The Templeton & Blanche River Company, organized in Montreal during the present year, are making most satisfactory progress on their property. A first class road has been built, some very commodious buildings erected and a large number of pits opened. The surface indications are very rich, and the outlook of the new organization is very promising. Additional capital for enlarged working is being procured and machinery of the most approved pattern will be put in before the snow flies. Mr. Tom Hines, an experienced miner, is in charge of the work.

Messrs. W. A. Allan, Ottawa; E. K. Green and T. Trimble, Montreal; accompanied by a representative of the REVIEW, paid a visit to the mines of this district during the month.

The Lièvre District.

Mr. Jas. White, who was injured in the Little Rapids accident, has been removed to his home in Western Ontario. He expects to be able to resume work in the course of next month.

Messrs. Poupore & Thompson, the contractors, are now making satisfactory progress with the new Lock and Dam at Little Rapids. A frame house for the Lockmaster has been erected, most of the loam has been removed, and the rock-work, it is thought will be begun about the 15th of next month.

Shipments by the Lièvre River have been much retarded by the low water, there having been but two feet depth at the Little Rapids. Barges could carry but one-third of their usual load. About a thousand tons of phosphate have been delayed, and claims by steamers in Montreal for dead freight and demurrage are causing some vexatious disputes. The need for the dam and canal, now being built, after years of needless delay, is made clearly manifest, and it is to be hoped that the work will be hurried forward with all possible speed.

Latest reports state that the water in the Lièvre has risen several inches.

The High Rock and Emerald mines have each been giving large outputs, the quantity being a little restricted by scarcity of labour, as the lumber camps have been securing their hands for the winter.

The North Star mine, under its new manager, Capt. Tom Williams, has been producing a larger output, and its shaft is now down 650 feet. The phosphate seam still continues of large size, and the demonstration of the existence of the mineral at depths is of much value to the district.

The output from the Union Mines will be about 350 tons.

At Little Rapids work is being steadily conducted. A rich show has been opened about 2,000 feet from the main shaft, which is developing nicely. Mr. George Smith, the superintendent, has severed his connection with the mine to take a position with the Ingersoll Rock Drill Company of Montreal.

Nova Scotia.

Since they were opened up the product from the Oxford Gold Mines has been 10,900 ounces of gold, or say some \$20,000. This year 2,440 ounces have been obtained from 650 tons crushed, an average little short of 4 ounces to the ton. Only forty men are at present employed. The company owns 64 mining areas, covering a tract of land 2,100 feet long by 1,500 feet wide; but most of the gold so far obtained has been from a strip 500 feet long by 25 feet wide, and 47 of 64 areas have not been opened. Thirty-five leads have been cut on the property and nearly all have shown gold. The works are in the hands of Mr. J. M. Reid, a thoroughly competent manager.

The last crushing at the Brunswick Mining Company's property gave 26 ounces from 40 tons of quartz taken from the Forrest lead, and 36 ounces from 35 tons of quartz from another lead. The company own a district five areas in width by about $\frac{3}{4}$ mile in length.

The following are the official returns for September so far received at the Mines Office:—

District.	Mill.	Tons Crushed.	Oz. Gold.
Wine Harbour.....	Victoria.....	33	6 $\frac{1}{2}$
East Rawdon.....	Rawdon.....	390	197 $\frac{1}{2}$
Lake Catcha.....	Oxford.....	60 $\frac{1}{2}$	234 $\frac{1}{2}$
Dar's Hill Salmon river.	Dufferin.....	910	319
Whiteburn.....	Cushing G. M. Co.	10	21 $\frac{1}{2}$
Stormont.....	Tributers.....	79 $\frac{1}{2}$	78 $\frac{1}{2}$

It is stated that the ore of the Eastern Development Company, Limited, shows wider streaks of the concentrated chelcopyrite as depth is attained. An assay of these streaks or bands of ore just made by the provincial assayer gives 31.71 per cent. of copper. All the concentrated ore streaks of the mine will run 20 per cent. copper and over, but when the entire width of the vein is crushed the intermingled barren rock brings the average down to from 5 per cent. to 10 per cent. The vein at the point the samples referred were taken is 10 feet in width, the depth being 220 feet.

Quebec.

Gold has been discovered on the property of Captain Bothwell, near Buckingham. Specimens sent to and assayed by Dr. J. T. Donald, Montreal, are certificated to have given 42 oz. 11 dwt. 16 grs. to the ton, or a cash value of \$800. The ore sent was not free milling, but

sulphurets. The vein has been traced through other properties, the owners of which are placing absurdly high valuations upon them. Several general specimens have been sent by disinterested parties to Dr. Hoffman, of the Geological Survey, to assay, and until his report has been received it would be unwise to place too much value upon the many reports now in circulation.

Mr. John P. Mullarkey, of Montreal, has secured a mining patent from the Department of Crown Lands for the W $\frac{1}{2}$ of lot 37, in 5th range Bersford, containing 9 $\frac{1}{4}$ acres, as an Inferior Metal Mining Location (Iron).

Ontario.

The siding from the Kingston and Pembroke Railway into No. 1 mine of the Calabogie Iron Company, is nearing completion. The lessees can then ship the accumulated ore, and realize on the product.

Silver has been found on the farm of a Mr. Racicot, near Lake Nosbonsing, in the Township of Ferris.

Messrs. Smith & Lacey are turning out large quantities of bright amber mica at their Ell Lake mines, near Sydenham. In the principal working there is now a vein ten feet in width composed entirely of mica crystals, some of them very large in size. The mica is of a light amber shade.

A very sad accident, whereby one man was killed and several others were seriously injured, occurred at the Calabogie iron mines on Friday, 7th instant. While eight men were working in the pit the roof gave way and ten or twelve tons of rock came down and completely buried them. The whole party had a marvellous escape from instant death.

Port Arthur District.

From the large variation of the needle, amounting to 135° in a number of places, Mr. M. J. Butler, P.L.S., is of the opinion that vast beds of magnetic iron ore will be found in the township of Marks, as it is scarcely probable that such a large variation would be caused by the presence of the small pieces of magnetite usually found associated with trap rock. One peculiarity which he has never seen noted before, was the constant variation; it is quite a common thing, he says, to see the needle 15° off the course for a distance of fifteen or twenty chains before any change in the variation would be noticed, when the needle would veer over suddenly to the opposite side of the pole and record 5° for a distance of ten or fifteen chains.

RABBIT MOUNTAIN MINE.—The management have completed the setting up of the last of the new machinery recently purchased, with a view to deeper and more extensive explorations. This machinery consists of: 1st. A large double drum hoisting apparatus of the most improved construction. These drums are independent, and may be used to work two shafts. With this they sink 1,000 feet at least. 2nd. An Ingersoll 7 drill compressor, with which they run four Ingersoll drills; and 3rd, a new six ton steel boiler, to supply the compressor and hoist. The compressor also works the underground pumps. Sinking with two drills is now being carried on below the 250 foot level. The vein here is very promising, and a rich ore body may be struck at any moment. At present the ore is, however, low grade. The 250 foot drift north is being pushed vigorously ahead through

dead ground, when it is expected that it will strike the continuation of the rich ore chute from the surface. The 200 foot level will now be pushed south with all speed. The vein in this direction looks very well, and it is confidently hoped that this drift will not go far before being in bonanza. The mill is not yet running, as they are awaiting the opening up of more ground.

THE BEAVER MINE.—This mine is still in bonanza. The main or lower adit having been found to be richest of all. The management are shipping a great deal of very high grade ore from above this level, part of which is sent to the smelting works direct as it is too rich to mill—the rest is milled. The ore is first stamped, then concentrated on true vanners, and the tailings are amalgamated. The ten head of stamps have been in continuous operation for some months, and by the look of things they will have soon to be increased. As it is the owners have ten head more on the ground and intend to erect them this fall. Owing to the soft nature of the ore the ten head at present working, stamp nearly 30 tons per day. They are now sinking below the level of the main adit, and the shaft is now some 40 feet down, still continuing in the rich ore body. The owners have decided to organize this mine as a joint-stock company, capital \$5,000,000; so it is stated. Mr. W. H. Furlong, M.E., is leaving at once to make the underground survey necessary for maps and reports. A new vein has recently been found on this property within half a mile of the Beaver vein. About 12 men have been working on this for a month with the most encouraging results. The vein, though small, is exceedingly rich in silver and silver ore, and though, as the workings continue into the hill, the width of the vein steadily increases, there has been so far no diminution in the quantity of silver. This vein runs almost at right angles to the Beaver.

THE PORCUPINE MINE.—This property, it is understood, has just been sold to Detroit people. Two experts have been here in their behalf and have submitted it to a most searching examination, the result of which will not be known for a couple of weeks. It is the intention, if the sale is affected, to at once commence operations on a large scale.

THE SILVER MOUNTAIN MINE is still being operated by a strong force of men, and work almost entirely exploratory in its nature is carried on. A good quantity of stamp rock has been got, both from their shafts and adits, but nothing extraordinarily rich; still, however, the prospects are extremely good, not to say flattering.

THE CROWN POINT MINE is being worked with a small force of men, and in the one adit level being opened they are getting some extraordinarily rich silver ore. It is reported that this mine is under contract for sale. In the event of this going through, we may expect to see a really valuable property worked as it deserves.

There are a number of new discoveries and properties being worked by two or three men that are not at present individually worthy of mention. The latest discoveries have been a short distance north-west of White Fish Lake, and north-east of Arrow Lake. When it is considered that the new railroad, a portion of which is now under contract, will pass through this district, the future is a very promising one.

Still further to the west, and near to the International Boundary, there has lately been found large deposits of hematite iron ore, and Americans, who have traced the belt through from Minnesota, have been taking up some thousands of acres of land there. This very place is located for the Canadian terminus of the new railroad. To the east of Port Arthur some of this iron has lately been found, which, if the deposits are extensive, will rival any iron on the north or south shores of Lake Superior. It will be spring again before the necessary explorations can be carried on.

Rat Portage District.

Though there is at present no gold mining carried on in this most promising district, there is certain to be, at no distant date, a great deal of it. The Gold Hill people did make an arrangement with a large London syndicate about the workings of their property. They were, however, unable to obtain their patents from the Crown Land Office, and it is said the agreement fell through. There are several other properties on the Lake of the Woods besides this, however, which, had they clear titles, could be made handsomely dividend paying mines. It is authoritatively stated that if patents are issued work will yet commence this year on more than one vein in this district.

Manitoba and North-West Territories.

The Medicine Hat Coal Mining Company are advertising for the sinking of a shaft, and will endeavour to have the same completed this fall. The prospects are good for the construction of the Medicine Hat Railway to the mines either this fall or early in the spring.

A correspondent who recently visited the Canadian Anthracite Coal Company's mines at Banff sends the following:—

The place is reached by driving five miles from Banff and then by walking down the railway track for a mile, for Anthracite has no wagon road to it. It is thus a sort of island in the mountains. The little mining village of some 200 or 250 people has grown up very rapidly—in less than a year—and, as every one knows, owes its existence to the discovery of workable beds of coal within a stone's throw of the railway. The obliging superintendent of the mine afforded every facility for visiting it, and the writer penetrated every tunnel to the very end. The work of coal mining is here very easy. The mouth of the pit is about forty feet above the railway track. The approach is nearly horizontal, as the mountain side is entered, and is some twelve feet in diameter. This allows a track to be laid, on which, drawn by horses, are the usual shaped trucks of the coal pit. Carrying lanterns, we penetrated the darkness, and reached the first seam. This is a splendid coal layer seven feet thick, with a dip of perhaps 30°. This had been worked both right and left. Entering the left hand tunnel we followed it to the very end, 520 feet, and secured from the men working at the extreme point a choice specimen of coal. Similar tunnels further in were followed, one where the coal was about three feet thick, and another of nearly five feet. On going into the extreme distances the air became heavy, and we were glad to learn that for the health of the miners ventilating apparatus will soon be introduced. The coal is thus very easily mined. It is brought out by the horse trucks and thrown down an inclined frame of iron bars. This in the meantime serves for sorting, but a rotating sifting apparatus is being prepared, which will be a great improvement. After picking over to remove any shale present, the workmen conducted the coal by spouts to the cars on the railway track. The expense of mining and moving the coal must thus be reduced to a minimum. The great question asked is as to the character of the coal. The government geologists in our North-West have been too timid. They for years decided against our Northwestern coal, but now such splendid deposits as that of the bituminous coal from the Galt mine are pushing their way into recognition. Scientific opinion should encourage, not raise doubts, as to important enterprises. To many it seemed too good to be true that we should find real anthracite on Canadian soil. It was wrongly said there is but one real anthracite deposit in the world and that in Pennsylvania.

Of course there are anthracite beds in South Wales and Peru, and now we know we have this valuable anthracite mine in the Rockies. The London *Times* correspondent calls our deposit semi-anthracite. Anthracite is simply stove coal. The specific gravity, percentage of carbon and hardness of the Rocky Mountain coal rank it with anthracite. The writer has burnt this coal. It has a small amount of flame, has intense local heat and no smoke. Its local conditions are similar to those of the Pennsylvania anthracite, for it is among the dislocated rocks where pressure and possible heat may have been applied, as is the case where the Alleghenies of Pennsylvania have changed the bituminous coal to anthracite. It is not easy to determine, without a full geological investigation, the age of the Rocky Mountain coal. Carboniferous rocks do occur in the Rockies, and at a higher elevation on the brow of Twin Peaks Mountain are Silurian beds, but in the Rockies the carboniferous and cretaceous are very conformable, and it may of the latter. At any rate the practical tests of our black diamonds from the mountains are highly satisfactory, and while we were at the mine an order of 4,000 tons for San Francisco was being filled. It would not be surprising if this anthracite should drive out the poorer varieties of bituminous coal found on the Pacific Coast, for the bituminous coal of Nanaimo is somewhat inferior to our Galt mine coal. Our party returned from Anthracite rather begrimed and blackened by the visit to the coal mine, but filled with deep thoughts as to the possibilities in many ways of our Rocky Mountains.

Dr. Selwyn, Director of the Geological Survey, has just returned to Ottawa from an extended tour through the various mining districts. He is of opinion that the extent of the vein, upon which are the Banff and Lethbridge coal mines, is almost unlimited, and that there is sufficient to supply the entire North-West for many years to come, as well as a healthy export trade.

British Columbia.

Mr. T. H. Collins, F. G. S., the well known Mining Engineer and Metallurgist, of London, England, is now at Yale, British Columbia. His object is to become acquainted with the mining capabilities of the province, with a view to the introduction of British capital, and he will be glad to receive communications from *bona fide* prospectors and discoverers.

The Illecillewaet Silver mines have been closed down. Snow has fallen two feet at the upper mines.

A telegram from Illecillewaet to the Selkirk Mining and Smelting Co., announces that the company will ship to San Francisco their sixth carload of silver ore, weighing twenty tons, and valued by assay at \$1,600. This makes the aggregate of the shipments to date nearly \$8,000. The mines look better than they have ever done, and regular shipments will continue.

The total amount of coal shipped from Nanaimo for the month of September was 27,730 tons. Of this Dunsmuir & Sons shipped 17,700; the East Wellington Co., 2,340, and the Vancouver Coal Co., 7,550 tons.

From a letter dated Camp McKinney, Sept. 16th, written by Mr. J. W. Reade, a practical miner and assayer, we extract the following, re the Rock Creek Mines:—

"The 'Amelia' shaft is down 50 feet; the company will commence to cross-cut the vein on the 20th. The 'Cariboo' shaft is down 42 feet, with a vein at that depth seven feet wide; the ore will concentrate 25 per cent. of sulphurets that will assay from \$500 to \$300 to the ton. They have quit sinking on the main shaft, and are at present getting out free milling ore to run the little mill which will be in operation soon. I think, however, that the 'Cariboo' will change hands before the snow flies, as a mining expert from Montana, who has been here for two weeks sampling the ore, told me just before he left for Butte City, that he was well satisfied with the property, and Mr. Rice—one of the owners

—has gone to Spokane Falls in company with him. I expect to hear any day that the property has changed hands. I sampled some ore from the 'Alice and Emma Consolidated' mine, and made two assays obtaining splendid results. The district is looking better every day, and I am now fully satisfied that in the near future we will have one of the richest mining districts in British Columbia."

The latest news received from Island Mountain mine is of an encouraging character. The vein was tapped 300 feet below the first tunnel and run in on a fine ore of considerable width. Work on the mill buildings is getting along well. The mill is about closed in and a portion of the machinery is in position. The boiler house is up and the boilers bricked in. The brick for furnaces did not turn out as well as expected, being too soft. The development of the mine is proceeding, and it is expected that crushing will soon commence.

The Hon. Secretary of the Nanaimo Relief Fund has received a letter from the Hon. Jno. Robson, Provincial Secretary, stating that the plan of distribution and the mode of management of the Relief Fund, has been entirely satisfactory to the Provincial Government, and that \$5,000 would be donated by the Government towards the Nanaimo Relief Fund.

A large number of miners came down from Alaska on the Idaho, with sums varying from \$600 to \$2,000 as the result of their season's work. The general opinion of the miners is that the diggings are very productive, but the weather is frightfully severe, rendering it almost impossible to work but for a short time in mid-summer.

United States.

The quarterly report of the Plymouth Consolidated Gold Mining Company dated 1st October gives the following:—

Gold	
Bullion Produced.	
January, 1887.....	\$62,350.49
February.....	60,683.76
March.....	59,296.45
April.....	60,893.03
May.....	78,822.34
June.....	65,029.14
July.....	64,732.17
August.....	59,696.14
September.....	59,025.58
Total product for nine months, '87	\$570,529.10
Operating expenses for same period	221,950.00
Profit.....	\$348,579.10
Addition to Pacific Mill—40 Stamps.	44,324.20
	\$304,254.90
Cash on hand, Jan. 1st, 1887.....	81,079.89
Amount applicable to Dividends..	\$385,334.79
Paid dividends for nine months	
Nos. 44 to 52.....	255,000.00
Surplus, Oct. 1st, 1887.....	\$130,334.79

Having been short of water (on which the company depend for power) for two months past the Empire Mill has been compelled to run on short time, thus reducing the output for August and September below the average. The fall rains are now due, and will soon furnish a full supply. The dividend payable 5th of October will be the fifty-third consecutive monthly dividend, making a total of two millions one hundred and twenty thousand dollars paid to the shareholders since the consolidation, June 1st, 1883, being twenty-one dollars and twenty cents per share.

MISCELLANEOUS PARAGRAPHS.

The Horrors of Fire-Damp.—No meteor, however terrible it may be supposed to be, can be compared to an explosion of fire-damp. Let one of those scourges of heaven be imagined (which appear sometimes as if designed for the punishment of human beings) a thunderbolt, a hurricane, a cyclone, or a whirlwind—burning, overthrowing, destroying everything in their course, and the effects produced by them will still be inferior to those caused by an explosion of mine gas. A discharge of a cannon loaded with canister shot, and fired point blank into a crowd; a powder magazine taking fire in the midst of a body of workmen; a gasometer exploding in a factory—can scarcely give an idea of an explosion of fire-damp suddenly overtaking the miner. The moment the mixed gas comes in contact with the flame of a lamp a tremendous explosion takes place, resulting from the combination of the components of the fire-damp, hydrogen and carbon, with the oxygen of the air. The two former separate to combine with the oxygen, with which they have the greatest affinity. The double phenomenon only takes place at a high temperature; without flame it would not arise. The reaction produces an effect like the most brilliant lightning, and makes itself heard by a clap of thunder. The explosion spreads instantly into all the galleries of the mine; a roaring whirlwind of flaming air destroys everything it encounters, overthrowing trams, and bratticing, and trap-doors, mounts into the shaft, and lifts from their foundations the staging which covers its mouth, through which it discharges thick clouds of coal, stone, and timber. The men are blinded, thrown down, scorched and sometimes burnt to a cinder; often their clothes take fire, and not unfrequently they are buried beneath the ruins of the fallen roofs. When an attempt is made to fly to their assistance, there is not time to rescue them; there are only corpses left which are scarcely recognizable. The calamity spares nobody, even though as many as one or two hundred miners may be at work; death extends over the whole of the mine where the explosive gas was present. The air-doors are thrown down, the ventilation of the mine is reversed, the underground atmosphere is vitiated by the combination of the fire-damp, and the stalls are filled with steam and carbonic acid. Sometimes the temperature rises so much that the coal is converted into coke at the sides of the galleries, and the commotion is so great that the dams have to withstand both fire and water, and the wallings, raised for the purpose of resisting the thrust of the measures, are themselves overthrown. Then to a scene of already indescribable desolation are added the horrors of inundation, falls of the ground, and fire, when the explosion has already made only too many victims. To add to so many horrors the foul air, carbonic acid, the after-damp or choke-damp, spreads throughout the mine, and suffocation terminates the existence of those in whom the explosion had left a spark of life.

A Just Estimate.—Perhaps no other industry has been so misunderstood as mining, and has been compelled to bear the burden of unjust condemnation which belongs to other, altogether foreign excrescences, which like parasites have fastened themselves upon it. If a poor farmer

attempts to conduct business on a farm by methods altogether impracticable and contrary to the best experience of years, the failure, when it comes, falls upon the man and his lack of wisdom, instead of being made an argument against farming and the farm, but let a mine be ever so extravagantly mismanaged by the most inexperienced and dishonest superintendent, the loss of money and all the long train of disasters is charged at once, to the uncertainty of mining and the worthlessness of mines. Simple justice demands more discrimination, and we may say that, with the more general information prevalent, it will be more difficult hereafter for the mistakes, fraud and inefficiency of incompetent management to place the responsibility to the account of the mine or of mining. Coal, iron, zinc and lead mining have passed through this phase in the history of their development, and it is time that silver and gold mining were divorced from speculative excitement, stock fluctuations and everything outside of the line of steady production. All must come to this point before the best results can be achieved, and before mining can be justly estimated at its true value in its influence upon the steady improvement of national prosperity and substantial advancement.‡

A Simple Process for Measuring Water.—To measure water roughly in an open stream, take from four to twelve different points in a straight line across the stream, and measure the depth at each of these points, and adding these together, divide by the number of measurements taken. This quotient will give you the average depth, which should be measured in feet. Multiply this average depth in feet by the width in feet, and this will give you the square feet of cross section of the stream. Multiply this by the velocity of the stream in feet per minute, and you will have the cubic feet per minute of the stream. The velocity of the stream can be found by laying off 100 feet on the bank, and then throwing a board into the stream at the middle, note the time passing over the 100 feet, and dividing the 100 feet by the time, and multiplying by sixty, gives the velocity in feet per minute at the surface. The velocity at the centre is only eighty-three per cent. of that at the surface, and so only eighty-three per cent. should be calculated. For example, suppose the float passes 100 feet in 10 seconds, that divided by ten and multiplied by sixty (seconds in the minute) gives 600 feet per minute as the velocity, and eighty-three per cent. of this gives 498 feet per minute as the velocity of the stream at the centre, and the area of the cross section multiplied by this will give you the number of cubic feet per minute in the stream. This, of course, is only a rough way of calculating, but it is often used, and is a good and simple way to obtain data to select a wheel by.

Ontario Gypsum Beds.—The gypsum beds of Paris on the Grand river have been worked for nearly half a century. South of the town they are found on the west side of the river, and on the north of it on the east side, extending a distance of about four miles along the river. There are two beds of three or four feet in thickness, interstratified with 16 or 18 inches of shale. They lie about ten feet above the level of the river and sixty or seventy feet below the table land. The quarries on the south side of the town have been worked during the past four years by Messrs. A. S. Gill & Co., who also have a mill in the town for grinding rock into the plaster of commerce. This quarry

has been worked for more than forty years and the tunnels have penetrated a distance of nearly 600 yards. Ten hands are employed on the works from October to May of each year—five miners, three mill hands and two teamsters. The average yearly product for the past four years has been 1,500 tons, which readily sells at \$1 to \$1.50 per ton at the mill. Owing, however, to its great weight and cheapness it will not stand the expense of shipment to any great distance for agricultural purposes, and the production is largely limited to the demands of the locality. The same company operate a quarry on the Jones tract, on the east side of the Grand river, in North Cayuga, their average annual output being about 650 tons. The cost of quarrying at Paris is ninety cents per ton and in Cayuga ninety-five cents, the average wages of workmen being \$1.25 per day. A new industry has been established in connection with the gypsum works of this town—the manufacture of alabastine. This article is produced from rock gypsum found in the mine near Cayuga, on the Grand River. It is used for painting purposes and takes the place of kalsomine. It is claimed by the manufacturers that as a first coating under oil paint on wood, brick or any other outside surface where paint is used, the saving in expense will be fully one-half. The deposits on the Grand river, below Caledonia, occur above Cayuga on the west bank of the river, while below the town, where the river turns and flows south-east, the beds occur on the north side. The deposits in workable thickness are confined to certain areas, having been formed, it is supposed, in ancient lake bottoms. The first bed, opened some forty years ago, was below Cayuga, and operated by Messrs. John Brown, of Thorold, and Wm. H. Merritt, jr., of St. Catharines. Large shipments were made to the United States—to Cleveland, Detroit, and other places; but on the discovery of the Michigan beds this trade was greatly reduced, although the Michigan gypsum is of inferior quality. This mine was worked in a small way on and off until it was reopened in 1879 by Wm. H. Merritt, who built a mill for grinding the rock. With much encouragement from the late Hon. George Brown the consumption of Canadian white land plaster in Ontario has been considerably increased in competition with the American gray, which comes over from Oswego, and which is very impure gypsum. There is a mill on Gill & Company's property, nearer Cayuga, which was built by the late A. W. Thompson and there are two above Cayuga, at Mount Healey and York, run by Donaldson & Bros., and Thomas Martindale, respectively. At Caledonia Mr. Johnson (late N. Garland & Co.) grinds some land plaster. The whole output along this lower part of the Grand river in land plaster and rock varies from about 4,000 to 5,000 tons per annum. The plaster is sold in Ontario for the most part, the duty preventing much from being shipped to the United States, while the rock, which is duty free, is chiefly shipped to that country.

A Miner's Heroism.—In a certain Cornish mine (South Caradon) two miners deep down in the shaft were engaged putting in a shot for blasting: they had completed the work, and were about to give the signal for being hoisted up; one at a time was all their coadjutor at the top could manage, and the second was to kindle the match and then mount with all speed. Now it chanced while they were both still below, one of them thought the match too long; tried to break it shorter; took a couple of stones, a flat and a sharp, to cut it shorter; did cut it

of the due length, but, horrible to relate, kindled it at the same time, and both were still below! Both shouted vehemently to the coadjutor at the windlass, both sprang at the basket; the windlass man could not move it with them both. Here was a moment for poor miner Verran and miner Roberts! Instant horrible death hangs over both, when Verran generously resigns himself: "Go aloft, Roberts," and sits down; "away, in one minute I shall be in Heaven!" Roberts bounds aloft, the explosion instantly follows, bruises his face as he looks over; he is safe above ground: and poor Verran? Descending eagerly they find Michel Verran too, as if by miracle, buried under rocks which had arched themselves over him, and little injured; he too is brought up safe, and all ends joyfully, say the newspapers. As Verran was anxious after this to work above ground, and also to gain a little schooling, a few hearty admirers of his heroic act were glad to subscribe a little sum to enable him to spend some months at school. Here he acquired the great arts of reading and writing, then established himself in a farm and married a schoolmistress, with whom he and his affairs have prospered as they deserved.

Experience, Essentially Requisite.—

Perhaps no other line of enterprise has suffered so much from inexperience and a total disregard of the fundamental principles of business, as the mining industry in this country. Methods have almost universally prevailed at times which now careful observation shows to have been most reckless and uncertain, having in them no evidence of reliability which would recommend them to the careful consideration of the intelligent and conservative business man as investment. It is now apparent that the almost general unfavourable results might have been safely predicted by any one of ordinary capacity, and it is also certain that at the present time it would be almost impossible to secure the investment of a dollar in any such proposition. This fact shows a marked improvement at the present time over the methods which have previously prevailed to such an extent and with such influence that its effects have as yet been by no means entirely removed. It may not be necessary to repeat that production is the chief object to be attained, and the security assured in this direction must be considered the only real basis of value in investigating the merits of any proposition in this great field, which promises such great results under proper management.

The Influence of the Mining Press.—

The history of the struggling existence and final starvation of hundreds of local papers, in prosperous mining localities, is not a creditable record for an industry so broad and liberal in many other respects, especially is this true in view of the fact that the mines have been most faithfully upheld, and owe the larger proportion of their value and success to the very means which has been neglected and unrewarded. The report of mining properties, strikes of ore bodies in mines, shipment from smelters, value of ore and mill runs, has been most faithfully made by the local paper, to be copied by the metropolitan reviews in the capital centers, until a tide of inquiry and investment has been attracted to the locality, and a general condition of prosperous activity established by which hundreds have been benefitted. In many cases this gratuitous work, which has cost time and money, has been done faithfully and impartially for those who have never contributed the amount of an annual subscription to the paper

which has been the chief cause of their prosperity. The mining industry of the United States today owes its present promising condition, its general activity, the favourable state of public opinion, the investment of capital and the wonderful development everywhere witnessed, more to the influence of the press than to any one or all other influences combined, but its return for all this benefit has, as a rule, been most niggardly and certainly unjust.

The Pierce Method of Charcoal Manufacture.—In the ordinary kilns one cord of wood has yielded from 30 to 35 bushels, of about 20 pounds to the bushel, while in the Pierce process of distillation in retorts the average yield of charcoal is claimed to be 50 bushels to the cord, which is worth, at 60 cents per bushel, three dollars. There are also obtained three gallons of crude wood alcohol per cord, valued at 95 cents per gallon at the works, \$2.85; 150 pounds of acetate of lime per cord, 1 cent per pound at the works, \$1.50; and 1,000 pounds of combustible hydrocarbons, equal in value for heating purposes to the amount of three dollars of other fuel; a total of \$10.35, against about \$2.25 worth of charcoal under the old process. The first works in the southern United States were built at Gooderill, Tennessee. This plant consists of 20 charcoal kilns and a 25 ton furnace. The second works to use this process were erected in 1886 at Calera, Shelby County, Alabama. This plant consists of 38 charcoal kilns, now in operation, with a capacity of 40,000 cords of wood per annum. The charcoal produced by this process has also been used at the Warner Furnace, West Tennessee, and at the Etna Furnace in the same district. The Decatur Works, Alabama, with 48 charcoal kilns, having an average capacity of 56 cords per kiln, or a total annual capacity of 40,000 cords, are now nearing completion. Alcohol and acetate of lime departments are connected with the plant. A 50 ton furnace is to be built during the present year, the size of the furnace, 12 feet bosh, 60 feet high, with a blowing engine having a steam cylinder 36x48, and a blowing cylinder 48x84 inches. The works in course of erection by the Nashville Iron, Steel and Charcoal Company, are constructed to use this process, and will consist of two 60 ton furnaces, with two blowing engines to work in combination, of which the steam cylinder will be 36x48 inches, and the air cylinder 48x84 inches. For the manufacture of charcoal there will be 80 kilns, with an annual capacity of 80,000 cords of wood. The process will also be adopted at several other works.

Quicksilver Ores.—Speaking on the character of quicksilver deposits, Prof. S. B. Christie, of the University of California, in his testimony in a recent case in San Francisco said:—Quicksilver deposits, as a general rule, are very different from those of the ores of other metals. Many other metals occur in well defined fissure veins, so that there is no difficulty in following the ore, and in many cases of calculating before hand the amount of ore in sight; but with the exception of the deposit at the old Almaden in Spain, and to some extent the deposit at the Idria in Austria, the quicksilver deposits, particularly those of California, are characterized by a great and persistent irregularity, so that it makes the mining of those ores much more difficult than that of other metals. New Almaden is a striking example of this irregularity. It has often occurred in the history of the mine that there was none or scarcely any

ore in sight, and it has often looked as though the mines must of necessity be shut down, and it has only been by the most careful and painstaking prospecting or dead work that it has been possible to keep up the production of the mine. Very frequently large bodies of ore will almost completely run out, and there will be visible in the fall of the works only a slight colouration in the vein matter, which indicates that there is ore left in that particular place, and by following out this little spring of ore carefully it may lead into a large deposit. As a result of this the workings of the mine are necessarily very irregular, and it requires the greatest skill on the part of the engineer in charge of the works to keep up a regular and steady output of ore.

Mining in Alaska.—The general formation of the upper Yukon is slate, lime and porphyry. In this formation many veins of gold and silver-bearing quartz have been found, but as yet they remain unnoticed by the miner, and he has rarely taken the trouble to break open a piece of quartz to examine it. Quartz carrying an abundance of free gold was picked up this summer on Forty-Mile creek, but its course is as yet not discovered, and, in fact, unprospected for, the rich gravel bars alone being the attraction. In some places these latter are indeed rich, some miners during this summer having rocked out as high as thirteen ounces in a day at the new diggings on Forty-Mile creek. This place was first discovered late last fall by a man named Franklin, and upon his report of the discovery of coarse gold there, the miners on Stewart and Salmon rivers pulled out for that section, and soon nearly 300 men were on the ground. In fact Forty-Mile creek was the objective point of all who have gone to the Yukon this season. This stream empties into the Yukon river about 100 miles below Fort Reliance, having its source in the Alaskan range of mountains on the east divide and to east of Mount St. Elias and the headwaters of Copper river. Running from Copper river to the east is an immense copper belt sixty miles wide, and it has been traced over the divide 100 miles. The diggings on Forty-Mile commence about three miles up from the mouth, and are continuous ninety miles up, as far as this summer's explorations extended. Several of the small tributaries putting into the main stream were somewhat explored and found to be rich, but scarcity of water in them for washing is a prevailing drawback. The bars worked along the main stream yielded all the way from \$10 to thirteen ounces per day per man, all very coarse gold, the market price in Juneau of which is about \$17 per ounce. Two nuggets were washed out of \$15 and \$32 value. It is estimated that in the neighbourhood of \$100,000 were washed out of these diggings this summer. All the miners, with the exception of those who did no washing to speak of, but spent their time prospecting, rocked out from \$400 to \$2,000 in dust. This gold was mainly taken out of the creek beds and very near to running water, for in no case could the miner wash farther back than four feet into the gravel banks on account of encountering hard frozen ground. The gold rather lies in bunches than otherwise. As one miner has said, several shovels of dirt could be taken up which would contain nothing but a few colours, while another would yield perhaps an ounce. The richest deposits lay behind the boulders and drifts. On one bar three men rocked out on the 25th day of July twenty-six ounces, which is equal to \$442, at the market price. About ninety days

can be considered as the extent of the washing season. High waters are a drawback in the early spring, and the streams commence to freeze up about the first of October. The ground there is covered to some depth with a thick matting of moss, which is impervious to the sun's rays, and in consequence when the ground underneath once becomes frozen it remains so. To obviate this very serious drawback, the miners have set fire to the moss, which in summer becomes as dry as tinder to the depth of several inches, and thus from the heat of the fire, and being uncovered and exposed to the sun, and atmosphere, it is thought that in a short time a vast amount of now frozen gravel will be thawed out sufficient to wash. Should this be the case, there is room enough on Forty-Mile creek and its tributaries for a thousand miners. There is no reason to doubt, and the boys from the Yukon believe, that other creeks that put down from the Alaskan range in that neighbourhood are equally as rich as Forty-Mile creek, but of course nothing whatever is known of them and will not be until explored. Alaska is a great country, and years will come and go before its resources are shown up.

Occurrence of Apatite in Slag.—Mr. W. M. Hutchings writes to *Nature* asking whether any of its mineralogical readers have come across, or have anywhere seen mentioned, the occurrence of crystallized apatite in a metallurgical slag or other artificially formed silicate. Having recently observed such an occurrence, and failing to find any record of such a formation, he says:—"The slag in which I have observed the formation of apatite is produced during the smelting of slag ores into in a blast furnace. It is a basic silicate of lime and ferrous oxide, containing about 30 per cent. of silica. The principal "flux" used in the reduction of the ore is tap cinder from the puddling furnaces, and it is mainly from this source that phosphoric acid is introduced into the slag. The slag itself, in bulk, is dark brown to nearly black in colour. It flows into slag pots of about three hundred weight capacity and cools slowly. I recently prepared some thin sections of this slag for microscopic examination. The greater portion consists of a mass of crystals of olivine, surprisingly colourless and transparent considering how much iron is present. The spaces between the crystals are occupied by deep-brown and yellow amorphous slag, and black sulphides of iron, etc. Both olivine crystals and dark amorphous matter are penetrated through and through by great numbers of apatite crystals in long needles. It is a most beautiful occurrence, analogous in every way to what one sees in rocks. Nearly all the apatite crystals have taken up and enclosed more or less of the amorphous dark material, which forms in the majority of cases a rod running down the centre, but there are also many cases of symmetrical arrangement of dark matter parallel to the sides of the hexagon. The apatite does not only occur in the mass of the slag as above described; it is formed also in free crystals, lining cavities which are formed in the centre of the lumps of the slag, owing to gases carried over from the furnace and liberated during cooling. Some of these cavities are of considerable size, and are often lined entirely with a thick growth of apatite needles, some as thin as the finest hair, others of much larger dimensions. I have taken out crystals over a quarter of an inch long for microscopic and chemical examination. Most of them contain a good deal of the amorphous slag, etc., enclosed,

as in the case of those in the mass of the slag. Sometimes in such cavities very beautiful little crystals of volatilized sulphides are seen among and on the apatites. I have seen galena crystals in this manner, but it is very difficult to remove them from the cavities without damage or loss.

The Oldest Iron Mine in the United States.—The oldest iron mine in the United States that is now in operation is stated to be the Iron Hill Mine in Delaware. It was discovered in 1684. The ore obtained from the mine is now treated at the Principio Iron Works, Maryland, at which works a blast-furnace was first erected in 1720. There has been no blast-furnace work at Delaware for some years past.

Explosives for Fiery Mines.—Some important information relating to explosives suitable for blasting fiery mines is given by Hilt.** Experiments with the high explosives show that dynamite will ignite a gaseous mixture containing more than 5 per cent. of fire damp. Nitro-dynamite and gelatine dynamite give more favourable results, even allowing 7 per cent. of gas to be present, without firing the coal-dust. The action of the water-cartridge is insufficient with blasting powder, but with dynamite it is safer, since the dust is not fired even with a 6 per cent. of gas. Nitro-glycerine and gun cotton have never caused an explosion even with 10 per cent. of gas. The same results are obtained with the new explosives, romite, carbonite and blasting gelatine. The Prussian Fire-Damp Commission consequently recommends the employment of dynamite with the water cartridge, and permits the use of other high explosives without the water cartridge. The latter, however, can scarcely be used in collieries, as they are too expensive and cause too much dust. Of the new explosives, *anigone* has been found thoroughly unsatisfactory. *Securite* proves to be a safe explosive, resembling dynamite in its action. The products of its combustion are not objectionable. The *Schulze-powder* offers no absolute security in

gaseous mixtures. *Carbonite*, while giving greater security than dynamite, has the same blasting action, and acts on the coal like the best blasting powder. If carbonite could be sold at a lower price, it would be the best explosive for use in the coal mine.

A New Process for the Manufacture of Aluminium has, it is stated, been recently patented in France. The operation is divided into two parts, in the first of which ten parts by weight of powdered alumina are mixed with four of lamp-black, a sufficient quantity of tar being added to form a thick paste. This is then placed in a suitable receptacle and calcined at a red heat till the oil or tar is completely decomposed, leaving a brittle solid, which is then broken into small lumps, and subjected in a closed vessel to the action of an atmosphere of carbon bisulphide, a current of which is kept constantly flowing through the vessel. On raising the temperature, it is said that this agent decomposes the carboniferous mixture with the production of carbonic acid gas and a sulphide of aluminium, from which the pure metal is afterwards obtained with the aid of hydrogen.

The Kimberly Diamond Mines.—The yield of diamonds from the Kimberly Mine alone, from the opening in 1871 to the end of 1885, is stated to have exceeded 17,500,000 carats, equal to 3½ tons weight of precious stones, in value about £20,000,000. To obtain this, as many thousand tons of reef and rock has to be excavated. The mine is 450 feet deep, and the cubical contents of this huge cavity measures about 9,000,000 cubic yards. Four thousand Kafirs are employed at this mine, and more than 20,000 natives of Africa arrive yearly at the mines in search of work; so that the employment of native labour and the development of native trade are incidental benefits conferred on South Africa by the discovery of the diamond fields.

THE SAMUEL ROGERS OIL CO'Y,
RUSSELL BLOCK, OTTAWA,

N.B.—"Sole Manufacturers of the above brands."

VALUABLE PLUMBAGO AND OTHER Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

FOR SALE. VALUABLE Copper Mining Properties — IN THE — Eastern Townships

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within 1½ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only 2½ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Caruncle Hill Mine, Lots 2 and 3 R. 14, and 2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, ¼ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHEY.

- 7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

VALUABLE Farm Lands for Sale IN MANITOBA.

2560 Acres of Splendid Prairie Farm Lands, Class 1.

The Manitoba and Northwestern Railway runs through the district in which these lands are situated.

Section	3	14	23	640 Acres.
"	15	14	23	640 "
"	17	14	23	640 "
"	19	14	23	640 "

Title direct from the Crown. Well settled districts surround these lands and good roads to them.

Terms of payment reasonable.

APPLY THIS OFFICE.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

C. P. SCLATER, . . . SECRETARY-TREASURER

HEAD OFFICE, . MONTREAL.

H. C. BAKER, Manager Ontario Department,
HAMILTON.

This Company will sell its instruments at prices
ranging from \$10 to \$25 per set. These instru-
ments are under the protection of the Company's
patents, and purchasers are therefore entirely free
from risk of litigation.

This Company will arrange to connect places
not having telegraphic facilities with the nearest
telegraph office, or it will build private lines for
firms or individuals, connecting their places of
business or residences. It is also prepared to
manufacture all kinds of electrical apparatus.

Full particulars can be obtained at the Com-
pany's offices as above, or at St. John, N.B., Hal-
fax, N.S., Winnipeg, Man., Victoria, B.C.

STYLE 26 B, - PRICE \$115.00.

ORCHESTRONES.

Department of Inland Revenue.—An Act respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, and which is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of

analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspector, to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue.

E. MIALL,
Commissioner.

MICA WANTED.

EVERY quantity of selected quality cut in square from 2x3 to the largest sizes which exist, or slabs to be cut in squares of the told sizes. Samples with lowest prices and notice of quantity and term of delivering may be addressed to Max. Raphael, Breslau, Germany.

Director George H. Cook, in the sixth annual report of the New Jersey Experimental Station for 1885 says, "The more difficult the solubility of these phosphates the less their price; while on the other hand it is claimed that under certain and not unusual conditions the lower priced ones will give the largest returns in increased crops. A more useful work could

hardly be undertaken by the experiment station than a series of field experiments for the purpose of testing these claims.

"In the trials begun in 1885 at this station in the case of five experiments out of the eight on different forms, the phosphate being used with potash and nitrogen compounds, the increase of crop was greater with the more insoluble phosphate than with the more expensive superphosphate, and that in three of these five cases the 'floats,' the cheapest of all, did the best work, goes a little way, at least, toward showing that the superphosphate may have had its day."

Mr. W. H. Bowker in his lecture on Homopathy and Agriculture," says, "There may be places where insoluble phosphates can be advantageously applied, as upon lands covered with fruit trees or devoted to grass. Perennial plants, like grasses and trees, no doubt extract phosphoric acid more readily than annual plants, owing to their numerous and well developed roots. Winter grains, especially wheat, from the long time it occupies the ground, and its growth in the fall, may also be benefited by an insoluble or partially insoluble phosphate."

Calling attention to these statements, Mr. Ward says that in 1884 more than four-fifths of the cultivated land in New England was comprised in the hay crop, while the pasturage adds a vast acreage. If it be admitted that the crude phosphates are serviceable even to grass alone, an incalculable field is opened for their use.

There is no subject of greater importance to Canada than this one, and it is to be hoped that our Agricultural Bureau will give earnest attention to experiments that may tend to supply our farmers with a cheap and effective fertilizer, easily obtained, pleasant to handle, and inviting confidence by its simplicity. This would render more "protection" to agriculture than can be obtained from any amount of fiscal legislation, and would utilize extensively the valuable phosphate deposits which Canada has the good fortune to possess.

Gold Mining in the Yukon Country.

Dr. G. M. Dawson, Assistant Director of the Geological Survey of Canada, and his assistant, Mr. McEvoy, have returned to Ottawa from their preliminary survey of the Yukon country. Being interviewed with special reference to the gold mining in that vast region Dr. Dawson very kindly gave us the following information:

In the Cassiar country placer mining has been in progress for a number of years, and some very rich creeks were formerly worked. Mining is still carried on, though now largely by Chinese. Quartz veins of considerable size are known to exist in a number of places in the immediate vicinity of some of the paying creeks, but so far no attention has been paid to quartz mining. As this section is of comparatively easy access from the coast and a waggon road could be constructed without

difficulty from the head of navigation on the Stickeen, it seems very desirable that efforts should now be made to test some of the quartz deposits.

East and north of Dease Lake, on the Dease and Liard Rivers, placer mining was some years ago quite remunerative. Still further north, along the Lewis, Pelly and Stewart Rivers—branches of the Yukon—and their tributaries, miners have been working river bars for several years past. The aggregate length of these streams, along all of which gold in greater or less quantity is found, is great, and the total area of the gold producing region which they drain is very extensive. During the summer of 1886 most of the work was done on the Stewart River, but in consequence of the discovery of 'coarse gold' at Forty-Mile Creek—further down the Yukon—nearly all the miners went to that stream this year. Forty-Mile Creek has now been prospected for nearly 100 miles in length, and some rich bars discovered, though the miners unite in saying that the gold is 'spotted,' or unequally distributed. About 250 miners are estimated to have been at work this year.

Asked if the reported hardships and difficulties were adequate to the results obtained by the miners, Dr. Dawson said that while there was undoubtedly much difficulty and many hardships to be faced, mainly owing to the inaccessibility of the country—there being no practical route, and also from the limited working season and the difficulty in working frozen ground when covered with moss and wood, he still had reason to believe that on the average good pay had been obtained, and while numbers were found to speak disparagingly of the results, on the whole he thought that the miners were very well satisfied with the country. He did not think, however, that any other than miners experienced in work on the western coast, men well accustomed to hard work and able to cope with difficulties of no ordinary character should be encouraged to enter the country at present.

