The company mines about 5,000 tons of ore daily, and this year has contracted to supply 400,000 tons to the acid-works of England, France, Germany, etc., and will treat at the mines over one million tons.

The average copper contents of the ore mined

is much better suited for sheathing ships' bottoms than ordinary copper, as it is more slowly acted upon by the sea-water. On these grounds the committee of the society has awarded the prize to M. Manhès.

PRICES FOR MINING SOFT COAL.

Reports have been received by the *Coal Trade Journal*, N.Y., from a large number of mining localities throughout the United States, showing the prices paid for mining, the width of seams, size of screens, etc. As these reports are too voluminous to publish in full the *Iron Trade Review*, Cleveland, O., has constructed the following table of comparison showing the widest ranges in the several items referred to :

State.	Width of Seam. (feet.)		Price for Min- ing per ton.		Size of Screen.	
	Largest	Small- est.	High- est.	Low- est.	Larg- est.	Small- est.
Alabama	3	2½	\$1.00	\$.62½	3	1
Colorado	9	...	1.12	.92	1½	...
Illinois	7	2½	1.29½	.37½	1½	...
Indiana	7	2½	.53½	.40	1½	...
Iowa	5½	4	1.00	.70½	1½	...
Kansas	3½	1½	1.85	.82½	1½	...
Kentucky	6½	4	.70½	.58½	1½	1½
Missouri	4½	1½	1.17½	.94	None.	None.
Ohio	5½	4	.55½	.46½	1½	1½
Pennsylvania	7	3½	.61	.35	2	1½
Tennessee	5	2	.70½	.30	1½	1½
Virginia	24	11	.94	.35	1½	1½
W. Virginia	14	3	.56	.40

These reports are not, of course, intended to be complete, as will be seen by the fact that the highest price reported from Ohio is put at 58½ cents per ton, whereas the present rate in some districts is 75 cents ; nevertheless they are of much interest to manufacturers and others and worthy of preservation. In several instances the price has been reduced from the bushel to the ton standard.

FAMOUS DIAMONDS.

The Amsterdam firm of J. Metz is busy with the erection of a special workshop, in which the cutting of the largest diamond of the world is shortly to begin. This diamond, which has recently been found in South Africa, weighs 475 carats, and is said to be greatly superior in color and brilliancy to all the other famous diamonds of the world, the largest of which, the "Grand Mogul," is in the possession of the Shah of Persia, weighing, after being cut, 280 carats. Next in size follows the "Orloff," of 195 carats, which adorns the point of the Emperor of Russia's scepter. The English "Kohinoor" originally weighed 116 carats, but in its present form is reduced to 102¾ carats. The "Regent," one of the French crown jewels, weighs 136⅞ carats. The time spent in cutting this last jewel was two years, during which time diamond powder to the value of £850 was used. The "Star of the South," which has been cut at Amsterdam, weighs 125⅞ carats.

In eight months ending November 30th, there were imported into India, in excess of all exports, gold bullion and coin amounting to \$20,396,980, or at the rate of about \$30,600,000 a year.

The power of Niagara Falls, exclusive of the velocity with which the water reaches the brink, is calculated to be 5,000,000-horse power, or nearly one-fourth of the whole steam power of the earth.

Asbestos, its Manufacture and Uses.

(Continued from page 11, Vol. 3, No. 3.)

So much for the first branch of the manufacture, which, although commercially very valuable, yields in interest to the second. Asbestos yarn may be worked up in a hundred different forms, serving as many different uses, while the paper appears to be chiefly serviceable for making joints, though it is now used also for making fire-proof partitions and for other building purposes. It may not be that we shall ever reach the time when our under-garments will be purified by fire instead of by the laundress' art ; but short of this, many uses now filled by materials the thorough cleansing of which can only be secured by their destruction may, possibly, be better served by asbestos.

We must now go back to the point in the process where the cleaning of the fiber ends. That description of raw material designed for the manufacture of yarn is discharged from the boiling-tanks into hydro-extractors. There all the free water is thrown out, and the drying is completed by steam heat. The fiber is then taken to a "shaking" machine, which separates the long fiber from the short, the latter being sent into the millboard department, and the former to the "carding" room. But its appearance is scarcely encouraging to one who has been accustomed to cotton or wool. These latter staples, examined under the microscope, exhibit a notched or serrated appearance, which explains the ready way the material clings together when twisted. But with asbestos, this structure is entirely wanting, and therefore the problem of twisting it into a thread presents special difficulties, which are rendered more evident when its behavior in the breakers and carding-engines is watched. Instead of leaving these in a sheet or "lap" it drops out in separate fragments, just as it entered, except that the fibers are combed out straight and laid side by side, parallel with each other. In spite of this, however, the carding is accomplished in several successive machines, each set to a finer gauge than the preceding. It is a difficult task to describe machinery of this class intelligibly, even with the help of engravings, to those who are totally unacquainted with it, and it would take more space than we have at disposal to describe the relative offices of card cylinders, lickers-in, and doffers. It is sufficient to say that the entire process is one long-continued brushing or combing, in which cylinders covered with teeth of gradually increasing fineness pass the fibers from one to another, continually drawing them out, until all knots and irregularities are eliminated and they lie straight and parallel.

The last machine is that known in the woolen trade as the condenser. Its final cylinder is covered with rings of card filleting with bare zones between them. The fibers are stripped from these rings by a reciprocating knife called a "fly-comb," and in the case of worsted are delivered in a number of parallel filmy tapes on to a travelling apron. Above this apron is a second, travelling in contact with it at the same speed, and having in addition to its forward motion a sideways or reciprocating motion. The tapes are fed forward between the two aprons and are at the same time rolled or "condensed" into threads. They are not spun, as there is no regular twist, but may be compared to threads of putty or dough rolled between the palms of the hands. The asbestos, as we have already explained, will not cling together upon mere contact, and consequently it leaves the last card cylinder as fragments rather than tapes. These fragments are neatly gathered into rows upon the apron by reciprocating scrapers, and are then

condensed as they proceed to the coiling cans. This is a part of the process that has required the most time and money to work out, and it was only after a long course of experiment that a carding and condensing apparatus was devised that was successful in producing satisfactory threads.

From this point, the manufacture of the yarn is simple. It is spun upon slubbing or roving-frames, such as are used in the cotton trade, except that no effort is made to draw it. These frames have a "positive take-up," and do not put any strain upon the yarn until it is twisted, when its tensile strength is very great, as the individual fibers are much stronger than those usually met with in spinning operations. The three remaining processes are doubling or twisting, braiding and weaving. In the first, a number of yarns are laid together, and are twisted into a cord or rope. This is generally used as the core of a braided packing, and is inclosed in a plaited cover by a machine of the usual construction, or the packing may be braided from the centre with fine threads. If a square packing be desired, in place of a round one, this is attained by the device of using four smaller cores around the central one. These extra cores are fed up through the heads around which the braiding spindles revolve in their mazy course, and are securely bound on to the middle core in such a way that the finished strand is of square section. One form of round packing is produced in a smallware loom, and is a specialty with the United Asbestos Company. It consists of a parallel or slightly twisted core, surrounded by an annular envelope of straight longitudinal warp threads bound together by a fine weft, which is drawn tight in the weaving and sinks into the soft centre, so that it is not exposed to wear until the covering is nearly destroyed. The result is an exceedingly elastic gland packing that has a fine bearing surface on the rod, and is capable of easy and rapid manufacture.

The asbestos cloth is woven in a loom exactly like calico, except that the reeds and healds are much coarser. The narrow cloth or tape is woven in a smallware loom. Both the sheeting and the tape are used for making joints, and the former is sometimes rubber-proofed to render it water-tight. The asbestos and India-rubber woven tape is so constructed that it can be bent around a corner without puckering, and thus is particularly useful in making joints in man-hole and mud-hole doors. If the cloth or tape be rubbed with plumbago or powdered asbestos before it is used, the joint may be broken and remade many times with the same packing. The cloth is also worked up into square gland packing by being cut into strips and built into a square rope with a backing of pure rubber to give additional elasticity. The edges of the strips lie in contact with the rod, and as the gland is screwed home, the compression of the rubber feeds the asbestos forward, so that a large proportion of the whole bulk can be actually worn away by the continual friction before new packing is required. It is scarcely necessary to detail the many other forms of gland packing that can be made, as it is evident that all the forms hitherto manufactured in cotton can be made with asbestos yarn.

The indestructibility of asbestos renders it serviceable for many miscellaneous purposes. It is used for filters and strainers both for domestic purposes and for chemical liquids. It is manufactured into drop-curtains for theaters, furnace-men's aprons and leggins, firemen's clothes and gloves, and ladders and ropes for fire-escapes. As a lining for deed-boxes, it serves to convert them into portable fire-proof safes ; and lastly,

it has attained a very great celebrity as the basis of a fire-resisting paint.

Throughout the whole of this article, we have spoken entirely of Italian asbestos. But there is a considerable trade in the Canadian material, which is lower in price. The hard and distinctly mineral structure of the American variety undergoes quite a different preliminary treatment from the softer silky texture of the Alpine product. The color of the cleaned Canadian fiber is a dead white, the staple is not long, and the peculiar greasy feel that we noticed above is absent."

On a Possible Genesis of the Canadian Apatite.

By G. HENRY KINAHAN, M.R.I.A., &c.

(Read before the Geological Society of Manchester, February 3rd, 1885.)

In an inquiry of this nature it appears expedient to establish a known basis to which reference can be made; we will select the Irish Lower Palæozoic rocks, as with them our knowledge is more intimate than those of elsewhere, and at time compare phenomena observed in Canada with those studies among them.

From my brief explorations among the Canadian rocks, it appeared that the apatite rocks, but especially those rich in the mineral, were confined to a band or group of a limited width; this being made up of an association of various eruptive rocks both in beds and protrusions, calcareous rocks of different kinds, and schists; among the latter there being subordinate quartzites, while more generally they were micalytes, talcytes, chlorilytes, or such like. The eruptive rocks that specially belonged to the group seemed for the most part to be more or less basic; such as granitona, diabase, gabbro, and the varieties of euryte (*Daubuisson*), or the hybrid rocks of *Durocher*. There are, however, protruding into these rocks different granitic rocks, also rocks apparently much younger, such as the dyke in the leave line at the Emerald Mine, in the vale of the Du Lièvre.

Some poorer apatites occur in beds as apatitic schists: similar accumulations have elsewhere been called *dradze lodes*.* The rich accumulations, however, occur in true lodes having two walls, in lodes with one wall (half lodes), in bunches, lay and lay, and as string or small irregular veins.

The true lodes appear nearly invariably to have selvages at both walls, either a flucan (steatitic clay) or a steatitic schist, in part they have a comb structure, but more generally the apatite appears to fill the fissure; but having scattered through it minerals, the more conspicuous being stacks or crystals of blackish mica and veins of pyrrhotite.† In one lode was observed a vein of quartz (*cab*), which appeared to be more or less parallel to the walls, and associated with it were crystals of various minerals. Some lodes or portions of them, seemed to be typical "dradze lodes;" but at the same time there did not appear to be any "vein-stuff" that could be classified as a regular typical "gangue;" in some deposits, however, especially the bunches, limestone came in, more or less irregularly, the apatite graduating into lime-

stone; while in the latter were apatite crystals, some of great size, the largest known at the time (August, 1884,) being 800 lbs. weight, as exhibited at the office of the MINING REVIEW, Ottawa.

The half lodes may have either a foot or a hanging wall with a selva; near which the ore appears to be richest, the veins as it recedes from it becoming dradzy, and eventually merging into the country rock. It should be mentioned that the country rock outside the walls of both the true lodes and also the half lodes may be more or less apatitic. From the state of the working it cannot be satisfactorily seen whether the ore in the lodes occurs as *courses* or *shoots*, but it probably occurs in both ways.

Some of the bunches occur in connection with the lodes, they have accumulated in "vugs" that joined into the lode; others, however, seem to be independent accumulations. Of the latter some are in more or less regular masses, but others send off, or break up, into irregular branches or veins. The lay and lay, as with other minerals, occur as layers in the planes of the stratification or the structures; while the strings and small irregular veins are like those filled with other minerals. From the foregoing it will be seen the deposits of apatite are more or less like those of galena in some limestone districts; while they are also like some of the accumulations of limestone dolomite or allied rocks in the Lower Palæozoic rocks of Ireland, as will be presently mentioned.

The "back" or "gossan" of the apatite lodes is ferriferous; probably principally due to the decomposition of the pyrrhotite and mica; the "gossan-colour," however, has peculiarities of its own, being somewhat like that of a coppery gossan, but at the same time quite distinct. It is very hard to describe it in words, more especially as in my experience I have scarcely met two persons who see colours similarly. It is, however, like the — colour of the Irish; that is, a mixture of yellow and brown with a purplish tinge. As far as I could see, the "back" seems to be usually sandy, sometimes clayey in depth; becoming more purplish, due to it being mixed with apatite sand*: while on the back of a bunch the "broken" and "hard shelf" are stained more or less with the typical "gossan-colour." A good knowledge of the gossan-colour and the nature of the back seems to be of great importance to the explorers, as on account of the frailty of the mineral the backs of the lodes are of more or less depth; while many of the bunches seem not to come to the surface, and their position must be guessed at by the colouring of the broken and hard shelf.

That the archæan rocks of Canada are to be separated from other metamorphic rocks and are to be supposed to have accumulated in their present crystalline states, appears quite unnecessary, as they make and are similar to other metamorphic rocks of various ages. In that little bit of the earth called Ireland, are found rocks identical with the majority of these Canadian rocks; which can be demonstrated to belong to the Cambrian (*Primordial*) Cambro-Silurians (*Ordovician*) and Silurians. Neither does it appear necessary to insist that lithological character, not even when they are also accompanied by a distinct break, constitute a petrological or stratigraphical boundary; as portions of the rocks of a group may be more altered than others, while a protrusion of

*The upper portion of the apatite lodes under the back, or what would be called in a copper or sulphur-ore mine the "gossan lode," seemed to be a cemented or re-arranged purplish apatite sand, in which are irregular crystalline pieces of the green variety.

granite or any other exotic rocks, when altered along with those associated, will have a hard boundary, and probably will appear as if older, while in reality the original protrusion was younger than the rocks which it now underlies.

In the Croagh-Kinsheagh district, counties Wicklow and Wexford, Ireland, there are rocks that have been subjected to a more recent period of metamorphic action than any that invade the adjoining rocks, the results being that these rocks are now as much altered as many of the Canadian Archæan Rocks; yet petrologically they belong to the uppermost or youngest Cambro-Silurian strata—rocks which some few miles to the N.E. are unaltered. In Ireland we can also see the relations between metamorphosed protrusions and their associated sedimentary rocks; good examples being exposed in the Slieve Croob district, County Down, and the Castlebar district, County Mayo, where there were protrusions of granite that are now altered into gneiss, having had boundaries* between them and the associated metamorphosed sedimentary rocks. As already mentioned in the archæan gneissose rocks of the Ottawa county, there is a band or group of strata made up of schists, eruptive rocks and varieties of calcareous or allied rocks; in it the valuable accumulations of apatite have been found, and the well-marked characters of this group are more or less analogous to those of bands or groups in Irish lower palæozoic rocks. Of the latter the best marked group is the middle division (*Eruptive series*) of the Cambro-Silurian, as seen in south-east Ireland (Counties Waterford, Wexford and Wicklow). Here it consists of eruptive rocks in bedded masses and protrusions, tuffose rocks, calcareous and dolomitic rocks, argillites, micalytes, talcytes, with subordinate quartzites and metalliferous schists; such as pyritites, graphityte and calcareo-ferriferous schists. The eruptive rocks are in a great measure similar to those in the vale of the Du Lièvre, Ottawa county, except that paramorphosis has more altered the latter.

(To be Continued.)

THE METAL MARKET.

Messrs. E. W. Carling & Co., of 16 Philpot Lane, London, England, report under recent date:—

A fair amount of business has been done in these commodities. Copper and Tin further advanced, more particularly the latter, but have since receded.

COPPER.—Chili bars, good ordinary brands, £44 12s. 6d to £45; Wallaroo and Burra Burra, nominal; English, tough, £48 to £49; best selected, £49 to £50; strong sheets, £56 per ton.

TIN.—Fine foreign, cash; straits, £83 17s. 6d. to £84 7s. 6d.; English ingots, £88.

TIN PLATES.—Charcoal, I C, 17s. to 20s.; coke I C, 13s. 6d. to 16s. per box.

LEAD.—Steady; English Ordinary Brands, £11 5s. to £10 17s. 6d.

SPELTER is easier, £13 10s. to £13 12s. 6d. QUICK SILVER is dull; £5 12s. 6d. in first hands and £5 11s. 6d. in second hands.

IRON.—Scotch pig, 41s. 10½d. cash.

ANTIMONY.—Regulus, £39 to £40.

YELLOW METAL.—Sheets, (4x4 ft.) 4½d. to 4¾d.; sheathing, 4¾d.

*This gneissic granite of County Mayo is more or less similar to the Labradorian or Norian gneiss of Eastern Quebec, and other Canadian localities. The protrusions, however, are mere specks in comparison, as some of the Canadian protrusions are larger than any of the Irish provinces, or perhaps of the whole of them.

*Coppery schists in West Cork have been called "dradze lodes." This Cornish term, however, I believe, ought correctly to be confined to a true lode, in which the mineral occurs as specks or spots irregularly in the vein-stuff.

†This has very much the appearance of nickeliferous pyrrhotite, but in the specimen brought home none was found.

PLUMBAGO LOT FOR SALE

IN THE TOWNSHIP OF BUCKINGHAM,

On which are extensive surface shows and out-croppings of fine quality of Graphite. Further particulars to be had at the office of the MINING REVIEW.

GRAVING DOCK.

BRITISH COLUMBIA.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Caisson, Graving Dock, B. C.," will be received at this office until Monday, the first day of June, 1885, inclusively, for the construction, erection and placing in position of a

CAISSON FOR THE GRAVING DOCK

—AT—

ESQUIMALT, B. C.

According to plans and specification to be seen at the Department of Public Works, and on application to the Hon. J. W. Trutch, Victoria, B. C.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, the blanks properly filled in, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque for the sum of \$2,000, made payable to the order of the Honorable the Minister of Public Works, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
A. GOBELL, Secretary.

Department of Public Works,
Ottawa, 23rd March, 1885.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the 3rd range. Some excellent surface shows have been uncovered on these lots and only require capital for developing. Price and particulars given at the office of the MINING REVIEW.

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

One of the most important features of the mining industry is the economical treatment of low grade ores. The history of mining, says the *Chicago Mining Review*, wherever prosecuted, shows unmistakably that the most satisfactory results and the most permanent basis, upon which a profitable and satisfactory business in this field has been established, is upon large bodies of ores, permanent and regular in their deposit, which have been rather under than over the average richness, although in most instances, where inexperienced men have been prominently active, the least valuable has been most eagerly sought, while the permanent and real basis of prosperity has been neglected.

The importance of a better method which shall open the wide field of low grade ores to profitable development, is exciting the attention of some of the best and most practical mining men of the age, and there is no doubt but the new inventions now under consideration, and being thoroughly tested by practical work, will show a large advance in this direction, indicating that in the near future hitherto valueless properties will be successfully and profitably worked and be converted into valuable dividend-paying mines.

The sudden death at Liverpool, England, on June 4th, of Mr. Furman Hunt, President of the Oxford Gold Mining Company, N. S., is announced. Mr. Hunt had been prominently connected, for many years

past, with Nova Scotian mining interests, which have lost in his death an able representative.

Dr. G. M. Dawson, of the Geological Survey, sailed June 25th from Victoria, B.C., on the schooner "Carolina," for the east coast. Comox and adjacent districts and islands will be thoroughly explored, and mapped geologically. Quatsino Sound will also be visited, and the coal measures and mineral deposits will be examined.

Messrs. Eugene Coste, and E. D. Ingall, have been appointed to the positions of Mining Geologists of the Geological Survey. This is quite a new department of the Survey recently created by the Director, and the selection of these two gentlemen to fill the positions has been judiciously made. Mr. Coste is a graduate of the School of Mines, Paris, is a Mining Engineer of marked ability, and has obtained much practical knowledge in the mining districts of England, Wales, France, Germany and Belgium. Mr. Ingall, graduate of the School of Mines, London, England, is thoroughly qualified for the position he now occupies, having had much practical experience in the mines in Great Britain, and for some years past, at the copper mines in Western Canada. Mr. Coste is at present operating in the Madoc district, and Mr. Ingall on the north shore of Lake Superior.

It is not improbable that the next meeting of the Institute of Mining Engineers will be held in Halifax, N. S., opening on the 15th September. The Province of Nova Scotia and the Dominion Government are making grants of money and offering free transportation over Government railways in order to insure the success of the meeting, which promises to bring many substantial benefits to the Province and to be one of unusual interest to the members of the Institute, whose Secretary will soon issue a preliminary circular on the subject, if such has not already been done.

Baron Grant, whose notorious career as a London financier (in connection with the Emma mine scandal) is feelingly remembered by many persons on both sides of the Atlantic, is the defendant in a law suit which is likeley to cause a sensation. The Baron recently undertook, on the behalf of a syndicate of capitalists, to investigate the merits of a gold mine in one of the Western States of America, which was offered for sale in London. The syndicate furnished the Baron with a liberal sum for expenses, and he sent a prospecting party to examine the mine. The prospectors returned with unfavorable reports of the mine, but they brought back \$9,000 worth of gold ore. The Baron advised the capitalists that the mine was a bad purchase, but he promptly converted the ore into cash, and it is alleged, pocketed the proceeds without making any report upon that

branch of the subject. The capitalists are now seeking for the value of the ore, with interest from the time it came into the Baron's possession.

The inhabitants of Port Arthur and the Thunder Bay district, petitioned the Ontario Government to subsidize a line of railway, to be known as the Thunder Bay Colonization Railway, the object of which is to open up a rich section of country and to afford transportation to and from the mines in the district. The petition, however, did not find favor with the Ontario Legislature, and a subsidy was refused. Mr. S. J. Dawson, member for Algoma, has since brought the matter forcibly before the authorities at Ottawa, and the Dominion Government, recognizing the importance of developing the rich mineral deposits of the Thunder Bay district, has instructed Mr. Wm. Murdoch, C.E., to make a survey of the proposed line of railway, with a view to satisfying the Government as to the feasibility of its construction. It is well known to the petitioners that a good location can be obtained, and a grant is, therefore, sure to be made.

The enterprising burglar was at work in the Geological Museum on the night of July 1st. Some one of the many strangers who visited the Museum on Dominion Day had cast longing eyes at the handsome collection of gold specimens, and during the night managed to obtain access to the room containing the mineral collection. By means of a fine saw the lock of the show case, in which the gold nuggets and bottles of gold dust present so enticing a picture, was removed, and the largest nugget made away with. This nugget, however, was nothing more than a fac-simile of the famous "Welcome" nugget found at Ballarat, Australia, moulded in plaster-Paris, and so well gilded as to deceive the unpracticed eye of the nocturnal visitor, who, by this time, no doubt realizes the truth of the adage, "all is not gold that glitters." The original "Welcome" nugget sold for £9,325 (about \$46,000) and the fac-simile in the Museum was labeled with its intrinsic value, and no doubt caught the covetous eye of its present disappointed possessor.

Thanks to the powerful means at the disposal of the mining engineer, ores formerly considered poor, and which are in fact very low grade ores, are often worked with large profits. The very extensive copper mines in the United States, on the south shore of Lake Superior, are brilliant instances of this; and in the colony of Victoria, Australia, a new country like ours, where labor is very high, ores yielding an average of five dwts. of gold per ton (say \$5.25) are esteemed rich, and others yielding only from two dwts. twelve grains to three dwts. (\$2.62 to \$3.15) per ton are sometimes worked to advantage.

The *Chicago Mining Review* says:—"The product of mining is indestructible and forms forever a factor of imperishable wealth, when added to the avenues of com-

merce and business. When its real value is understood, its true worth recognized and its development is undertaken in business-like and intelligent methods; when its requirements are studied, its demands met, when necessary conditions are secured, no industry known to men will produce more attractive features, more permanent qualities, or give better returns for the expenditure of capital and labor, than the development of the mineral resources of this country" (meaning the United States)—nor, we add, than the mineral resources of Canada.

The Calumet and Hecla Mining Company has declared a dividend of *seven dollars* a share, payable July 13th, and aggregating \$700,000. To our minds this present extra large dividend has the seeming of being very explicit proof that the suspension and reductions of dividends to which the management resorted last year was not justifiable nor made in the interest of the smaller shareholders, inasmuch as that suspension could but have the effect to make such holders to sell out their stock at the depreciated prices which immediately ensued. And the question arises: who bought the stock thus sold, upon which a dividend of seven dollars per share is now to be paid, in the face of a low copper market? (*F. & M. Record*).

The enormous profits that have been and are now being derived from the mining of low grade ores in the United States and Australia will give some idea of what can be done with the gold-bearing quartz veins of the Lake of the Woods and those on the north shore of Lake Superior. We are told, and statistics prove it to be true, that Australia ores yielding from \$3 to \$5 per ton are esteemed rich. In many of the mining districts of the United States \$6 per ton ore is worked at a large profit, and the Plymouth Consolidated Gold Mining Company, whose property is situated in Amador County, California, has worked its mines very extensively during the past two years at a profit of upwards of two hundred per cent., the ore yielding an average of not upwards of \$11 per ton. We are assured by very competent men, whose opinions have been borne out by careful tests, that the auriferous veins of the Lake of the Woods district have a mean value of over \$12 per ton, and the ore of the *Huronian* mine, to the southwest of Shebandowan Lake, has yielded an average of from \$18 to \$20 from a vein measuring from 5 to 12 feet in width. Surely this should be sufficient to encourage the owners of these properties to proceed to thoroughly develop them.

Mr. Coste, in his report to the Geological Survey, warns miners against the idea, so generally spread amongst them, that the richness of an auriferous quartz vein must naturally increase with depth, and states that, on the contrary, with depth a de-

crease in richness in gold in quartz veins was for a long time, by many, considered a law. Dr. Selwyn has, however, strongly refuted this theory, first in 1854, again in 1856, and in his "Notes on the Physical Geography, Geology and Mineralogy of Victoria, 1866," and now that the "Reefs" in Australia are explored to great depths, experience shows that he was right when saying: "That the extraction of gold from quartz reefs, if properly conducted, may be regarded as an occupation which will prove as permanently profitable in Victoria as tin and copper mining have been in Great Britain. It is a fact that gold quartz mining is more remunerative now in Victoria than ever, as shown by the statistics to be seen in the quarterly reports of the "Mining Surveyors and Registrars" of that colony. The following table from these statistics shows that if you take the two years 1876 and 1882, six years interval, the average yield in gold per ton is only less in two districts, is the same in two others, and is greater for the other three districts during the later period:—

1876.				DISTRICTS.	1882.			
Tons of Quartz crush'd	Average yield of gold per ton.				Tons of Quartz crush'd	Average yield of gold per ton.		
	oz	dwt	grs			oz	dwt	grs
315,407	0	6	14.16	Ballarat.....	466,754	0	6	14.41

49,784	1	3	12.58	Gippsland...	28,732	1	4	6.66

Another table, taken at random from these statistics, serves to illustrate how variable is the average of gold per ton in the "New Chum Reef," now being worked at great depths:—

Approximate Depth.	Tons of Quartz.	Average Yield of Gold per ton.		
		oz.	dwt.	grs.
At 460 feet.....	432	0	4	17.44
" 540 ".....	279	0	8	15.91

" 977 ".....	1,582	0	18	21.98
" 1026 ".....	2,285	0	11	7.61
" 1026 ".....	2,197	0	9	22.72
" 1026 ".....	2,999	0	9	21.42
" 1030 ".....	3,101	0	12	1.39
" 1106 ".....	410	0	13	15.74
" 1140 ".....	334	0	8	0.21

The average yield, it will be seen, changes all the time, vertically as well as horizontally; this is the "Bonanza" feature so well recognized everywhere for the other metals, and gold certainly must not be excepted; for this metal, as well as for the others, the decrease of the richness in depth cannot be made a law more than the increase. The gold quartz miner, in consequence, must bear in mind that the richness of his quartz is liable to change every foot, on the level or in the shaft, and he should always explore in advance the underground, keeping careful records of

the quartz crushed from the new levels and of the gold obtained; it is the only means at his disposal by which he may know whether his rock is paying or not. Assays of selected specimens, or a certain richness at one time will not teach him much, and will often induce him to incur unremunerative expense.

The Phosphate Trade.

A visit to the Rivière du Livère will give some idea of what is being done at the phosphate mines in that district. There are at present no less than four steamboats actively engaged in forwarding supplies to the mines and towing ore-scoops loaded with phosphate from the various landings on the river bank to the C.P.R. terminus at Buckingham village for transportation thence by rail to Montreal. In fact, so rapid has been the delivery of ore at this point that the railway company has had some difficulty in providing rolling stock to forward it. At the mines there is more phosphate being raised than ever before, and the force of miners is being increased as rapidly as provision can be made for their accommodation, and this in the face of a somewhat low market—low only by comparison with other seasons, for at present prices the margin of profit is greater than that attending almost any other mining industry. The outlook for an increased production is very bright, and the future of this important industry has never been so promising. During the month of June the output of four mines aggregated not less than 2,500 tons. During the last two or three months the mines have been visited by a number of mining engineers, geologists and practical miners, all of whom have expressed much surprise at the large bodies of ore which are in sight in the openings now being worked, and at the unmistakable indications of an almost inexhaustible supply of high grade mineral. The opinion, however, has been given by some of these practical mining engineers that the system which has been adopted of working the deposits is not such as will serve for permanent mining to the best advantage, and suggestions have been thrown out for important changes to be made in this direction. At many points the beds or veins are of a sufficiently well defined and permanent character to warrant the sinking of vertical shafts and drifting on the veins at different levels. Tunneling has also been proposed, where it is at all practicable, to tap the mineral at the lowest point possible, and by means of trams to thus avoid the expense and labor attending the hoisting of ore and refuse rock. The services of intelligent, practical mining engineers might be engaged to advantage at some of the phosphate mines where skilful mining would be an important factor in reducing the cost of production. The system in vogue at present at almost all of the mines is much akin to open quarrying, and it is argued by scientific miners that this is not the most economical method of raising the ore, as it entails the removal of an unne-

sary amount of rock, which is counted as dead-work. The nature of our phosphate deposits, however, is so different to that of any other mineral veins, and their character so irregular, that it requires practical experience and close and careful observation in the immediate vicinity of the mines to enable whoever may be conducting mining operations to determine how such deposits can be worked to the best advantage. During the past three years many important changes have been made. Steam power and machinery have been introduced; facilities for transportation have been greatly increased and the cost reduced almost, if not quite, fifty per cent.; more attention is given to cleaning the ore in order that it may go forward to the foreign market in a high state of purity; an increased demand for Canadian phosphate has been created; and the reputation of the mines is now firmly established. Having accomplished all this, mine owners can now turn their attention to studying the best methods at their disposal for permanent and economical mining, and with this end in view the suggestions and advice of practical men should, and certainly will, receive their earnest consideration.

THE MINES.

Proceeding up the Rivière du Lievre the first mine to be observed from the deck of the steamer is the famous *Emerald*. On the summit of a mountain, sloping to the river bank, can be seen the derricks, ore-bins filled with bright green phosphate and the waste dumps, indicating that a large force of miners are at work under ground. On a plateau, about mid-way between the mine and the river, is a cluster of neat and substantial buildings, including boarding houses, store houses, stables and the manager's office and dwelling. It presents the appearance of a small village, and is evidence of the profits which have been and still are accruing to the owners of this very valuable property. An excellent wagon road leads from the mine to the river, over which the ore is carried and placed in bins where it awaits transportation by scow to the railway at Buckingham. About seventy men are employed at this mine, and the output averages 500 tons per month. The convenient location renders the cost of transportation less from the *Emerald* than from any other mine in the district.

THE LITTLE RAPIDS MINE

is the next above the *Emerald*, about three miles further up the river, but, though only half a mile inland, is not visible from the steamer—in fact the *Emerald* is the only mine that can be seen from the river. The *Little Rapids* is situated on the crown of a mountain on Lot No. 6, in the 1st Range of Portland East, and is one of the best developed mines in the entire phosphate district. Three shafts, the deepest being 170 feet, and a large open cutting have proved the continuity of a true and well defined vein for several hundred feet. The vein varies in width at different levels, from 3 to 13 feet, and the mineral is of wonderful purity, quite free from pyrites and other objectionable matrix. The openings on this vein have exposed a body of mineral measuring upwards of 5,000 tons, which can be worked at a very small cost. Other veins have been prospected on the property, and are now being developed, and it would appear that wherever ground is broken bodies of phosphate

are encountered. All visitors to the district are attracted to this mine, and are much impressed with the singular regularity of the vein on which the most work has, as yet, been done. In this respect it differs from the other important mines, whose deposits are more *pocketly* and variable. The machinery at the *Little Rapids* is well suited to the work it has to perform, and the buildings are of a substantial and commodious character. The ore that has been forwarded to the river bank presents an imposing sight on account of its pleasing pale green and uniform colour. Shipments from this mine will be of a very high grade.

THE NORTH STAR.

In our last edition we gave some particulars of the workings at this mine, and further developments have proved it to be a veritable "bonanza." The shaft is now at a depth of 190 feet in solid mineral, and from it 640 tons of high grade phosphate were raised during the month of June. The force employed at this mine does not exceed 50 men all told, a number of whom have been employed on the roadway between the mine and the river. An excellent road for a distance of 3½ miles has been completed, over which the ore is being hauled and delivered on the river bank. Everything connected with the *North Star* mine is now in perfect order and thoroughly systematized, which reflects much credit on Mr. W. H. Smith, the company's superintendent and business manager, when taken into consideration the many difficulties and disadvantages under which he has laboured.

STAR HILL MINE,

in Portland West, continues to be a heavy producer, having given an output of 650 tons for the month of June. This mine gives employment to 80 miners and workmen, and is substantially and suitably equipped. The road from the mine to the river is in good condition, and the teams engaged in hauling ore to the landing are averaging about two tons a trip. The company owns extensive territory, but only three deposits are at present being worked, one of which is said to be as large as any yet opened in the district.

HIGH ROCK.

At this mine preparations are being made to greatly increase the production. Additional machinery has been purchased, some of which is in course of erection, and the force of miners has been almost doubled during the past few weeks—at present it averages 160 men. *High Rock* has always been the heaviest producer of the Canadian phosphate mines. The output for June amounted to 710 gross tons, the largest yet attained in one month, and it is expected that with the increased force and additional machinery, the output for July will considerably exceed that of last month.

The Lievre River Phosphate Company and Messrs. McLaurin and Blackburn (Templeton) are also doing good work, and at present it would appear that the mines of Ottawa county will send forward an unusually large amount of phosphate during the present season—the low market notwithstanding.

PHOSPHATE QUOTATIONS.

The market abroad continues steady and the feeling points to better prices for autumn shipment. Latest advices report a half-penny a unit advance since the arrival of first shipments. The market is now firm at 1s. ½d. for 75 per cent. mineral with the usual one-fifth rise, ex-ship London and Liverpool. This is equivalent to \$19 per ton in Montreal, with freight at present rates.

OCEAN FREIGHT:

Freight per S.S. from Montreal to London and Liverpool has been freely offering at 5s. to 7s. 6d., and last month's shipments went forward at an average of not over 5s. per ton. Summer rates are not likely to rule high, and it is expected that autumn shipments will be carried at as low a figure as last year.

Correction—The first shipment of phosphate from Montreal this season was made by Messrs. Lomer, Rohr & Co., on account of the Ottawa Phosphate Company, to Liverpool, on May 21st, and not by Messrs. Wilson & Greene as stated in our last edition. The above is a correct list of shipments to July 1st.

The Griffin Manufacturing Company, No. 92 Liberty street, New York, recently erected a mill at the phosphate works of Read & Co., Newton Creek, Long Island, N.Y. It is running steadily about one and one half tons an hour, sixty mesh, at a speed of 200 revolutions a minute. The dynamometer shows that it requires from 18½ to 19½ horse-power. Another mill has been ordered, and orders are expected for three more within thirty days. The trial has been entirely satisfactory.

VILLENEUVE MICA MINE.

This property may fairly be classed among Canada's most valuable mining locations, and of all the mica mines in the country there is none to compare with it, either in respect to its productiveness or the quality of the mica it produces. This mine is being carefully and systematically developed, and the micaceous vein on which it is located has already been proved to considerable depth and for a long distance. A drift is being run into the face of the mountain to tap the vein about 60 feet below the surface, and in doing this work a large amount of mica has been taken out. The end of the drift is now penetrating a body of feldspar and quartz thickly studded with mica crystals, and the further the drift is run the more numerous do these crystals become. During the past few months shipments have been made from the Villeneuve mine to France, Germany, England and the United States, and the mica has been pronounced by the dealers to be equal in quality to that which comes from the Ural Mines, East India, North Carolina and New Hampshire. The crystals in this mine appear to be well formed, and their average size is larger than those usually met with in other mica mines. The mica when cut into sizes and packed for shipping commands the highest market price, and the mine, when more developed, will be

capable of a large annual out-put. Samples have been forwarded to this office in plates measuring 12 x 12 inches, and have surprised many of our visitors, who had not been aware of the occurrence of so excellent a quality of mica in Canada.

Kingston Red Granite.

The owners of this valuable property, the "Canadian Granite Company (limited)," are making preparations to erect dressing sheds and polishing mills at the quarry, which is now well opened and in shape to produce stone in unlimited quantity. The granite, which is of a good medium sized grain in point of crystalline texture, is sound and uniform and of a beautiful rich flesh or salmon-red colour. The position of the quarry offers unusual facilities for working and for obtaining a reliable supply of labor. Vessels employed in the grain trade between Chicago and Kingston can carry the granite as return freight to the western cities, either in the rough or in finished blocks and paving stones. Dimension stone of almost any size can be taken from this quarry, and when the necessary machinery and mills have been put in position the company will be prepared to supply any demand. The stone commands a high price on account of its very pleasing color and the fine polish of which it is susceptible.

Dealers and workers in granite speak of it in the highest terms, and those to whom shipments have been made pronounce it equal to the red granite of Aberdeen and the Bay of Fundy. Already there is a large supply of paving blocks shaped and piled at the quarry, apparently of an extra good quality, owing to the free cleavage of the stone, of which the workmen say it enables them to earn better wages than they have been accustomed to earn at other granite quarries where they had been engaged on the same kind of work. These men, who are paid so much per hundred blocks, become very expert at their business, and the rapidity with which the blocks are turned out under their dexterous manipulation of the hammer, drill and chissel is interesting to witness.

A permanent roadway is being graded from the quarry to the Lake shore, a distance of about 200 yards, on which a tram will be laid to the Company's dock, and with water communication with the western cities during the summer months, and rail communication by Kingston and Pembroke, Canadian Pacific and Grand Trunk Railways at all seasons, it may be said that this quarry possesses advantages which places it in a perfectly independent position as regards shipping facilities. The Canadian Granite Company is composed of competent business men of ample means to place this enterprise on a sound and permanent basis, and the enterprising way in which they are endeavouring to establish so important an industry points to certain success. Nature has done much for the Kingston Red Granite Quarry. Means, intelligence and enterprise will turn it to account.

THE QUEBEC GOLD MINES.

Mr J. Fraser Torrance, Mining Engineer, formerly attached to the Geological Survey of Canada, is at present engaged in examining the gold and silver deposits in the Beauce district. Mr. Torrance has formed a very high opinion of the productiveness of the gold-bearing quartz veins of the district, and writes from Gilbert river, Beauce, as follows:

While so much capital is lying idle it is surprising that no attention is paid to this attractive field for investment. A recent writer very truly remarked. "The production of gold is decreasing and the amount required is constantly increasing. Gold mining is almost the only industry whose product is the more valuable the harder the times and the less it costs to produce. It is almost the only mineral product that never depreciates in value and that never overstocks the markets. The full significance of these facts should be carefully weighed by our Canadian capitalists who have suffered from the reckless multiplication of cotton and woollen mills, sugar refineries, etc., etc. They are well appreciated in California, where the commercial depression has induced unusual activity in opening new quartz mines.

Unfortunately our Quebec gold field, differing from California in this respect, has no golden records of past successes in quartz mining to encourage our capitalists in fresh enterprises. Almost all the capital invested therein has been devoted to alluvial mining upon the Chaudiere and its tributaries. Some of the companies were highly successful; others came to grief from a variety of causes, but rarely through a lack of gold. For many years all mines on the Gilbert were harassed by desultry and expensive litigation as to the validity of the De Lery patent, which granted to that seignior that exclusive right to all gold within the bounds of his seignior. But this question has been finally disposed of by our courts upholding the rights of the De Lery Gold Mining Company as lessees of Mr. De Lery.

In A.D. 1864 this company was organized; and one of its first acts was to erect a quartz mill at Devil's Rapid on the Chaudiere. This was so faulty, however, in its construction, that the inexperienced manager failed to extract from the adjacent quartz veins enough gold to pay the working expenses. This led the company to speedily close the mill, although samples from more distant veins are claimed to have yielded from 15 dwts. to one ounce gold per ton. And from that day to this nothing has been done towards testing or developing the numerous large and promising quartz veins of this district beyond sinking a few shallow prospecting pits and selecting samples for assay. Some of these assays were so rich that the lucky owners asked enormous prices for their properties, while the titles were disputed. Their cupidity naturally over-reached itself.

Most people imagine that this Quebec gold field is confined to the valley of the Chaudiere. But the very profitable operations of the Hon. J. H. Pope in Dittan (about 70 miles to the south-west of Gilbert) extending over many years, and the enormous profits of the Rooks Mining Company in Vermont, confirm the statements of Sir William Logan as to its great area. Nothing has yet been done to trace and prospect it beyond Cranbourne in the opposite direction. But Sir William thought it probable that it would be ultimately traced as far as Gaspé.

Dr. Selwyn has done good service in pointing out the close geological resemblance of this region to the famous gold districts of Victoria, Australia, wherewith he should be very familiar. At the present day the placer mines of Victoria are declining in value; but the quartz mines are steadily increasing in number and productiveness. The same thing must occur here. Our miners on the Gilbert have constantly observed that their best *pay* was struck close to where the quartz veins crossed their channels or leads. The very natural inference was, that most of this gold (if not all of it) was derived from these quartz veins.

In Dakota, California and Victoria, the richest quartz mines of to-day are worked upon the site of exhausted placers. This is a good reason for believing that quartz mining is certain to become a permanent and profitable industry in this province. But there is very little use in any poor prospector attempting to test these quartz veins at his own expense. There is neither crushing-mill nor assayer in the district to test his samples for him.

The best way to undertake this work would be for men of means to employ an experienced engineer to search for such veins in accessible localities, bond them at moderate prices and properly test them. Quite a number could be tested in the course of the season at an outlay of two to three thousand dollars. Then a small portable mill of the best modern type might be erected beside the best of them, at a cost of five thousand dollars, and the work of development proceeded with. As soon as the regular mill runs had thoroughly established the value of the mine, capital could readily be found to develop it on any scale that the owners deemed advisable.

A cautious enterprise of this kind could hardly fail of success, *if conducted with the proper technical skill.*

THE MINES NORTH OF LAKE SUPERIOR.

Their Development Progressing with Satisfactory Results.

The mining region surrounding Port Arthur has been visited during the past few months by a vast number of practical miners, mining engineers and capitalists seeking investment, who have been a unit in pronouncing the district one possessing great mineral wealth. Prominently among the recent visitors was Mr. Charles F. Eschweiler, a stock holder in the famous Calumet and Hecla, who has had long and useful experience in the vicinity of that celebrated mine. This gentleman is eminently qualified to form an opinion of the value of mineral deposits and he has stated that this mining district deserves, more than any other on this continent, the fullest and closest attention, and added that he entertained not the slightest doubt that mining on the north shore of Lake Superior will prove as successful as anything that has yet been accomplished among the valuable iron ore and copper mines that have made the south shore famous.

The north shore district is certainly attracting a great deal of attention. Since the snow disappeared from the mountains and the ice from the lakes, no less than ten well organized and thoroughly equipped parties of prospectors have started out from Port Arthur and are distributed over the gold and silver regions, extending from the *Silver Mountain* and *Rabbit Mountain* mines to the *Huronian* mine on Jack Fish Lake. A large number of explorers are also out, and new discoveries are continually reported. This mineral district is very extensive and it will take years to thoroughly explore it. In the meantime it will be wise to develop some of the rich lodes that have already been located, and to proceed with active and properly systematized mining operations. With the assurance that has been given of the richness of the ore there is no need for *wild-cat* stock jobbing—rather the formation of strong companies to engage in honest mining under the direction of experienced and competent men, and success will follow. Ore is there in abundance, rich in gold and silver beyond the average ore of other districts where it is mined at enormous profit; sufficient development has been done on some of the locations to

eliminate the element of uncertainty, and capital should, therefore, be available for permanent mining. The practical miner, the capitalist and the public are not to be led astray nowadays by fabulous assays of picked specimens. What they require to know is the average yield of the vein matter before they can be induced to invest their money in a mining venture. To obtain this information a shaft should be sunk to a depth of at least one hundred and fifty feet on the vein and drifts run at different levels. When this has been accomplished and the ore proved by mill test to carry metal in paying quantity, it can be said there is a mine whose value has been practically demonstrated. Capital will then be forthcoming, and will seek investment in such property, and the mining industry of the district will thus be established.

THE RABBIT MOUNTAIN MINE

is owned chiefly by Americans, and is being worked under their direction. This mine has produced a large quantity of marvellously rich silver ore, and although we have not received very recent reports of progress we have been led to understand that the vein continues to show strength, and to yield good stamp-rock in large quantity.

THE SILVER MOUNTAIN MINE

awaits development, and although there are large bodies of ore rich in silver, little has yet been done towards opening them up. The proprietors are not showing much activity or enterprise themselves, and are holding the property at much too high a value for a perfectly undeveloped claim to expect capitalists to come to their assistance.

THE BEAVER MINE

may be classed among the working silver mines of the district and its owners are preparing for a largely increased production at reduced cost. The vein on which this mine is located is a well determined fissure and is highly spoken of by experts who have visited it.

THE TWIN CITY MINE

is capable of yielding silver ore in large quantity, and under careful management it could be very profitably produced. The whole vein-stone is good stamp-rock and the vein carries native silver in fair quantity. But of all the mines that are being worked on the north shore of Lake Superior the

HURONIAN MINE

is unquestionably the most attractive. Here there is a well defined fissure vein of gold-bearing quartz measuring from 5 to 12 feet in width, and extending for upwards of half a mile across the location. A shaft has been sunk on the vein to a depth of one hundred and fifty feet, and at the fifty foot level drifts have been run in opposite directions for about one hundred and fifty feet altogether, and some stoping has been done. The ore obtained is for the most part free-milling and has yielded gold averaging from \$18 to \$20 per ton. Dr. Selwyn, Director of the Geological Survey of Canada, and for seventeen years Director of the Geological Survey of Australia, one of the great gold-producing countries of the world, has pronounced the *Huronian* a good mine and one that will continue to be a steady producer for many years to come. Dr. Selwyn is acknowledged to be one of the ablest authorities of to-day on the origin and nature of gold veins, and, though naturally very reticent and cautious in expressing an opinion, he does not hesitate to do so with reference to the *Huronian* mine.

GOLD MINES OF THE LAKE OF THE WOODS.

So much has been said about these mines that the public would be led to suppose that important development had been made, but judging from the report of Mr. Eugène Coste, Mining Geologist of the Geological Survey, such is not the case; on the contrary, very little work has been done in the district and the so-called mines are still in an entirely primitive state, and so will they remain until they fall into the hands of practical mining men having sufficient capital to proceed with mining operations on an approved system and on an extensive scale. At all the mines in the Lake of the Woods district the openings may be described as mere prospect holes in the ground. The proprietors of the various locations have given more attention to furnishing the *press* with fabulous assays of the ore than to engaging in practical and honest mining. According to their reports the analyses of the vein matter never showed less than hundreds of dollars to the ton. Some of the veins in the district are undoubtedly auriferous, notably those of the "Pine Portage," the "Kewatin" and the "Winnipeg Consolidated" mines, and one of the veins of the "George Heenan Location"; but their richness is not exceptional, though sufficient to yield a handsome profit in the hands of strong companies and if worked efficiently. Serious mistakes have been made in the district, resulting in several cases in a suspension of work and abandonment of the property.

At the "Argyle" mine, for instance, the first thing to be observed is a splendid crushing-house for amalgamation and concentration, provided with ten powerful stamps and two fine concentrators; but you look in vain for the shaft, for none of the numerous holes in the ground are deserving of that name. The few thousand dollars expended in machinery on this property, before a mine had been located, would have been sufficient to have sunk a shaft at least three hundred feet in depth and to have run drifts at different levels. There would then have been a mine and the owners would have had the satisfaction of knowing its value; instead of which, after this premature outlay for a crushing-house, when there was no ore to crush, the company ran short of money and was forced to suspend its operations.

At "Pine Portage" mine a somewhat similar mistake has been made. The erection of crushing machinery should have been deferred, and when erected it should have been on the lake shore instead of on a creek which dries up every summer. At this mine, however, work has not been suspended. It is being slowly developed with rather encouraging results, and in the hands of a strong company would no doubt pay largely.

It would appear that the main object of the proprietors of the Lake of the Woods mining locations has been, from the outset, to sell their claims to capitalists at high figures, and with this in view have trusted more to sensational newspaper advertising than to the intrinsic value of their properties, which could only be established by systematic development. In this a great mistake has been made, for no one will be induced to pay a high price for property which has not been tested, and of which it is, therefore, impossible to know the value.

In short no serious work has yet been undertaken in this new gold district of the Lake of the Woods. The district is, nevertheless, one deserving attention; it is intersected by numerous auriferous veins, many of which are, without doubt, capable of being profitably worked by companies if their operations were properly

conducted, and especially if they were operating on a large scale. It is the impression of competent men, who have carefully examined the quartz veins of this district, that many of the lodes will prove to have a mean value of over \$12 per ton, which is the average richness of all the reefs until now worked in Victoria, and of which official statistics have been published.

BRITISH COLUMBIA.

Decrease in Gold and Large Increase in Coal.

REPORT OF MINISTER OF MINES.

The report of the Minister of Mines for the year ending 31st December, 1884, which has just now reached us, shows that there is still another decrease in the output of gold, the total being \$736,165, a decrease of over \$58,000 from that of 1883. The number of miners engaged has also lessened, being 1,858 in comparison with 1,965 of the previous year, while the average yearly earnings per man is \$396, a decrease of \$8, and the lowest since 1858.

The highest output of gold in any one year since was that of 1864, when the total amounted to \$3,735,850, with 4,400 miners, an average earning per man of \$849. In 1875 the output was \$2,474,904, with 2,024 miners, an average wages earned of \$1,222, the highest of any year in the mining operations of the province. Since 1875 the yield has steadily decreased. The total output of gold including the last six months of 1858 has been \$48,672,128.

The reports from the various gold commissioners of the districts are printed with the report, and furnish general and statistical information in reference to the operations for the year and progress or retrograde made.

CARIBOO.

In this district there has been a slight decline in the product and a decrease in the number of white miners, and a corresponding increase in Chinese. Little prospecting was done. The miners think that the government assistance would give more substantial results if a thoroughly reliable and competent quartz expert were to examine the ledges and give a practical opinion of their value; or else bonus a company who would test deep ground on promising enterprise.

Williams creek is referred to as being about played out, with the exception of a few hill claims.

Lower Antler creek is now mined exclusively by Chinese. The Nason company has made extensive preparations to push their claim, and good results were expected. Grouse creek was doing well.

The report states that "legislation would appear to be necessary in view of large claims being held by absentees on Lightning creek under a 'real estate' title, whereby the project of bringing up a bed rock drain is completely blocked."

The closing of the assay office at Barkerville is referred to as being a loss to the community, as it was discouraging quartz prospecting. The hope was held that it would again be opened.

The approximate yield of gold in the district, exclusive of Omineca, is \$423,855, of which Barkerville division contributed \$153,600; Lightning creek, \$78,000; Quessnelmouth, \$77,600; Keithley creek, \$89,595.

Little has been accomplished during the year in developing the various quartz mines.

The high prices of provisions had been a detriment to the progress of the country, many old Caribooites having left the district. This is accounted for by the high prices of provisions, caused by excessive charges of the railway line, the rates for freight having been higher than that of ox teams. The completion of the line was anxiously looked for, when an advance in progress was expected.

A prospecting party, who had been out eight weeks, returned without having struck any pay.

W. Stephenson's report from the Forks of the Quesnelle refers chiefly to the large number of Chinese miners, who evidently had been taking out good pay.

CASSIAR.

The report of Mr. J. L. Crimp, gold commissioner, is not very encouraging. The total output during the year was \$101,600, by 180 miners, whites and Chinese being equally divided. Dease, Thibert and McDame creeks were spoken of as being about worked out, though there were a few good hill claims on Thibert creek. McDame creek contributed the largest amount, \$53,600.

LILLOOET.

Mr. F. Sones' report of this district shows a large increase in mining operations over that of previous years, the output being \$107,934, an increase of \$39,592 over the previous year. A very large amount of the increase is due to the Bridge River mines, in which section the miners are nearly all white men. The mica discovery of James McKinlay is referred to, and the prospect that it would be developed if found without fracture below the frost.

The lack of enterprise in opening up the auriferous benches of the Fraser was referred to, and also on the Big Slide lode.

YALE AND LYTTON.

The gold mining operations in this district are confined principally to the Chinese working on the Fraser. The total output in Yale and Lytton divisions would be about \$15,000, with no new developments except the record of claims opposite the town of Yale.

KAMLOOPS.

There is nothing to report from this section, except that a prospecting party who had been out for a lengthy period met with poor results.

KOOTENAY.

Mr. Vowell's report gives the output of this district at \$60,826, the largest amount being from Wild Horse creek, \$36,730. These returns are considered satisfactory as compared with last year.

Prospecting for additional placer mines met with poor success owing to the constant high stage of water.

The developments of quartz were large, 49 claims being made at Kootenay Lake and 135 in the Kicking Horse region. The prospect was that the quartz mines would be extensively developed during the season of 1885. The necessity of an assay office for the district was referred to, on account of the rapid increase in quartz mining.

COAL MINING.

The report of the output of coal for the past year shows a total of 394,070 tons, an increase of 181,070 tons over that of 1883 from the various mines of the province. This gratifying circumstance is referred to as adding greatly to the general wealth of the province.

The principal market for the coal was that of California, to which point and various others 306,478 tons were exported. The local consumption

amounted to 87,488 tons, 20,000 tons more than that of the previous year. Of the 1,035,076 tons of coal imported into San Francisco, British Columbia contributed the largest amount, 291,546 tons, Australia being next with 190,497 tons.

The working of the various mines of the province are exhaustively referred to in the report and a great deal of statistical information given.

The number of miners engaged is 1,214, their wages averaging from \$2.50 to \$4 per day for whites, and \$1 to \$1.25 for Chinese. Of the latter 503 are employed. The value of the plant used in mining is \$700,000 for all the mines.

GOLDSTREAM QUARTZ DISCOVERY.

THE LEDGE STRUCK IN A CUTTING ON THE
ESQUIMALT-NANAIMO RAILWAY,
BRITISH COLUMBIA.

Mr. Antonelli, contractor on the Goldstream section of the Esquimalt-Nanaimo railway, arrived in Victoria early in June, with fine specimens of gold-bearing quartz, from lodes discovered by the workmen. He says that four lodes have been exposed in a rock-cutting 20 feet in depth, one of which is six feet and another four feet wide; the width of the others had not been determined. Some of the specimens shown by Mr. Antonelli contain fine gold, visible to the naked eye, and in one of these is a nugget weighing about \$2. A quartz expert from Nevada pronounces the ore free-milling and similar to that which made Grass Valley, Cal., famous. Several Californian miners have visited the ground, and speak favorably of the lodes and the country rock. Several of the Railway employes have left the works to prospect the adjacent hills. A Chinaman picked up a large lump of gold in the cutting, and, fearing that it would be taken from him, packed up his blanket and started for town.

The value of the discovery cannot be determined until considerable work has been done on the ledge. A force of miners are at work on one of the seams, and the indications, so far, are that the lodes are very rich, though they may not be proved so by a more thorough examination and development.

Mr. Perry, C.E., employed on the Island Railway, reports that the ledge has been traced for over a mile in length, the surface outcroppings being from 3 to 5 feet in width. The quartz is rose-colored in appearance, with slight traces of free gold, and shows every indication of being rich. The lodes being outside of the railway belt are open to pre-emption under the mining laws. Two locations have already been taken up, one by Mr. Jos. Hunter, C.E., and others, named the *Triumph* ledge; the other by Messrs. Perry & Pinder, now known as the *Perry* ledge. Specimens from the *Triumph* have been forwarded to San Francisco for assay; others from the *Perry* ledge will soon follow. A large box of specimens has been deposited by Mr. Perry in the Island railway office.

A number of experienced prospectors have gone to the vicinity of the *strike*, and will thoroughly examine the district. There is ample capital available for development if, after a thorough test of the ledge, it is proved to be one that will pay. Experienced miners have expressed the opinion that it will, and if such should prove to be the case, the benefit to Victoria, and the Island generally, will be great.

At present the value of all the gold in the world is counted at \$6,000,000,000.

THE KOOTENAY CO.

Their Annual Meeting in Victoria, B.C.

The annual meeting of the Columbia and Kootenay Railway and Transportation Company was held on June 4th, when a mortgage of one and one half million dollars was authorized. The directors were authorized to sell to miners their claims for \$1,000 each, that being the amount required by the government to be expended on mining claims on government lands before crown grants are issued—the \$1,000 to be paid to the government and held for the use of the company on completion of the terms of charter. This action will give the miner a crown grant on payment of the \$1,000, and enable him to organize his company should he so desire, and proceed without delay in developing and working his mine. It was stated at the meeting that the provisions of the charter have been strictly complied with, and the projectors expect to take active steps during the coming year to construct the railway as contemplated by the charter.

Profitable Mining in Low Grade Ore.

English capitalists, says one of our *Exchanges*, have no objection to putting a few sovereigns in mining enterprises whenever convinced that they will get them out again with a fair prospect of a few more. Accordingly they are working mines in nearly all the Pacific States and Territories, and the operations at the two mines in California, owned by English companies, for the last half of the year 1882, are worthy of note. These are the Plumas Eureka and the Sierra Buttes. The first named produced 29,460 tons from its respective claims during that period. All this ore was reduced, besides 30 tons previously on the dumps. The ore yielded only \$6.60 in free gold, and yet it was worked at a profit, because the expense of mining, including prospecting, was only \$3.35, while the cost of milling was only 45c. per ton, making a total expense of \$3.80. The net balance for the half year was \$141,600, and out of this sum a dividend of \$70,313 was recommended. This has since been paid. The mine has given to its stockholders to date, the sum of \$1,730,800. The Sierra Buttes mine produced 15,769 tons ore during the same interval, all of which passed through the mill. This ore yielded \$7.48 per ton, or, including tailings, \$8.18. The working expenses were \$5.56, including \$4.98 for mining and prospecting, and 58c. for milling. Excluding the work on the eighth and ninth levels, the working expenses were \$4.15 per ton. The net balance for the half year was \$43,800, from which a dividend of \$30,625 was recommended. This has since been paid, and makes a total of \$1,460,300 given to stockholders to date. Here are two low grade mines that are being worked by English capital at a profit. We have in Canada numerous quartz claims of equal value, and some much richer in gold, that are now lying idle for the want of capital to develop them. Cannot English capital be employed in Canadian territory to as good advantage to the capitalist as it can in the United States? Those who are familiar with the nature of our mineral deposits, and their accessibility, say it can, and we will be pleased to see Englishmen investing more liberally in our mining industries.

One cubic inch of gold is worth \$210; one cubic foot, \$312,380, and one cubic yard, \$9,976,762 (counting the ounce at \$18).

THE MINNESOTA GOLD EXCITEMENT.

Mr. W. M. Curtis, M.E., in a letter to the *Engineering and Mining Journal* from Detroit, Mich., says:—

"The entire collapse of this North Sea's bubble has not surprised intelligent and honest assayers to whom samples of the "gold rock" were submitted.

Just where the blame rests is a little in doubt at present; but all circumstances seem to point to an accidental concurrence of a few amateur, dishonest, self-styled assayers, who gave high returns on any rock, simply to add a few dollars to their incomes, without knowing the similar rascality of the others, or suspecting the extent of the excitement that was to be raised.

The chief culprit in these false returns now claims simply carelessness and want of knowledge of assaying to account for giving, during the past six months, hundreds of dollars per ton to any gabbro boulder, the necessary pyrites giving him the clue for a gold return. The same rock at another time would run high in silver. One St. Paul expert, after giving 25 ounces of gold per ton, with the remark that it occurs as "chloride of gold" (in those old weather-beaten, moss-covered rocks of Lake Superior), calmly says he does not think it much of a country for gold either, but looks for large silver yield.

Besides the assaying, no one but the United States Land Office seems to have made anything. Some \$100,000 have been paid for worthless land, mostly rocks, bluffs and swamps, difficult to explore or reach, devoid of valuable timber or agricultural land. The fishing, however, is good. If it were not for the difference of the level of the lakes, it would be difficult to decide whether to call the country an archipelago of lakes or of islands.

On our trip, in canoe, from Vermilion lake to Grand Portage, we crossed 55 lakes and made 54 portages (32 miles portages), poled up six rapids, ran down many more, and yet did not go where the lakes were very plentiful, following mostly the United States boundary line of large lakes.

To the west of Emery's camp, the centre of the gold excitement, only the upper traps rise above the water, so that it is doubtful if anything will be found until the Vermilion Lake belt is reached. To the east, however, especially east of Gun Flint Lake, the Animikie or Canadian silver-bearing belt is very well developed, so that it is possible that rich silver deposits like those of Silver Islet, Rabbit and Silver Mountains may be found. A dense underbrush and a heavy covering of moss make exploration especially difficult. There is, without doubt, a fine belt of iron ore nearer Lake Superior. For beautiful scenery, fine fishing, and opportunity to study greenstone trap in all its forms, this country is unsurpassed.

It might be justice if the United States Geological Survey would devote part of the \$100,000 obtained for these lands to determine the construction and the continuation of the veins in this district."

By an explosion on the 20th June, in the Burley Pit, at Apedale, North Staffordshire, ten persons were killed.

During the past ten years Kimberley, South Africa, has exported diamonds valued by itself at forty million pounds sterling, and by the jewellers who deal in them at a hundred millions.

MINING NOTES.

NOVA SCOTIA.

The Rawdon gold mines show 161 ounces of gold for the month of May.

The Salmon River mine at Chezzetcook has resumed operations with promising results.

The amount of gold per man employed, as reported to the mine offices, has never been greater than at present.

The Gallagher mine, in the district of Stormont, shows returns of 499 ozs. 17 dwts. gold from crushing 197 tons of quartz.

Never in the history of gold mining in this Province has the volume of paying work done been greater than at the present time.

The operations of Messrs. Hall and Owen on their property at Leipsigate Lake are progressing favourably and the vein is being proved by judicious development.

The Spring Hill collieries in Nova Scotia are raising 1,500 tons of coal per day. In one day last month 1,693 gross tons were shipped by rail. This is the largest output yet attained by any colliery in Canada.

QUEBEC.

The asbestos mines of the Eastern Townships are yielding more abundantly this season than ever before, and there is more activity noticeable, especially at the mines in the townships of Thetford, Coleraine and Broughton.

At the Bristol iron mine in the County of Pontiac, owned by the Robert's Iron Company, of Charlotte, N.Y., mining operations are actively progressing. There is a fine quality of ore on three sides and in the bottom of the shaft, and ore is being raised at the rate of fifty tons a day.

The Capelton copper mines are yielding abundantly and are being worked at large profit, notably the mine owned by the Nichols Company, New York. The ore is shipped to the company's sulphuric acid works at Brooklyn, N.Y., and after the sulphur has been extracted the copper matte is sold, chiefly in Swansea.

The Forsyth iron mine in Hull Township, Ottawa County, is still idle. The shaft is filled with water and the machinery and buildings are going to ruin. This is one more instance of want of enterprise of Canadian mine owners. The proprietors of this property will neither work it themselves nor lease it to people who are ready to work it and pay a reasonable royalty on the ore extracted.

Gold mining in Beauce continues active, and the district has been visited during the past few months by many scientific mining engineers and practical miners, all of whom have expressed the opinion that the quartz ledges could be very profitably worked, and that under a proper system of mining the alluvial deposits would yield good *pay*—many of them are doing so although the methods employed are most primitive.

At the Haycock iron mine, in Ottawa county, is another monument to misspent capital in the shape of decaying buildings and machinery,

which were located and erected before a mine was established. It is unquestionably a valuable property, containing abundance of high grade ore, but is as yet not only quite undeveloped but it has not yet been even properly prospected, and, notwithstanding this, not less than \$125,000 has been uselessly expended on buildings, machinery and ill-advised mining.

ONTARIO.

Owing to the dullness in the iron trade none of the mines in Frontenac county are being worked at present.

Two more mines will be opened this season by the Central Ontario Railway Company, and the force of workmen employed at the Coe Hill mine will be much increased.

Two gentlemen of Pembroke are opening up a copper vein in the vicinity of North Bay which promises to develop well as the surface indications of the lode show considerable mineral strength.

The Central Ontario Railway Company commenced running ore-trains before the end of May, and ore has since been forwarded daily to Weller's Bay from the Coe Hill and other iron mines for shipment to Cleveland, Ohio.

It is not improbable that a change will very shortly take place in the management of the Canada Consolidated Gold Mine in the township of Marmora. Messrs. Stevens and Newberry, who have furnished the money to carry on the work under the present lease, are much dissatisfied with results, and it is to be hoped that the contemplated changes will be the means of placing this property on the list of dividend paying mines. The vein is capable of producing abundance of rich ore that would yield gold at a large profit if properly treated.

BRITISH COLUMBIA.

Early in June a strike was made on Finley creek, about ten miles from Kootenay lakes. Rumour says the miners make from \$5 to \$7 a day.

During the past winter in Cassair district one tunnel claim on McDame's creek produced a little gold, also one on Thibert creek, but the winter was so severe as to render it almost impossible to do anything.

A dry gulch near Lorne creek is being successfully worked by several parties. Water is being brought on the ground for washing. Parties who have been prospecting the various creeks adjacent to Lorne creek report having struck good *pay*.

The Yale silver mine, owned by Mr. Teague and others, will be developed in order to test its worth and extent. Ore assaying \$75 to the ton has already been taken out and if the mine gives promise of continued richness, it will be extensively worked.

Information has been received that the silver discovery on Shuswap lake is likely to prove of some importance. It is said that the lode is sixty feet in width and that seams containing gold and silver have been found, the outcroppings of which assay from \$40 to \$80 per ton.

In Cariboo district the Big Bonanza claim, on Lightning creek, through which the water broke, is again being worked with increased vigor, and

at William's creek good *pay* is being taken out. Bridge river miners report that they are doing very well, as also those on Kithley creek, north of the 150 mile post.

The Marquis of Lorne Co., on Dease creek, has found a hill channel which prospects from \$1 to \$20 to the pan. The company is making preparations to begin washing at once. This company has been prospecting for the past three years in the Cassair district and this is the first encouragement it has met with.

News from the miners on Lorne creek is satisfactory. A nugget weighing 104 dollars, the largest yet found on the creek, has been taken from the original Young American claim where a wing dam has been constructed. All the miners are busily engaged in making preparations to take out gold, building flumes, etc. Some Chinese miners have been driven from the creek.

R. E. Sproule shot and killed Thomas Ham-mill on the 3rd June while the latter was at work on the *Blue Hill* claim at Lake Kootenay. The murderer fled to the mountains after committing the crime and has since been captured. Sproule was looked upon as a dangerous man, having had a real or fancied grievance against the Ainsworth Company for invasion of his rights as a discoverer.

Mr. George Seymour and four men have been constantly engaged for the past nine or ten months in prospecting for coal for the West Vancouver Coal Company on Quatsino Sound. In the borings they have struck seams 3 and 4 feet thick, but none that would pay to work. Prospecting will, however, be continued as they are confident the search will be ultimately successful.

UNITED STATES

Ice was two feet thick at the bottom of some of the marble quarries in West Rutland, Vt., May 23.

A marl pit which abounds in petrified remains of animals has been discovered near Cuthbert, Ga.

A gigantic crystal of spondumene found in Dakota measures, according to Prof. Blake, thirty-six feet in length and from one to three feet in thickness.

Plymouth Consolidated Gold Mining Company, of California, has declared a dividend (No. 26) of \$50,000, or 40 cents a share, payable July 9. Total dividends \$1,300,000.

During the first five months of this year the output of the Calumet and Hecla is said to have been 23,440,000 pounds of copper, against 21,660,000 pounds for the same time in 1884.

A nugget of gold taken from the Cœur d'Alene mines recently was nearly four inches long, two and a half wide, and one inch thick. It weighed nineteen ounces, thirteen pennyweights and eight grains.

A stone found near Wildwood and Sumpter-ville, Fla., recently, is said to be on one side an exact imitation of a lamb's head, while the other side resembles the head of a seal. The shape of the neck, head and nose is almost perfect.

The first shipment of red slate ever made to Europe was sent from North Granville, N. Y.,

in May last. It is a fact not generally known, that the only red slate in the world is found in four towns of Washington County, New York State.

A ledge of white stone, which somewhat resembles marble, and is susceptible of a high polish, exists in Paradise Valley, Nevada. When quarried, it is said to be much lighter and softer than ordinary rock, but hardens upon exposure.

The 19th of June was a great day for Alaska, the occasion being the starting of the large quartz mill on Douglas Island. The mill began operation that day and all the stamps, 120 in number, started at one time, and is now running in full blast and works beautifully. There is great rejoicing among all the miners over the great success. There was a salute fired of 120 guns in honour of the occasion.

The *Copper Queen* mine in Arizona has been sold to an English organization, and a statutory meeting of the company, now known as the Copper Queen United, was held on the 8th June at the Guild Hall Tavern. No business was transacted at the meeting because of awaiting developments in a law suit, commenced by vendors of the property against the promoters, and consequently no payments have as yet been made nor the title passed.

Gold in Manitoba.

A correspondent at Shellmouth, Marquette District, Man., says:—

"Our town may now be described as an Eldorado in the North-West. Gold has been discovered in very considerable quantities on the bank of the river. It has also been found in the cellars of the houses, in the wells; everywhere is gold. Indeed, it is a veritable 'Tom Fiddler's ground.' In its present crude state an ounce or more may be easily washed out in a week, worth \$16 to \$18. Each day you may see men sitting along the bank washing out gravel in frying-pans or other vessels. Our real estate agent has written to the Government for instructions as to claims, and we are awaiting the advent of seekers after the precious metal."

New Caledonia Mineral Production.

New Caledonia is in minerals the richest of the French colonies. In 1883 it produced 9,025 tons of nickel ore, which yielded about 824 tons of nickel, worth 6,592,000 francs, or 8,000 francs (\$1,600) per metric ton. The production of chromium amounted to 3,850 tons. French Guinea in 1882 produced 1,558 kilogs of gold, worth about five million francs (\$1,000,000).

Mining Stocks as Investments.

Again we would call the attention of our readers and of their friends to the undeniable fact that mining stocks—so generally abused for some time and even derided in business circles here in New York—are comparing more than favorably, as investments, with railroad stocks and bonds. That is to say, any comparison of market results to investors will be found altogether and markedly on the side of mining securities. This fact we would specially call to the attention of the financial editors of certain of our secular contemporaries that have perversely gone out of the way to belittle mining stock investments, with the superficiality of information habitual to the *daily press*.

The experience of those who may have bought mining shares about the first of the present year and held them, will attest that within a month nearly every mining stock on the official list here in New York, and at San Francisco, has advanced from five to several hundred per cent. At the same time there is not one railroad security that has advanced as much as five per cent. A few names will tell the story so that he who runs may read it clearly:—

On the 9th of May, for example, the Consolidated California and Virginia was selling at \$1.55 and the first of the year at thirty cents, while to-day it is fetching from \$3 to \$3.20 per share.

The Eureka Consolidated at the first of the year was selling at not more than \$1.25 per share and \$7.25 thirty days ago, while at the present writing it is quoted at \$8.

The Homestake on the 2nd of January sold at \$10 per share, thirty days ago at \$11.87, while it is now quoted at \$14.12.

The Ontario, at the opening of 1885, was selling at \$18.25—a month ago sales were made at \$21.37; now it cannot be bought under \$25 a share. The Standard at the opening of the year was selling at 54 cents; a month ago it fetched \$1.30 and now \$1.60 is the quotation. Hale and Norcross was selling five months ago at \$4, a month ago at \$6.75, and at present at \$8.75. But to make the matter plain to the dullest understanding, we ask attention to the following showing of the market for all the Comstock shares at three dates of the present year:—

	Jan. 1.	May 11.	June 10.
Alta.....	05	30	90
Belcher.....	60	1 25	1 37½
Best and Belcher....	1 12½	2 87½	3 75
Chollar.....	1 87½	2 37½	2 62½
Crown Point.....	1 90	1 62½	1 75
Gould & Curry.....	1 00	1 75	2 37½
Mexican.....	50	1 12½	1 75
Ophir.....	50	1 50	2 25
Potosi.....	65	90	1 00
Savage.....	1 62½	3 75	4 75
Sierra Nevada.....	65	1 37½	2 00
Union Con.....	60	1 00	2 00
Utah.....	15	2 12½	3 12½
Yellow Jacket....	1 62	3 00	3 12½

Many other mining stocks have appreciated in like fashion, as for example, the Grand Prize, the Bulwer, the Iron Silver, etc., and very few have depreciated, such as the Horn Silver, Bassick and Navajo.—*Financial and Mining Record*.

A NEW PROCESS.

London *Engineering* informs us that Mr. P. Manhes has taken out patents for a process by which he claims to extract gold and silver from copper mattes. The mattes are roasted, after grinding, with from one to three per cent. of ammonium chloride, in a muffle-furnace. The heat is to be kept so low that the matte does not get red-hot, but all the ammonium chloride must be driven out. After this, the matte is not altered in appearance, but all the gold and silver are present in the form of chlorides, while the iron and copper remain as sulphides. The chlorides of the precious metals are then to be extracted by one or other of the well known solvents, sodium hyposulphite being specially recommended.