Supplies are brought up the Yukon from its mouth in Behring Sea, yearly, by one or more steamers. The trading post now furthest up is near Forty-Mile Creek, but steamers could ascend much further if required. Supplies brought in thus, however, do not arrive till August, which is too late for the summer work of the miners. It is therefore customary for miners to carry in supplies over the Chilkoot Pass and down to the Lewis River. The best way, when possible, is to spend one winter in the country and thus get two good summers work. Little attention has yet been paid to other minerals than gold, but coal has been found on the Lewis, and evidences of copper are frequently met with.

The published maps of the country which at present exist are very incomplete and inaccurate, and though much still remains to be done, the work of Dr. Dawson's expedition will enable a much more accurate delineation of the region.

New Process of Treating Crude Phosphate.

Mr. F. S. Shirley, New Bedford, Mass., and managing director of the grinding mills at Buckingham has discovered a new process by which apatite in its crude state is rendered soluble to a marked degree in water and by which, it is claimed, that the poorer rock which now goes begging can be utilized and made marketable. Mr. Shirley is having his process thoroughly tested by several eminent agricultural chemists and as soon as their reports have been made known they will be communicated to our readers through these columns. The matter is one of vital importance to our phosphate industry and we await further developments with interest.

Our Asbestos Industry.

R. W. Ells, M.A., L.L.D., Geological Survey, of Canada.*

The mining of asbestos is carried on at several points along the line of the Quebec Central Railway, viz., at Thetford, Black Lake, Coleraine and Belmina. Some work has also been done near Coleraine station. Near Danville, four miles from the Grand Trunk railway, a mine of considerable extent has been operated for several years. As this industry has already grown to large proportions and bids fair to become one of the most important in the Dominion, a brief description of the various asbestos properties, its mode of occurrence, and some facts bearing on the future of the industry may be of general interest.

The various companies engaged in mining asbestos at Thetford are King Bros., the Boston Asbestos Packing Co., Johnston & Co., and Ward Bros.; while at Black Lake and Coleraine are situated the mines of the Anglo-Canadian Co., Frechette's and the Lionais Martin or Scottish Canadian Company's property. These all lie along or near the line of the Quebec Central railway which crosses the property at Thetford, while at Black Lake it is from a quarter to half a mile distant from the workings. At Belmina which is about four miles from the railway at Coleraine station, a small force of men, from six to eight, have been engaged for several years, merely on exploratory work on property owned by Mr. John Bell, of London, England. With a view of acquiring more definite information concerning this valuable mineral, a somewhat detailed examination of all these properties was made in order to render assistance, if required, to any parties interested in this industry.

All the asbestos mines in the Eastern Townships are situated on portions of the great serpentine belts which extend in tolerably direct lines, though with many breaks, north-eastward from the Vermont boundary for some distance beyond the Chaudière river. Further east these peculiar rocks present large areas in the Shickshock Mountain Range, which extends through the northern portion of the Gaspé Peninsula in rear of Ste. Anne des Monts, and further east on the lower part of the Dartmouth river. Though indications of asbestos are found at most points throughout the whole serpentine formation, the developments of this mineral appear, in so far as yet known, to be greatest in the areas about Thetford and Black Lake and near Danville, though there is no apparent reason why it should not be found in paying quantities at other points, and it is prob-

able that subsequent exploration will largely extend the area where profitable mining operations can be carried on.

The serpentines, without going into any detailed account of their mode of formation, may be stated to be intimately associated with masses of dioritic or doleritic rocks, of certain varieties of which, rich in olivine or some allied mineral, the serpentine is in many cases doubtless an alteration product. The serpentines are also frequently associated with masses and dykes of whitish rocks, often composed entirely of quartz and felspar, but at times with an admixture of black mica, forming a granitoid rock. They occur generally not far from the axes of certain anticlinals which exist in the group of rocks designated the altered Quebec Group by Logan. The asbestos traverses the serpentine in veins, often irregular, and which range from mere threads to a thickness of three and even in some cases of six inches, in all of which the fibre of the vein is, unless affected by the dislocations of the containing rock, at right angles to the sides of the fissure. The rock is in many cases somewhat impure from the admixture of grains or small irregular veins of chromic iron, which break the continuity of the fibre in the vein and require the mineral to be carefully 'cobbled' in order to separate these impurities. The veins at or near the surface are also affected by the infiltration of water by which the asbestos is discoloured and its value correspondingly reduced. This is especially noticeable in areas where the surface serpentine is shattered, either by the action of weather or other causes, and this discolouring ceases as the rock becomes solid. As a rule the veins increase in value or quality of fibre as lower depths are reached. Veins are not, however, continuous; the size frequently varies, and like all mineral veins they are affected by faults or slides which often cut off, completely, a valuable working face. In such cases the slicken-sided character is very marked; sheets of impure or imperfect asbestos with long coarse woody fibre lying along the lines of fault. The veins have often the aspect of true segregation veins, and the containing walls often change their character for a distance of half an inch to three inches on each side of the vein. The theory of their formation is however as yet an open question.

Asbestos mining was commenced at Thetford in the year 1878, by what is now known as the Boston Asbestos Packing Company. The demand at that time was exceedingly limited and considerable difficulty was at first experienced in finding a market. The output for that year did not exceed 50 tons, but its value was soon ascertained and explorations on the serpentine belt at this place resulted in finding asbestos in workable quantity over a considerable area.

The Thetford river appears to mark the western limit of the serpentine on these properties, the rocks on the other side of the stream being altered slates and sandstones. To the east of the railway which cuts directly across the area the serpentine forms a knoll with an elevation of about 90 to 100 feet above the track. All the works are confined to this portion of the area and consist of open cuts in the face of the hill, nothing apparently having yet been done to ascertain the value of the area between the railway and the river.

The quality of the asbestos at all the four mines at this place may be stated as excellent. The fibre is fine and readily worked and the veins are, for the most part, especially in the lower cuts, comparatively free from chromic

iron or other impurities, reaching a width of from three-quarters of an inch to four inches, though in some, notably the quarry of Johnston & Co., veins of five or six inches are observed. The fibre in these large veins is not however of such good quality, in so far as yet worked, as that found in those of less size, and veins of one and a half to three inches give as good material as can be wished. Numbers of such veins yielding fibre which ranks as extra first quality are found in all the mines at this place. In some of the cuts these appear as a perfect interlacing network in the surrounding walls and can be counted by the dozen. While all these properties may be said to be about equally productive that of the Boston Company may be especially mentioned both for the amount of its output, which will probably equal that of the three others combined, as well as for the excellent way in which the property has been developed by its experienced manager, Mr. Thomas Sheridan, with a view to successful future operations, and also as illustrating the remarkable improvement in the quality and increase in the quantity of the fibre as the depth increases; a feature clearly established at all the mines, not only in this vicinity but also at Black Lake.

The profitable output of the asbestos is at present apparently only limited by the demand. The amount extracted since the commencement of operations here may be briefly stated thus:—

Boston Asbestos Packing Company, opened 1878, output for 1886, 700 tons. Total output to end of 1886, 3,000 tons.

King Bros., for 1886, say 250 tons, adjoining to north, total since 1881, 850 tons.

Irving Johnston Company, for 1886, say 400 tons, opened since 1879, total 2,500 tons.

Ross-Ward Bros., one quarry, three years only, say 400 tons.

The cost of extraction varies in different localities and depends upon the amount of barren rock encountered, which owing to the action of faults is greater in some cuts than others. It may, however, be safely put down at \$20 to \$25 per ton.

The prices obtained for the asbestos at points of shipments on railways range from \$50 to \$55 per ton for second quality to \$80 or even \$100 for first, a considerable portion of that taken from the lower cuts realizing the latter figures. The markets are Great Britain, Germany, Belgium, the United States and Italy.

The majority of the veins worked range from three-fourths of an inch to two inches and a half. The material is blasted out, carried to the dump, broken up and cobbled by boys and old men, who grade the asbestos, this latter depending upon the colour as well as purity of the fibre, with due regard to its length. The wages paid for labourers in the quarry range from \$1 to \$1.10 per day, and for boys and cobbles, 50 cents.

The comparison of the cost of extraction with the value of the raw material shows a very good margin for profit. The works at this place are, however, carried on, for the most part, during the six months of summer and autumn only, since it has not as yet been found advantageous, in view of the limited market, to undergo the inconvenience and extra expense of continuing operations during the winter. As the market enlarges, however, the mode of working will doubtless adjust itself to the demand. The properties worked at Black Lake are situated on the west side of a steep ridge of serpentine which rises to a height of about 900 feet above the waters of the lake itself.

The three areas are contiguous and from a fourth to a half mile east of the railway. The work is carried on by open cuts in the face of the hill, in all of which veins of excellent asbestos are disclosed, ranging in size up to four inches. The fibre is, in most of these, somewhat discoloured from the presence of water which penetrates the shattered serpentine, and, as a consequence, the greater portion of the output grades as second; but in most of the openings the solid rock is now reached, and the quality of the asbestos is rapidly improving. These mines have not been in operation so long a time as those of Thetford, but the output, which is as follows, show readily the growing importance of this locality:

The output of the Anglo-Canadian (formerly Hopper's mine), for 1886, may be stated at 330 tons, and the total output for the four years, 1,500 tons.

The Frechette mine has been at work only one year, with an output of about 200 tons.

The Lionais-Martin mine, now the Scottish-Canadian Company, has done a large amount of exploratory work. Its estimated output for 1886 may be stated as 250 tons, with a total from the commencement of, say 700 tons.

The cost of mining here varies but little from that at Thetford, and may be stated as averaging \$25 per ton.

In the vicinity of Black Lake several other areas occur, in which the exploratory work done, though not very extensive, shows indications that fully warrant the statement that a valuable and profitable output may be expected. These properties are known as the Reed and Hayden properties, and are situated on Lots 27 and 28, Range B, Coleraine. In various open cuts in the side of the hills numerous veins are disclosed, ranging upward to a width of two and a half inches, with surface indications apparently in no way inferior to those of the adjoining properties now being worked at this place, or even of those of Thetford, not only as to number and size of veins but also as to quality of fibre. These indications appear at many points on both the Hayden and Reed properties, which embrace a total of 200 acres. Between these and Caribou Lake the serpentines extend as an apparently continuous ridge, and show at intervals very good indications of asbestos, but this portion has not as yet been explored to any extent, and but little can be said from actual examination of the value of this section of the serpentine belt, though that it will be found equally productive with the adjoining areas seems reasonable.

In the vicinity of Coleraine station serpentine also occurs, but the main ridge, extending south-west from Black Lake, keeps to the north-west about one mile and a half, where it forms a conspicuous hill feature. This has been but little examined, but an opening was made on its south-east extremity during the present year by Mr. Kennedy, disclosing the presence of a number of veins of asbestos, one of which had, near the surface, a thickness of nearly four inches. Sufficient work was not done to determine the persistence and value of these veins. An interesting feature in connection with this opening is the presence of mica in considerable quantity in direct contact with the asbestos, a feature not as yet noted at any other point.

The asbestos area of Wolfestown is situated on the north east extremity of a serpentine ridge, which extends south-westerly, with several interruptions from the road leading from Coleraine station to Wolfestown, to the vicinity of Lake Nicolet. It is owned by Mr. John

Bell, of London, Eng., and though a considerable sum of money has evidently been spent on this property it has been largely in the way of explorations. The surface indications, while not equal to those of Black Lake, yet show at several points numbers of veins, some of which reach a thickness of one and a half and even two inches. Only a small force of men is employed, and the property cannot yet be said to be fairly proved. Considerable deposits of chrome iron are found in the hills on this area, which embraces 600 acres. At present it would be exceedingly difficult to give any decided opinion as to the merits of this property. A very fair showing of workable veins has been exposed in the upper part of a deep cut which it is now proposed to intersect at a considerably lower level. Should the same rule of increase which holds at Black Lake and Thetford apply here, there should be good paying ground when the lower level is driven in past the capping of barren rock, provided the veins already disclosed are not cut off by faults, whose presence is noted here as at other points. The total amount of asbestos taken from the Belmina area is about twenty-five tons.

In addition to the properties already described the only other point where this mineral is worked successfully is on Lot 9, Range 3, Shipton, about four miles from Danville on the Grand Trunk Railway. The outcrop of the serpentine is quite limited here, with steep sides all round, and contains a number of veins of asbestos, mostly of small size though the quality of the fibre is good. Faults have affected the value of this property considerably, some very good veins with a thickness reaching two inches having been cut off completely at a depth of 50 feet from the surface. The output, however, is considerable, for the year ending 28th August, 1886, being 450 tons, but from various causes it is at present much less, the mine not being worked to its full capacity.

It will be seen from the facts here presented that the asbestos interests of the province are very important, and judging by the ratio of increase for the last six years will soon assume large proportions. The demand is annually increasing as new uses for the raw material are being found, and from the prospects presented not only at the mines already opened, but in those areas contiguous and which appear equally rich, the supply is practically limitless.

The Utility of Crude Phosphate as a Fertilizer.

48 Congress St., Boston.
1st November, 1887.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—Noting your article in regard to Ground Phosphate and the utility of its application to the soil in its crude state, I feel that the miners and others interested in phosphate do not fully realize the advantages they are losing by inaction and their failure to push their product more into notice, for no matter how advantageous its effects may prove, to be appreciated it must be constantly brought to the notice of the agricultural world, and by persistent trial prove its value so as to receive the endorsement of such recognized authorities

as will vouch for the effective results of its application. I have been informed that some little time ago Mr. R. C. Adams, of Montreal, requested subscriptions for the purpose of introducing this article in the United States, but it was not responded to. Prof. Shaler, of Harvard, has unbounded faith in the utility of the crude material, but requires funds for experiments, and other professors are ready to test its efficacy but naturally feel that as it is the phosphate industry that is to be benefited it seems only fit that those interested in it should be the ones to contribute to the expense, as a small contribution from each would create a sufficiency for the purpose. I trust you will urge its being carried out; if money is lacking let the mine owners contribute the material, say if each mine will contribute from three to five tons of rock and the mill you refer to the grinding, a sufficient quantity would be accumulated to furnish the several United States Experimental stations with a supply for a fair test. Now is the time; for it should be dressed in before winter, and its beneficial results will record themselves next year and soon score a convincing mark that cannot be questioned or rubbed out. Trusting you can enthuse the interested ones.

I am sir, yours, &c.,

F. STACEY SHIRLEY.

Seabury, Que., 9th Nov., 1887.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—We note the remarks in your October number in regard to ground phosphate, and it seems a great pity that the value of this in its crude form, without any acid treatment, is so little known, and more so that some organized effort cannot be made to secure it the attention it deserves, for though the effects on the soil are not so rapid as the high priced fertilizers, the lasting effects obtained are more than an equivalent for its lack of rapidity, especially when the cost is compared, the mild acids formed in the soil and constantly accumulating from atmospheric changes, forming a continuous solvent for it. It is becoming a question with agricultural scientists whether under all circumstances this will not in the long run prove the most profitable when the results are considered against those from high grade fertilizers; for though these produce big results they also impoverish the soil and render their continuous use a necessity, whereas the steady improvement of the soil while giving fair average crops is the proved result of the application of the crude rock when finely ground.

We hope you will use your best efforts to make its value known, for on this depends not only the continued advancement of our phosphate industry but also better and more profitable results to our agricultural community.

The mills here are now idle owing to the low water in the river preventing the shipment of supplies of crude rock, but for this the output could have been readily doubled, as the power from the new wheel put in this season is unlimited, and the new grinders and cleaner lately erected make the equipment complete and ensure most satisfactory results.

Yours truly,

Du Lièvre Milling and Manufacturing Company,
per R. C. Hunton.

Montreal, October 27th, 1887.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—The use of crude phosphate on the soil is a matter of the greatest importance both to the phosphate industry and the country at

large, and it seems improper that we should be compelled to go outside of Canada to gain information on a matter of really national concern. The subject was urged upon Dr. Selwyn's attention last spring, and he stated that he should urge the necessity of making experiments on the Government farms. During the ten years that phosphate has been exported largely from Canada scarcely anything has been done to promote its home consumption, although the worn-out lands of Eastern Canada offer the most urgent opportunity for its use. Two struggling factories have attempted to introduce the phosphatic manures, but the lack of information as to its value has limited their use.

A New England firm writes: "We are doing all we can, without going to too much expense, to educate the farmers of this section to the advantages of using ground apatite, but it is very difficult in the absence of any testimony as to its advisability by known authorities on fertilizers. At the same time we believe that a little money expended in advertising its merits would be a good investment on the part of those interested in mining it."

Your journal cannot do better service than to urge upon the agricultural departments of the Government the desirability of prompt and thorough experiments and the diffusion of knowledge as to the results of the use of phosphate upon the soil in various forms.

It would be wise also for the producers to encourage every possible experiment in the United States, as the northern portions along the lake shore are the natural field for the consumption of Canadian phosphate, and an immense demand must arise there in the future.

Yours &c,

ROBT. C. ADAMS,

Managing Director Anglo Canadian Phosphate Company (Limited).

Improvements in Coal Washing.

In an exhaustive paper on this subject, read before the South Wales Institute of Engineers, Mr. R. de Solderhoff has separated the treatment into three divisions:—(1) Sub-division of coal according to sizes; (2) Washing the coal; (3) Storage and loading of the washed coal. Sometimes also when coal above $\frac{3}{8}$ inch in size has to be used for coking, the coal has to be crushed after it is washed. Also at times when two different kinds of coal are washed, then the mixing takes place after washing, and simultaneously with storing and loading. The apparatus used to sub-divide the coals described are revolving screens, reciprocating tables, and pointed boxes. The washing machines are of two kinds: one to wash $\frac{5}{8}$ -inch to $\frac{3}{8}$ -inch coal, and the other (the felspar washing machine) for washing coal of sizes from $\frac{3}{8}$ -inch to impalpable powder.

Having described the principal elements of a washing plant, the writer gives a description of the very complete and simple plant at the Hohenzollern collieries in Upper Silesia, and the more complicated plant at Dowlais. The washing machinery at the Hohenzollern colliery is situated quite close to the pit, and the whole of the coal is tipped upon two screens placed side by side. The large coal above 3 inches is taken by a Briard transporter and carried to the railway sidings, while the smaller coal drops into a 120-ton bunker placed beneath the screens. From the bunker the small coal is lifted by means of an elevator to the top of the building, where it is submitted to a first

sizing in a revolving screen, which divides it into six sizes.

The first five sizes are washed separately, in five machines ranged on the first floor of the building. After being washed the coal is drained in five short revolving screens, and each of the five sizes is stored in a separate bunker overhanging the railway sidings. The water drained off from the screens is used for steeping the smallest sized coal. This fine coal is separated into five sizes in a pointed trough, and each of these sizes is washed in a separate felspar washing machine. The small coal after being washed mixes together in a trough, which takes it to a cistern from which an elevator with perforated buckets lifts it into the bunkers. The washing machinery is capable of treating 400 tons of coal in ten hours, and requires 32 cubic feet of water per minute. The building is 53 feet long by 35 feet wide and 45 feet high. A horizontal single cylinder engine is employed.

The Dowlais washing plant is of a more complicated character, owing to the machinery having to be erected on a long narrow slip of ground divided by an arched-over incline, and provision having to be made for washing bituminous and steam coal separately. The arrangement therefore comprises two sets of plant—the washing system for bituminous coals, and the washing system for steam coals. The bituminous coal is brought to the Shephard machine, which existed previous to the erection of the new washing machine, where it is crushed by means of rolls. It is then elevated into a revolving screen, which divides it into two sizes—from $\frac{3}{8}$ -inch to 0, and from $\frac{3}{8}$ -inch upwards. The nut coal, from $\frac{3}{8}$ -inch upwards, is raised by means of another elevator into a second revolving screen, placed above the Shephard washing machines. This screen divides the coal into five sizes, which are each washed in a separate machine. After washing, the nut coal is raised by an elevator into bunkers—from which the nut bituminous coal may be discharged into waggons as required. The fine bituminous coal, from $\frac{3}{8}$ -inch downwards, is transported by a current of water along a trough to a revolving screen, which divides the coal into two sizes, from $\frac{1}{4}$ -inch to $\frac{3}{8}$ -inch, and from 0-inch to $\frac{1}{4}$ -inch. The coal from $\frac{1}{4}$ -inch to $\frac{3}{8}$ -inch is washed in two felspar machines placed immediately below the screen, and the coal from 0 inch to $\frac{1}{4}$ -inch is conveyed by a current of water to a pointed trough. It is here divided into six sizes, each of which is washed separately in the felspar machines placed next to the pointed trough. The bituminous coal, $\frac{3}{8}$ -inch and upwards, is sent from the elevator raising the washed coal into a crusher. After being crushed it meets the small steam coal in a bunker situated below the crusher, from which the elevator raises the coals, already partly mixed, to a screw placed on the bunkers erected in front of the crushing department. The screw finally mixes the two coals and distributes them into bunkers, from which the small mixed coal is taken to the coke ovens.

The steam coal is also treated in the new washing arrangement. Arriving in waggons, it is tipped into a bunker, and from there an elevator raises it into a large revolving screen. This screen divides the coal into six sizes, one of which is 0 to $\frac{3}{8}$ -inch, the five others varying from $1\frac{1}{4}$ inches to $\frac{3}{8}$ -inch. The last five sizes are each washed separately in five machines ranged on the ground floor, whence the coal is run off on to five reciprocating tables for the purpose of draining off the water. The dry coal drops into bunkers, whence it may be sent

away in railway waggons. When, however, the five sizes are required for coking, the coal is sent by a trough into a revolving screen, fixed next to the crushers, whence it is taken in a dry state by means of a screw to the crushers. The water draining off, which contains small coal in suspension, coming from the drying revolving screen and the reciprocating tables, returns to the felspar machines.

The fine coal from 0 to $\frac{3}{8}$ -inch, from the large revolving screen, enters first into another revolving screen, which divides it into two sizes, $\frac{3}{8}$ -inch to $\frac{1}{4}$ -inch, and $\frac{1}{4}$ -inch to 0. The first size is washed in two felspar machines, while the second and smaller is carried by water to a pointed trough similar to that used for dividing the bituminous coal. The pointed trough divides the coal into six sizes, each of which is washed in a separate machine. All the fine washed coal in a felspar machine runs together into a large basin, whence an elevator with perforated buckets raises it to the top of the bunkers. This small coal may be bunkered if desired; if not, it may be sent by transporter to the crushing building, where it is re-mixed with the crushed bituminous and steam coals. The overflow of small coal from the small-coal basin runs first into a long trough provided with a screw, and as the small coal settles, the screw brings it back to the common small coal basin, whilst the water runs into settling ponds or clarifiers. The clarifiers are three long pointed troughs, provided with a screw situated underneath. The dirty water, after having passed through the clarifiers, returns to the well of a centrifugal pump, by which it is sent back and redistributed to the washers. The mud, settling in the clarifiers, drops by gravity into the trough of the screw, which transports it to an elevator which raises it and drops it into a bunker.

The Canadian Iron Trade.

By James H. Bartlett, M.E., Montreal.

I desire, very briefly, to call the attention of the Institute to the Iron trade of the Dominion of Canada.

A wonderful development is now going on in Canada. The completion of the Canadian Pacific Railway, and the numerous extensions of the various railways all over the country, combined with the progress made in nearly every kind of manufacture, is drawing attention to the field offered in Canada for the profitable employment of capital, and specially to the opportunity there is for the manufacture of iron.

In a paper presented to the Institute at the Halifax meeting,* the writer gave a review of the various attempts to manufacture iron in Canada. The facts then presented were not such as to offer much encouragement to anyone to embark in similar enterprises under the conditions then existing, but, happily, these conditions are now changed, and an early development may be anticipated.

There are two reasons which make the present time an appropriate one to direct attention to the field offered for enterprise in this direction, the first being the favorable reports of the experts who examined and reported on the exhibit of minerals at the Colonial and Indian exhibition, held in London, England, last year. The exhibits there of coal and iron attracted so much attention that at the request of the Iron and Steel Institute a paper on the "Ironmaking resources of our Colonies as illustrated by the Colonial and Indian Exhibition," was prepared and read at the last meeting of the Institute.

This report of 135 pages is very exhaustive, and the conclusion arrived at, so far as Canada is concerned, is, that she has in many parts of the country every natural facility for the manufacture of iron.

The second and more important reason is the recent change in the Canadian customs tariff inaugurated in May last. The tariff is now generally two-thirds of the American tariff, in addition to which the Government, in order to encourage the manufacture of iron, grants a bounty upon pig-iron made in Canada out of Canadian ore.

The present tariff changes in full are to be found in the Appendix.

It will be remembered that the Provinces forming the Dominion of Canada were only confederated in the year 1867. Previously they were all separate and distinct colonies, each with its own fiscal tariff. After confederation the customs tariff was simply a revenue not a protective tariff, until the year 1879, when an import duty of \$2 per ton was imposed upon pig-iron which previously had always been admitted free of duty; but the iron section of the tariff was still very incomplete. As Canadian iron-workers' wages are regulated by Pittsburgh wages, it is impossible, unless sufficient protection is afforded, to compete with Belgian, German and English manufacturers whose wages are on a much lower scale.

With one single exception all manufactures of iron in Canada have been made with charcoal as fuel. Many of the attempts were made early in the century, when the operations were of very small dimensions. The only furnaces which have been successful have used bog iron-ore and have made only a few tons of iron per day.

The various attempts to make charcoal pig-iron and blooms in the four older Provinces of Ontario, Quebec, New Brunswick and Nova Scotia, have generally met with a want of success. The failures are clearly attributable to want of protection, the sparsely settled condition of the country, want of transportation facilities, and of judgment in the selection of the situation.

The market, as may be supposed, was at the time very limited, as, saving the small quantity of charcoal pig-iron required in making car-wheels, there was no home market, except in competition with imported coke-iron, to meet which was impossible. A variety of experiments have been made, which are counted as failures in the iron manufacture, bringing unwarranted discredit upon this industry. The experiments in many cases were costly, and were undertaken by patentees of all kinds, of no standing or experience in the trade. The only attempt ever made to manufacture coke pig-iron and refined bar-iron has proved the possibility of doing so. The quality of the article is in both cases superior to that imported and commands a higher price.

The importance of the manufacture of iron to the country generally will be appreciated when it is stated that the total balance of trade against Canada from 1868 to 1886 was \$381,000,000. The total value of the imports of iron and steel during that period was \$253,250,000, from which it may be assumed that the balance of trade would have been in our favor, had we made our own iron.

A great bar to the trade has been a want of information regarding the extent of the market to be supplied. This difficulty has been to some extent removed, the writer having collected and tabulated the statistics of the

Canadian iron trade for all the years since confederation, so that it is now possible to see what has been required in the past, and to estimate what will be necessary in the future.

Some particulars of the nature and extent of the Canadian iron trade may be of service at the present time as a guide to anyone desirous of ascertaining facts necessary for the direction of enterprise in this special field. The confederation of the Dominion of Canada took place in 1867, and particulars of the trade only date from then.

The following table will show the Canadian iron trade.

Imports of Iron and Steel and Manufactures thereof into the Dominion for Home Consumption for years.

1868.....	\$ 6,885,365
1869.....	7,385,780
1870.....	7,750,867
1871.....	10,808,645
1872.....	15,913,179
1873.....	25,435,020
1874.....	20,700,387
1875.....	18,199,198
1876.....	12,965,117
1877.....	11,082,321
1878.....	9,398,306
1879.....	7,962,295
1880.....	10,123,660
1881.....	12,955,855
1882.....	17,499,488
1883.....	20,080,274
1884.....	14,790,727
1885.....	11,415,713
1886.....	11,053,365

Total..... \$253,210,512

This large amount of \$253,000,000 was paid out in hard cash by the people of Canada to support the iron industries of other countries. Of this amount \$94,879,630 was free, and \$158,330,882 dutiable.

The value of iron and steel and their manufactures imported into Canada for home consumption during sixteen years, 1868 to 1884, is over \$230,000,000. The trade is divided into seven headings, the value of imports under each from 1868 to 1884 being as follows :

Iron.....	\$75,179,153
Steel.....	9,938,614
Rails.....	43,068,618
Castings and forgings.....	9,703,717
Cutlery and edge tools.....	10,742,331
Hardware and manufactures....	47,926,637
Machinery and engines.....	29,182,414

Total..... \$230,741,484

The imports under the headings alone of iron, steel and rails amounted in 1883 to 328,838 tons, and in 1884 to 273,967 tons; and the annual import since 1875 has averaged over 250,000 tons.

It might be supposed that a very considerable proportion of this weight is due to rails for the Canadian Pacific Railway; but apart altogether from the Pacific rails, there have been on the average over 64,000 tons of rails imported each year for the past ten years.

For a young country with a small population, the amount of iron and steel consumed in Canada is remarkable. In the year 1878 a greater money value of iron and steel was imported into Canada than into the United States; and not making any iron of our own, the value of our consumption of iron and steel, *per capita* of the population, is always many times as much as the value of the imports *per capita* into the United States, as will be seen by the following figures :—

The following table shows the *per capita* consumption of imported iron, steel and manu-

factures in Canada and in the United States since 1868 :

Year.	Canada.	United States.
1868.....	\$2.04	\$0.69
1869.....	2.17	0.74
1870.....	2.25	0.84
1871.....	3.01	1.09
1872.....	4.55	1.30
1873.....	7.01	1.39
1874.....	5.77	0.81
1875.....	5.15	0.46
1876.....	3.46	0.28
1877.....	2.89	0.22
1878.....	2.40	0.18
1879.....	2.00	0.20
1880.....	2.49	0.91
1881.....	2.98	1.00
1882.....	4.05	1.02
1883.....	4.56	0.75
1884.....	3.32	0.60
1885.....	2.28	0.50
1886.....	2.20	0.61

CANADIAN IRON WORKS.

There are in the Dominion at the present time only the following iron works:

Londonderry, N.S.—Two coke blast-furnaces and puddling-furnaces, with refined bar-mill, forge, etc.

Radnor, near Three Rivers, Que.—One charcoal blast-furnace.

Drummondville, Que.—Two charcoal blast-furnaces.

New Glasgow, N.S.—Open hearth steel furnace and rolling-mill.

Halifax, N.S. (one); *St. John, N.B.* (three); *Montreal* (four); *Hamilton, Ont.* (two); *London, Ont.* (one)—rolling mills for re-working scrap and puddled bars, mostly into nail plate.

New Glasgow, N.S. (one); *Hamilton, Ont.* (one)—forges for re-working scrap, mostly into car-axles.

Montreal.—Rolling-mill for making butt-welded pipe; foundry for steel castings.

Toronto, Ont.; Hamilton, Ont.—Foundries for cast-iron pipes.

In Canada, as in the United States, the greatest consumption of iron and steel is created by the construction of railways. When the change from iron to steel rails took place, there were four rolling-mills re-rolling iron rails in Canada, one in Montreal, two in Toronto, and one in Hamilton. The substitution of steel rails, however, caused the mills to suspend operations, their machinery and appliances not being suitable; the mills were dismantled, and the consequent losses have not yet been entirely forgotten. But another and a more recent disaster, namely, the commercial failure of the Steel Company of Canada, Limited, has been most disheartening, effectually dampening the enthusiasm of many believers in the possibilities of the development of our natural resources in this direction. It is hardly to be wondered at that the general Canadian public should lose faith, when an enterprise so brilliantly ushered into existence should only have lasted so short a time, and with such bad results, not only to the shareholders and others financially interested, but to the country generally. When the actual facts are known the reasons of this failure will be plainly seen. These facts are here presented simply with a view to clear the iron industry from this cloud under which it at present rests.

THE LONDONDERRY MINES.

In the forests of the Cobequid Hills, in the Province of Nova Scotia, miles away from any road or settlement, a vein of iron-ore was years ago discovered. Geologists visited the locality and pronounced the deposits of great extent, and a grant of land was obtained from the Government. A Catalan forge was built in 1850, and

three years later a small blast-furnace was put up, charcoal in both cases was used as a fuel, the trees from the forest around being made into charcoal. A small stream ran past the iron mine, and was made to drive the blast-engine. The iron-ore was very pure, so the pig-iron made was of superior quality. There was no home market, but it was exported to England, although the iron had to be carted to the nearest shipping-point, namely, Great Village, six miles away from the furnace, and situated at the entrance to a small tidal river on the Cobequid branch of the Bay of Fundy. Navigation on the upper end of the Bay of Fundy is dangerous; the tides, which here rise to the height of 71 feet, rush in and out with great rapidity; the river could only be entered at high tide by vessels drawing not more than 12 feet of water, and the navigation to the entrance of the river was bad. The construction of the Intercolonial Railway, which eventually was brought within three miles of the furnace (at the expense of permanently lengthening the main line by five miles, and unfavorably affecting the gradients and curvature) made the place more accessible. It was still only a little hamlet in the midst of the forest, but it was self-contained, having plenty of ore and timber for making charcoal. There was a demand for the iron, as, owing to its superiority, the English War Office, upon the recommendation of Sir William Fairbairn and others, were using it for the manufacture of ordnance. This was before the age of steel; no doubt the iron commanded a high price; and, altogether, the works were remunerative to their owners.

In 1873 the Acadia Iron Mines, as they were then called, were purchased by a company of a few English capitalists having Sir William Siemens at their head with a capital of two and a half millions of dollars. Their intention was to make steel directly out of iron-ore by a new patented process, invented by Sir William Siemens, and also to make coke, pig-iron, etc. This company, known as "The Steel Company of Canada," had its headquarters in England and managed the Londonderry business from there. They paid \$400,000 in cash and \$600,000 in paid-up stock for the Acadia iron mines, also \$40,000 for the patent rights, a total of \$1,040,000.

The accidental location of the little charcoal blast-furnace seems to have given rise to the choice of the situation for the new works. It would be different to account for the selection in any other way. Works specially designed for the new patented process, with rotators, regenerative melting furnaces with gas-producers, two blast-furnaces, branch railways to the Intercolonial Railway and the different ore-mines, houses, buildings, etc., etc., were built. The scale on which the expenditures were made can be best understood by reference to the item of cost for the manager's house, which came to \$40,000.

The works were completed and got into operation, probably at a further expenditure of about \$1,250,000. The new process did not seem to do very well; and after costly experiments, and repeated trials, it eventually proved here as elsewhere, a complete failure. Hundreds, perhaps thousands, of tons of expensive machinery had to be broken up, and the melting furnaces and gas-producers were pulled down. A second-hand rolling-mill was purchased, some puddling furnaces were built, an axle-forge with a foundry for car-wheels and general castings were added, and the products of the works was changed from steel to pig-iron, bar-iron and castings. The place was not now

self-contained, as before; charcoal was no longer the fuel used, so the trees were of little use, except for timbers in the iron-mines. What was wanted was coal and coke; and, although at the time of the purchase coal was supposed to be on the property, it has never yet been actually discovered. The coal-field of Pictou is 51 miles to the eastward, that of Cumberland 34 miles to the westward. Limestone in considerable quantities is required, and is obtained from Brookfield, 25 miles to the eastward. When, after having paid freight on all these materials, iron is made out of them, there is no outlet but by the same Intercolonial Railway, the distance by rail to Montreal being 773 miles.

This condition of affairs was bad enough; but the situation was made much worse by the fact that the company had never built any coke-ovens of its own, and that, at this time, only one colliery mined a coal suitable for coking, and also owned the only coke-ovens in the country. This colliery, consequently, supplied coke at its own price, helping materially to kill the goose which laid the golden egg. One day, an explosion took place in this particular coal-mine, set the mine on fire, and closed it. It has been closed ever since, but is now being opened again. For a time coke was not to be had, at any price; the blast-furnace had to be shut down, and the loss, from this cause alone, can be better imagined than described. After this experience, some coke-ovens were built, and to some extent this has made the company independent. Finally, a coal mine was purchased and fully equipped; but, upon practical trials, the coal was found to be to a considerable extent unfitted for the company's uses. It was also discovered that, through an arrangement to have the iron-ore mined by contract, the contractor had made money for himself, but had permanently injured one of the iron mines.

Instead of running a general store, from which a considerable revenue would accrue, some outsider was granted the privilege, and took advantage of it.

It is not surprising that, after all the vicissitudes, and in view, also, of the fact that until 1880 imported pig-iron was admitted free of duty into Canada, the company failed. It is more to be wondered at that the struggle was maintained so long.

In 1880 an import duty of \$2 per ton was imposed, and in 1883 a bounty of \$1.50 per ton of pig-iron manufactured out of Canadian ore was granted by the Dominion Government. Under these improved conditions, the company's operations were continued by the liquidators. Since the change in the tariff, a reorganization has been effected. The management is now centered in Canada, and the enterprise will no doubt be made productive to the proprietors and the country at large. Under a careful management, there can be no question that a satisfactory dividend can be earned upon the expenditure of the works as they stand.

It is manifestly unfair to condemn every projected iron-making enterprise in Canada simply because, in the past, this particular case has not succeeded. In spite of all their troubles, the pig-iron, bar-iron, and other products of the Londonderry works, have been of a very superior quality, and have always commanded the highest price in the market.

RESOURCES OF NOVA SCOTIA AND OTHER PROVINCES.

In almost every Province iron-ore is found in abundance, and the Provinces which have not coal have an abundance of timber fit for making charcoal. We possess the only deposits

of coal on both the Atlantic and Pacific shores; in Vancouver's Island and Cape Breton the coal seams run out under the ocean. In both these Provinces, British Columbia and Nova Scotia, nature has been prodigal with deposits of various descriptions of iron-ore of very good quality, and with plenty of flux, all in the immediate vicinity of the coal fields.

There are now a number of collieries mining a good coking-coal in Nova Scotia; and the railway construction now progressing there will bring an unlimited supply of fuel within reach of all parts of the Province.

In the county of Pictou, N.S., iron, coal, and limestone are found in the closest proximity; within a radius of ten miles there is everything necessary to build up a great and successful industry; and this mineral wealth is found on the seaboard, so that the products of the industry can be cheaply transported by water to the head of Lake Superior, if required; several descriptions of iron-ore are found in this county. There is specular iron-ore, with 68.33 per cent. of metallic iron; compact limonite, with 57.71; fibrous limonite, with 59.50; red hematite, and also fossiliferous hematite, with 54.36, and spathic ore, with 43.56.

(To be continued.)

OUR LADY FRIENDS will be interested in knowing that by sending 20c. to pay postage, and 15 top covers of Warner's Safe Yeast (showing that they have used at least 15 packages) to H. H. Warner & Co., Rochester, N.Y., they can get a 500 page, finely illustrated Cook Book, free. Such a book, bound in cloth, could not be bought for less than a dollar. It is a wonderfully good chance to get a fine book for the mere postage and the ladies should act promptly.

Phosphate shipments from Montreal to November 15th, 1887:—

The price for 80% phosphate continues firm abroad, and a sale has been made to a port on the west coast of Great Britain at a shilling and a farthing. One shilling per unit with ½d. rise is the quotation for 80% in the principal ports. Cable offers for ground phosphate have been received at 8d. per unit with ½ rise for 60%, and 10½d. per unit with ½ rise for 70%. Prices are also quoted at Buffalo and Chicago at \$10 per ton for 65% ground in bags. These enquiries show that the much desired demand for ground phosphate is increasing. English prices for the

lower grade crude phosphate remain at last quotations, 9d. for 70% and 10d. for 75%, both with ½d. rise, which is some advance over the ruling prices for the season. The sale of the grades has been somewhat hindered by competition from French phosphate and by offerings of Aruba phosphate at 8½d. for 70%.

The shipping season as usual closes with higher rates, as shippers do not like to carry stock over winter and therefore submit more readily to the demands of vessels. Rates to Hamburg were 15s. per ton; to England 10s. to 12s. 6d. direct, or 6s. 3d. via Southern cotton ports. The low water in the Lievre River has kept back a considerable quantity of phosphate which might otherwise have been shipped. The completion of the canal is eagerly looked for.

The reprehensible system by which large numbers of valuable phosphate properties are acquired, and held undeveloped by speculators, is severely commented on by the *Canadian Trade Review*, which in a recent article says:—

"The manner in which the phosphate racket is worked ought to have the attention of the Provincial Parliament when it next assembles, and the question might be considered whether it is not in the public interest to make such provisions that those who have mining claims and refuse to turn them to some practical advantage to themselves and the public should within a certain specified time be compelled either to work them or surrender them on payment of a royalty—to themselves and the province,—to such parties as may make *bona fide* offers to operate them. This locking up of one of the provincial resources out of which a public revenue is derivable ought not longer to be tolerated in the interest of mere speculators, who have at present every thing to gain and nothing to lose by their delay."

Two eminent United States scientists, in a report on phosphate deposits at present under consideration, have given an extended discussion to the question of the utility of crude phosphate as a fertilizer. When their studies are completed we are promised their report for publication in these columns.

Du Lievre District.

Operations are being conducted on a very much reduced scale at the Little Rapids Mine. The men are principally employed cobbing the ore.

Over 90 men are working on the new lock and dam at this point. The length of the lock is to be 135 feet, and it is thought the work will occupy a little over a year before it is completed.

A new cobbing house is being erected at the Union Mines, the lumber for which is being drawn from Holland's mills.

News reaches us from the North Star Mine that everything there is highly satisfactory. Mr. J. F. Higginson states that the last shipment has been made for this season. Capt. Williams states that the new boiler and machinery which has lately been put in proves very satisfactory and works well. He is making preparations on the wharves for his winter's drawing.

The Emerald, North Star and Union Companies have managed at last to get their output down the river. They have suffered much inconvenience from the low water.

The High Rock Company have supplied about 6,000 tons of phosphate, and there are about 4,000 tons remaining which the management have been unable to send down. A new

cobbing house 45x30 is being built which will make the tenth now on this property. Something like 170 men are constantly employed at this mine, which is one of, if not the best, on the Du Lievre.

Shipping on this river is gradually ceasing. Two mines have already finished their season's work, but one or two seem determined to push their produce through as long as they can.

Wakefield.

On the property recently acquired by Mr. W. H. Fuller, Ottawa, a pit has been sunk to the depth of 80 feet in a highly felsphatic rock enclosing some veins of a grayish-green apatite, portions of which are comparatively free from inclusions. Other portions of the veins, however, are somewhat mixed and require hand cobbing to make it at all marketable. This lot, together with some small pits on lots 17 and 18, in the 2nd range, will probably have yielded by the spring about 200 tons, including a first and second quality.

Kingston District.

At the property of Captain Boyd Smith, at Eagle Lake, there has been shipped to Kingston during the season about 1,800 tons of No. 1 phosphate, of which about 1,500 tons have gone to Montreal by barge, and the balance to Philadelphia. Any further shipments will go to the phosphate works at Philadelphia. The seasons output will average 85 per cent.

The No. 2 ore will be kept for shipment to Chicago and other Lake ports on opening of navigation next spring. Besides this there has been mined ready for market an amount of magnetic iron ore, in stripping veins and leads, and in prospecting for and mining phosphate, some 500 tons of which will average 65 per cent. This has been mined and saved at a mere nominal cost, as it was generally one of the walls of vein matter and would have to be taken out to make room for the mining of the phosphate along side of it, for, strange to say, both iron and phosphate are part of each other. Much more work would have been done this season but for the scarcity of efficient hands. Most of the miners in this section being employed at high wages by the new iron companies on the line of the K. & P. Railway.

Mr. Joseph Harris, superintendent of these mines, writes:—

"Until now we claim to have the best organized force for its size, and to be getting out the cheapest mined and highest grade No. 1 phosphate of any phosphate mine in Canada. This is in great part on account of exceptional cheapness of cobbing, owing to freedom from mica, pyroxene, rock and pyrites, or, in fact, any foreign matter (vide the report of Dr. T. Sterry Hunt), while for the markets of the United States we are so placed as to have a fair profit, in the difference of freights alone, in our favour. The phosphate, too, does not occur so much in bunches or in irregular quantities as elsewhere in Canada; but in regular leads or veins which can be depended upon for regular mining work."

On account of the scarcity of efficient hands there has been little work done at the St. George's Lake mines. There are some 150 to 200 tons of high grade No. 1 there to be shipped next season.

During the winter there will be employed on both properties between 50 and 60 of the best men sufficient to run a large force, and accommodation for these is being provided in the comfortable houses being erected. Cornwall miners and their families will be brought out and every endeavour made to mine and handle

from 4,000 to 5,000 tons of high grade ore, or more, should the market justify it. Captain Boyd Smith is of the opinion that the best market for all his output will eventually be found in the United States.

MINING NOTES.

Nova Scotia.

A preliminary meeting for the purpose of organizing a gold miners association was held at the *Critic's* office on Wednesday afternoon, the 9th instant. After some discussion on the necessity of such an association the meeting adjourned for permanent organization on Tuesday, 6th December.

Mr. Kamper, of the German Syndicate which contemplates establishing iron works upon an extensive scale in this Province, has recently stated that he and his associates are prepared to invest three or four thousand dollars in that enterprise provided the Government's fiscal regulations are favourable and the quantity and quality of available iron come up to their expectations. The syndicate manifestly intend operating on an extensive scale, for, everything being satisfactory, they contemplate turning out from forty to fifty thousand tons of iron per year and supplying all the steel rails that the Canadian market requires. The syndicate have engineers engaged making the necessary inquiries and experiments and will ship some hundreds of tons of iron to France to be tested there.

Quebec.

Very satisfactory reports continue to be received from the Wright Silver Mine at Lake Temiscamingue. Arrangements are being made with the Temiscamingue Railway Company to carry the ore eastward. The management expect to ship ore every week next summer.

A local exchange says:—There is talk of William McVeigh making a sale of his iron mine, which is situated at the end of the Grand Calumet Bridge. Another mine has been struck three miles east of here and is supposed to be rich. We think that the railway company will yet build a branch line here, if not a loop connecting Bristol Iron Mine, the McVeigh and all the other rich surroundings.

Mr. S. P. Franchot, reports that everything at the Central Lake Mine looks well, and we may look for great things from this new mine next season; the shows on the property are really fine and look to be of a high grade ore.

Work on the Hamilton Powder Co.'s new magazine is going ahead, and when completed will prove a boon to the mining community, who have long felt the want of such on the river from which they could obtain their blasting material without having to send to Montreal for it and very often experiencing great delays in transit. The magazine is a step in the right direction.