The El Callao, the famous Venezuelan gold mine produced \$175,500 during the month of April, and paid the shareholders a dividend of \$2.50 per share, aggregating \$80,500.

A NEW CONCENTRATOR.

The *Denver Times* says that Ex-Governor Tabor has organized a company to manufacture and introduce a new concentrator which, if it shall do what is claimed of it, will cause a revolution in mining in Colorado and the West. After the crushing of the ore it is concentrated by means of pans, arranged to work like prospectors' gold pans. Each machine has about a hundred pans on it, or has a capacity of seventy-five tons a day. From 75 to 85 per cent. of mineral is claimed to be saved, and the cost of treating the ore is only forty cents per ton.

Large Pumping Engines.

One of the largest pumping engines in the Birmingham district for draining the submerged mines has been started at Princes End at the Moat Colliery. The engine, which was supplied by Messrs. Hathorn, Davey & Co., of Leeds, is a horizontal one, with a 10-foot stroke. The pumps have two 19-inch plungers with 10-foot stroke, placed at a depth of 464 feet. The bottom lifts facing the plungers are 156 feet long. At each stroke of the plungers 245 gallons of water are brought to the surface, and the engines will raise 2,000,000 gallons of water per day. Messrs. Hawksley & Co., of Sheffield, have supplied three Lancashire boilers, 30 feet by 7 feet. The engine will dispense with six smaller engines, and will drain several miles of mineral area submerged for years. The cost of the engine and works carried out by the Drainage Commissioners is about £14,000. In a very short time the new engine will render workable immense quantities of coal and ironstone which will not contribute improvement to the present depressed state of trade.

TEMPERING MINING PICKS.

There is probably no service to which steel can be put which so effectually tests its value as mining picks. The tempering of a pick is a very nice piece of work and should be done with great care. In the first place a good charcoal fire is necessary; next, good steel, and then a good light hammer with a smooth face anvil; and lastly a man is needed with a good keen eye, considerable experience and excellent judgment. No good pick can be turned out if any of the above essentials are wanting in the process. A pick should never be "upset" or hammered endwise, or raised above a full red heat. The steel should be, moreover, heated as quickly as possible, as long exposure to heat—even if the heat is not in excess—injures its texture. Many blacksmiths find great difficulty in tempering picks, because they do not choose good steel. After being heated the pick must be worked with care, special pains being taken in drawing it out, to hammer on all sides alike, in one place as much as another, and on one side as much as the other. When ready for hardening, it should be heated in the blaze of a charcoal fire until red hot, then plunged into cold rain water and kept there until it is nearly cold; but if kept too long in the water or until it is quite cold, the corners are liable to fall off. Some blacksmiths use hot water. No salts of any kind should exist in the water, but the water should be cold; if the water is warm and a little ice should be thrown in to chill it, the tempering will be all the better. Pure soft water for hardening will make a tougher pick, and one less liable to crack at the edges than where salt water is used. The last hammering

of a pick should always be given on the flat sides, across close to the edges, and then up each side about an inch. By so doing the corners will be less liable to crack off.—*Journal of Commerce.*

The Ingersoll Rock Drill at the New Orleans Exposition.

The Ingersoll Rock Drill Company, of New York, have carried off the highest honors at the New Orleans World's Fair, where their handsome exhibit of rock drills, air compressors and other mining machinery attracted general attention. The judges have awarded them three first prizes, namely, a gold medal for the best rock drill, another for the best air compressor and still another for the best display. In making these awards, the judges, who had the best opportunity of appreciating the qualities of the different makes of machines placed in competition at the fair, side by side, have but confirmed the popular verdict and voiced the general opinion regarding the merits of the machines manufactured by the Ingersoll Company.

A RUSSIAN PLACER MINE.

A Party of Eight "Pan Out" a Pound of Gold a Day.

A recent issue of a Russian journal contains a somewhat incredible report to the effect that the latest mining news is the discovery of a remarkable placer mine about twelve miles from the river Amoor, on the China side. A majority of the miners from beyond the Baikal province, numbering about 6,000, are now at work, and as the news of the discovery spreads the force is daily augmented by fresh arrivals. The road leading to the mines is from Soatenska, the nearest town along the river Shelka and Amoor, thence a short distance across the mountains. The gold is obtained by the primitive method of washing in pans, and the work is not conducted as in well regulated mines, where the men work in rooms, but is carried on by small bands of prospectors, who work in parties of from eight to ten and take out about a pound a day. The work is not considered paying when much less than a pound a day is taken out by one party. In the villages near the mines there is no paper money in circulation, gold dust being used instead. As in all new mining camps, provisions are high, the price of meats being about \$1 a pound, and bread is the same price, while for a gallon of whiskey \$20 is the price exacted from the thirsty miners. When an offence is committed the culprit is brought before the President of the village, who acts in the capacity of Mayor. He is tried, and if found guilty is summarily dealt with. The fear of swift justice is so powerful that few crimes are committed. Gold and valuables of all kinds are left exposed without danger of being stolen.

The estimated supply of gold now available as money will not exceed \$2,600,000,000.

A few years ago a life was lost for every 30,000 tons of coal mined. Now 100,000 tons are mined per life lost.

A crane capable of lifting a weight of 147 tons is in course of construction at Hamburg. It will be the largest machine of the kind on the continent of Europe, that of Antwerp coming next with a lifting power of 129 tons.

The Gold Product of Venezuela.

United States Consul, Wm. Henderson, stationed at Ciudad Bolivar, under date of January 10th, 1885, makes a most interesting report to the State Department at Washington, concerning the resources and productions of Venezuela, from which we take the following statement of gold exported from that country, not only for the year 1884, but also for the nineteen years ended with 1884. His first table is one of the gold received from the mines and exported from Ciudad Bolivar during the year 1884, which shows that *El Callao* shipped 175,424 ounces; *Chile*, 22,970 oz.; *Panama*, 19,474½ oz.; *Potosi*, 8,509½ oz.; *Nacupay*, 574½ oz.; *Private mines*, 6,982 oz.

As usual *El Callao* heads the list; the *Chile* comes next, although it has not done as well in 1884 as in 1883, showing a decrease of over 9,000 ounces. *Panama* has done remarkably well for its first year's workings; *Potosi* has also done fairly well since it began work in March under the new management. *Nacupay*, owing to difficulties with the government, stopped work in April last and so far, Mr. Henderson says, shows no sign of starting again.

The second table shows the yearly amount of gold shipped from Ciudad Bolivar by the agencies of the gold mining companies and merchants from the year 1866 to 1884, both inclusive, aggregating, during that period of nineteen years, 1,557,567½ ounces, valued at \$29,818,000.

The chief mining field is that of Zuruary, in the State of Guayana.

It is stated that the amount produced of roofing slate in the United States alone is 500,000 squares per year. A "square" is about 100 square feet.

A Working Colliery at the Antwerp Exhibition.

The *Colliery Guardian* says:—The colliery at the Exhibition is a great attraction. It was a happy idea of MM. Desenfans and Soupart to exhibit a complete model of the underground workings of a coal mine, not in miniature, but in full size. There is the drawing shaft, down which the visitor may travel into the darkness of workings some 30 feet below ground. Here he will find every thing as it exists in an actual mine, less the fire-damp. A wag the other day suggested the propriety of introducing a little of the latter occasionally, just to show the effect of an explosion, but we have not learned that the suggestion has yet been acted upon. There are roads, faces of work, and drifts in progress; even the water and the dirt have not been forgotten, as the visitor will learn on returning to the daylight. Real miners have been provided to show how the work is performed, and horses, not less real, are there to haul the trains of ore-tubs to and fro. Such an exhibit was sure to attract by its novelty, but the result is even greater than the expectation of the promoters. The pit-bank is crowded from opening till closing time by persons patiently waiting their turn to descend. When Old London is worn out at South Kensington, a colliery might be transported thither with every chance of its turning out to be equally attractive.

The conclusion of Professor G. H. Kinahan's paper "On a possible Genesis of the Canadian Apatite," begun in our June number, will appear in the August issue of the REVIEW.

50 Square Miles.

This limit will be very valuable. Apply at the office of the MINING REVIEW for price and particulars.

PLUMBAGO LOT FOR SALE
IN THE TOWNSHIP OF BUCKINGHAM,
On which are extensive surface shows and out-croppings of fine quality of Graphite. Further particulars to be had at the office of the MINING REVIEW.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Rolled Iron Joists and Steel Plate Girders for the New Departmental Buildings, Wellington Street, Ottawa, Canada," will be received at this office until Saturday, the 25th July next, inclusively, for the Supply and the Erection of Rolled Iron Joists and Steel Plate Girders for the New Departmental Buildings, Wellington Street, Ottawa, Canada.

Plans and specifications can be seen at the Department of Public Works, on and after Monday, the 6th day of July.

Tenders must be made on the printed forms supplied. Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned. The Department will not be bound to accept the lowest or any tender.

By order,
A. GOBEIL, Secretary.
Department of Public Works,
Ottawa, 2nd July, 1885.

FOR SALE.
**DEVELOPED
PHOSPHATE MINE**

ADJOINING THE FAMOUS LITTLE RAPIDS MINE IN PORTLAND EAST.

THIS location has been pronounced by experienced practical miners one of the most promising apatite producing properties in the district. There are over TWENTY SURFACE EXPOSURES OF GOOD PROMISE, and one deposit now being worked that proves an extensive body of phosphate AT A DEPTH OF FIFTY FEET.

Price reasonable and satisfactory reasons given for selling.
Full particulars obtainable at this office.

NOTICE TO CONTRACTORS.

SEALED Separate tenders addressed to the undersigned and endorsed "Tenders for Hot Water Heating Apparatus, Barrie, Ont.," will be received at this office until Monday, 20th inst.

Plans and specifications can be seen at this Department, Ottawa, and at the office of Messrs. Kennedy, Gavillier & Holland, architects, Barrie, Ont., on and after Thursday, 2nd inst.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
A. GOBEIL, Secretary.
Department of Public Works,
Ottawa, 2nd July, 1885.

PHOSPHATE PROPERTY
In the Township of Portland West,
FOR SALE.

Lots 25, 26, 27 and 28, in the 3rd range. Some excellent surface shows have been uncovered on these lots and only require capital for developing. Price and particulars given at the office of the MINING REVIEW.

FOR SALE,
White Marble Quarry on Calumet Island.

At this quarry there is an inexhaustible supply of most beautiful white marble. Samples to be seen and information obtained at the office of the MINING REVIEW.

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

The gold and silver mines on the north shore of Lake Superior are attracting attention beyond the limits of the Dominion, and capital is being freely invested where owners are not unreasonable in their demands. We give some account in another column of what is being done towards developing the deposits.

Encouraging results are now being obtained from some of the gold mines of Nova Scotia. During the past two years suitable machinery has been brought in and skilled labour employed, and in all cases where this has been done, and the mines placed under efficient management, the quartz has been found to yield gold in paying quantity.

In this issue of the REVIEW will be found some interesting facts in connection with the phosphate mining industry of the county of Ottawa which are evidences of its rapid development and of the great importance it is becoming in the district. During the past two years it has been our pleasant duty to record the advancement of this industry, but never has the condition of the mines or the outlook for the future of the Canadian phosphate trade been so encouraging as at present.

We are informed by correspondents in London and Liverpool that a great number of Canadian phosphate mines are being offered in those markets. As far as we can

learn, these so-called mines, with few exceptions, are mere prospects where no development work has been done, and for the most part have not even surface indications to warrant the reports that are being placed before capitalists, or the prices asked for the properties. We are also informed that this is much the case in New York as well as abroad.

The alluvial gold deposits in Beauce are being more extensively and systematically worked this year than at any former time, and there exists no doubt that with a proper system for saving the fine gold contained in the alluvium this district will prove to be one of the most attractive mining fields in Canada for the investment of capital. The quartz ledges are also being carefully prospected throughout the district, and the results already obtained point to extensive gold quartz mining in the near future.

The asbestos mines of the Eastern Townships are giving employment to a large number of quarrymen and labourers and are being worked with much energy and very profitably. The output of these mines is of a quality equal to that of any asbestos mines in other parts of the world and has become well known in the European markets, and is much sought after by dealers and manufacturers. This industry has been making rapid strides during the past three years in the county of Megantic, and the entire serpentine formation in the district has been thoroughly explored, to a great extent prospected, and the mines that have been located are being systematically and profitably developed.

We find further testimony to the great mineral wealth of our Lake Superior district in the *Chicago Mining Review*, as follows:—

"There are evidences which prove beyond a doubt that the Lake Superior country is destined to become one of the most important mineral regions of the world. Nature, as far as her gifts have been brought to light, evidently gave with lavish hand to this favored section, the extent and variety of whose resources have never been appreciated."

Speaking on the same subject, Prof. Chas. F. Eschweiler, in an interview with the editor of the *Port Arthur Sentinel*, said:—

"The mineral wealth and the really wonderful resources of the country cannot long be hidden from practical men of means. You have here the proper geological formations in which to look for the minerals. You have evidences on every side of you of the disturbances of the rocks which make a mineral country. You have the veins,

and in many of them I have now no doubt you have the minerals in paying quantities. I was a skeptic of your mineral resources when I put foot in Port Arthur. I am now a strong believer in the country; strong in the faith that you are surrounded by one of the most promising mining fields on the face of the earth. This is saying much more than I ever said of any country before, and much more than is necessary. You ask me what I have seen that leaves these favorable impressions on my mind? Well, sir, I will tell you that I have seen enough to convince the most stubborn unbeliever that you have veins in this country that will pay handsome dividends to investors if they will but work them in a proper way. I have been into your silver region, known as the Rabbit Mountain District. I saw enough there to convince any man of the value of your silver veins. I do not like to particularize where there are so many assurances of the value of the veins. On seeing the Beaufort mine I determined to go on further without examining the country around it. I camped near it and made and secured a discovery in less than a week. I was satisfied with the richness of your silver country. Some people say the silver deposits are only to be found at surface. That is true only in local instances the result of local causes. I could soon explode that theory in a way you would understand. Then I desired to see something of your gold district, and made a tour of inspection of several gold bearing veins. I saw them and am convinced of the great value of your gold country. 'See Naples and die,' is an old expression. I say, let any mining man see the Huronian mine vein and he will be convinced of the value of your gold country. Good as it is, it is not the only promising vein I saw in the gold region. I examined several that in history will leave their own great record. Believe me, sir, I am not a sanguine man. I have seen too many disappointments in mining adventures to admit of any indiscretion in expressing my views now. But I can tell you this, that during an active life of forty years among many mines, I never saw a young country with such a promise as this district has."

The Nova Scotia meeting of the American Institute of Mining Engineers will open at Halifax on September 15th, and promises to be not only interesting and instructive to the visitors but of much importance to the Province. It is expected that 200 to 250 members will be present at this meeting which promises to be a grand success. Arrangements are completed for the entertainment of members and guests, including, besides the inspection of the picturesque city and suburbs of Halifax, a sail down the harbor, a drive to the Montagu gold district, and excursions to the Pictou and Sprunghill coal regions, Londonderry iron-works, Cape Breton, the Joggins, Grand Pré (the country of *Evangeline*), etc.

Prospectors should be encouraged in every way, and not looked upon as visionary men who dislike regular work. Many

good miners make poor prospectors. Prospecting is a kind of work for which some men are particularly adapted, and because they lead a nomadic life it is no reason that they are not as good citizens as those living in a town for years. They are the pioneers of the mining camps, and serve a most useful purpose since the result of their searches is the basis of the mining system. —*The Press, Idaho.*

America has long been celebrated among mineralogists as the home of enormous crystals; and the prodigious specimens of apatite, beryl, and other minerals, have been the subject of wonderment. But for size the crystals of spodumene exposed in the excavations upon the Etta tin mine, in Pennington county, Dakota, carry off the palm. Professor Blake, reporting on the subject, is authority for the statement that one of these crystals is *thirty-six feet in length* in a straight line, and from *one to three feet in thickness*. The cleavage is smooth and straight, but the lateral and terminal planes are obscure. Crystals from five to twenty feet long are numerous, and recline in all directions.

Notice has appeared in the *Canada Gazette* that application will be made for Letters Patent of incorporation, under "The Canada Joint Stock Companies Act, 1877," for the "North America Mica Company," with \$1,000,000 capital stock, divided into ten thousand shares of one hundred dollars each. The names and residences of the applicants are:—D. L. McArthur, Winnipeg; W. S. McLennan, Winnipeg; W. L. Boyle, Winnipeg; James Fisher, Winnipeg; Alex. Matheson, Rat Portage; Geo. McPherson, sr., Anabaskasing Bay; J. C. Hunter, Duluth, Minn.; A. R. Macfarlane, Duluth; and A. M. Morrison, Duluth. The head office of the company is to be Winnipeg, and its object is to develop the mica, asbestos and other mineral resources of the land it holds or may acquire in Ontario, Manitoba and the North-West Territories.

THE PHOSPHATE TRADE.

This has been a season of unusual activity at the phosphate mines of the du Lievre River district, and miners have met with much encouragement. The large increase in the output of the more important mines is evidence that Canadian phosphate is coming more and more into demand as the mineral becomes better known and that mine owners are not dissatisfied with the present market price. True it is that some years ago the price paid in England for our phosphate was a good deal higher than it is now, but the margin of profit to producers was then little, if any, greater. The cost of transportation in former days added quite two dollars per ton for delivery at points of shipment, and ocean freights ruled much higher than they do to-day. Now the increased railway accommodation and summer transportation on the du Lievre river have reduced the cost of delivery from the mines to Montreal to a minimum.

Ocean freight, a few years ago, could not be relied on at less than fifteen shillings a ton while for the past two years eight shillings has been the highest paid, and five shillings may be said to have been the average rate; so that by the reduction in transportation charges the output of our mines can now be laid down in London, Liverpool and other British ports at about \$4.50 per ton less than formerly. This in itself will compensate for a considerable falling off in values. But it is not at all likely that the phosphate market will remain sluggish, if it can be styled so at the present time; it is only in sympathy with general trade which is characterized, the world over, as being greatly depressed; and it has this advantage, there is a demand for every pound of mineral that can be produced, at a price that shows a margin of profit of from 75 to 100 per cent. on the cost of production. That an increased demand for Canadian phosphate is imminent there exists not the slightest doubt; the high grade of the mineral has brought it much into favour in Germany and France, in which countries there is an increasing consumption, and in England our phosphate is now better known than it was when shipments did not exceed four or five thousand tons annually. A letter recently received from one of our mine owners, dated London, gives a most encouraging report of the probable future for the product of our mines in that market. He says: "I am much encouraged as to the future demand for Canadian phosphate. The objections which were to be encountered on all sides a few years ago have now subsided, and the difficulties that had been met with in its use have for ever been overcome. A low grade Belgian phosphate, soft and of a dull shade, is coming largely into use here in England, which is found to combine well with Canadian, and a large supply of the latter is wanted for this purpose. Demand is not limited, but prices, though steady, are in sympathy with the depressed state of all agricultural markets. There is some question as to the continuance of the supply of Spanish phosphate, and this together with the high cost of Norwegian, favours an increased demand and higher prices for Canadian in the future.

THE MINES.

To describe the mines now would be but to repeat what we published in our last number. They are all turning out ore in large quantity and doing excellent work towards further development. The deep workings are all showing immense bodies of mineral which in every instance is found to be purer and more free from admixture with foreign matter than are the deposits near the surface, and hence there is a great saving of labor in clobbering and dressing the output. The production of the more important mines in the district for July and August has been most satisfactory.

The Emerald, with an average force of 80 men, all told, has produced an aggregate of 1,460 tons during the past two months.

The North Star, with a force of 65 men, including all classes of workmen, has produced 1,210 tons.

Star Hill Mine, during the past two months has given employment to an average force of 102 men and has turned out 1,214 tons.

High Rock Mine, with 130 men employed for the last two months has mined and dressed 1,380 tons, making a total output, for the months of July and August, for the four mines of 5,264 gross tons with a force aggregating 377 men.

The *Little Rapids* mine, of which we gave a full description last month, continues to improve with development, and although but a small force is employed the monthly output is more than sufficient to cover all expenditure for the large amount of dead work that is being done in opening up new veins. It may be said that there is no mining being actually done here, the object being to thoroughly prospect the deposits before attacking the bodies of mineral of which there are several thousands of tons in sight in the shafts and open workings. Buildings are being erected for the accommodation of a large number of miners and other improvements are being made for the advantageous handling of the output of the mine.

The *Gold Hill* mine has been quite recently opened in the Gore of Templeton and promises to develop well. Work was begun on this property on August 5th with a force of 15 men and already upwards of 50 tons have been forwarded to point of shipment.

The mines of the Du Lièvre district have been visited during the summer by a large number of strangers from the United States, England and Europe, all of whom have expressed much surprise at their condition and the large quantity of phosphate they are producing. The quality of the mineral also has been very highly spoken of by these visitors and a great future for the industry predicted by them.

PHOSPHATE QUOTATIONS.

The foreign market remains steady and prices have not varied since last report. The market continues firm at 1s. 1/2d. for 75 per cent., a fifth of a penny rise, ex-ship London and Liverpool.

OCEAN FREIGHT.

Little variation has been reported during the summer months; S.S. rates from Montreal to Liverpool and London varying from 6 to 8 shillings per ton.

PHOSPHATE SHIPMENTS from MONTREAL for JULY and AUGUST.

May and June..... 5,347

Total to date 14,590

Villeneuve Mica Mine.

The value of this mine has long since been established, and as work progresses in the drift that is being run into the mountain side the depth and continuity of the micaceous lead is more and more positively demonstrated, and the crystals become more compact, larger and more free from defect than those that were mined near the surface. The floor of the drift or tunnel, from its mouth to the extreme end, a distance of sixty feet, is thickly studded with well formed crystals lying on their edge in the vein of white quartz and feldspar. The walls also, and the roof of the tunnel show innumerable crystals of mica, well formed and of good average size. There is now at the mine about ten tons of crystals sorted into grades, as regards size and quality, which will be cut and otherwise prepared for market. A contract has been given for the erection of a cutting-house that will afford accommodation for a force of workmen adequate to the output of the mine. It is expected that all necessary preparations for carrying on permanent work will be completed about the first week in September, after which this mine will supply a large quantity of mica of a quality such as has never before been produced in Canada and better than which is not produced at any mine in the world.

Galetta Lead Mine.

This mine, situated about seven miles from Arnprior, produced during last year 294 tons of galena, which was manufactured into lead at Kingston, yielding 2,883 pigs, or 155 tons of pure lead. New machinery had been ordered and it was expected that the output for the present year would show a large increase. We are informed, however, that work at the mine has recently been shut down.

OTTAWA AT ANTWERP.

The great success which has attended the Antwerp exhibition, and particularly the Canadian exhibit, has called forth most flattering comments from the European and British *press*.

The Canadian court is situated between the English and German sections, with the exception of the Manitoba Farm exhibit, which occupies a separate and distinct position.

In the Industry section Mr. W. A. Allan, of Ottawa, exhibits some very fine specimens of apatite from his *Little Rapids* mine in Portland East; 36 specimens of mica from his Villeneuve and Pike Lake mines; and a magnificent specimen of apatite crystal mounted on a pedestal.

The Canadian Granite Company exhibits some fine specimens of red granite from its quarry on Deadman's Bay, and Prof. Selwyn a large number of specimens of ore, whilst the Geological Survey is represented by 292 specimens of Canadian ores, pebbles, building stones, &c., together with an obelisk, representing the gold obtained from the auriferous deposits of British Columbia during the past twenty-four years, which is valued in official returns at \$48,672,128.

The manufacture of rope from asbestos bids fair to become an industry of considerable importance in England.

A prominent broker has recently sold 1,000 tons of steel rails from the Pennsylvania mills, to be delivered in Illinois before 1886, at \$29 per ton. Eight months ago the same quantity of steel rails was sold to the Canada Pacific road at \$26 per ton.

IRON MINES.

THEIR DEVELOPMENT IN CENTRAL ONTARIO.—

FURNACES LIKELY TO BE ERECTED.—

THE OUTLOOK.

The report of the Commissioner of Crown Lands of the Province of Ontario, for the year 1884, which has reached us since our last number issued, contains interesting information concerning the iron mining industry in the Province. In the counties of

FRONTENAC, LANARK AND RENFREW

the iron ore output, during 1884, is reported to have been 18,094 tons, 15,094 tons of which were shipped to the United States, the balance, 3,000 tons, had not been forwarded.

On account of the depressed state of the iron markets, the mines in Eastern Ontario have been worked but to a limited extent during the past two years.

THE MINES.

ZANESVILLE IRON MINE.

This mine is four miles from Bedford station on the Kingston and Pembroke Railway, with branch line into the mine, which is situated on the shore of Thirteen Island Lake, with shaft sunk to the depth of 200 feet. The machinery is driven by steam, with air compressor, capable of driving fifteen drills. The hoist loads ore direct from the shaft on Kingston and Pembroke Railway cars. Value of machinery, \$10,000. Owing to the depression in the iron market there were only from ten to fifteen men employed during the past year, whereas if the machinery were worked to its full capacity 100 men would be required.

ROBERTSVILLE MINE.

The Robertsville Mine, in the Township of Palmerston, on line of the Kingston and Pembroke Railway, with shaft sunk to a depth of nearly 200 feet, has machinery valued at \$8,000. Very large quantities of ore have been taken from this mine in past years, but during 1884 it had not been worked to any extent.

WILBUR MINE.

This mine is in the Township of Lavant, and on the line of the Kingston and Pembroke Railway—worked by the Bethlehem Iron Company—and the ore forwarded to their works in Pennsylvania, for the manufacture of Bessemer steel. The shaft is sunk to a depth of about 200 feet, mine opened about 350 feet in length underground, has all necessary machinery for successful mining, including 40-horse power boiler, with air compressor, two portable 15-horse power boilers and Lidgerwood hoist. This machinery is capable of 3,000 tons output per month, if worked to full capacity. Quality of ore say 55 per cent. metallic iron.

BOYD-CALDWELL MINE.

This is adjoining the Wilbur Mine, and on same vein, sunk to a depth of about 200 feet; has been worked with steam drills, by a 15-horse power boiler. Hoist lands the ore on platform of Kingston and Pembroke Railway. No ore has been forwarded from this mine during the past year, but there is an output of about 3,000 tons ore ready for shipment.

Caldwell and Gildersleeve Mine.

This mine is a half-mile distant from Flower station, Kingston and Pembroke Railway, Township of Lavant, and has been worked with drills by a 25-horse power boiler. Shaft sunk to a depth of eighty feet, but no mining has been done during 1884.

RADENHURST MINE.

The Radenhurst Mine is about three-fourths of a mile from Flower station, and believed to be the same vein as the Caldwell-Gildersleeve Mine; is sunk to a depth of eighty-feet. Drills worked by two boilers of 10-horse power each.

CALABOGIE MINING COMPANY'S MINE.

There are three shafts sunk on east side of Grassy Bay, at Calabogie Lake, Township of Bagot, about one-fourth, one and a-half, and one and three-fourth miles respectively from Kingston and Pembroke Railway track. This mine has not been worked to any appreciable extent, not having any machinery.

WILSON-MARTELLE MINE.

This mine is also on east side of Grassy Bay, Calabogie Lake, one mile from Kingston and Pembroke Railway. Shaft sunk to a depth of thirty feet; no steam-power used up to the present. Vein about 1,100 feet in length, as indicated by survey with magnetic needle, and lies in low land, covered with about ten feet of soil. The indications point to an improvement of the ore and decrease of silica as the shaft goes down.

Analysis of ore taken from the surface by J. Blodgett Britton, of Philadelphia.

Undetermined matter and loss.....	0.342
Total.....	100.000

The report contains the following interesting statement of the operations, during the past year, of the Coe Hill Mining Company, forwarded to the Commissioner of Crown Lands by Mr. W. Coe, Madoc. The greater part of the ore from the Coe Hill mine has been shipped to Cleveland, Ohio. This ore was then tested as to its suitability for the manufacture of steel rails. The usual test made is to allow for five defective rails out of every one hundred and twenty turned out, but I am glad to state, that the proportion on using this ore was only one in every one hundred and seventy two. The test made proved it so satisfactory for this purpose, that a considerable quantity of the ore sold was placed in this use, but owing to slackness of orders for steel rails in the depressed state of the iron market during the past season, and the consequent curtailment in their production, one establishment used this ore entirely for making crucible steel—which is the higher grade of steel for making cutlery. We have many assurances that on the renewal of business we can place every ton of ore taken from this mine in good hands at paying prices.

COE HILL MINE.

The excavations already made on the surface of the deposit are a thousand feet long and from 20 to 60 feet wide. There are now three shafts on the vein. Number one shaft is seventy-five feet deep, and is opened eighteen feet wide at the bottom from the hanging wall. There are no signs yet of the foot wall, and from all appearances this part of the deposit will prove to be of immense width. Everything taken out of this shaft has been ore of the finest quality—not a single load of rock has been separated from it. On the west end of the shaft and fourteen feet below the top or surface there is a drift driven thirty-eight feet. Close to the bottom of the shaft there is another drift driven the same direction as the one above, and communication opened from it to the first drift by

means of a wenze or small shaft. This has been done for the purpose of being better able to mine the ore, also affording a pillar in end shaft, for protecting the shaft from the blast of the holes, as well as keeping the foot and hanging walls in a firm position.

Number two shaft is 105 feet deep and is developed by means of drifts or tunnels in each end of shaft, also communication opened to the drifts by means of wenzes or small shafts, thus leaving pillars fourteen feet in thickness and from eighteen to thirty feet high for the same purpose as number one shaft. This shaft is located 500 feet from number one, and shows a width of sixty-five feet of ore. We tested this part of the property with the diamond drill to the depth of 240 feet before sinking the shaft, and got at that depth sixty-five feet of ore.

Number three shaft is ninety-three feet deep and is also developed by means of drifts east and west of main or hoisting shaft, with pillars in each end of shaft the same as numbers one and two. Number three is situated 400 feet from number two.

ARTHUR MINE.

We have done considerable work in opening up the Arthur mine in Chandos. We have about eight miles of railway to build to get to this property. This is contemplated being done the coming season. We have made three different borings with the diamond drill, in all about 500 feet, on this deposit, and find from these the ore to be in great quantity, while its quality is excellent.

CLEVELAND MINING COMPANY'S MINE.

We have been very fortunate in making a new discovery of iron ore in Tudor. This is a large deposit, and has the advantage of being situated very near to the railway. An analysis of the ore shows sixty four per cent. of metallic iron, no titanium, and faint traces of sulphur and phosphorus. This analysis is made from an outcrop of surface ore. Work has been begun here with a diamond drill and will be followed up by clearing about ten acres for the purpose of building up a location the same as at Coe Hill. Our engineer has been over the ground, and located a branch from the main railway into the mine. The work of chopping out the right of way will be proceeded with at once. We intend working the mine vigorously the coming season, and expect to make large shipments from it.

THE BAKER MINE.

We have leased this mine, situated in the Township of Tudor, to some Cleveland gentlemen. Owing to the lateness of the season when they commenced work, little could be done besides stripping and making other preparations on the surface for active work the coming spring.

THE ORTON MINE.

The mine is situated on the Free Grants in the Township of Tudor. We have just removed our diamond drill from this mine, where it has been at work for a month past. This has proved an immense deposit, but contains a percentage of titanium. We hope to be able to sell a considerable amount per year of this ore, in small quantities, to large consumers to be mixed with other varieties of ore.

GENERAL REMARKS.

The depressed state of the iron trade the past year has caused us to slacken operations in opening up new properties, but we hope that confidence in manufacturing circles will soon be restored and business activity again prevail.

In January of this year there were lying on the different docks of the United States, upwards of a million tons of ore that was mined for last year's furnace supply, which has not been used. This fact keeps the iron ore market in a very depressed state.

However, looking over American statistics, we have every reason to congratulate ourselves on the progress we have made in the iron ore trade.

On comparing the results of our business with the whole of the Marquette section—the great iron-producing district of Lake Superior—we find that the shipments from there, from 1852 to 1857 inclusive, amounted to only 85,319 tons, an average of a little over 17,000 tons per year, while our first season's operations show shipments of 30,000 tons from one mine.

THE ERECTION OF FURNACES.

Referring to this subject, Mr. Coe says: "It has been my ambition to get a furnace in operation by which we could smelt, at home, a considerable portion of our iron ore. In fact, the building of a furnace is a necessity in our business, as we have, in sorting our ores, to lay aside such grades as will not pay for shipment. The cost of mining, hoisting, and sorting these ores would be lost entirely were we not to use them; they amount to over fifteen per cent. of the whole quantity mined. These ores cost just as much as No. 1 ore, and while the metallic iron itself they contain is just as rich as No. 1, they are too lean to pay the cost of transportation, not usually averaging over fifty per cent. In every mine we open there will be at least 20,000 tons of this material, and a considerable quantity yearly thereafter. Now it is to our interest to make use of these just as well as other or best quality of ore, and to do so we must have furnaces to smelt them. The question will be asked, why have you not done so? In answer, I may say, for two reasons: Our time has been occupied in opening up mines and making freight for the railway, and doing a variety of work which is preliminary to every mining enterprise, such as constructing pockets for the ore, building up our location, and other matters comprising a variety of details which it is almost impossible to enumerate. Another reason is, that the iron trade has been in a very depressed state; values have seriously fallen with large stocks on hand, which it would be ruinous to try to compete against. We have been compelled to defer for a period the erection and using of a charcoal furnace in connection with our business. But there has been no time lost in this matter, as we consider it very necessary to have a large accumulation of ore on hand before starting a furnace; our estimate for a furnace being based upon the No. 2 ore production of five mines."

RAILWAYS.

This subject is here taken up by Mr. Coe, and of the Ontario Central Railway he says—It was built in order to develop the mineral resources of the section of country through which it passes, as well as for the accommodation of the general public; but I will first illustrate the way similar enterprises have been treated in the United States.

The Marquette, Houghton and Ontonagon Railway is a line about ninety miles in length including its branches. This was the pioneer line in the famous iron fields of Marquette County, Lake Superior. A large land grant subsidy both from the general Government and the State of Michigan was given to the road, and by which the road was aided more than three million dollars. The North-Western Railway also received large aid in the way of land grants.

The Detroit, Mackinaw and Marquette Railway, which now reaches these iron mines, likewise received a large land grant.

The Duluth and Iron Range Railway, completed last summer from Two Harbours, on the north shore of Lake Superior, to Vermillion Lake Iron Mines, a line about seventy-five miles in length, received a land grant from the State of Minnesota, the pine alone from which was more than sufficient to pay the entire expense of the road, a sum considerably in excess of two millions of dollars, all the mines being given as well to the company. We lay down our ore on the docks at Cleveland, beside the product of these subsidized companies, and pay a tariff charge of seventy-five cents per ton to the United States Government for the privilege of doing it. In marked contrast is the policy of the United States in developing these great natural storehouses of wealth to that pursued towards our company in attempting to develop a similar enterprise. We have not received one dollar of aid from Government, municipality, or individual; but fault has been found with us for buying less than one-tenth the amount of lands given to any one of the companies named, for which the Government had never been able to find a purchaser. How can it be hoped that enterprises of this kind in their infant state can flourish without the fostering aid of the Government, similar to that given like enterprises in adjoining countries. A railway has never been built nor works like ours attempted to be prosecuted, outside our own company, without assistance of some kind. If the Government desires the success of this and kindred enterprises, we feel it ought to treat us, as all other enterprises of this kind, which have succeeded, have been treated both in this country and in the United States. The money paid for these lands is paid under a feeling of protest, as we think the Government is exacting outside pay for what it could and should freely give us. If the results indicated by the figures above given are more desirable than the stale barren rocky ridges in their natural state, through which our road passes, and in which our mines are located, we hope that the Government will indicate its appreciation of them by giving such aid as is easily within its power, by refunding the money paid for these lands.

THE MINERAL BELT OF ONTARIO, extending from Lake Nipissing to the Ottawa River, comprises ten times the area of any known mineral territory in the United States, but there is this difference, in our country the process of development has only commenced, while in the States the minerals have been opened out and the mining industry long since passed the experimental stage. The building of the Central Ontario Railway has done a great deal to encourage enterprise on the part of prospectors and mine owners in the section through which it passes by providing means and facilities for the ready transportation of ore and supplies. There is a necessity for similar roads every thirty miles distant between Nipissing and Ottawa, and there would be a business similar to that now done by the Central Ontario for each of the roads when built. I believe if the interior of the country was opened up by lines of railway branching from the Canada Pacific Railroad they would not only pay but prove an immense feeder to that road, which would then be the backbone of a system running into and developing the great mineral belt of the interior, the products of which would thus find an outlet to the markets of the world, and the results would soon show themselves in the marked increase of Ontario's wealth and population.

It is a subject which will eventually attract public attention, and when the magnitude and importance of the interests involved are fully known, it will be a matter of surprise that these opportunities should have been so long neglected and unimproved.

In conclusion Mr. Coe says: The import duty now paid by shippers to the American Government on iron ore is a serious drawback to the successful carrying on of this trade. I should like very much to see reciprocity in natural products between the two countries, which would remove this embargo and put us on more equal terms with the ore-producing interests of the Lake Superior sections.