There is nothing very new to report in the matter of the recent find of gold on the property of Captain Bothwell. Several miners are at work and a ton or two of the ore is to be barrelled up and sent to England for treatment. The Captain states that he has certificates of

several analysis, which have since been made and which have all shewn gold in more or less quantities. He promised to send us copies of these certificates for publication, but up to the hour of going to press they have not been received. Despite the fact that assays made from specimens taken by uninterested parties from the pit, and made by Dr. Donald, of Montreal, and Dr. Hoffmann, of the Geological Survey, have been found void of any trace of the precious metal, Captain Bothwell has every confidence in his mine, and feels sure that he will soon be in a position to remove the doubts that are expressed by those skeptical of the value and importance of his discovery. The latest specimens of the ore shown us are certainly of a totally different character and of a much superior quality to those submitted when the discovery was first made public.

The Nailon property, one of the adjoining lots to that of Captain Bothwell's, has been purchased by a syndicate of four Buckingham gentlemen and is being worked for gold. The indications are reported encouraging.

The Graphite City Plumbago Mill is being put into thoroughly good shape, it being the intention to commence operations again there next summer. It presents rather a difficult job as the entire building 100 x 40 has to be raised in order to insert new timber and posts, however, under the superintendence of Mr. Chas. Devenney the work is pregressing satisfactorily.

Mr. Thomas Daley, of Upper Wakefield, has struck a valuable vein of the clearest mica, together with one of iron and another of stone suitable for porcelain, on lots 19 and 26, Portland Township, which he recently purchased. These mines are pronounced by an expert to be ones that will pan out handsomely.

Reports of an unusually busy season reach us from the mica mines of the B. & C. M. & M. Co., at Villeneuve. At present there is a very large demand for the product of the mine both in Canada and the United States, and in order to meet this two steam drills and a staff of forty men are kept hard at work both night and day. Work on the old pits has been stopped for the present, and slicing the hill from the outside is now being conducted on two beautiful seams of Muscovite of a very superior quality. The business has increased so much within the past few months that it has been found necessary to remove the hands employed in cutting, cleaning, sorting and packing the mica from Buckingham to the mines, where increased accommodation has been provided. This will greatly facilitate the handling of the product. Mr. Key, the mine superintendent, did not give satisfaction, and he has been superceded by Mr. Neil Cochrane, a miner of considerable experience. A market for ground mica has been found in Cleveland, Ohio, where it is used for lubricating purposes, and for this, large quantities of the waste product are being utilized. Pure white feldspar entirely free from iron or other deleterious impurities is found in large quantities on the property, and the management have good reason to believe that this will be utilized in the pottery manufacture. Dr. Stackhouse, of Ottawa, has made a report on specimens submitted to him, and states that for dental purposes alone the feldspar will prove of great value. Already several orders have been filled for Canadian dentists. The amount of

cuttable mica shipped for the month ending the 15th was over 3,400 tons.

Messrs. J. & C. Russell have lately put in some working plant at their silver mine on Calumet Island. Before winter sets in several car loads of the ore will be shipped to New York and Philadelphia where it will be smelted, and upon the results and expense of this operation will depend very much whether operations are to be resumed next season.

Ontario.

The two calcining furnaces at the Bristol Iron Mines are nearly completed, and the gas producer will be finished in the course of a fortnight. A cargo of gas producing coal is already on hand when roasting work will be commenced and about one hundred tons will pass from the mine through the calciners per day. A very convenient skip and self-dumping iron car is completed which will convey the ore direct from the bottom of the pit to the furnaces. The stock pile having become inconveniently large, mining was suspended for a time in order to make but one handling of the ore, which will now be done entirely by machinery. The company have not as yet settled the question as to whether the ore will be shipped the coming winter by the Brae Side, C.P.R., or by the P.P.J. railway.

Mr. E. B. Haycock, who has been prospecting all summer in the Temagamingue district, has returned to Ottawa. He has been successful in securing some very promising locations bearing rich indications of gold, silver, copper and asbestos. An assay of the copper specimens by Dr. Donald, Montreal, has given a very high percentage of copper while others, examined by Dr. Hoffman, have been spoken of very favourably. Mr. Haycock will sink a shaft on some of these locations next season, and upon the results then obtained will depend the extent of further operations.

The Victoria Galena mine, near Sault Ste. Marie, has done nothing this year, the management awaiting the completion of the railway and bridge at Sault Ste. Marie.

With reference to the very rich discoveries of gold reported within the past month from the Sudbury district our correspondent writes: "Several claims of gold discoveries are reported in this vicinity, that is from six to thirty miles distance from Sudbury. Some are quartz bearing gold, others are veins of quartz with iron and copper pyrites containing gold to a certain extent. The most important gold bearing quartz discovery has been made by Messrs. Tough & Company, at a point about twenty miles from Sudbury. I have seen some specimens showing free gold taken from the surface of the rock at a height of over one hundred feet and others from a lower point near the level of the ground. The mineral can be seen in a great many places in quartz veins running through the rocks. Some blasting has been done for specimens for the assayer and free gold was taken out with each shot. Mr. J. Heys, of Toronto, who made the assays, was here about ten days ago and informed me that an analysis of the specimens gave from \$40 to \$7,000 to the ton. Assays from discoveries made by different prospectors have shown \$200 per ton for good specimens, and from \$30 to \$100 for some inferior quality of quartz. Experts pronounce the discoveries of immense importance, while such as have gone over the

Tough property state that they have never seen richer indications. Agents of New York and Chicago capitalists are at present in Sudbury with the object of purchasing the Tough mine. Current gossip has it that one and a-half million dollars is wanted for it. No doubt a good round sum will be required before a purchase can be carried through. Messrs. Tough's location covers about one square mile. Other locations have been made under the Mining Act. Good strong energetic company's will find investments that will pay in this district."

The Bedford Mining Company has been organized with a capital of \$250,000 to mine iron and other metals at Bedford, near Kingston. The incorporators are Sir Richard Cartwright, Hon. Alex. Morris, Wm. Morris, John D. Hower, Benjamin W. Folger and others.

A meeting of the Elgin Silver Mining Company has been called for November 8th, when the business of the company will probably be wound up. The mines, located at Jackfish Bay, Lake Superior, have been experimentally worked by the company for several seasons past at an expense to the shareholders of about \$10,000.

It is reported that Mr. Adam Burwash, Mattawa, has gone to England with the object of floating a company to work the gold said to have been found in that vicinity.

The Port Colborne Natural Gas, Fuel and Light Company have sunk its well at Port Colborne to a depth of 150 feet and has obtained a supply of gas of extra quality sufficient for lighting and for all the fuel they can supply. The greatest flow was at 800 feet.

Port Arthur District.

At the Beaver Mine sinking in No. 2 shaft has been started again—the shaft being still in silver. A wing on the lower level, 150 feet north of the shaft, is also going down. Drifting north on the middle drift has been commenced, and the stoping in the upper portion of the mine of the same quality of rich ore, still continues. The organization of the company still goes on, and Mr. W. H. Furlonge has finished his underground surveying and sampling. A one-quarter interest has been recently purchased in this property by Gov. Alger, of Michigan, and a one-twentieth interest by another Michigan gentleman.

Sinking the main shaft of the Rabbit Mountain Mine still goes on with unabated vigour, and they are nearly 300 feet deep now; they will drift to the south as soon as the 300 feet level is reached. The bottom of the shaft is looking well, and in it some of the decomposed magnesian silicate so rich in the Beaver Mine is now being found. The drift on the 250 foot level to the north is looking as usual.

The reported sale of the Porcupine has not been effected, and the property is consequently lying idle.

Due south of the Porcupine, and only a short distance away, is a very promising prospect—The Badger. An adit is now in some 200 feet, and some very rich ore is extracted. The vein is, however, left standing so that the value is only ascertained when they break into it.

A reported very rich strike at Silver Mountain lacks confirmation, but at least development is going ahead steadily and mill rock is constantly being extracted.

R. 230, situated north-west of Whitefish Lake, is being systematically opened up, and some ore, unsurpassed anywhere, is being taken from two shafts upon it. Other properties on this vein also show silver, and altogether this part of the district bids fair to come to the front in a short time. Numerous other veins are being prospected with greater or less success in a small way, and enquiries by capitalists are coming from everywhere.

The Attick Lake mines, located about 25 miles south-west of the Beaver, and which are also in the slate formation, are showing up very favorably. There are now four veins opened on locations E 19 and R 238, varying from three to seven feet in width. Two of these veins are of exactly the same character as that of the Beaver vein, and much better indications of silver than that which the Beaver vein showed at the same stage of development. Some further developments are now being made at the junctions of these two veins, on location R 238, owned by W. A. Allan, of Ottawa. At this point, the spar and vein matter is about 12 feet wide, showing both native and leaf silver within two feet of the surface.

There have been a good many new locations taken up in this neighbourhood within the last four months, but so far very little work has been done owing to the difficulties in getting in supplies, there being no waggon road within 20 miles; but this obstacle will soon be removed, as the Port Arthur and Duluth Railroad, which is now in course of construction, will pass close to Attick Lake.

Rat Portage District.

Mr. A. C. Lawson, of the Geological Survey, has returned to Ottawa from his season's work in this region. He reports abundant evidence of gold at Manitoulin Lake, where it is found in quartz veins carried by a green slate formation. He also reports an immense iron bed at Hunters Island, Lake of the Woods, and the discovery of silver and other economic minerals at various points.

Work will be started almost immediately on 211 P., Clearwater Bay, Lake of the Woods, on two very promising gold veins owned by Mr. Dounais, of Port Arthur. No mining is now going on in this section, though the opening of the Gold Hill Property on a large scale, next spring, is now assured.

Manitoba and North-West Territories.

A company called the Calgary Mining and Smelting Company are making application to the corporation of Calgary for a bonus of \$10,000 with a view to the erection of smelting works at that place. The company own the Carrilton location situated upon Mount Stephen, near Field, B. C., containing a vein of galena ore carrying silver extending along the full face of the location, 1,500 feet. The company propose to smelt the ore from their own mine as well as ore from the other mines in the district.

In a three days competitive test of the Canadian Anthracite Company's coal made recently in San Francisco, results of a highly satisfactory character were obtained. It is expected that by the new machinery now being put in

the output of the mine will be increased to 250 tons per day. Large shipments are now being made to San Francisco and San Diego.

The following analysis of this coal was made by C. A. Luckhardt, of the Nevada Metallurgical Works, San Francisco :

Fixed Carbon.....	81.06 p. c.
Volat. Carbon, &c.....	11.31 "
Moisture, &c., 212.....	0.90 "
Hygroscopic Water.....	1.00 "
Sulphur.....	0.77 "
Ash.....	4.96 "

100.00 "

Ash contains :

3,402 Silica.
1,257 Oxide of Iron and Alumina.
0,269 Lime as Oxide Calcium.

4,928 per cent represented.

Specific gravity..... 1.417

An Order-in-Council has been passed on the recommendation of the Minister of the Interior, and under the provisions of the "Act respecting Public Lands," correcting the regulations of the 7th March, 1884, with respect to the disposal of mineral lands, other than coal lands, in Manitoba and the North-West Territories, and of such mineral lands in British Columbia as are the property of the Government of Canada. Generally, it may be said that the few changes in the mining regulations have for their object the assimilating of the system of administering mining lands within the railway belt in British Columbia with the mining laws of that province, adhering, however, to the principle that the purchaser of mining lands shall acquire the right to such mines, minerals, and substances as may be found within the boundaries of his claim produced vertically, but not the right to follow the lead or vein of gold or silver bearing quartz, which originated in his own claim, outside of those vertical lines, as is the case under the ledge or California system, which prevails in the province.

An anthracite coal mine is being opened near Canmore by a company organized by Mr. Brickendorf.

The Canadian Anthracite Coal Company have had an engine and boiler and a considerable amount of new machinery recently put into their property.

British Columbia.

Reports from the Illicillewact mines are very good. The company are making regular shipments of silver ore to Omaha and to the Silby Smelting Company in San Francisco. The ore bodies are increasing in thickness as they penetrate the mountain and it is now an established fact that the mineral belt extends for two miles in a straight direction. The ore found is rich in lead and silver, and is very desirable for smelting. In some of the company's mines, a drier and richer ore is found assaying up into the hundreds. The company are extracting ore from four or five mines, and all paying largely over expenses. They feel confident that they can in another season supply a forty ton smelter. Limestone and iron ore for fluxes are to be found in the immediate vicinity of the mines. The shipments now are one car load per week.

Alaska.

James McAdams and four other miners who have been working all summer at the new diggings at Forty-Mile Creek have returned to San Francisco. They are the first to reach this point from the new diggings, about whose

reputed richness much has reached Californian papers at odd times by the telegraph from Victoria. McAdams is one of the discoverers of this district, and Mulheim has been in these wilds for the past two years. The latter says : "About 100 miners came out with us. Some have made as high as \$1,000 this season, while others were broken. The average was from \$200 to \$500 each. The thermometer falls to 80 degrees below zero up there. The ground is thickly covered with moss and is frozen for the year round. It is the most fearfully wild country. I would not advise any body to go to this region. I don't think people would be justified in doing it. It has been greatly over estimated."

MISCELLANEOUS PARAGRAPHS.

Value of Manganese Ore.—In response to numerous enquires Messrs. Ledoux & Co., New York,† mention the following uses for which manganese is available:—The First. Chemical use. The demand for this purpose is comparatively small, all Europe taking not more than 10,000 tons per annum, of which 4,000 tons goes to Liverpool. The price varies from 10 pence to 12 pence per unit of peroxide per ton of 2,240 lbs., the principle thing being, first, that the ore shall run as high as possible in peroxide and that it shall contain no carbonates. Second. Metal use. For metal use an *ideal* manganese ore should contain not less than 50 per cent. of manganese, not more than 0.10 per cent. of phosphorus and not over 10 per cent. of silica. Carbonate of lime present is an advantage; copper decidedly objectionable if over 0.15 per cent., while nickel and cobalt should be absent. Two good shipments, highly praised by the English metal men as to quality, recently analyzed as follows :

	No. 1.	No. 2.
Manganese.....	53.85	51.35 per cent.
Silica.....	7.29	4.00 "
Phosphorus.....	0.04	0.01 "
Carbonate of lime.....	4.00	11.79 "

Manganese ore for metal use is worth about 1s. 4d., with 1d. per unit deducted if the silica runs over 14 per cent., or the phosphorus over 0.13 per cent. The present system of payment is generally, first, an advance of 75 per cent. of value through New York bankers against the bills of lading, balance on the confirmation of the analysis by the buyers or some independent chemist. You will notice that I give only English quotations, the American market being in the hands of one or two buyers only, who pay whatever price they have to, without reference to any standard schedule. Like all English metal dealings there a great many deductions and charges difficult to understand here. For example, a shipment of 100 tons ex steamer from Norfolk, Va., sold in Liverpool as follows: Cr. *By sale*, agreed analysis: Manganese, 50.00 per cent.; moisture, 2.00 per cent.; 100 tons, less 2. moisture, net 93; 1s. 3d. per unit of metal, £3 6s. 8d. per ton, £336 13s. 4d. *Charges.*—Marine insurance, £300 at $\frac{1}{2}$ per cent., £1 10s.; sea freight, at 8s. per ton, £40; sampling, at 6d., £2 10s.; analysis fee, 21s., preparing sample, 10s., £1 11s.; commission at $2\frac{1}{2}$ per cent., £8 8s. 4d.; total charges, £53 19s. 4d.; net proceeds, £282 14s. The only things in this account of sales that interest the shipper are the weight, assay and net returns. From this we will see that his 100 tons of 50 per cent.

ore brought him £282 14s., or \$1,371.09, being \$13.71 per ton of 2,240 pounds.

Copper Mining in Michigan.—"Comparatively few," writes C. D. Lawton, Commissioner of Mineral Statistics, "comprehend the scale on which all the work is carried on at our great copper mines. They do not realize the fact that the rock from which the copper is eliminated must be mined far underground at a depth of from hundreds to thousands of feet, and thence raised to the surface, taken to the rock house and passed through breakers, whence it must go to the stamp mill—perhaps several miles away—and there it must be pounded into fine mud and sand, which in turn is run over a system of sieves, jiggers, and slime tables, undergoing an elaborate process of mechanical separation of the copper from the sand, after which the copper must be taken to the smelting works, and then cast into ingots, when it is ready to be sent to the market." Then Mr. Lawton in enumerating the expense of reduction says that "Few, even mining men, who are not acquainted with the details of the work at our Michigan copper mines are ready to give credence to the statements that rock which has a gross value of but \$1.65 per ton, or less than 15 pounds of refined copper, on an average, to the ton, can be mined at a depth of more than 1,000 feet below the surface, hoisted, broken, stamped, washed and separated, smelted, and taken to a market and sold, and still leave a net profit of 22 cents on every ton. Yet this was the year's result at the Atlantic mine in 1885, is equally favourable for 1886, and the company paid a dividend of one dollar per share to the shareholders. In order to accomplish this, 800 tons of rock were raised and stamped per day. Each year, as the price of copper has diminished, the daily production has been increased, in order to reduce the average cost. Ten years ago, when there were but 230 tons of rock mined and treated per day, the average cost was \$3.90 per ton at this mine. The cost of stamping and washing was then 88 cents per ton, while now it is but 30 cents. The total average cost per pound of copper obtained at the Atlantic mine ten years ago was 22 cents, in 1885 the same was produced for $9\frac{1}{2}$ cents. The mine is no richer now than formerly, in fact, there has been, practically, no change in the quality of the rock. The advantage gained is due to improved facilities for mining and manipulation, and to a better comprehension of the work."

Chlorination of Gold-Bearing Sulphides.—Mr. E. Gybbon, Spilsbury,‡ New York, gives the following description of a novel method of chlorination:—The chlorinator consists of a plain iron barrel lined with lead, and provided with a manhole on one side for charging and discharging the ore. The ore is charged in one-ton lots. The barrel is first partially filled with water; then a sufficient quantity of chloride of lime is dropped in, on top of which the roasted ore is charged. On top of the ore is poured the requisite amount of sulphuric acid, the manhole cover is put in place and thoroughly secured, and the barrel is started to revolve. The reason for charging in this order is to prevent the sulphuric acid and chloride of lime from coming in contact before the barrel has been securely closed. When the charging is completed the barrel is started and is kept revolving until the whole of the gold is dissolved. A very ingenious arrangement has been devised which enables the operator, by means of a clay pop-valve, to test from time to time, without

opening the barrel, the presence of an excess of chlorine gas. With the sulphides operated on, each one-ton charge consumed 20 pounds of chloride of lime, and 25 pounds of acid. The time occupied in chlorinating so far has been six hours, but as experience is gained it is expected that this time will be reduced by nearly one-half. When this operation is completed, enough water is introduced to nearly fill the barrel, which is again revolved so as to thoroughly wash the ore and dissolve the chloride of gold. The barrel is then opened and the liquor is decanted off upon large shallow filter-beds. Another wash-over is then put into the barrel, which is again revolved for a few minutes, and then decanted upon the filter. Ultimately the whole charge is turned down in the ordinary way, and a final wash over is given on the filter. The results so far obtained have been remarkably successful. The result of the last eight charges run is appended. Each charge contained a little over one ton of ore of such fineness that 99 per cent. of it would go through a 100-mesh and 60 per cent. through a 150-mesh screen. The assays made of the roasted ore showed 36.70 gold per ton.

Assay of tailings from first charge gave.....	\$1.56
“ “ “ second “	1.03
“ “ “ third “	0.78
“ “ “ fourth “	0.52
“ “ “ fifth “	trace
“ “ “ sixth “	0.78
“ “ “ seventh “	trace
“ “ “ eighth “	0.78

In order to further test the advantages of this system, one charge considerably heavier than the others was tried and it was endeavored to filter it direct in the usual way. While nearly double the amount of wash-water was used for this charge, and while the time occupied in filtering was much more than the other charges required, the tailings resulting contained \$5.68 per ton. There seems to be no difficulty in filtering through a bed of ore from 3 to 4½ inches thick, but when the thickness of the bed is greater, then the filtering of such very fine material becomes almost impossible; hence the advantage of decanting. The precipitation is done in the usual manner with proto-sulphate of iron. The cost of roasting, labour, chemicals, and power will never exceed \$4 per ton. So far it has not attained that figure, some of the work having been done as low as \$3.15 per ton. The actual gold recovered is in all cases within a few cents per ton of the full assay value of the ore, less the amount shown by assay to have remained in the tailings. While the gold obtained in the stamp-mill and amalgamating works is seldom purer than 897 fine, the gold obtained by this process is generally over 978 fine.

That Bad Man.

Some of the Influences that Make Sinners of us Instead of Saints!

Moral characteristics are too often the outgrowth of physical causes. If so, should a man with a diseased body be trusted with armies, banks, railroads or other great enterprises?

In order to strengthen the mind, we must strengthen the body. But in aiding physical forces, certain muscles are frequently strengthened, because of their use, at the sacrifice of the parts of the body unemployed.

The oarsman develops the muscles that are brought into use in rowing, and by continually developing them he is prepared for the great

event. The poet and the artist study nature to improve the mind and the eye.

To enable one to employ all his forces to the best advantage, the body must be in a healthy condition, so that all parts may fully perform their functions and thus elevate the mind by strengthening the body.

The irritable man, the unjust man, the unsuccessful man, the woman in her duties of life, the counting room defaulters, and the thousands continually making failures, receive too little charity, even when the result is prostration by disease, or sudden death by suicide, or some terrible crime. For not until life is ended, and the result of the post-mortem examination is known, can the physician declare that the cause was organic derangement of the system. They pronounce it blood-poisoning, melancholy, loss of vigor, or nervous prostration. These so-called diseases, nine times out of ten, arise from the kidneys, which are diseased so that they cannot expel the waste matter from the blood.

There are hundreds of thousands of people who do not know that the same quantity of blood that passes through the heart (this much favored and admired organ), passes also through the kidneys. If the latter organs are healthy, injurious matter is not retained, but the pure blood that has become filtered by the little hair like tubes which fill the kidneys, goes to the heart to be diffused through the entire body, producing health, and again taking up deadly waste matter, as it goes.

But if the kidneys are diseased, the uric acid attacks the weakest organ in the body, which must eventually give away. It is then that the physician and the patient treat what are really the effects, not the causes. The strong point that the proprietors of Warner's safe cure make is that their great remedy cures so many general diseases because it corrects the causes, leaving the effects to right themselves.

Now, nearly everyone who becomes prostrated, is, if fortunate enough, able to secure the attentions of a physician, who seeks to make an analysis of the fluids passed. We have no doubt that the founders of this great Warner's safe cure, have awakened the medical men from their lethargy on the importance of urinalysis.

We are to-day in receipt of a little book, Warner's safe cure pamphlet, in which we find very valuable information in regard to diseases, the causes of their existence and their cures. It is very ingeniously put before the reader in conversational style, the reader asking questions, and the publishers in their answers making very plain some points but seldom understood. This matter will be received with much more interest than the mass of stuff which is floating about the country, proclaiming the various merits of pretended nostrums.

Personal Charms.

How the Delsartian Theory of Development Beautifies Women.

What is the Delsartian method?

If ladies can secure cultivation of the voice, so as to read and converse in sweetly modulated yet strong and deep tones, and by the same course of training acquire grace of carriage and the development of chest and lungs that ensures health and adds to personal charms, the methods employed are worthy investigation.

So thought our reporter, who called upon Mme Gray, the noted teacher of Oratory and Physical Culture at one of our leading hotels.

As he entered the room a lady tall but well proportioned came with graceful movement toward him. A well shaped head, crowned with a wealth of iron gray hair, dark, brilliant eyes, beneath finely arched brows, were noted as she approached. When she spoke it was with a voice sweet and low, yet with a wonderful compass.

"What is the secret of this power of vocal expression you seem to have?"

"Secret? there is no secret," laughed Mme. Gray. "Time was when I had one of the weakest and thinnest of voices. Any one can accomplish what I have done. It is so easy to acquire a full, resonant voice, that will never tire or grow hoarse. All vocal disabilities may be overcome, hesitation, stammering, stuttering, soon disappear under proper training."

"Does this training affect the physical system?"

"Yes, it will develop the bust to almost ideal perfection. Gentlemen will add four or five inches chest measurement in as many months."

"It is desirable from a point of beauty, then?"

"Yes, ladies gain the roundness of waist, taper of arm and hand, and the perfect poise, ease and grace in movement, that add so much to personal charms."

"Health, I should think, would be benefited, also?"

"Indeed it is. Lung and throat troubles decrease, narrow chests and thin arms are developed, and female weakness largely overcome."

"It seems to be a regular panacea?"

"No, I am sorry to say that some organs cannot be made good in this way after they have been injured as mine were by a sojourn near a southern swamp. Before I tried physical culture and Warner's safe cure I was a confirmed invalid. I was a consumptive in early life, and it is only a few years since I overcame a serious liver trouble. I owe much to Warner's safe cure, and I do not hesitate to acknowledge it."

"And the consumption tendency?"

"Disappeared after the use of this remedy, and when I had learned how to breathe. Not one in twenty breathe in such a way as to fill the air-cells, to expand the strong muscles at the base of the lungs, which should do the labor of expelling the air. Hence, if kidney disease prevails, the lungs affected by the kidney poisoned blood soon give way."

"Is not your system the Delsartian theory?"

"Yes, and I greatly rejoice when this grand teacher gave to the world his ideas. They correspond to those I had long taught, for I am a pioneer in this work and have devoted life and energy to teaching the world that women may gain vocal accomplishments, health, grace and beauty all at the same time by these methods of cultivation."

"You are yet teaching?"

"Yes, at the School of Oratory and Physical culture at Syracuse, N. Y., a permanent institution, now in very successful progress."

**VALUABLE
PLUMBAGO
AND OTHER
Mineral Lands
FOR SALE,
IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.**

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

WM. H. DICKSON,
160 Waller St., Ottawa.

**FOR SALE.
VALUABLE
Copper Mining Properties
— IN THE —
Eastern Townships**

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within 1½ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only 2½ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Carbuncle Hill Mine, Lots 2 and 3 R. 14, and
2, 3, 4 R. 15, 718 acres. Same class of ore as is found
in the Ascot properties above described, but yielding a
higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, ¼ Lot 25 R. 12, 50 acres, with
dwelling houses, smith's shop, ore sheds and office, large
winding and pumping steam engine, with boiler, winding
and pumping gear, and about forty fathoms Cornish lift-
ing pumps complete, railway tracks, ladders, etc., situated
three miles from Grand Trunk Railway. A consider-
able amount of mining work has been done at this mine.
A well defined vein richly charged with vitreous purple
and yellow sulphurets of copper traverse the entire
length of the property, five feet in thickness, yielding 8
to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This prop-
erty for the most part is unexplored, but copper is found
on the greater part of the property. On one of the lots
a vein about twenty feet in width has been found.
Samples of the ore have yielded as much as 22 per cent.
of copper, being also rich in sulphur. Other samples of
pyrites from the same property, free from copper, have
yielded as high as 48 per cent. of sulphur. The only
drawback to this property is in its distance from the
railway, it being about four miles from Garthby Station,
Quebec Central Railway. A new line is chartered,
however, which, when built, will run directly through
the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler,
pumps and appliances. Within three years after this
mine was first opened it produced nearly \$500,000
worth of copper. It is situated about half a mile distant
from the stations of the Grand Trunk and South Eastern
Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
10th. Bolton Mine, two miles from Eastman Station,
Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Can-
adian Copper and Sulphur Company, and were acquired
by the present owner at sheriff's sale, giving an indis-
putable title thereto.

The whole or any portion of the property will be
sold at reasonable prices.

APPLY THIS OFFICE.

Mineral Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands,

1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

Nov. 22nd, 1886.

Department of Inland Revenue.—An Act respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, and which is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of

analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspector, to accompany the bill of inspection of such inspector stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen or of the phosphoric acid, claimed to be contained shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue.

E. MIALLE,

CONDUCTED BY E. T. A. BELL.

The CANADIAN MINING REVIEW, is devoted to the opening up of the mineral wealth of the Dominion, and its publishers will be thankful for any encouragement they may receive at the hands of those who are interested in its speedy development.

Visitors from the mining districts, as well as others interested in Canadian Mineral Lands, are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the office not later than the 15th of the month.

Address all correspondence, &c., to the Manager of the CANADIAN MINING REVIEW, Ottawa.

Gold and Silver Ores of Ontario and Quebec.

The oft recurring discovery of gold ores holding free gold in some new locality brings before our notice the present condition of this branch of the mining industry. Treatment by amalgamation of sulphuret ores either in the raw state or after roasting has resulted in a loss by this process of too large a percentage of the gold the ore contains, as there are few or no true free milling ores in the districts like the quartz and free gold ores of Nova Scotia. In 1880, Mr. Richard P. Rothwell, editor of the *Mining and Engineering Journal* of New York, bonded the Gatling Mining Company's mill and mines in the Township of Marmora, along with other properties for a New York syndicate, and expended some \$15,000 in testing the value of the mines, and the possibility of treating the ores profitably. Amalgamation was tried and condemned, and the chlorination process (*which is a wet one*) recommended. The Canada Consolidated Gold Mining Company was formed and worked the mines and erected extensive works for milling and treating the ore by chlorination, but in the fall of 1883 the company closed the works, which are now under a first mortgage of \$100,000, and a second one of \$300,000. Interests in the company are held by parties in Canada, United States and France, and these interests do not seem to be united on any course of action or re-organization, with a view to further working. After the operations of the company ceased in 1883, the mines and plant were leased by one of the chief stock-

holders from New York and two gentlemen from Detroit. The lessees operated it until the fall of 1884, and produced some \$30,000 in gold by chlorination, but much trouble was experienced in working the process in summer, and still worse in our cold winter climate, proving for a second time in Canada that *a wet process will not pay in winter*, as was formerly proved in copper ores in the Province of Quebec, at a cost of \$500,000. This ought to be sufficient evidence against a wet process in this climate. The ore is Arsenical Iron Pyrites (Mispickel) holding Arsenious Oxide As_2O_3 . 55.40 per cent. = Arsenic 42.00 per cent., and averages \$14 per ton in gold. The Ore having been crushed and dressed, the Arsenious Oxide is driven off by roasting in revolving furnaces and lodges in chambers conducted at much expense for the purpose of saving it. Since the date the lessees stopped mining until the present time the Arsenious Acid has been resublimed in a small furnace and an exceedingly pure quality produced, yielding as high as 99.86 per cent. of Arsenious Oxide, which has been mostly shipped to the United States, where it sells at \$60 per ton and is the purest in quality which has been brought to that market. It is worthy of note also that the gold produced from these ores was the purest or that most free from alloy which has been sent to the mint of the United States. There are many other deposits of this ore in the district not held by this company. In this and other sections the gold and silver ores already found are of great variety, and are with few exceptions such as give better results when smelted than by either amalgamation or chlorination processes being sulphuret ores of Iron, Copper or Lead, with varying richness in the following: Gold, Silver, Copper, Lead, Antimony, Arsenic, Sulphur, all of which can be best utilized by roasting and then smelting along with lead. The volatile matter, Antimony, Arsenic, Sulphur, being first driven off in proper furnaces for that purpose, and the residue smelted in presence of Lead, the Iron present passing into the slag is tapped off, leaving the heavy metals Gold, Silver, Copper and Lead in the the furnaces until a value of from \$1,000 to \$2,000 to the ton of Gold and Silver is reached. A mixture of ores is required for smelting as the slate, lime and quartz, forming the gangue can be proportioned so as to produce along with the Iron a good running slag. The advantages of smelting in presence of Lead are, a larger percentage of the precious metals is obtained than by amalgamation or chlorination, the great variety of ores that can be worked, also low grade Galena holding under \$10 per ton of silver can be made use of by this process. As we have an abundant supply of such Lead ore as well as some rich in silver in this district, a means of working the low grade at profit is obtained, which would prevent the impor-

tation of Lead and its manufactures into the country as is now done. The central position of Ottawa, with rail and water transportation and our vast water power made available for milling of ores, and the electro-metallurgical treatment of metals renders the Capital pre-eminent for the location of such an industry.

The Phosphate Season of 1887.

The shipment of phosphate by the SS. *Scotland*, on the 24th of November, for England, via a southern cotton port, closed the season of 1887 and made a total export from Montreal of 20,349 tons, against 19,298 in 1886, a gain of 1,051 tons, though less than in some previous years. The low water in the Lievres River prevented the forwarding of a considerable quantity from the mines in Portland, and some further output was held over in hopes of a better market next year for the lower grades. In addition to the amount exported to Europe should be reckoned about 200 tons used in Canada and about 300 tons sent to the United States; so that the total deliveries of the year will approximate 21,000 tons.

In reviewing the business features of the season, we may remark that

FREIGHTS have been fairly moderate in figure and sufficient in supply. Rates have ranged from 2s. 6d. for vessels going round-about voyages, to 15s. for direct steamers for Hamburg. The railway rates may be stated as 6s. 3d. to Liverpool and Glasgow, 7s. 6d. to London, 10s. to Irish ports, and 12s. 6d. to 15s. to Hamburg.

Higher prices are obtained in Ireland and Germany than in England, but hardly an equivalent for the extra freight. The steadily increasing change of the deal-shipping trade from Quebec to Montreal and from sailing vessels to steamers, largely augments the supply of tonnage that requires phosphate for ballast, and the low rates of freight that sometimes during the season obtain for grain make even the regular line steamers anxious to get phosphate for dead-weight cargo at ballast rates. When grain rates drop below 1s. 6d. per quarter the ship agents give the preference to phosphate at 7s. per ton. The large Quebec wood shippers have nearly all opened offices in Montreal, and it is expected that Montreal will continue to absorb the export trade from the Ottawa district. The prospects for favorable freighting facilities for phosphate are, therefore, very hopeful. It is also pleasing to remark that the unwise and foolish competition and antagonism heretofore existing among the Montreal phosphate shipping agents has been replaced by a spirit of co operation and amity, and unnecessary expense has thus been avoided.

PRICES opened rather weak, owing to trade depression in Europe and a large visible supply of low grade phosphates, but the price for 80 per cent. phosphate strengthened and was firm at the close. The lowest sales for 80 per cent. were made at 11¼ for Ireland, which was equal

to less than $10\frac{1}{2}$ in England, but the bulk of the deliveries in England were made on contracts at 1s. per unit. For Hamburg $12\frac{1}{2}$ d. to 13d. was obtained, and as high as $13\frac{1}{2}$ d. for a German outport. All these prices carried $\frac{1}{2}$ d. rise per unit over 80 per cent.. For lower grades the prices were relatively lower, 9 $\frac{1}{2}$ d. for 75 per cent. and 8d. for 70 having been accepted, these grades being slow of sale owing to the competition of French phosphates of nearly equal quality that were of so soft a nature that they required no grinding.

THE FUTURE OUTLOOK for Canadian phosphate is favorable. $12\frac{1}{2}$ d. could be had now for 80 per cent. for next season, and there are some signs of a strengthening in the price for low grades. A sale of 600 tons ground phosphate has been concluded in Chicago at a price equal to about 17 cents per unit or \$10 per ton for 60 per cent. This affords an opening for the output of the mines which has not been utilized before and the increase of which will have a very beneficial effect upon the future of the industry. A good market for all the high grade phosphate that Canada can produce now seems assured. The extension of the field for low grade and pulverized phosphate and the introduction of suitable grinding machinery, with processes for separating impurities by a more effective and less expensive method than the present system of hand cobbing are the great desiderata, and it is cheering to know that on all these points there is great reason for encouragement. Several of our active and enterprising phosphate managers and agents are investigating and pushing diligently in all these directions with a combination of zeal and knowledge which is sure to be rewarded. Great interest is being excited in the use of the crude phosphate upon the soil and in the development of a home market which will largely increase the demand. The amicable spirit which, it has been remarked, exists between the Montreal shippers, is extending among the foreign selling agents. Heretofore the price of Canadian phosphate has often been unduly depressed by rivalry in effecting sales and by indiscriminate offerings of the same lots through various brokers, giving the impression that the supply was greatly in excess of the requirements. The business is now becoming concentrated and a better understanding exists as to its conduct. Altogether it may be said that the phosphate business of Canada is in a sound and healthful condition and a continuous and prosperous future seems to be assured to it.

Canadian Fertilizer Industry.

The only attempts so far made to utilize Canadian phosphate at home have been at the fertilizer factories in Brockville and Smith's Falls, Ontario. The factory at Smith's Falls was established originally for the manufacture of chemicals of various kinds, but a few years ago the production of fertilizers was tried as an experiment, and as a very good article was

made, with no adulterations, it got a good name and the demand has been steadily increasing. Mr. Brodie, B.Sc., a graduate of McGill College, has charge of the works which are controlled by Messrs. Brodie & Harvey, the well-known flour and milling firm in Montreal. Mr. Brodie states that he makes the sulphuric acid from pure sulphur. He gets rid of the hydrofluoric acid gas, which is produced by the action of the sulphuric acid on the apatite, by a simple arrangement of wooden chimneys, thus solving a difficulty which has embarrassed many persons in their first efforts to use Canadian phosphate. He makes a "complete fertilizer," that is, a mixture of the three principal ingredients of plant food, namely: phosphate, potash and ammonia. The demand is growing in a very encouraging manner, for when a farmer tries it once he generally comes back for more. Mr. Brodie says he could sell 1,000 tons the coming year if he could make it, but the factory is small and the facilities not very great.

There is evidently a large and extending field in this direction both for profit and usefulness. The soil of the older settled provinces of Canada has become impoverished by many years of cropping without replenishment, and districts that once yielded great stores of grain now only afford the scantiest pasturage. If one was animated only by patriotic and philanthropic zeal he could render no greater benefit to his country than to enter on a missionary crusade to enlighten the farmers as to the value of mineral manures; or if he likes to make his benevolence profitable to himself let him supply the article with which the farmer may prove the truth of his teachings. The establishment of fertilizer factories in Canada and the education of the farmer in the use of manures is a cause that invites the best attention both of the capitalist and of the Government.

Soluble and Insoluble Phosphate.

It is estimated that 400,000 tons of sulphuric acid 50° strength are used annually in the United States to convert insoluble phosphoric acid into soluble phosphoric acid, and that this quantity will be doubled during the next five years. Four hundred thousand tons of sulphuric acid at \$10 per ton is \$4,000,000, for cost of the acid (1,750 pounds being required for each ton of the South Carolina phosphate rock, the value of the acid is the larger of the two) to say nothing of the other expenses attending its use, the item of transportation alone being nearly doubled, adding largely to its cost to the farmer.

If soluble phosphoric acid immediately reverts to its original condition when applied to the soil, and it is so stated in bulletin No. 12 of the Maine Experimental Station, it seems to be a useless expense to use sulphuric acid when fine ground phosphates are equally available to plants at one quarter of the price.

It is estimated that there are 1,000,000 tons of fertilizers made annually of the value of \$30,000,000, thus adding by using sulphuric acid over one-half to their cost. This is not a small burden for the consumer to pay for lack of knowledge.

Ancient Mines and their Value.

H. B. Small, Ottawa.

It is a somewhat curious fact that in the search for mineral wealth and new mining localities, all recollection of the mines worked by the ancients should have comparatively passed away, and that in many instances the very sites of those mines have been forgotten. From the earliest pages of the Bible, where we read, "the gold of that land is good," reference is made to mineral resources, but the location is almost if not quite lost. Not long ago the writer read a work that casually fell into his hands, entitled "The Land of Midian," which described very fully researches made by Captain Burton in an almost unknown country, viz., the east coast of the Gulf of Akabah, one of the two narrow inlets in which the Red Sea terminates. Captain Moresby and Dr. Becke had been there before Burton, but until the visit of the latter it was practically unvisited and its shores unexplored. From its barren and rocky surroundings the population is scant, but there is abundant evidence of a former populous time. Ruins of large towns, not built of mud as the modern Arabian dwellings are, but of solid masonry, roads cut in the rock, aqueducts several miles long, and remains of artificial reservoirs, all point to former wealth. And this was due to the presence of minerals. Gold is there, silver, tin, antimony, and the auriferous quartz, just as in the Australia and California of to-day. Ancient mining works lie destroyed round every town ruin; heaps of scoriae still remain close to the mineral furnaces; there are mines for turquoise, and from the brief accounts of the country, the mineral wealth there is ten-fold that of the neighbouring peninsular, where in a few deserted mines turquoise are still found. Yet this mining country is to-day unworked, whilst the new world to its northernmost limits is being scoured for fresh finds and fresh workings.

In Servia, in Central Europe, where the history of its mines embraces three periods, the Prehistoric, the Greek and the Roman, the old abandoned workings have quite recently been again occupied, and with every prospect of success. These mines under the Romans were worked for silver, lead and copper. Shafts and open quarries are frequently being discovered with the still standing ores, smelting furnaces, and enormous heaps of slag holding half refined ores and metals. These latter covered with ancient forests, continue well preserved. The smelting as then carried on was done by piling the ore between layers of wood in vast pyramids on the tops of the hills, and firing these in

windy weather. Half melted masses with charcoal and half burnt wood are found from time to time. These ore residues, it is said, would even now pan out well by re-treatment, as the slag still contains paying percentages of lead, rich in silver. An analysis recently made of this slag shows that the ores were first partially oxidised by roasting, and then reduced by smelting with pyrites. Calculations based on the amount of metal procured from the existing slag heaps, estimate the returns to have been 40 per cent. of lead, 60 oz. of silver and 1 to 3 oz. of gold to the ton! Surely some of these ancient mines are worth looking after, and would be a better investment than many of the western "flats" or mining cities.

The Canadian Iron Trade.

By James H. Bartlett, M.E., Montreal.

(Continued from last issue.)

A radius of ten miles from Stellarton would include the entire Picton coal-field, four large collieries in active operation, producing over half a million tons of coal per annum, a coal particularly suitable in quality for the manufacture of coke and for iron working. Within this radius, too, would be included immense deposits of limestone, and five different varieties of iron-ore, with deposits of fire-clay and moulding-sand. It would take in Pictou harbor, the finest harbor on the south shore of the Gulf of St. Lawrence, with five loading and shipping wharves and piers, and over 75 miles of railway, radiating from Stellarton; and would also include the towns of Pictou, New Glasgow, Westville, Stellarton, and many villages and hamlets, aggregating over fifteen thousand inhabitants, together with a steel-works and forge, foundries, boiler and machine-shops, glass-works, saw-mills, stone-quarries, brick-yards, ship-yards, etc., some of the largest ships ever built in Canada having been launched from here.

The Cape Breton coal-fields are only 180 miles distant by sea. A railway to reach them is now in course of construction; another railway is building to the westward, which will reduce the distance from the Cumberland and Joggings coal-fields to 75 miles, instead of 112 miles as at present.

The Inspector of Mines for the Province of Nova Scotia, says in his last annual report: "It may be remarked that in Pictou County the conditions for making iron and steel cheaply are unsurpassed, as within a few miles are collected numerous iron-ores, fluxes, and good furnace-fuels, and there is railway and water communication with all parts of the Dominion."

In New Brunswick there is hematite iron-ore; in the county of Carleton ore and coal are to be found, and also in different districts of that Province. Bog-ore occurs in Queen's, Sunbury, York, Charlotte, Restigouche, and Northumberland Counties, in close proximity to the Intercolonial Railway.

The iron-ores in Quebec are magnetites, occurring more or less throughout the Laurentian range of mountains along the Ottawa river. At the Hull or Baldwin mines, west of the Gatineau River, the ore analyses 67 per cent. The Haycock mine ore ranges from 64 to 68 per cent. of metal; the Bristol mine 58 per cent. In Three Rivers and Drummondville there is bog iron-ore in abundance, and unlimited timber for making charcoal.

In the eastern district of Ontario, back of Kingston, Belleville, Trenton, and Cobourg, between Lake Ontario and the Ottawa River, in the townships of Marmora, Hastings Tudor, Bedford, Madoc, Wollaston, Palmerston, Bagot, Belmont, Darling, Barrie, Galway, Snowden, and many others, there is magnetic iron in abundance. This district is served by the Ontario and Quebec, Kingston and Pembroke railways, the Central Ontario, Cobourg and Peterboro', and Grand Trunk railways, and by the Rideau and Trent canals. There is plenty of timber all through this district. A surveyor who has explored through these districts, and away up 130 miles further, to the intersection of the Canadian Pacific Railway, assures me that not only was there an unlimited quantity of iron through that district, but that the forests along that line of communication could not be surpassed in any country in the world for the production of charcoal. There are also deposits of iron-ore in many other parts of the Province. In Manitoba there is iron-ore, and they have about 15,000 square miles underlaid with coal.

In the Northwest Provinces, the future great wheat-producing country of the continent, there are deposits of iron-ore reported, but the country is so vast no special explorations have been made for it. They are working large deposits of anthracite coal at Anthracite, N.W.T., of a quality which compares favorably with the best from Pennsylvania, and there are 500 square miles of this section. The climate of this country is cold, but 50,000 square miles of it is underlaid with coal of good quality, easily reached and worked, in seams estimated to yield from five to nine million tons per square mile.

San Francisco is largely supplied with Nanaimo coal, and the blast-furnaces in Oregon get most of their iron-ore from Texada Island in British Columbia. The eastern cities of Portland and Boston are supplied with some of their coal from Nova Scotia, and it would appear possible also to supply iron-ore to eastern furnaces from that Province.

DISPOSITION OF THE GOVERNMENT.

There is at present an opening in Canada for the manufacture of iron. In the Canadian hand-book for the Colonial and Indian Exhibition, prepared under the direction of the Hon. John Gilling, Minister of Agriculture, it is stated, "for a country having 11,000 miles of railway, with a weight of over a million tons of rails, and possessing for the manufacture of iron natural advantages which few, if any places in the world surpass, the development of Canada's iron industry is wonderfully slow. There appears to be a good field for skill, enterprise, and capital in connection with our iron industry."

Sir Charles Tupper has recently said in the Canadian Parliament: "Our present annual consumption is equivalent to 250,000 tons of pig-iron, leaving steel rails out of the question altogether. To make this quantity of pig-iron it requires 750,000 tons of iron-ore, 120,000 tons of limestone and 750,000 tons of coal to make it into iron in its first stage, pig-iron; and the freight required for the means of intercommunication in bringing these materials together amounts to not less than 1,625,000 tons. To manufacture it into puddled bars, merchant bars and the various shapes and sizes into which it is made, would require an additional quantity of 750,000 tons of coal, making a total consumption of 1,500,000."

On the ground that the development of the iron industry of Canada will tax the coal

industry of the country to its utmost capacity, in order to furnish the additional output that will be required, and with all the advantages connected with that increased development, Sir Charles Tupper was enabled to say to the House that, although making anthracite coal free will take \$497,000 away from the Government in revenue which it is now receiving, they would be perfectly justified in doing it, because the development of this iron-industry would be given to the coal-mining industry a greater advantage and boon than that which would be taken away by the removal of the duty.

The disposition of the Government is further shown by the liberal bounty already mentioned, which is given, in addition to the protection afforded by the tariff, to producers of iron from Canadian ores. This bounty is payable quarterly in money.

THE CANADIAN COAL TRADE.

The growth and extent of the Canadian coal-trade will be seen from the following figures:

Total Consumption of Coal in the Dominion.

Year.	Net tons of 2,000 lbs.
1868.....	714,893
1869.....	636,704
1870.....	859,630
1871.....	852,217
1872.....	1,227,653
1873.....	1,338,403
1874.....	1,454,636
1875.....	1,362,363
1876.....	1,466,531
1877.....	1,751,031
1878.....	1,665,814
1879.....	1,748,164
1880.....	2,094,844
1881.....	2,260,680
1882.....	2,708,654
1883.....	3,085,689
1884.....	3,556,673
1885.....	3,439,745
1886.....	3,515,769

The total production of coal for the Dominion is shown in this table:

Total Production of Coal in the Dominion.

Year.	Net tons of 2,000 lbs.
1868.....	623,392
1869.....	687,527
1870.....	734,285
1871.....	804,431
1872.....	1,038,349
1873.....	1,228,852
1874.....	1,068,166
1875.....	998,104
1876.....	950,483
1877.....	1,020,875
1878.....	1,109,595
1879.....	1,152,783
1880.....	1,456,795
1881.....	1,514,542
1882.....	1,845,548
1883.....	1,831,819
1884.....	1,997,368
1885.....	1,973,987
1886.....	2,104,170

APPENDIX.

The following is the new Canadian tariff on iron and steel, and articles manufactured from them (the percentages stated are *ad valorem*, and the tons are net tons of 2,000 pounds).

Goods Subject to Duties—Wrought scrap-iron and scrap-steel, being waste or refuse wrought-iron or steel that has been in actual use and is fit only to be manufactured, \$2 per ton; ferro-manganese, ferro-silicon, spiegel, steel bloom-ends, and crop-ends of steel rails, for the manufacture of steel, \$2 per ton; iron in pigs, iron kentledge and cast scrap iron, \$4 per ton; iron in slabs, blooms, loops, puddled bars, or other forms less finished than iron in bars, and more advanced than pig-iron, except castings, \$9 per ton; bar iron, rolled or hammered, comprising flats, rounds

and squares, and bars and shapes of rolled iron, not elsewhere specified, \$13 per ton; iron and steel wire, galvanized or not, No. 15 gauge and coarser, not elsewhere specified, 25 per cent. *ad valorem*; wire of spring-steel, coppered or tinned, No. 9 gauge or smaller, not elsewhere specified, 20 per cent.; boiler or other plate-iron, sheared or unsheared, skelp-iron, sheared or rolled in grooves, and sheet-iron, common or black, not thinner than No. 20 gauge, not elsewhere specified, including nail plate of iron or steel, No. 16 gauge and thicker, \$13 per ton; sheet-iron, common or black, smoothed or polished, and coated or galvanized, thinner than No. 20 gauge, Canada plates, and plates of iron or steel not less than 30 inches wide and not less than $\frac{1}{4}$ in. in thickness, $12\frac{1}{2}$ per cent.; hoop or band or scroll or other iron, 8 in. or less in width, and not thinner than No. 20 gauge, \$13 per ton; hoop or band or scroll or other iron, 8 in. or less in width and thinner than No. 20 gauge, $12\frac{1}{2}$ per cent.; railway fish-plates, \$12 per ton; rolled iron or steel angles, channels, structural shapes and special sections, weighing less than 25 pounds per linear yard, not elsewhere specified, $\frac{1}{2}$ cent per pound and 10 per cent.; rolled iron or steel beams, girders, joists, angles, channels, structural shapes, and special sections, weighing not less than 25 pounds per linear yard, $12\frac{1}{2}$ per cent.; rolled iron or steel beams, girders, joists, angles, channels, eye-bar blanks made by the Kloman process, together with all other structural shapes of rolled iron or steel, including rolled iron or steel bridge plate not less than $\frac{3}{8}$ in. thick, nor less than 15 in. wide, when imported by manufacturers of bridges for use exclusively in the manufacture of iron and steel bridges, $12\frac{1}{2}$ per cent. *ad valorem*; iron bridges and structural iron-work, $1\frac{1}{2}$ cent per pound, provided that the duty shall not be less than 35 per cent.; forgings of iron and steel, or forged iron of whatever shape or in whatever stage of manufacture, not elsewhere specified, $1\frac{1}{2}$ cent per pound, provided that the duty shall not be less than 35 per cent.; steel ingots, cogged ingots, blooms and slabs, by whatever process made, billets and bars, bands, hoops, strips and sheets of all gauges and widths, all of above classes of steel not elsewhere provided for, valued at 4 cents or less per pound, 30 per cent.; but not less than \$12 per ton, except ingots, cogged ingots, blooms and slabs upon which the specific duty shall be not less than \$8 per ton; when of greater value than 4 cents per pound, $12\frac{1}{2}$ per cent.; plate of iron and steel combined, and steel not specially enumerated or provided for 30 per cent.; (*provided*, that on all iron and steel bars, rods, strips or steel sheets, of whatever shape, and on all iron or steel bars of irregular shape or section, cold-rolled, cold-hammered or polished in any way in addition to the ordinary process of hot rolling or hammering, there shall be paid $\frac{1}{2}$ cent per pound in addition to the rates imposed on the said materials, and *provided further*, that all metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast or made from iron or its ores by the crucible, Bessemer, pneumatic, Thomas Gilchrist basic, Siemens-Martin or open hearth process, or by the equivalent of either, or by the combination of two or more of the processes or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granulous or fibrous in structure, which is cast and malleable, except what is known as malleable iron castings, shall be classed and

denominated as steel, and *provided further*, that all articles rated as iron or manufacture of iron, shall be chargeable with the same rate of duty if made of steel, or of steel and iron combined, unless otherwise specially provided for); malleable iron castings, and steel castings not elsewhere specified, \$25 per ton, provided the duty shall not be less than 30 per cent.; cast-iron vessels, plates, stove-plates and iron, sad-irons, hatters' irons, tailors' irons and casting of irons not elsewhere specified, \$16 per ton, provided the duty shall not be less than 30 per cent., cast-iron pipe of every description, \$12 per ton, provided that the duty shall not be less than 35 per cent.; axles and springs of iron or steel, parts thereof, axle-bars, axle-blanks or forgings for carriages other than railway and tramway vehicles, without reference to the stage of manufacture, 1 cent per pound and 30 per cent.; iron or steel car-axles, parts thereof, axle-blanks or forgings for axles, and car-springs of all kinds, and all other springs not elsewhere specified, without reference to the stage of manufacture, \$30 per ton, but not less than 35 per cent.; fire engines, 35 per cent.; locomotives and other steam-engines, boilers and machinery composed wholly or in part of iron or steel, not elsewhere specified, 30 per cent.; (*provided*, that any locomotive which with its tender weighs 30 tons over, shall pay a duty of not less than \$2,000; portable machines, portable steam engines, threshers and separators, horse-powers, portable saw mills and planing mills, and parts thereof in any stage of manufacture, 35 per cent.; boiler tubes of wrought iron or steel, 15 per cent.; tubes not welded, nor more than $1\frac{1}{2}$ in. in diameter, of rolled steel, 15 per cent.; lap-welded iron tubing, threaded and coupled or not, $1\frac{1}{4}$ in. in diameter and over, but not over 2 in., for use exclusively in artesian wells, petroleum pipe-lines and for petroleum refineries, 20 per cent.; wrought iron tubing, threaded and coupled or not, over 2 in. in diameter, 15 per cent.; other wrought iron tubes or pipes $\frac{3}{16}$ cent per pound and 30 per cent.; safes, doors for safes and vaults, scales, balances and weighing beams of iron or steel, 35 per cent.; skates, 20 cents per pair and 30 per cent.; wire rope of iron or steel, not otherwise provided for, 25 per cent.; screws, commonly called "wood screws," 2 in. or over in length, 6 cents per lb.; one inch and less than 2 in., 8 cents per lb.; less than one inch, 11 cents per lb.; builders', cabinet makers' and carriage hardware and locks, tin-smiths' tools and harness makers' and saddlers' hardware, including curry combs, 35 per cent.; muskets, rifles and other firearms, and surgical instruments, 20 per cent.; iron or steel rivets, bolts with or without threads, or nut or bolt-blanks, less than $\frac{3}{8}$ in. in diameter, $1\frac{1}{2}$ cent per lb. and 30 per cent.; nails and spikes, wrought and pressed, galvanized or not, horse shoe nails, hob nails and wire nails and all other wrought iron or steel nails, not elsewhere specified, and horse, mule, or ox shoes, $1\frac{1}{2}$ cent per lb., but not less than 35 per cent.; cut tacks, brads or sprigs, not exceeding 16 ounces to the thousand, 2 cents per thousand; exceeding 16 ounces to the thousand, 2 cents per lb.; wrought iron or steel nuts and washers, iron or steel rivets, bolts with or without threads or nut and bolt-blanks, and finished hinges or hinge-blanks, not elsewhere specified, 1 cent per lb. and 25 per cent.; cut nails and spikes of iron or steel, 1 cent per lb.; Swedish rolled iron nail rods, under $\frac{1}{2}$ in. in diameter, for manufacture of horse shoe nails, 20 per cent.; iron or steel railway bars and rails for railways and tramways, of any form, punched or not punched, not elsewhere specified, \$6 per

ton; manufactures, articles or wares not specially enumerated or provided for, composed wholly or in part of iron or steel, and whether partly or wholly manufactured, 30 per cent.; screws, of iron, steel, brass or other metal, not otherwise provided for, 35 per cent.; sewing machines whole, or heads or parts of heads of sewing machines, \$3 each and 20 per cent.; axes of all kinds, adzes, hatchets and hammers not elsewhere specified, 35 per cent.; chopping axes, \$2 per doz., and 10 per cent.; garden rakes, two and three-pronged forks of all kinds, and hoes, 5 cents each and 25 per cent.; hay knives and four, five, and six-pronged forks of all kinds, \$2 per doz., and 20 per cent.; mowing machines, self-binding harvesters, harvesters without binders, binding attachments, reapers, sulky and walking ploughs, and all other agricultural machines and implements, not otherwise provided for, 35 per cent.; picks, mattocks, blacksmiths' hammers, sledges, track tools, wedges and crow bars of iron or steel, 1 cent per lb., and 25 per cent.; shovels and spades, and shovel and spade blanks, \$1 per doz., and 25 per cent.

Free Goods.—The following articles may be imported into Canada or taken out of warehouse for consumption free of duty:

Articles imported by and for the use of the Dominion Government or any of the departments thereof, or by and for the Senate or House of Commons, including arms, military clothing, musical instruments for bands, military stores, and munitions of war, imported by and for the use of the Army and Navy; or imported by the Dominion Government or through any of the departments thereof for the use of the Canadian militia; fire-brick, for use exclusively in processes of manufactures; anthracite coal; gannister; iron or steel rolled round wire rods under $\frac{1}{2}$ in. in diameter, when imported by wire manufacturers for use in their factories; locomotive tires of steel in the rough; rolled rods of steel under $\frac{1}{2}$ in. in diameter or under $\frac{1}{2}$ in. square, when imported by knob or lock manufacturers or cutlers for use exclusively in such manufactures in their own factories; steel rails, weighing not less than 25 pounds per linear yard, for use in railway tracks; steel valued at $2\frac{1}{2}$ cents per pound and upwards for use in the manufacture of skates; scrap iron and scrap steel, old and fit only to be re-manufactured, being part of or recovered from any vessel wrecked in waters subject to the jurisdiction of Canada; steel bowls for cream separators; steel for the manufacture of files, when imported by file manufacturers for use in their factories; wire of iron or steel, galvanized or tinned, No. 16 gauge or smaller.

The foregoing act went into force on the 13th May, 1887, and applied to all goods imported or taken out of warehouse for consumption on or after the said day; but all goods actually purchased on or before May 13th at any place out of Canada, for importation into Canada, on evidence to the satisfaction of the Minister of Customs of the purchase having been so made, and all goods in warehouse in Canada on that day, could be entered for duty until July 1st, or in the case of goods, at the rate of duty in force immediately previous. From the United Kingdom or any British possession, carried by way of Cape Horn, to be entered in British Columbia until November 1st, 1887.

It is reported that Chief Justice Henry, of Ottawa, has again opened up his gold property in the Wine Harbour district, Nova Scotia. This mine has yielded good returns in the past.

The Phosphate Beds of South Carolina.

Mr. Frederick Stearns, Charleston, S. C. writes*: "A short journey of fifteen miles by the South Carolina Railroad brought me via Summerville (the centre of the recent earthquake action) to Lamb's, a private station on the Ashley River, where the works of the Charlestown Mining and Manufacturing Company are situated, and through the courtesy of Col. Joseph A. Yates, superintendent, and his assistant, Mr. W. M. Wallace, I was enabled to study the deposits of phosphatic rock which underlies or rather overlies this whole region, and as well to note the process of mining, washing, drying and preparing it for use. The whole coast region seems to have once been the bed of a shallow inland sea, and over a compact bed of marl, some forty or more feet in depth there lies a deposit of phosphate of lime from eighteen to thirty-six inches thick. This is just below the recent soil and sand. It is reached by stripping the surface till at a depth of fifteen to twenty inches the deposit is found. The phosphate is in the form of nodular concretions, from the size of one's head down to coarse gravel, about sixty per cent. of it being sand and marshy humus. This is loaded on to tramway cars and hauled on an inclined road to the top of the washing house. From the cars it is dumped into long troughs—inverted pyramids—at the bottom of which are large revolving shafts armed with steel teeth, which serve to break up the large lumps into smaller ones and return the whole into lower troughs, in which revolve other shafts armed with paddles, spirally arranged, to carry the phosphate forward and deliver it on to a screen inclined at an angle of 45 degrees, from which it falls to the floor. During all this time it is treated with sprays of water and the dirt and sand are borne off in a contrary direction by a suitable reverse slant in the troughs.

The damp, but clean, phosphatic rock is then shoveled into barrows and wheeled into the upper part of large brick kilns about 60x100 feet and twenty-five feet high. The kiln is first prepared by spreading on the bottom a layer of washed phosphate pebbles, two feet thick. In this are laid iron flues to give air, and over these a pile of firewood (southern pine) two feet thick, and then on this the phosphatic rock is tumbled from the barrows above until it reaches ten to twelve feet thick, about 400 tons to a kiln. The mass then being ignited from the flues, burns slowly, and when consumed the moisture of the pile is driven off, and the rock is ready for shipment and sale to the fertilizer establishments, which, by processes peculiar to each, treat it with sulphuric acid, to free or to make more soluble the phosphoric acid it contains. It is then ready for use by the planter.

The two establishments operated by this company produce 125,000 tons of the rock annually. The profit is somewhere about 20 per cent. on the capital invested. The limit of production is only bound by the demand. The price ranges from \$7 per ton to (now) about \$4 per ton. Analysis of the washed rock show: Dirt, one to three per cent.; silica, in form of coarse white sand, twelve to fifteen per cent; lime, forty-one per cent.; phosphoric acid, twenty-seven to thirty per cent. The color of this curious deposit is from a cream yellow to a coarse brown orange, forming irregular concretions. Its source is evidently from the marine animal life, which in former geological ages abounded in this then shallow sea. The fossilized vertebra and teeth of fish and some

animals abound in it. I gathered triangular teeth of sharks measuring four inches on each size, indicating monsters of that period that must have been whalelike in size. These teeth are as perfect as when shed, highly polished, with razor-like sharp edges, finely serrated.

The discovery and development of these riches occurred soon after the war and afforded the impoverished people a source of income, and wealth that proved to be more valuable than gold mines.

Negro laborers are employed entirely and are found of late years tractable, industrious, and work to the entire satisfaction of their employers when treated justly and with consideration.

There are seven large mines in this region, the output of which goes largely to Europe. Other deposits are under water and are dredged for, but otherwise are treated as are those of dry diggings.

The Megantic Mining Company.

MONTREAL, December 5th, 1887.

The Editor

THE CANADIAN MINING REVIEW.

SIR,—I notice in the November issue of your Journal, an exhaustive report upon the Asbestos industry of Canada, by Dr. R. W. Ellis of the Geological Survey, of Canada, and as this very important branch of trade has lately received a great impetus, owing to the increased demand for this valuable product, which now enters so largely into the manufacture of certain classes of goods. I take pleasure in submitting some additional information which may be of interest to your numerous patrons.

During the time which has elapsed since Dr. Ellis' made his report, marked progress has been made in the development of several of the locations to which allusion has been made, and large quantities of Asbestos have been shipped to the United States, Germany and other foreign ports.

The Megantic Mining Company's Mine, one mile from Coleraine, which a year ago was only a mere prospect, has recently developed into a very rich property, and may be classed to-day as one of the most valuable of its kind in Canada. Judging from the innumerable veins of Asbestos, now in sight, ranging from one-half inch to three inches, and taking into account the large quantity which has been extracted and shipped, while prosecuting the work of development, leaves no doubt in the mind of any one who has seen the property, as to the great future that may be confidently anticipated for it. The company has pushed forward the work of development with great rapidity, and to facilitate the removal of the earth and rock they have laid down 668 feet of tracks, from the extreme ends of dumps. They have also opened a road from the mine to Coleraine Station, a distance of one mile and a quarter, the greater portion of which will in the future, be kept in good condition by the county, as it now forms part of a new road opened from New Ireland to Coleraine Station.

There are some very important features as to the quality of Asbestos found on this property, which deserve special mention, viz: the extreme

fineness of the fibre, which is equal to that of the finest silk, while its length makes it more valuable for spinning purposes. These desirable qualities will add materially to the value of the Canadian Asbestos when placed in competition with Italian, and largely increase the output, by securing for our product the preference, in point of excellence, as long, fine fibres command a more ready sale, at a greatly increased price over the inferior grades. The mines east of Coleraine have produced a quality of Asbestos, which has already gained a high reputation abroad, and the more recent magnificent discovery at Coleraine, places Canada in a position to compete against the world.

Great credit is due to the management of the Megantic Mining Company for the spirit of enterprise which they have exhibited in developing this important industry. They have had a large staff employed during the past season, and owing to their indefatigable efforts and the distribution of money among the labouring classes, a small village has sprung up at Coleraine, and not the least conspicuous of the many cottages is the neat and substantial looking residence of Mr. J. S. Drysdale, the Superintendent of the company, which is also used as their offices.

Yours very truly,
G. W. GRANT.

Alleged Conspiracy to Defraud the Tumbo Coal Mining Company.

Much excitement has been created in Victoria, B. C., over the arrest of W. G. Campbell, who represents himself as a mining expert, and Geo. Kennedy of the Brunswick hotel, on a charge of conspiring to defraud the Tumbo Coal Mining Company. It is stated that the prisoners received nearly \$8,000 under false pretences.

Our space this month is too limited to admit of anything like a detailed account of the proceedings in the Police Court; but the following is a brief *resumé* of the principal evidence adduced so far:—

Chas. Gabriel, sworn, said:—Am a merchant; know the defendants; became acquainted with them in this way: Sometime about November or December last year, Mr. Olsen brought Mr. Kennedy to my store, and they informed me that they had discovered on Tumbo island croppings of coal, samples of which they showed me; after a long talk with them about the quality and quantity of the coal, I told them I would look into the matter and if there was anything in it I would get help to develop the mine. I then got Mr. Dennis Harris to go in with me to furnish the capital, in consideration that Olsen and Kennedy would give us half of the mine, to which they both agreed. Soon after that Mr. W. Lang and Mr. Olsen brought Mr. Campbell to my house on Sunday and represented him to be a coal expert. Mr. Campbell said he and Mr. Kennedy had discovered the coal and he would like me to send him up to look at it; I informed him that I had already sent some Japanese up there, when he informed me that no one but an expert like himself could give a report; he was also an assayer and could give a good report as to the quality of the coal. I told him I did not need his services. Some days afterwards Mr. Olsen brought me a piece of paper to my store, telling me it was the report of an assay made by Mr. Campbell, on the coal; I believe Kennedy was with Olsen when the assay was shown to me: I then told them that I would like to see Mr. Campbell, and when he came I asked him what was his opinion on the assay he had handed to some gentlemen; he informed me that it could not be better (Mr. Olsen and Mr. Kennedy were present). Witness told Kennedy as he had such a good opinion of the mine, if he was willing to help us develop and report on it, we would make him a partner, giving him one-sixth interest in the mine; he then told me that he would not accept those terms, as he was engaged by Mr. Sanders and others to go up and report on some anthracite coal which had been discovered, but he would go up there and report on the mine, if he had time, before the Boscowitz sailed for the north; a few days after he came to the store and asked me how much I would give him if he would go and make a report; told

him that we had decided not to send anyone there unless he would take a share in payment; he went away, but came back a few days after, and I asked Kennedy and Olsen if they were willing to give Campbell a part of their share; Campbell informed me that the parties who were to send him up north were not ready, and he would accept one-sixth share in the mine as payment for prospecting the mine; he said that he was sent up here expressly by capitalists of San Francisco, who represented thousands and millions of dollars, to look after coal and other minerals, and that on his report two men in San Francisco would invest any amount; he said the same thing in the presence of Mr. Sayward; Mr. Sayward and I then signed the agreement and sent him up on the steamer Hope, which we chartered. Mr. Kennedy, Mr. Olsen and I accompanied him. After Campbell had inspected the island, he then informed me that he was satisfied as to the value of the property; he was in company with Kennedy all the time we were on the island; I was alone on the beach, when Campbell came to me and said that the company was very foolish to give Kennedy and Olsen so much out of the mine as their share, which was half of the mine, they supplying no capital; they would find no man to give us what we were giving them; he would advise the company to buy them out and get the mine to ourselves; when we reached the steamer coming back to Victoria, I asked Campbell how much he thought it would be fair to give to Kennedy and Olsen; he told me \$10,000 would be a fair price for their share, as the property was worth not less than \$25,000, without touching a stone on it. I then asked him if he had told Kennedy the value of the mine, and he said no, as he was not employed by him but by the company; he would give no information to Olsen or Kennedy as to his report, and when he handed that in the company could do what they liked with it. He gave me to understand that he would keep his knowledge of the value of the mine from Olsen and Kennedy. About a week after our return Campbell, Kennedy and Olsen came to my store several times, and Kennedy seems to have been annoyed at me for keeping what Campbell said to me about the mine, and said that he did not think much of Campbell because he would not give him the information contained in the report; Campbell came after and said that Kennedy had insulted him and treated him shamefully for not telling him and Olsen his opinion of the mine; they were not on speaking terms, but he (Campbell) did not care for Kennedy so long as he was working in the interest of the company; a few days after Kennedy and Campbell were in the store, but they would not speak to one another; the latter brought his report and I asked him whether Kennedy or Olsen knew the nature of it and he said no; the company, composed of W. P. Sayward, T. B. Hall and myself, held a meeting; Campbell was present and so was Kennedy, but they were to all appearances bitter enemies; Campbell said that the mine was worth \$25,000 and advised the company, known as the Tumbo Island Coal Company, to buy Kennedy and Olsen out for \$10,000; on his representation we made arrangements to purchase the share of Kennedy and Olsen for \$7,500, to be paid by note for \$5,000 and \$2,500 after; we subsequently paid \$3,750 in cash, less \$100 for discount; the balance of \$1,250 was placed to the credit of Mr. Olsen; he has received it by several payments. Kennedy's interest in the mine ceased when we paid the \$3,750, as he said he wanted to go to the Alaska mine with two of his friends; he never left the city, and after several meetings of the company with Campbell as to the development of the mine, we sent him up to the island to make a survey as to where we could sink a shaft; he came back with a man named Isaac Tatton, who lives on the island, and informed the company that where the shaft was to be sunk was on Mr. Tatton's land, and that he had refused to allow the company to sink a shaft there unless they paid for it, and that he had brought Tatton down with him, so that the company could make their arrangements with him. I asked him whether we could not dig the shaft on our own land, and if we did, would it not cost less. Campbell advised us strongly to give \$500, which he said Tatton demanded; if the company did not do so it would cost them a very large amount of money; we were under the impression up to that time that we could prospect on any part of the island; after some time the company agreed to pay Tatton the \$500; I told him to call at my store and I would give him a check; he did so, and I handed him a check on the Bank of B. N. A.; when I left the meeting I left Tatton and Campbell in Mr. Sayward's office; about a couple of weeks ago I had occasion to go to Tumbo Island, and, in consequence of what I heard from Mr. Tatton, I brought him to Victoria; after we got here I saw Mr. Sayward and Mr. Hall and they advised me to take Tatton to Mr. Mills; after this I saw Mr. Olsen and took him to Mr. Mills' office, where he made a declaration; I took the same course with Mr. Lang; Mr. Campbell informed Mr. Sayward and myself that he was in correspondence with a Mr. Pearce, in England, and he was coming out to ne-

gotiate for the mine; he showed us a letter which he said he had received from Mr. Pearce, and that he was to go to Port Townsend to meet him and take him to Tumbo Island; Campbell wanted us to send a boat to the island, and as we had an occasion to send a man there, we sent Kennedy; Kennedy told me that Campbell had arranged with him to take the boat from Tumbo Island to Orcas Island. Campbell told us that Mr. Pearce and he waited two days on Oscar Island, and that Kennedy never brought the boat there and Mr. Pearce had to return. Kennedy brought a bill for his services and charged \$3.50 per day. Campbell brought a bill for the expenses of himself and Mr. Pearce.

Cross-examined—On Mr. Campbell's report we were to sink 350 or 400 feet; we have gone down 20 or 24 feet. Campbell has not received money for his services, but for his expenses; am on bad terms with Campbell; slapped his face just before I went to Tumbo.

B. Olsen sworn, deposed as follows: Know Kennedy and Campbell, the prisoners; the former was watchman on board the ship *Rosenfeld*; she was wrecked opposite Tumbo Island; I was on the island for water and provisions and got well acquainted there; the time we discovered the coal we were fishing; there was no one except Kennedy and myself on the ship; we discovered the coal about six or eight feet from the water's edge; we went for days and days after that, following the ledge up for over half a mile; came to Victoria and told that we had struck a pretty good thing; spoke to Mr. Gabriel first; Kennedy was not with me and he did not know I was going to Gabriel; the latter made the remark that I need not go to Mr. Dunsinnir, as he could find money; called on Mr. Harris, of Lowenberg, Harris & Co.; made arrangements with him and Mr. Gabriel whereby they were to take half of the mine and keep it in order; had not seen Campbell; got acquainted with him in the Grand Pacific Hotel and had a conversation with him; he acted as though he wished to buy from me; Campbell told me I was very foolish to have anything to do with Mr. Harris and Mr. Gabriel. After Campbell came down from the island, he said there was nothing there. He came up to my house one time with Kennedy and was very down on me, because I would not stick up for every cent of the money and give half to Campbell; the latter said he would give a good report because he wanted to make money on me and on the company; they threatened to kill me if I would not do as they wanted me to do. Campbell said to Kennedy in my presence that he would make a bogus report to the company; I do not know who sent Campbell to make a report, that is the company's business; Campbell and Kennedy would tell me nothing; have received money from the company; kept the money myself; Campbell and Kennedy wanted me to do as the latter had done, take all my money from Gabriel and divide with Campbell.

B. Olsen (recalled)—After the conversation, Campbell said he had made \$5,000 out of the business and would make \$5,000 more; it was like the snap of my finger. Campbell and Kennedy came to my house after and were angry with me; I got excited; they said I was a scoundrel; after Campbell got the money he told me there was no coal on Tumbo island.

Wallace Lang, sworn, said: Am a carpenter; formerly boarded at the Grand Pacific hotel; that was about last March; am slightly acquainted with a man named Dick; remember seeing him and Olsen; they were talking in the hotel and beckoned me to come over; Mr. Campbell was not there, nor did he come that day; he may have been in the hotel the next week; Campbell, Olsen and myself were together and Olsen wished Campbell to see Mr. Dennis R. Harris and Mr. Gabriel; took a walk to Mr. Harris' residence, but he was out, whereupon we went to Mr. Gabriel's house and he informed us that he had had some Japanese on the island and was perfectly satisfied with their report; Mr. Olsen wished Campbell to look at the coal and give him an analysis of it and about a week after Olsen came to me at the hotel with a box of specimens; he did not know where Campbell lives and I showed him the house; when we got there, the latter looked at the specimens and said he would make an analysis, which Olsen could get in a few days; the company some time after this wanted to have an inspection of the island and Mr. Campbell, Mr. Kennedy, Mr. Gabriel and myself went up on the steamer Hope; that was on a Sunday; some time after that Olsen and I went to Mr. Campbell's house and he said the indications were good; previous to that, however, I heard him say that the mine was not of much account, although he said the croppings looked well; he told Olsen that he would have a good chance to sell and that he would make a good report; Kennedy was not present at the time; sometime after the sale was made—

Mr. Drake—Ah! how do you know about that?

Witness—Because Olsen told me he had to give a certain percentage to Mr. Campbell. I told him to keep his money in his pocket; went to Campbell's house, but

the conversation between him and Olsen was over when I got there; one thing I remember, though, is that Campbell said it was a cheap prospect; I afterwards went to Campbell's house with Kennedy and Olsen; we did not speak of the mine then, but on another occasion I had a piece of ore and Campbell said he would make a good report and have a chance to sell the mine; have seen Campbell and Olsen together four or five times; Campbell seemed very much pleased; Campbell and I did not continue on very good terms; we passed each other two or three times without speaking; remember going to Campbell's house when Olsen and Kennedy were there; there was not a friendly feeling existing towards me; remember Campbell saying after the return from Tumbo Island that the mine was not worth twenty cents; never heard him say that in the presence of Olsen; Campbell told me he was a mining engineer; he had good credentials, and as one of the Crocker family called upon him took him to be a *bona fide* engineer; neither Mr. Kennedy nor Mr. Campbell made a proposition to pay me any money at any time.

To the Court—Was promised an interest.

To Mr. Mills—It amounted to 1-12 interest in the mine.

Mr. Mills—Did Campbell ever tell you he had an interest in the mine?

Witness—No.

Mr. Mills—Well, if he didn't how could he give you an interest in the mine? Why don't you tell me the truth about this when I ask you?

His Honor—Was it under any agreement that Campbell promised you the interest?

Witness—It was, as I had been the means of bringing Olsen to him.

To Mr. Mills—Spoke to Mr. Gabriel about the share I was to receive; yes, I was a little anxious about it; Campbell did not mention a price.

W. P. Sayward, sworn—I was introduced to Mr. Campbell by Mr. Gabriel, who said that he was an engineer; we wanted to know what Mr. Campbell would go the island for and I think he said he would go for \$50; this proposition was afterwards withdrawn and in lieu of it he was to get one-sixth share in the mine, to continue as mining engineer and make a report accordingly; he went up there and when he came back said the indications were as good as he had seen in any other coal mine; he said we were giving Kennedy and Olsen too much (that was one-half interest for working the mine) and thought it would be much more profitable for us to buy them out; he said he considered the property, as it stood, worth \$25,000 and by sinking and developing it he could get a large sum of money for it; he also thought if we could buy Kennedy and Olsen's half interest for \$10,000 it would be cheap enough; a bargain was finally made between Mr. Gabriel and Olsen and Kennedy for \$7,500, and one-half that money was paid to Mr. Kennedy; Campbell told me that Kennedy was offended with him and they were not on speaking terms, and gave a reason, but I do not remember what it was; he said that on more than one occasion, and he did not want to negotiate with Kennedy; this conversation took place after the return from Tumbo Island; Campbell said he was in correspondence with a man named Mr. Pearce, of London, who represented large capitalists; he said he went to Port Townsend to meet him and take him to Tumbo Island, but that the weather was so bad they got no farther than Orcas Island; the arrangements whereby Mr. Campbell and Mr. Pearce were to get to Tumbo Island were made with Mr. Gabriel; remember Isaac Tatton coming down to my office with regard to the \$500.

To the Court—Went up to Tumbo Island last December, but it was so wet that I could tell nothing about it; relied upon Campbell's judgment entirely; often had a talk with Mr. Kennedy.

The Court then adjourned.

In General.

Mr. F. S. Shirley, New Bedford, Mass., informs us that an horticulturalist of his acquaintance has tried ground phosphate in its raw state upon some of his plants with very encouraging results. A small quantity was mixed with the earth in the pots, and the difference in the growth of the plants compared with those not so treated has been very marked. Being cleanly and odorless ground phosphate, seems especially adapted for house plants.

Phosphate shipments from Montreal to November 23rd, 1887:—

Date.	Shippers.	Ship.	Destination.	Tons.
Nov. 16	Lomer, Rohr & Co.	s.s. Concordia	Glasgow.	118
" 16	Millar & Co.	s.s. Lake Ont.	Liverpool.	112
" 16	Wilson & Green.	do	do	156

" 23	Millar & Co.	s.s. Katie	do	40
" 23	Wilson & Green.	do	do	96
Total				1,590

Mr. Adolph Lomer, of Messrs. Lomer, Rohr & Co., of Montreal, sailed for England on the 26th ulto., on a business visit to England and Germany. This firm were the largest shippers of phosphate this year, having handled the production of the Emerald, Dominion and McLaurin & Blackburn's mines, their total shipments aggregating 8,744 tons.

Mr. F. Hilton Green, of Messrs. Wilson & Green of Montreal, sails for England on the 22d inst. This firm were the second largest shippers, being agents for the mines of the Phosphate of Lime Co., Capt. Boyd Smith and Mr. W. A. Allan. They exported 7,468 tons.

The Anglo-Canadian Phosphate Co. rank third, with an export of 2,025 tons, besides local sales, and Messrs. Millar & Co., who ship for the Union Mine, come fourth with a shipment of 1,267 tons, besides 287 tons sent to the United States.

Du Lievre District.

A visitor from the Emerald Mine reports that three new magnificent leads have been struck and that the older workings are doing very well. A bright green phosphate is being produced that makes a fine appearance and will give high analyses.

A vein of silicate of magnesia or mountain cork has also been found on this property. It is of the same family as asbestos and meerschaum and the men have been whittling pipes out of it. It is pure white in color, very light in weight and unbreakable by a fall. The discovery has excited much interest and the material is thought to be valuable.

The old cobbing house at No. 11 pit, High Rock mine, has been superseded by a new and more commodious structure 60x30. Inside have been placed two large circular screens or sieves through which all the ore passes, and by which the cobbing, formerly done by hand, is greatly facilitated. Twice the quantity is now handled in less than half the time taken by the old process.

No. 11 pit, or more correctly speaking, tunnel, running 250 feet into the hill on a 300 ft. level, and widening out at the end to a distance of 225 ft., is as rich as ever. Four air-drills are at work, and about 450 tons per month are being raised from it. The other pits on the top of the hill are all turning out satisfactorily. 140 men are employed, and after Christmas vacation the management contemplate putting on a full night shift in No. 11. The drills will be worked night and day, and the number of hands will be increased.

Mr. W. W. Pickford has had three men prospecting for a couple of months on what is known as the Portland East mine, located near the Emerald property and owned by the High Rock Company. A very promising show has been found, which Mr. Pickford will work in the Spring.

Through an unfortunate typographical error in our last issue, it was stated that the new cobbing-house at this mine was the tenth on the property. There are but three cobbing houses.

Some very promising shows have been opened on the Little Rapids property since our last. Work is carried on briskly, although with a very much reduced staff.

Despite the somewhat unfavorable nature of the weather of late, good progress has been made with the construction of the new Locks.

The ice which gave promise of being so good for travelling, has been rendered very unsafe by the soft weather and hauling has been much impeded thereby.

The Union and North Star are going ahead much as usual, but there is nothing special to report.

It is understood that during Christmas week operations will be generally suspended throughout the district.

Perth District.

The Anglo-Canadian Phosphate Co. have had encouraging success at the Otty Lake Mines the past month, having struck a seam of good phosphate six feet in width. The output for November was 129 tons, with only about 20 men employed.

Templeton District.

The outlook of the Templeton and Blanche River Company of Montreal is reported encouraging. Up to the 28th of last month at least 250 tons of high grade ore had been taken out of the various pits. The Perkin's pit has been cleaned out, an excellent tramway built, two dumping wagons constructed, a first-class derrick and a comfortable cobbing house erected in connection therewith, and the pit, generally, made ready for effective winter work. Mining was begun there on Saturday the 28th ultimo, and the result has been very gratifying—four tons of the highest class mineral being the result of the first day's operations. If this pit continues productive the necessity of adding steam will have to be faced in about 30 days; and in any case, if the property is to be operated effectively, steam appliances should be brought in some time during the winter, the summer roads being impracticable for that purpose. The pits already opened are numbered 1, 2, 3, 4, 5, 6, 7, and the Perkin's pit, eight in all. Of these, 2 and 5 have temporarily given out; No. 7 and the Perkin's are being worked effectively and 1, 3, 4, and 6 still show good veins and may be taken up at any time; No. 1 has a solid floor of phosphate and is in a very advantageous position for winter work. A winter road has been constructed from the mines to the foot of Post's Hill, cutting off about 1½ miles of distance and several heavy rises, and hauling to the front will commence as soon as the Lakes and swamps are sufficiently strong to carry, which will be about the beginning of January.

The only other mine at present doing any work is that of Messrs. McLaurin & Blackburn,

who are carrying on operations with a very reduced staff. Mr. McLaurin has severed his connection with the property.

Work has been suspended for the winter at the mines of the Canada Industrial Co., Mr. Jackson Rae and Messrs. Gillespie & Patterson.

Newfoundland.

A lot of specimens of magnetic iron ore from Sandy Point, St. George's Bay, has reached St. Johns en route for England. The deposit is said to be very extensive, the ore cropping out on the face of the hill, running with well defined walls clear to the top of it. It runs then backward for a long but as yet unascertained distance. The lode is over one hundred feet wide and thousands of tons of ore could be taken off the face of the lode in sight. A number of men are prospecting, having strong reasons for assuming that coal will be found at no great distance from the deposit of iron.

Nova Scotia.

The adjourned meeting of the Nova Scotia Gold Miners' Association was held in the office of the *Critic*, Halifax, on Tuesday, 6th instant. The draft constitution and by-laws prepared by the temporal committee was submitted, and after some amendment adopted. The election of office bearers was postponed until the meeting in February, and the following were appointed an interim committee:—Hon. H. L. Wadsworth, Chairman, J. M. Reid, T. N. Baker, John Anderson and John McGuire.

The Oxford Gold Mining Co., from May to November of this year, have declared dividends amounting to 16% on their capital stock of \$125,000.

Mr. F. A. Wiswell, the late superintendent of the Essex Gold Mining Co., has leased the whole of that company's property, which has lately been lying idle, and with his usual push and enterprise, has already called for tenders for work on all the partly worked leads on that property, and also for prospecting others known to exist there.

The following are the official returns so far received at the Mines Office for the month of November:—

District.	Mill.	Tons Crushed.	Oz. Gold
Sherbrooke	Goldenville	205	48
"	Miners	200	71
"	Pactolus	150	23½
Lake Catcha	Oxford	61½	191½
Whiteburn	Cushing G. M. Co's	27	27½
Salmon River	Dufferin	825	321

Work at the collieries of the counties of Pictou and Cumberland are particularly brisk for this season of the year, and the outlook for the future is very encouraging.

The Intercolonial Coal Mining Company are actively engaged in preparations for a largely increased output, having sunk their slopes 500 feet further, making a total depth of 3,200, probably the longest slope in the Province. They are also reopening their new shaft, the Scot Pit, the working of which will be extended as far as possible during winter, with a view to further development.

This company have recently secured the services of Mr. Charles Fergie, of Wigan, England, and doubtless this enterprising corporation will be able to compete successfully with the wealthy Acadia Coal Mining Company, operating the Acadia, Albion and Vale collieries.

The Acadia Company own a very valuable property, but in portions of it they are likely to have many serious difficulties to overcome. At the Albion, about seven years ago, a disastrous explosion occurred at the Foord Pit—a shaft 900 feet deep—after which the mine took fire, and the flames extended to the Cage Pit—another valuable mine connected with the Foord. These mines had to be flooded and abandoned. Efforts are now being made to re-open them. On 1st December the Cage Pit gave outward and visible evidence that the fire still exists, but even now that difficulty will soon be overcome, as the fire is being built off and confined as rapidly as possible. In the hands of General Manager H. S. Poole, the property ere long will probably be one of the finest in the Dominion.

At Spring Hill, Cumberland County, the Cumberland Coal and Railway Co. continue to extend their already extensive works, being at present engaged sinking to another seam of coal. On November 30th the largest output of coal ever made at any mine in Nova Scotia in one day was made at these mines, the quantity being 2,683 tons.

The opening of the Joggins Branch Railway is likely to prove highly beneficial to the Joggins mines. The company has been reorganized and General Manager McNaughton is now advertising for fifty experienced coal miners.

Mr. John H. Harding, of St. John, N.B., is reported to have formed a company in Montreal to work a manganese deposit in Maitland on the Shubenacadi River. The capital of the company is \$10,000, consisting of 1,000 shares of \$10 each. Manganese is used for bleaching, painting, colouring glass and a number of other useful purposes, and the demand, therefore, is gradually increasing. Such is the enquiry for this useful metal that Mr. Harding has been offered \$80 per ton for all he can produce.

New Brunswick.

Some quantities of ore recently taken from the Glebe Manganese property, owned by Messrs. F. J. Alley and others, of Bar Harbor, Maine, is valued at \$200 per ton.

Latest reports from the Mineral Vale mine, New Ireland, announce that concentrating machinery of the latest and most approved pattern is shortly to be put in by the proprietor.

The output from Major Markham's Manganese property continues satisfactory.

Prospecting for antimony in the neighborhood of Springfield has recently been carried on by Gilbert Grundall, of Moncton, and others, it is said, with encouraging results.

Negotiations for the sale of the extensive Manganese deposits at Jordan Mountain are nearing completion. Baltimore people are expected to give \$40,000 in cash to the present proprietors.

Quebec.

On Thanksgiving Day Mr. O. Spencer, of Calumet Island, discovered a mineral deposit on his land, which is believed to be of a valuable character. From what we learn the ore resembles very much that of the Lawn Mine, only it is of finer grain. It is said to contain silver and a superior grade of copper, but this conclusion is merely from conjecture as no analysis has as yet been made. The deposit is situated on lots 12 and 13 in the 5th range of the island. Several tons of the ore are lying loose on the surface in the vicinity of the vein which is said to indicate the presence of a large deposit. We have heard that Mr. Spencer has refused an offer of \$600 for the mineral right.

Iron has been found on the farm of Mr. John McTiernan, Clarendon.

At the Villeneuve mica mines a new hoisting engine and another drill has been added to the plant. The present output is reported to be close upon 2,000 lbs. per week.

A typographical error last month made the output from this mine in tons instead of pounds. The paragraph should have read 3,400 lbs.

The gold mining operations in the Buckingham district have ceased. Work will be resumed by Captain Bothwell, and the Syndicate in the spring.

A dispute between Mr. Church, of Aylmer, and a German named Louis Redant, about the possession of a mica property in the Township of Cawood has been settled at the suggestion of Mr. Clarke, the Crown Lands Agent. Both parties have agreed to a division of the property.

At the South Ham Antimony Mine, near Lake Nicolet, the proprietor, Dr. Reed, has, during the past season, driven in an adit 304 feet long—6 + 7 from the base of the hill in which the ore is located—striking the bottom of the deepest shaft, now 100 feet. All the works are now thoroughly drained and ventilated, and pumping is now no longer necessary. The mine can be most economically worked for several years by following east and west on the vein which has been traced on the surface about 1,200 feet. The adit runs nearly north, striking the vein rich at 100 feet from the surface.

Mr. A. M. Evans, M.E., of Cardiff, Wales, at the request of English capitalists, examined the property in the early part of last month and reports very favorably upon it, stating that the measure is about 70 feet broad and will yield antimony in paying quantities, some portions giving very rich ore as high as 80 per cent. An approximate estimate shows that two million tons of ore may be expected from the measure if taken at a depth of 100 yards, and so far as can be ascertained there is no reason to expect it to terminate at three times this depth. Mr. Evans advises the smelting of the ore at the mine, with charcoal, to be made out of the immense quantities of timber on the property.

The miners are now driving eastwards on the vein taking out splendid ore, which is to be piled up until five or six hundred tons of first-class ore have been mined, when the erection of suitable concentrating and smelting machinery will be considered. The property is

located in the middle of a district rich in asbestos, copper, iron, soapstone and other minerals, and hopes are entertained that the Dominion Lime Company's railway will very soon be pushed into close proximity to the property. The people of Wolfe County are much indebted to their worthy members, W. B. Ives, M.P., and R. N. Hall, M.P., for the interest they have taken in this new line. The subsidy from the Dominion Government was in very large measure due to their efforts.

New acid works are in course of construction by G. H. Nichols & Co., at the copper and nickel mines at Orford, and are nearly completed. The manufacture of sulphuric acid is expected to commence within a short time.

According to the Sherbrooke *Examiner*, the owners of the Orford mine are putting in new machinery on their property, which, until recently, was owned by the Orford Copper and Sulphur Company. It is now in a prosperous condition and continues to yield large quantities of ore. From 1,500 to 1,600 tons are shipped monthly to New York, and there are reasons to believe that the output will increase in the near future.

The high grade ore mined at the Cowan & Ray mine last year has been shipped to Montreal this season by Mr. S. P. Franchot.

Ontario.

At Malone, a station on the Central Ontario Railway, the old Feigle Mine has been worked to some extent during the past season. The quartz was milled at the Gladstone Stamp Mill and some good results obtained (the Feigle and Gladstone properties are both on the same vein), but the parties doing this work not being able to obtain a lease from the Feigle Company the work has been stopped. At the same mill several hundred tons of concentrates, left by the lessees of the Consolidated, were roasted in an experimental muffle furnace for the purpose, and it is said very encouraging results, both as to gold and arsenic, were obtained. We understand that a furnace of the same description has recently been erected at the Consolidated.

At the Richardson Mine, near Eldorado, in the Township of Madoc, a shaft has been sunk nearly 90 feet, disclosing a body of quartz some 30 feet in width, but the length has yet to be ascertained. About 100 tons of the ore was milled at the Bannockburn Stamp Mill, but we have not heard with what result.