AN EPITAH.

Iron Trade Review, Cleveland, O.

MINES NORTH OF LAKE SUPERIOR.

Their Development Progressing—Immense Bodies of Ore—Rich in Gold and Silver.

The mines of Thunder Bay are attracting as much attention at the present time as those of any other mining locality in North America, and deservedly so. During the past few months they have been visited by a vast number of scientists, capitalists, and practical mining men, among whom there is a consensus of opinion as to the unquestionable richness of the enormous mineral region which is now being explored and prospected. It cannot be said, however, that the mines which have been opened up are being developed by their owners with that degree of push and energy which characterizes mine owners in the Western States and other mining districts, and it is only just to suppose that the reason for this is found in the fact that the capital employed is inadequate to the requirements of the mines. Before much can be accomplished towards a proper development of these valuable properties, machinery and other mining plant must be brought on the ground, and little can be done in this direction until transportation is facilitated by the construction of permanent roadways. That this may be speedily done, the Ontario government should be liberal with its grants, and in the absence of government aid mine owners should adopt a policy of co-operation and do the work themselves if they have means at their disposal for this purpose. If they are without the necessary capital to carry on this important work and to establish their mines on a paying basis, then they should offer sufficient inducement to capitalists to come to their assistance. *The Engineering and Mining Journal*, commenting on this very subject, points out that the parties who own the prospects, thus far discovered in the Thunder Bay district, are for the most part with means wholly inadequate to develop or successfully work mines; but with the exaggerated confidence of ignorance, they are all convinced that a prospect is a mine, and they accordingly put prices upon their property which are far too high for any prudent capitalist to pay. It may be that a few bonanzas near the surface can be worked with profit; but the present owners, or those buying at their prices, will have to go through the usual experience until they get educated up to the appreciation of the fact that the value of a mine is the net value of the ore actually proved by shafts and levels, and that the man who invests his money to work a mine is he who takes all the risk, and should have most of the chances in his favor. Nothing can be more injurious to the interests of a new mining field than to fall into the hands of those who can not work it themselves, and who put such high prices upon the prospects as to keep capital out or cause what goes in to be unprofitable.

THE MINES.

At *Rabbit Mountain* mine little work is being done at present. Several prospect shafts have been sunk on this location, all of which show good silver bearing rock, one of them at a depth of 150 feet showing a seven foot vein of fairly rich ore. A large heap of high grade ore taken from the shafts awaits the crusher. It is said negotiations are in progress which, if carried to a successful issue, will enable the owners of this property to proceed with operations on a permanent and business-like basis. Meanwhile a few men are engaged in collecting from the dump all the pay ore.

SILVER MOUNTAIN MINE.

Here quite a village is springing up but very little opening has been done at the first dis-

covery on this location. There is plenty of ore in sight and native silver can be seen well disseminated through the dump at the opening that has been made. We are informed that five sixths of the eastern half of this location has been sold to Cleveland capitalists, who are preparing to take in machinery and to get to work systematically to develop this truly valuable property, whose enormous richness is admitted by every one who has inspected it, all of whom express surprise that more work has not already been done towards opening up the vein. The Cleveland people have now twenty men employed doing preliminary work.

BEAVER MINE

is now working day and night and good progress is being made. This mine shows to great advantage; the mountain on which it is situated is over two hundred feet high with the vein uncovered, cross-cut and driven into on the escarpment on both sides, all the vein matter being, it is said, good pay ore.

TWIN CITY MINE.

Here considerable tunneling has been done but the mine has been idle latterly, pending the completion of the waggon road which will enable the company to take in its mill and such machinery as will be suitable for the reduction of the ore. When this has been done mining operations will be actively resumed. The ore now on the dump at this mine is very rich in silver.

Explorers have been numerous and busy during the summer throughout the Silver Mountain region and much prospecting has been done. Claims have been taken up in all directions and a number of mines have been located. Within a few miles of the *Rabbit Mountain* mine there are the *Silver Creek*, *Cambrian*, *Silurian*, *Crown Point*, *Silver Falls* and *Silver Hill* mines, all of which promise to develop into valuable properties.

HURONIAN MINE.

In the gold bearing district, adjoining the silver region to the north and west, is situated this very rich gold mine. On the property owned by the Huronian Mining Company is a decided fissure vein of gold and silver bearing quartz, having an average width of over six feet, which has been exploited for a distance of 2,500 feet. The vein is highly mineralized throughout its entire length and carries, as far as tested, the sylvanite ore, a compound of gold, silver and tellurium. The entire vein matter is pay ore while some of it is extremely rich. A shaft has been sunk on the vein to a depth of 140 feet, at the bottom of which rich sylvanite ore is found. Dripping has also been run on the vein for a distance of 160 feet and some stopping has been done, all of which workings have proved the persistency of the vein in its mineral features. Free gold has been constant in all the workings, and gold and silver are not only finely disseminated throughout the veinstone, but they are in union with the sulphurets with which the vein is so heavily charged.

The mine is now being worked under new management, and from what is known of the results already obtained under former management there is no doubt that it will become ere long one of the best paying mines on this continent. The ore which has been taken from the shaft and drift has yielded an average of \$20 the ton in gold, and it has been since discovered that a large portion of the gold was lost owing to the imperfect machinery employed, which consists of a ten-stamp mill, two Frue vaners and a concentrator. A recent assay of the

ore, by Ledoux & Ricketts, New York, gives 138.40 ounces in gold, and 1057.32 ounces in silver per ton (2000 lbs.), equivalent to a money value of nearly \$4,000. This was, of course, selected ore; but it is not at all unreasonable to expect, after what has already been demonstrated, that the entire veinstone will yield an average of \$30 the ton if properly treated by suitable machinery and under efficient management.

THUNDER BAY COLONIZATION RAILWAY.

It would appear there is now some hope that this much needed line of railway will be constructed in the near future. The Dominion government has granted a subsidy of \$3,200 per mile, and the route has been explored and reported on by Mr. Wm. Murdock, C.E., who is quite enthusiastic, not only as to the necessity of the railway, but on account of the easy location the country affords and the natural richness of the section the railway will penetrate. Mr. Murdock in his report, says:—

"This railway would connect Port Arthur and north shore stations with the American system of railways at Duluth, and thus supply an urgent need without doing injury, but on the contrary, assisting the traffic of the Canadian Pacific railway.

"The proposed route would open up an entirely new country, and would pass through the finest forests of the district, the richest silver country on the continent, and the Iron Range Railway has the largest deposits of the finest iron in America, which would be all tributary to this line of railway, and on either side of the proposed line, the soil is suitable for cultivation, and the greater part of it would produce crops equal to any grown in Manitoba.

"It would supply the struggling mining industry which must have railway facilities to foster and establish it.

"The line as laid down by me is the correct one, inasmuch as it would give railway facilities to all the working mines, without favoring any particular one. The mining industry of the district will bring millions of dollars of foreign capital to the country, if assisted by railway facilities in time.

"The route throughout presents no engineering difficulties, and would simply be ordinary railway work similar to the Canadian Pacific between Port Arthur and Savanne, and the same in distance."

British Columbia's Mineral Deposits.

What is Being Done this Year to Develop Them.

Mr. Amos Bowman, Mining and Civil Engineer, of the Dominion Geological Survey, arrived in Victoria early in July on a mission of much importance to British Columbia, that of specially examining the mineral deposits of Cariboo, and reporting and mapping the same, and obtaining every general information possible in reference to the mines of the district. The work of the Dominion survey in that province has heretofore been confined to locating and examining a certain belt in blocks to connect with surveys in the east, so as to have one continuous belt from sea to sea.

The Dominion and Provincial authorities have combined this year, and each appropriated \$2,500 for the purpose of the present survey. In previous years the amount set apart was too small to allow of more than a superficial survey being made, for the geologist had to also act as geographer. The appropriation this year will obviate this, and the services of a geographer have been secured for that special work. Mr.

McCoy, of Ottawa, a graduate of McGill, has been sent out as a general assistant, being specially adapted for that position, while Mr. Voligny, of New Westminster, has been employed as draughtsman and topographical assistant, which will enable the work done to be reported quickly, as draughting can be done while in the field.

Mr. Bowman will thus be able to devote his whole time to the geological work, and will examine the various mining districts in Cariboo, and it is expected that good results will follow. The design is to map out the placer mines where worked, and denote them on a map, with amounts of gold taken out marked, and also to locate and determine the extent and worth of quartz ledges. The direction and extent of the gravel formations will be gathered, and every information that will be of use in mining will be clearly shown in map form. Districts that have been worked will be mainly followed. The benches of the Fraser will also be examined. These were undoubtedly a lake country and extend into the mountains to gravel deposits, some of which contain gold while others do not.

Another feature that will be demonstrated, it is thought, is that the rich mineral deposits which occur in Utah and north of that state also exist in British Columbia in the same mineral belt. There is little doubt but the rich deposits which prevail south also exist in the province and northward to Alaska. Of course this will all have to be determined afterwards by the prospector. However the maps will be prepared showing the mineral belt which will prove of great assistance to the prospector in his work.

The age of the gravel deposits will also be determined, whether tertiary, glacial, volcanic, or of a later period, and it will be shown when and how these deposits were placed in Cariboo. The reports will be printed and given to the public as quickly as made, and the means at the disposal of the survey are such that this can be readily done.

BEACON HILL QUARTZ.

A Shaft Partly Sunk on a Ledge at Finlayson Point, Victoria, B.C.

The last quartz excitement that interested people was the reported rich strike at Goldstream, in which a number of contractors and engineers were interested, and from which they had great expectations. However, it has quieted down and we hear no more about it, further than the query of a stranger when he picks up the specimen from the collection on our office table. But there is always some restless spirit among the great majority, and one of these has discovered that it is not necessary to go to Cariboo or even Goldstream to get the precious gold-bearing quartz, and the other day he recorded a claim on the rock off the battery at Finlayson's Point. His name is John Lundy, and he arrived here last spring from California. He has had a long experience in prospecting in California and Nevada and for the past month has been prospecting in the mountains off the Chemainus River. In April last he discovered a quartz ledge running from one side of the rocky point to the other, and disappearing into the sea. Staking out his claim on the legal length, he hired a couple of men to sink a shaft on one drift of the lode, which is about a foot in width. Spurs run out in several directions, but Lundy believes that when the shaft is down twenty-five or thirty feet the main ledge and color will be found. The shaft, as at present, is about 8 feet by 6, and shows a well-defined ledge of quartz to its full depth. In all of this there is plenty

of pyrites of iron, but nothing more. Still Lundy thinks that if the shaft was but sunk twenty or thirty feet further the precious metal would appear. About five feet down the quartz becomes of a bluer color and between the trap wall and the quartz is a drift of blue clay and slate, which the prospector informed the reporter was always a favorable sign, and he is very sanguine that gold would be found at the greater depth. He has expended about \$80 and his time in sinking the shaft so far, but like many another worthy prospector is now impecunious and wishes to form a company, to sink it deeper and thoroughly test the ledge. This would cost comparatively little, probably a couple of hundred, and in the event of the mine proving a valuable one, it would well repay the investment. It would be rather startling news if such should prove the case, and a mine of wealth have been under our feet and passed over thousands of times, and yet not known. The quartz can be readily examined by a trip to Beacon Hill.—*British Colonist, Victoria, B.C.*

BRITISH COLUMBIA MINING NOTES

The gold-diggings around Lillooet and Bridge river are returning fair wages. Miners in the Soda Creek vicinity are also getting some gold.

Prospectors have brought specimens of galena and a quantity of gold dust from Cowichan lake and river, and will return to further prospect the district.

An argentiferous galena claim has been rediscovered on the north fork of the Ille-cille-wat and recorded. Assays of the ore have given \$84 in silver to the ton.

What is supposed to be silver ore has been found in a ledge near Cowichan lake, and specimens have been forwarded for assay. Men are now engaged in sinking on the ledge.

The prospects for a successful season in the Kootenay district is said to be bright. There has been quite a rush to Fenley Creek. About forty Chinamen have gone up and have been taking out for \$1.50 to \$8 per day. It was expected that when the water subsided even better results would be had.

About twenty new claims have been located in the Semilkaween district, where recent gold discoveries have been made, and miners are reported to be taking out about \$3 to \$10 per day. The creek in which these discoveries have been made is a tributary of the Tulameen, and has been named *Granite creek*.

A mica mine, discovered last autumn, is being developed at Clearwater lake, between Big Bend and Cariboo districts. A trail has been cut to the mine and provisions and tools taken in. We are not informed if any quantity of mica has as yet been produced, but the quality is said to be very good.

More recent reports from Lorne Creek and Kitsum-Kaylum, are not encouraging. Miners are disappointed at the poor output, so far, this season. The *Discovery* claim, on Lorne Creek, after six days' washing, scarcely showed a colour; but better results are hoped for. Prospectors have made no new discoveries.

Other creeks in Lorne Creek district have been prospected and several claims staked out, on

some of which the ground yields as high as \$1 to the pan and averages well. It is, therefore, expected that the bed-rock will be very rich. It is rumoured that the miners have been earning \$1 a day from the gravel at Kitsum-Kaylum.

At Zerran mine, on Scotch creek, a tunnel has been driven forty-eight feet, and has entered a fine body of mineral. At fifty feet a cross-cut will be made to test the width of the vein, and a quantity of ore will be forwarded for mill test. An assay already made gave \$109.50 the ton, but the mill test is expected to prove the average richness of the vein.

Up to the beginning of July little has been done at the Lorne Creek placers on account of exceptionally high water, though some of the claims were being successfully worked. It is expected a great deal of fluming will be done this summer and some new ground has been paying well. The indications point to a large yield for the season from this creek.

Gold quartz has been discovered at the head of McCullough Creek, which flows southerly into Gold creek; the latter, a tributary of the Columbia, flows into that river about 50 miles above Farwell. The quartz, described as "rotten quartz," is said to be very rich, and free gold is visible to the naked eye. If there is any quantity of the quartz this is an important discovery.

A claim has been located at Leech River, within twenty miles of Victoria, which promises to become of importance. A careful examination of the ground gave many colours to the pan, and mining experts have pronounced the claim worthy of introducing hydraulic. Water can be brought from a lake a mile distant and paying results are predicted from these alluvial diggings if worked by the hydraulic system.

Thirty to forty miners are reported at work at Lake Kootenay, in galena ledges. Gold has been discovered on Slocan stream, a tributary to the Kootany river, about ten miles from its junction with the Columbia. Development of these claims will, however, be retarded, owing to the difficulty of access, which renders it impossible for prospectors to take in tools and other means wherewith to test their discoveries.

Specimens of galena from the strike near Shuswap Lake have assayed \$40 the ton and if expectations are borne out by further tests mining operations will be carried on extensively next year. Practical miners are of opinion that the ledge will be found to carry ore in fairly paying quantity. The vein is from seven to fourteen feet wide and has been traced for miles. If it can be proved that this ledge will pay, ample capital is available to work it.

No new discoveries have been made this year in the Cassiar district, and the old ones are said to be worked out, consequently, most of the miners have decamped. On McDame's creek there are about 28 white miners and about the same number of Chinamen. The Lorne claim is the only one on the creek where miners are encouraged, it is returning about \$10 a day per man. Thibert creek has about 25 miners at work on it, and Dease creek about 15. None of the claims on these two creeks are paying the miners more than their grub.

The mineral production of the United States is estimated at \$400,000,000 per annum and that of Great Britain at \$350,000,000.

UNITED STATES MINING NOTES.

Gold ore, worth no more than \$5 per ton, is being profitably worked in California.

The Tamarack Company's combination shaft has reached the great Calumet & Hecla ore-bed at a depth of 2,260 feet.

The dividends paid by mining corporations in the United States for the first five months of the year aggregated \$2,114,030.

The ordinary yield of the gravel channels in the northern counties of California is from \$40,000 to \$50,000 per acre.

The gold production of the United States in 1884, was equivalent to 1,789,949 troy ounces; and the silver to 37,744,605 troy ounces.

The net product of the 20 stamp mill of the Granite Mountain mine of Montana since December 1, 1884, to July 22, was \$718,927.63.

The following is the June output of the copper mines of Lake Superior as far as reported: Calumet and Hecla, 2,576 tons; Quincy, 270; Atlantic, 212; Franklin, 190; Huron, 115.

From January 1, 1885, to August 8, the output of anthracite coal was 16,724,560 tons, as compared with 17,459,917 tons for the like period of last year, showing a decrease of 735,357 tons.

The production of copper in the United States in 1884, including 2,858,754 pounds made from imported pyrites, was 145,221,934 pounds, worth \$17,788,687, at an average price of 12½ cents per pound.

News has been received from Alaska that the new 120-stamp mill at the Treadwell mine, on Douglas Island, was placed in position in June last, and that the first month's receipts amounted to \$100,000. This is the largest quartz mill on the continent, and was erected at heavy expense and under many disadvantages, in that out-of-the-way country. It was expected that \$250,000 would be recorded for the second month's mill-run, and as the expense of mining is not more than 20 per cent. of the proceeds, there is every indication the mill will prove a very valuable investment.

Plymouth Consolidated Gold Mine.

The product of this dividend-paying property for June is reported officially at \$82,656.70 making the product for the six months ending with 30th June, \$493,607.65 or a monthly average of \$82,267.94. The operating expenses of property aggregated \$160,792.84 for the six months, being a monthly average of \$26,799. The profit of the half year was \$332,814.81, which added to cash left over on 1st of January, 1885, made the sum disposable for dividends \$407,109.87. The six dividends paid this year aggregating \$300,000, together with \$10,914.86 expended in constructions, left a cash balance of \$96,195,000 on the 1st of July, or \$46,195 after the dividend of the 9th of July was paid. The stockholders of this company have already received \$13 per share in the form of dividends.

Production of the precious metals in Mexico since 1493 amounts to almost \$3,000,000,000, or about \$1,000,000,000 for each century.

Deep Mining in Australia.

The ten deepest shafts in Victoria on the 31st March were: 1. Magdala Company, Stawell, 2,409 feet; 2. Lansell's 180 mine, Sandhurst, 2,041 feet; 3. Victory and Pandora Company, Sandhurst, 2,000 feet; 4. Newington Company, Pleasant Creek, 1,940 feet; 5. Prince Patrick Company, Pleasant Creek, 1,830 feet; 6. Crown Cross United Company, Pleasant Creek, 1,815 feet; 7. Prince Albert Company, Pleasant Creek, 1,770 feet; 8. North Old Chum Company, Sandhurst, 1,684 feet; 9. Oriental Company, Pleasant Creek, 1,676 feet; 10. New Chum and Victoria Company, Sandhurst, 1,625 feet. Only two of these shafts were deepened during the quarter, viz.: that of the Victory and Pandora Company by 60 feet, and that of the North Old Chum Company by 20 feet.

Gold Product of Victoria.

While the aggregate product of gold of the Australian colony of Victoria for the first quarter of 1885 was less than last year for the same quarter and aggregated but \$3,848,000, we observe that these same Victoria mines have paid during the quarter at least \$1,056,995 in dividends or, according to districts, as follows:—

Ballarat	\$ 410,950
Beechworth	6,280
Sandhurst	405,565
Maryborough	32,555
Castlemaine	81,100
Ararat	13,745
Gipps Land	106,800

Total

—Financial and Mining Record, N. Y.

Jordan's Patent Pulverizing Machine.

This is an appliance recently exhibited in London by the engineering and manufacturing firm of T. B. Jordan, Sons, & Commans, London, of which the London *Mining Journal* gives the following description:

"Jordan's patent pulverizing machine for the reduction of hard or tough substances, such as ores, emery, quartz, flint, coprolites, paint materials, cereals, etc., to a fine powder, is a machine that will meet the requirements of mining engineers and manufacturers. This pulverizer is a massive cast iron casing, inside which beaters revolve in opposite directions at great velocity; the faces of the beaters are so angled as to prevent the material to be pulverized flying against the casing, and so as to strike it to and fro from the path of one set of beaters into that of the other. The material falls from the automatic feeder into the crushing casing and is beaten by impact into any fineness required. The pulverized material is carried away by a current of air induced through the machine by vans on revolving beaters. The force of the air current can be regulated by valves, and delivers the material when reduced into a collecting chamber in any required fineness, from 30 to 120 mesh. From thence the material is drawn off at will or delivered automatically. The machine is simple and very effective, and subject to little wear and tear. No grates or sieves used, and may be pronounced an admirable machine."

The same firm also exhibits, a "Dry Gold Amalgamator," to be worked in connection with the pulverizer, and for extracting the gold from the pulverized ores in a dry state. This amalgamator consists of a cast iron cylinder about 3 feet 6 inches in depth, in the centre of which works a revolving iron tube which works inside a larger tube revolving in an opposite direction; the powdered gold ore is fed into a hopper at

the top of the centre tube. Mercury is kept in the amalgamator in such quantity that there is a vertical height of about 30 inches of the liquid metal in the outer tube when the inner tube by its rotation is centrifugally emptied of mercury. Its rapid upward progress through the mercury is counteracted by a set of revolving blades, which keeps it agitated and separated in the mercury. On rising to the top of the column of mercury, a blast of air blows the ore along a pipe to waste pits or settling chambers as desired. The dry powdered ore having to pass through this column of mercury in a separated condition causes the finest particles of gold to come in contact with it and thus perfect amalgamation ensues. To show the superiority of this machine over those in ordinary use, it is reported that quantities of pyriteous ores, containing 4 ozs. 8 dwts. per ton was put through the apparatus with the result that only 4 dwts. 20 grs. of gold were left in the tailings, showing that 96 per cent. of the gold had been taken out, and in dealing with various descriptions of the refractory ores, from 92 per cent. to 98 per cent. of the gold has been extracted. These machines and the pulverizers are likely to come into great use in future gold mining operations.

They also have a Hydraulic Amalgamator for the amalgamation of free gold. Consists of a hollow column set in a cylindrical basin or muller revolving within another fixed basin charged with mercury, the slime or tailings from the mills are conducted into the hopper on the top of the shaft which is caused to revolve at about 30 to 40 revolutions per minute; the pressure in the column, about 10 feet, causes the material to pass through the mercury which is kept agitated and bright by the rotatory motion, the slime rising over the edge of the outer basin is discharged.

Large Casting in Italy.

The largest casting ever attempted in Italy was successfully accomplished at the ironworks of Signor Gregorini, of Levere, on the Lake of Isao, Lombardy. The colossal block of cast iron, measuring 14 cubic metres (494.43 cubic feet), and weighing 107 tons (105 English tons), is intended for the anvil of a 10-ton steam-hammer now being constructed for the Royal Arsenal of Spezia. The operation occupied twenty-three hours.

The World's Production and Consumption of Copper.

At a recent meeting of the shareholders of the Arizona Copper Company, held in London, England, Mr. G. Auldjo Jamieson gave a comparative summary of the world's production and consumption of copper, as follows:—

"The production of copper for the year 1879 was 149,000 tons all over the world; in 1883 it was 193,000 tons. In those years the production of copper had increased 11 per cent.—no very great increase after all, compared with the enormous increases during preceding and longer periods. The consumption of copper in England and France in 1883 was 94,334 tons, and in 1884 it was 107,143 tons—an increase in one year of 13 per cent. So that measured by these figures they had come up at last to this point, that the consumption of England and France—two by far the most important of the consuming countries—had outstripped the rate of increase in the supply. In the United States in 1883 the consumption was 58,000,000 pounds, and in 1884 it was nearly 96,000,000—an increase of 8,000,000 pounds. On January 1st, last year, the price of copper

was \$290 a ton and the stock visible and in hand, was 40,186 tons. On December 31st last, the price was \$236 a ton, but the stock on hand was only 36,638 tons. There took place during the year 18 per cent. of a fall in prices and 812 per cent. of a fall of the visible stock on hand. America, with which they were mostly concerned, had in 1880 to import its copper largely from Chili. In 1882 it exported 745 tons to England; in 1883 it exported to England 9,410 tons; and in 1884 it exported to England 17,309 tons. So that from 1880 when it was importing copper, there had been a rise from a negative quantity to a positive exportation of over 17,000 tons. The question was—Is consumption come up to the level of and is it likely to outstrip production? On these matters he could offer no observations that would be worthy of their consideration; but it was his duty to observe what was said by those whose authority carried weight. In the report of the most authoritative of the metal brokers in London, this statement was made in the end of 1884:—"We are apt to undervalue the fact that although the demand for electricity is still behind hand, we have nevertheless absorbed and more than absorbed all available supplies. Indications of the copper wealth of the world increased, but the cost of mining is not to be judged from sensational newspaper articles; and there are important sources of supply where not only will exploration cease, but actual production must be killed by present values. Isolated mines may be able to give us copper at a fabulously low price, but they may grievously mislead us as to the average cost of production; and if a little more hopeful feeling springs up, if sentiment which has throughout the year been against all markets, turn in their favor, we may a year hence look back on the value of copper to-day as a momentary depression at variance both with former experience and with the present circumstances of the consumption."

Minerals Found with Gold in New South Wales.

The most common minerals that are found with vein gold are iron pyrites, which is never quite free from gold, and is sometimes exceedingly rich in it; iron oxide, which is for the most part derived from the decomposition of various pyrites; mispickel, in calcite, as at Lucknow, where the mispickel contains in parts over 2,000 ounces of gold per ton; also in calcite, at the Crow Mountains, Barraba, at Lake Cowal; at Humberg Creek; at Grenfell; at Solferino, in the Garibaldi Reef; at Merimbula; and also, it is stated, near Gunnedah. With mispickel at Carcoar, and at Moruya with silver sulphides also; with pyrrhotine and calcite, as at Hawkins Hill; with galena and zinblend at Grenfell; with galena, zinblend, magnetite, molybdenite, chlorite, and scheelite at the Williams mine, Adelong; talc, asbestos, and serpentine, near Gundagai; steatite, cuprite, malachite, tenorite and other copper ores, notably in the Canobolas and in the Winterton mine, Mitchell's Creek, near Bathurst, where it is also associated with barytes in well-developed although small crystals, and with mimetite, a chloro-arsenate of lead; it is also found with mimetite in the Adelong district; it is reported with tinstone in the cliffs at Eden, and with native arsenic at Solferino. Beautiful specimens of native gold, in malachite and red oxide of copper, have been yielded by the Kaiser mine, Mitchell's Creek, near Bathurst. Gold and native copper have been found together in quartz veins, and in the rocks through which

the veins pass. In alluvial deposits, gold is associated in New South Wales with a very large number of minerals; and it is remarkable that certain of them, such as platinum, osmium, sapphire, ruby, oriental emerald, and diamond have not yet been found *in situ*. Among other minerals, we have tinstone, titaniferous iron, magnetic iron, chrome iron, brookite, rutile, anatase, emerald, beryl, topaz, zircon, hyacinth, spinel, garnet, red and brown hematite, pyrites, binocide of manganese, galena, blende, tourmaline, magnesite, and many more of less value.—(*E. and M. Journal, N.Y.*)

The Deepest Mines Known.

The deepest mine, according to Humboldt, is an abandoned one at Kuttenburg, in Bohemia, where the lowest part of the mine is 629.33 fathoms deep. A staple which had been sunk from the workings of the colliery Des Viriers, at Gilly, in Province of Hainault, in Belgium, had attained the depth of 581.5 fathoms. The Adelbert mine, in the Prizibam district, in Austria, has a shaft 546.5 fathoms deep, according to M. M. Jars and Duhamel. An abandoned argentiferous copper mine, at Kutzy Puhl, near Innsbruck, in Tyrol attained a depth of 546.83 fathoms. The Sampson silver lead mine, at Andreasburg, in the Hartz mountains of Germany, is 468.66 fathoms deep. The Rosebridge colliery, at or near Wigan, Lancashire, England, is 403 fathoms deep. In the Zwicken district, in Saxony, coal is drawn from a depth of 434.5 fathoms. Duckinfield coal mine, in Cheshire, is 358.5 fathoms. At the Dolcoath tin mine, in Cornwall, the engine shaft is 350 fathoms. The Wheal Vor, a tin mine in Cornwall, containing rock kilas, in 1859 was 321 fathoms deep. A silver mine in the Konsberg district, in Norway, is 311.5 fathoms deep. The Wheal Mary Ann, a lead mine in Cornwall, is 300 fathoms deep. The Camphausen coal mine, in the Saarbrück district, in Prussia, is 275 fathoms deep. Ince Hall coal mine, Lancashire, is 300 fathoms; Worthington coal mine, Lancashire, is 300 fathoms; Ryhope coal mine, County Durham, is 271 fathoms; Renard coal mine, Anzin mines, France, is 272 fathoms; Pendleton coal mine, Lancashire, is 363.5 fathoms; Douglas Bank coal mine, Lancashire, is 262 fathoms.—JAMES V. MURPHY, in *National Labor Tribune*.

ASPHALT.

In about the centre of the island of Trinidad, just off the coast of Venezuela, there is an asphalt lake. It is said to cover about one hundred acres and is apparently inexhaustible. It is a black, sandy substance, and is believed to be crude rotten petroleum. A singular feature of the substance is that, although about fifty thousand tons are taken out of this lake annually, it constantly fills up so that there is no lessening of the supply. This singular lake of paving material is owned by the Venezuelan government, but leased to a company in Washington.

A lump of coal brought from the Victoria, Sydney, C.B., mines, is three feet five inches in height, nineteen inches wide, fifteen inches thick and weighs 400 pounds.

The returns relating to gold mining in the colony of Victoria for the first quarter of 1885, show a falling off in the yield to the extent of 8,351 oz. 4 dwts. 22 grs. compared with the preceding three months.

Gold Mining Simplified.

A somewhat incredible gold story has appeared in the U. S. *Press* to the effect that Mr. Bob Paul, of Township No. 10, Cabarrus county, N.C., went to the Charlotte mint for the purpose of having his gold dust coined, and told this tale:

"On my farm is an old gold pit that was dug by an English miner, as tradition says, during the revolutionary war. The same authority says that this miner took \$15,000 from this pit in gold, and being satisfied with his wealth, abandoned the pit and went back home, leaving the mine full of rich ore. The people of the neighborhood worked the mine at different times, but it was finally neglected and forgotten. Weeds grew up around it, and the rains partly filled up the excavation. During the past winter I was troubled with mud in my front yard, and at the suggestion of my wife I went and hauled three cart loads of sand and gravel from the old pit-hole and scattered it over the yard. Last Monday, while walking over the gravel, I noticed a glittering object, and on picking it up I found that I had a nugget of virgin gold, weighing an ounce. I examined further, and the sand and gravel proved to be rich in gold. I carted the three loads to a branch near by, and 'panned out' gold valued at \$325. I then went to the mound taken from the pit, and got a bushel of the ore and pounded it to dust in a mortar, and obtained gold to the amount of \$125."

After hearing the story and seeing the \$500 in gold, Mr. Eli Hinson, a wealthy citizen of Mecklenburg county, offered Mr. Paul \$50 a bushel for the 2,000 bushels of sand and gravel lying at the mouth of the pit-hole. The offer was promptly refused. The story about the Englishman is said to be true by a doctor 50 years old, who lives near Mr. Paul. Experts have gone into the mine, and a full supply of modern machinery will be put in.

On a Possible Genesis of the Canadian Apatite.

By G. HENRY KINAHAN, M.R.I.A., &c.

(Read before the Geological Society of Manchester.)
Continued from page 11, Vol. 3, No. 4.

In the S.W. of Galway and the S.W. of Mayo these rocks also occur (*Lettermullen and Croaghpatrick beds*); but in these places the bands are of less width, while the rocks are not as well exposed; those seen are, however, more similar to the Canadian rocks, being more altered.

There are also in West Galway two other bands of more or less similar rocks; one, the younger (highest strata in the *Great Micalyte series*), being the uppermost member of the group of rocks that appear to be the equivalents of the Arenig rocks (Upper Cambrian) of Wales; while the older is a group in the supposed Lower Cambrian (*Ophiolyte* and *Dolomyte series*). In the latter there are some peculiar calcareous or allied rocks, exactly similar to some of those met with in the vales of the Du Lièvre and the Gâtineau. In the Co. Donegal there are also similar bands, but of even less widths; they, however, are interesting on account of the rocks in them. The exact age of these is not yet satisfactorily worked out, but in the "Geology of Ireland" it is suggested that they are probably of Cambrian or Cambro-silurian age.

Certain limestones and dolomytes, in these groups of rocks in S.E. Ireland, Galway, Mayo and Donegal, also in other Irish localities that need not now be specially enumerated, are very curious, entangled in, and associated with, basic

eruptive rocks [*Gabbro, Granitone, Euryte* (Daubuisson) or *Hybrid rocks* (Durocher) and allied rocks], also with quartzites or greissens (*quartz rock* or *reef quartz*). This connection of calcareous and calcareous rocks with eruptive rocks induced me some years ago to suggest that they were probably adjuncts of vulcanicity (*Geology of Ireland, chap. XII. and XIII., and prior papers*); while, since then, subsequent explorations seem to add strength to the suggestion, as rocks of these kinds occur in such intimate relations to eruptive rocks that they could not be ordinary sedimentary accumulations, but must have come into their present position in solution, or have been injected therein; the first, however, is more probable than the last.

The similitude between the Irish association of rocks, if the limestone was replaced by apatite, and those in the vale of the Du Lièvre forcibly presented itself when the latter was first seen, while subsequently, examination strengthened it.* An examination of the "back" of the lodes and bunches exhibited a color similar to that of rocks which, in Ireland, give indication of the presence of phosphoric acid, although in some cases very faint. This seems to suggest, considering the relative state of the rocks, those of Canada being more metamorphosed than the Irish ones, that there might be an affinity between them; while further examination and consideration appear to strengthen the impression.†

It should also be mentioned that in some of the Irish eruptive rocks, which apparently belong to those called *Euryte* by Daubuisson or the *Hybrid rocks* of Durocher; there seems to be small quantities or traces of phosphoric acid.‡ This appears to be an important consideration, as will be presently mentioned.

The inquiry in connection with the home rocks is as yet far from being complete. After I learned the "gossan colour" of the apatites, which was previous to my going to Canada, I have not had an opportunity of examining any but submetaphoric rocks, in which the pyroxene is little if at all changed; while according to the researches of G. H. Williams, of Baltimore, in the associated eruptive rocks of the apatites of the vale of the Du Lièvre, and also in Scandinavia there is a paramorphoses of the pyroxene and the felspar, the first "being more or less changed into hornblende and the latter into wernerite." Nevertheless, the home researches, up to the present, appear to suggest that in the Irish submetaphoric rocks there has been a limited paramorphoses of limestone into apatite.

From what has been observed in Canada and in Ireland, I would venture to suggest that *it is possible the present Canadian apatites were originally limestone or allied rocks, the change to apatite being due to paramorphoses, which at present cannot be satisfactorily explained.* Such a suggestion seems allowable, when we consider that the paramorphoses of pyroxene, into hornblende, although known to take place, cannot as yet be explained. An objection that may be raised is,—Where did the phosphoric acid come from? If, however, it can be satisfactorily proved that in some or many of the

* Regular lodes of dolomyte and calcite occur in Irish eruptive rocks; also veins of bastard limestones, with one wall merging at the other side into the country rock,—such lodes and half-lodes that I call to remembrance are, however, mere bagatelle to the Canadian lodes of apatite.

† Phosphoric acid in small quantities is frequently found by chemists in limestones and dolomytes. It would, however, be necessary to know the exact localities where such limestones and dolomytes came from in order to determine whether the rocks were an ordinary deposit or subsequently partially altered. This is an important point; as unless special localities where such apatite limestone came from is known, they ought not to be brought in as evidence "that many limestones contain apatite."

‡ These rocks weather with a partial gossan color of the Canadian apatite.

unaltered Irish eurytes this acid is present, this objection would in a great measure be answered. Because if in the Irish assembly of sub-metamorphic rocks there are found phosphoric eruptive rocks and limestones associated, while in the Canadian metamorphic rocks apatite and non-phosphoric eruptive rocks are similarly related, it may be supposed that the additional action to which the latter were subjected was such as to allow the phosphoric acid to replace the carbonic acid.

In addition to the similitude between the form and occurrence of the limestone and apatite, there are other circumstances that may add weight to the previous suggestion, besides showing that other characteristic minerals of Canadian Archaean Rocks may be also the products of metamorphic action. Not however to excessive metamorphism, that is, an excessive change that took place at one time, or in one period of time; but to successive alterations, due to periods of metamorphic action, with intervals of greater or less duration between each. Rocks of such a great age as the Laurentian should necessarily be subjected to such vicissitudes; as during the lapse of time since they were first accumulated, they must sometimes have been at great depths below the surface of the earth, while at other times they were at or near it; therefore it appears safe to conjecture that the change they underwent during the first period of metamorphic action was subsequently augmented by the action of latter periods. Artificially, graphite can be produced by heat, so also can specular iron ore; if therefore in the Canadian rock, when submetamorphic, there were graphitytes, pyritelytes, pyrrhotilytes, with feriferous limestones, and schists, as found in the Irish rocks, there would have been rocks that, by subsequent alteration, should change into the graphite-schist and other graphite producing rocks, the "specular schist" and other iron ores; while it might be also suggested that the metamorphoses of pegmatyte would further develop its minerals, and by concentration increase the size of each individual mineral; thereby accounting for the great size of the crystal of mica and other constituents of the Archaean pegmatytes.