A mica mine has been opened in the Township of Hungerford. The mica occurs in quartz or felthspathic dykes, and it is clear and white while the chrystals are of a good size. This property promises well, and no doubt if properly worked will yield good returns. So far insufficient capital has hindered operations being conducted to any great extent.

On lots 7 and 8, in the 11th concession of Elzevir, are found three very large deposits actinolite intermixed with asbestos of a very fair quality. The fibre is, however, short. Some 300 tons have been milled at Bridgewater for use as fire proof paint, roofing and felting.

Very little during the past season has been done in iron mining in this section of the province. Nothing has been done at any of the mines in which the Central Ontario is interested, with the exception of the St. Charles Mine, in

the Township of Tudor, where some work is being done. This mine promises well.

Explorations were made on the property of the once famous Blairton mines, near Marmora. Many new discoveries of magnetic and hematite iron have been made.

A sample of gold-bearing quartz, taken from the Ranger Mine, near Sudbury, on October 13th, has been received at the Geological Museum. It is a lump of hard grey rock about twice the size of a brick, with little splashes of yellow metal imbedded here and there in the side of a fresh fracture. The Ranger Mine is about twenty miles from Sudbury, on the Algoma branch of the C.P.R. The specimen is the property of Mr. Tough.

Local papers state that Messrs. Tough & Frawley, in order to make sure of their gold location, have erected a shanty directly upon the vein and placed two men in charge armed with Winchester repeating rifles. The property includes 900 acres.

Prospecting around Sudbury has stopped for the winter, but there is much confidence felt in the gold find there, and the spring will doubtless see a good deal of activity in the mining transactions thereabouts.

A valuable discovery of silver, about 12 miles from Sault St. Marie, is reported. The vein is 5 feet thick and 2 shafts are being sunk. It is said that a company with a capital stock of \$500,000 has been formed to work the property.

A meeting of the directors of the Kingston and Pembroke Mining Company was held at New York on the 15th instant. A report of the operations for the first six months was presented. It was shown that 22,000 tons of ore had been mined at a net profit of \$14,000. The result was considered satisfactory, although not so favorable as had been expected. One mine showed sulphur, and its output was not of great value. A large sum of money was spent in development work, and in another mine a new vein has been struck which is sixteen feet thick. The company own the mineral lands along the line of the Kingston and Pembroke Railroad.

Port Arthur District.

The more prominent occurrences to report during the past month are the continued taking up of large tracts of iron lands, more especially by Americans, on Hunters Island, and the rich developments of the new Rothwell vein, about four miles north-east of the famous Beaver Mine.

The manager reports that he has "struck it rich" quite close to the surfaces—the ore showing considerable argentite and a little native. The prediction of the Director of the Geological Survey that numerous other veins would probably be found which would be just as likely to be prototypes of the Beaver is being rapidly verified.

The Beaver mine having passed into the control of the new "Beaver Milling and Mining Co.," General Hecker U. S. A. has taken the position of manager, and doubtless Mr. Kirkland will ere long try his luck on some of the other prospects owned by millionaire Peters and himself in the Whitefish Lake region, west of Silver Mountain.

Funds are being raised to improve the communication between the Silver Mountain mine—the present terminus of the government road—and the rich deposits north west of Whitefish Lake and in the Attick Lake districts. Already about \$300 have been raised and the government are expected to contribute \$600 more.

To assist prospectors and others in taking up land, the Ontario government are having a base line run from Whitefish Lake to Hunters Island on the International boundary through the Silver and Iron region, and have also made preparation to have the International boundary traversed between Arrow Lake and Hunters Island, in the Thunder Bay and Rainy River district.

The output at the Beaver, Rabbit Mountain and Silver Mountain mines, owing to the steady enlargement and improved machinery continues to grow daily more satisfactory.

In the departure of Mr. W. H. Furlong M.E. the district loses a most reliable and experienced engineer. From his association, professionally with the famous Silver Islet and Beaver mines, and his familiarity with the various important gold mining regions of the Western States, and his studious disposition, he has acquired a vast fund of information which will be of great service in the new region he has chosen viz: the new inland gold fields of Africa, which are at present attracting so much attention.

Manitoba and North-West Territories.

It is the intention of the Medicine Hat Railway & Coal Company to sink a shaft on their property, and to lay a standard gauge track to connect their mine with the C. P. R. in the spring.

Mining on the Saskatchewan has not been very brisk during the past season, and the little that has been going on has now closed down for the winter. Some ten or twelve men were at work, most of them between Edmonton and Victoria, making from \$5 to \$6 a day.

On the North Saskatchewan River, in the North-West Territory of Canada, about 80 miles above the town of Edmonton, Alberta, there is an interesting example of naturally reduced iron. Along the river bank a lignite formation crops out for several miles, overlaid by clay shales and soft argillaceous sandstones containing nodules of clay ironstone. These nodules are similar to others found at Edmonton, and prove by analysis to be carbonates of iron, containing 34.98 per cent. of metallic iron. The Saskatchewan seam of lignite has at some time or other been burnt, leaving a bed of ashes, clinkers and burnt clay, in places 20 ft. thick, and now covered by a dense growth of grass and underwood. From this mass of burnt clay pieces of metallic iron can be picked out, weighing in some cases 15 or 20 pounds. They have evidently been reduced from the nodules above mentioned by the heat of the burning lignite. Most of the pieces of iron are much rusted; but when scratched with a file they show a bright surface. The observation is interesting, and to some may help to explain how primitive man originally discovered the reduction of iron ore.

British Columbia.

At the Quesnelle Quartz Mining Company's property work has been carried on by continuing

the shaft down 50 feet further; also a cross cut was run of about 60 feet at right angles from the main drift, the same formation continuing as at the 150 foot level. As it is difficult to get supplies and necessary machinery to work sulphurets, work will be suspended for the winter. The mine prospects well, but it will require more money and skilled labour to be expended on it before pay can reasonably be expected. The present shareholders have more faith than funds, and faith without funds goes only a short way in developing a mining property in British Columbia.

Mr. James Gray, manager for the Ophir B. d. Rock Flume Company, operating in the Big Bend of the Columbia River, has obtained a considerable quantity of gold in nuggets, ranging in value from 25c. up to \$10 and \$15. Gold is found in considerable quantities on the claim which this enterprising company is working. The camp is now an established concern, and when the wash-up for the season takes place it is believed the result will be astonishing.

The outlook for quartz mining in British Columbia never was brighter. If only a few railroads were pushed through the country the results in mining would be astonishing.

The total shipments of coal by Messrs. Dunsuir & Sons, of the Wellington collieries, for the month of November, aggregated 23,832, representing an output of nearly 1,000 tons for each working day. Of this large aggregate, 17,309 tons were shipped foreign and 6,523 tons were local shipments. It is expected that even this large output from the Wellington collieries will be still further increased.

A remarkable specimen of argentiferous galena extracted from the property of the Selkirk M. and S. Co. at Illecillewaet, was recently on exhibition in Victoria. The piece, which is entirely free from quartz, weighs over a quarter of a ton, and is pure metal composed of silver and lead, carrying 81½% of the latter and 77 ozs. of the former to the ton. It is a piece of a block that weighed, it is said, quite a ton.

United States.

The roasting of Canadian iron ores is to be prosecuted in Cleveland on a more extensive scale than heretofore. Besides the roasting oven put up some time since, a new and improved one is being erected by the Cleveland Rolling Mill Company. It will be ready for use very soon.

MISCELLANY.

The Algoma Silver District.—Writing to the *Mining Journal*, London, Eng., Mr. Charles W. F. Crauford contributes a very valuable article on the silver mines in the neighbourhood of Port Arthur. Here are a few extracts: "The whole country seems to teem with mineral wealth. Lead and copper, however, appear to make to the east, while the richest silver deposits would seem to lie along a line stretching away to the south-west of the White Fish Lake, 40 miles from Port Arthur, and beyond that to the Arrow Lake, 30 miles further. A very large number of rich discoveries are reported in districts along this line. Owing

to the lack of capital necessary to do the exploratory work, almost all these promising veins are lying dormant. On our visit to the Beaver Mine, 18 miles distant, Captain Williams kindly took us underground, when, after mounting some 20 or 25 feet up the hillside, we entered the deep adit. The usual mistakes seem to have been made in the early development of the mine. The vein broke up into strings and was lost for some time, till cross-cutting in the direction indicated by the upper workings, a bonanza was struck, and some \$2,000,000 worth of ore was opened up in five months. From this out the history of the mine has been a veritable romance. Levels have been driven in solid ore 6 or 7 feet wide by 7 high, worth at least \$1,000 per running foot of the level; pockets of virgin silver have been met with where the bits could not drill owing to their being stopped by lumps of the pure metal, and prills worth \$6,000 to \$7,000 a ton have been barrelled and sent to the smelting works; indeed, we were shown a single barrel said to contain ore worth £2,000. The country rock enclosing this remarkable vein is a black, very carbonaceous, and much jointed, argillaceous shale, conjectured to be of the Cambrian age. The lode, which is two or three feet wide in its narrowest part, swelling in many places to seven or eight, and averaging at least five, is enclosed between well-defined walls, and is nearly vertical. Its metalliferous contents are principally silver glance, with very considerable deposits of native silver, a proportion of rich galena carrying from 700 to 1,000 ounces of silver to the ton, together with a certain amount of zinc blend, worth quite 1,000 ounces of silver per ton, and also a small quantity of iron pyrites. Captain Williams informed us that owing to the soft nature of the vein-stuff no mine in Cornwall can do its stoping so cheaply; 7s. 6d. is all that it is estimated to cost per fathom for breaking away the lode. This rich ore chute measures quite 200 feet along the drifts, and as at present 100 feet of vertical depth of the bonanza has been developed. Taking the average width of the vein as five feet, this would give about 800 tons of rich ore in the backs above the adit. Anyone who has seen the deposit would not be surprised to hear that 250 ounces of silver per ton is considered a very moderate estimate, which would give about 2,000,000 ounces as the contents of this block of ground. Beyond this, however, the shaft has been sunk 40 feet, still continuing in rich ore. About a mile and a-half south-east from the Beaver is the Rabbit Mountain mine, owned and worked by a St. Paul company. It carries a magnificent 5-foot vein, from which a large amount of silver has been extracted. South-west of the Beaver is the very promising Porcupine vein. The adits and shafts in this mine show the same rich ore as is found at the Rabbit and Beaver. This mine has been sold to a Detroit syndicate, who intend pushing work vigorously at once. From enquiries I have made, development may be estimated at \$25 per foot, taking roughly that there would be one foot of shaft to three feet of drift. This estimate includes superintendence, building the rough log shanties, chopping out roads, and, in fact, everything. \$25,000 would, as I understand, be an adequate sum to prove or disprove the value of any one of these properties, as this would give, roughly speaking, 1,000 feet of workings. Some 16 miles west from these mines is the Silver Mountain mine, now being worked by a Liverpool company. Not having visited the mine, I cannot, of course, speak from my own observation, but from specimens shown to me it would appear to be a valuable property. It is some-

what mortifying to reflect that British capital has hitherto been forestalled, and that American companies are the proprietors of the richest of these mines; and that in the case of the Beaver, the last of the original owners having been tempted to accept an offer of \$105,000 cash for his one-eighth share of the mine, they are netting the comfortable sum of \$1,500 per diem. And further, that within a few months, when the new stamps are in operation, it is no extravagant dream to suppose £300,000 will be flowing across the frontier from this mine alone. Since penning the foregoing I have learned that contracts have actually been signed for constructing the projected railway which is to open up that splendid silver district, and which will run from Port Arthur to meet the American line at the Tower iron field."

The Best Shape for a Blast Furnace.

—F. W. Lurnann† discusses the various interior forms of blast furnaces, with the object of determining the shape that offers the least resistance to a regular descent of the charge. The furnace which was found by experiment to give the best results was of the following dimensions: Height, 31 feet 7½ inches; diameter at the throat, 3 feet 7 inches; at the tuyeres, 4 feet 1 inch. There was no bosh, the furnace being cylindrical in shape to a height of 4 feet 1¼ inch, and then gradually narrowed towards the throat, the total diminution in diameter of 5·9 inches being spread over a height of 27 feet 6 inches. The furnace had a capacity of 353·17 cubic feet, and made, during the period between the end of August, 1885, and the commencement of December, 1886—about 460 days—2781·3 tons of grey, mottled and white charcoal pig iron of the highest quality, the production being thus at the rate of about six tons in the twenty-four hours. The capacity being 353·17 cubic feet, a ton of pig iron was produced with a furnace capacity of 58·9 cubic feet, as compared with a capacity of 106 cubic feet per ton of pig iron in large coke blast furnaces in Germany, and 353 cubic feet and upwards in the Cleveland district. The consumption of charcoal amounted to 1·113 ton per ton of pig iron, the charge yielding 46·9 per cent. of metal. The temperature of the blast was 400° C. After the furnace was blown out, the internal diameter was found to have been considerably enlarged in the neighbourhood of the tuyeres. The furnace was erected at Musen, in the Siegen district. The author concludes by expressing the hope that these experiments with blast furnaces without boshes will be continued with furnaces in which coke is the fuel employed.

Cost of Mining.‡—Much stress is laid upon the claim of cost, extravagance and losses in mining, by a certain class when the subject is under discussion. Statements are often made concerning the amount of money put into mines in order to bring a little out, and other comparisons which are odious, not because they are comparisons, but because they are not. In the first place it may be safely stated that the money expended in the actual development is paid to a class of hard-working men and contributes not only to their support, however unwise their expenditure of what they receive, but also goes to some extent to the maintenance of other branches of business, some of which might, however, be allowed to starve to death to the advantage of the whole locality. Outside of the money expended in the legitimate development of the mines there are and have been large sums of money spent which cannot be justly charged

to the account of mining. The items under the head of expense account which a young superintendent, fresh, perhaps, from school, and knowing nothing of mines, may spend in the luxurious furnishing of an office with plate mirrors, velvet carpets and fine furniture, and the purchasing of horses, carriage, wines, etc., cannot under any strict business law be fairly added to the cost of mining. In one sense, also, the expense of inexperience, which purchases machinery before there is a mine to be worked, or erects a costly plant for milling ores where a furnace is required, should not be added to the sum total of the legitimate cost of mining. Mining, when most intelligently and economically conducted, is an expensive industry. Large capital is required to insure success even where experience and ability of the highest order directs every operation. The business of extracting ores, in and of itself, is costly and difficult under the most favourable circumstances, so that it should not be forced to bear an additional burden in this direction for which it is in no sense responsible. Already there is noticeable a marked improvement in this direction. A better understanding more generally prevails. Business men are giving personal attention to their investments and are investigating more thoroughly than ever before the basis of the enterprises into which they are invited to put their capital. Under the dispensation which is rapidly removing the development of a mine from the speculative influence of the stock board to the domain of a practical, productive industry, a cloud of evils have taken flight and others are preparing for a hasty exodus. The abolishment of a long list of unnecessary expenses, with the reduction of the cost of transporting and treating ores will add largely to the value of mines and the profits of mining. Every successful method of treatment, every new line of railway, every new facility in the way of more available mill or furnace, improved machinery and every other improvement tends to decrease the cost of mining and, as a natural consequence, increase the value of the product and extend the producing capacity of the mines. These things give promise of most wonderful results in the future and establish beyond a doubt the security and permanence of the great industry.

What is Graphite?—Graphite is not lead, as its name plumbago and "black lead" would seem to indicate, nor is it a carburet of iron, as some works of scientific pretension still call it. Except that some impure specimens contain about as much iron as ordinary clay, it is the purest form of carbon, the diamond not excepted. Prof. W. Mattieu Williams believes that it is nothing else than extremely finely divided charcoal or soot; and reasons upon the subject as follows: The hand-rails on the staircases of the Metropolitan Railway stations, after some use, become coated with a delicate film of graphite or "black-leaded." The same is seen, but more faintly, on suburban hand-rails, but not at all in rural stations. "Whence comes this graphite film? Why is it developed as we approach the centre of London, reaching its maximum in the most densely populated and sootiest regions of the metropolis? My answer to these questions is, that it consists of a selection of the very finest particles of London soot. The hands of passengers in rubbing along these rails conduct a debtor and creditor transaction. There is soot-carbon on the hands and soot-carbon on the rails, as on every thing, animate or inanimate, that is exposed to a London atmosphere. Some of the soot-particles

on the rails are brushed off by the hands, some rubbed down and smeared on the wood; some are abstracted by the hands, and some are contributed by the hands as additions to the smearing. It is obvious that in such proceedings the coarser particles are those that will be brushed off or carried away, while only the finest, the impalpably minute particles, will adhere as a black, varnish-like, unctuous film to the hard wood." So, when the coarsest lamp-black or ordinary soot, the finest vegetable-black, and powdered plumbago, are rubbed upon paper, the appearance of the fine black will be found to be intermediate between that of the other two substances.

The Microscopical Structure of Iron.

—In a paper communicated to the German Iron and Steel Institute, Dr. H. Weeding states that the presence of even a very small quantity of manganese causes a marked change in the structure of the iron, producing a peculiar crystalline structure, in which the crystals are unsymmetrically arranged. This structure compels manufacturers of high-conductivity telegraph wire to avoid the presence

of any manganese in it. The author is of opinion that iron masters over-estimate the value of manganese, since this metal ought really to be dealt with as carefully as silicon. In describing the careful way in which it is necessary to prepare the sections, the author remarks that the temperature at which surface colouration ensues is dependant on the nature of the iron, and that he has found in his experiments that an iron containing but little silicon becomes far more rapidly discoloured than one containing a considerable proportion of that element, the temperatures given in text-books in relation to this point being wholly inaccurate. Iron rich in manganese is, on the other hand, more rapidly attacked than is an iron free from manganese. The best ground colour to give the specimen is yellow. In the discussion which ensued on the reading of the paper, S. Stein remarked on the change in the form of the crystals of pig iron when manganese is present, this element causing the iron to crystallise in rhombohedra instead of in octahedra, the form in which pig iron crystallises when free from manganese. On etching, it was found that iron-phosphorus and iron-silicon

alloys withstood the action of the etching agents far more than the purer pig iron. The presence of particles of these alloys in the pig iron becomes distinctly visible on etching the surface.

Men Who Win.

Five Hundred Dollars Thrown Away—His Aim Was Success

A good healthy body is almost sure to be found associated with a good conscience.

A close student of human nature is rarely willing to place large matters of trust in the hands of another, until he has seen the one whom he is to trust. He looks for the fresh health and vigor, the honest countenance and manly form, and in fact all that is attractive in men. He doubts the dyspeptic with sallow skin, drawn-out features, the evident weak and irritable nature. He feels as Shakespeare makes Julius Caesar say:

"Let me have men about me that are fat;
Sleek-headed men, and such as sleep o' nights;
You Cassius hath a lean and hungry look;
He thinks too much; such men are dangerous."

He does not doubt the honesty of the poor unfortunate, but he fears disease of the body will affect the mind, bring misfortune upon the individual, and loss to himself.

It may be injustice to the weak, but if the man has not the mental strength, or if he is wrapped up in his misery, he cannot take in the situation of the world, does not see that ideas are broadening, and that isms and teachings are advancing! How can an employer hope for success from such a man? The dyspeptic look, the wax-like complexion and sallow features show disease. The far-seeing man notes all these signs, and knows that the great light of man, the brain, is affected or will be, at no distant day.

He discards the poor victim of disease, who goes wearily out into the world. Discouraged at last he takes to his sick bed. He seeks medical aid. Lacking the broad ideas of the successful man of the world, he tries the same medical treatment that he has tried before. The same bigoted council is sought, the same drugs are administered by the same old family friend that treated him months and years before and his parents before him, and in such a way he drags out his miserable unsuccessful existence.

Is he to blame? Why not? When he sees daily, and hears from every side, proclamations of a remedy known as Warner's safe cure, which is becoming more popular daily, hourly, while he is becoming weaker.

J. A. Gettys, insurance agent of Chillicothe, Ohio, suffered for nearly three years with dyspepsia in its worst forms, having periodical spells of vertigo, fainting and chills. He wrote over his own signature: "I spent about \$500, had the best medical attendance, tried all the remedies recommended without success, until I was induced to try Warner's safe cure. I used three bottles, have gained twenty pounds and feel like a new man."

Such a man as we have described, nine times out of ten, unconsciously to himself or to his physician, has a kidney disorder, which is fast wasting his body and life. He sees the merits of Warner's safe cure at every turn, and hears it proclaimed from the housetops, and yet he does not use it, because it is said by his illiberal physician that it is not professional, and not admitted by the code. Meanwhile the man of the world presses forward, cares not a fig for this or that school; his aim in life is success and he looks hopefully forward to the world beyond, believing and trusting in man in this world, and to his faith for the world beyond.

VALUABLE
PLUMBAGO
AND OTHER
Mineral Lands
FOR SALE,
IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

FOR SALE.
VALUABLE
Copper Mining Properties
— IN THE —
Eastern Townships

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
- 2nd. Sherbrooke Mine, part Lots 12 and 13, R. 7 Township of Ascot..... 329 "
- 3rd. Belvidere Mine, part Lots 9 and 10, R. 9 and 10, R. 8 Ascot 292 "
- 4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within 1½ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only 2½ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

5th. Carbuncle Hill Mine, Lots 2 and 3 R. 14, and 2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

6th. St. Francis Mine, ¼ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.

10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

MINING ENGINEER,
BELLEVILLE, ONT.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands,

1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

Notice to Contractors.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Post Office at Coaticook, P.Q.," will be received at this office until Thursday, 29th December, for the several works required in the erection of Post Office, at Coaticook, P.Q.

Specifications can be seen at the Department of Public Works, Ottawa, and at the office of the Collector of Customs, Coaticook, on and after Tuesday, 13th December, and tenders will not be considered unless made on form supplied and signed with actual signatures of tenderers.

An accepted bank cheque payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract or fail to complete the work

contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,

Secretary.

Department of Public Works,
Ottawa, 5th December, 1887.

Notice to Contractors

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Post Office at Napanee, Ont.," will be received at this office until Tuesday, 10th January, for the several works required in the erection of Post Office, at Napanee, Ont.

Specifications can be seen at the Department of Public Works, Ottawa, and at the office of F.

Bartlett, Esq., Architect, Napanee, on and after Tuesday, 20th December, and tenders will not be considered unless made on form supplied and signed with actual signatures of tenderers.

An accepted bank cheque payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,

Secretary.

Department of Public Works,
Ottawa, 19th Dec., 1887.

NOTICE RESPECTING PASSPORTS.

PERSONS requiring passports from the Canadian Government should make application to this Department for the same, such application to be accompanied by the sum of four dollars, in payment of the official fee upon passports as fixed by the Governor-in-Council.

G. POWELL,
Under Secretary of State.
OTTAWA, 19th Feb., 1886.

Department of Inland Revenue.—An Act respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall

have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspector, to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALI,

Commissioner.

15th Dec., 1887.

Black Diamond Steel

THE VERY FINEST STEEL

For Miners' Use

Will hold a Good Edge and Save Money in Blacksmithing.

LARGE STOCK

Always kept at our MONTREAL BRANCH HOUSE, or can be delivered promptly from Works at Pittsburg. Address

PARK, BROTHER & CO.,

LIMITED,

337 ST. PAUL STREET,

MONTREAL.

The Canada Co.

Will issue Licences to Prospect or to work Minerals on any of their Mining Lands and Mineral Reservations,

Covering nearly a

Quarter of a Million Acres

In Eastern Ontario, and principally within the belts containing

Iron, Phosphate, Gold, Galena, Plumbago, Mica, Marbles, Building Stone, and other valuable Minerals.

For list of lands and terms apply to the Company's Mining Inspectors,

H. T. STRICKLAND,
Peterborough, Ont.,

For lands in the County of Hastings and westward, and to

ANDREW BELL, P.L.S.,
Almonte, Ont.,

For lands East of the County of Hastings.

TO MINERS AND OTHERS.

Bannerman & Powers,

VULCAN BOILER WORKS,

428 and 340 Wellington St., Ottawa.

MANUFACTURERS OF

IRON AND STEEL BOILERS

OF EVERY DESCRIPTION.

Tanks, Girders, Iron Roofing, Bank Vaults, Smoke Stacks

—AND ALL KINDS OF—

SHEET IRON WORK.

Repairs Neatly and Promptly Executed

MICA WANTED.

EVERY quantity of selected quality cut in square from 2x3 to the largest sizes which exist, or slabs to be cut in squares of the told sizes. Samples with lowest prices and notice of quantity and term of delivering may be addressed to Max. Raphael, Breslau, Germany.

THE INTERCOLONIAL RAILWAY OF CANADA.

THE ROYAL MAIL PASSENGER AND FREIGHT BOATS BETWEEN CANADA AND GREAT BRITAIN

—AND THE—

Direct Route between the West and all points on the Lower St. Lawrence and Baie des Charleux, also New Brunswick, Nova Scotia, Prince Edward Island, Cape Breton, Newfoundland, Bermuda and Jamaica.

New and Elegant Buffet Sleeping and Day cars run on through express trains.

Passengers for Great Britain or the Continent by leaving Toronto at 2.30 a.m. train, Thursday, will join outward Mail Steamers at Halifax a.m. Saturday.

Superior Elevator, Warehouse and Dock accommodation at Halifax for shipment of grain and general merchandise.

Years of experience have proved the Intercolonial in connection with Steamship lines to and from London, Liverpool and Glasgow to Halifax, to be the quickest freight route between Canada and Great Britain.

Information as to Passenger and Freight rates can be had on application to

E. KING,
Ticket Agent,
27 Sparks Street,
Opposite the Russell, OTTAWA.

ROBT. B. MOODIE,
Western Freight and Passenger Agent,
93 Rossin House Block,
York St., TORONTO.

— FOR —

Asbestos Materials of all kinds.

Under the head of Coal, no mention appears

to be made of the lignite of the Souris district in Manitoba, of which so much was said and predicted when its discovery was first announced. If this formation is of any value at all as a fuel, the settlers on the almost treeless districts around Brandon and the adjacent country would be much benefitted by such fuel being made accessible. We notice also that no mention is made of Peat or Peat deposits. Whether this formation can be classed as a mineral we do not profess to know from a geological point of view, but we fancy it would not be a very easy matter to state accurately where Peat ceases and where lignite begins. We hope the next issue of this report will include these products of the mine.

The amount of labour bestowed on the Report by Mr. Coste and his assistant, Mr. Brumell, does those gentlemen great credit, and although the tables as they appear do not look very formidable, we can assure our readers that no one who has not buried himself in statistical reports can form any idea of the vast amount of time and labour, and burning of the midnight oil that goes to make these very tables. Sheets of calculations and pages of addition are often represented in a plain table of one or two columns, occupying perhaps in their totals half a page of matter. We bespeak the thanks not only of the mining community but of business men generally for this useful and concise Report—a report which will be consulted in the United States and in Great Britain equally with Canada. An official report always carries weight, the sources from which its information is obtained being authentic, and as reliable as any such information can be. The only wonder we can express is that the Government has not called for such a report long before this. To the mining industry and to the general public it certainly is the most useful of all the reports that can emanate from the Geological Survey, being shorn as it is of the scientific parlance peculiar to the ordinary geological reports.

Ontario's Imbecile Mining Laws.

It is very gratifying to notice that other journals are now taking up the question of the backward condition of the mineral development of the province consequent upon the present unsatisfactory state of the mining laws. The *Toronto World* of the 9th inst. advocates as a necessity "A mining policy for Ontario," and continues daily to show evidence of its necessity, and other papers have followed suit with equally good cause for complaint. The total neglect of the interests of the mining community by the authorities (save and except in the instance of a few chosen parties and the district in which they operate) has been too well carried out for the benefit of the few favorites, and to the detriment of the real workers—the discoverers of minerals. As we have again and again pointed out in these columns, the present system of granting mineral

lands is nothing short of legalized fraud, and is too glaring an injustice to be allowed to remain any longer in this condition. Are the Ontario legislators blind or asleep? If not, let them read carefully the pages of *THE CANADIAN MINING REVIEW* during the past year, as well as the recent issues of the *World*, and awake to the urgent claims of the mining community for justice. Our demands are:—The *location* of a *mineral claim* by the discoverer *on the ground*, instead of the present system of having it done, or rather having it *not* done, as it is too often the case in the land office, that Mr. Speculator has a prior and unlimited application for a whole district. *Free grants* of mining claims *to miners*, and *compulsory development* of these claims, under just and proper regulations for the manner of working. Surface lines as boundaries of mining claims are not the just mineral boundaries. A miner should follow the dip of the lode, vein or bed of ore, as surface lines or boundaries are not those in the interest of development, or protection of capital or labor invested. Auction sales of mining lands are in the interests of speculators only, and ought to be discontinued. *Competent mine inspection*, and *complete provincial mining statistics*, and *trustworthy mineral reports*, and not political advertisements, as at present, by "special agents" of questionable standing. Equal educational advantages to mining and agricultural students, or none, to anyone.

Iron and Steel Institute.

We have to acknowledge this month the second volume of the Journal of the Iron and Steel Institute for 1887. Among the many interesting features of its extensive and well edited pages we need only select the titles of a few of the principal papers in order to show its scope: "On the Metallurgical and Mechanical Exhibits at the Manchester Royal Jubilee Exhibition," by Mr. Thomas Ashbury; "On the Reduction of Ores of Iron in the Blast Furnace," by Sir Lowthian Bell, Bart., F.R.S.; "Notes on the Basic Open-Hearth Process," by Mr. J. W. Waiies; "On Electric Lighting in Works and Factories," by Professor J. A. Fleming M.A. An old pamphlet published in London by the iron manufacturers of Great Britain as far back as 1756, and entitled "The Case of the Importation of Bar Iron from our own Colonies of North America," is also reproduced, and will be read with peculiar interest by the iron manufacturers of the Dominion.

Raw Phosphates.

Previous to the year 1770 it is difficult to find any record of the use of bones for agricultural purposes. In 1740 their value for a top-dressing for grass lands was accidentally discovered at Sheffield, where a heap of bone shavings, scrapings, &c., was buried in a field with marvellous results.

The mechanical division of bones in their

raw state was difficult and so costly that it precluded their use in any other form than crushed.

Liebig, some fifty years ago, found that by the application of sulphuric acid to bones it reduced them to a finer state of division than could be done by then known mechanical means.

This application is often called dissolving bone in acid. There is no clear solution.

It is a mere breaking up, it is a softening, pap-forming process, and bone in this state, would more appropriately be called bone pap.

The bone is merely so far reduced that, when rubbed between the thumb and finger, no grit is felt. Bone cannot all dissolve, for the sulphuric acid, when added rightly, unites with the lime of carbonate and phosphate, and forms with that insoluble sulphate of lime or plaster.

It is this which gives the grayish white look to the bone porridge.

At the present time comparatively few bones are used for fertilizing purposes; phosphate rock, phosphorite, apatite and coprolites having been substituted generally in place of bones in manufactured superphosphates and commercial fertilizers. Where originally it was impossible to get raw bones ground fine by machinery that difficulty does not exist with phosphate rock, phosphorite, apatite and coprolites, as they are all easily reduced to an impalpable powder at a low cost with the present machinery now in use, and it has been found by repeated experiments by competent authorities that if the phosphates are ground to an impalpable powder, they are as available to crops as if they had been treated with sulphuric acid, the carbonic acid of the soil and the soil water being as efficient a solvent as the sulphuric acid.

In saying that phosphoric acid is insoluble it is meant that it is insoluble in pure or distilled water. Water which contains carbonic acid, ammonia or common salt (and all water contains one or more of these) has the power of liberating the phosphoric acid from its base lime and rendering it available to roots. The action is slow, but it is sufficient, and it is more rapid the finer the pulverization of the phosphate.

In fact phosphates treated with sulphuric acid to render them soluble before, but not after they are applied to the soil and sold under the name of superphosphate, when applied to the soil reverts or goes back to its original condition; this is generally admitted, but it is soluble in the acids of the soil in the same manner as are the phosphates ground to an impalpable powder. It is estimated that 400,000 tons of sulphuric acid, 50° strength, are used annually in the United States to convert insoluble phosphoric acid into soluble phosphoric acid, and that this quantity will be doubled during the next five years.

As it requires about a ton of sulphuric acid of this strength for every ton of phosphate rock containing sixty per cent. of phosphate of lime, it is readily seen that the sulphuric acid will cost more than the phosphate of lime, and reducing the quantity of phosphoric acid in the resulting superphosphate one-half.

Certainly this is a most costly way for the farmer to obtain the phosphate of lime, finely divided so that the acids of the soil can act upon it. The present machinery in use is by far the cheapest method, for in addition to the great cost of the sulphuric acid and the necessary expenses attending its use, there comes the expenses of transportation which has been doubled by the addition of the sulphuric acid. It is claimed by some that for tilled and quick growing crops, (it is conceded that it will for grass and winter grains) the phosphoric acid will not be liberated as fast as the crops require it from the phosphate when in an impalpable powder; but there can be applied at the same cost, four times the quantity of phosphoric acid in phosphate of lime in an impalpable powder, than there can be in phosphate of lime treated with sulphuric acid, and there can be no question but that with using four times the quantity as much phosphoric acid, if not more, will be as available for the growing crop as if one-quarter part was used that had been treated with sulphuric acid; again the additional three quarters used is not lost, but becomes assimilated in the soil for the drafts of future crops upon it.

But we are not confined to the use of sulphuric acid or the slower operations of nature to render the phosphoric acid in phosphate of lime immediately available for crops. It has long been known that fermenting manure or peat with phosphate of lime powder scattered or mixed through it, would render the phosphoric acid at once available.

This certainly is a better as well as a cheaper way for the farmer to procure soluble phosphoric acid, than to get it in phosphate of lime, treated with sulphuric acid at four times its first cost and the expenses for transportation doubled.

The theory of scientific agriculture is based upon a complete knowledge of soils, plants, animals and manures, and it is evident that until these elements are thoroughly understood, no attempts at improvement or plans for increased production can possibly be successful. The manure question is the most important one connected with agriculture or horticulture. With fine ground phosphates as the basis of operations, we can now obtain complete manures for any culture, made according to any formula and containing in a readily assimilable form all the ingredients called for.

A Visit to Ohlendorff's Chemical Works.

Frank D. Adams, M.Ap., Sc., Geological Survey, Ottawa.

While in London in 1886 in connection with the Colonial & Indian Exhibition, an invitation was extended to a number of gentlemen from the various British Possessions represented at South Kensington, by the Manager of the Anglo-Continental (late Ohlendorff's) Guano Works to visit and inspect the company's well known establishment. As the subject of phosphate manures is one of special interest to Canadians, and this company do about the largest business, as manure manufacturers and guano merchants, in the world, a few notes on our visit may perhaps prove of interest to your readers.

Meeting at St. George's docks early in the morning our party embarked in the company's smart little steamer, which we found gaily decorated with flags awaiting our arrival, and started down the Thames, under the various bridges, past the tower and then by the interminable wilderness of warehouses and manufacturing factories lining the banks of the river, till we reached the Tidal Basin, where the company's works are situated. On landing we were cordially welcomed by the manager, who, in a short speech, gave us a few general facts concerning the works. The London factory, we learned (for the firm owns three others situated at Hamburg, Antwerp and Emmerich-on-Rhine respectively), covers no less than eight acres of ground and turns out weekly over 1,000 tons of manufactured manures, giving regular employment to about 300 men in addition to a number of women. Being situated on the bank of the Thames with convenient wharves, steam cranes, &c., it has great facilities for loading and discharging vessels, and a siding of the Great Eastern Railway connects the factory with the various railway systems of the United Kingdom. This factory, together with the other three above mentioned, were taken over in 1883 by the Anglo-Continental (late Ohlendorff's) Guano Works with a paid up capital of £800,000.

The stores and warehouses, which were first visited, are lofty buildings with the floor space laid off in regular streets walled on either side to a height of 30 feet by continuous piles of bags of raw guano. At the time of our visit, we were informed, there were about 10,000 tons of this guano in stock, and when we looked at the immense number of bags, each of which was, roughly speaking, worth about £1, or \$5.00, some general idea could be obtained of the immense money value represented by this stock, which, together with the value of the other goods here stored, frequently exceeds £200,000. Although the day was only a moderately warm one the odour of ammonia exhaled from the guano was distinctly perceptible, but I was informed that in hot weather it was quite strong.

We then went on to the factory where super-

phosphate was being manufactured from South Carolina rock. The crude phosphate was first cracked, then ground in roller mills and then sifted by means of a blowing machine. The fine powder was then placed in a rather shallow circular decomposing chamber constructed of masonry and provided with a rotating stirrer, the chamber was closed and the necessary amount of oil of vitriol run in from above. The chamber was then connected with a Root's Blower and the stirrer set in motion. When the re-action was finished the mass of semi-liquid superphosphate was allowed to run through holes in the bottom of the chamber into a closed bin below, in which it cooled. When raw Peruvian guano is used, it is first pulverized in a Carr's disintegrator and sifted to free it from stones before treating it with the sulphuric acid.

In smaller storehouses, adjacent to the factory, were various other crude phosphates which the company employed or were experimenting upon. Among them were bones, Belgian phosphate, Guadeloup phosphate, Australian phosphate and Basic Bessemer Slag. I enquired from my guide, who was one of the gentlemen connected with the works, whether Canadian phosphate was employed, and he replied that some of it had been used, but that it was not liked for three reasons: 1st, on account of its greater hardness it was more difficult to grind than other crude phosphates; 2nd, being less easily decomposed by sulphuric acid it was found difficult to render the whole of it soluble; 3rd, on account of the quantity of fluorine given off on treatment with the sulphuric acid. He acknowledged that the first two difficulties might be overcome, to a certain extent at least, by more powerful machinery and finer grinding, and the third objection did not seem to be a very vital one, seeing that the South Carolina phosphate, which they were using at the time, contained some 2 per cent. of fluorine, which was set free on treatment of the rock with sulphuric acid and carried off by means of a blower. If a blower is used at any rate the presence of a few per cent. more of fluorine did not seem to be a matter of much importance. These objections do, however, still tell decidedly against Canadian phosphate as shown by the fact that at that time Sombbrero phosphate, of 70 per cent., would in England, bring as high a price as Canadian phosphate of 80 per cent., and the former does not contain a trace of ammonia.

The Basic Bessemer Slag above mentioned, although by no means very rich in phosphoric acid, is nevertheless so cheap, and contains this acid in such a soluble form, that it will undoubtedly meet with a rapidly extending use. In the year 1886 rather over 400,000 tons of it were produced, containing, on an average, from 17 to 20 per cent. of phosphoric acid, and as Mr. Gilchrist, one of the inventors of the basic (Thomas & Gilchrist) process, remarked to me in course of conversation, the iron master who produces

it can give it away and make sixpence a ton on it, as it is a bye product in the manufacture of his steel, and it costs him that amount to cart it away. As a cheap source of phosphoric acid, it, therefore, leaves but little to be desired, and its production must be regarded as one of the triumphs of modern times, seeing that great deposits of iron ore which, previously, on account of a high content of phosphorus, could not be worked into steel, are now profitably employed for that purpose, and the deleterious element phosphorus removed in it is not wasted, but rendered available for enriching the soil. The phosphoric acid, furthermore, exists in such a state that the slag does not require to be treated with sulphuric acid, as in the case of most crude phosphates, but can be applied directly to the soil. In the report of the Connecticut Agricultural Experiment Station for 1886, the director, Dr. S. W. Johnson, speaking of this slag as a manure, says: "During the last year it has been introduced into this country. The following analysis has been made on a sample from one bag sent to the station:—

Phosphoric acid, soluble in Ammonium Citrate..... 19.59 per cent.
Phosphoric acid, insoluble in Ammonium Citrate..... .30 "

"The slag was a fine meal, which passed a $\frac{1}{50}$ inch sieve. It is sold bagged in New York for \$12.50 per ton. The phosphoric acid which it contains costs, therefore, about $3\frac{1}{2}$ cents per pound." The same phosphoric acid in ordinary phosphates was at that time selling for $7\frac{1}{2}$ cents per pound.

Our party then visited the sulphuric acid works, which had, unfortunately, a short time before, been partially destroyed by fire. Workmen were engaged in soldering, or, rather, melting, together, by means of oxyhydrogen blowpipes, the lead plates for the construction of the acid chambers, the joints produced being extremely neat. Spanish pyrites supplies the sulphur required by the works.

After visiting a small museum, in which were exhibited samples of the various crude materials and manufactured products of the factory, as well as many curious remains of birds, some of them still showing the feathers, which are occasionally found in the guano, we returned to the wharf, passing through another portion of the great warehouse where the manufactured manures are stored in bulk, in hills or small mountains, often containing thousands of tons. Cards showed the amount of phosphoric acid contained in each of the brands, the richest which I saw being a small heap of superphosphate manufactured from Canadian apatite.

In addition to the regular phosphatic manures, such as superphosphate, dissolved guano, dissolved bones, etc., most of which also hold ammonia, the firm manufactures a number of special manures, such as "grain manure," "flax manure," "tobacco manure" and "cane manure," a large amount of the last mentioned being ex-

ported to the West Indies; and also deals in raw fertilizers, such as nitrate of soda, kainit, bone dust, etc. The various manures for exportation are carefully weighed, bagged and the bags sealed. Every bag is accompanied by a guaranteed analysis, the large scale on which the manufacture is carried on, and the testing of the manure by chemical analysis, from time to time during the process of manufacture, leading to a great uniformity in the finished product.

Having thanked the various gentlemen connected with the works for their very kind invitation and our most enjoyable visit, we embarked in our little steamer and returned to London the same evening.

We invite Correspondence upon matters consistent with the character of the REVIEW.

Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

Chromic Iron.

QUEBEC, 11th Jan., 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—Will you give me a few lines in your interesting journal to direct the attention of chemists, capitalists and investors to the question of establishing works for the manufacture of Bi-Chromate of Potash in the eastern townships. Chromic Iron is, as many of your readers are well aware, found in considerable quantities in this district, notably in South Ham, Lake Nicolet, Leeds, Thetford, Wolfestown and other points within the great serpentine belt in the Province of Quebec, and assays of the ore have given as much as 60.0 of chromic acid. In the United States the Tyson Company, of Baltimore, the Kailon Chemical Company, of Philadelphia, and other large manufacturing establishments are purchasing Canadian ore at \$18 per ton, paying duty and freight and returning the manufactured product for sale in the Dominion. There is also a very large annual consumption in Great Britain and Europe. Does it not seem reasonable to suppose that the manufacture of Bi-Chromate of Potash in our own country would pay? The late Sir William Logan evidently thought so when he wrote (Geology of Canada, 1863, p. 150):—

"The process of manufacturing the Bi-Chromate of Potash is one which might be very well carried on in this country. It consists simply in calcining the finely ground ore with Crude Potash, in a proper furnace, exposed to a certain current of air, by which the chromic oxyd. is acidified, and unities with the potash. The resulting mass is lixiviated with water, and the solution, being mixed with a certain amount of sulphuric acid furnishes by evaporation crystallised Bi-Chromate of Potash. In the absence of sulphuric acid, a crude neutral Chromate of Potash might readily be prepared by simple evaporation and shipped to England to be there converted into Bi-Chromate."

The facilities for obtaining quantities of Potash from the woods, the cheapness and facility with which the ore and requisite fuel may be obtained, the immediate vicinity of

railway transportation, are such as to offer much encouragement for the working of chrome ores in the eastern townships.

I am, etc.,

R. J. R.

[When Mr. Thomas Macfarlane, F.R.S., first suggested in his Report to the late Sir William Logan, in 1863, the advisability of establishing such manufactures in this section of the country there was a strong monopoly in the English and Scotch markets, and prices ranging from £11 10s. to £12 could then be obtained for the ore. At the present time competition on the European market is keen, and prices comparatively low. It is true that as high as 60% has been obtained from Canadian ore, but this average would be more properly stated as a little more than 40%—too low to compete in Europe with the mineral from Russia and Siberia which goes as high as 70%. Three samples of Canadian Chromic Iron, taken, we believe, from the Province of Quebec, were tested at the Colonial Exhibition held in London two years ago with results ranging from 43.25 to 49.4%, and it was learned from a Glasgow firm doing a large business in the mineral that manufacturers there did not care to purchase any containing less than from 50 to 52% of Chromic acid. Ore of that percentage was worth about £4 per ton delivered in Glasgow. In the "Mineral Resources of the United States," published by the United States Geological Survey, the following facts concerning Chromic Iron are given:—Production in United States 1884 2,000 long tons, value \$35,000; 1885 2,700 long tons, value \$40,000. Price varies according to cost of transportation to a manufacturing centre. In San Francisco it is worth about \$15 a long ton, subject to all the fluctuations of the imported ores from Russia and Turkey. In 1885 the price delivered at Baltimore or Philadelphia was \$26. The price of Potassium bichromate fell from 10½ cents in 1884 to 9½ cents per pound in 1885. In 1885 2,500 short tons of Potassium and sodium bichromates were made in the U.S.A. A large amount of Chromic Iron was imported from Russia and Asia mines.]—EDITOR.

Will Coal be Found in Ontario?

Westville, N. S.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—The question whether coal will be found in Ontario, or, rather, in the upper provinces, I may more correctly put it, is one of such vast importance to the Dominion that it demands more consideration than it apparently gets at the present time. From observations I was enabled to make, during a brief sojourn in Ottawa, after my arrival in this country from England, I was led to believe that coal will sooner or later be found within 100 miles of that city, and that belief was shared by a man who has for a great number of years been employed boring for Coal and other minerals in England and Scotland. I will not at the present time go into any particulars as to what gave rise to that belief, but will be pleased to communicate more fully with any capitalist who may be interested in the subject (my name and address may be had at the office of this paper). I must confess I felt somewhat disappointed at hearing what opinion some eminent geologists are reported to have expressed on the Rock Formation of Ontario; disappointed because if suc-

reported expression of opinion has actually been made it will, I fear, have an injurious effect inasmuch that it will have a tendency to deter capitalists from investing the capital necessary to put down deep borings (the only means by which coal is likely to be found). I hope other and more able pens than mine will now take it up.

I will here put a few questions which I trust some of our geologists will kindly note and answer.

1st. Has the knowledge of the formation of Ontario and Quebec as gained by geological surveys, &c., being such as would justify geologists in advising against boring for coal?

2nd. What reason is there for supposing that Coal will not be found in Ontario, where the Strata is the same as overlies and underlies coal in other parts of Canada and, to my own knowledge, at over fifty collieries in England?

3rd. What is Natural Gas and what is its origin?