It may appear presumptuous in a person, not a chemist, to put forward some of the above suggestions, still, as during the last six or eight years I have been studying the possible or probable genesis of apatite, they may be excusable. Besides, from my knowledge of Irish rocks, and also of rocks in a few English and Scotch localities, I suspect, now that special attention is directed to the subject, that apatitic rocks will be discovered in different localities; nor would I be surprised if some of them were of commercial value.

In the Atlantic States, from Maine to Virginia, 65,000 long tons of land plaster and 60,000 tons of stucco, total 125,000, were made in 1884, of which nearly all was from Nova Scotia gypsum.

The Austrian product of the money metals for the calendar year, 1884, was as follows: Gold, \$15,670, and silver, \$1,267,142. This is a somewhat larger product of both metals than that of 1883. The gold product of Hungary is not included.

A Russian Expert Expedition.—The Russian government proposes sending experts to Turkestan, to study the turquois mines on the Persian frontier. The same commission will visit the sulphur deposits recently discovered near Khiva, and the lignite mines and petroleum springs in the district of Ferghana.

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Clock Tower, &c., at Post Office, Hull, P.Q.," will be received until TUESDAY, the 18th day of August next, inclusive, for the erection of

CLOCK TOWER, &c., AT HULL, P.Q.

Plans and specifications can be seen at the Department of Public Works, Ottawa, on and after Monday, the 3rd day of August next.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 27th July, 1885.

TIMBER LIMIT
ON LAKE WINNIPEG
FOR SALE.

50 Square Miles.

This limit will be very valuable. Apply at the office of the MINING REVIEW for price and particulars.

FOR SALE,
White Marble Quarry on Calumet Island.

At this quarry there is an inexhaustible supply of most beautiful white marble. Samples to be seen and information obtained at the office of the MINING REVIEW.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the 3rd range. Some excellent surface shows have been uncovered on these lots and only require capital for developing. Price and particulars given at the office of the MINING REVIEW.

FOR SALE.

DEVELOPED

PHOSPHATE MINE

ADJOINING THE FAMOUS LITTLE RAPIDS MINE IN PORTLAND EAST.

THIS location has been pronounced by experienced practical miners one of the most promising apatite producing properties in the district. There are over TWENTY SURFACE EXPOSURES OF GOOD PROMISE, and one deposit now being worked that proves an extensive body of phosphate AT A DEPTH OF FIFTY FEET.

Price reasonable and satisfactory reasons given for selling.

Full particulars obtainable at this office.

PHOSPHATE LANDS FOR SALE.

The Laurentian Phosphate Min-
ing Company offers for sale upon advan-
tageous terms the mining rights upon the
whole or part of their valuable phosphate
lands in the Township of Templeton, con-
taining in all 1,300 acres.

Part of the property has
been developed and proved
to be unsurpassed in rich-
ness.

Most favorable reports by the late Henry
G. Vennor, F.G.S., and other experts, may be
seen upon application to the undersigned.

The principal shareholders now residing
abroad, is the reason for wishing to realize
and close up the business of the company:

To parties purchasing the whole of the
company's interest, their Letters Patent would
be transferred, thus enabling the purchasers
to carry on the business as a company with-
out loss of time or further expense.

For further particulars apply to

J. M. BROWNING,
99 St. James street, Montreal.

THE CANADA COMPANY

Will issue Licenses to Prospect or
to work minerals, on any of
their Mining Lands and
Mineral Reservations,

COVERING NEARLY A

QUARTER OF A MILLION ACRES

In Eastern Ontario, and principally
within the belts containing,

Iron, Phosphate, Gold, Galena, Plum-
bago, Mica, Marbles, Building-stone,
and other valuable minerals.

For lists of lands and terms apply to
the Company's Mining Inspector.

H. T. STRICKLAND,
Peterboro', Ontario.

ADAMANTINE SHOES, DIES AND CRUSHER PLATES

Will outwear 3 sets of those made of cast iron or gun metal. These Shoes, Dies and Plates are in extensive use in all the States and Territories of North and South America.

Address **CHROME STEEL WORKS, BROOKLYN, N.Y., U.S.A.**

SEND FOR ILLUSTRATED CIRCULAR.

S. H. KOHN, Proprietor.

C. P. HAUGHIAN, Supt.

When ordering send rough sketch with dimensions.

Rock and Ore Breakers or Crushers.

("THE BLAKE STYLE.")

This style of Rock Breaker after 15 years practical test at HOME and ABROAD has proved to be the BEST ever designed for the purpose of breaking all kinds of hard and brittle substances, such as QUARTZ, EMERY, CORRUNDUM,

GOLD AND SILVER ORES,

ASBESTOS, COAL, PLASTER, IRON ORES, MANGANESE, OCHRE, COPPER, TIN and LEAD ORES. Also for making RAILROAD BALLAST and CONCRETE.

MR. S. L. MARSDEN, who for the past twenty years has been connected with the manufacture of the "Blake Crusher," New Haven, superintends the construction of this machine. Awarded GOLD MEDAL at the Massachusetts Mechanics' Association, 1881, and SILVER MEDAL (special) American Institute, 1882.

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

In the money centres of the world the mining industry is beginning to be regarded with more favor than it has been for years past, and the time is now opportune to say a word to prospectors and owners of mining claims who, we deem it, are much in need of a little friendly advice. We do not feel that we can advise more forcibly, or place before our readers the relative positions of *mines* and *capital* in a more common-sense light than by quoting from the editorial columns of the *Chicago Mining Review* whose editor appears to take in the present situation and to realize the value of capital, its necessity to the development of mining industries the world over, and the price that must be paid for it. He says:—

"It is admitted on all sides that lack of capital is one of the greatest needs of thousands of localities where there is undoubted evidence of satisfactory ore bodies; hence it is certainly most unwise to place such exorbitant prices upon mere prospects, which will require the expenditure of thousands of dollars to make of them producing and profitable mines, that capitalists seeking investment turn away and put their money into more inviting fields.

The great demand for the establishment and vindication of the mining industry now is production. This can only come from mines, never from prospects. Hundreds of localities are rich in the most promising prospects but they add no tangible evidence of value to the district, which in many instances is practically deserted. These prospects, which represent an investment of labor, enormous in the aggregate, will never become mines, never add anything to the wealth of the

country, or reimburse those who have given so much to them, without capital.

The millions in sight are not so attractive when the cost of turning them into a marketable commodity has been thoroughly demonstrated. The rich veins of high grade mineral that the prospectors' toilsome shaft has revealed, requires long and costly expenditure of well directed capital before its value can be changed into money.

A critical time is approaching in the history of our mining industry, and the question of its future is largely in the hands of miners and prospectors. The existence of immense mineral resources of wonderful extent and variety has been fully demonstrated and confirmed, but the permanent and regular production depends upon extensive operations requiring large expenditure of capital. Those holding claims must, therefore, form a new standard of value, based more nearly upon the cost of acquisition and less upon the estimated value of the unknown probabilities at a cash price, allowing nothing for cost of producing; otherwise the surplus idle capital which is flooding every money centre, will seek other channels and follow them."

We give an account elsewhere of what is being done at some of the more important mining locations in the silver district on the north shore of Lake Superior. We will be glad to receive some statistical information concerning the working of these properties; such as, the number of men employed, the amount of capital invested, what machinery has been erected, and the estimated value of the ore that has been raised on each location. In addition to the very encouraging reports of progress that reach us regularly, statistical information would be of much interest to our readers.

We are indebted to Professor Wm. Boyd Dawkins for a copy of a lecture, in pamphlet form, entitled "Canada and the Great North-West," delivered by that celebrated gentleman at the Salford Town Hall on 28th April last. Professor Dawkins in the course of his lecture, after referring to the important lumbering interests of the Ottawa district, drew attention to our phosphate industry in the following words:

"Another point in regard to Ottawa is that there exist in the neighborhood valuable deposits of phosphate of lime (apatite), in which a large and important trade is being developed. It was not a little interesting to me to go some distance up one of the wonderful rivers, which form the highway in that part of the world, and examine some of the phosphate mines near Buckingham; and it was still more interesting to me to see the same material in process of manufacture at Widnes, in Lancashire. There is an important trade between this district and the mineral districts of Ottawa."

The extent of the gold fields of Nova Scotia is not, generally known. They

stretch along the Atlantic coast from Yarmouth to the Straits of Canso, varying in width from 10 to 40 miles, and cover an area of about 7,000 square miles. Gold was not discovered in the province until 1838, although Sir Charles Lyell proclaimed its presence in 1842. Some of the mines have proved very rich. The most prosperous operations in the province are now being carried on by the New Albion Company at their Montague mines in Halifax county. What is needed for the development of other mines is more capital. The production of all the gold mines in Nova Scotia in 1884 amounted to 16,059 oz., 18 dwts., 17 grs., being an average of \$2.40 per day, per man.

In another column will be found some facts in connection with alluvial gold mining on Slate Creek, in Beauce. Latest news from the St. Onge Company's mines is very satisfactory and proves that we were not astray in our predictions of a year ago. All obstacles have now been overcome, and as a reward for the labor that has been expended this company have the intense satisfaction of seeing coarse gold and large nuggets being washed from the gravel at the bottom of the shaft in sufficient quantity to pay handsomely, and yet they are one hundred feet from the middle of the river bed.

We have learned with much gratification that the grand jury of the Antwerp International Exhibition has awarded a silver medal to Mr. W. A. Allan, of this city, for his exhibit of Canadian Apatite and Mica. The official document conveying this order of merit was received from the Belgian authorities by Sir Charles Tupper, High Commissioner in London, and transmitted by him to the Government of Canada, with his personal congratulations upon the award.

Mr. Eugene Coste, M.E., Mining Geologist of the Geological Survey, is at present in the Lake Superior gold and silver district. Mr. Coste's recognized ability as a mining engineer makes his visit to the North Shore district a matter of much interest, and as his opinion of the mines will be awaited with eagerness, it is to be hoped that his report will be made public without unnecessary delay.

Mr. W. de L. Benedict, M.E., of New York, is making a flying trip, professionally, to the Black Hills, Dakota, in the interest of New York capitalists. Mr. Benedict has identified himself with the mineral resources of Canada, particularly the phosphate industry, and is capable of giving a professional report on mining properties from a business standpoint as well as scientifically.

Mr. J. Obalski, M.E., under instructions from the Quebec Government, has begun an inspection of the phosphate lands in Ottawa county. Mr. Obalski is the government Mining Engineer and his report will be looked for with much interest.

THE PHOSPHATE TRADE.

One of the greatest industries in Canada today, and the one that is developing most rapidly, is phosphate mining. The product of our mines is attracting the attention of all the fertilizer markets of the world, and is now more sought after than at any period since the mines were opened and Canadian apatite was offered to manufacturers of super-phosphate. So far, this season, England, Scotland and Germany have taken the entire output of our mines, but it is not unlikely that direct shipments will be made to France next year and that the United States will demand a certain supply. Our phosphate trade, it may be said, is now on a firm basis, though in some respects producers are yet dissatisfied with the system in vogue for the disposition of the product of their mines, but as this great industry is only now in its infancy, it will be found, no doubt, that as the annual output of the mines increases and producers become more experienced in dealing with the various markets where their trade lies, a satisfactory custom, governing purchase and sale, will be arrived at.

The number of visitors to the mines in the Lièvre river district is steadily increasing. During the months of August and September a number of English and American mining engineers and capitalists passed over the district and critically inspected some of the mines that were most developed and would give them an idea of the permanent character of the deposits. The *Emerald*, *Little Rapids*, *North Star*, *High Rock* and the *Union Company's* mines did much to open their eyes to the vast proportions of the phosphate beds and veins and the enormous production of which these mines are capable. Of the deposits the visitors have nothing to say except in terms of the highest praise, but many of them have expressed some doubt as to whether the system of mining now followed is the correct one. As phosphate mining is a comparatively new industry in Canada, and as similar deposits are not elsewhere found, we can only look to experience to teach us how our mines can be worked to best advantage and the output raised and dressed most profitably. Mine owners appear to have given a good deal of attention to these important considerations during the past three years, and many radical changes and improvements have been introduced with most satisfactory results.

It will be seen by our statement of shipments for the month of September that 17,853 tons of phosphate had gone forward this season up to date. There is now at the mines and shipping points several thousand tons awaiting transportation, a great portion of which will go forward before the close of navigation.

The mines are giving employment to a large number of men and are yielding a steady output of ore. Among the most productive are the *Emerald*, *North Star*, *High Rock* and *Union Company's* mines. These employ a force aggregating 338 men, and their joint output for the month of September reached 2,285 tons, distributed as follows:—*Emerald*, 75 men, 780 tons; *North Star*, 70 men, 580 tons; *High Rock*, 115 men, 565 tons; *Union Company*, 78 men, 360 tons. This output for the four mines as compared with August shows a slight falling off, which is accounted for by there having been a considerable amount of dead work done.

Other mines throughout the phosphate district are being steadily worked and are contributing their quota to the year's production. Several new properties have been opened within recent date, notably the *Cold Hill* mine in the

Gore of Templeton, the *Lily* and the *Glasgow* Canadian Phosphate Company's mine in the Township of Derry, all of which are said to be developing very satisfactorily, but we have received no particulars of progress.

At the *Little Rapids* mine there is a fine showing of ore in the veins that have been opened up and other veins are being vigorously prospected on the property. This mine has been highly spoken of by every one who has visited it, and especially by Dr. T. Sterry Hunt, who has pronounced it to be as valuable a property as any that has been yet discovered in Canada. He says of it that with a proper force of miners the *Little Rapids* mine is capable of yielding high grade ore as abundantly as any one of the heavy producers in the phosphate district.

The Phosphate of Lime Company are opening up lot No. 2, in 1st range of Portland, and it is said to be developing satisfactorily. This same company are constructing a tramway from their High Rock mine to the Lièvre River and expect to have it completed about the middle of November.

Mr. G. H. Bacon has completed his mill at the Basin du Lièvre and will now proceed to grind phosphate. The progress of this new industry will be watched with much interest.

Phosphate Quotations.

There has been no variation during the month in prices. We quoted 1s. $\frac{1}{2}$ d. for 75 per cent. in August, which we find, by report of sales during that month, was $\frac{1}{2}$ d. a unit higher than the market ruled. The market is now firm at 1s. for 75 per cent., a fifth of a penny rise, ex-ship London and Liverpool.

Ocean Freight.

Steamship rates, from Montreal to Liverpool and London, are now at 6 to 7 shillings per ton. Seven shillings is the highest reported to us for September.

PHOSPHATE SHIPMENTS FROM MONTREAL FOR SEPTEMBER.

The Phosphate Industry of South Carolina

It will be interesting to many of our readers to know how vastly phosphate mining has increased in importance in South Carolina during the past fifteen years, and we therefore give some facts and figures from which they may form an idea of the proportions to which this industry may attain in Canada when her phosphate belt has been more extensively opened and the mines developed.

The following report, forwarded to us from Charleston, S. C., gives the history of phosphate mining in that State:

"South Carolina has been wonderfully enriched by this extensive industry, which, in

connection with the manipulation of phosphates, it is estimated by the State Agricultural Department, has brought \$50,000,000 into that State since 1868. There are at present in operation in the State 14 companies engaged in mining phosphate on land, 11 river mining companies, and 11 fertilizer manufacturing companies. There have been mined and shipped, from 1868 to 1884, 2,699,000 tons of phosphate rock, equivalent to about \$16,000,000; there have been manufactured from 1871 to 1884, 2,000,000 tons of fertilizers, equivalent to about \$34,000,000, giving a total of \$50,000,000, which has been brought into the State by the phosphate industry in the last 17 years. Of this amount the State has received as revenue \$1,200,000, which was paid as royalty, besides the heavy taxes levied on the products of the land companies and fertilizer manufacturers. The production of phosphates for 1884 was 409,000 tons of rock and 236,884 tons of fertilizers.

In 1880, according to the United States census, there were 28 fertilizer companies in South Carolina, having an aggregate capital of \$3,993,300. In the amount of capital invested in this industry South Carolina stood second in the list of States. Maryland ranking first, with a capital in fertilizer manufacture of \$4,271,870, or not quite \$300,000 more than South Carolina. The third State on the list was New York, which had over \$1,000,000 less employed in the manufacture of fertilizers than South Carolina. In the number of hands employed South Carolina ranked first, having more than twice as many engaged in the fertilizer industry as Maryland, and nearly three times as many as New York.

Since 1880 there has been a rapid development of this important industry in South Carolina, as may be readily seen from the fact that in that year only 190,000 tons of phosphate rock were mined; while in 1884 the amount was 409,000 tons, or largely more than double. The increase since 1880 has been steady, the amount mined in 1881 being 265,000 tons; in 1882, 330,000 tons; in 1883, 355,000 tons; and in 1884, 409,000 tons.

The total amount of phosphate rock mined in South Carolina since the discovery of these deposits has been as follows:

YEARS.	TONS.
1868-70	20,000
1871	50,000
1872	60,000
1873	90,000
1874	100,000
1875	115,000
1876	135,000
1877	165,000
1878	210,000
1879	200,000
1880	190,000
1881	265,000
1882	330,000
1883	355,000
1884	409,000
Total	2,699,000

Of this amount there was—	
Of river rock.....	1,229,170
Of land rock	1,469,830
Total	2,699,000

Of this amount, 1,359,000 tons, or more than one half, has been mined during the last four years.

As already stated, the aggregate capital invested in the manufacture of fertilizers in South Carolina in 1880 was \$3,493,300. At the present time over \$6,500,000 is actually invested in this industry. This, of course, does not include the unpaid capital stock of incorporated

companies, but only the actual investments in money.

The list of phosphate mining and manufacturing companies, not including several companies engaged in manufacturing fertilizers from cotton seed, is as follows:

Name.	Location.	Capital.
Hammond, Hull & Co., Beaufort		\$
Hume Bros., & Co., limited, Beaufort		500,000
Phosphate Mining Co., Beaufort		250,000
Sea Island Chemical Co., Beaufort		500,000
Ashpoo Phosphate Co., Charleston		50,000
Ashley Phosphate Co., Charleston		100,000
Atlantic Phosphate Co., Charleston		200,000
Bolton Mines (Wyllie & Gordon), Charleston
Charleston Mining and Manufacturing Co., Charleston		1,000,000
Coosaw Mining Co., Charleston		125,000
C. H. Drayton & Co., Charleston
Edisto Phosphate Co., Charleston		200,000
Etiwan Phosphate Co., Charleston		300,000
Julius Fishbourne, Charleston
Marine and River Phosphate Mining and Manufacturing Co., Charleston
Oak Point Mines, Charleston		400,000
Pacific Guano Co., Charleston		1,000,000
C. C. Pinckney, Charleston
Rose Mining and Manuf'g Co., Charleston		100,000
South Carolina Phosphate and Phosphatic River Mining Co., Charleston
Stono Phosphate Co., Charleston		500,000
Wando Phosphate Co.		100,000
Wilcox & Gibbs Guano Co.		305,800
Port Royal Fertilizer Co., (near Port Royal)		125,000
Gregg's Phosphate Mines, Charleston
St. Andrew's Phosphate Mining Co., on Stono River
Bradley's Phosphate Mines, near Charleston
Pon-Pon Phosphate Mines, on Edisto River
Dotterer's Phosphate Mines, near Charleston
Farmers' Phosphate Co., Charleston
David Roberts, on Wimbee Creek
J. W. Seabrook, on Morgan River
J. M. Crofut, on Beaufort River
J. D. B. & J. Seabrook, on Parrot Creek
J. G. Taylor, on Parrot Creek

One of these companies has a surplus of exactly three times its total capital, and another has a surplus of more than double its paid-up capital.

The successful mining of phosphate rock under water requires a very liberal outlay of money and the best machinery that can be devised, while for grinding and pulverizing the rock after being mined, costly machinery of the most improved character is essential. Constant experiments are being made to devise new and better machinery for this purpose, and many inventions that promised well at the start have proved a failure when tested in regular steady work."

Ottawa Colonization Railway.

The construction of this line of railway would be a boon to the section of country through which it would pass. It is not only much needed by the settlers throughout the valley of the du Lièvre, but would be an appreciable acquisition in the development of the phosphate mining and lumbering interests of the district. It would stimulate mining in the localities where mines are now being extensively worked, and would foster an augmentation of the industry by opening up new fields where mineral is plentiful, but, owing to their inaccessibility, are valueless and neglected. It would be the means also of inducing immigrant farmers to take up and cultivate the many stretches of fertile land lying between the mountain ranges and on their slopes, which for agricultural purposes is unsurpassed in any part of this Dominion, and it would encourage present settlers to enlarge their farms and to engage extensively in agricultural pursuits, for it would enable them to reach a market for their produce, an advantage of which they are now deprived. In addition

to these benefits to be afforded by the construction of the Ottawa Colonization Railway, we have the very best authority for saying that the road, when completed, will afford a safe and remunerative investment for capital. The line, as located, starting from the village of Buckingham, takes a northerly and westerly direction, running in proximity to the important phosphate mines on the east side of the du Lièvre, and crossing the river at a favorable point penetrates the very heart of a rich phosphate-bearing region. For many miles it traverses a cleared and well cultivated section of country, and throughout its entire length no obstacle in the location of a favorable route was encountered and not one engineering difficulty was presented. As the plans and profiles show, the construction of the road from end to end would be inexpensive and much below the average cost of railway construction in this country. The Quebec Government has granted 4,000 acres of land per mile, the present value of which should be sufficient to at least grade the line and put on ties and rails, and with the construction of the railway the value of this land would be very much enhanced. There exists no reasonable doubt that as soon as any responsible company or individual can satisfy the Minister of Railways and Canals of their *bona fides* and ability to carry the construction of the road to completion, so soon will the Dominion Government also subsidize the Ottawa Colonization Railway as it has done in the case of innumerable other provincial railway enterprises, notably, her sister road, the Gatineau Valley Railway. This is a matter of much interest to the inhabitants of that portion of Ottawa county through which the road will pass, and they would like to know how soon they may expect to see a movement towards its construction. Whoever undertakes the work can rely upon receiving whatever co-operation and assistance is necessary from them to insure its successful accomplishment. The charter holders might give us some information on this subject.

VILLENEUVE MICA MINE.

This valuable property has developed into a steady producer of the highest grade of *muscovite*, and the crystals that are now being taken out are found to yield plates of the average sizes required by dealers and stove manufacturers. As has been before stated in these columns, in reference to this mine, plates of unusually large dimensions have been taken out, some measuring as high as 12 x 14 inches, and many very large crystals are being constantly met with, but the average yield of those taken from the vein is improving with each week's work in point of size, and the presence of discoloration has noticeably decreased. The mine has been visited during the past month by many practical and scientific men, all of whom have been highly pleased with its appearance and promise. Mr. L. H. Shirley, C. & M. E., of Montreal, in company with English capitalists, inspected the property last month and was much impressed with the permanent character of the vein, and the large number of mica crystals that are visible in all directions on the surface, and in the workings on the vein. The micaceous lead extends for many hundred feet, and has a width of from 50 to 60 feet. The tunnel which has been driven into the mountain has proved its continuity downwards, and from this tunnel, which is the only working yet started on the property, all the mica has been taken, of which several tons have accumulated

ahead of the cutters. The composition of the vein, in which the mica crystals occur, is chiefly feldspar and quartz, in which, besides mica, crystals of tourmaline are numerous. The formation at Villeneuve is similar to that in which the best mica mines of North Carolina have been opened, and the quality of the mica may be said to be identical.

Of the North Carolina mines, Mr. Arthur Winslow, M.E., in a letter to the *Engineering and Mining Journal*, of recent date, says:—"While recently on a trip to Mitchell County, a few of the mines in that important mica section were visited. The mica occurs there as a constituent of veins that traverse a highly feldspathic granite. The veins themselves may be regarded as granite dikes, of extremely coarse composition, made up of ill-defined mammoth crystals of mica, feldspar, and quartz. The distribution of the mica in the veins is irregular, but at those localities visited the larger crystals seemed to be in the central portion of the vein. A distinction of importance to the miner is made between what are called 'fluken veins' and 'rock veins.' The former are veins that have suffered from the disintegrating effects of weathering, and the rock is comparable to the 'brown ores' of the gold miner. The feldspar has been so decomposed in these veins that they can be easily worked with a pick, and the mica, which has remained almost intact, is extracted without much expense. It is to these veins that the work of the mound-builders, with their crude appliances, was confined. Such veins are limited in extent downward, and pass by degrees into rock veins, which latter are very hard and difficult to work. The mica is generally taken out in blocks an inch or two thick and a foot or so in diameter. The color of the sheets, when split, is white, a pale green, or a rum color. They are frequently spotted and blurred with stains of manganese or iron, and this very much lowers the market value. The white mica is always valuable, and the rum-colored is much sought after."

"The mines are often worked by the owners of the land or by companies. Leases on mica properties are generally given for one-sixth of the product with fluken veins, and for one-seventh with rock veins. The preparation of the mica for market is a very simple process, consisting in splitting it into sheets of about one-sixteenth of an inch in thickness, and in cutting these, according to patterns, into squares with a pair of ordinary tinner's shears. One man can split and cut many pounds in a day. The squares range in size from 3 by 4 inches upward. And the prices vary, according to size and color, from \$1 to \$5 and more a pound. The mining of this product is in many cases very crude, and is carried on on a small scale. Yet, with a good, average vein, the profits are large. The difficulty, of course, lies in securing a good vein. As with all veins, the material varies in composition, and the rich finds are generally in pockets that often contain, within a few cubic yards of vein rock, several hundred dollars' worth of mica."

It will be seen, from what Mr. Winslow says of the North Carolina Mica Mines, that, with the exception of the "fluken veins," the mica of Villeneuve is found in precisely the same rock composition, the vein at the Villeneuve mine, however, being much larger and more productive than those of Mitchell County, N.C., and other localities in the State. Here the quantity of merchantable mica appears to be unlimited, and under proper management the Villeneuve mine is capable of producing it at a larger margin of profit.

Gold Mining in Beauce.

The result of the past summer's work in the alluvial gold deposits of Beauce has been very encouraging to those who have been actively engaged in working them.

In many parts of the district gold has been found in paying quantity in the gravel beds, and prospecting has been successfully carried on among the quartz ledges which will no doubt lead to extensive quartz mining in the near future. But the most encouraging work that has been reported to us has been done by the St. Onge Gold Mining Company, on Slate Creek. After patient and determined prospecting, this company has at last hit upon the old bed of the river in their No. 8. shaft, at a depth of 180 feet, and are now being richly rewarded for their perseverance and large outlay. For several feet above bed-rock the ground carried more or less gold, and what is now being raised is washing quite \$10 per man, although the disintegrated surface of the bed-rock, where the coarse gold is deposited, and the gravel for six inches above it, has not yet been touched, and the bottom of the shaft is fully one hundred feet from the true bed of the river. This is certainly a marvellously rich showing, and there now exists no shadow of doubt that the coarse gravel and the bed-rock in the middle of the channel will contain large gold in quantity to pay enormously. These recent developments have greatly increased the value of ground along the lead, and it is anticipated that gold mining on Slate Creek will be extensively engaged in within the next few months. Such results as have attended the operations of the St. Onge Company were never met with in any other part of the Beauce district—not even on the Gilbert river in its palmiest days, when the gold excitement ran so high there. We will await with much interest the reports of the yield of the gravel on bed-rock, and will keep our readers informed from time to time of the results of future operations in this field.

A report has just reached us by telegraph that the gravel on bed-rock at bottom of shaft No. 8, on the St. Onge Gold Mining Company's property, is now being raised, and is found to carry coarse gold and nuggets in quantity, and that the week's *wash-up* has exceeded the most sanguine expectations.

THE ASBESTOS MINES.

The past summer has been one of more than usual activity at the asbestos mines of the Eastern Townships and an increased output over that of any former season has been the result. The most productive mines of the district are those in the Townships of Tretford, Cole-raine and Broughton. Several of these mines are being vigorously worked and all are yielding a very high grade of mineral. It is estimated that the output for the district for this season will aggregate about 1,400 tons, and the prices obtained for the different grades have been:—first quality, \$80; second quality, \$60; third quality, \$40; and the lowest grade, suitable only for pulp, \$10 per ton, at the mines. The force employed by the various operating companies aggregates 350 men, distributed as follows: King Brothers, 40; Boston Asbestos Packing Company, 100; the Johnson Company, 100; Ward Brothers, 20; Lionais & Company, 40; and Kennedy & Company, 50 men. A small additional force of men are engaged in desultory mining in the district, but neither their number nor the amount of asbestos mined by them has been taken into account in the foregoing statements. There is every conveni-

ence afforded for shipping the product of the mines, and those engaged in this industry are well pleased with the result of their summer's work. It is the opinion, however, of many practical men who have recently visited the mines that economical management is totally disregarded, and that under a better system much larger profits might be realized.

GRANITE WORKS.

The Canadian Granite Company have purchased a valuable property on the Canal Basin at Ottawa, where they are erecting extensive buildings to be used as a polishing mill. The granite, which is of excellent quality and of a pleasing salmon-red shade, will be brought from the company's quarry at Kingston to Ottawa in barges and dressed and polished at their new mill. The company will soon be ready to supply an unlimited demand of ornamental polished granite and monuments in every variety. The quarry is capable of furnishing an unlimited quantity of magnificent stone, and the machinery in the mill will be the most modern and complete in Canada.

THE NORTH SHORE MINES.

Lake Superior District.

There are few, if any, sections on this continent where such rich and massive deposits of silver ores have been discovered as those of the Lake Superior silver district. Native silver, like copper on the south shore of the lake, has been taken from many veins, and the average vein of the district is found to carry silver in sufficiently large quantity to insure profitable mining. Some of the veins that have been opened have produced such extraordinary rich specimens that prospectors have become excited and in their eager search for "bonanzas" will no doubt pass by extensive deposits of low grade ore which could be mined at a large profit. There is no certainty that the veins which have shown such very rich outcrops will continue to carry ore of so high a grade, and it is not to be expected that they will, but if they are found to yield ore in large quantity, that it will pay to work, then it will be seen that the profits of this mining industry can be regulated with much greater certainty by increasing the capacity of the machinery, and making it adequate to the productiveness of the mines, than by relying upon the continuance of high grade ores.

SILVER MOUNTAIN MINE.

This mine is attracting more attention at the present time than any other mining location in the new silver district. Prospect shafts have been sunk, from which very rich ore has been raised, and the vein is being thoroughly prospected by practical men of large means. The mine is a comparatively recent discovery, the location having been taken up by Messrs. Daunais, Richards and Trethewey a little more than a year ago. These gentlemen did some development work, sufficient to partially test their property, and then succeeded in inducing Cleveland capitalists to become interested with them. This syndicate have now an option on the mine, under which they are vigorously engaged in making further tests with a view to proving the continuity of the vein. A tunnel is being driven towards the vein, and if the result of this and other development work is satisfactory, preparations will at once be made for permanent and extensive

mining. Everybody is hopeful that the expectations of the owners and the syndicate will be realized, and those who are interested in the future of this mineral district are closely watching the result of each week's work at the Silver Mountain mine.

TWIN CITY MINE.

This mine was discovered in 1883, and the first development work was undertaken by gentlemen from St. Paul and Minneapolis, in which they expended upwards of ten thousand dollars. Their work produced a considerable quantity of native and black silver and a high grade of argentiferous zinc blende. This work, as far as it was prosecuted, proved most satisfactory to all concerned; but it was found, that operations could not be profitably continued without a mill and reduction works, and as the condition of the roads rendered the transportation of machinery practically impossible, operations were suspended. It is to be hoped that this obstacle will soon be removed. Meanwhile a promising property is neglected.

BEAVER MINE.

This is likely to develop into a very productive mine. It has been continuously worked during the past year, and what has been accomplished in the way of development warrants preparation for permanent work. The vein has been pronounced a true fissure and can be seen cutting the formation across two bluffs, one of them two hundred feet high, on either side of which it can be worked without the expense of hoisting or pumping. The vein carries some very rich ore and some of lower grade, and in the hands of a powerful company would no doubt pay largely if extensively worked.

SILVER CREEK MINE.

Like the *Twin City* and *Beaver* mines, this one was discovered in 1883. Work was not begun here, however, until a few months ago. It is in the same geological formation as the other important mines in the silver region, and the vein, which is about three feet wide, carries native silver and argentite. It is supposed to be a continuation of the *Twin City* vein, or one running parallel to it, and is steadily producing good stamp ore, which awaits being treated, and this will be done when roads have been opened that will enable the owners of the mine to take in machinery for that purpose.

On other three properties, known as *R. 48, 140 T.* and *57 T.* mines, work was also begun during the past summer, but has been suspended and will not be resumed until something definite has been done towards locating the new government road which has been so much talked about, and of which the district is seriously in need. These three properties are in the immediate vicinity of the *Rabbit Mountain*, the *Silver Creek* and *Beaver* mines, and give promise of developing into mines of not a little importance.

A party of Michiganders have organized under the title of the Peerless Mining Company for the purpose of operating in this new and attractive field and have taken up four locations within two miles of *Silver Mountain* mine. It is expected that this company will now organize under the laws of Canada and proceed to open up some of the ground they have recently acquired.

Many other American capitalists have come into the silver district during the past few months, to look for claims in which to invest, and the citizens of Port Arthur are beginning to open their eyes to the fact that it is quite possible all the choice locations may be taken up by their enterprising neighbors before they

have quite realized the richness of the mineral deposits by which they are immediately surrounded.

In the gold district work is being most successfully pushed at the famous

HURONIAN MINE

under the able superintendence of Mr. Charles Eschweiler, M.E., whose staff has been reinforced by the arrival of Mr. F. C. Smith, a prominent assayer of Milwaukee, and Mr. Richard Crow, of Boulder, Colorado, who has taken charge of the company's mill. With a competent staff of miners and workmen Mr. Eschweiler and his new assistants are carrying on operations at this mine with most satisfactory results. The vein is an unusually large true fissure, and the ore that is now being taken from the shaft, drifts and cross-cuts is so rich in gold that five stamps are paying all the running expenses of the mine. As the number of miners now employed could keep twenty stamps busy this is indeed a very satisfactory showing. The vein has been prospected to a depth of nearly 200 feet and drifted on for upwards of 400 feet at the 50 and 150 feet levels and has been found to carry high grade ore at all points in these workings. All the experts and miners who have visited the *Huronian* mine have predicted great results, under good management, and present appearances lead us to think that their predictions are about to be realized. The miners have been working in rich ore in both levels, and it may be said that wherever the vein is opened it is with the same encouraging result. Other discoveries have been made on the property, the most recent of which promises to be one of importance.

Iron Trade Depression.

The boom which has been predicted by some enthusiasts and anxiously awaited by everybody interested in this important trade has not yet begun to show itself. The *Hardware Trade Journal*, of Manchester, England, thus speaks of the continued depression:—

"There seems to be no silver lining yet visible to the cloud that hangs over the condition and prospects of the iron trade. In every direction the complaints are pitched in the same key—that of overproduction, and a consequent recession in prices. The home trade has not been so quiet for several years, through the limited ship building and railway making; and the export trade each month shows a smaller tonnage and value of the iron sent abroad. This depression has existed, with one or two brief intervals of sunshine, for seven or eight years—the result, it is to be feared, of the overproduction and the high prices of the ever-to-be-remembered years of 1872, 1873 and 1874."

The *Bulletin of the American Iron and Steel Association*, after reviewing the improved condition of business at the beginning of September says:—"The feeling of confidence that did not exist two months ago, and which is now everywhere visible, can be directly traced to the increased business which these two months have brought. In our iron and steel industries, however, candor compels us to say that the revival has not equally affected all branches. There is an increased demand for best grades of foundry and forge pig iron and a decided hardening in prices, but common grades remain as they were."

The *Iron Trade Review*, of Cleveland, O., writes editorially on September 5th, in a somewhat incredulous way, as follows:—

"The improvement in the iron market con-

tinues, but it won't do to crow much yet. If better times are coming, the best thing is to let them come and not make any fuss about it. One of the wisest things that can be done at the present juncture is to put a cold compress on the head of the exuberant Associated Press reporter at Pittsburgh."

THE HALIFAX MEETING

OF THE

American Institute of Mining Engineers.

FIRST SESSION HELD ON SEPTEMBER 16.

Address by Sir A. G. Archibald.

REVIEW OF NOVA SCOTIA'S GOLD FIELDS.

The Apatite Deposits of Canada, etc., etc.

The meeting of the Institute, which opened in Halifax, N.S., on the 15th September, was not so largely attended as had been anticipated, not more than 120 members being present. The arrangements for the meeting and for the entertainment and comfort of the members were perfect, and the hospitality and cordiality with which the Institute was received and entertained has made the meeting memorable.

The first session was held in the Legislative Council Chamber on Wednesday, the 16th of September, at which there was a large attendance of ladies and citizens. Mr. Jamme, chairman of the local executive committee, after welcoming the visiting engineers, introduced Sir Adams G. Archibald, K.C.M.G., who opened the meeting with an eloquent address, cordially welcoming the members of the Institute, from which we quote the following paragraphs, want of space preventing us from publishing the address *in extenso*. After expressing his gratification that the Institute should have honored Halifax by appointing a meeting of their body there, Sir Adams continued:—

"We welcome you on various grounds. If you had come on the visit merely as citizens of a friendly country, we should have been delighted to see you. You are connected with us by so many ties, the ties of a common lineage and a common language, a common literature and common traditions. You are sharers with us and the parent country in common political and judicial institutions, and in a fullness of freedom such as exists nowhere else in the world. Had you come, therefore, with these claims only on us, we should have been delighted with the opportunity of showing the gratification your visit would confer. You come, indeed, with all these claims on our regard, but you have others still. We welcome you on these grounds; but we welcome you also—some of you as representative of great industries in your own country—others as men of special skill and science, who have made your names household words everywhere. All of you are welcome as connected with a profession which has done more, perhaps, than any other to promote improvements in the material condition of the world."

"It has been the task of that profession to

groped in the bowels of the earth for the treasures that nature has hidden there, to clear them from the dross with which they are associated, to prepare and purify them for the use and comfort of man. You have had to organize inert matter, to put it into shapes and forms by which it could be utilized—so as first to create and then to direct a motive power—and thus making matter the slave of mind, to perform prodigies of power and endurance and speed which have revolutionized the world. We welcome you, therefore, as gentlemen connected with this great profession."

"But besides all this, we may have an *arrière pensée* not quite unselfish. We know that your visit will give us pleasure. May we be pardoned for entertaining the idea that it may also profit us in the result?"

"We claim in this province to be possessed of large mineral treasures. I do not refer to the gold and the silver, the royal minerals, because whether we have them or not is a matter of comparatively small importance to our country. But as regards those minerals which everywhere form the basis of national prosperity, those which are of absolute necessity and universal use—iron and coal; these we have unquestionably in great abundance and of excellent quality."

Sir Adams then gave a sketch of the familiar history of the grant of all the minerals of Nova Scotia and Cape Breton to the Duke of York, or, more properly, to his creditors, in 1826.

"For thirty years (half the term of the original grant or lease), the Mining Association held the minerals of the province back from development, and it was only in 1857, after years of wordy war, that the Association gave up its claim to all the minerals except the coal in certain small areas. The Legislature then vested in the owners of the lands all the minerals except gold and silver, lead, copper, coal, iron, tin, and precious stones. Under this agreement, mines have been opened in every part of the province. There are collieries actually worked in six of the eighteen counties into which the province is divided. Gold mines have been opened in twelve proclaimed districts in six counties, and in other districts, not proclaimed, in other counties. Already over one hundred coal leases have passed the Great Seal, and the leases of gold mines are innumerable."

"The royalties reserved are 10 cents a ton on coal; iron, 3 cents a ton on the ore; gold 2 per cent. and all other minerals 5 per cent. These royalties go to form a fund for the support of the local government, which derives in one way or another over \$100,000 a year from this source."

"While the freeing of our mines from the monopoly of the association gave an immense impulse to them, the fiscal policy which had governed our relations with the United States has tended to retard the development of our coal interests. From 1854 to 1866, our coal was admitted into the United States free of duty. When the reciprocity treaty was repealed, two-thirds of our entire sales were made to that country. After that, the States imposed a duty of \$1.25 a ton. This soon reduced our exportations to that country. The trade in six years dwindled from two-thirds to one-fifteenth of our whole sales. Then the duty was reduced to seventy five cents. But the trade continued to dwindle till in 1884, instead of being two-thirds, it fell to one twentieth of our entire sales. But in the meantime our total sales, notwithstanding the reduction in, or rather the extinction of, the sales to the United States, have gone on increasing from year to year, and last year we

sold well on to 500,000 tons more than we did when our trade with the States was in the most flourishing condition. It would seem, therefore, that our coal trade is not dependent on the United States market. But when the time comes, as doubtless it will, when the laws of nature prevail, when they are not overridden by fiscal restrictions, and the trade is allowed to flow in its proper channels, it will be found that the opening of American markets to provincial productions will not only greatly extend our industries, but will add to the comfort and convenience of the large classes in the neighboring country to whom cheap fuel, cheap light, and cheap mechanical power are unquestionable blessings."

Mayor Mackintosh followed with an appropriate speech, in which he cordially welcomed the visitors to Halifax and briefly referred to the more important mineral features of Nova Scotia.

President Bayles, on behalf of the institute, gracefully responded, and referred to the interest the American engineers and capitalists have in Nova Scotia's great mineral resources, more especially in its magnificent coal and iron deposits, from which, he intimated, closer commercial relations may enable them to draw supplies of fuel and ore for their eastern works.

In his opening address President Bayles discussed, in a very able manner, the relations of the engineer to labor, calling attention to the danger of the socialistic tendency of the times, and the necessity for guiding the movement into safe channels. The following extracts from his address contain the pith of Mr. Bayles' expressed views on this important subject:

"However blind we may be to the spread and influence of socialistic teachings, there is little excuse for persistence in cherishing the idea that the wage-earner has no cause for dissatisfaction with the present unequal and inequitable distribution of the products of industry. More general education, a free press, and organization for resistance or aggression, have been the agencies by which the working classes have gained clearer ideas of their power and opportunities. The dull despair of mediæval servitude has given place to an intelligent and profound discontent with a situation which every year seems to make them more hopeless; and I do not hesitate to venture the opinion that, unless strong and willing hands are extended to lift them up they will again and again reach from the mire to pull down and destroy that to which they cannot attain unaided."

"The wage-earner's future, in all but exceptional instances, promises nothing better than continuance in the labor he has learned, as a competitor with machinery which may at any time displace him and force him to seek some other and perhaps less congenial employment, or starve."

"The hopelessness of the position of the average wage-earner consists in his ignorance. The progress of the arts has been so rapid that few men starting in life without education are able to keep pace with them, or, indeed, to acquire such familiarity with principles that they can hope to attain to responsible positions of management. While the sphere of those born to serve has been thus steadily narrowing, the sphere of those so fortunately situated that they have been able to acquire liberal education is steadily broadening. The capitalist is rarely safe in intrusting his interests in mining or manufacturing to the merely practical man. Success in business enterprises of every kind now depends upon so many things of which the merely practical man knows little or nothing, that management is usually intrusted to the

man who combines education and experience, and his staff of responsible assistants is made up of young men of education who take subordinate positions to gain experience."

"But for industry and thrift there should be something better than our present industrial system gives. Arbitration should decide fairly and impartially the issues between workman and employer, and some part of the profits of production should seek investment in ways which will react favorably upon the interests of labor. Participation should be established on an equitable basis as the reward of faithful service, and co-operation should be promoted wherever and whenever it can benefit the wage-earners."

Upon the conclusion of the addresses, the remainder of Wednesday's session and that of Thursday were devoted to the reading and discussion of papers. Owing to the time set apart for this purpose being limited, only a few of the large number of papers presented were read. The following is a list of those that were heard and discussed:

The Nova Scotia Gold Mines, by E. Gilpin, Inspector of Mines, Nova Scotia. Studies in the Apatite Region of Canada, by Dr. T. Sterry Hunt, Montreal, Canada. The Pictou Coal Field, by J. S. Poole, Stellarton, Nova Scotia. Our Glacial Problem, by Rev. D. Honeyman, Halifax, Nova Scotia. Steel Castings, by A. V. Abbott, New York City. Topographical Models and their Uses, by E. A. Lehman, Philadelphia, Pa. An Electrical Furnace for Reducing Refractory Ores, by Dr. T. Sterry Hunt, Montreal, Canada. A New Method for the Determination of Phosphorus in Iron and Steel, by J. B. Mackintosh, New York City. The Specific Gravity of Low-Carbon Steels, by G. S. Miller, Benwood, West Va. The Manufacture of Iron in Canada, by J. H. Bartlett, Montreal, Canada. The Coal Fields of Cumberland County, Nova Scotia, by R. G. Leckie, Springhill, Nova Scotia. The Homogeneity of Open-Hearth Steel, by H. H. Campbell, Steelton, Pa. Improvements in Ore-Crushing Machinery, by S. R. Krom, New York City. Note on a Self-Dumping Water-Tank, by W. Ide Pierce, Tangier, Nova Scotia. The Estimation of Manganese, Carbon and Phosphorus in Iron and Steel, by Prof. Bryan W. Cheever, Ann Arbor, Mich. E. D. Campbell's Colorimetric Process for Estimating Phosphorus in Iron and Steel, by Prof. Bryan W. Cheever, Ann Arbor, Mich. The Oil Regions of Pennsylvania and New York, by A. C. Ashburner, Philadelphia, Pa. The Contraction of Iron under Sudden Cooling, by H. M. Howe, Boston, Mass. The Philosophy of Fire-Brick Hot-Blast Stoves, by Frederick W. Gordon, Philadelphia, Pa. The Wolf Benzine-Burning Safety-Lamp, by E. J. Schmetz, Columbia, S. C. The Cape Breton Coal Field, by W. Routledge, Sydney, Cape Breton. The Amalgamation of Gold Ores and the Loss of Gold in Chloridizing-Roasting, by C. A. Stetefeldt, New York City. Lixivation and Amalgamation Tests, by F. W. Clarke, Boston, Mass. The Geology of Natural Gas, by C. A. Ashburner, Philadelphia. Notes on the Treatment of Gold Ores, by William Bruckner, Marysville, Mont. Basic Bessemer Materials, by Prof. T. Egleston, New York City. The Blast-Furnaces of the North Chicago Rolling-Mill Company, by Frederick W. Gordon, Philadelphia, Pa.

The Apatite Region of Canada.

Dr. T. Sterry Hunt, in presenting a verbal abstract of his paper, entitled "Studies of the Apatite Deposits of Canada," alluded to his published communication on the Canadian Apatite Deposits made to the Institute in February, 1884,

and proceeded to describe some of the later results of mining apatite in the Lièvre district, to the north of the Ottawa river, where the mines are as yet confined to a small area in the townships of Buckingham, Portland, Templeton and Derry; earlier workings having been along the Rideau Canal to the south of the Ottawa. The large mining operations recently undertaken in the Lièvre district show that the crystalline phosphate of lime or apatite belongs to lodes of great size, which traverse the ancient gneiss of the region. These lodes include granitoid feldspathic and pyroxene rocks with large masses of quartz, of carbonate of lime, of pyrites and of apatite. All of these often show a banded structure not unlike that of the gneiss, to which they are evidently posterior, and of which they often contain fragments. Their study is full of interest to the geologist. The mining operations on these great lodes, which are often over one hundred feet in breadth, are in part by open cuts and in part by shafts, and have reached depths of a little over 200 feet. The production of some three or four of these mines in 1884 was from 4,000 to 5,000 tons each of commercial apatite. The improved machinery, and the better system now being introduced here, is greatly increasing the yield of these mines, some of which during the past summer have put out 600, 700, and even 1,000 tons in a month. The mineral, yielding on an average eighty per cent. of phosphate of lime, is now worth in Montreal eighteen dollars per ton, and is mined with great profit. It is chiefly shipped to Great Britain, where it is used for the manufacture of high grade superphosphates; but it is believed that in the near future a larger market will be found for the apatite in the United States and Canada. The growing demand for high fertilizers on this continent, and the fact that the apatite of Canada may be shipped to the valleys of the Ohio and Mississippi at much cheaper rates than the phosphate rock of South Carolina, gives a great importance to these Canadian mines. The output from those of the Lièvre district this year will probably exceed 30,000 tons. Works on a large scale are now in construction at the lower falls of the Lièvre on the line of the C. P. R., for the grinding of phosphates and the manufacture of fertilizers. While the productiveness of the Lièvre mines has caused the neglect of the earlier discovered deposits of the Rideau district, there are among these some which, in the speaker's opinion, will be found, when properly developed, not inferior to those of the Lièvre, and he believes that these two districts of phosphate-bearing veins in Canada will soon become an important source of revenue to the country, and a great benefit to the agriculture of the continent.

Nova Scotia's Gold Mines.

BY

EDWIN GILPIN, JR., A.M., F.G.S., F.R.S.C.

The reading of this paper was listened to with much attention. Mr. Gilpin dwelt at some length upon the composition of the auriferous veins and the geological features of the formation in which they occur, and gave some interesting information on the mining and milling systems in vogue in the province, and the cost of production of the precious metal. Want of space prevents us from publishing now the full text of Mr. Gilpin's paper, but it is our intention to do so in our next number.

In the afternoon of Wednesday the visitors enjoyed a delightful cruise in the Halifax harbour under the auspices of the executive committee, and in the evening they attended a promenade concert and fireworks in the public

gardens given in their honour. On Thursday evening the members of the Institute attended a reception in the Province building, tendered them by the citizens of Halifax, and on Friday morning the visitors took their departure, having been divided into three parties, one of which, the largest, going to Pictou and Cape Breton to inspect the coal mining industries of those districts. Another party made a tour of Grand Pre and the Annapolis Valley, stopping at Windsor to view the extensive gypsum quarries, while the third party visited the Spring Hill and Joggins' coal mines and the famous Londonderry iron mines.

THE MONTAGUE GOLD MINES

were visited by one of the parties and at the *New Albion* mine the engineers saw one of the most remarkable collections of gold ore ever seen in America. The samples of quartz were so filled with strings of gold that the pieces of rock were held together by the precious metal.

Professor G. H. Torrey, United States Assayer at New York, was with the visitors, and has an intimate knowledge of the Nova Scotia gold mines, of which he holds a high opinion. He says that gold mining in the province may be considered as hardly yet in its infancy, and thinks that mining success in Nova Scotia in the future will be found largely, if not altogether, in her low grade ores, from slate belts, and in deep mining. In conversation, Prof. Torrey pointed to the history of the Black Hills, which shows that the mining of low grade ores will pay when found in large seams. And, he remarked, if it will pay there—two hundred and fifty miles from railway communication, where every pound of supplies has to be carried, with wood scarce and labour \$3 per day—how much more will it pay in Nova Scotia, where the gold fields are close to the railway or seaboard, where there is an abundance of ore, and labour at \$1.50 per day. In reply to a question as to why, in the face of these manifold advantages, American capital is not more liberally invested in our mines, Mr. Torrey, pertinently replied: "If your people show their faith in your own country by their works and investments, you will find our people willing to put in perhaps an equal amount of faith and cash."

THE DRUMMOND MINE

at Westville was visited, and the Acadia mines. Those who went to the *Drummond* were shown over the works, and several of the ladies went down the shaft. This colliery is running on full time, giving employment to 450 men and boys, and has a daily output of 600 tons. It is now owned by Montreal parties, who have a capital of \$750,000, and is famous on account of the great explosion of 1873, when the mine was destroyed by fire and sixty-five men and boys perished. The present workings have reached a depth of 2,800 feet.

Sir George Elliott, the wealthiest colliery owner in the north of England, was with the visitors to the *Drummond* and has laid before Montreal capitalists a scheme for pooling or amalgamating the four Pictou colliers under one powerful syndicate with increased capital and more economic management, with a view to putting an end to the existing competition. Sir George inspected the *Albion*, *Vale* and *Acadia* mines as well as the *Drummond*, and was particularly struck with the vast quantity of coal available. He declared that, considering the depth, there is three times more coal in Nova Scotia than in any similar area in the world, and that this vast deposit had not yet been even "scratched."

GYPSUM QUARRIES.

Those of the members of the Institute who formed the Annapolis party were entertained at Windsor and inspected Mr. Dimock's gypsum quarries on the banks of the river Avon. These are among the finest white gypsum quarries on this continent and were inspected with much interest by the visitors.

AT GRAND PRE

this party made a short halt and were given an opportunity of visiting the forge of Basil, the blacksmith, the cottage of Evangeline, the grave of Evangeline's father, and several other points of interest in the locality.

During the excursions of the different parties the more important coal, iron and gold mines in operation were inspected by the Mining Engineers, as well as the gypsum quarries. The visitors saw a great deal that was new and interesting to them and no doubt gathered much information. The Halifax meeting of the American Institute of Mining Engineers is pronounced to have been in every way successful, and it will probably have the effect of giving an impetus to the mining industries throughout the Province of Nova Scotia.

GOLD IN BRITISH COLUMBIA.

Rich Mines on the Columbia River—Placers that in 1862 Yielded 300 Ounces of Dust a Day--Crumbling Red Quartz with Yellow Veins and Flakes of Pure Gold.

It will be remembered that about twenty-five years ago enormously rich discoveries of gold in placers were made in the northern interior of British Columbia, or "the Fraser River country," as it was then more popularly known. It was no uncommon thing in 1862 to take from one claim on the southern or eastern slopes of the Caribou Mountains 250 or 300 ounces of gold a day, equalling a coin value in New York (at that period of high premiums) of from \$5,000 to \$8,000. The lavish and riotous waste which ensued during the season that this continued was never exceeded in the romantic annals of gold mining.

Further prospecting in that region led to the discovery, in 1866, of good placers upon Gold and McCullough Creeks, near the Big Bend of the Columbia, and some working was done there under almost insurmountable difficulties for one or two seasons. The great expense and hardship to be encountered by miners in that remote and inclement region caused its early abandonment, however, though it was well known that valuable mines would be opened there as soon as the advance of civilization rendered them accessible.

The approaching completion of the Canadian Pacific Railway has now brought about this result by opening communication into these mineral-bearing mountains, and the miners are again flocking to the deserted creek beds and rehabilitating the abandoned camps. Though the present summer has witnessed the beginning only of the new era of prospecting and mining, there is every promise that the movement will be continuous and increasing until a large and prosperous mining population shall enliven the solitudes that are now rarely penetrated by the most daring Indian.

The Rocky Mountains trend so rapidly westward, north of the boundary line, that in latitude 52°, about where the new railway crosses, they lie considerably west of the meridian of

Salt Lake, and, instead of being 600 miles wide, as in Colorado and Utah, they are not over 150. They consist in that region of three parallel masses or ranges. The easternmost is the Rockies proper, the water-shed between the Atlantic and the Pacific. It is here a broken and disordered range of uplifted metamorphic rocks covered with ice and snow, and formed, by their original rupture and the subsequent effects of the weather, into shapes of the most fantastic, yet gigantic, beauty. Next westward, is the equally grand and lofty, but more orderly, range, called the Selkirks, whose glacier-capped summits bristle with innumerable black pinnacles, making most striking scenery. Beyond the western foothills of these rises a third and lesser uplift, known as the Gold Range, in which, no doubt, may be traced the geological, if not the geographical, backbone of the continent and beyond which the land falls away to the plateaus of British Columbia.

These three ranges are separated from one another by the Columbia river.

This great water-course rises in some lakes lying near the international boundary between the Rockies and the Selkirks. Thence, a strong swift stream, it flows northward for 100 miles before it can find its way past the huge wall of the Selkirks on its left; then it makes a sudden sharp sweep westward around the northern end of this range, and begins a course straight southward, between the western flank of the Selkirk and the eastern foothills of the Gold Range, and continues this until it has descended to the mouth of the Snake River in Idaho, when it turns westward to the sea, dividing Oregon from Washington Territory. The sharp sweep which the river makes around the northern end of the Selkirks is called the Big Bend, and it is there that the new gold excitement finds its present focus, though Farwell is the entrance point and supplying centre.

The placer deposits worked by the miners of '66 in Gold and McCullough Creeks, which enter the river near the Big Bend (whose landings, Boat Encampment and La Porte, will be recalled), showed that in the Gold range, whence they came, there must be mother ledges of auriferous quartz; but when it was found impossible to supply themselves even with provisions, any thought of the introduction of machinery needed for the working of quartz was, of course, futile. Now, however, prospectors are finding quartz ledges and the construction of the railway, to be completed in November of the present year, will furnish a means for the introduction of needful machinery and supplies.

The course of the railway through Kicking Horse Pass in the Rockies, Beaver Pass in the Selkirks, and Eagle Pass in the Gold Range, leads it to make its second crossing of the Columbia at Farwell, only forty-five miles below the two placer-bordered creeks mentioned. Next year, doubtless, a steamboat will be put on between Farwell, the town now growing up at the crossing, and the Big Bend, but at present a trail for pack-horses, which is to be extended into a waggon road next spring, is the only means of ingress. This lack of a road for only forty-five miles may seem a trivial obstacle to some readers, but those who have ever seen the roughness of those foothills and the amazing density and the gloom of the forests will readily understand the vital importance of a road. The trail is being cut by the Provincial Government, which will also build the waggon road. It is impracticable to pull an ordinary boat up the river.

This work would not be done, of course, had not recent explorations confirmed the old information and added much that is new. Several

ledges which have long been known on McCullough and Gold Creeks are now being thoroughly examined by means of shafts and tunnels in order to determine their extent and probable value. On another stream, French Creek, close by, quartz rich in both gold and silver has been opened, and it is thought to be abundant. Every day brings word of some new "find" in the neighbourhood, and the expectations of every one who has seen the specimens brought back are roused to the highest pitch.

That it is reasonable to suppose that good mines will be developed in that region is indisputable when one studies the relation between this Big Bend district and the other gold and silver producing districts of the North-West. The line of uplift, continuous with the Gold and the Selkirk ranges, and extending to Grace River and beyond, is that upon which, in 1862, the fabulously rich Caribou placers were found, implying, of course, quartz in the heights behind. Along the Canon River, between the Caribou and the Big Bend districts, every little snow-fed stream yields more or less of the precious metal, and at Big Bend the deeper the mountains are penetrated the more encouraging are the reports. Following southward along these ranges, creek after creek pours into the Columbia its tribute of golden gravel, in many places destined to attract miners now overlooking anything less than the extraordinary. The valley of the Illecillewaet, by which the railway descends the western slope of the Selkirks, shows that it is worth while to prospect the whole of that range on account of its exhibition of lodes yielding rich assays in silver, galena, chlorides, and sulphurets. Further down in the Kootenay district are mines now well advanced that are yielding ores which pay a fine profit after being carried on horseback or in waggons for 200 miles, and then shipped to Omaha or San Francisco for smelting. The same line of mountains traced still further southward leads to the mining regions of Montana and Idaho, to the richest regions of Utah, and so on to Arizona and Mexico.

Moreover, the appearance of the ores produced in this far North-West is similar to that of the rock found to be rich in Kootenay, Montana and Utah. Silver specimens closely resemble the ores at Butte City, Montana, while the gold-bearing rock from Big Bend would be easily mistaken for that coming from the Summit district of Colorado, where some ore is worth \$20,000 a ton. This gold ore is a rusty, reddish, half decomposed quartz, through which the gold is distributed in thin streaks, where it lies crowded in flakes easily visible to the naked eye, and often in places as large as the head of a lead pencil. Some small pieces of quartz are more than half their weight in pure gold.

It is quite certain that next spring will see a great rush to the Big Bend, and that after the inevitable boom of noise, success, failure, and experiment passes by, a residuum of solid and increasing value will remain, out of which a very productive gold and silver district will be made to yield its much-needed addition of coin.

James W. Marshall, the discoverer of gold in California, died on the 10th of August at his home in Kelsey. He was seventy-four years old and died a poverty-stricken and disappointed man.

The lime cartridge, for use in coal mining, seems to be growing into general favor in England. The *London Mining Journal* reports that it is proving a decidedly economical substitute for dangerous shot firing.

CALUMET AND HEOLA.

This world renowned copper mine is now opened for fifteen years ahead. That is, if not another stroke of development work were made, or if the mine "petered" at the bottom, fifteen years of copper product at the present rate of annual production could be taken out of the mine. If the Tamarack shaft demonstrates the continuance of the Calumet vein throughout its property, President Agassiz says that the company has then sixty years of copper production in its territory. At the recent annual meeting President Agassiz told the stockholders that the mine was now producing 500 tons more of mineral per month than last year, at very little increased cost. Five hundred tons per month means 6,000 tons per year, which, assaying seventy-five per cent. pure copper, means 4,500 tons of ingot, which, at \$200 per ton, or ten cents per pound, is \$900,000 per annum.

THE TREADWELL MINE.

Sixty thousand dollars in bullion was forwarded in September from this wonderful quartz mine on Douglas Island, Alaska, and represents a considerable profit to those interested.

With the machinery used the cost of mining and milling the ore will not exceed at the utmost \$1.50 per ton, while Mr. Treadwell states that he can mine and mill it for \$1.10. The ore pays about \$8.50 to the ton, so it can readily be summed up the amount of profit that is made from the mine. Considering the inexhaustible quantities of paying ore there is in this phenomenal deposit, the owners have a constant source of wealth, and the development has been done by a very few California capitalists.

The mill at the mine is probably the largest and best constructed stamp-mill in the world. It has 120 stamps, runs day and night, and requires 250 miners and other employees to keep it working. The machinery is all of the latest and most approved pattern, and there is ore enough in sight to run the 120 stamps for fifty years.

Senator Jones, of Nevada, one of the parties interested, has recently visited the mine and pronounces it the *biggest thing on record*.

MINING NOTES.

NOVA SCOTIA.

A deposit of copper ore has been discovered near Pugwash, situated close to the main road and within a short distance of the coast.

The gold mine at East Rawdon continues to yield good returns. During the month of August gold to the value of \$8,350 was taken out.

A brick of gold weighing 54 ounces was taken to Halifax in September from the Caribou mine. The brick was valued at \$950 and was the result of three weeks' labor of six men.

A manganese property in East Onslow, Colchester County, has passed into the hands of a New York firm, who have the necessary means and practical knowledge to work it to advantage.

The largest bar of gold ever seen in Nova Scotia was taken to Halifax last month from the New Albion mine at Montague. It weighed 1,054½ ounces and was the product of fourteen days' crushing in a twenty-stamp mill. It was valued at \$20,619.

The Cowan mine at Kemptville, 23 miles from Yarmouth, is doing good work. From the last crushing gold to the value of \$1,600 was obtained, and there is every prospect that the next crushing will yield a still better return. Thirty men are employed at this mine and the force will be increased so soon as provision can be made for additional accommodation.

Returns from the Nova Scotia gold mines, received up to September 15th, show the following production:—

Districts.	Tons Quartz.	Oz. Gold.
Salmon River.....	960	725
Sherbrooke.....	112	16
Lake Catcha.....	214	217
East Rawdon.....	136	420½
Uniacke.....	76	12

PROVINCE OF QUEBEC.

The Albert Mining Company are about to introduce steam drills in their copper mine at Capelton.

Six asbestos mines in the Eastern Townships give employment to 350 men, and the yearly output aggregates 1,200 to 1,400 tons.

The Orford Copper and Sulphur Company are stacking their surplus ore near the Passumpsic Railway track so that it can be conveniently loaded into cars when wanted.

The only mica mine that is being worked in the province is the *Villeneuve* mine. With a small force employed this property is yielding abundantly and the mica is of the very highest grade.

The phosphate mines of Ottawa County are turning out more ore now than at any previous period since they were opened. Four mines give employment to 333 men, from which the September output aggregated 2,555 tons.

The St. Onge Gold Mining Company have penetrated wonderfully rich gravel at the bottom of their shaft on Slate Creek, and are now washing gold in quantity. This company have no doubt hit upon the richest alluvial gold deposit in the Beauce district.

PROVINCE OF ONTARIO.

A company at Lake Linden, Michigan, have secured important mining property in the Silver and Rabbit Mountain regions of Canada.

A deposit of copper ore near Sudbury is being prospected by New York parties under a bond from the owners. An equitable arrangement has been entered into by the parties concerned by which the owners receive a royalty on ore extracted while the property is being tested. The lessees have bound themselves to extract a certain number of tons of ore quarterly or pay the royalty on the specified amount. The lease is for one year with option to purchase, and renewable under certain conditions.

Mr. Charles F. Eschweiler, superintendent of the Huronian mine, Lake Superior district, recently forwarded a sample of ore taken from the vein to Ledoux & Ricketts, assayers, New York, and has received the firm's report of assay, as follows:—138.49 ounces of gold and 1,057.22 ounces of silver per ton of 2,000 lbs. Taking gold at its value of \$20.67 per ounce and silver at \$1.07 per ounce, the assay shows a value of \$2,852.58 in gold and \$1,131.33 in silver, or a total of \$3,983.91 per ton.

BRITISH COLUMBIA.

Gold has been struck on Finley Creek, Kootenay district, and a great many Chinese are moving in from the Wild Horse country to work the placers.

Men working on the government trail from Goat river to the Fort Shepherd trail have found gold quartz on the route. The news has drawn many prospectors thither.

Work in the galena mines at Upper Kootenay is at a standstill. The Ainsworth Company have only a few men employed, and the Connecticut Company are nearly idle.

It is rumoured that the iron mine at Sooke, owned by F. G. Richards & Co., of Victoria, has been sold to English capitalists and that it will soon be opened and smelting works established.

The mines at Kootenay are developing well, according to report of Gold Commissioner Vowell, and are giving every appearance of yielding an abundant supply of good ore. The "Ella" and "New Jerusalem" claims are giving rich indications.

A large party of eastern gentlemen, connected with the Kootenay Mining and Smelting Company, having a mining expert from Germany with them, came over the Northern Pacific line and passed up to the lake on Sept. 1st, their object being to locate a smelter and erect plant.

Great complaints are heard on all sides from miners and others in the Kootenay district on account of the uncertainty which prevails with reference to the Ainsworth land grant. It is said that unless something is done shortly in this matter it will very much retard the progress of mining in that section.

It is said that petroleum has been discovered in British Columbia. It was observed floating on a small creek about 100 miles from Victoria. It is opaque and nearly as thick as molasses; poured on paper it burns freely and emits the odor of coal oil. It is supposed that near this spot will be found a large supply of native petroleum.

A large number of miners from Lorne Creek arrived in Victoria in September. They report the mines have been worked out, and none of those who came down had any more than they went up with. There has been some gold taken out, but the money expended in getting it will nearly balance this. A few, however, have taken out somewhat more than expenses.

At the Shuswap Silver Mine a tunnel has been driven for 80 feet, and some cross-cuts have been made. The company are now sinking a shaft and report the ore improving as work progresses. There is an almost inexhaustible quantity of ore, and if it is found to carry silver in paying quantity it is expected that Montreal capitalists will immediately commence the development of the mine.

The Kootenay Mining and Smelting Company are very active and persevering in their efforts to get to work this year. They have completed their work in so far as getting communication with the Northern Pacific railroad, having now a direct route from thence to the mines. Parties going to the mines can now go

from Sand Point, on the Northern Pacific railroad, direct to any part of the lake in twenty-four hours by taking the new road from Mud slough to the river at Bonner's Ferry and the company's steamer to the mines.

The representatives of a company of eastern and Chinese capitalists have been in negotiation with the government of British Columbia for some time with the object of introducing the manufacture of iron and steel on a large scale. It is proposed to erect extensive smelting works near the iron deposits on the east coast, and proceed to open them and manufacture steel and iron for export to China and Japan. The company have unlimited means.

The gold strike on Granite Creek, a branch of the Semilkameen River, close to the American boundary, is attracting wide attention. Upwards of 1,000 men are in the district, whose success varies from food to \$100 a day per man. Access to the diggings is gained via Hope and Fraser river, and provisions are plentiful. Benches on the upper part of the creek are said to prospect well, nuggets worth from \$8 to \$10 are being taken out. The creek is staked off for two and a half miles from its mouth. There is also reported a rich quartz strike on Kettle River, but as yet little is known of it.

UNITED STATES.

The Calumet and Hecla product for the month of August was 2,575 tons, 1,285 pounds.

The output of the mineral products of the United States, in 1884, were valued at \$103,104,620.

The production of phosphates in South Carolina for 1884 was 409,000 tons of rock and 236,884 tons of fertilizers.

The total amount of assessments levied by the Eureka Silver Mining Company, of Nevada, is \$350,000. The total amount paid in dividends aggregates nearly \$5,000,000.

Of gold and silver the mint authorities estimate the production in the United States, in 1884, at \$30,800,000 gold, and \$48,800,000 silver (coining rate); total, \$79,600,000.

The Plymouth Consolidated Mining Company, California, have paid their twenty-eighth successive monthly dividend of fifty cents a share, aggregating \$50,000 and making \$450,000 paid to their shareholders this year.

Unified Diamond Mines (Limited).

This company has been organized in London, England, with a capital of £10,000,000, with the view to purchasing as large a number as possible of the diamond mining properties, situated in the four mines, Kimberley, De Beers, Dutoitspan, and Bultfontein. These four mines, since their discovery in 1870, have produced more than £40,000,000 worth of diamonds. According to the official statistics of the Cape Colony, the product of the four mines added together exceeded during the last two years the respective figures of £2,680,000, and £2,480,000, even at the actual low price of diamonds. At a meeting of directors held August 7th, the note upon the purchase scheme was amended. Indebted companies are to pay fifteen shares of £20 each for eight debentures of £2 each.

A Large Piece of Amber.

A piece of amber weighing eight pounds is at present being exhibited in the Mark Museum at Dantzig, for which the owner has refused £1,500. It is probably the largest piece in the world without blemish. Frederick the Great, more than a century ago, paid the same sum for a piece weighing 13 lbs., which is preserved in the mineralogical museum at Berlin; but it has gaps and cavities. Two beautiful pieces of work in amber are also to be seen in Berlin. One is a flute, which also was an acquisition of Frederick the Great. The other is a complete tobacco-pipe, belonging to Frederick William III., the father of the present Emperor; it bears an admirably carved likeness of that monarch.

NOTES.

The exports of iron ore from Spain during the first five months of 1885 were 1,226,377 tons.

Four thousand five hundred and sixty feet is the depth recently reached by a Prussian diamond drill.

The opinion is now entertained that the art of making artificial stone is pre-historic, and that the Pyramids were built of that material.

Spain exported during the first five months of 1885, 51,235 tons of pig lead compared with 52,119 tons during the same period in 1884.

From a report of the Commissioner of Lands of British North Borneo it appears that gold exists in considerable quantities in that territory.

The total value of all minerals raised in the United Kingdom in 1884 is reported as £61,232,028 at the mine, as against £64,635,834 in 1883.

The exportation of ingot copper from Spain during the first five months of 1885 amounts to 11,688 tons compared with 6,223 tons during the same period in 1884.

The deepest mines in Great Britain are in Cornwall and Devon, the three deepest being Dolcoath, 2,446 feet; Clifford Amalgamated, 2,232 feet; and Tresavean, 2,100.

El Callao: this famous Venezuelan gold mine produced 10,518 ounces of gold during July, worth about \$203,786. It paid a dividend of \$2.40 per share, aggregating \$77,280.

C. G. Hussey & Co., at Pittsburg, Pa., have just made six sheets of copper that are believed to be the largest ever rolled. Each sheet is 13 feet 9 inches long and 9 feet 7 inches wide.

The deepest boring in existence is for coal near the village of Schladebuch, between Corbetta and Leipzig, which has reached a depth of 4,559 feet. This boring is 1,872 inches at the bottom and 11 inches at surface.

The New South Wales Gold Product for 1884: according to the annual report of Mr. C. S. Wilkinson, F.G.S., F.L.S., Inspector, was 104,932.68 ounces (\$2,100,000), being 16,844.70 ounces (\$316,000) less than product of 1883. Thus it is apparent that the annual product of the Australian gold fields continues to decrease steadily year by year.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for additions to interior fittings, &c.," will be received until FRIDAY, the 2ND OCTOBER next, for the execution of the additions and alterations and interior fittings, &c., required in the

POST OFFICE

—AT—
OTTAWA, ONT.

Plans and specifications can be seen at the Department of Public Works, Ottawa, on and after Wednesday, 23rd instant.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with the actual signatures.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party decline to enter into a contract to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.
Department of Public Works, }
Ottawa, 22nd Sept., 1885.

TIMBER LIMIT

ON LAKE WINNIPEG

FOR SALE.

50 Square Miles.

This limit will be very valuable. Apply at the office of the MINING REVIEW for price and particulars.

FOR SALE,
White Marble Quarry on Calumet Island.

At this quarry there is an inexhaustible supply of most beautiful white marble. Samples to be seen and information obtained at the office of the MINING REVIEW.

PHOSPHATE PROPERTY

In the Township of Portland West,

FOR SALE.

Lots 25, 26, 27 and 28, in the 3rd range. Some excellent surface shows have been uncovered on these lots and only require capital for developing. Price and particulars given at the office of the MINING REVIEW.

CONTRACT FOR SUPPLY OF MAIL BAGS.

SEALED TENDERS addressed to the Postmaster General, (for Printing and Supply Branch), and marked "Tender for Mail Bags," will be received at Ottawa until 12 o'clock, noon, on MONDAY, the 2nd NOVEMBER, 1885, for the supply of the Post Office Department of Canada with such Cotton Duck, Jute and Leather Mail Bags as may from time to time be required for the Postal Service of the Dominion.

Samples of the Bags to be furnished may be seen at the Post Offices at Halifax, N.S., St. John, N.B., Charlottetown, P.E.I., Quebec, Montreal, Ottawa, Toronto, London, Winnipeg, Man., Victoria, B.C., or at the Post Office Department at Ottawa.

The Bags supplied, both as regards material and manufacture, to be fully equal to the samples, and to be delivered from time to time in such quantities as may be required at Ottawa.

The contract, if satisfactorily executed, shall continue in force for the term of four years, provided always the workmanship and material be satisfactory to the Postmaster General.

Each tender to state the price asked per bag in the form and manner prescribed by the form of tender, and to be accompanied by the written guarantee of two responsible parties, undertaking that in the event of the tender being accepted, the contract shall be duly executed by the party tendering for the price demanded. Undertaking also to become bound with the contractor in the sum of two thousand dollars for the performance of the contract.

Printed forms of tender and guarantee may be obtained at the Post Offices above named, or at the Post Office Department, Ottawa.