This last question is brought out by the fact that several discoveries of Natural Gas have recently been made in Canada, and I am informed that in Pictou County, Nova Scotia, holes were frequently made with sticks, etc., in the soft ground near the banks of the East River, and Natural Gas would arise therefrom which would burn freely. Is there any reason to think that the gas as given off there would be different from that found in other parts of Canada, or that it would have a different origin?

I am, yours respectfully,

BRITON.

An American View of our Mining Laws.

Ottawa, 20th. Jan. 1888.

The Editor

THE CANADIAN MINING REVIEW.

SIR,—Allow me a small space in your valuable journal to compare your Mining Laws with those of the United States, under whose laws I have been mining for some time past, and to endeavour to demonstrate the impracticability of developing your mining industries where such laws exist.

It is a well conceded fact, patent to every fair minded person, that the development of a country, the prosperity of a country, its industries, its wealth, must originate in its mines, its lumber and its fisheries. California, and indeed the whole of the Pacific Coast, owes her prosperity to her mines and to the indomitable will and energy of her miners, who risked their lives and their health, their all, in developing the mineral wealth of the country and the Pacific Coast in general.

In the first place the Government of the United States reserve the right to all her mineral lands, coal included; and mineral lands cannot be purchased except under conditions herein after mentioned, giving to the discoverer the first Right of Patent, thus preventing parties from purchasing mineral lands for the purpose of speculation.

Sections 2324-2325 of the revised Mining Laws of the United States say, that any bona-fide miner can locate 1500 feet upon any location (not already located), and after recording the same can, upon showing the actual outlay of \$1,000 upon such location, obtain a United States Patent for it—or the miner need but spend an outlay of \$100 per year to hold such location, and at any time in the future may obtain his Patent upon the proper

showing. Now, I find in your mining regulations that a claimant must file his declaration and obtain a receipt and pay \$5.00 which receipt only holds good for the period of one year, and must be renewed every year, which, in fact, is in reality a licence in every acceptance of the term, and which with us, in California or on the Pacific Slope, would only retard mining or prospecting, as how many poor fellows work from hand to mouth, and to compel them to put up \$5.00 per year would, indeed, be wrong. Were your Government to abolish all such fees and encourage honest mining; not by subsidizing companies, but by protecting the miners in their locations against these land sharks who obtain large concessions of land and hold it to the detriment of the good interest of the country. I, for my part, was formerly a Canadian, but have mined in Australia and New Zealand under the license system; and also in California, Nevada, Alaska and the Pacific Coast generally, under our United States system, and can only say that for prosperous mining and unhampered prospecting in my opinion, and I echo that of thousands, our laws are the most generous.

In regard to the sale of mineral lands, especially in large concessions, to parties who only hold them for speculative purposes, no one can deny that the policy of the Canadian Government must surely work a great wrong on the people and be a detriment to the development of your mining interests, which in the estimation of every thoughtful person, are among the most extensive in the world, and have caused an interest to be awakened, not only here in Canada, but in the United States, England and in Europe generally. Were it not for the foreign capital invested in the mines of the United States to-day, it is hard to say where our miners would be—what would be the condition of the Pacific Coast? To avoid capital from leaving your country and seeking the United States, it is only necessary to open up and develop your mines, and in order to do so the miners must be encouraged and protected, every inducement must be extended to them and not hampered by licenses, and such regulations that would necessarily be a drawback. Space will not permit me to enter into a *résumé* of your Mining Laws, but from careful observation I can see much to change for the better, with all due deference to your law makers. In regard to what is called the "California" or "Ledge" claims it is a well conceded fact that never was a law yet made that had not two sides to the question, nor ever a law framed that did not work a hardship to some. I do not write these lines for the purpose of provoking an argument on the merits of your laws, but to give you the views of an old miner who has prospected in California and in other parts of the Pacific Coast, and has yet to find laws that are better or more generous than those of the United States for the protection of her miners and the development and encouragement of her miners.

In the *Toronto World* of Saturday, January 14th, I find several well written articles on the mineral wealth of Canada, and I am singularly struck with the several opinions of those gentlemen, who are of the same opinion as myself, in regard to what your Government should do in development of your immense mineral resources, and can only echo one sentiment of Mr. C. M. Dobson, M.E., "why should a colony like Canada be so much in the rear of Australia and Africa?"

Yours respectfully,

WILL H. NETTLE.

The Alleged Conspiracy Case—Evidence Continued.

Isaac Tatten sworn, said: I live on Tumbo Island; know Mr. Campbell and Mr. Kennedy; got acquainted with the latter when he was watchman on the Rosenfeld, about two years ago next March; the first time I met Campbell was when he came to look at the island with Mr. Gabriel; the next time I saw him he brought Mr. Gabriel's brother up to induce me to sell my underground rights; Mr. Kennedy came up with them, they were up on business connected with this coal mine, I believe; the next time Campbell came up, he came to survey it and Kennedy came with him; they told me they had come to survey my claim off; Kennedy said Campbell was a surveyor; had no conversation with Campbell before the survey; they partly surveyed the ground, then went to Victoria and came back again; I asked Mr. Campbell where he was going to put the shaft, and he told me he did not know exactly, and he asked me if I would give him half if he put it on my land; I said I would, and after the survey was completed he told me I had better go down to Victoria with him; asked him how much he thought he could get for putting it there; he replied that he thought the company would stand about \$500; the company held a meeting in Mr. Sayward's office; Campbell did not give me any instructions what to say to the company; I came to Victoria with Mr. Campbell and Mr. Kennedy; when we got to Victoria we went to Mr. Sayward's office; the company asked me how much I wanted for sinking the shaft on my land, and I said \$500. I think I made a mistake a minute ago, I do not think Mr. Kennedy was there; Mr. Campbell, Mr. Muirhead, Mr. Gabriel and Mr. Sayward were in the latter's office; I believe that was all; I spoke to all hands about the \$500; they agreed to give me the money, and I went up to Mr. Gabriel's store and he gave me a cheque; before that, however, Campbell told me to meet him at Capt. Clark's office; got the cheque and carried out Campbell's instructions; when I got there he asked me if I had got the cheque; I said yes, and he said "Well, we will go to the bank and draw the money;" we went and drew the money, and he took it out of my hands and counted \$250 out, and gave me \$250; he put the other \$250 in his pocket; I asked Mr. Campbell several times if there was any coal on the island and he told me he didn't think there was; also asked Mr. Kennedy if the government would take Campbell's survey; he said yes, as he was a government surveyor; asked Kennedy what he got for his interest in the mine, and he told me that he had got about \$400 or \$500, and thought that I would get about \$350 for my underground rights; I did get that sum; when I got that amount I signed a document in Mr. Mill's office; that is my signature on the document produced marked "B;" signed another document in Mr. Sayward's office when I got the \$500; the document produced marked "C" bears my signature.

Cross-examined by Mr. Pooley—The second time I saw Campbell was on the 2nd of May, with Mr. Kennedy and Mr. Wilkes; do not know if Mr. Wilkes surveyed the place or not as I was not there; I told Campbell the shaft was on my land; I did object to the way the lines were run as I wanted them drawn the way I had taken my land up; I attempted to make several trips with Kennedy to bring Campbell from Orcas Island; the first trip we made Campbell was not there, the second trip we found him and brought him to Tumbo Island;

we got on to the island about 7 o'clock in the morning; I went home to my house and that same day came down and told Kennedy that I objected to the way the lines were drawn on my land. I wanted them a little to the eastward; I told them the lines should be drawn as I wanted them because I had the first right to the island; I did not in the presence of Mr. Kennedy and Mr. Wilkes say that I would make the company pay dearly for it, as Mr. Gabriel had not treated me rightly; neither did I say that I would make the company pay for every gallon of water used if they put an engine on the land; I made the remark that I would sell out if they would give me a good price; I wanted to sell out my farm and the whole business to them; had on the 4th of April sold my underground rights; was not alluding to the particular shaft that the company was going to sink, that I wanted a good price for; it was the whole of the farm, 160 acres; only a small part of my farm is good; Campbell and Kennedy returned to the island about the 27th May; Mr. Wilkes came up with them; there were six or eight miners; that was after the survey; then it was that the shaft was staked off; did not on this occasion demand \$1,000 from the company before any shaft was put down on my land; Campbell asked me to come down to Victoria to see the company and I went; do not remember telling Mr. Wilkes not to do any work on that shaft till I returned; when I met the company there was a little talk; did not agree to give them all the timber on the land, only enough for the shaft, in consideration of the \$500; when I met Mr. Campbell at Capt. Clarke's store, I think Mr. Muirhead was present; did not show them the cheque until we got to the bank; they asked me if I got the cheque and I told them yes; Muirhead and Campbell did not advise me to deposit the cheque neither do I remember Muirhead telling me that the cheque was drawn on the bank of B. N. A.; Campbell identified me at the bank as Isaac Tatten; I drew the money and Mr. Campbell took it and counted it out; he counted \$250 for himself and gave me the other \$250; the money was in \$50 bills; I put \$200 in the bank and kept \$50; we came out of the bank together; I went one way and he the other; we had a drink together afterwards; Campbell asked me if I would give him half when we were alone on the island; I do not remember whether any one was present at the time; do not know if Gabriel and Muirhead left Sayward's office together; I did not state on the 9th of May in the presence of Mr. Campbell, Mr. Kennedy, Mr. Muirhead and Mr. Wilkes, that the company had paid Kennedy \$4,000 and that I was going to make them pay handsomely for it; I know Mr. Henson; did not tell him that I had banked my \$500.

To Mr. Drake:—Tumbo island is almost two miles long; there are about 250 acres; I have my homestead and preemption certificates, one at home and the other in the land office; first knew Kennedy in March 1886; cannot tell on what date I met Campbell; did not see him there before Olsen came.

To Mr. Mills:—Was told on the 4th of April that I would be entitled to compensation if my surface rights were touched.

T. B. Hall, sworn, deposed as follows: My place of business is on Store street; have an interest in the Tumbo Coal Company; know Mr. Campbell and have seen Mr. Kennedy; Mr. Campbell has one-sixth interest in our company; do not know Olsen; had no conversation with Campbell; was introduced to him at one of the meetings at Mr. Sayward's; Mr. Campbell

said that the coal limits were a good property and by spending a little money on developing they could be sold well; the next thing, if I remember correctly, was to get all Tatten's rights and I was under the impression that we had all these rights until I was told that our rights were surface; I understood when we bought the rights we could do as we liked on the island; Campbell has repeatedly told me that the property is good; remember the meeting when Tatten came down with regard to the shaft; we all demurred against paying him that money; it was upon Campbell's suggestion that it would be better to pay the money and have the matter settled at once that the money was paid; Campbell never told me that he was going to get half of the money; no one ever told me personally that I should buy the mine; knew very well that \$7,500 was to be paid for the property; really cannot say what conversation took place on that point when Campbell was present except that the mine might bring \$25,000 if it were developed; never knew Kennedy until he came to our office and introduced himself; he told me that he had \$100 against the company; told him it was the discount on the note I knew of it as Mr. Campbell had already told me of it; he expressed surprise at that and said that he and Campbell were not on speaking terms; told him that if \$100 was due him he should have it; he told me the reason he and Campbell were not on speaking terms was that the latter had refused to show him the report; he then left my office.

Cross-examined by Mr. Pooley:—It was not Mr. Campbell who induced me to join this company; no inducement was offered; I went in of my own free will, in consequence of what I heard from Mr. Gabriel; he told me that two or three Japanese had been up there and had pronounced it a good property; Mr. Gabriel did not tell me at that time that the Japanese had made a report in writing; had not seen Campbell's report; I got my impression that we could do as we liked on the island from the conversation that took place in Mr. Sayward's office; it is quite possible that I asked Campbell what his opinion of the mine was; was not told when I went into the company that \$2,000 had already been expended, and do not recollect Mr. Campbell saying that the work that had already been done was perfectly useless. Mr. Hall here said that he could not possibly take an interest in what was going on as he had so much to do with his own business, and it was almost impossible for him to remember the conversations that took place last spring.

To Mr. Drake:—Went into the company on Mr. Gabriel's representations; Mr. Kennedy was in my office several times on that \$100 business; do not know, as a matter of fact, that a note was given to Mr. Kennedy; I have a quarter interest after Mr. Campbell's sixth interest is deducted; Mr. Gabriel is the financial manager, and all accounts pass through his hands.

To Mr. Mills:—Mr. Gabriel told me that he had perfect confidence in Mr. Campbell's opinion; did not know Campbell before I entered the company; and had parted with no money when I first entered the company.

Mary Olsen, sworn, said:—Am the wife of Mr. B. Olsen; knew Campbell and Kennedy; saw them first in my house on Douglass street; am living now on View street; they came to the house in the forenoon to see my husband and myself about a coal mine; heard a conversation; Campbell and Kennedy called my husband a fool and a silly for not going to Gabriel and getting his money, and they wanted him to

meet them at Gabriel's store in the afternoon to get the money; my husband never went out of his house that afternoon, as he got excited; they told him if he did not do as they wanted him to do, they had plenty of friends in San Francisco, and only had to write a letter and he and Mr. Lang would be killed; they wanted my husband to go to Gabriel's and get the money and divide it between them; Kennedy was present all the time; they told Mr. Olsen to get his money as quick as possible, and if he thought he was cheating himself, he was working for Mr. Gabriel; they never said anything about the coal on this occasion; Mr. Campbell told my husband that he had better get his money before he (Campbell) went to work in the mine; he said he had made \$2,000 and, with a snap of his fingers, said he could make plenty more from the company; Campbell and Kennedy said Gabriel was a thief, and would take the bread out of my husband's mouth, and when he found out that there was no coal in the mine he would not pay, that is the reason Olsen should get his money; on Sunday evening Mr. Campbell came to the house just as I was going to church; my husband was in San Francisco; he wanted to know what arrangement my husband had made about the mine before he left; told him I didn't know; he wanted to know why my husband had gone away before he got the money and why he had left it in Mr. Gabriel's hands; he wanted me to go on Monday with him; said he could get money for me and if he could not get it on Monday he would get it on Thursday at the latest; I told him I did not know my husband's business; Campbell went away saying he would be back on Monday to see me before he went to the mine; I never saw him after that at the house; Kennedy came once or twice with my husband and once when he was away; he also wanted to know the reason that my husband had not got the money before he went away; Kennedy said nothing about Campbell but said the mine was no good and after Campbell went up to the mine Olsen would not get a cent; Kennedy intimated that he was advising this on account of myself and the children; about 2 o'clock one morning Campbell came around the house, when I was alone; he tried the back gate and hearing the noise I got up; I opened the window and asked who was there; he said, don't get frightened, it is me; I looked close into his face and saw it was Campbell; he came close to the window and I got frightened and let the window down and hollered twice; Campbell ran across a field; I am afraid of Campbell because I never liked his face, and warned my husband against him.

Cross-examined by Mr. Pooley:—Cannot remember the date when Campbell first came to my house; it was last year; had never talked to anyone about this matter; I never had a chance to speak to the police about some one coming to my house at 2 o'clock in the morning, because I have been sick; am quite sure that Campbell is the man who came to the house; have never talked to Mr. Gabriel about this matter; was told by the lawyer to come to the court; had no conversation with anyone as to what I was to say; have never told anyone what I was going to say here; signed a paper of the evidence I was to give here with the lawyer; I can swear on the Bible that the man who came to the house at 2 o'clock in the morning was Campbell; the first time Campbell and Kennedy came to the house they had a glass of punch; when I came in they were fighting; I mean by that they were quarrelling; I did not see them drinking as I went into the kitchen; they started to quarrel when Campbell talked

about the mine and my husband got mad; about half an hour after Lang came; they stopped quarrelling; as soon as he came I left the room; they started to quarrel again.

This closed the evidence for the prosecution. Mr. Drake said he would like to cross examine all the witnesses.

Chas. Gabriel (re-called), cross-examined by Mr. Drake—I charged Mr. Kennedy with conspiracy for obtaining a larger sum of money than there was any necessity of; the court will be the judge of "necessity"; when I first saw Mr. Olsen he told me that he and some others had discovered some coal; he told me that it was Mr. Kennedy; told Mr. Olsen that if this mine was good I could find capital; the prospecting licence was taken out some time after that; Mr. Harris, Mr. Kennedy and myself went over to get the license; sent up two Japanese before the prospecting license was taken out; they told me that there was plenty of coal all under the seam; did not tell Lang that I was satisfied with the report of the Japanese, but told Campbell so in his presence; cannot tell the exact date of the month that I went up to the island, but think that it was December; Mr. Prior said the island was worthless as far as the coal was concerned; did not believe him, as I don't think any man would be able to judge who had only made a cursory examination; he did not go far on shore; sent the Japanese up to Tumbo Island in charge of my brother, who is a gold miner; was introduced to Campbell by Olsen; Campbell gave in a report [report read]; I know Mr. Wilkes; we engaged him to sink a 400-ft. shaft; the Japanese did not do much work; have only a half interest and never tried to get a further interest; there was never any row between Kennedy and myself; thought at the time the price paid was too high, but Campbell's arguments convinced us. We have paid \$5,400 between Kennedy and Olsen; Mr. Wilkes said that the coal on Tumbo Island was the very best he had ever seen; Messrs. Hall, Sayward and myself agreed to pay Tatten the \$350 for the underground rights; the total amount paid in respect to the mine was between \$8,000 and \$9,000; promised to pay Kennedy and Tatten \$3,750 for the mineral claims; Tatten signed the agreement; [the original agreement was here read aloud in court by Mr. Gabriel]; Mr. Kennedy has fulfilled his part of the agreement; I charged Kennedy with conspiracy on evidence that has already been produced in court; after Kennedy had been purchased out men were sent to sink the shaft; had a special agreement with Olsen; Kennedy was present when that arrangement was come to. [A document signed by Mr. Gabriel was read aloud; stated that Gabriel had paid Olsen \$3,750]; Kennedy signed a receipt for \$7,500 to Mr. Pooley; took three trips to Tumbo Island; don't know the dates; Kennedy and Campbell slept together in a room on the steamer; they told me they slept in the one room; knew they slept together, because early in the morning they came out together; do not remember telling Kennedy to buy Tatten out for \$350; if Campbell had acted honestly we would not have paid Tatten so much; Mrs. Campbell told Mrs. Wilkes that Campbell had received \$1,000 from Kennedy; Kennedy brought samples of coal from Tumbo Island and analyzed them; the samples were good; the Japanese reported favorably on the mine; induced Mr. Hall to become a partner on the strength of Campbell's report; Wilkes was introduced to me as a man having a great deal of experience in shaft-sinking

To Mr. Mills—Purchased the mine on Mr.

Campbell's advice; he put the value of \$25,000 on the mine; Kennedy and Olsen's interests were estimated as being worth \$10,000; Campbell and Kennedy were bitter enemies; they both told me that they never saw one another; gave Kennedy \$500 in cash because he wanted to go to Alaska; you (Mr. Mills) advised me not to pay the cash, because you thought the men were defrauding me.

W. P. Sayward, re-called for cross-examination by Mr. Drake—Joined Mr. Gabriel in the Tumbo Island company about a year ago; it was about the time the Japanese went up to make an examination; received a verbal report from Mr. Gabriel that the property was good; the report was so favourable that I went to see the property; when I saw it I was not favourably impressed; was a party spending some money before Mr. Campbell went up; saw Mr. Campbell's report in March last; the report made by Mr. Campbell was a geological report; this report says there are indications of coal; did not go so much on the report as I did on the conversation I had with Mr. Campbell; Mr. Prior went to the island with me, and his opinion coincided with mine; would have placed some reliance on Mr. Prior's report, only he had no opportunity to form a report; Mr. Prior is a mining expert; his opinion would have been better in my estimation than that of Mr. Campbell; know Mr. Wilkes; he took a contract to sink a shaft; Mr. Wilkes thought the measures good for coal; Mr. Wilkes' contract was to sink 400 feet at 10 per foot; for the \$350 paid to Tatten we expected to get the mineral right; only saw Mr. Wilkes a few days ago; he made no statement to me regarding Tatten's lines and the place where the shaft was sunk; am under impression that Mr. Wilkes was at Tumbo Island before I paid Tatten \$500; the reason why I think too much was paid Campbell and Kennedy was that he had been humbugged through reports and statements; Mr. Kennedy made no statements; Mr. Campbell always reported the mine in a favourable light; don't know that the reasons were correct; have no reasons for taking proceedings against Kennedy, only that he was a party to the conspiracy to get money out of the company; do not know whether Mr. Kennedy had something to sell; bought something from Mr. Kennedy; know nothing about the value of the property; it remains to be proved whether we paid too much; if we found a valuable coal field we would not have paid too much; we cannot tell the value of the mine unless we sink a shaft; had no knowledge of Kennedy being a party to the conspiracy until these proceedings were taken; did not give instructions for these proceedings.

To Mr. Pooley—I think I introduced Mr. Wilkes to Mr. Gabriel and said he was an experienced miner and we could depend on his report; Mr. Wilkes went to the island with Messrs. Muirhead and Campbell; when Mr. Wilkes returned he said he was favourably impressed; after Mr. Wilkes' return I let the contract to sink a shaft; if Wilkes had been unfavourable, I don't know what I would have done; was not present when an agreement was made to pay Mr. Kennedy \$3,750; was in favour of paying him \$2,500 and the balance when we struck bed-rock; was not in favour of paying him \$3,900; we did not meet when the agreement was made to pay Kennedy \$3,750; objected to the agreement before it was made; find no fault with Mr. Campbell's report on the coal mine; Mr. Campbell went up with Mr. Wilkes and made surveys; Campbell said Tatten would allow no one on his land unless he

was paid; the result was that I sent Campbell to Tumbo Island for Tatten, and paid him \$500 for permission to sink the shaft; Tatten agreed to allow us to open the mine and roads and to allow us use timber for general mining purposes; I do not know how much work was done by the Japanese; if a witness states that there is only enough work done for a man to cover with his hand he is drawing on his imagination.

To Mr. Mills.—Before proceedings were taken I heard Olsen's statements and Tatten's statement regarding the \$500; I agreed to these proceedings before action was taken; Campbell valued the mine at \$25,000, and thought if we got it over \$10,000 we would get a good bargain; I did not place much reliance on the Japanese report, but I did place much reliance on Mr. Campbell's report; I inferred that Campbell and Kennedy were not friendly, and I did not know that they were holding meetings; I spoke to Mr. Wilkes before any arrangement was made and asked what he would charge for sinking in sandstone; Campbell went up with Wilkes and gave up the contract because it did not pay him.

Charles Wilkes said: "I have been a coal miner for 28 years; Mr. Sayward sent for me and introduced me to Mr. Gabriel; they asked me to explore a mine on Tumbo Island; went there and selected a spot for a shaft; when I returned to Victoria told Mr. Sayward I saw the best indications for coal on the island; Mr. Gabriel said to me that the Japanese told him the indications were good; went to Tumbo Island in the steamer Hope to sink a shaft; there were nine men at work, and Messrs. Campbell, Wilkes and Muirhead arrived there next day and started to work; Tatten came to the shaft where we were at work; we started to sink the shaft on Tatten's ground.

To Mr. Mills—I did not say what date I went to survey the land; had a contract to sink the shaft at \$30 per yard; threw up the contract because the men would not work; was not going to work all summer for nothing; from the word go the company acted the second best towards me; Mr. Sayward would not pay me and sent me to Mr. Gabriel; I don't know anything about signing the contract; you will get very little out of me.

Allan Muirhead, sworn, said: I know all parties connected with this case; went to Tumbo Island on 3rd May with Wilkes and Kennedy; Campbell left us at Clover Point; on the 5th we reached the island; after arriving there I marked a tree and Mr. Wilkes said it was the best place to sink a shaft; in the evening Tatten came to the tent and Wilkes asked him to look at the shaft; Tatten said he wanted the lines changed and the shaft would then be on his (Tatten's) property; Tatten said if they could afford to pay Kennedy \$4,000 they could pay him \$1,000 for sinking the shaft; we went for Mr. Campbell on Thursday; did not get him; on Monday they brought Campbell; Tatten showed him his boundary post and his line; the eastern line was cut through the bush; the shaft was about a chain and a half outside Tatten's line; we started surveying and Mr. Campbell was chief surveyor; next morning Tatten told Campbell that he wanted the lines changed further east; he said "I have the first right on the island and will have the lines where I like;" he finished the survey, and before he left Tatten came to the tent and said he wanted \$1,000 before he would allow the company to sink on his land; Campbell said he might get \$200 or \$300; Tatten said he would not take less than \$500.

Tatten also said the company did not use him right, and he was going to make them pay; they had no water on their land, and he was going to make them pay for water; we returned to Victoria; Campbell called a meeting of the company; I was present; Mr. Campbell told the company that Tatten wanted \$500. Wilkes corroborated Mr. Campbell's statement and said the best indications for coal existed on the island. Mr. Gabriel asked me to draw up the agreement with Mr. Tatten; I returned to the island with Mr. Campbell and ten others; we laid out the shaft and Mr. Campbell to come down, the company wished to see him; Tatten told Wilkes not to start work on the shaft before he returned from Victoria; Campbell asked me to take the agreement to Mr. Sayward's office; the company held a meeting and there were present Messrs. Hall, Sayward, Gabriel, Tatten and myself; Mr. Gabriel told Tatten that the company had no right to pay Tatten \$500; Tatten became angry and said he would go back; finally they agreed to pay \$500, and the agreement was signed; I went into the outer office to insert a clause regarding timber for mining purposes; Mr. Gabriel followed me and said that he wanted to get even on Tatten who could neither read or write; he asked witness to insert a clause giving the company all the timber they required; I refused to insert the clause; Mr. Gabriel left the meeting in company with Mr. Tatten; I went to Capt. Clarke's store with Mr. Campbell; after leaving Capt. Clarke's we met Mr. Tatten; the latter was shaking a cheque and said he had \$500 from the company and intended to get \$200 more; Tatten asked witness to identify him at the bank; I did not care about going and told Tatten to ask Mr. Campbell to identify him; Campbell came from the bank about five minutes before Tatten; the latter came to us and said he banked the money. After the contract was thrown up I was engaged to go to Tumbo Island to take charge of the company's tools. I remained on the island for two months, expecting a few days when I came to Victoria to find out whether the contract was let. I did not know Mr. Kennedy when he received \$3,350; Mr. Campbell and myself met Olsen one Sunday afternoon near Wriglesworth's store; Olsen asked Campbell to help him get some money from Gabriel as he believed the company would try to swindle him. Campbell said he would have nothing to do with it.

To Mr. Mills—Mr. Campbell introduced me to Mr. Gabriel; I have known Mr. Campbell for two years; Mr. Campbell engaged me to survey the island; I went to Mr. Campbell's last night; what we were talking about you will never get from me; we talked about everything in general and nothing in particular; we did not speak about this case; on Sunday last went to Mr. Campbell's we spoke about the case; I wrote the agreement at Mr. Campbell's residence; a portion of the agreement was taken from a form supplied by Mr. Campbell; I received no assistance in drawing up the agreement from Mr. Campbell; Mr. Gabriel instructed me to draw up the agreement; Mr. Campbell told me to take the agreement to the meeting of the company; I was first introduced to Mr. Campbell by Mr. Eli Harrison; I have had a little experience in engineering; I remember meeting Messrs. S. P. Mills and Gabriel, and I said the company had treated me right; Campbell had used me like a gentleman and I did not wish to say anything about the case; Mr. Campbell introduced me to Mr. Kennedy.

This closed the evidence for the defence, and after some argument from counsel on both sides the defendants were bound over, Campbell in the sum of \$2,500 and Kennedy in \$1,000, to appear at the next assizes.

Disastrous Colliery Explosion in Pictou Co., Nova Scotia.

[Special to The Canadian Mining Review.]

Westville Pictou County, N. S. Jan. 16th. 1888.—Yesterday (Sunday) about 2 p. m. the inhabitants of this town, were startled by a severe shock which shook the buildings like an earthquake, and on looking out to ascertain the cause, dense volumes of smoke and flame were seen issuing from the New Winning, a coal mine at the Albion mines about two miles distant, owned by the Acadia Coal Co. Ltd. Your correspondent at once proceeded to the scene of the accident, and was gratified to learn that no lives had been lost. The seam worked there lies some 100 feet below the Cage Pit seam which has been on fire for over seven years, and during the past summer, the management decided to extract the Pillars out of a portion of the New Winning with the result that the roof gave way, making a connection with the Cage Pit in which it was soon discovered that the fire still existed; the extraction of the Pillars was at once discontinued, that portion of the mine built off, and to all appearance made secure and safe. From inquiries made on the spot yesterday it appears that an accumulation of gas in the Cage Pit had come in contact with the fire during Saturday night and the explosion thus caused blew down the building between the Cage Pit and the New Winning. As soon as this became known General Manager Poole and a large force of officials and workmen at once went to work to rebuild the buildings and once more cut the connection between the two mines. A temporary stopping having been put up the whole of the men proceeded to the surface, and the last of them had only been a few minutes on the surface when a terrific explosion took place, sending a stream of flame out of the two Slopes which set fire to the bank house, an extensive and well equipped building at one end of which stood two winding engines and a boiler house containing three multitubular boilers. In a few minutes the whole buildings were a mass of flames and were soon totally destroyed; the engines and boilers being seriously damaged, if not rendered entirely useless for further use.

At the time of writing I have not ascertained whether the explosion has set fire to the coal in the New Winning but under the most favorable circumstances the work of re-opening the mine will be a very difficult task owing to its connection with the Cage Pit.

The loss to the company will be very great; but it is a great consolation to them and the community at large that the explosion took place at the time it did; had it been when the miners were at work the loss of life would have been fearful. It was indeed a sad sight to stand by and see such a destruction of valuable property, but what sadness would have been added to the scene had wives and mothers been there mourning for loved ones lost.

The output at this mine was over 200 tons per day, and a great number of men and boys will be thrown out of employment, but it is expected the management will be able to find employment for many, if not all, at their other mines shortly.

Since the commencement of coal mining at the Albion the following pits have been lost by

explosions: the Bye Pit, the Dalhousie Pit, the Foster Pit, the Foord Pit, Cage Pit, and last, the New Winning; and it is an unfortunate fact that the whole of these pits are connected.

An Improved Method of Laying Coal-Dust in Mines.—Mr. T. O. Robson* gives a description of an apparatus attached to an ordinary water-tub which is made to travel along the wagon-ways of a colliery. The water is conveyed from the tub through a hollow spindle projecting at the back through a stuffing-box, and having at its outer end a hollow boss perforated round its circumference. Over this boss is fitted a chamfered wooden boss similarly perforated and surrounded by a circular bristle brush. The wooden boss is made removable, so that the brush can be renewed or repaired. The spindle, boss and brush are made to rotate by means of an endless chain and tooth wheels connected with one of the axes of the tub, and a simple stop-valve is added to regulate and cut off the supply of water. With this apparatus 100 gallons of water have been sufficient to thoroughly saturate 1,700 yards of way, a superficial area of 150,000 square feet, the tub travelling at a speed of about four miles an hour.

A Fire-Damp Indicator.—At the Manchester meeting of the British Association, Mr. J. Wilson Swan read a paper on fire-damp indicators. The old tests for the presence of fire-damp in coal mines have become entirely insufficient. It is now a matter of vital interest to ascertain the presence of small proportions of fire-damp in pit air. The danger is usually tested by means of the flame of the safety lamp, which shows, by elongation, when the air had become foul to the extent of 2 per cent. of fire damp; but it would show nothing at all if the proportion was less than 1 or 2 per cent. Yet 1 or 2 per cent. is quite a dangerous proportion if the air is heavily laden with coal dust, and there happens to be a long tongue of flame projected into it by a blown-out shot. The author has been lately striving to supply the want of a more sensitive indicator of fire-damp, and the outcome of his efforts was the apparatus he exhibited. With this apparatus tests were made for fire-damp in various parts of a colliery; in a well ventilated portion of the pit one-eighth of 1 per cent. was detected, and near a blower of gas 6 per cent.

Long-wall Working in Successive Stages.—According to C. Demanet,† the use of self-acting inclines worked by the weight of the descending tubs is open to considerable objections in cases where the proportion of dirt is excessive as compared with coal. The objections may be obviated by having recourse to the following methods:—The inclines are laid with a single road, and a small hauling engine, worked by air at a pressure of from 45 to 60 pounds, is fixed at the foot of each incline at its junction with the gate road. The engine is mounted on a bed-plate about 5 feet long by 3 feet 3 inches wide, and has a drum about 2 feet 3 inches diameter by seven inches wide, capable of containing 275 yards of rope $\frac{1}{2}$ inch diameter, and driven by gearing at two different speeds of 6 to 1 and 4 to 1 respectively. The cylinder is an oscillating one with reversing gear, and is $5\frac{1}{2}$ inches diameter by 10 inches stroke. During the day-shift, when there are only empty tubs to be drawn up to the working face, the quick gear is employed.

Wire Rope Haulage and its Application to Mining.

By Frank C. Roberts, C.E., Philadelphia, Pa.*

Progress in the facilities for handling mining products has been largely superinduced by the necessities of commercial economy rendered requisite in order to meet the demand of competition. So rapid has been the depreciation in the value of mineral products, primarily due to the disproportionate increase of output over

FIG. 1.

Fusee or Conical Spiral Drum.

consumption, that it may be justly claimed that mining, when considered as a commercial success, depends largely upon the ease and cheapness by which the products are brought to the surface of the ground. In all methods of performing this operation, wire rope enters as an important factor; and the object of the present sketch will be to explain, as fully as is consistent with the space allotted, the various adaptations of wire rope employed in placing coal and ores within the reach of our overground systems of transportation.

These adaptations will be considered in the following order:

- I. Hoists.
- II. Inclined planes.
 - a. Engine planes.
 - b. Gravity planes.
 - c. Aerial planes.
- III. Haulage.
 - a. Tail-rope system.
 - b. Counter-rope system.
 - c. Endless-rope system.

I. Hoists.

The term "hoist" is applied to the system whereby the mine-product is elevated from the mine-level to the surface through vertical shafts. In our country this system finds its widest application in the anthracite coal-regions, where it is the prevailing method. The principle, briefly described, is as follows: A vertical shaft is sunk to the level which it is proposed to operate, and from this point the various workings penetrate. At the head of the shaft is placed an engine with a wire-rope drum attached. To this drum is fastened the hoisting-rope, which is led over a grooved wheel and

attached to the carriage or cage upon which the cars rest while they are hoisted. The cage being at the foot of the shaft, loaded cars are run upon it and the signal is given to the engineer to start the hoisting-engine. In this manner the cars are hoisted to the surface and switched off to their destination.

Hoists may be divided into two classes, viz: *single* and *double* hoists. The former have a single shaft and drum, with a non-reversing hoisting engine, the cars being lowered by means of a friction clutch attached to the rope-drum, and sufficiently powerful to hold the cage when loaded in any position. This system is exceedingly economical of fuel, the work of the engine being almost constant. The *double hoist* consists in a plant of two shafts or shaft-compartments and drums, with the hoisting gear so regulated in operation that when an empty car is descending on one side a loaded car is ascending on the other. This arrangement requires, of course, a reversing engine; and although the plant is more expensive in instalment, it is to be recommended where large capacity is required.

Two types of hoisting-engines are constructed viz, *first* and *second-motion* engines. In the

FIG. 2.

Parallel-spiral-grove Drum.

FIG. 3.

Drum for Hoisting from Different Levels.

former, two engines with cranks at right angles, to each other are coupled direct to the drum-shaft; in the latter, the engine carries a pinion, meshing with a spur-wheel keyed to the drum-shaft. The rope-drums in either case are proportioned in diameter to the size of the rope employed, and in length to the depth of the shaft. In single shafts but one drum, of course, is necessary, but double-shaft hoisting-engines are provided with two rope-drums, each having its separate rope.

Fig. 1|| illustrates what is known as the fusee or conical-spiral drum. Two of these drums are placed end to end on a common shaft with a strap-brake seat between them. The wire-ropes are attached to the small ends of the drums and the engines wind one rope while unwinding the other. In this manner the leverage of the rope performing the function of hoisting is diminished, while the descending rope has an increased leverage; and, as a result, the work done by the engine is more uniform and the gentle starting of the lead is more easily accomplished. These drums vary between 5 and 15 feet in diameter, and are of such lengths as may be suited to the depth of the mine.

Fig. 2 represents the parallel-spiral-groove drum, which has a wide application, although lacking the advantage obtained in the fusee by the equalization of leverages. When applied to double hoists, two of these are keyed to one shaft, the end-flanges being bolted together. The ropes are attached as to the fusee, one winding while the other is unwinding.

In many mines or shafts, work may be progressing at different levels below the surface. Fig. 3 illustrates a design of hoisting-drum suitable to such requirements. It will be seen that, by means of a toothed wheel, the driving-power is transmitted to the drum, the arrangement being such that the gear meshes with a circular rack fixed in the end of the drum. When it is desired to adjust the length of the rope to a different level, the wheel is slipped out of the rack by means of a lever, and the drum is revolved until the proper length of rope is wound or unwound. The wheel is now returned to its former position, and the drum is ready for use.

In a vertical hoist, the wire rope, after passing off the drum, leads to what is known as the *head sheave* (Fig. 4), which is so located that its outer circumference is directly over the centre of the pit, and from which the rope leads vertically downwards into the mine and is attached to the *cage* upon which the mine-cars are hoisted to the surface. Fig. 5 represents a modern hoisting-cage, such as is used in the coal regions. Upon two opposite sides of the pit are located the guide-bars, which are usually constructed of hard wood. In order to pro-

vide against accidents in case of the rope breaking, the cage is provided with safety-catches, the action of which is such that the instant the tension on the rope is released the quadrant-racks shown at the side of the cage imbed themselves in the guides and the cage is arrested in its descent. This movement is affected by a series of rubber springs set in telescopic distance-rings through which the draw-head-bolt passes, the whole being encased in the spring-pocket shown underneath the draw-beam. When the rope is in tension, the draw-head-bolt passes through and underneath the spring-pocket and compresses the springs; but upon the release of the tension in the rope the springs push the draw-head-bolt in toward the centre of the cage, and thus act upon the levers connected with the quadrant-catches.

Another arrangement contributing towards the safety of hoists is that known as *cage landing-fans*. These consist of arms or prongs so arranged that the cage with its contents is landed upon them, where it is perfectly secure until the car is run on or off. The signal being given to lower, the fans are thrown back by means of a series of levers, and the cage is allowed to descend.

In connection with safety-apparatus may be mentioned the *hoist-indicator*, whereby the position of the hoisting-cage is shown at any moment. This is useful to prevent "overwinding." The simplest arrangement of this device is worked from the drum-shaft by means of a worm and gear actuating a pointer on a dial.

In addition to the indicator as a safeguard against overwinding, all shaft-heads should be equipped with *safety detaching-hooks*. These hooks are so arranged that if by any accident or unforeseen cause the hoisting-engine is not stopped when the cage reaches the surface or the landing-place, then instead of the cage being drawn up into the poppet-head, causing its own

FIG. 4.

Head-sheave.

destruction and the wrecking of the whole shaft-head, it becomes simply detached from the rope and remains hanging in the upper guides, while the loose rope-end is merely wound round the drum.

In Fig. 6 may be seen a general arrangement of a double-shaft first-motion hoisting-plant fitted with two fusee-drums.

Ropes.—In proportioning the wire rope requisite for a vertical hoist of a given capacity, great care should be taken to assume a safety-factor of sufficient magnitude. Not only should the weight of the cage and loaded truck be considered, but also the friction of the guides and head-sheaves and the weight of the rope itself. It is the latter factor that has led many European mine-operators to employ what is known as "taper" ropes, *i.e.*, those having an increased diameter towards the drum-end. The peculiarities of each application must be noted and a safety-factor of not less than five adopted. The drums and head-sheaves must be properly proportioned to the size of the rope, or else the continual bending and unbending will soon destroy the elasticity of the wire. Nothing but the best Swedish iron or reliable steel rope should be employed. The danger to life and property is too great to permit the risk of non-uniformity in the material of the rope.

Wine rope for vertical hoists should be composed of six strands of nineteen wires each, wrapped about a hempen centre. The latter adds much to the elasticity and life of the rope. Ropes of small diameter (up to $\frac{3}{4}$ inch), with six strands of seven wires each, are sometimes employed for hoisting purposes; but their use necessitates larger head-sheaves and drums and, consequently, increased cost.

Crucible steel ropes, when composed of good material, are more durable than iron ropes, and have entirely replaced the latter in some mining regions. It must be borne in mind, however, when making a change from iron to steel, that the aim should not be to reduce the diameter of the rope, but to increase its durability.

FIG. 5.

When starting the cage from the bottom of the shaft, the rope should be taut; the presence of slack causes a sudden and dangerous stress in the rope. The following table shows clearly the necessity for care in this direction :

*Table of a Series of Tests Showing the Extra Stress upon

Total....				19,713

As stated in our last issue, the Montreal Board of Trade gives the total amount as 20,349 tons. The difference is caused by the "ground phosphate in bags" not being included in this estimate.

In General.

Prof. Saunders, of the Central Experimental Farm, states that he has under consideration a series of experiments at the farm with ground phosphate in its raw state. The experiments will be made during the coming season.

Mr. Coste estimates the total quantity of phosphate exported from Ontario from the year 1877 to 1886 as 8,983 tons, of a value of \$110,888; from Quebec during the same period 146,044 tons, of a value of \$2,704,447. The total quantity exported from both provinces is computed at 155,027 tons, of a cash value of \$2,815,335.

Latest advices state that phosphates are reported a little higher for the low grades, the French and Carolina phosphates having advanced a halfpenny.

Mr. Adolphe Lomer, of Messrs. Lomer, Rohr & Co., Montreal, has returned from his visit to England.

We are informed that Captain Henwood, superintendent of the Emerald mine, has tried raw phosphate on his garden with most satisfactory results. He has been in the habit of taking small quantities of finely ground ore from the borings at the mines and applying it as a manure to the soil. The wonderful growth of his flowers and vegetables attest to the success of his experiment.

Complaint reaches us of the manner by which Canadian ore is handled when it reaches the other side. It is said that frequently the tests are made by interested parties, who grade the ores down below their true quality, and thus force shippers to take any price they may choose to offer. The true way to remedy this state of affairs, or rather to avoid it, is to cultivate a market on this side of the Atlantic both for the trade and the chemically treated product.

Du Lievre.

The Union mines have been sold to the Canadian Phosphate Company (Limited), which has been organized in London with a capital of 110,000 shares at £1 each, and is formed to acquire, work, and, by the introduction of additional capital, further develop the property of the Union Phosphate and Land Company, of New York, now in operation, and, it is stated, producing considerable profit. The property consists of the Star Hill, Williams and Ruby mines, 1286 acres in extent, all freehold, situated in the Township of Portland, Ottawa County, Quebec. The Star Hill and Williams mines include three distinct deposits. One of these is at present unexplored, but the other two have a length of 3355 yards, and an average breadth of not less than 100 yds., measured by the outcrops. The running so far has been conducted on a small scale, amounting to about 5000 tons annually. The cost of mining, dressing, and shipping ore, including freight to the United Kingdom, commission on sales, and all expenses in Canada, is put at £2 5s. per ton. Thus, at the lowest price ever touched, there is a profit of £1 14s. per ton, and at present prices over £2 on the first quality and £1 2s. on the second. These figures are verified by the engineer's report. The purchase money has been fixed at £90,000, the whole of which the vendors were prepared to receive in shares, but in order to comply with the rules of the London Stock Exchange, to which application will be made for an official quotation and settlement, £36,666 will be taken in full-paid shares and the balance in cash. The mines have been reported upon by Messrs. Bainbridge, Seymour & Rathbone, of London. The new company entered into possession on 1st January, and its representatives will meet in Buckingham

shortly. Among the principals are Mr. Couper, of Messrs. Couper, McCarnie & Co., London, and Mr. W. H. Williams, of New York.

The show recently discovered about quarter of a mile from the deep shaft of the Little Rapids mine, and on the same property, is yielding highly satisfactory results.

Templeton District.

At a meeting of shareholders held in Montreal recently, the Templeton and Blanche River Company decided to put in steam working plant and machinery on their property at an early date.

Wakefield.

Mr. W. H. Fuller has suspended operations until spring opens, when work will be resumed on his property, lots 17 and 18, in the 2nd Range.

Perth District.

Captain R. C. Adams, Managing Director of the Anglo Canadian Phosphate Company, sailed for England early in the month to attend the annual meeting of the shareholders.

Kingston District.

Under the careful superintendence of Mr. Joseph Harris some 55 men are presently working on Captain Boyd Smith's Blessington mines. Four shafts, averaging from 70 to 100 feet, have been sunk since November and a large quantity of No. 1 ore has been mined. The prospects for next season are reported to be most encouraging.

Nova Scotia.

At the Coal Mines of Pictou County business continues good for this season of the year. The absence of snow enables the railways to handle their traffic and keep a fairly good supply of cars at the various collieries.

The Intercolonial Company keep their full complement of men working at their Drummond Mine, a fact which speaks well for their trade, as it has been found necessary for several winters past to reduce the number of workmen.

During the past month, the output from the Acadia has fallen off somewhat, not, however, through any scarcity of orders, but owing to the present lift being worked out faster than the new lift can be opened up. At the Albion Mines (also the property of the Acadia Co., Limited), slow but steady and sure progress is being made in the draining of the Ford Pit. The company purpose putting into their new slope a hydraulic pump, worked by an engine and transmitter on the surface.

At the Vale Colliery, the Acadia Co. has had the water pumped out of the 6th seam which has been closed for some time, and a few men are now at work. It is expected to be in full operation at an early date.

A discovery of coal is reported from Antigonish County, but particulars are not yet public.

Valuable Phosphate Property,

On Rideau Lake, formerly known as

Marshall Property.

Address:

H. UNDERWOOD,

45 William St., New York.

The Joggins Coal Co. in Cumberland County, has orders booked for 25,000 tons of coal. There is a demand for experienced miners at this mine.

At the Gowrie Mines, Cape Breton County, boring operations have been going on, and at a short depth below their present workings an excellent seam of coal has been found.

The Lingan Mining Co. intend to re-open their Lingan and Barrasois Mines next year, and will build a railway to connect these mines with their Victoria Mine, where a new slope is to be sunk and the output increased twenty-five per cent. This will bring their output up to some 80,000 tons.

Mr. Joseph Hudson, son of Mr. Hudson, formerly General Manager of the Albion Mines, has been appointed Manager at Victoria.