The lowest or any tender will not necessarily be accepted.

WILLIAM WHITE,
Secretary.
Post Office Department, Canada,
Ottawa, 1st October, 1885.

GRAND COLONIAL

Exhibition in London, Eng., 1886.

FIFTY-FOUR THOUSAND FEET RESERVED FOR CANADA.

First Royal Exhibition Commission Since 1862.

THE Colonial and Indian Exhibition to be held in London, England, commencing May 1st, 1886, is intended to be on a scale of great magnitude, having for object to mark an epoch in the relations of all the parts of the British Empire with each other.

In order to give becoming significance to the event, a Royal Commission is issued for the holding of this Exhibition, for the first time since 1862; and His Royal Highness the Prince of Wales has been appointed President by Her Majesty.

The very large space of 54,000 square feet has been allotted to the Dominion of Canada by command of the President, His Royal Highness.

This Exhibition is to be purely Colonial and Indian, and no competition from the United Kingdom or from foreign nations will be permitted, the object being to exhibit to the world at large what the Colonies can do.

The grandest opportunity ever offered to Canada is thus afforded to show the distinguished place she occupies, by the progress she has made in Agriculture, in Horticulture, in the Industrial and Fine Arts, in the Manufacturing Industries, in the Newest Improvements in Manufacturing Machinery and Implements, in Public Works by Models and Designs; also in an adequate display of her vast resources in the Fisheries and in Forest and Mineral wealth, and also in Shipping.

All Canadians of all parties and classes are invited to come forward and vie with each other in endeavoring on this great occasion to put Canada in her true place as the premier colony of the British Empire, and to establish her proper position before the world.

Every farmer, every producer, and every manufacturer, has in erect in assisting, it having been already demonstrated that extension of trade always follows such efforts.

By order,
JOHN LOWE,
Sec. of the Dept. of Agriculture.
Ottawa, 1st Sept., 1885.

MINES AND MINERALS.

Developed and Undeveloped Mines and Minerals of Commercial Value BOUGHT AND SOLD.

PHOSPHATE LANDS FOR SALE.

The Laurentian Phosphate Min-
ing Company offers for sale upon advan-
tageous terms the mining rights upon the
whole or part of their valuable phosphate
lands in the Township of Templeton, con-
taining in all 1,300 acres.

Part of the property has
been developed and proved
to be unsurpassed in rich-
ness.

Most favorable reports by the late Henry
G. Vennor, F.G.S., and other experts, may be
seen upon application to the undersigned.

The principal shareholders now residing
abroad, is the reason for wishing to realize
and close up the business of the company.

To parties purchasing the whole of the
company's interest, their Letters Patent would
be transferred, thus enabling the purchasers
to carry on the business as a company with-
out loss of time or further expense.

For further particulars apply to

J. M. BROWNING,

99 St. James street, Montreal.

THE CANADA COMPANY

Will issue Licenses to Prospect or
to work minerals, on any of
their Mining Lands and
Mineral Reservations,

COVERING NEARLY A.

QUARTER OF A MILLION ACRES

In Eastern Ontario, and principally
within the belts containing,

Iron, Phosphate, Gold, Galena, Plum-
bago, Mica, Marbles, Building-stone,
and other valuable minerals.

For lists of lands and terms apply to
the Company's Mining Inspector.

H. T. STRICKLAND,
Peterboro', Ontario.

ADAMANTINE SHOES, DIES AND CRUSHER PLATES

Will outwear 3 sets of those made of cast iron or gun metal. These Shoes, Dies and Plates are in extensive use in all the States and Territories of North and South America.

Address **CHROME STEEL WORKS, BROOKLYN, N.Y., U.S.A.**
SEND FOR ILLUSTRATED CIRCULAR.

S. H. KOHN, Proprietor.

DEVELOPED

PHOSPHATE MINE

ADJOINING THE FAMOUS LITTLE
RAPIDS MINE IN PORTLAND EAST.

THIS location has been pronounced by experienced practical miners one of the most promising apatite producing properties in the district. There are over TWENTY SURFACE EXPOSURES of GOOD PROMISE, and one deposit now being worked that proves a extensive body of phosphate at a depth of FIFTY FEET.

Price reasonable and satisfactory reason given for selling.

Full particulars obtainable at this office.

FOR SALE

Valuable Phosphate and
Farming Property,

In the Township of Templeton, County of Ottawa, Province of Quebec, adjacent to the celebrated phosphate mines of McLaurin at Blackburn, Jackson Rae, J. H. Post, and others, consisting of

LOT 14, RANGE 10 AND 14, RANGE 11
CONTAINING 300 ACRES.

Dwelling-house, Barns, Stables and Out-houses, in good order, on the property, proximity to a good phosphate opening from which several tons of high-grade phosphate have been raised, and where mining operations can be at once started.

The property has been partially prospected and several promising out-croppings of phosphate have been exposed. It has been pronounced a valuable phosphate location, miners working in the vicinity, and satisfactory reasons can be given for offering it for sale.

The owners, Messrs. Pearson, who hold clear title to the lots, will sell them in simple, or the mining rights only.

Cost of transportation from the property point of shipment will not exceed \$2 per ton. For terms and full information apply on premises, or to

OFFICE:

UNION CHAMBERS, 14 Metcalfe Street.

The CANADIAN MINING REVIEW is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts as well as others interested in Canadian Mineral Lands are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 20th of the month.

Address all correspondence, &c., to the Publishers of the CANADIAN MINING REVIEW, Ottawa.

Notwithstanding the valuable work that is yearly being accomplished by our Geological Survey, and the information that is being given to us in the Director's periodical report, it is incontrovertibly true that the people of Canada are practically without information and comparatively ignorant concerning the extent and variety of the mineral resources of their own country. Lack of information concerning the past history of our mining industries, and the continued neglect on the part of the Dominion Government to establish a mines branch in connection with the Geological Survey of Canada, for the systematic compiling of mining statistics and the publication of an annual report of mines, has a tendency to retard the progress of our mining industries and to perpetuate our ignorance of what might be achieved by enterprize and judicious use of capital in the development of our mineral deposits. There is much need of wider knowledge of Canada's mineral resources and a better understanding of their capabilities; for their successful development would become a potent factor in advancing our national prosperity. This knowledge and understanding can only be given to us through governmental interposure, and it is to be hoped that the Minister of the Interior will not delay in establishing a Department of Mines capable of liberally dispensing mining information.

Now that the shipping season for phosphate is drawing to a close, mine owners have ceased to forward ore from the mines,

as all the available freight from Montreal to foreign ports, per steamship and sailing vessels, up to the close of navigation, has been secured, and the phosphate awaiting shipment has been delivered at Montreal.

For this reason the Canadian Pacific Railway Company has seen fit to discontinue the running of trains on the branch line from Buckingham station to the village. This is certainly a most unwarrantable proceeding, and has created much dissatisfaction among mine owners in the Lièvre district, who have been liberal patrons of the C. P. R. By the carrying of the output of the phosphate mines over the road to Montreal, that portion of the freight charges credited to the Buckingham branch has shown it to be the best paying portion of the Eastern Division. This traffic can be relied upon for seven months in the year (the shipping season from the mines to Montreal) and the profits therefrom to the railway would warrant more liberality on the part of its managers than they are now displaying. Machinery and other heavy freight is constantly being forwarded to the phosphate mines, and at this season of the year mine owners are laying in their supplies. From the first of November of each year, until sufficient snow has fallen to make good sleighing, the roads between the railway at Buckingham station and the village are practically impassable, and at this very time, when railway communication would be of the greatest convenience to the miners, the company sees fit to discontinue to run trains over the branch. Had timely warning been given of this ungenerous intention, steps would have been taken to forward all heavy freight before the cancelling of trains; but no intimation of such discontinuance was given, until within a few days of its taking effect, and consequently everybody was unprepared for it. One train daily to and from Buckingham village could be run during the winter months at a profit, as the passenger traffic alone would be sufficient to defray the expense. During the season of navigation the company realizes large profits from this short piece of its line, and it is surely not asking too much of its managers in requesting that the order to discontinue the running of trains over the Buckingham branch be rescinded, and that thereafter there may be at least one train daily.

A meeting of representative phosphate miners of the Lièvre river district was recently held in Buckingham to protest against the action of the Canadian Pacific Railway Company in taking off the train between Buckingham station and the village. Mine owners are very indignant, and justly so, that their interests should be thus disregarded, and will take prompt steps to have their grievance favorably considered. The capital invested in the phosphate mining industry has reached large proportions, and the men who have interest at stake here are sufficiently independent not to allow themselves to be trifled with. Another meeting has been called, at which will be

discussed the propriety of constructing an independent narrow-gauge line from Buckingham village, on the west bank of the Lièvre, for the transportation of ore to the Ottawa river and thence to Montreal by barge. If their request to have a daily train over the Buckingham branch of the C. P. R. is not granted, these gentlemen will certainly provide for themselves this other accommodation.

An exchange tells us: "Graphite and black lead are identical, or nearly so, with plumbago. The mine at Ticonderoga, N. Y., produces nearly all the graphite mined in America. It is the purest known, and is used for all the purposes to which graphite can be put, excelling all others as a lubricant."

If Canada forms a portion of America, and we understand that such is the case, our contemporary is in error. There are two mines in the Province of New Brunswick producing graphite in large quantity as pure as any that has yet been found in other parts of the world, and the deposits of graphite in the Ottawa district are in no respect inferior to that produced in Ceylon or at Ticonderoga.

In this number of the *Review* we publish Mr. Edwin Gilpin's paper on "Nova Scotia Gold Mines," read before the Halifax meeting of the Institute of Mining Engineers, which will be found to be replete with interesting facts and statistics. Of the meeting, *The Engineer and Mining Journal* says:

"The recent visit of the mining engineers to Nova Scotia served to dispel many erroneous impressions. Not a few were surprised to find that Nova Scotia has a known coal area of nearly 700 square miles, or nearly twice the area of the Pennsylvania anthracite fields, and that some of the Nova Scotia fields have a greater thickness of workable coal than probably exists anywhere else in the world. The coal, too, is of good quality, though, when not washed, the slack and coke contain generally very large percentages of ash and sulphur.

The iron ore deposit of Londonderry is one of the finest in the world, and greatly surprised many experts. The country altogether is larger and better than was expected.

It was pretty generally believed that the climate of Nova Scotia was both cold and wet. This erroneous impression was thoroughly dissipated; for certainly no trace of coldness or frigidity was found anywhere to offset a warmth and ardour rarely equalled in any other part of the world the Institute has yet visited. As for the legend that in Nova Scotia the normal condition of the atmosphere is rain and fog, the visitors were convinced, both by personal experience and private information, of the contrary; for they found it a well established fact that the natives are always *dry*."

This speaks well for the natives. Their being *always dry* is, we take it, a reference to the hospitality they extended to their guests, and this is further corroborated by a special correspondent of the *E. & M. Journal*, who says:

"At New Glasgow we briefly examined the steel works, where steel is made from scrap and pig-iron, said to be the only steel works in

Canada; and the glass works, which make lamp chimneys, tumblers, wine-glasses, &c. Judging from our experience, we should say that Nova Scotia furnishes an extensive market for the last named article."

The same journal, referring to Nova Scotia's mineral wealth, says:

"Nova Scotia has been treated with great partiality by nature, which has heaped upon it with great prodigal hand, the choicest treasures of her mysterious laboratory. Gold, the sorcerer that bewitches the world; coal, the mainspring of civilization; iron ore, manganese, gypsum, and many other useful minerals are placed in large abundance within easy reach of man, in a fertile country with wholesome climate. In their proximity to each other and to magnificent harbors, nature has provided all the natural elements of national wealth and prosperity. The artificial elements, capital and energy, only have to be added to secure for this favored land an enviable position among the nations of the earth."

Such, it may be said, is the case in nearly every province of this Dominion. Our people are energetic, but we lack the enterprise and capital necessary to the advancement and successful development of great mining industries. The former can be fostered and nourished by the judicious employment of capital that must be looked for from more wealthy communities, and to procure this indispensable agent, we must offer sufficient inducement to capitalists to encourage them to come to our assistance, and we must be scrupulously careful to see that the capital that may find its way into Canada, for the development and advancement of her mining industries, is directed into channels where it can be profitably employed.

The South African gold field, of which many promising reports have been printed in London, according to Mr. Thomas C. Kitto, M.E., are really without a substantial trace of gold, and the geological formation of the country is not one that promises gold. The large nuggets that have been displayed there as of local origin have all been carried thither from Australia.

THE PHOSPHATE TRADE.

The shipping of phosphate for this season has virtually ceased—at least the forwarding of ore from the mines has been discontinued—and will not be resumed until the opening of navigation in 1886, excepting from those mines that are so situated as to necessitate winter transportation, and from these handling will be begun as soon as the roads are in good condition for sleighing, and the ore delivered at railway to await shipment next season.

At the mines in the Lièvre district nothing could be more satisfactory than has been the result of the past six months' operations. During the two months after the breaking up of last winter, the managers at the mines directed their attention to opening new ground in some cases, to adding new machinery in others, and in all cases to increasing and improving the facilities, and putting the mines in shape, for permanent and more extensive operations.

In consequence of this determination on the part of mine owners to prepare for systematic mining in the future, it became necessary to do a certain amount of dead work; but their wis-

dom has been amply evidenced by the increased monthly out-put since these improvements have been accomplished. Nevertheless, the time that had to be given to this work has had the effect of reducing the year's production of ore, and it is not probable that the shipments for 1885 will aggregate more than 23,000 tons.

The shipments of Phosphate during the past season from Canadian mines have given more satisfaction to the buyers abroad than have those of any former year, due, certainly, to the greater care of the mines superintendents in seeing that the ore is properly dressed and cleaned before it is forwarded. The quality of the past summer's shipments has been of a very high grade, the cargoes of first-quality ore having averaged quite 80 per cent. The richest shipments, however, that have been reported to us were from the *Little Rapids* mine, the return of which, from the London brokers, gave in one case 85.79 and in another 85.18 per cent. tribasic phosphate of lime. These are probably the highest analyses ever given for Canadian phosphate in cargo lots, but there is no reason why a very large proportion of the out-put of the mines should not be shipped in an equally pure state, though in some cases more than others it is more difficult to separate the ore from foreign matter which tends to lower the analysis. These shipments from the *Little Rapids* mine were made through Wilson & Green, of Montreal, and the result is evidence of their careful handling of the ore on this side, and that of their representatives on its arrival at London.

The most important development in mining during the past season has been at the Dominion Company's *North Star* mine, in Portland East, where a shaft has been sunk to a depth of 266 feet, the bottom of which is in a fine body of ore. From the surface to its present depth this shaft has penetrated ore, but the extent of the deposit has not been determined, nor will it be until drifts and cross-cuts have been run at different levels. At the 200 ft. level a drift has been run for some distance in solid ore, and some stoping has been done. We understand it is the intention to start another drift when a depth of 270 ft. has been reached. The present condition of the *North Star* is such as to insure a heavy out-put for many months to come. The ore is of a very high grade, and the way it has been handled, and the manner in which the work has been carried on at this mine, reflects much credit on Mr. W. H. Smith, the company's competent manager.

At other mines in the Lièvre district much lower depths have been reached than had ever been attempted before, and with very satisfactory results, and some important developments have been made at mines that have been but recently opened.

At the *Little Rapids* mine, during the past month, a cross-cut was started on a vein in one of the open cuttings, which has penetrated a body of ore, apparently another vein, the extent of which has not yet been defined. The miners are working in solid ore, which forms the roof, floor and sides of the drift. This work has exposed one of the largest bodies of phosphate ever met with in the district.

The *Emerald*, *High Rock* and the Union Company's mines maintain the reputation they have long since earned as heavy producers, and from each there is a steady production of high grade phosphate. The *Emerald* and *High Rock* mines have increased their out-put, month by month, since last year, and the October production of the mines in the Lièvre district has aggregated about 2,500 tons; the force of miners employed being much the same as reported last month.

The Glasgow Canadian Phosphate Company's mine, in Derry, has been developing satisfactorily and is producing a fair quantity of ore. This company has now put its mine in good working order, and has equipped it with machinery and other plant necessary for extensive operations. One of the directors of the G. C. P. Company (a Scotch organization) visited the property not long since, and expressed himself well satisfied with the prospects as he then saw them.

PHOSPHATE SHIPMENTS FROM MONTREAL FOR SEPTEMBER.

Date.	Vessel.	Destinat'n.	Shippers or Agents.	Tons.
Sept. 30	S.S. L. Superior	Liverpool..	Millar & Co.....	210
Oct. 3	S.S. Baumwall	Hamburg..	Lomer, Rohr & Co.	780

Total to October 31st				20,986

Phosphate Quotations.

One shilling for 75 per cent., with a fifth of a penny rise, has been the ruling price for Canadian phosphate in the London market during the past three months, and no report of any variation from these figures has reached us.

Ocean Freights.

The average freight charges for phosphate shipments from Montreal to Liverpool and London for the past season have been about five shillings and sixpence, having varied from three to seven shillings per ton. To Hamburg they have ruled at twelve shillings and sixpence. As the shipping season is virtually closed, there is no freight offering, and consequently no rates are reported.

The phosphate location in Templeton, adjoining the *Post* mine, formerly the property of Mr. J. H. Post, has recently been purchased by Mr. John Lamb, of Toronto, who purposes putting a force of men on at once to open it up, and will continue mining operations throughout the winter. Mr. Lamb is well satisfied with his purchase, and expects to make a good shipment of ore from the mine next season.

VILLENEUVE MICA MINE.

Recent reports from this mine are to the effect that it is producing a liberal quantity of excellent mica with but a small force of miners employed. Several experienced cutters are engaged, and find it impossible to keep pace with the miners; consequently there is a large accumulation of crystals, (in the neighborhood of eight tons) awaiting the cutters to prepare them for market. A shipment of several hundred pounds of cut mica was made from the mine in October, which has been pronounced by the consignee to be of as good quality as any that has ever been mined in America—quite equal to that which he has received direct from the North Carolina mines.

The drift, or tunnel, which is being run into the micaceous lode has reached a distance of 80 ft. from the face of the mountain and has opened up a body of mica-bearing quartz in which well

formed crystals are everywhere imbedded and are to be seen in vast numbers in all directions. This *Villeneuve* mine is certainly developing into a property of incalculable value, and ere long it will be capable of supplying almost the entire Canadian market, and it is not improbable that there will be a surplus to ship abroad.

Adamantine Shoes, Dies and Crusher Plates.

A visit to the *Chrome Steel Works* in Brooklyn, N.Y., was made recently by our correspondent, where were seen made the celebrated *Adamantine Shoes, Dies and Crusher Plates*, which are being extensively used in the gold and silver reduction mills, and wherever rock breakers are employed, in all the States and Territories of both North and South America, with the most satisfactory results. When it is understood that they outwear any other known, their value as compared with those of other materials may be computed. This is a large saving and

economizes not only in the freight, which is quite an item, as in many cases they have to be carried on the backs of mules over rough and mountainous country, thus adding greatly to the first cost, but in the trouble and delay caused in replacing those worn out, which, occurring at such short intervals, amounts to a considerable sum in time. They save also in the amalgam. The wear is so slight that little, if any, of the metal from which they are made gets mixed with the crushed ores, which saves the precious metals from a mixture of foreign materials. It is often the case that certain *Shoes* and *Dies* break off at the shank; these are made extra strong at that point, and there is no danger of their breaking.

The *Chrome Steel Works* are also manufacturing plates for amalgamating pans, from the same materials, which are destined to become very popular. There was also seen in process of manufacture the well-known *Chrome Tool Steel* made by this company. Their trade has increased wonderfully of late years, and now reaches over twenty tons per day. It is used for every description of tools. It is made of several grades, in rounds, squares, and octagons, and is guaranteed to do more work, as a tool steel, than any other known brand by from 50 to 100 per cent, according to work to be performed. We would refer our readers to the company's advertisement, which appears in another column.

A petrified tooth, twelve inches long and six inches in diameter, supposed to belong to a mastodon, has been unearthed in a gravel pit at St. Catharines, Ont.

GRANITE WORKS.

Ottawa has a new industry that is likely in the near future to prove of much importance. The Canadian Granite Company has completed the improvements and additions that were being made to the mill recently purchased at the canal basin, and the machinery, which has arrived from the manufacturers in the United States, is now being put in place. The polishing mill is a commodious structure, with excellent provision for light, and is substantially built from foundation to roof. The sheds in which the stone cutters will be employed in summer cover an immense area, and for the winter an excellent cutting shed has been provided for them adjoining the mill. The machinery is all of the most modern patterns, and of greater capacity than any now in use in Canada. The company's red granite quarry, at Kingston, has been described before in the REVIEW. It also owns a serpentine quarry convenient to Ottawa, from which very handsome stone can be obtained, and a marble quarry as well. The gentlemen composing the Canadian Granite Company possess the enterprise and business capacity to insure its success. They have shown their wisdom in securing the services of so competent a manager as Mr. P. A. Taylor, under whose supervision the works at Ottawa will be conducted. The polishing mill will be in operation before the end of the month, after which the company will be in a position to turn out monumental and architectural work of all conceivable designs, in granite and marble, and ornamental designs in stone of any description.

ASBESTOS.

The total shipments of asbestos from Canada for the season of 1885 will aggregate 1,400 tons, or thereabouts, and the prices received for the various grades have been very encouraging to mine owners. The principal operators have been King Brothers, the Johnson Company, Ward Brothers, Lionais & Company, Boston Asbestos Packing Company, and Irwin & Hopper. In the October number of the REVIEW the name of Kennedy & Co., was mentioned, by mistake, among the mine owners of the district. Mr. Kennedy is employed as manager of the mine owned by Messrs. Irwin & Hopper, of Montreal. The quality of asbestos from the mines in Coleraine, Thetford and Broughton is of a quality that is not excelled in any part of the world. We have recently seen blocks of the mineral of the very finest quality, from the Eastern Townships mines, some of which weighed nearly two hundred pounds, with the fibre not less than four inches in length. Those who are engaged in the asbestos mining industry express themselves well satisfied with the result of the past season's operations.

An asbestos mine exists on the spur of a hill about two miles from Gundagai, New South Wales, in which the lode has been driven upon for a distance of ninety feet, and a shaft 100 feet deep has also been sunk. The mineral occurs in a serpentine formation similar to quartz veins, and is mined in the same manner. The material is very abundant and is stated to be of as good quality as any in the world. The shareholders have started an asbestos manufactory, in which they propose to work up asbestos for various purposes, among others for the manufacture of a fire-proof paint. On the same property another class of asbestos has been discovered and worked in connection with gold. The lode is peculiar in character, and with one

or two minor exceptions is almost identical with the famous Lucknow lode, which has proved so rich in gold.

A NEW USE FOR ASBESTOS.—In the processes connected with the dyeing and printing of cotton cloth it is frequently necessary to hang the fabric in loops from parallel rods for the purpose of exposure to steam, air or ammonia. In order that the cloth should hold upon the rods without slipping or being strained, it is necessary to wind rope or strips of cloth around the rods; but this only mitigates the difficulty without accomplishing its removal; for the heat and corrosive action of the vapors rot any covering in a few weeks, and the first notice of any deterioration is generally the appearance of small pieces of roll covering among the cloth in process of finishing. Recently asbestos rope and asbestos cloth have been used for this purpose and prove to be very durable. Larger ropes of this refractory material have been used for the transmission of power over places exposed to heat.

MINERAL WOOL.—This material is nothing more nor less than the slag of blast furnaces converted into a fibrous state and, in appearance, resembles the fibres of fleecy wool or cotton, and for this reason it has been given the names of *mineral wool* and *silicate cotton*. It possesses excellent non-conducting qualities and is well adapted for all practical purposes to retain or exclude heat in connection with steam boilers, pipes or refrigerators, and is also useful as an incombustible lining or protection in cases which admit of its application. In many of the uses to which it is applied *mineral wool* serves the same purpose as asbestos, but does not possess some of the properties which make this latter mineral so valuable for the great variety of uses to which it is adapted.

In the next issue of the REVIEW will appear a description of the methods employed in the manufacture of *mineral wool* and more particulars as to the character of the article itself.

NOVA SCOTIA'S GOLD MINES.

By EDWIN GILPIN, A.M., F.R.S., F.R.S.C.

Read before the Halifax Meeting of the American Institute of Mining Engineers, Sept, 16th.

It has fallen to my lot on this occasion to endeavor to convey to your Institute an idea of our gold fields. I can assure you that I am quite sensible of the well capped apex of a smile when I speak of an annual production of gold valued at \$300,000 to an Institute whose members dig and refine annually over \$30,000,000 of the precious metal. But possibly before you leave us you will endorse the golden forecasts of our politicians and revivalists, and not only express yourselves in the words of one of your most eminent financiers that "there are millions in it," but also show us how to carry on our mining more profitable.

OUR GOLD FIELDS

stretch along the Atlantic shore of the province from Yarmouth to the Strait of Canso, a distance of over 200 miles, and is in some places forty miles wide. The country underlain by the auriferous strata and associated rocks is rough, and generally unfitted for farming, so that it is comparatively unexplored. The Geological Survey has begun to map out the district, but several years must be spent before a complete survey can be made. It is therefore difficult to give any exact estimate of the number of square miles underlain by the auriferous

measures. The total area has been estimated at from 6,000 to 7,000 square miles, about one-half of which is occupied by "granite." The exact age of these measures has long been a vexed question among the provincial geologists, and is perhaps not yet positively settled. They may be roughly divided into two sections. The upper one is composed principally of black slates, frequently pyritiferous, with beds of quartzite and veins of quartz. The lower section is made up of alternating beds of quartzites, fine and coarse and frequently feldspathic, and gray and bluish black slates, sometimes magnesian, and holds numerous veins of quartz. The thickness of the upper section has been estimated at 3,000 feet, and that of the lower section at 9,000 feet. The veins in the upper section, though frequently auriferous, have not yet proved of economic value. The following opinions as to their age are those advanced by Sir William Dawson, and appear, in the opinion of the writer, to be based on the only available data:—

CAMBRIAN.

England.	Nova Scotia and New Brunswick.
Tremadoc slates and Lingula Flags.	Mira and St. Andrews series in Cape Breton.
Menevian series.	Acadian series, St. John, N.B.
Longmynd series.	Acadian series, St. John, N.B.
Harlech grits and Llauberis slates.	Quartzites and slates of the Atlantic coast of Nova Scotia.

THE ACADIAN SERIES

of St. John, New Brunswick, so carefully examined by Professor Hartt, forms with its well characterised fauna the typical representative on the western continent of the formation known in England as the menenan of Barandé's etage C, of the primordial in Bohemia. The Atlantic coast series of Nova Scotia, with the two divisions of quartzites and clay slates so divided from the respective predominance in each of the rocks named, are considered by Sir William Dawson, Dr. Selwyn and Professor Hynd to precede these. It is to be regretted that hitherto the light thrown on the subject by fossil evidence has been of the most meagre kind. Dr. Selwyn has recognised in the Lunenburg slates markings of the nature of these named in Sweden, *Eophyton*. Sir William Dawson, however, considers them the trails of aquatic animals named by him *Rhabdichnites*, which are characteristic of the Acadian series. Professor Hynd discovered at Waverley nodular bodies and markings, which Mr. Billings referred with doubt to the genus *Eospongia* and casts of orthis. Dr. Dawson states that they may be compared with the problematical object from the Eophyton sandstone of Sweden, described by Linnarson under the name of *Astylospongia Rudrata*, but considers them fucoids with radiating fronds, and allied in form to Hall's *Phytopsis* from the birdseye limestone, or to Linnarson's *Scotolithus* from the Eophyton sandstone, and has given them the name of *Astropolithon*.

THE ONLY OTHER FOSSIL FORMS

observed are tubes from St. Mary's river resembling scolithus. So far as the above fossils give any information, they serve to confirm the supposition that the measures in question are to be referred to the Cambrian period. Within that period the fossils may be compared with those of the Fucoidal or Eophyton sandstones of Sweden, which underlie the equivalent of the Acadian series. They may, therefore, be regarded as probable equivalents of the Lower Cambrian or longmynd series of Europe. The "granite" rocks extend in irregular patches and belts throughout all the gold fields. So far as they have been studied in their relation to the auriferous and newer strata they appear to be intrusive masses. At Cochran's Hill, in the Sherbrooke district, the auriferous measures close to the granite are penetrated by veins of

granite from one inch to six feet in thickness, and have become highly metamorphosed. Sir William Dawson similarly describes the granite of Nictaux as altering the Devonian beds and converting them for a short distance away from the junction into gneissoid rocks holding garnets.

THE NOVA SCOTIA GRANITE

has all the characteristics of a plutonic rock in its want of stratification, its frequent porphyritic appearance, its passage into graphic granite, etc., and closely resembles in lithological characters the intrinsic granites of the eastern townships of Quebec and of New England, some of which belong to the Montalban series of Dr. Hunt, while others are later than the Upper Silurian; and it differs materially from the typical Laurentian of Canada. In the latter the gneiss is usually hornblende, laminated and interstratified with diorites, pyroxene rock, limestone, serpentine, etc. The granites are older than the oriskany sandstone which they penetrate and alter at Nictaux. The auriferous strata are now presented to the miner in a series of undulations having a general east and west course roughly parallel to the trend of the shore. Wherever the anticlinal crests have been severely denuded, the upper division being swept away, the beds of the lower section are presented in concentric layers, forming four elliptical curves with north and south dips. In some cases the movement has caused an overturn and northerly dips only are seen. These denuded crests are sometimes two miles in width and several miles long. In these strata and pursuing a course parallel to them are found the veins, more particularly the subject of this paper. At the first glance they seem to be contemporaneous beds of quartz, and were so considered for some time. They, however, present the characteristics of veins such as "horses," country rock inclusions, banded structure, etc. In addition, feeders frequently radiate from them and connect two or more veins, and the veins themselves break across from bed to bed. I presume that we are to look to the forces which produced the great folds for

THE ORIGIN OF THE SPACES

now filled with quartz. The action which introduced the quartz possibly partook of the nature of a leaching out of the metallic constituents of the surrounding beds, and this idea is supported by the fact that the richness of the veins is frequently seen to be connected with the contact of feeders or cross veins which cut the enclosing strata. The forces producing the great east and west folds, and possibly incidentally forming the spaces for the veins, were succeeded by numerous other disturbances. The effects of these are now chiefly shown in dislocations varying in amount up to many hundreds of feet both along and across the run of the strata and enclosed veins. These faults when running across the country rocks some times present large fissure veins frequently auriferous; and in the openings they make parallel to the measures are found false veins also sometimes auriferous, and frequently affecting the gold values of the veins they impinge upon. The exact date of the vein filling cannot now be determined. It may be said that it preceded the carboniferous period, for at Gay's River, in the county of Halifax, the lower carboniferous conglomerate (the basal rock of the carboniferous system) resting on slates, generally considered to represent the auriferous strata, carries water work gold.

A PARALLEL OF MODERN DATE

is now presented near Lunenburg, where the waves of the Atlantic are breaking up the

slates and concentrating the gold on the beach. In this connection it may be remarked that we have no regular alluvial workings. The surface soil of several of the gold districts is in my opinion quite rich enough to work, by sluicing and crushing. Several old river courses, and the brooks flowing from the gold districts, deserve exploration in a systematic manner, especially where they form small lakes or 'still waters.' The veins worked in this province vary in width from one-half an inch to six feet, the most common thickness being from four to six inches. The quartz is usually crystalline and fairly friable, but also oily and compact. The gold occurs in coarse sights and in minute grains and films in the associated pyrites. The miners rarely crush quartz unless it shows free gold. The minerals associated with gold are iron pyrites; mispickite, galena, copper sulphides and blends. Calcspar is also found, but in some cases it has been observed that the gold diminishes as the proportion of spar increases. Galena and copper pyrites are considered by many miners to hold out the best promise of economic amounts of gold. The veins afford many good examples of chimneys or pay streaks. It is to be regretted that no pains have ever been taken to map out these pay streaks, in order to gain information which might show some rule governing their mode of occurrence and extent. Their width, dip and downward extension are of the most varied form, and we have yet no rule beyond the caprice of the miner's goddess to disclose a clue to their whereabouts.

THE GREATEST DEPTH OF A PAY STREAK

that has been worked here is 600 feet, and a horizontal length of 300 feet may be considered a maximum. No attempt has yet been made to sink below an exhausted pay streak; although the fact of more than one having been observed at the surface in the same vein would show that the conditions favoring their deposition were not isolated. It is to be regretted that no attempts have been made to find out if such ore bodies do come in again at a lower level—for in many cases the pay streaks have become exhausted before a depth of 200 feet was reached. This problem once answered in the affirmative, there would be an inducement held out to more systematic mining—and fewer abandoned shafts and crumbling mills would dot the landscape. In several districts a zone from 300 to 900 feet wide has been observed extending across the general run of the measures. The veins in this zone do not appear to be affected in their gold values, but the enclosing slate and the irregular feeders found in them carry gold in amounts as high as 9 dwts to the ton. Several times considerable quantities of these low grade ores have been profitably crushed in small mills of 8 to 20 stamps, but

NO SYSTEMATIC ATTEMPT

has yet been made to work them on a large scale, and as a regular operation. In the opinion of many persons acquainted with our gold fields these low grade belts are well worth attention, and they consider that in the future they will prove highly profitable. In most of the gold districts the presence of valuable veins is indicated by surface boulders of auriferous quartz, and the labor of the prospector is frequently lessened by following them to the north along the course of the striation of the rocks. The boulders are carried various distances up to 1,800 feet, and in some instances the strike on the underlying rocks pointed like an arrow to the portion of the vein which yielded them to nature's great plough. The extent of the transportation of the quartz

boulders is limited and strongly marked, for outside the narrow belt lying south of a system of auriferous veins hours of search will fail to show a boulder yielding a sight of gold. Some years ago in a paper read before the North of England Mining Institute I drew attention to this local transportation and to its presence side by side with a more extensive system. At numerous localities through the auriferous district of the province are met hills and mounds having a general north and south course, and made up of clay mixed with gravel and boulders of every size and degree of attrition. Many of the boulders can be traced to the granitic ranges, often several miles distant, and the fragments of carboniferous and of later traps, and of sandstones resembling none now known here in measures older than the carboniferous, must have been carried over a far greater interval. These hills have been observed surrounded by and merging into the districts already alluded to as distinguished by auriferous veins and a detritus carried but a few yards. If the reason for this varying cover is to be sought for in a single cause, there must first have been in the district under consideration conditions permitting the deposition of material derived from distant sources, the principal condition being a depth of water; then with a rising land the impact of ice would give stirring and limited transportation; or else a more or less general covering derived from distant sources has, through a change of level, been subjected to a force gouging through it, and scattering fragments and masses of quartz and rock on the line of its impact. As I am afraid I have trespassed already too much on your time I will merely refer to

THE MINING AND MILLING SYSTEMS

of our gold fields. There is little novel about them, and they may, speaking generally, be described as rough and ready methods adapted to small veins and a corresponding capital. The shafts are invariably sunk on veins which dip at all angles, from 45° to the perpendicular; stopes are started at all depths and carried direct from the shaft, underhand, in steps, and part of the rock stowed on following scaffolds. Usually the vein is left standing on one side of the slope, and is taken down in lots of several tons at one operation. By this plan the ore is kept separated from the dead rock, and is less exposed to handling, an important item in coarse gold ores. Shafts are left at scaffold ends at frequent intervals, and through them the hoisting and pumping is done by every imaginative device an ingenious man can invent. Few shafts exceed 200 feet in depth, and the workings seldom extend much beyond the pay-streak. The mills claim no striking originality in pattern; one of the best in the province was built by Messrs. Fraser & Chalmers, of Chicago. The milling merits no particular notice, the dependence being on the amalgamation in the batteries by free mercury, lining plates not being used. Copper aprons and plates are amalgamated by hand, and many miners consider them better than any so called 'patent' arrangements. Exact figures of the amount of gold saved cannot be given. About 15 per cent. of the free gold is lost, and little of the gold held in the sulphides, etc., is saved. The amount of the sulphides, etc., varies from one to 60 per cent. in the quartz veins, and their gold values sometimes run \$4,000 to the ton, but I presume that from \$40 to \$50 would represent their average value. A few small lots have been concentrated and shipped to Swansea, but the problem of the tailings has not yet been solved in Nova Scotia.

THE COST OF MINING VARIES GREATLY

per ton with the hardness of the encasing rock and the size of the vein. It may be put down at 50 to 70 cents for the open cast low grade workings, and from 95 cents in narrow slate belts up to \$15 in narrow veins. The value of the ore crushed varies from 3 dwts. to 4½ ounces per ton; the average annual value has fluctuated between 10 dwts. and 1 oz. 2 dwts.; the total amount crushed since the year 1862 is, from official returns, 495,923 tons, yielding 366,976 ounces, an average value of about 14 dwts. In conclusion, I may remark that the gold ores are the property of the crown, and are leased for revenue purposes. The areas are 150 by 250 feet in size, and any number can be leased on payment of a fee for the execution of the papers. The royalty is at the rate of 2 per cent. on the gold, valued at \$18 an ounce, and is paid by the mill owner, who is obliged to take out a license and to make regular return of his work to the Mines' Department. The areas are bounded by vertical lines, and laid out as nearly as possible along the general course of the veins of the locality they are applied for. Attempts have been made to substitute the apex law, and other well proved distinguishing marks of the American mining law, but the department cling tenaciously to their old methods, and think there can be few changes except for the worse.