Work at the various collieries has been very brisk during the past year, and the output notably at Springhill, Sydney Mines, Gowrie, Caledonia and Victoria has been larger than in former years. The total shipments are estimated to be over a million and a half tons, the total increase being over 150,000 tons. The workmen generally have had more regular employment, but it is much to be regretted that owing to keen competition there has been little, if any, improvement in prices. There has been no advance in wages although, owing to steadier employment, better average pay has been earned.

The *Colonial Standard* (Pictou) says: The output of Coal during 1887 has been the largest in the history of Nova Scotia, while the prices obtained have been higher than in any year since 1873.

At Springhill the output of coal has been nearly half a million tons, which it is contemplated to largely increase during the coming year. A new Slope, and also, it is said, a new shaft is to be sunk. The complaint of the miners here is that the pits are overcrowded with men. Everything has gone on fairly and smoothly between management and men during the year.

This company has purchased a large tract of Coal land at Cow Bay, Cape Breton. Operations are in progress to sink a shaft to a depth of some 350 feet, where it will tap the coal at a point in the centre of the basin where levels and cross-cuts will be entered.

At the Joggins Mines the shipments for 1887 reached 14,000 tons. This year, owing to the mine having connection with I.C.R., the output will be largely increased. A new company has lately taken hold who intend to push business. There are orders already in to keep the mine running for five months. More miners are wanted.

The Chignecto Colliery announce a fair increase in output over 1886.

Owing to the strike at the mines of the Halifax Company, work at the Drummond Colliery was brisker than usual during the first four months of the year. The management contemplate considerable extensions during this year. A number of miners are presently idle as they refuse work in places at wages offered.

The total output from the mines operated by the Acadia Company (Limited) shows a considerable falling off from former years, owing to the long strike. Notwithstanding this, however, there has only been a decrease of some 6,000 tons at Acadia, while the Albion actually shows an increase of 7,000. The decrease from Vale, however, reaches 37,000 tons.

The shipments from Caledonia Mines include 73,000 tons round, and 29,000 tons slack. A fine increase of 29,000 tons over '86.

From the Gowrie the shipments were very large, next in quantity to the Sydney Mines. Of round there were shipped 95,000 and of slack 23,000 tons. It is a coincidence that the increase at this mine is exactly the same as at Caledonia, viz., 29,000.

Sydney Mines still take front rank with a total of 147,000—of which 9,000 tons only were slack—an increase over '86 of 27,000 tons. Victoria Mines, also, show a handsome increase, the totals being 65,000 against 46,750 for '80. an increase of 19,000 tons.

The largest increase over '86 is shown in the shipments from Little Glace Bay. In '86 they only amounted to 28,000, whereas last year they footed up 76,000, a handsome increase of 47,000 odd tons.

The *Trades Journal*, Stellarton, gives the following comparative statement of output for the years 1886-87:

	'86	'87	In.
Spring Hill.....	389,476	442,000	53,000
Chignecto.....	7,527	12,742	5,215

Cape Breton.....	588,000	717,000	129,000

Grand total for 1886: 1,373,000.

" " 1887: 1,524,000.

At the Albion Mines 9,000 tons of Coke were made and sold during the year.

The *Critic* is unofficially informed that the Lake Lode Gold Company, of which Mr. Sawyer, of Boston, is managing director, and Hon. L. L. Wadsworth, manager, has during the past year, realized net profits sufficient to pay for the mine. During this time, the mine has been thoroughly opened up and placed in a position to yield large profits during the coming year. The wise management have resisted the temptation to invest in expensive machinery, and the five stamp mill which was on the property when they purchased, has continued to do all their work. The Lake Lode Mine is only a fair sample of the value of our gold mines when they are properly worked.

The following are the official returns so far received at the Mines Office for the month of December, 1887:—

Mine.	District.	Tons	Ounces
		Crushed.	Gold.
Empress.....	Renfrew.....	236	104½
Oxford.....	Lake Catcha.....	69½	112
Moose River Co.....	Moose River.....	301	224
Dufferin Mining Co.....	Dars Hill.....	922	417

The last return from the Dufferin Mine gives 417 ounces from 922 tons crushed. This we believe says the *Critic* places it in the lead of gold producers for the year, although the Oxford must be close on its heels.

Since these notes were written the Albion collieries have again been wrecked by explosives and are on fire. These mines are the scene of the great explosion of 1880, when forty-five lives were lost. This time, fortunately, no lives were lost, but four men were badly injured, and fifteen men working in the Halifax pit when the fire was discovered had a hair breadth escape. The fire was discovered in the Halifax pit at 10 o'clock Saturday night, the 10th instant. Hardly had the men reached the surface when the mine exploded. Two explosions occurred on Sunday, the second one at 1.30 of tremendous force, wrecking the engine house, destroying the fan, burning all the hoisting gear and destroying all other buildings in connection with the mine. This explosion was so great as to be felt like an earthquake shock in the surrounding country for twelve miles distant. The mine is still on fire. It is supposed to have been communicated from the Cage pit, which has been on fire since the great disaster eight years ago.

E. GAUJOT,

MINING ENGINEER.

BELLEVILLE, ONT.

Quebec.

Messrs. Hodgins & Ostrum have made some excavations on the Creighton Iron lode on lot No. 2, Concession 7, Township of Clarendon.

Since our last issue Dr. Reed has taken out of his Antimony Mine, at South Ham, twenty tons of ore, said to average over 40 per cent., from a portion of the vein or measure five feet wide and eighteen feet long. The cost of taking the ore to Garthby Station, Quebec Central Railway, is \$2 per ton; freight, commission and insurance to Liverpool \$4 per ton; making a total cost of \$15.50 per ton, as follows:

Mining.....	\$7.50
Cartage, freight, etc.....	8.50
Total.....	\$15.50

The management state that the ore is worth £8.00 in England—giving a profit of \$24.00 on each ton to the mines.

We are indebted to Mr. Coste's report for the following comparative statement of Asbestos shipped up to 1886. These returns were obtained from the mines of the Eastern Townships:—

Years.	Tons.	Value.
1879.....	300	\$ 19,500
1880.....	380	24,700
1881.....	540	35,100
1882.....	810	52,650
1883.....	955	68,750
1884.....	1,141	75,097
1885.....	2,440½	142,441
1886.....	3,458½	206,251
Total.....	10,024½	\$624,489

Mr. Francis D. Taylor, M.E., Lennoxville, who has lately been engaged as one of the principals in the celebrated Tortilita case, leaves shortly on a business trip to Mexico.

The recent heavy snowfall has impeded traffic on many of the roads to the various mining camps, and, on this account, most of our provincial correspondence has been delayed until too late for publication this month.

Work is going on briskly at the Villeneuve Mica Mine, and the output of first-class mica continues good.

Ontario.

Latest advices from the Bristol district state that the iron mines are now fully equipped with the best machinery, and that the workings continue to prove the ore deposits to be immense and of great value. The miners are now drifting through solid ore over sixty feet wide. The two Calcining furnaces are turning out about one hundred tons of ore per day, and when desirable the quantity can be increased by four times this amount. About 10,000 or 12,000 tons of Calcined ores are expected to be hauled to Wyman's Station during the next two months. A road has been opened from the mines to the railway for this purpose, but nothing short of a railway or a tram line will adequately handle the immense quantity of ore that is being developed. The Bristol Iron Mining Company expect that either the P. P. J. Ry. or the C. P. R. will run in a spur track, and it is understood that either of these companies are favourably disposed to tap the mines in this way as soon as arrangements can be made. As hauling must necessarily be limited to the winter months, it is to be hoped that one or the other of these lines will give their attention to the matter before spring opens. The Bristol Iron Mining Company have effected many improvements in the locality; large numbers of men and teams are finding employment, and business generally has been much enlivened since the commencement of their operations in the district.

James Reed,

Reedsdale, Megantic, P. Q.

A discovery of Magnetic Iron Ore recently made on Lot 28, 4th Concession of Bedford Township, Frontenac County, promises to rival others in the well known Iron Mining District of the Kingston and Pembroke Railway. It is owned by Messrs. D. G. MacMartin and W. Davies of Perth who, preliminary to move extensive work in the spring, have contracted with a party of miners to take out one thousand tons this winter at one dollar per ton. They have had offers for the purchase of the ore from several parties in the United States who have received samples. A surface piece tested by Prof. Hoffman, of the Geological Survey Office, gave 62.98 metallic iron. The outcrop is very strong, and with the help of a dip-needle shows a width of from 30 to 150 feet which can be traced for about a quarter of a mile.

Messrs. Tough & Stobie, original discoverers of the Sudbury Gold properties, have formed a joint stock company with a capital of \$240,000 in which a number of prominent American capitalists are largely interested.

On lot 6, concession 9, North Burgess, a mica mine of much promise is being developed by Mr. D. G. MacMartin with very encouraging results. A shaft has been sunk 50 feet showing crystals of good size and quality all through the rock. At the south-west end 8 feet from bottom a drift has been driven in. The entire drift is a mass of mica, showing crystals of large size and of excellent quality. Mr. W. A. Allan, of Ottawa, is part proprietor with Mr. MacMartin.

A new discovery of gold is reported at the Richardson Mine, Township of Madoc.

Port Arthur District.

Since the date of our last issue the Rabbit Mountain Mine has been closed down just when everything had got into good working order with large improved machinery, and when a new mining captain of experience had taken it up enthusiastically.

The reasons assigned are an impending law suit instituted by one of the original owners and the necessity for better financial arrangements. This trying to make a mine pay as it goes along from the daily yield is a paltry way to operate an extensive mine.

Captain Hanson goes to the Transvaal gold fields with Mr. Furlonge—a strong team.

The Beaver Mine continues the even tenor of its way—ore coming out as fast as it can be economically handled.

The late manager entertained about forty of his friends from Port Arthur lately at the new hotel—the party driving out in sleighs, staying over night and returning the next day. In spite of the extraordinary deep snow and prevalent cold a most enjoyable time was spent.

Professor Eschweiler is making very good work at his pet "Badger" mine, a short distance south-west of the famous Beaver Mine. The Professor evidently knows what he is about, and has everything in good shape. Teams are engaged in hauling logs and preparing the site for his mill. The ore, we are told, looks very good indeed.

At Silver Mountain work is progressing with the full force of seventy-five men. In addition to the tunneling westward, both No. 3 Shaft and the winze in No. 1 Drift are going steadily down. The vein in No. 3 Shaft is seven feet wide, and the work in the winze shows a very good looking vein, three and a half feet in width, carrying silver combined with the usual blende and galena.

Crown Point Mine is progressing slowly but carefully under the supervision of Capt. Montgomery, who is hopeful as ever of making this mine take the lead. About fifteen feet more will bring him under the winze in the upper pit. Want of capital is the great drawback in working this promising property.

Besides the railroad commenced and constructed some ten miles from Port Arthur to the mining region another competitor, attracted by the outlook, has come to the front. It is called the "Ontario, Manitoba & Western Railway." It is projected to run through the mining region south of the C.P.R. and make direct for Winnipeg, crossing Lake of the Woods at the Narrows. The promoters expect to reduce the present travelled distance by about thirty miles and gain considerable on better grade. The Provinces of Ontario and Manitoba are expected to bonus this enterprise.

Mr. Peter D. McKeller, of Fort William, gave us a call during the month. He states that nothing will be done on the immense deposit of Magnetic Iron Ore owned by himself, his brother and Messrs. Graham, Hall & Co. for some little time yet. It is likely that a spur track, connecting the mines with the C.P.R. at English River, will be constructed, and Mr. McKellar entertains hopes that a better tariff will yet be obtained from the United States for the export of iron ores to that country. The property is some 240 acres in extent and is located adjacent to the Seine River.

Manitoba and North-West Territories.

Messrs. Sache and Walliss have begun mining coal on the claim of the former, near Edmonton. The seam is reported to be fully three feet thick and the coal hard and bright, approaching more closely to Anthracite than any other coal yet mined in the neighbourhood.

British Columbia.

The gold shipments for 1887 show a decrease from 1886 of \$174,118.81,

Bank of British Columbia.....	\$ 320,794 33
Bank of British North America.....	58,774 00
Garesche, Green & Co.....	19,356 19
Total for 1887.....	\$578,924 52
do do.....	753,043 33
Decrease.....	\$174,118 81

The placer mines of Williams, Lightning Grouse, Antler, Mosquito, Keithley, Horsefly, and the numerous other gold bearing creeks of Cariboo, not forgetting the Quesnelle and Fraser rivers, are still being worked, principally by means of hydraulic plant, and in some instances good pay is secured. Last season was peculiarly dry, and only a few weeks washing was had by most of the claims, and as a result the returns have been poor.

The following are the returns of gold yield in the Cariboo District for 1887:—

Barkerville.....	1st Jan. to 15th Nov.....	\$ 79,373
Lightning Creek, ".....	".....	30,700
Quesnellmouth, ".....	".....	61,000
Keithley Creek, ".....	".....	66,600
Desultory mining, ".....	".....	10,000
Mining from Nov. 1st to 31st Dec.....		10,000
Total.....		\$247,673
Yield of 1886.....		285,300
Decrease.....		\$ 80,627

At the Corbin and Kennedy claims in the Selkirk, several tunnels have been run in, extending from ten to fifty feet, and there are now about 300 tons of ore on the various dumps. Developments have proved permanent veins, some from two to four feet in width; others from six to nine feet. Numerous assays have been made giving averages between \$80 and \$100 per ton.

In the Stump Lake district a shaft 100 feet deep has been sunk on the Star. Assays give from \$20 to \$150 per ton.

In the same district the Nicola Mining company, of London, England, are estimated to have taken out from \$20,000 to \$30,000 of ore. On their property there is a 250 foot tunnel and over 300 feet of shafts.

In the Kootenay district the Otter Tail Gold and Silver Mining Company were fully prepared to commence work this season, they having erected a quartz mill, saw mill, and intend to erect a smelter, having made roads and tramways to their mines, and had likewise a quantity of ore on hand. Unfortunately, both for the company and the district, their property was destroyed by fire in June last—totally annihilating about \$60,000. The timber limits the company had secured are burnt up. This company owns four or five claims, and in some of their leads there is known to exist a large quantity of ore (silver) assaying from 30 to 55 oz. to the ton, close to the railway, and other parties own five or six claims adjacent thereto, one of them assaying 40 oz. to the ton. The leads vary in thickness from one to six feet, fully justifying the erection of a smelter in that locality.

In Upper Kootenay the season for those working in the placer or creek mines was pretty fair. On the old camping ground, Wild Horse Creek, Chinamen and others made a fair summer's work work hydraulicing, etc.

The total output of gold from the Cassiar district for 1887 is \$55,305; last year it was \$63,610—a considerable decrease. The miners are hopeful of striking better ground soon and Cassiar may again become a notable gold district.

During the year 198 placer claims and 26 mineral claims were recorded in the Lillooet section by the mining recorder, 22 of the latter being on Cayoosh Creek, three at Anderson Lake and one at Pemberton Portage. Five mineral claims were also located on Big Bar Creek.

The gold output is secured from the following sources:—

A. W. Smith, Lillooet.....	\$ 65,605
F. W. Foster, Clinton.....	20,432
E. Bell, Clinton.....	5,000
Other reliable sources.....	8,894

Total.....\$100,022
Yield of 1886.....132,000

Decrease.....\$31,978

The apparent decrease is probably accounted for in the fact that Cayoosh Creek, the principal source of supply, is chiefly in the hands of Chinese, from whom no reliable returns can be learned. If the output could be learned it would probably foot to an amount greater than last year.

In North Kootenay the most important work of the past season has been that accomplished in the Illicillewaet mines, where about 250 men were altogether engaged in mining and prospecting. In the Big Bend about thirty men were engaged in placer mining in Carne's Creek, McEnloch Creek, French Creek and Smith's Creek. On the first-named creek no gold was secured on account of high water during the entire season. The Ophir Co.'s hydraulic claim on McEnloch Creek has been well opened out and good prospects of handsome returns were taken from the gravel. It will be spring time before it is possible to make a clean-up. On French Creek there are four companies at work running tunnels into the hill. The Victoria Co. are making good wages—from \$7 to \$10 to the man. The French Creek Tunnel Co., have recently got into good pay in their creek claim, they having sunk and drifted under the stream. The May Mining Co. and the "Three Dollar Co." are engaged in sinking. Smith's Creek is a newly discovered ground, the stream emptying into the Columbia from the west side. About half a dozen men have been working there during the summer, taking out small wages. Nothing has been accomplished in the way of developing the quartz ledges in the Big Bend.

The coal output for 1887 is considerably in excess of any previous year, being 410,573 tons. The nearest approach was in 1884, when 394,070 tons were mined. The output for 1887 would have been much greater but for the melancholy disaster at the Vancouver Colliery. The chief market for the coal is San Francisco, to which point 335,854 tons were shipped.

The output from the Wellington Mines (R. Dunsmuir & Sons) for the year ending 31st December last was 242,723 tons, with a total value at \$4 per ton at mine's mouth of \$966,892. 715 men were employed.

The output from the Vancouver Company's Mines has been 137,800 tons, of which 114,800 tons were shipped to San Francisco and other points while 20,050 was consumed locally. The unfortunate accident in May reduced the output from 16,039 tons in April to 4,351 in May.

It is thought that the total yield of coal from the East Wellington Mines has been in the vicinity of 30,000 tons.

The total from the province may be placed thus:—

R. Dunsmuir & Sons	Tons. 242,723
Vancouver Coal Company	137,850
East Wellington (probable)	30,000
Total.....	410,573

The Mines and Scenery of Algoma West

Pneumonia!

A Scientific and Accurate Description of this Dreaded Blood Disorder.

"It is generally supposed that pneumonia is due to the accidental penetrating of specific microbes into the system, but the observations of M. Jaccoud show that the disease really results from the development, under favorable conditions, of microbic germs permanently present in the system. A chief condition of such development is a sudden chill, which explains the frequent coincidence of lung affections with abrupt changes of temperature."—*Scientific American*.

Another prominent (American) authority ascribes pneumonia to an excess of ozone, ozone being produced by passage of electricity in the air.

A distinguished American physician tells the New York Tribune that the prevalence of pneumonia indicates the universality of a uricacid condition of the Blood,—sudden chills always being characteristic effects of too much acid, of one sort and another.

The disease, as M. Jaccoud observes, is undoubtedly in the blood, but if in the form of permanent microbes or germs, these germs must be developed by the uricacid condition of the blood. Indeed, they cannot presumably exist in alkaline blood. Uricacid is the name for the waste matter of the system, which the kidneys, through evident though unsuspected impairment, have not been able to filter from the blood,—the filter being foul and stopped up in many of its little hair-like tubes.

The Tribune's authority says that pneumonia is a secondary disorder, the exposure and cold being simply the agents which develop the disease, already dormant in the system, because the kidneys have been but partially doing their duty. In short pneumonia is but an early indication of a bright's diseased condition. This impaired action may exist for years without the patient suspecting it because no pain will be felt in the kidneys or their vicinity, and often it can be detected only by chemical and microscopical examinations. Nearly 150 of the 740 deaths in New York City the first week in

a recent March, and in six weeks 781 deaths were caused by pneumonia alone.

If one has occasional chills and fever, a tendency to colds in the throat and lungs, rheumatic and neuralgic pains, extreme tired feelings, short breath and pleuritic stitches in the side, loss of appetite, back-ache, nervous unrest—scalding sensations or scant and discolored fluids, heart flutterings, sour stomach, distressed look, puffy eye sacs, hot and dry skin, loss of strength and virility, pneumonia is likely to strike him down any day, and his recovery will be doubtful.

These indications may not appear together, they may come, disappear and re-appear, for years, the person not realizing that they are nature's warnings of coming calamity.

The disease is very quick-acting and if the accompanying kidney disorder is very far advanced, recovery is impossible, for the kidneys give out entirely, and the patient is literally suffocated by water.

The only safeguard against pneumonia is to maintain a vigorous condition of the system and thus prevent attacks, by using whatever will radically and effectually restore full vitality to the kidneys, and for this there is nothing equal to Warner's safe cure. If the kidneys are not sound pneumonia cannot be prevented. This remedy is known to millions, used, probably, by hundreds of thousands all over the globe, and commended as a standard specific wherever known and used. It does not pretend to cure an attack of pneumonia, but it does remove the cause of, and prevent that disease if taken in time.

When a physician says his patient has either Bright's disease or pneumonia, he confesses his inability to cure, and in a measure he considers his responsibility ended. In many instances, indeed, persons are reported as dying of pneumonia, heart disease, apoplexy and convulsions, when the real cause of death, and so known by the physicians, is this kidney consumption. Thousands of people have it without knowing it, and perish of it because their physicians will not tell them the facts.

The same destiny awaits every one who will not exercise his judgment in such a matter and be true to himself, his family and to society.

**VALUABLE
PLUMBAGO
AND OTHER
Mineral Lands
FOR SALE,
IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.**

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

**FOR SALE.
VALUABLE
Copper Mining Properties
— IN THE —
Eastern Townships**

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within $1\frac{1}{2}$ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only $2\frac{1}{2}$ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Carbuncle Hill Mine, Lots 2 and 3 R. 14, and 2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, $\frac{1}{4}$ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

ESTIMATES GIVEN.

Orders Executed with Care under Personal
Superintendence.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

Department of Inland Revenue.—An Act respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting Agricultural Fertilizers came into force on the 1st of January 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall

have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chapter thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

OTTAWA.The REVIEW is published purely in the interests of the Canadian
Mining Industry, and its publishers will be thankful for any
encouragement they may receive from those interested in its speedy
development.Visitors from the mining districts, as well as others interested in
Canadian Mineral Lands, are cordially invited to call at our office.Mining news and reports of new discoveries of mineral deposits
are solicited.All matter for publication in the REVIEW should be received at
the offices not later than the 19th of the month.Address all correspondence, &c., to the Manager of THE
CANADIAN MINING REVIEW, Ottawa.**NOTE.**—Owing to stress of matter we are compelled
to hold over several communications of interest until
next issue.**Natural Gas.**

Within the last two years natural gas has become a subject of great practical interest to Canada. In this cold climate the question of fuel for heating and of light for our dwellings, shops, and factories, during the long nights of winter, is one of the first importance among other necessities of life. With the exception of Nova Scotia and British Columbia, at the extreme east and west, available coal is not found in any of the provinces; for, although a thin seam of coal does exist in New Brunswick it is scarcely worth mentioning, and the people of Manitoba prefer importing coal to using the inferior lignite which is found in the south-west corner of their province. Under these circumstances, the possibility of finding, in many places, a cheaper and better substitute in the form of natural gas, may be hailed as a boon of no small importance. This therefore unexpected

source of heat and light has been largely developed in some parts of the United States, especially in Pennsylvania, Ohio and Indiana; and the question is naturally asked, have we anything of the sort in Canada? Lately this question has become of special interest to the citizens of Ottawa. Geologists tell us that we have here the same formation which yields the apparently inexhaustible supplies of gas in Ohio, and that its thickness and character are such as to lead us to expect that it may produce this substance in large quantities. But it is not a question of production alone. The gas must have also been retained in the strata through long ages in order that it may now be available. This again necessitates the existence of the natural reservoirs in which to store it; and it seems that these are only to be looked for under anticlinal arches and domes. The anticlinal theory, in reference to the accumulation of petroleum and gas, was first propounded by our own geologists, Logan and Hunt, in 1860, and the truth of this theory has been fully established. Indeed the physical laws governing matter make it impossible to be otherwise. The existence of available supplies of high pressure gas is therefore a question of geological structure as well as of the presence of the gas-producing strata. And both of these conditions would even prove unavailing without a sufficient cover to retain the gas; so that the concurrence of all three of these conditions is necessary to obtaining a supply of this valuable substance. Other conditions may also be mentioned, such as that the anticlinal must be an extensive one, otherwise the quantity of the gas and its pressure will be small in proportion.

We see, therefore, that although the rocks under the City of Ottawa, for example, may have been producing gas through a long geological period, it has all escaped as soon as formed, owing to the position of the strata and the want of a cover. This will naturally be the case also everywhere near the outcropping edges of the Trenton formation. The Utica shale is scarcely of the character necessary to hold down gas under high pressure. What is wanted is a more plastic and impervious formation.

We see that it is proposed to bring "gas experts" here to point out the proper places to bore. It is, however, not a matter for "gas experts" to deal with, but purely a geological question, and we have surely talent enough nearer home to advise us in this matter. We will no doubt find plenty of wiseacres to tell us there is no use to look for natural gas within an available distance of Ottawa. In the United States natural gas is brought 20, 30 and even 40 miles. The burden of proof will rest with those who deny the utility of incurring the small expenditure necessary to try, provided the most likely places be pointed out by our geologists.

The city council of Ottawa has acted rashly in granting equal rights to two companies to lay pipes, etc., in our streets. A gentleman con-

nected with one of them has suggested a way out of the difficulty by the city itself laying the pipes and allowing both of the rival companies to supply the gas simultaneously. But he should remember that *pressure* will have something to do with this arrangement. One company might not only be supplying all the gas, but be actually pushing it down the other company's well, which would become a mere safety valve to the other. Our city fathers must solve this problem, which has been of their own creating, in some other manner, and place no unnecessary barrier in the way of the citizens enjoying the gift which nature has apparently placed near our doors.

Production of Salt and Silver.

In the brief review last month of Mr. Coste's Statistical Report on Minerals in Canada, we were only able, from the limited space at our command, to glance at the general features of the work, without commenting at any length on several of its articles which are well worthy of special notice. Mr. Coste was materially aided in the preparation of this work by Mr. E. D. Ingall, R.S.M., to whom in large measure the inception of the undertaking is really due, and to whose assistance Mr. Coste gracefully alludes in his opening paragraph.

The article on salt, by Mr. Ingall, is especially worthy of notice, as it gives a concise history of the salt works of Canada from the start, and contains much valuable information respecting the process by which salt is manufactured from the brine. The causes which tend to depress this industry, and so limit the production of native salt, appear to be principally the competition of English salt coming into Canada duty free, and with discriminating freight rates in its favour. The Canadian demand is limited, whilst that of the States is large and rapidly increasing. The subject was treated very discursively in the Geological Survey Report of 1876-7 by Dr. Sterry Hunt, since which date we believe no official data have been given to the public until Mr. Ingall took it in hand. He states that the large area in Ontario underlain by the salt, would enable the Goderich district to supply all the salt demand of the Dominion for years to come. As the fish trade of the lakes increases, which every succeeding year shews to be the case, the demand for salt for curing purposes will increase likewise, and its production on the spot must materially tend to the ultimate use of the native product over the imported article. The tables compiled by Mr. Ingall and inserted at the close of his article will be found very useful for reference.

Another exceedingly well written article from Mr. Ingall's pen is that on Silver. From it we learn in as concise a manner as is compatible with a statistical abstract, the exports of this precious metal since 1873. Owing to the interest now attaching to the silver mining operations in the Port Arthur district, which

we believe will be very largely extended this year, the article we allude to will doubtless be frequently consulted by those interested in silver mining. A remarkable fact is noticed by Mr. Ingall, namely, that there is a vast difference between the official records of silver exported from 1871 to 1875, and the published returns of silver produced. Now, as Canada is not a country which consumes much silver in its unmanufactured condition, this discrepancy is not readily accountable. This fact alone shows of what value Mr. Coste's work will be from year to year, for reference and for information, which may be looked upon as official. Silver mining bids fair to become one of the most valuable of Canadian mining industries.

Mining Around Port Arthur.

A correspondent resident at Port Arthur, and who, although not personally interested in any of the mines there, is a close observer of mining operations, and everything pertaining thereto, sends us the following remarks relative to the work carried on last year (1887). His observations are reliable.

"Mining operations have been carried on very energetically during the year. Upwards of ten thousand acres of mineral lands were purchased from the Ontario Government during the past twelve months, principally iron lands, explorers having traced the rich iron deposit of northern Minnesota into Canadian territory. Active steps will be taken in the early spring to develop these and other properties which will necessitate the expenditure of a large amount of capital and give employment to a great number of men.

"The most phenomenal success in the district is the 'Beaver' silver mine, which, during three months last summer, returned to its owners all the money (about \$200,000) previously invested in working it. Nearly all the other properties on which work has been progressing continue to improve, and it is not improbable that within the next year half a dozen mines may be working quite as successfully as the 'Beaver.'

"The completion of the Port Arthur, Duluth and Western Railway from Port Arthur to the international boundary will greatly facilitate mining operations, not only in the iron but in the silver and gold districts contiguous to this route. Ten miles have been graded this fall, and the timber and ties necessary for the completion of the first twenty miles are on the ground, and it is expected that forty miles will be in operation by 1st July next. This road will also tap a large area of pine timber lands near the boundary which is at present the property of the Provincial Government, and open up a large tract of good agricultural land."

The Nanaimo Explosion.

The details of the terrible disaster at the Wellington Colliery, with its melancholy list of dead, cannot fail to awaken in the hearts of our readers feelings of profound sympathy for the unfortunate wives and families so suddenly bereaved; much suffering must necessarily exist, and we are confident that as soon as an appeal is made for pecuniary assistance the

public will respond with a ready and liberal hand.

The mine has always been regarded as the best arranged and ventilated on the island, and practical men state that its equipment could not have been better. Only a few days before, in accordance with regulations, it had been thoroughly inspected by practical men who reported it to be in the best possible condition. Until the result of the Enquiry has been made known the cause of the deplorable occurrence can only be conjectured. Mr. E. G. Prior, M. P., who inspected the mine shortly after the explosion, examined the faces of all the levels and stalls, and is firmly of opinion that the primary cause of the explosion was a blown-out shot in the face of the main east level. Everything goes to prove that the explosion started from there. All the timbers are blown from that point, and there is a thick coating of soot on that side of all the rock and timbers. A miner's powder canister capable of holding about four pounds, was found within twenty-one feet of the blown-out shot, and the shot itself points in a direct line for the can. The contents of this can had exploded. Some dozen other cans, more or less, full of powder were found in different parts of the levels, headings, &c., where the explosion had passed through, the contents of which had not exploded. Mr. Prior is quite confident that gas played no part in the explosion, but that the latter was started by a blown-out shot, which discharged the powder-can and ignited the coal dust. The mine though dry, is by no means dusty, and is one which, under ordinary circumstances, he would consider perfectly safe from explosion by coal dust.

We are glad to see that the miners are insisting upon practical miners only being allowed to sit on the Enquiry. We need hardly add that in the interests of the mining community a searching investigation must be made with a view to adopting preventative measures for the future.

Prospecting Licenses for Gold.

In striking contrast to the shameful apathy and negligence of the Provinces of Ontario and Quebec, the Provincial Legislature of Nova Scotia has always had the true interests of the mining community at heart, and by many wise enactments has done much to foster and encourage the development of the resources of the province. This is shewn by the rapid progress and prosperity of the industry, and by the large and increasing revenue annually derived from it by the local treasury. There is, however, still room for improvement, particularly in the present system of granting Prospecting Licenses for Gold, as may be gathered from the following practical remarks made by the Commissioner of Mines:

"These licenses are granted for six months, with an option of renewal. Their location and renewal has led to much confusion and trouble in new districts, as they

are frequently selected almost at random for speculative purposes, and mistakes arise when portions of them are selected for leasing, etc. In view also of the large extent of ground covered by leases which are practically unforfeitable, the following suggestion may be worth consideration. This is briefly that the system of granting prospecting licenses be abolished, that leases be issued for any term decided on, say 20 or 30 years, to be held by labour or annual rental. That on the non-performance of the labour or non-payment of the rental the lease be thereby forfeited without recourse to any court of investigation or forfeiture. To give an opportunity to those who may be desirous of prospecting, the cost of the lease for the first year could be made the same as that of a prospecting license of equal extent, but if the lessee desired to continue his operations he should then before the close of the first year secure the continuation of the lease for another year by payment of the permanent rental, and so on. An arrangement similar to this would, on the basis of a small annual rental, of say \$1.00 an area, prove a boon to the prospector, for under the present arrangement he would pay for a prospecting license of one area for 12 months, 75 cents, then for a lease \$2.00, in all \$2.75. This secures him the ground for say two years; if he did not work, his lease would be liable to forfeiture. Under the proposed arrangement the same sum would secure to him his area for three years. This arrangement would also give the Province a revenue from the numerous unworked leases now hindering exploration and probable discovery of valuable ground in all our mining districts, stimulate the holders to work, and give a security and fixity of title to leases, which is desirable in the interests of investors. Provision could be made to protect properties on which any temporary cessation of work was necessary, or which were in litigation, and to prevent injustice to any prior occupant who had made any bona fide expenditure."

We commend these able suggestions not only to the careful consideration of the legislators of Nova Scotia but also to the local governments throughout the country, where they are equally applicable.

We invite Correspondence upon matters consistent with the character of the REVIEW.

Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

The Dominion Mining Laws.

OTTAWA, 8th January, 1888.

The Editor

THE CANADIAN MINING REVIEW.

SIR,—I have read with a good deal of interest Mr. Nettle's letter to you, dated the 20th ultimo. It is quite clear that Mr. Nettle has not read the Canadian Mining Regulations for himself, but has accepted as true the construction placed upon them by somebody who has had an interest in misrepresenting them. There is not a solitary provision in these Regulations which would justify Mr. Nettle's denunciation of speculative companies and land sharks, etc. There is no objection, now that Mr. Nettle is apparently an American citizen, to his praise of the laws of his own country, but I take the opportunity of saying that it would puzzle him to produce a tittle of evidence in support of his strictures on the Canadian Mining Laws which are contained in the letter addressed to your paper. Mr. Nettle condemns the \$5 entry fee imposed under the Canadian Mining Regulations, but conveniently forgets to mention that there are free miners' licenses, poll-taxes, fees to the Mining Recorder, and other specious modes of levying upon the prospector resorted to in every State and Territory of the American

Union, which find no counterpart anywhere within the Canadian North-West, to which the Canadian Mining Regulations more particularly refer.

I am, yours respectfully,
CANADIAN.

Our Undeveloped Resources.

OTTAWA, 20th Feb., 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—I am very glad to see that the question of the development of Canada's mineral resources is being so well ventilated at present, and hope that the agitation now going on may lead to some really practical steps being taken in this direction.

That there is a great necessity for something to be done has been patent for years to all those who know anything of the development of mining districts in other countries, but, unfortunately, the mining community form too small a portion of the population to make their voice heard, and their want of any organization whose function it would be to champion their rights, still further lessens their weight in the legislative councils of the land. Mr. A. C. Lawson, of our Survey, in an article recently contributed to the *Toronto World*, has very ably represented these views.

Unfortunately, it is very difficult to convince the rest of the community of the necessity for these steps, and one can well understand how hard it is for those only familiar with the development of the farming and lumbering resources of the country to realise that the mineral resources require any different treatment.

The fact remains nevertheless, and the principles which have been found successful elsewhere will have to be followed before we can do anything with our mining districts, beyond having spasmodic "booms" at long intervals which never end in anything useful, and do an immense amount of harm.

The principles to which I refer are those of encouraging the actual prospector and of making the holding of mineral lands conditional to working.

In these and the following remarks regarding the mining laws I am referring more particularly to those provinces with which I am acquainted, viz: Ontario and Quebec.

Now, the laws of these provinces do not attain these two ends, but, on the contrary, bring about results which will eventually prove most disastrous, and this for the reason that they offer every facility to the man with spare funds to buy up all the land upon purely speculative grounds before anything has been discovered upon it.

These results may be best illustrated by an example. A prospector starts out into the bush having expended all his savings in the purchase of the necessary outfit to enable him to carry on his campaign long enough to have a chance to find something for his exertions. He goes out into the bush far from the haunts of civilized man, and after going through the toils and dangers of his arduous calling he may be lucky enough to find indications of some good vein or deposit of mineral. He cannot now, as he should be able to do, stop and explore his find to see if it is going to be worth while for him to take it up, for unless he is very prompt he may find that someone has "got on his tracks," and surveyed and acquired the land before him; so he has to take his

chances on this point; he therefore retraces his steps to the nearest town, often a long and tedious journey by trail and water course, and there, being out of funds, must make the best terms he can with the man of spare cash in order to enable him to acquire the land and pay the expenses of taking a surveyor and party out into the wilds. Then comes the rush, not of prospectors, but of speculators, who promptly take up land all round and thus immediately put a stop to all further explorations in the vicinity, which is the very spot where both experience and common sense would lead us to look for other veins or deposits.

Even if he is able to finance it himself, by the time he has acquired the necessary length of the vein all his spare cash will have been exhausted and he will have to defer testing his find till the next season, meanwhile securing the necessary funds to do so by saving out of wages earned at other employment.

Then, when after all this, he is in a position to further test his vein he may find that it does not develop as his first and necessarily cursory examination led him to believe, and that instead of a prize he has drawn a blank, so he has to begin all over again, or, more likely, he abandons exploring under such disheartening circumstances and goes where the conditions are more favourable.

This, sir, is no imagined case, but an actual and constant occurrence with the lamentable result that the resources of the country are passing rapidly out of the grasp of the Government who only can control the development of the resources of the country for the general good of the community and for the furtherance of the growth of the nation.

Thus we find in our mining regions whole areas tied up which in size would equal any of the mining districts of England; and, needless to say, after the first discoveries which have led to this state of things exploration ceases; for who wants to make discoveries on other people's land?

Occasionally, of course, the owners of these lands expend money in exploring them, but this is exceptional; and we find most of the property is held by parties living far from the district, whose resources and energies are expended in other pursuits and who regard their mineral locations simply as they would a ticket in a lottery which may by some chance suddenly bring them a fortune.

Besides these there are many other ways in which the present law entails hardship upon the prospector, but space will not permit me to further illustrate them here, suffice it to say that the final result is that where we should have a hundred explorers searching for the valuable mineral deposits, which undoubtedly exist in our mining regions, we now have one; and that the small capitalist, instead of fulfilling his proper part in coming to help the prospector to do the preliminary testing of deposits already found, becomes simply a speculator in mineral lands; thereby not only failing to perform his proper function, but by coming in too soon in the economic machinery actually prevents the working of the whole train and blocks discovery at the outset.

So much then for the effect of the prevalence of erroneous conception of the conditions necessary for the development of mining districts, and we find similar causes militating against the successful development of individual mines.

It is very common to find parties starting to open up mines with an altogether too limited idea of how much expenditure is required before a promising prospect can be put on the footing of

a paying mine. They think that an investment of a few thousand dollars ought to ensure continuous returns of handsome profits; and if their expectations are not realised, which, of course, they cannot be, except in very rare cases, they either give up an effort which, if carried out pluckily, would have most likely turned out very profitable in the end, or else they continue it in a half-hearted way which of itself courts failure, and is very disheartening to all engaged and only delays the final failure.

Instances have frequently come under my notice where, as we say, the "eyes have been picked out" of the mine, and the company, instead of pushing on the underground development work vigorously so as to find and explore other ore bodies in their vein, have confined themselves to work in and around the first found body, and when that has all been exhausted have not the capital or pluck to do all the "dead work" necessary to put the mine again on a paying basis which should have been done in the first instance. The result is another abandoned mine about which it is almost impossible to get reliable information, so that in the absence of any evidence to the contrary, it is taken for granted that it was properly and thoroughly tested, and another failure is recorded, doing infinite damage to the reputation of the district.

In thus pointing out some of the reasons for the backwardness of the mining industry of the country, I am not, of course, appealing to the mining community, as these things are already too well known to and deplored by the profession, but hope that I may be contributing somewhat to a better realisation of the case by the outside public which end must be attained before we can get anything done.

I am, Sir, yours, etc.,

ELFRIC DREW INGALL,

(Mining Geologist of Geological Survey of Canada. Associate Royal School of Mines of England.)

Coal in Ontario.

OTTAWA, February 14th, 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—In the January issue of the CANADIAN MINING REVIEW, I was quite surprised to see a correspondence from Westville, N. S., from the pen of "Briton," in which that gentleman states that "during a brief sojourn in Ottawa" he was "led to believe that coal will be sooner or later found within 100 miles of that city." This important statement is then followed at the close of his communication by three questions which practically resolve themselves into two: Does the Carboniferous system in geology occur in Ontario? or in other words: are the coal measures found in the series of geological formations of Ontario?

With regard to the third question which "Briton" puts, I have only to refer him to reports on that subject where 'natural gas' has been obtained and utilized for years past, and add that an analysis of the 'gas' at East River, Pictou, N.S., would have to be made before any comparison could be instituted.

Taking first, the country surrounding Ottawa, and examining its geological history closely, i.e., taking into account the lithology, stratigraphy, and particularly the palæontology of the rock formations occurring within the limits indicated and even far beyond that, it is found to be clearly divisible into three great classes each of

which belong to and are referable to well-known and easily recognized *systems* in geology, as follows:—

1. The post-tertiary or post-pliocene formations, consisting of sands, marls, gravels, clays, &c., most of which were deposited in the geological epoch immediately preceding the advent of civilised man in this part of North America and in which no trace of coal can be found, so that this geological series may properly be discarded. 2. Then comes the Cambro-Silurian or Ordovician formations. These are likewise well-known and extensively developed in the Ottawa region. They are all of marine origin and were deposited along the shores or at the bottom of a great sea or ocean without interruptions or breaks in time of any kind, including all the formations from the Hudson River down to the Potsdam, viz., (*in descending order*) Hudson River, Utica, Trenton, Black River, Chazy, Calceiferous, Potsdam. The thousands of localities where these geological formations are well known to crop out to the surface of the ground in this neighbourhood and exhibit their strata along the line of strike, have afforded geologists abundance of material for sections in which the exact sequence of the beds may be obtained, from the heavy quartzite conglomerates of the Potsdam formation resting unconformably on the contorted strata of the *third* or Laurentian system, followed upwards by shaly and heavy bedded sandstones which pass gradually into the Calceiferous sandrock of the next formation, to the highly bituminous and fossiliferous strata of the Utica formation, which themselves pass upwards into the calcareo-arenaceous shales of the Hudson River formation.

The numerous rivers and streams of the Ottawa Palaeozoic Basin which run through and over the strata, exhibit the various formations above mentioned so well that a continuous series indicating the proper succession of all the beds of the rock constituting them, has been fairly obtained and known not to present any trace of a coal seam whatever throughout the whole area and along any of the lines of outcrop. The lithological and stratigraphical characters of the whole strata as known are therefore decidedly against the occurrence of coal in the neighbourhood of Ottawa.

But the palaeontological argument is by far the strongest in this question of the existence of coal in Quebec or Ontario? A very brief examination of the fossil remains which are so well preserved and so abundant in the measures about Ottawa, together with a slight knowledge of the flora and fauna of the coal period, suffice to convince even the most sanguine exponent of the existence of carboniferous rocks or productive coal measures about Ottawa, (after instituting a comparison) that the latter series of formations are not the ones occurring here at all. When the sedimentary formations of Ottawa were laid down, the carboniferous age, characterized by the occurrence of a luxuriant vegetation, consisting of gigantic tree-ferns and other low orders of plants, chiefly acrogens, was not even predicated as yet; in fact, the highest types of animal life which are known to have existed in those old Ordovician times were of a very inferior order to those of the coal period, in which "air breathers" are known to have existed in great abundance. If the carboniferous or coal-bearing rocks occurred in the Ottawa Valley or in Ontario and Quebec (where the arguments above referred to apply equally well), then the accompanying flora and fauna would be present which characterises that period in the earth's history all the world over, but neither do the rock formations of Ottawa contain coal

nor do the fossil remains entombed in their strata point to the occurrence of that extensive and useful series in this part of Canada.

The statement which your correspondent then makes regarding the strata which overlie and underlie the coal-bearing rocks of Canada, as well as those which overlie at least fifty collieries in England, viz.: that they are the same as those which we have at Ottawa, cannot at all be entertained, except from a purely general lithological standpoint. The occurrence of shaly strata, associated with limestones and sandstones, occur in nearly every system of the geological record, so that these are, by themselves, not sufficient data upon which to go; but the evidence afforded by the fossil remains, telling the exact time in the history of our planet when the rocks in which they are entombed were laid, is most conclusive and final.

Now, Sir, if the knowledge of the geological formations of Ottawa and its environs is such as to point conclusively to the fact that the carboniferous or coal-bearing rocks do not occur in this district—your present correspondent would like to know if it is not better in the light of all to "deter capitalists" from investing and sinking funds which will be entirely wasted and productive of no other results than those which have attended the labours of many who have already bored for coal at Whithy, at Levis and other parts of Canada, all of whom have learned by experience that the parties who carry on these boring operations are the sole individuals who profit thereby, and that the strata bored are of a very different nature from the coal-bearing rocks of Canada and elsewhere which are easily recognized wherever they occur.

I am, yours respectfully,

NORMAN.

The Problem Solved.

Apropos of the natural gas excitement at Ottawa, the following from the pen of a correspondent to the *North Hastings Review* will be read with relish:—

"I beg to advance the theory that the natural gas contributed by 211 Parliamentary representatives has been for 20 years absorbed by these porous rocks and now forms a vast reservoir which the Wallace gas company is about to tap and supply through pipes to dwellings for heat and fuel. This I submit is a plausible explanation of the source of supply, as from its heavy quality the parliamentary gas would naturally sink. The trouble will be to separate the stuff in the reservoir, for should Sir John's food be cooked with Mr. Blake's gas, it would give him the mollygrubs, and should they heat Mr. Laurier's room with Sir John's gas, the member from Quebec would be asphyxiated. This utilizing of natural gas in Ottawa is a great scheme of public economy."

MISCELLANY.

Decomposition of Chrome Iron Ore.—

C. Donath* decomposes chrome iron ore by mixing the finely powdered ore with five times its weight of barium dioxide, and heating it for half an hour in a porcelain crucible over a Bunsen burner. A greenish yellow mass is obtained, which is soluble in cold water acidulated with hydrochloric acid, the solution containing all the chromium in the form of chromic acid.

Curious if True.—In South Africa coal is reported to have been found among gold reefs. An enterprising prospector went to the *Digger News* and said, "I had both a

disappointment and success yesterday. I was looking for the main reef out near Booksburg, and had sunk a shaft 90 feet deep, when I came upon this bally stuff" (handing out a few samples of coal). Whoever would have thought of finding gold between the reefs?