The Nova Scotia meeting was a memorable one, and, with the exception of the Colorado meeting, probably the largest, as it was one of the most agreeable, in the history of the Institute.

Tests of Coxheath (N.S.) Copper Ore.

"Coxheath," in a letter to *E. and M. Journal* of a recent date says:—

"Some ten tons or more of ore from the Coxheath mine, of Cape Breton, owned by the Eastern Development Company, were smelted at the Bay State Smelting and Refining Works, in East Boston, on the 6th and 7th of October.

The ore, which is reported to be the average run of the mine, consists of copper pyrites in a silicious gangue, accompanied by a small percentage of iron pyrites, and assayed between six and seven per cent. But the peculiar interest of the test arises from the fact that both the fuel and flux, consisting, respectively, of coke and limestone and iron ore, were all brought from Cape Breton, being the same as would be used in smelting on the spot.

The run was made under the management of Dr. E. D. Peters, in a blast furnace belonging to the works, and produced a *matte* assaying about 38 per cent. of copper, while the slag carried less than one-third of one per cent. of that metal. The present aspect of the copper market offers little encouragement for the development of new copper enterprises; but with coke at 75c. a ton, and labor and fluxes at very low prices, it certainly seems that copper can be produced about as cheaply at Cape Breton as at any place on the continent, provided the quality and quantity of the ore supply are satisfactory.

Dr. Peters reports the *matte* free from all deleterious substances and certain to make copper of excellent quality.

Quite a number of Boston gentlemen interested in copper matters visited the works during the two days' run of the little cupola-furnace and expressed much satisfaction at seeing such

a fair test of the quality of the coke and the suitability of the fluxes."

If the quality and quantity of the ore supply is satisfactory, and the developments at the *Coxheath* mine prove that it can be relied on, it would appear that everything is favorable to the successful and profitable production of copper in Cape Breton.

EL CALLAO.

This South American gold mine for the eight months ended with August, 1885, has shipped gold to its London bankers and paid monthly dividends as follows:

	Product.	Dividends.
January	\$166,000	\$103,000
February	175,000	103,000
March	150,000	64,000
April	175,000	77,000
May	135,000	51,000
June	150,000	64,000
July	208,000	77,000
August	205,000	77,000
Totals.....	\$1,559,000	\$616,000

EL CALLAO, in the State of Guayana, in the Republic of Venezuela, is assuredly the most productive gold quartz mine in the world. Its product between 1875 to 31st December, 1884, amounted to \$10,526,000. Last year the value of the gold shipped to London was reported by its bankers at \$3,475,000, and this year, to include August, as will be seen by the above statement, the shipments have been valued at \$1,559,000. From 1879 to 1881 the average yield of gold was three ounces per ton of quartz milled; in 1882 it was 4½ ounces; in 1883 six ounces; and in 1884 as high as seven ounces. Of course, such a mine has paid handsome dividends upon 32,000 shares into which the property is subdivided. Last year the dividends aggregated \$1,932,000, or \$8.60 per share.

Another productive quartz mine in the same field, says the *Financial and Mining Record*, in a recent article, "Venezuela as a future source of gold supply," is the Chili, also the Potosi, the Nacupai and the Venezuela, Panama, which four properties employ 190 stamps, though, assuredly, not to such profit as El Callao, but in the aggregate have produced in 1884 \$1,150,000. One great drawback is the remoteness of this promising gold field. As described by an English Australian miner who has recently visited them:

"They are situated on the south bank of the Oronoco river, about 250 miles up from the English island of Trinidad, and 130 miles inland from the landing place. As the crow flies they are about 300 miles from Trinidad, and about 130 miles from Demerara; yet the bad policy of their Government compels you to travel nearly 600 miles from Trinidad to reach the fields. The first and nearest port on the river to the gold fields is Las Tablas; the steamer stops here four hours to land mail and take in passengers, but passengers going to the gold fields are not allowed to land there. The Government and their confederates (the shopkeepers) must first pick and fleece them all they can by compelling them to go 100 miles further up the river to the old Spanish town of Angustora, Bolivar. Then they must purchase another passport and pay another passage down the river to Las Tablas. From this place to the fields the road is good and very level nearly the whole distance (130 miles), yet you are charged from \$250 to \$300 per ton for freight. I came down the whole distance in a two-mule cart in 28 hours. There are about 7,000 people on this field; 6,000 of them are the native race of the

West Indies, and about 1,000 Corsicans and Germans. The whole of the mining work on this field is done by colored people. The miners get 4 pesos per day of six and eight hours, which is \$3.30 of American money."

The same miner remained at the mine, he states, for three months and examined it thoroughly in all directions, finding scores of quartz veins that had never been prospected; also many alluvial tracts formerly worked but left idle at present owing to the high wages given by the working companies which take up all the good labor, for the natives will not work. We also append the prices of food which he gives: tea, \$2 per pound, sugar 50 cents, butter \$1, cheese 75 cents, ham 75 cents, beef 16 cents, and bread 31 cents per pound, \$20 per barrel of 65 lbs.; salt pork \$20 per barrel of 65 lbs. Bass' ale \$1 per bottle and brandy \$2.50. Indian corn 25 cents per quart, and clothing 300 per cent. dearer than in England. He adds:

"After all I have seen of this field I think it will yet prove itself to be one of the richest and most extensive gold fields in the world. There seems to be no end to the reefs in these mountains; but the Government must try to be a little more liberal to the capitalists who are willing to risk their capital to develop the gold mines of Venezuela. At the El Callao mine there is a strong detective force traveling around the mine night and day, underground and at surface, each one having a revolver slung round his neck."

GOLD VEINS IN WALES.

Mr. W. Lewis, in a recent letter to the *Financial and Mining Record*, says:—"There are many in this country not aware that there are any gold mines in Wales, or that the Welsh people have had experience in gold mining in their native country."

As one who was there for years as second superintendent in charge of one of the leading gold mines in Merionethshire I can testify that I have seen as rich ore taken out there as any I have seen in America.

When I left for this country, in 1863, the following mines were in operation and producing well:—

The Vickre & Clogan mine was considered the first on the list; it has been worked more extensively than any of the others. The vein was quartziferous, containing small amount of bismuth, galena, and bi-sulphuret of iron, and varied in width from two to four feet—product about 15 dwts. of gold to the ton, although some of the ore was much richer than was selected and treated in amalgamating pans, on small scale the result from these pans was astonishing. The Cambrian mine was in full bloom. The ore of the Prince of Wales mine was more refractory than the commoner of the veins there; but as they concentrated the tailings and shipped it to Swansea, the mine paid handsomely for years. The Foel and Cefn Coch were also in operation, and several small mines in the Gamlwyd are working with good results and the reports from Gwynfynydd were very flattering.

The formation of the country that these auriferous veins traverse is the silurian rock, which is very fossiliferous in some parts there. The Cambrian group also makes its appearance on the northeast boundary of the silurian."

The Russian papers confirm the statement that gold has been discovered on the Chinese side of the Amoor, and thousands of Siberian gold-diggers have gone to the spot.

GOLD MINING IN MICHIGAN.

Announcement was recently made of the discovery of a vein of gold-bearing sugar quartz on section 35, town 48, range 28 west, Michigan. The property on which the discovery has been made belongs to the Lake Superior Iron Company. The correspondent of the *Detroit Free Press* says that this gold boom is no heedless clamor of inexperienced men. The men who are backing it are miners of experience. Assays have been made which show well. Average pieces taken from among the best specimens gave \$8,965 in gold and silver, nearly all being gold. These choice specimens varied in weight from six ounces to as many pounds, and this was their average value. The second assay was made from the leanest piece of quartz which could be found in the rock taken from the vein. In this there was no free gold visible to the naked eye or distinguishable with the aid of an ordinary prospector's pocket glass. It gave \$62.64 to the ton, nearly all in gold also. It is stated that a vein of this quartz four feet wide has already been traced over 700 feet.

VICTORIA (Australia) GOLD FIELD.

The yield of this field is officially reported for the second quarter of 1885 at 185,037 ozs. 15 dwts. 10 grs. as against 192,438 ozs. 11 dwts. 15 grs. for the March quarter, and making the half year's product 377,476 ozs. 7 dwts. 1 gr. The product for the half year may be set down at \$5,549,000.

The gold yield of Victoria continues to decrease, that for the quarter ended June 30th being less than the corresponding quarter of any year since 1876. The decrease is chiefly in alluvial mines. The yield is increasing in quartz mining and great depths have been reached—Lansell's 180 mine, Sandhurst, having attained a depth of 2,041 feet, the deepest shaft in the colony.

The quantity of quartz crushed during the last quarter reported above, was 211,643.3 tons, averaging 10 dwts. 8-9 grs. in gold per ton. No district averaged as much as one ounce per ton, and the lowest average for a large quantity was 7 dwts. 10-9 grs.; in the Ararat district 8,586 tons averaged but 4 dwts. 9-4 grs. The pyrites and blanketings treated amounted to 1,509 tons, with an average yield of 2 ozs. 1 dwt. 15-78 grs. per ton; and 8,785 tons of quartz tailings and "Mullock" yielded but 1 dwt. 11-88 grs. per ton.

The official reports show that the gold mining industry is not in a booming condition, though no less than £189,059 19s. 4d. were paid in dividends during the quarter ended June 30th, which means that about \$5 were paid in dividends for each ounce of gold produced, or 25 per cent of the gross product—a creditable showing on ores yielding as low as \$10 per ton.

QUEENSLAND (Australia).

Two quartz mining districts of this part of Australia, produced for the seven months ended July 31st, 1885, as follows:—

	Ounces.	Value.
Charters Towers.....	77,422	\$1,548,000
Gympie.....	50,182	1,003,000
Totals.....	127,604	\$2,551,000

THE GREAT NORWEGIAN GOLD-BEARING QUARTZ VEIN.—In one of the galleries of the *Oscar* gold mine, on the Bömnel Island, on the west coast of Norway, a block of auriferous quartz was recently broken out, the value of which is estimated at £70,000. The deposit has now been worked for a year and a half, and the working has, according to the reports of the

owners, already returned the sum invested. The work is pushed on with all dispatch, and it has been found that the quartz increases in gold downward.

The Gold Product of the World.

The world's production of gold for the year 1884 is estimated, in round numbers, by the *Financial and Mining Record*, as follows:

United States.....	\$25,500,000
Russia.....	18,000,000
Australia.....	24,500,000
Venezuela.....	4,400,000
Columbia.....	3,000,000
Mexico and other Spanish American States.....	1,500,000
Austria and Hungary.....	1,000,000
Africa.....	1,750,000
Canada.....	1,250,000
European States.....	500,000
Japan and Brazil.....	850,000
Total.....	\$82,250,000

As for the consumption of gold in the industrial arts alone, during the last nine years, it has averaged annually, at least, \$60,000,000, as a little investigation must show. The director of U. S. mints in his last annual report placed the amount of gold consumed during 1883, by India (\$18,965,635), the United States (\$13,000,000), France (\$11,000,000) and Great Britain (\$10,000,000) at \$52,965,635, out of a total gold production for that same year that did not exceed \$86,000,000.

The Way Mines are Sold in England.

It will be interesting to our readers to know to what extent swindling has attained in connection with the sale of mining properties to English capitalists, and the *modus operandi* employed by the professional manipulators to dispose of worthless properties at fabulous prices, or to effect sales of mines at figures that are out of all proportion to their intrinsic value. The *N. Y. Engineering and Mining Journal* makes a praiseworthy effort to enlighten unsuspecting and unsophisticated investors by publishing the following:

"The process by which the public on this side of the Atlantic is inveigled into investing in worthless mining schemes are nefarious enough; but they have not been systematized and codified, so to say, as have been the methods in vogue in England, nor is the formation of public companies here reduced to so exact a science as on the other side.

Among the congressional documents for the year 1876 is a bulky volume that exposes those methods. It contains the history of the sale of the Emma mine in London. This is an old story, but worthy of repetition; for it is constantly re-enacted by different people with only slight differences of detail.

The Emma silver mine, in Utah, had begun to yield profits in 1871, when, as usually happens in the west, claimants to the property at once sprang up to contest the title of the occupants. In the Emma case, litigation ceased on the understanding that the mine should be sold and the profits distributed in stipulated proportions. Mr. Lyon, who claimed a one-third interest, agreed to take \$500,000 for his share. Mr. Trenor W. Park, the largest owner, and Hon. Mr. Stewart, acting as counsel for Lyon, went to London. For some months previous as much ore as the mine could be stripped of had been sent forward and sold in England with as much publicity as possible. Arrived in London, Messrs. Park and Stewart were introduced by a banker, who is always a prominent member of such bands of conspirators, to Messrs. Coates and Hankey, brokers. The terms of the plot—for it can hardly be called

a sale—were now arranged; but Messrs. Coates and Hankey, being too weak to carry them out, resigned in favor of Albert Grant, the most astute company-monger of the age.

When once a broker undertakes a job of this nature, he becomes arch-conspirator. Vendors and all others are expected either to be quiescent or to obey his injunctions, and to say and do, without question or compunction, what he commands. The broker finds directors, concocts the prospectus, fees newspapers, manipulates the stock, and generally, as *deus ex machina*, makes what is worthless appear as of untold value, and a swindling extortion looks like a generous gift to the public. When, however, a man as notable or notorious as Baron Grant is secured, he never appears upon the stage.

In the Emma affair, Grant was fortunate in having the assistance of two such able and skilled operators as Park and Stewart. While he selected names for his long list of available directors (all prominent brokers are supposed to have at command a number of influential directors' familiarly called 'guinea pigs,' including a fair sprinkling of M.P.'s and of needy noblemen, to whom the fees are a consideration and who are too ignorant to be inquisitive), Messrs. Park and Stewart went in search of a man ostensibly to protect the interests of the American shareholders of the company, and by a happy accident they secured the services of the American Minister.

Having selected a strong board of well known men, whom the unwary public supposed to be heavy investors, but who, in fact, besides receiving a salary of £500 a year each, had been duly qualified by a donation of stock, the prospectus was issued. The property, which by transactions among themselves the sellers had valued at \$1,500,000, was offered at \$5,000,000. A dividend of $1\frac{1}{2}$ per cent. a month, equal to 18 per cent. on the capital, was guaranteed, and was to be paid out of resources on hand and out of ore in sight, said to be of the net value £357,750. The public, however, were not informed that of the £1,000,000 they were asked to give for the mine, Baron Grant, of whom they had never heard in that connection, was to get, as his fee, almost as much as the mine was deemed by the vendors to be really worth; that the lawyers, who drew up the prospectus so cunningly that the public would have no redress when they should discover themselves swindled, were to receive a comfortable fortune; and that the bankers, who had merely introduced Messrs. Park and Stewart to Messrs. Coates and Hankey, were to have what would serve many a small banking firm as capital; that the brokers who had been too weak to engineer the scheme should receive, nevertheless, a consideration for handing it over to the baron; and that even the metal brokers who had previously sold the ore on a good commission were to be richly recompensed for the loss they might sustain should they not continue to be employed by the new organization. These and other equally significant facts were kept carefully concealed; the public rushed to subscribe, and the amount demanded was offered twice over.

The subsequent history of the mine is curious. Although the public paid £1,000,000 for it, not a farthing was reserved for working capital. The mine was productive when purchased, and the ore on hand was sold with the mine. Enough, therefore, was extracted to pay working expenses and twelve $1\frac{1}{2}$ per cent. dividends. A thirteenth was paid, but the amount was borrowed from Mr. Park on the security of the ore in transit. The ore did not cover the advances, and the company remained in debt to Mr. Park. There being no more productive

ground within reach, and no money wherewith to make explorations, mining was stopped and litigation begun, for which stockholders were willing to furnish the means, though they had declined subscribing a penny for exploratory work in a mine that had apparently yielded £180,000 profit in a twelvemonth.

When such large sums are realized with so little labor, of course the broker can afford to be liberal, and to throw about thousands of pounds more lavishly than most men would their pennies. Thousands are used to bribe newspapers, a fact proved in a court of justice to the disgrace of British journalism; bankers are paid to lend their names; brokers in all parts of the kingdom are paid to make fictitious bids for the stock; men in the highest standing in the community are paid to serve on the board; and when the trap to catch the public has by such means been well baited, prospectuses are showered over the kingdom by hundreds of thousands, and are supplemented by special articles of leading newspapers. One copy is sure to reach every widow with a small income, and every needy clergyman. Both these classes being pinched for means and credulous, are liable to be tempted to buy shares. The broker counts that among so many hundred thousands there is sure to be a given proportion of fools who will be duped; therefore the more dubious the speculation, the greater the number of prospectuses, and the more extravagant the promises.

Carlyle classified the population of Great Britain as 'forty million, mostly fools,' but the great English promoters have graded the British fools according to degrees of gullibility. They have in their offices bookcases filled with bound volumes containing a directory of the whole kingdom, every possible subscriber, male or female, taking rank either in a small upper class *a*, if possessed of both wealth and penetration, or in one of the large lower classes, *b*, *c*, etc., which comprise the credulous and needy. A very small edition of a prospectus privately issued to class *a*, offering a sound investment, insures its acceptance. But an issue of half a million prospectuses, bulky as a volume, may be necessary to catch enough credulous subscribers of small sums to yield the grand total. Thousands and thousands of dollars are spent on printing and postage. The risk is therefore great, but the stakes are heavy.

There can be little doubt but that this system of raising joint-stock companies and afterward so manipulating them as to conceal the fraud, to which all concerned have been knowingly or inadvertently parties, has done more than anything else to corrupt commercial morality in England. The chief conspirator, the broker, may be the chief criminal; but the man who bonds to him knowing that he will use his property to perpetrate a fraud, is not innocent; the director who accepts qualification shares, which he is supposed to have paid for, or who sells or lends his name to be used to assist in floating an enterprise on more or less false or fraudulent statements, of the character of which he is aware or even willingly ignorant, is an accomplice to a swindle, whatever his title may be.

Even if the property be intrinsically good, when sold above its value and all the money subscribed has been grabbed by the broker and his satellites, so that little or nothing is left to develop its resources, it may become unprofitable; while if it prove valueless, a stigma attaches, not only to those who sold it, but to the whole community where it is situated.

This is an outline of the manner in which a vast number of mining properties situated in all parts of the world have been sold in London,

and the English palate has become so accustomed to these highly seasoned prospectuses, lies and exaggerations that it is said, by those who are well informed on the subject, to be almost impossible to sell a mine in London at a fair and honest valuation. Under these conditions, it is not at all strange that English investors in mines, for the most part, lose their money; it is almost a miracle when, through extraordinary richness, the mine withstands this method of floating and the additional load of the usual English management sent out by such a company, and pays a fair return to its stockholders."

MINING NOTES.

NOVA SCOTIA.

The Oxford Gold Mining Company has declared a dividend of two cents per share.

At the last cleaning up at the Cowan mine, Yarmouth, 9 tons of quartz produced 53 ounces of gold.

The discovery of a valuable seam of coal on the banks of Salt Spring Brook, near London-derry, is reported.

Advices from Boston are to the effect that public confidence in Nova Scotia mining enterprises is fast being restored.

A New York firm has purchased a manganese property in Colchester County, near Truro, and will proceed at once to develop it.

The output of coal at Spring Hill, for the week ended the 10th October, was 330,000 tons, the largest on record in Nova Scotia.

It is reported that rich gold bearing leads have been discovered near Calidonia, which may prove to be as important as any in the province.

It is not unlikely that the Renfrew Gold Mining Company will declare a dividend in November, but no mention has been made of the amount.

The final clean-up at the New Albion Gold Mine, for September, produced another bar of gold, making the total product for the month 1,369 ounces.

An argentiferous galena deposit discovered at Ohio, Antigonish county, will be developed by a syndicate composed principally of gentlemen of New Glasgow.

New steam-hoisting gear has been added to the machinery at the *Albion* mines, Montague. The owners of this property, during the month of September, netted a profit of \$21,000.

Coal miners in Nova Scotia have arrived at the conclusion that the Government will have to forego the royalty which is proving too serious a tax on the coal mining industry.

A subscriber to *The Critic* reports to that paper that the largest and most promising gold-bearing quartz vein ever discovered in the province has been uncovered in the Gold River District.

Some specimens of copper taken from a mining property on the Granville side of Digby Gut, Annapolis county, by Prof. Ken-

nedy of King's college, have proved, by analysis, to be rich in copper.

The September yield of the Archibald and Motts gold mine was \$8,000. The lead extends nearly two miles and is two feet wide, seven hundred feet of which has been opened, and it is found that the vein improves in richness and width in descending. One hundred men are employed.

The Block-house Coal Mine at Cow Bay, Cape Breton, was to have been sold on 28th October, for non-payment of \$12,000 taxes due the Government. The total liabilities of the mine are said to be about \$200,000, and the value of the property has been estimated at \$400,000.

In the Supreme Criminal Court at Halifax, in the trial of Smith & McLeod, for "salting" a gold mine at Chezzetcook, which they afterwards sold to a company formed in New York for a good price, the jury, on the 17th October, rendered a verdict of guilty. An appeal will probably be made, and meanwhile, McLeod and Smith have been admitted to \$6,000 bail.

The Acadia Coal Company, the Halifax Company (Limited), and the Vale Coal, Iron and Manufacturing Company, whose principal offices are respectively in New York, London and Montreal, consolidated on the 16th October, at a meeting of the different managers held in New York, and will be operated from Nov. 1st under a temporary board of directors. The Intercolonial Coal Mining Company has been asked to enter the syndicate and will probably do so. The scheme was inaugurated by Sir George Elliott.

The annual meeting of the Cumberland Railroad and Coal Company was held in Montreal last month, at which the following directors were elected: John McDougall, G. A. Drummond, R. Cowans, R. G. Leckie, L. A. Senical, D. Morrice, J. S. Clauston, James Corssen, C. C. Colby, M.P., Stanstead, and J. B. Renaud. At the subsequent meeting of the directors, officers were appointed as follows: John McDougall, President; R. Cowans, Vice-President; R. G. Leckie, Managing Director; J. R. Cowan, Secretary.

NEW BRUNSWICK.

The Markhamville Manganese Company has made a shipment of two hundred tons of ore to Liverpool.

A company is being formed at Dorchester to mine and reduce copper, gold and silver ores and minerals, with a capital of \$500,000.

QUEBEC.

The Phosphate mines of the Lièvre district, Ottawa County, have produced 2,500 tons during the month of October.

Operations for this year will soon cease at the asbestos mines of the Eastern Townships, as mining cannot be successfully continued during the winter months.

Late shipments of mica from the Villeneuve mica mine have surprised some of the dealers who were not aware of the existence in Canada of anything approaching it in quality.

The last day's washing from the St. Onge company's shaft on Slate creek, Beauce, that has been reported to us, produced 9½ ounces of

coarse gold; some of the nuggets weighing from ½ oz. to 1 oz. 12 dwt.

Work has been suspended for some time past at the Bristol iron mine, in the county of Pontiac. The property is owned by the Roberts' Iron Company, of Charlotte, New York State, and the suspension of operations is owing to the death of Mr. Roberts, its President.

St. Onge Gold Mining Company is doing good work on Slate Creek, Beauce, and is washing a large quantity of gold. The gravel that is now raised from this shaft is very rich in coarse gold, and many large nuggets are constantly found. The company, during the past month has been giving attention to the erection of buildings and machinery, and is now fairly equipped for permanent work.

ONTARIO.

The New York gentlemen who had been prospecting a copper location in Drury Township, on the line of the Algoma branch of the Canadian Pacific Railway, have abandoned it and relinquished their lease on the recommendation of their manager who scouted the probability of finding copper in paying quality in the formation of the locality. It is stated that this same manager made application for adjoining locations and went to not a little trouble before he succeeded in securing one. It is not unlikely he will now change his opinion of the geological features of the district. Those who know whereof they speak pronounce this abandoned location to be a most promising property and one that would develop into a valuable copper mine in the hands of competent miners.

Thunder Bay District.

Port Arthur District has made its first shipment of marble for monumental purposes.

It is expected that a shipment of ore will be made from the *Silver Creek* mine before the close of navigation.

Last month a consignment of machinery was shipped to the Rabbit mountain mine and work will be immediately started on ore.

Machinery necessary for further development of the Silver Mountain mine has been ordered. Cross-cutting is still progressing at this mine, and work in the tunnel is going on favorably.

E. N. Riotte, manager of the New York Metallurgical Works, with other gentlemen, visited the Port Arthur silver region during last month. Mr. Riotte is interested in a location at the west end of Silver mountain.

The *Huronian* gold mine is working day and night shifts and the mill is doing good work. The ore in both levels from the original shaft, and that from the shaft started on the recently discovered vein, is averaging an ounce of gold to the ton and a fair quantity of silver.

One of the Cleveland company engaged in testing the Silver Mountain mine arrived in Port Arthur from the mine last month and reported that the new strike in the lower tunnel of the Beaver mine is rich in silver. At this mine they are working three shafts and making good progress.

BRITISH COLUMBIA.

Williams Creek, Cariboo District, afforded as rich gold-diggings as any in the world, and yielded \$45,000,000 in gold from its bed and banks.

The news from Lorne Creek mines is very discouraging, and miners are leaving the diggings in numbers, being thoroughly disheartened.

Rich specimens of gold-bearing quartz have been found in the Semilkameen district, and iron ore has been discovered a few miles off the Hope trail.

The Tularmen river, in the vicinity of Granite Creek, embracing an area of about 50 square miles is being explored, and is thought by practical miners to hold out encouraging prospects.

A new creek has been struck in the Semilkameen valley, and it is now known as Bear Creek. It is said to hold out good prospects, and miners are already at work in considerable number.

A correspondent of the *Mainland Guardian* says there is, no doubt, some gold in Granite Creek, but not sufficient to warrant a man in leaving other employment to go to the diggings. Mining is practicable in but a few places and only at very low water.

At Cariboo, in the years 1861-62, provisions could scarcely be had at any price—freight being \$2,000 a ton. It is not strange that with labour at \$16 for an eight hour shift, and flour at \$150 a barrel, few of the many who went to those diggings brought out with them as much as they took in.

There are now upwards of 1,000 men in the Granite Creek district, and contradictory rumors are current as to their prospects. Some Montana miners pronounce the "Granite" the best creek they have ever been on for good, even pay. The gold is obtained by wing-damming the bed of the creek.

The *Island Sentinel* says: The Semilkameen gold fever is spreading, but, while some wonderful stories are printed and crowds are rushing to the diggings, we occasionally see parties coming this way from the Semilkameen. While listening to reports we can hardly reconcile the action of parties leisurely leaving the mines, even for a short time.

The deposits of auriferous black sand on the North Coast of Vancouver are very extensive. If the report from Oregon of the discovery of a method for saving the gold be confirmed, these deposits will become very valuable. Attempts to separate the gold have hitherto proved unprofitable, but it is stated that by this new process 95 per cent. of the gold contained in the sand can be saved.

UNITED STATES.

California, from 1849 to 1861, produced about \$700,000,000 in gold.

During the past thirty-five years the product of gold and silver in the United States alone has been \$2,246,000,000.

\$70,000 in gold, the result of 15 days' work at the Tradwell mine on Douglass Island, Alaska, was forwarded to Victoria, B.C., in September.

The Plymouth Consolidated G. Mining Co., California, paid a dividend on the 5th of October of fifty cents a share, aggregating \$50,000. With that dividend this property will have paid the stockholders \$14.50 per share.

The Calumet and Hecla Mining Company declared a dividend of \$5 a share, or \$500,000 on the capital stock, payable November 2nd. This makes \$17 a share paid this year, and a total of \$28,850,000 divided among the stockholders to date.

The Griffin Pulverizer Company.

This Canadian enterprise was referred to by the *Eureka Sentinel*, Sept. 26, attention being directed to the organization of a company in Montreal, under the above title, in the following paragraph:—

"Some time ago mention was made in these columns of the Griffin pulverizer, a new invention which, if it accomplishes what its owners believe it able to do, and if no unforeseen difficulties are encountered by it when put to work, will prove a great acquisition to the economical working of ores in the West. The patentee is a brother of W. E. Griffin, Wells, Fargo & Co.'s agent at this town. From an exchange we learn a company known as the Griffin Pulverizer Company has been organized, with a capital stock of \$50,000, with headquarters at Montreal, Canada. It is intended to manufacture machinery for the pulverizing of phosphates and ores generally."

In connection with the foregoing the following notice appeared in *The Canada* (official) *Gazette* of November 7th:—

"Public notice is hereby given that, under 'The Canada Joint Stock Companies' Act, 1877,' letters patent have been issued under the great seal of the Dominion of Canada, bearing date the 6th day of November, 1885, incorporating Alexander W. Morris, manufacturer, Robert C. Adams, gentleman, and Chas. B. Morris, gentleman, all of the city and district of Montreal, in the Province of Quebec, in the Dominion of Canada, and Edwin Packard, gentleman, and James R. Griffin, patentee, both of the city of Brooklyn, State of New York, United States of America, for the purpose of the manufacture and sale of machinery for the pulverizing of ores, phosphates, quartz and other hard substances throughout the Dominion of Canada, by the name of 'The Griffin Pulverizer Company,' with a total capital stock of fifty thousand dollars, divided into five hundred shares of one hundred dollars."

"Dated at the office of the Secretary of State of Canada the 6th day of November, 1885."

In the list of incorporators of this company we are pleased to see the name of Robert C. Adams, who is so well and favorably known among operators in the Canadian phosphate industry. The company has our best wishes for a successful career.

A HAND CRUSHER.

A convenient little hand crusher, for use in laboratories, is manufactured in San Francisco. Both jaws are faced with hard white iron, the lower parts of which are plain surfaces, and between them the ore is crushed. An ingenious arrangement of corrugations forces the ore down at each stroke of the lever, and the whole can be quickly taken apart for cleaning after each lot is worked. The lever has a rubber covering where grasped by the hand, and a rubber cushion where it strikes the bed-piece to prevent jar and noise. The height to which the lever can be raised is regulated. The jaws are 3 inches wide and open at the top

1½ inch, consequently, a piece of rock 3 x 1½ inches can be crushed. With the lower part of the jaws set at one-tenth of an inch apart, 40 pounds of the hardest rock can easily be crushed in one hour, and 20 per cent. of this will then go through a No. 60 sieve. Then the machine is set closer and the remainder is run through. This hand crusher is very complete and is not expensive.

A Possible Future Market for American Iron and Steel.

There are strong influences at work that are quite likely to lead the Chinese Government to begin the construction of an extensive system of railways with a view to provide for military exigencies as well as for commercial ends—military exigencies to grow possibly out of the habitual tendency of Russia to trench upon the territory of her Oriental neighbors. It is reported that the plan for such a system of railroads has been so far advanced that already the Chinese are negotiating for the means in Europe for its execution, and it seems to us that with such a plethora of idle money as there is, such a government as that of China should have no difficulty in placing a loan to be thus employed to ends that are creative and not destructive.

In that event, a demand for a vast quantity of iron and steel will be created which, with proper management, should be turned to the material advantage of our iron and steel industry. We certainly should be able to compete favorably with Europe in a very great deal of the material and appliances used in the building of Chinese railroads. Every exertion should be made in this country to win a liberal share of the industrial advantages to the West that are sure to be the result of an extensive construction of railroads in China. — *F. & M. Record*.

Work of the London Mint.

The recently issued report of the Deputy-Master of the Mint, giving an account of the operations of that department for the year 1884, is a more than usually interesting document. From it we learn that the amount of gold coined during the year exceeded by more than a million the amount coined in 1883, while the silver coinage was but little in excess of the average. The coinage of bronze, however, was larger than in any year since 1875.

The total weight of metal melted down during the twelve months was 470 tons, made up as follows: A certain proportion of alloy being of course included—gold, 67 tons; silver, 198 tons; and bronze, 205 tons. The total number of coins struck out of this metal was 65,295,382, giving an average of more than 1,200,000 pieces per week throughout the year. Out of these, however, 8,932,081 pieces did not come within the limits of the standard legal weight, so that the number of pieces available for issue was reduced to 56,363,301, the value of these good pieces being, real or nominal, £3,157,966 10s. 1d. Of this amount, £3,070,292 10s. 5d. (41,093,301 pieces) consisted of imperial coinage, the remaining £87,673 19s. 8d. (15,270,000 pieces) being colonial coinage for Canada, Jamaica, Hong Kong, etc. All this coinage, both imperial and colonial, has been executed at the mint, its increased coining power rendering it unnecessary that any portion of the work of coinage should be intrusted to private firms.

The greatest number of coins struck of any

denomination was about 11,700,000, consisting, as will readily be supposed, of pence. Half-pence came next in point of numbers, nearly 7,000,000 of this coin being struck. The number of farthings struck was over 5,700,000, a seemingly large number considering the present small general circulation of this coin. Of shillings, nearly 4,000,000 were coined; sixpences, over 3,400,000; threepences, over 3,300,000. Sovereigns and half-sovereigns were coined to the number of over 1,700,000 and 1,100,000 respectively. Of colonial coinages, that of bronze half-cents for the Straits settlements was numerically largest, 4,000,000 of this coin being struck during the year.

NOTES.

Six-tenths of the gold produced is yielded along with silver.

The iron age is passing away and is being superseded by the age of steel.

Economy, enterprise and free use of capital are indispensable for successful mining.

The excessive import of copper into England and France this year has been almost entirely from America and Japan.

A smoke stack for a smelting works at Pueblo has recently been completed, measuring 10ft. in diameter and 319 ft. high.

Exaggeration misrepresentation of the richness of mineral districts have a tendency to work them permanent injury.

India, which has, heretofore, bought her copper from England, has now a supply at hand in Japan which yields six thousand tons annually.

At Newcastle-upon-Tyne it is announced that the steel plate industry is now fairly well employed, and that there is every prospect of increased work.

The iron product of the United States in 1860 amounted to 900,000 tons of ore; to-day it foots up 8,000,000 tons a year, almost a nine-fold increase.

A new gold-like alloy, valuable in the arts and certain mechanical channels, has been discovered, and is of interest to the copper trade, as its composition contains 66 per cent. of copper.

The Russian Government proposes sending experts to Turkestan to study the turquoise mines on the Persian frontier. The same commission will visit the sulphur deposits recently discovered near Khiva, and the lignite mines and petroleum springs in the district of Ferghana.

AN IMMENSE LODE OF SILVER-BEARING IRON-STONE.—A lode has been discovered at Carowa station, about sixty miles from Silvertown, South Australia. It has been traced for over twelve miles, and in one place is 400 yards broad. A surface assay gives from 2 ounces to 24 ounces of silver a ton.

The exiles who live in the mines in Siberia are exiles of the worst type and political offenders of the best. They never see day-light, but work and sleep all the year round underground, extracting silver or quick-silver under the supervision of task-masters, who have orders not to spare them.

McIntyre & Lewis,
BARISTERS, SOLICITORS & NOTARIES PUBLIC.
Conveyancing of Properties and Mineral Rights.

OFFICES: **Union Chambers, Ottawa**
(adjoining Canadian Mining Review Office.)
ALEX. F. MCINTYRE. TRAVERS LEWIS.

ERNEST GAUJOT,
MINING AND MECHANICAL ENGINEER,
And Expert in Milling and Smelting.

Will examine and report on Developed Mines and Mineral Lands.

Address:
Belleville, Ont., or Buckingham, P.Q.

J. F. McANDREW.
Expert in Gold, Silver, Copper, Iron Plumbago and Phosphate Mining.

ORES ANALYZED.
Mineral Lands examined and reported on.
ADDRESS:
Buckingham, Province of Quebec.

WOLFF & COTTON,
PROVINCIAL LAND SURVEYORS.
ONTARIO AND QUEBEC.
OFFICE, 52 ELGIN STREET.
(Opposite Russell House),
OTTAWA.

J. OBALSKI,
MINING ENGINEER,
Will examine and report on mines, and make analyses.
OFFICE, 63 ST. GABRIEL STREET, MONTREAL.
CONSULTATION FREE.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tenders for Iron Roof Trusses and Girders for Armories, Drill Hall, Montreal," will be received at this office until THURSDAY, the 12th day of November, next, inclusive, for the construction of

Iron Roof Trusses and Girders,

FOR

Armories at the Drill Hall

MONTREAL.

Plans and specifications can be seen at the Department of Public Works, Ottawa, and at the office of A. Raza, Architect, Montreal, on and after THURSDAY, the 22nd instant.

Tenders must be made on the printed forms supplied.

Each tender must be accompanied by an accepted bank cheque, made payable to the order of the Honorable the Minister of Public Works, equal to five per cent. of the amount of the tender, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department will not be bound to accept the lowest tender.

By order,

A. GOBEIL.

Secretary.

Department of Public Works,
Ottawa, 14th October, 1885.

TIMBER LIMIT

ON LAKE WINNIPEG

FOR SALE.

50 Square Miles.

This limit will be very valuable. Apply at the office of the MINING REVIEW for price and particulars.

FOR SALE,

White Marble Quarry on Calumet Island.

At this quarry there is an inexhaustible supply of most beautiful white marble. Samples to be seen and information obtained at the office of the MINING REVIEW.

PHOSPHATE PROPERTY