A Nova Scotia Miner's Heroic Act.—

About eight o'clock on Wednesday morning, 18th ult., the men employed about the pit mouth and buildings of the British and Colonial Land Association were started by a cry, "Run for your lives the dynamite is on fire?" When the men had fled to a place of safety, W. N. Reseigh, agent of the mine, came back and looked into the building whence the alarm had come. He noticed flames issuing from a box in which one of the contractors had dynamite fuse, detonators, etc., stored. Knowing there were men working in the shaft a few feet distant he determined to save them at any risk. He ran into another building, secured a bucket of water, and at the eminent risk of his life extinguished the flames and saved the lives of the men. He was not a moment too soon. A coil of fuse in the box was completely burned and a tin box containing detonators was scorched and blackened on all sides. The dynamite, only a few inches away, had not yet taken fire. Had he been a minute later the hero of the occurrence would not be alive to tell the tale. Mr. Reseigh is a native of Cornwall, England, and has only been in Canada a few months. By his coolness and pluck many lives were saved, and the destruction of thousands of dollars worth of property avoided.

A Lesson in Cheap Mining.—Any facts serving to show how, with proper care and intelligence, the expenses of mining and reducing free milling gold ore may be carried on, cannot be republished too often. Therefore we give the following facts, taken from the *Financial and Mining Record*, of the Spanish mine in Nevada county, California. The figures given relate to operations in the month of November, and, we may add, are sworn to by the mine superintendent, F. W. Bradley, as required by law in this instance. The record is as follows:

MINE.

Thirty days work produced 4,057 tons of ore.

Cost of production.	Labor.	Supplies.	Total.
Extracting ore.....	\$679 63	\$196 65	\$876 28
Delivering ore to mill..	193 25	13 69	206 94
Dead work.....	100 90	14 35	115 25
General expense.....	70 70	4 75	75 45
Total.....	\$1,044 48	\$229 44	\$1,273 91
Cost per ton.....	25 8-10 c.	5 6-10 c.	31 4-10 c.

MILL.

Twenty-nine days' work reduced 4,047 tons of ore.

Cost of reduction.	Labor.	Supplies.	Total.
Mill expense.....	\$225 67	\$162 82	\$388 49
Water for power.....	5 00	198 00	203 00
Handling ore.....	177 00	2 40	179 40
General expense.....	70 71	4 75	75 46
Total.....	\$478 38	\$367 97	\$846 35
Cost per ton.....	11 8-10 c.	9c.	20 8-10 c.
Bullion produced.....			\$2,644 57
Total expense.....			2,120 27

Profit..... \$524 30

This shows the ore to have worked only a trifle over sixty-five cents per ton. Cost of mining and milling combined was about fifty-two cents per ton. In working this large amount of ore a net profit of only thirteen cents per ton was made, the total profit being \$524.30 on 4,047 tons of ore. As we have remarked before,

the mine is worked under exceptionally favorable circumstances, and the ore is easily reduced; but it is surprising to know that under any conditions a profit, however small, can be made out of such very low grade rock. Water power is used to drive the Huntingdon mills, but has to be paid for.

Petroleum Fields of the United States and Canada.—Mr. B. Redwood describes the method and cost of boring for petroleum in the various petroleum districts. In the Washington field, Pennsylvania, the wells are much deeper than in the older fields, and are invariably torpedoed, often more than once, the charge in some cases being 80 quarts of nitro-glycerine. Nearly all the wells are flowing wells, and should yield a 100 barrels a day in order to pay, owing to the expense of boring, which averages 7 to 8 shillings a foot as against 2 shillings in the Bradford district. Besides Pennsylvania, New York and Ohio, the States of West Virginia, Kentucky, and Tennessee also produce oil in large quantities, and it is also found in many other States. In California there are also one or two small fields. In one, tunnels were driven into the hill-side, but the yield was small; as a general rule, the wells have to be pumped. The Canadian petroleum industry dates from 1857; the principal field now is Petrolia, sixteen miles south-west of the outlet of Lake Huron and Bothwell, thirty-five miles distant. There are now 2,500 productive wells, with an aggregate production of 70,000 barrels per annum. The wells at Oil Springs, Petrolia, are about 375 feet deep, and are torpedoed with 8 to 10 quarts of nitro-glycerine.

Salt Mining in Canada.—Nearly all the salt produced in the Dominion is manufactured in Ontario, adjacent to Lake Huron, the largest number of working wells being situated in the County of Huron, whilst a few are being operated outside of this area in the counties of Lambton on the south, Bruce on the north, and Perth on the west. There were nineteen wells working during 1886, six of which are located at Godrich, where the salt was originally discovered. The remainder of the works are located at the following places:—Dublin, Seaforth, Clinton, Hensall, Exeter, Blyth, Kincardine, Brussels, Cartwright, Glaston and Wingham. Numerous other wells have been bored and blocks operated besides these, but are not now working, owing to the depression in this industry. The first discovery was made at Godrich, in 1865, in a boring made there in search for petroleum. In 1876 Mr. Attrill put down a drain and drill-hole near Godrich, which came upon the first salt bed at a depth of 997 feet from the surface, and in a depth of 520 feet below this the hole penetrated six salt beds aggregating 126 feet in thickness, the thinnest bed measuring six feet and the thickest thirty-five feet wide. The salt occurs at a greater depth in passing eastwards from the lake shore, a boring at Seaforth, about thirty miles south-east from Godrich, having struck salt at a depth of 1,035 feet.

The Largest Smeltery on the Continent.

—The immense smelting works at Omaha, Nebraska, are the largest of their kind in America and as the erection of works of a similar nature are at present, under contemplation in various parts of our Dominion, a brief sketch of these may prove of interest and value to our readers at the present time:—The Omaha works were a small establishment originally started by Messrs. A. L. King, C. H. Downs, C. W. Mead

and General W. W. Lowe in 1869, which has gradually advanced with the city until at the present time, the works have far outstripped in growth and magnitude, all other establishments of the kind in America, and in conjunction with the Grant Smelting works of Denver, (which are owned by the Omaha firm,) the company can lay claim to the largest smelting establishment in the world. Whilst the Denver establishment, however, is confined to smelting operations only, the Omaha shops both smelt and refine. The large quantities of ore which daily find their way into Omaha for treatment are principally brought from Montana, Idaho, Colorado, Utah, Dakota, and Arizona. Base bullion is also shipped to the works on a large scale from the different smelting works throughout the country, for the purpose of refinement. About 40 per cent of this latter substance comes from the Denver branch of the firm. An idea of the magnitude of the company's operations may be gathered from the fact that they employ over 500 men and have already \$3,000,000 invested in the enterprise. The annual business done by the corporation, too, is in the like proportion. During the last year upwards of 315,000,000 has been "turned over." The company receives on an average 200 carloads of ore per month, and over 200 cars arrive monthly laden with base bullion consigned to them. When the ore or bullion arrives at the works the first thing done is to make an assay, from which the company is enabled to measure the amount of lead, silver, gold, antimony, or any other metals they will severally yield per ton, and so accurate has this process become that by treatment of a comparatively small portion the furnaces will disclose, almost to a dollar, the net value of a large shipment. Cash is then paid according to the prices for the time being ruling in New York. The ore is now treated on the larger scale. As in the assay this is effected through the medium of reverberatory furnaces so constructed that by means of a dome, or low arched roof, the flame in passing through the fire chamber, is reflected or reverberated in the ore. Whilst undergoing this fiery ordeal the metals are separated and the attendant at the furnace secures them in the form of base bullion or unrefined metal. Lead, silver, gold and antimony are thus extracted from the same ore. The bullion is then moulded into bricks, which are in due course sent to the refinery. Here they are again placed in reverberatory furnaces and all existing dross and foreign substances are extracted until nothing remains but the pure metal. This also is moulded into bricks. The gold brick made by the company weighs 250 ounces and is worth \$5,000. Silver is turned out in \$1,000 ounce bricks which are worth about \$1,000 each. This process of reducing the ore is, of necessity, of the most technical nature, and a thorough knowledge of metallurgy and chemistry is necessary for a proper appreciation of its intricacies. To enter into an elaborate dissertation on the inner workings of the process, however, would be outside the scope of this article. The greater portion of the gold and silver is forwarded to the United States mints, at New Orleans and Philadelphia, where it is purchased by the government. The refined silver sells at prices ranging from 94 cents to \$1.15 per ounce, whilst gold brings the uniform price of \$20.67 per ounce. For the half year ending July 1, of the present year, the works have turned on 4,583, 264 ounces of silver and 40,640 of gold, whilst they have placed the enormous amount of 28,514,000 pounds of lead on the market during the same period. For the last named

metal the ruling price is about 4½ cents per pound. The company is also extensively engaged in the manufacture of blue-stone, of which they turn out sixty barrels per day. This substance is principally employed in the working of electric batteries. The works cover a great area of ground and comprise a series of solidly constructed brick buildings in which the seething flames of upwards of one hundred furnaces are constantly at work.

The Decline of Natural Gas in America.

—In a paper read at Cleveland, Mr. N. B. Wood expressed the opinion that the supply of natural gas is rapidly being exhausted. Either gas is being formed, or the quantity being wasted has been over estimated, or the supply must soon be exhausted. The two latter are, perhaps, the facts in the case, but the last is the more important. Immense gas wells will cease to be known in a few years, and those districts which are now the most productive will be soonest exhausted. Already there are reports of the failure of noted wells; and noted districts are becoming unproductive. Careful and conservative engineers are advocating laws regulating the sinking of wells and the more economical use of gas. At Erie, where gas has been used for a great many years, the supply has fallen off to such an extent that it is now being piped into the city from a distance. Credible information states that since so many gas wells have been sunk at Findlay the quantity of gas has perceptibly diminished. The only exception is East Liverpool, where gas has been used in the potteries for twenty years without sign of exhaustion.

Crude Phosphate as a Fertilizer.

—Our readers who have been following the discussion in these pages on the question of the utility of crude phosphate as a fertilizer, will read with interest the remarks of Mr. Andrew H. Ward, Boston, on the subject. Mr. Ward in an able article recently contributed to the *Eastern Farmer*, says:—

"Of all the crops raised, corn requires the largest amount of phosphoric acid, 100 bushels with stover abstracting from the soil sixty-four pounds, while potatoes and tobacco take from the soil a large amount of potash, 600 bushels of potatoes abstracting 219 pounds. It is assumed that the soil contains enough of the other mineral elements for the growth of crops, for we are constantly informed that all that is required to add to the soil is nitrogen, phosphoric acid and potash, and latterly nitrogen is not held in as high esteem as it was, particularly in the growing of corn. The experiments in Connecticut on this crop show the nitrogen increased the crop enough to pay the cost thirteen trials out of ninety-six.

"The pecuniary loss rose and fell with the amount of nitrogen used. With mineral fertilizers alone the crop gathered some sixty-five pounds of nitrogen per acre. As sixty-four pounds of phosphoric acid can be furnished in fine ground phosphate of lime at \$1.28, and 219 pounds of actual potash in murate of potash for \$7.66, both combined costing \$3.94 to furnish the mineral elements deemed necessary to supply to the soil the amount abstracted from it by 100 bushels of corn or 600 bushels of potatoes. It does not seem to be economy, good judgment, or profitable, to let our lands run down and go to waste, and it will not be long before agriculture will be more thought of in this section, and more attention given to it.

"The one great want has been manure. Our stock has decreased, our lands have not been kept in condition for the want of manure and a bad system of tillage, consequently farming has not, as a general thing, been so profitable as to induce those who could get out to remain in, or induce those who were out to come in, but our farms have now got to a price that should induce purchasers, and by the application of artificial manures they can be made to grow paying crops at once.

"With fine-ground raw phosphates as the basis of operations, we can now obtain complete manures for any culture, made according to any formula and containing in a readily assimilated form all the ingredients called for."

Wire Rope Haulage and its Application to Mining.

By Frank C. Roberts, C.E., Philadelphia, Pa.

Continued from January Issue.

II. INCLINED PLANES.

It is often found economical and convenient, when sinking a shaft, to incline the line of descent at an angle to the vertical, so that the material shall be hoisted on trucks running on track systems. Power is supplied by hoisting engines, and for this reason these planes are denominated engine planes. Again, in many localities, especially in the bituminous coal region, the adits to the mine are at a considerable elevation above the overground system of transportation, requiring the lowering of the mining-product from the mine to convenient points for shipment. This is usually secured by means of an inclined plane termed a gravity plane, and operated by the gravity of the descending load. In either type of inclined plane the line of descent may be curved or have variable grades, the only requisite being that the fall shall be in one direction and that the grade shall be sufficient to enable the loaded or empty car to descend by gravity.

Fig. 8 represents the arrangements of tracks

most economical in construction for either system, while it also has the merit of a capacity equal to that of any other. The section C is termed the *parting*, its purpose being to enable the descending and ascending cars to pass each other. For this reason it is placed in the centre of the inclined plane. The distinguishing feature of this road-bed is that above the parting we have three lines of rails, while below we have but two. This plan necessitates the use of an automatic switch at the lower point (A) of the parting (see Fig. 11, which is, however, reversed in position, as compared with Fig. 8). This simple arrangement consists in two iron-bound timbers pivoted at one end and moving over the rails. In the illustration the switch is arranged so that the loaded car going up will take the track S while the wheels of the descending car on M, in passing A, will shift the switch to the position shown in dotted lines. When the next loaded car ascends it passes into the parting on the track M. This arrangement of road-bed has been in use with great success, and the general verdict of the mining community is that it answers, to all intents and purposes, the ends sought by more expensive devices. To avoid the necessity of the automatic switch at the lower end of the parting, the system illustrated in Fig. 9 has been devised. Its operation will be readily

understood from the figure. The double-track incline, Fig. 10, is frequently employed, but the extra expense of broader road-bed renders it less common among mines of ordinary capacity. Where the output is very large, however, its advantages are evident.

An important detail in connection with all inclined planes is the arrangement of switches placed at the mine-end of the plane. Fig. 12 shows a simple and efficient device. The switch consists of three pivoted tongues, which govern, according to their position, the disposition of the cars. In the gravity system the loaded cars descend alternately by the tracks P and Q, and the empty cars always pass to N. In the engine-incline the loaded cars ascend alternately by the same tracks, the loaded cars here passing to N. As the switches are placed, the empty cars, in the gravity-plane, will pass to N and the loaded cars advancing by M will pass to Q, while the empty car returning by P will open E and close D. A being closed, the empty car passes again to N, while the next loaded car advancing by M, descends the plane by P. Except that the tongue A has to be kept closed by a tender, the switch is automatic. The same is true of the operation of the switch at the head of an engine-plane, except that the loaded instead of the empty cars pass to N.

In all inclined planes it is necessary to employ some form of safety-device to provide against accidents arising from the breakage of the hoisting-rope. Much attention has been directed to these safety-devices, but in all designs the operation is dependent upon one of two principles—either to stop the cars or to guide them off the incline. The chief objection to these devices is that they are all controlled by a man stationed at the head of the plane. It is to be regretted that there exists no simple and inexpensive method whereby the safety arrangements are rendered automatic, as in the vertical hoists.

Fig. 13 represents a simple device for stopping runaway cars. Two heavy iron-bound timbers, A, are pivoted near their centres at the side of the outer rails, as shown. The arrangement of counter-weights is such that when it becomes necessary to bring the timbers into action the pin P, forming the connection between the two timbers, is withdrawn by pulling the wire S, connecting with the head of the plane. As a result, the release of the counter-weights W throws the timbers over the rails, as indicated by the dotted lines. A number of these devices are placed along the incline, all being connected to the single wire leading to the head of the plane. This method is somewhat inferior to the one illustrated in Fig. 14, owing to the uncertainty of stopping the cars when descending at a great velocity, their tendency being to jump the timbers and continue their course. The device shown in Fig. 14 consists in side-switching the car. This is performed by the tongues D, E, F and G, actuated by a system of bell-cranks and weights, as shown. The switch is held open by the pin P, and when this is withdrawn by means of the wire S, the switches are closed by the action of the counterweights W. This device, although resulting in the partial destruction of the car, renders the danger to life and valuable property considerably less than the preceding arrangement. What is known as the *dead-fall* is employed in some mines. A heavy timber, guided in an upright frame, is placed over the track, and, when released, falls over the rails.

In all applications of wire rope except vertical hoists, it is necessary to support the rope at

Fig. 13.

Fig. 14.

frequent intervals by rollers, otherwise the rope would drag upon the ground and increase the power absorbed by friction, as well as cause the rope to wear out rapidly. A cheap and efficient roller (Figs. 15 and 16) is constructed of gum-wood, of as large a diameter as is consistent with the location, and from 12 to 24 inches in length. The axles are 1 inch or $1\frac{1}{4}$ inch round iron, running in simple cast-iron bearings. The much-discussed question of comparative detrimental effect upon wire rope of wooden and iron rollers is doubtless to be answered in favour of the former; but whatever the advantage may be, it is so slight that it is hardly worth consideration, since, in a properly-constructed plane, the rope simply rests upon the rollers.

Curves.—The difficulty of passing curves is solved by two efficient and simple methods. Figs. 17 and 18 illustrate one device, whereby the rope is taken round a curve by means of a series of wheels about 24 inches in diameter, placed outside the track. The car, in turning a curve, brings the rope between the rails; but, after passing, the rope is guided back into the

groove of the wheels by the timbers C, placed in front of each pulley. The guide-wheels are sometimes placed, as shown at A, Figs. 19 and 20, between the rails and a few inches to one side of the centre line. These wheels are, of necessity, smaller than the preceding, and are held in a slightly-inclined position to the horizontal by the bearings E, Fig. 20. The rope is

FIG. 15.

FIG. 16.

FIG. 17.

FIG. 18.

FIG. 19.

FIG. 20.

attached to the car at the same level as the grooves of the wheels. In passing a curve the rope is drawn to the centre of the track, and falls back into the grooves when the curve has been rounded. Either of these systems may be employed with advantage, the determination of the more efficient being a matter of location.

(To be continued.)

American Institute of Mining Engineers.

The fiftieth meeting of this Institute, being the eighteenth annual meeting, will be held at Boston, Mass., beginning on Tuesday evening, 21st instant. We are indebted to Dr. Raymond, Secretary of the Institute, for the following information regarding the proceedings:—

Tuesday Evening February 21.—Opening session at 8 p.m. at Hotel Brunswick, to be called to order by General Francis A. Walker, President of the Massachusetts Institute of Technology. After the addresses of welcome and reply, there will be, at 10 p.m., a supper, at which visiting members and friends will be the guests of the local committee.

Wednesday, February 22.—Sessions morning and afternoon, at the Institute of Technology. In the evening, a subscription dinner at Hotel Brunswick.

Thursday, February 23.—Omnibuses will leave Hotel Brunswick at 8.20 a.m. for Fitchburg depot. Special train leaves depot at 8.55 a.m., arriving at 10.25 a.m. at Fitchburg, where Simonds' rolling machinery for rolling car axles, conical and spherical shot and various irregular shapes, Simonds' saw factory, and (for those who desire it) the works of the Putnam Machine Company, and the Fitchburg Steam Engine Company, will be visited. The party will be entertained at luncheon by Mr. Simonds', and the train will leave Fitchburg about 1.15 p.m., arriving about 2.50 p.m. at Waltham, where the Waltham Watch Works will be visited. Leaving Waltham about 4.30 p.m. the party will reach Boston about 4.45 p.m. Those who wish to inspect the famous testing-machine at Watertown can easily arrange to include this excursion by omitting the stop at Waltham, in which case they will arrive in Boston at 5.08 or 5.38 p.m.

On Thursday evening there will be a session at the Institute of Technology.

Friday, February 24.—Morning and afternoon will be devoted to minor excursions and visits, of which about twenty have been planned, a guide being provided for each. Opportunity will be given to members to signify their choice among these. The more important of those thus far arranged are to the following places:

The Sewage-Pumping Engine (visit under the auspices of the Boston Society of Civil Engineers); the Harvard University Museums and Laboratories; Cotton Mills at Lowell; the Clapp-Griffiths Works; the Laboratories of the Massachusetts Institute of Technology; the Norway Iron Works; the Tyler Tube Mill; the Ames Shovel Works at North Easton; the Mitis Works at Neponset; the Boston Art Museum.

On Friday evening the closing session will be held at the Institute of Technology. At this session the Annual Report of the Council will be presented, and the result of the election of officers will be announced.

Members desiring to present papers at this meeting will notify Dr. Raymond as soon as possible, forwarding either the full manuscript of papers or abstracts, with such information as to nature, length, amount of illustrative drawings, etc., as will permit a judgment as to their

acceptability. The following papers have been announced up to the present time:

The Formation of Fissure Veins, by S. F. Emmons, Washington, D. C.

Spirally Welded Tubing, by J. C. Bayles, New York City.

The Theory of Jigging, by H. S. Munroe, New York City.

Notes on the Topography and Geology of the Cerro de Pasco, Peru, by A. D. Hodges, Jr., Boston, Mass.

The La Plata del Libano Mines, Columbia, by Willard Ide Pierce, New York City.

Western Kentucky Coals and Cokes, by Joseph H. Allen, Mannington, Ky.

Steel Rails, by Frederick A. Delano, Chicago, Ill.

The Thermal Properties of Slags, by H. M. Howe, Boston, Mass.

The Russell Process in Its Practical Application and Economical Results, by Ellsworth Dagget, Salt Lake City, Utah.

Recent Developments in the Open Hearth Process, by Alfred E. Hunt, Pittsburgh, Pa.

The Husafvel Furnace for Making Malleable Iron, by F. Lynwood Garrison, Philadelphia, Pa.

An Improved System of Water Supply for Hydraulic Mining, by H. D. Pearsall, London, Eng.

The Determination of Silica in Cinder, by R. H. Lee, Lewiston, Pa.

A Method for the Estimation of Manganese in Steel, by Frank Julian, Chicago, Ill.

A Glossary of Furnace Terms, in English, French and German, by Thomas Egleston, New York City.

Systems of Mining in Large Bodies of Soft Ore, by R. P. Rothwell, New York City.

Prominent Sources of Iron Ore Supply, by John Birkinbine, Philadelphia, Pa.

In General.

Messrs. Couper, McCarnie & Co., London, Eng., in their Buyer's Circular of the 16th ult., state: "MINERAL PHOSPHATES.—Canadian.—The shipments for 1887 show that 20,000 tons were exported to United Kingdom and Continent during the past season, which maintains the average of recent years. South Carolina Phosphates are held firmer, but the price is not yet sufficiently remunerative to encourage Raisers to sell any large quantities for this market. Somme Phosphate.—The only obstacle to a general acceptance of the Syndicate terms has been a few resales of speculative parcels; in spite of this, a fair business has passed at the rise. Belgian Phosphates dull, and little doing. Sail freights are getting scarce, and will tend to increase the quotations slightly for this material. There is not much doing in Cambridge Coprolites, and to effect business Raisers have been obliged to accept a low price.

Since our last issue, we have received communications from prominent shippers asking us to give an unqualified denial to the statement that Canadian ore on reaching Great Britain is frequently handled by interested parties, who grade the ore below its true quality, and thus force the miners to take any price buyers on the other side may offer.

Du Lievre.

Mr. C. C. Hoyer Millar, of Messrs. Millar & Co., Montreal, a partner in the well known firm of phosphate brokers, Messrs. Couper, McCarnie & Co., London, England, and a director of the Canadian Phosphate Company, Ltd. (the company which has been formed to take over the phosphate lands of the Union Phosphate Mining and Land Company, at West Portland), accompanied by Mr. O. M. Harris, his representative in Montreal, visited the company's mines during the last week in January for the purpose of seeing what new machinery, tramways, buildings, etc., would be required for the future working of the new company's mine and augmentation of the output. Mr. Millar was much pleased with the present appearance of the workings, and entertains great hopes for the future of this large undertaking. We learn that a tramway from the mines to the river will be laid early in the spring, and that considerable extra machinery is being purchased, and also that more cobbing houses, tenements, etc., are to be built almost immediately. The number of employees will also be increased.

The rumour which gained currency in several of the Ottawa papers that Mr. Wm. Mackintosh had been appointed superintendent of the Canadian Phosphate Company's Mines has no foundation in fact. Captain J. E. Smith, who conducted operations with so much acceptance to the Union Company, will retain the position with the new corporation.

We are informed that the Commercial Union Phosphate Company has been incorporated in the State of Wisconsin with a capital of one hundred thousand dollars, to operate phosphate lands in the township of Portland West. Mr. J. A. McIntosh, of Milwaukee, is one of the promoters, and among other gentlemen mentioned are Mr. James L. Gates, lumberman; Mr. James Kneeland, gentleman; Messrs. Ames and Avery, Real Estate Agents; Mr. Henry Herman, Real Estate, all of Milwaukee; and Mr. R. G. Peters of Manistee, Mich., the principal owner of the well known Beaver silver mine near Port Arthur. Operations will be commenced early in the spring. The capital stock is divided into one hundred shares of a par value of \$100.00 each.

A correspondent to *The Daily Review*, Milwaukee, writes:—

"I am informed that some of Milwaukee's leading financial gentlemen are interested in this company. When such men as James Kneeland, R. G. Peters, Manistee, James L. Gates, Messrs. Ames and Avery, and other gentlemen of very high financial and commercial standing are interested in this company, there can be but one opinion on the success of the Commercial Union Phosphate Company, and that is, financial prosperity to all those interested and a boon of great value to the agricultural community, who require so much of this great fertilizer to restore the worn out fields to their original producing capacity. Phosphate, in its natural state, ground, is one of the finest fertilizers in the world for house plants and garden vegetables, being odorless and adds a fine flavor to all kinds of plants. It is stated by the very highest scientific authority that every ton of wheat absorbs 16 pounds of phosphate from the soil. In this case how much does the great agricultural districts and wheat growing countries require of this—the greatest gift of nature's provider to replace what is every year absorbed from the soil. It is unquestionable that nothing has yet ever been discovered to equal apatite or phosphate for fertilizing purposes."

The Du Lievre Milling and Manufacturing Company, who, up to the present time, have only been running their grinding mill at Seabury (Bassin du Lievre) are making arrange-

ments to push the development of their mining property, and as soon as spring opens a large gang of miners will commence work at the Lillie mine. This will ensure a supply of rock for grinding. When last prospected, a rich vein was opened up showing a large quantity of high grade ore and the management are confident that by pushing mining operations vigorously, profitable results will accrue. We are informed that everything is now ready for extensive operations: boarding house, cook house, smith's shop, steam plant and machinery, all being in position ready to start work. With ample capital this Company propose to mine, grind, and market their own product, for which contracts for large supplies have already been made. A portion of the ore will be treated by Mr. Shirley's new process, by which the crude rock is rendered soluble.

The contractors are making rapid progress with the construction of the Lock and Dam at Little Rapids.

A night shift has been put on at the North Star. The blacksmith shop at this mine was burned down last month.

The Central Lake mine is turning out well, and gives promise of a large output when navigation opens.

The Emerald and North Star are turning out about their usual winter's output, and large shipments will be made during the coming season.

Latest advices from the Lievre announce that the staff at the Little Rapids mines will be considerably augmented in a few weeks. During the winter many valuable bodies of ore have been uncovered, and arrangements are being made to prosecute the work on a more extensive scale than heretofore. The shipment last year, with a comparatively small number of men, figured over 700 tons, averaging from 81 to 85%: there is every indication that this high standard will be maintained during the coming season.

Templeton District.

Mr. Trimble, of Montreal, managing director of the Templeton and Blanche River Company, was out at the mines during the month completing arrangements for the immediate erection of steam working plant and machinery. Everything is being done conducive to a large output as soon as the shipping season opens.

Mr. R. Blackburn states that some 60 men are working at his celebrated mines, and that the quantity and quality of the ore is steadily improving. Three hundred tons have been hauled to the river, and the sheds at the mines are full. The present output is very largely sugar phosphate.

Kingston District.

Captain Boyd Smith, of Washington, D.C., proprietor of the Blessington Mines, sailed per s.s. Aurania for London on 11th instant. He will be on the Continent some time, and hopes to secure a large number of miners and their families to settle on his properties in Canada.

With a largely increased force, skilled labour, and improved machinery, Superintendent Harris will produce a large output from these mines during the ensuing season.

Phosphate land in Sydenham is attracting

more attention than ever, and five hundred acres which Captain Boyd Smith, of Washington, bought for \$7,000 a few years ago, is held now at a quarter of a million.

Nova Scotia.

All the Nova Scotia collieries are greatly hampered through scarcity of rolling stock on the Intercolonial railway, caused in part by the snow blockades, on the northern division, and increase of business.

Owing to these causes, the shipments from the Springhill mines for last month only amounted to 26,228 tons of 2,240 lbs. The output under ordinary circumstances would have been over 29,500 gross tons.

A trial test of nine tons of quartz taken from a 5 inch lead on the Cochrane Hill property yielded 18 ozs. of gold.

The 15-stamp mill is kept running night and day, and about 45 men are employed at the Cowan mine, Kemptville

The International Coal Company held its annual meeting at Montreal on 15th instant. The following directors were elected:—Sir D. A. Smith, M.P., Messrs. Hugh McLennan, John McLennan, A. Kingman and T. B. Brown. At a subsequent meeting of the directors Mr. H. McLennan was elected president and Mr. T. B. Brown secretary-treasurer.

Quebec.

At the Villeneuve Mica and Mining Company's mines, one of the buildings used as a store, sleeping house, and other purposes, has been burned to the ground since our last. The fire originated through an overheated stove-pipe: the loss is covered by insurance.

The annual meeting of the company was held in Ottawa on Wednesday, the 14th inst., when the following were appointed officers for the ensuing year:—President, S. P. Franchot; Secretary-Treasurer, G. Von Rehn; Directors, B. H. Buxton, E. Hodges and F. Gorman. It was decided that all meetings of the company will henceforward be held at Buckingham.

The company entertain hopes of an extended business during the coming year. The output continues to fulfil every expectation both as to quantity and quality. A crystal was taken out last month which weighed a little over 160 lbs.

Mr. Thomas Cosgrove, Hathaway, was in the city lately with several very likely specimens of phosphate, asbestos and other minerals taken from his property.

We are informed that the Boston Asbestos Company have sold all their output for the coming year at a rate not less than \$75.00 per ton.

The Scottish Canadian Asbestos Company are erecting a crusher and other plant which will do away with the slow and expensive mode of hand cobbing hitherto employed. It is estimated that the new machinery will cost over \$10,000.

Ontario.

The new opening made recently on the Richardson mine, near the old pocket, looks well, but as yet no depth has been obtained, sufficiently to prove a true vein.

Capt. Symonds, Superintendent of the Bristol Iron Co's mines, gave us a call during this month. He states that the calcining furnaces recently erected by Messrs. Taylor and Langdon are not giving the satisfaction promised, and roasting has temporarily suspended. Captain Symonds leaves for New Jersey, in a day or two, on a visit to the patentees of the furnaces and hopes to be able to have the defect remedied and work resumed at an early date.

There are at present 80 men on his pay roll. 20,000 tons of ore are on the dump, of which 6,000 has already been calcined. Mining will be conducted with vigor as soon as the snow leaves the ground.

A general meeting of the Lake Superior Copper Company (Limited) was held in London, England, on the 5th instant. For the purpose of enabling the company to resume mining operations, the directors are authorized to issue the remainder of the unallotted ordinary shares of the company, or such portion of them as they might deem necessary, at a discount of 75 per cent., and upon such terms as they may think fit. The chairman explained, however, that within two days a legal difficulty had arisen which rendered the directors unable to submit the resolution, it having been stated on high legal authority that directors had no power to issue shares at a discount. The activity in the copper market and the rise in the price of copper seemed to afford the company the opportunity for which it had long waited, of beginning their work again on a considerable scale. At the time the work was stopped, the prospects were all in favor of the mine turning out an exceedingly good one. The stuff had improved in quality from the surface to the point they reached. To work it the shareholders would have to make some sacrifice—they would have to take shares with some slight liability in order to be able to get the outside public to come in. The expense of unwatering the mine would be £400 or £500, but they must have two or three months' capital in hand—to work the mine they ought to have £10,000. Resolutions were passed requesting the directors to take immediate steps for relieving the shareholders from any liability at present attaching, or supposed to be attached, to the shares at present issued, and for obtaining capital for the future working of the mine in such a manner—either by the sale of the property or otherwise—as may be deemed best.

Some strong veins of white mica are being opened up at Mr. D. G. MacMartin's mines at Pike Lake. As development proceeds the crystals are found to increase in size and to be more regularly formed. Several hundred pounds of merchantable mica have already been taken out and await transportation. The output and quality improves daily, and the product of this mine will be sufficient to furnish a large portion of the demand for Canadian consumption.

The vein being developed at the Tough and Stobie gold property continues to improve as depth is attained.

Mr. W. B. McAllister is boring for oil at Pembroke. A depth of 100 feet has been attained, and favorable indications are reported.

Port Arthur District.

The BADGER MINE is rapidly coming to the front as a favorite. Those who inspected the mine last week report much of the ore extracted as equal to the best output of the celebrated Beaver mine. It is the intention of the owners to have fifty men at work as soon as the accommodation is complete and the mine sufficiently advanced for their profitable employment, which will probably be about May next.

The BEAVER MINE is working steadily along, producing silver in quantity. A number of silver bricks were brought into town for shipment last week. Everything around this mine indicates that men of wealth, who believe thoroughly in their prize, are working it to the best of their ability.

SILVER MOUNTAIN has apparently settled down into a comfortable existence. Although nothing astonishing in the way of valuable silver deposits are reported, it is evident from the extreme caution of the managers in keeping their operations to themselves, that they intend somebody to benefit thereby. It is stated that parties, not a hundred miles from Port Arthur, cabled for a number of shares to Liverpool, but were answered that all were sold and none in the market.

The CROWN POINT Mine, immediately adjacent to Silver Mountain, develops slowly with a very small force. More accommodation, however, for man and beast is being provided by the owners, who are buying up adjacent land suitable for building purposes.

The CARIBOU MINE under Capt. Rothwell is developing richly and gives great satisfaction to the owners, who are also preparing for work on a larger scale.

MINING LOCATION R. 230 is beginning to fall into hands worthy of such a promising prospect. Ore quite as rich as the best Silver Mountain or Beaver Mine specimens have been taken out of this mine. The Marquis of Huntley, who visited this district last summer, is reported to have control of nearly, if not quite all of this prospect, and will erect a stamp mill next season should the output continue satisfactory.

THE PORCUPINE Mine is again doing a little, and it is reported will shortly become the property of a syndicate able to do it justice.

The Ontario Government are preparing early for the increased traffic into the mining region by building an almost entirely new bridge across the Kaministiquia River on the Government road to the mines.

What is wanted very badly, however, is a railroad, and it is to be hoped that the Ontario

FOR SALE.

Asbestos Mines.

Reeddale, Megantic, P. Q.

Government will realize that they have the right and that it is their bounden duty to assist such an enterprise. Two schemes are now being pressed on the notice of the Government—the first being a road direct from Port Arthur to connect with the Duluth and Iron Range Extension, of which about ten miles have already been built from Port Arthur westward. The other is practically the same as the former for the first fifty miles or more, and then runs direct for Winnipeg to take its share of the immense grain trade which is now suffering from lack of sufficient accommodation. Both schemes have excellent backing, and only want the usual Provincial legislation and bonus to start them vigorously into life.

The topographical survey of the great lakes in this interesting region is progressing favorably under Messrs Russell and Macdougall, who will remain in the field as long as the ice holds good.

A great deal of harm is being done to the Thunder Bay district by the extravagant reports given in the Winnipeg papers and reported as emanating from ex-manager Kirkland of the Beaver mine. He is reported to have said that he had sold one-half of his interest in that mine for \$600,000 and could not manage to get it back again for \$700,000. This is rubbish pure and simple, as we have it on excellent authority that Mr. Kirkland neither has or had any interest whatever.

The district is all right and does not need any "booming."

Manitoba and North-West Territories.

The severe weather has greatly retarded work at the mines of the Canadian Anthracite Coal Company, at Banff, and about two hundred men have been idle for several weeks. Latest reports, however, state that the weather has modified, and that operations have been resumed.

The Edmonton *Bulletin* states:—Five coal mines are being operated to keep this town and immediately vicinity supplied with fuel, all within what might be called the corporation limits—W. Humberstone's, D. Ross', and Frank Hall's on the north side, and J. Walter's and E. Caverhill's on the south side.

British Columbia.

At a meeting held lately at Nanaimo, it was decided to organize a Mining Institute for the district.

The explosion which occurred about nine o'clock on the morning of 24th ultimo, in No. 5 shaft of the Wellington Colliery, owned and operated by R. Dunsmuir & Sons, has proved to be a more serious disaster than was at first anticipated. About two hundred men, whites and Chinese, were in the mine at the time, and latest reports show that at least ninety of these perished. As the shaft timbers were destroyed and cages could not be used, a pulley and rope were immediately prepared. A temporary cage was made and lowered to a considerable depth. Several of the imprisoned miners reached it and were hauled up. In the last level, where it is believed the explosion occurred, 25 bodies were found in a heap, some of them terribly disfigured. Messrs. Dunsmuir's loss is estimated at between \$25,000 and \$30,000.

The *Colonist* has received a private despatch from Nanaimo announcing that the East Wellington Colliery, operated by W. S. Chandler, has been shut down. No reason is assigned.

Advices from the Treadwell mines near Juneau, Alaska, state that on New Year's day, the powder magazine containing 2,000 pounds of blasting powder exploded with terrific force, blowing the building into atoms and doing much damage to surrounding property. Fortunately the miners were all working on the ledge beyond the reach of the explosion, and only one life was lost. A workman in the mill, oiling shafts some distance above ground, was thrown down and severely injured. The explosion was felt with great force in Juneau, two and a half miles away.

The Alaska *Free Press* reports that negotiations are in progress with English capitalists for the purchase of the Bears Nest claims on Douglas Island. One million and quarter dollars are wanted.

A number of miners are now preparing to start into the Yukon, crossing the lakes and making the journey down the river on the ice. They expect to reach the mouth of Forty-Mile creek about the middle of April, and get up that stream to their claims by the time the ice breaks up, which is from the 1st to the 15th of May. By being on the ground at that time they can get in about four months work before their return next fall.

"SHE."

Improbabilities Sometimes Become Realities—A True Woman's Fidelity.

Several works bearing unique titles, written in fascinating style, and giving evidence of wonderful imaginative power have lately been received by the reading public with much popularity and pleasure.

Perhaps the most striking of them is the book bearing the odd title of "She." In this the author has fairly outdone himself in his popular line. Ayesha and her beloved Kallikrates are unique characters in fiction. Ayesha, the heroine, is a beautiful creature who tasted of the essence of nature's forces at the fountain head, and became immortal.

Her patient waiting for the coming of Kallikrates, the beloved of her youth, whose individuality was maintained through centuries, though the change called death regularly occurred, only to be followed by rebirth, is a fine illustration of woman's fidelity.

The closing scene, when she conducts Kallikrates to the very centre of the earth, the birthplace of all life, in order that he may taste of immortality, is a fit climax to the fine creation.

The question naturally suggested by this strikingly original story is whether there is not somewhere in nature, a potent force whereby life may at least be temporarily prolonged.

Mrs. Annie Jenness Miller, editor of "Dress," says: "In every instance Warner's Safe Cure has the effect to give new energy and vitality to all my powers." Mme. Gray, teacher of Oratory and Physical Culture at Syracuse, declares: "Before I tried physical culture and Warner's safe cure, I was a confirmed invalid. I owe much to that excellent remedy, and do not hesitate to acknowledge it."

Human life seems too short, though men in

former ages lived longer than those of the present. History tells us that they lived more in accordance with nature's laws—their mode of living was extremely simple, and in their daily life they followed the dictates of human intelligence.

If sickness comes, we of to-day, seek the remedy among the artificial forces instead of resorting to the field of nature.

If, when diseases come, we would consult nature, the chances are that we would fare better, for we would then treat the cause of such disorders. Modern research has shown that most of the commonly known diseases owe

their origin to the unhealthy state of the kidneys, the blood purifiers of the system, and if they are kept in a healthy state by the use of Warner's safe cure, a vegetable compound and simple production of nature, much of the prevailing sickness would be happily averted.

It is probable that the author of "She" derived many of his beautiful imaginings from close communings with nature, for we are all agreed that whatever is of or from nature is more beautiful and wholesome, than that which is artificially constructed.

VALUABLE PLUMBAGO AND OTHER Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

WM. H. DICKSON,
160 Waller St., Ottawa.

Russell House, Ottawa.

OR TO THE OFFICE OF

THE CANADIAN MINING REVIEW,
OTTAWA.

FOR SALE. VALUABLE Copper Mining Properties — IN THE — Eastern Townships

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within $1\frac{1}{2}$ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only $2\frac{1}{2}$ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Caruncle Hill Mine, Lots 2 and 3 R. 14, and 2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, $\frac{1}{4}$ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

ESTIMATES GIVEN.

Orders Executed with Care under Personal
Superintendence.

Mineral Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

Recently a disposition has been manifested to check this criminal waste of a rapidly diminishing source of revenue, but so far with little practical effect. In the sale of mining lands, for instance, the Government reserve the timber for three years. During that time the lumberman who owns the limit in which the lands are situated has the privilege of removing such timber as he may want. Very frequently this timber would be of considerable value to the miner in the construction of his works and buildings, but having no direct interest in the timber, and having every interest in learning the character of the rocks beneath it, his first step after taking possession is usually to start a forest fire to burn the moss, forest growth and debris from the rocks. But with them goes valuable timber. It is lost to the owner of the land, to the limit holder, and to the Province. Unfortunately, the fire is seldom limited to the locality of its origin, but extends into neighboring properties, sweeping large areas of timber. Thus by the insane policy of the Government does the work of destruction go on, and while they are encouraging tree-planting in the old settled parts of the Province, they are every year, by their stupidity, destroying more of the primitive forest growth than the entire population of the Province could replace in a generation. No wonder summer droughts are increasing; no wonder the agriculturists in the

older portions of the Province find farming a less remunerative occupation than in bygone days; their representatives at Quebec are removing from the Laurentian hills the forests which protected the sources of the rivers and preserved the moisture necessary for the steady development of their farm products. Some day the eyes of the people will be opened to the mischief which has been wrought, and to the necessity of adopting a measure of forest protection before all is lost. What is wanted is an amendment to the Mineral Act which will give the proprietor of the land the ownership of the timber upon it from the day of purchase, thus making it his interest to exert himself to save such portions of the forest as do not interfere directly with his operations.

How Commercial Union Would Effect Our Industry.

At a meeting of the Toronto Commercial Union Club held in that city at the end of February last, a valuable paper on the mining interests of Canada, and how they would be effected by Commercial Union was read by Mr. T. D. Ledyard. In this paper he alluded to the great richness of Canadian iron ore; he pointed out how the state of the iron trade is the financial barometer of a country's prosperity, and how, if that trade is prosperous, other lines of business take their cue from it. Whilst our grain markets are threatened with curtailment by Indian and Australian wheat, our ores are looking up. England derives from and for a long time has been dependent on Spain for most of her Bessemer ore, and from that quarter comes also the greater part of the iron ore imported into the United States. But the iron producing districts of Spain are threatened with an early exhaustion, the production being already much reduced. Mr. Ledyard claimed that "a very few years must see the end of them," and no part of the world "will offer greater inducements for the manufacture of steel than our own Canada. In that case it would not be at all surprising to see some of the large English iron manufacturers transporting their works to Canada." At present the duty of 75 cents per ton prevents many of our iron deposits from being worked. An American expert after viewing the Belmont mine, the ore of which is of exceptional purity, stated that if he was working it, he would take out 400 tons a day. The duty on this would be \$300, and how would such a per diem tax work on any industry? The removal of this duty alone by Commercial Union would benefit both Canadians and Americans alike. Apart, however, from the export trade, there are large quantities of lower grade ore which it would not pay to export, but which could be profitably smelted on the spot if we had a market large enough to induce capitalists to put up the necessary works. The Canadian market is too small for this, but if the whole North American market was open to us there are many points where furnaces would

be erected, and the manufacture of iron and steel would benefit the whole community. Although the C. P. R. traverses hundreds of miles close to deposits of Bessemer ore suitable for making steel, the very rails used on that railway were bought in England, probably made of Spanish ore, and did not contribute one dollar's worth of benefit to any Canadian, although similar ore from which they are made is almost alongside the track. Four-fifths of their value might have been distributed to pay for the labour of our own mines and mechanics had furnaces existed here. Instead of this, said Mr. Ledyard, our money has gone to pay Spanish mines and English labourers who care nothing for us and who could not probably point out Canada on the map.

Nature never intended Customs barriers to keep apart two portions of the same continent which she intended to be commercially one. These remarks apply not only to iron but to pyrites, the demand for which for sulphuric acid manufacture is now assuming very large proportions in the United States, but on which the duty of 75 cents per ton prohibits any trade, the pyrites being only worth \$4.50 per ton in New York. Copper ore would be shipped largely to the States if there was no duty, the tariff barring the way, and consequently the new copper districts in Algoma and Nipissing remain undeveloped. The same remarks apply to several other minerals. The opponents of Commercial Union tell us we have the Canadian markets, but 300,000 tons of pig iron is about the annual consumption of Canada, whilst the North Chicago Rolling Mills alone use 1,700 tons a day, or as much as would supply the whole of Canada! Mr. Ledyard wound up his remarks by saying "let us have free trade with 'our own continent, our natural market.'"

Mining Report, 1887, for British Columbia.

The Annual Report of the Minister of Mines for 1887, being "An account of Mining operations for Gold, Coal, &c.," in the Province of British Columbia, has been laid on our table, and the digest of it, after careful perusal, will prove of great interest to our mining friends generally.

The total estimated yield of gold last year in the Pacific Province is valued at \$693,709, being a decrease since 1886 of \$209,942. Several reasons are given in the reports from the various districts for this falling off, the principal of which appears to have been the unusually dry season which compelled most of the hydraulic claims to shut down very early in the year, the limited number of men employed on productive works, and the giving out of the old placer mines. An impetus to gold mining during the coming season is anticipated, owing to the reports which have been received from all quarters of the discovery of ledges carrying the precious metal in different degrees of richness, and the increasing confidence bestowed on

quartz veins in various locations. Quartz mining is proverbially slow in its first stage, and particularly so when the ore is of low grade, as such can only be handled profitably by wealthy companies. The large amount of prospecting carried on last summer has brought to notice many creeks containing gold in paying quantities, but veins are not so easily found owing to the heavy growth of timber generally covering them. One of the chief centres of quartz mining is Illecillewaet. One year ago this place was comparatively unknown, but a village last summer grew up around the C. P. R. station. The metal obtained here is silver, and the shipments by the Selkirk Company between 25th July and 7th November consisted of some 250 tons of selected ores, representing a gross value of \$21,000, and a net value at the smelter of \$15,000, nearly \$63 per ton as the average net yield at the latter. The range of the percentage of lead was from 17 to 52, and of the silver assay from 36 to 149 ounces per ton. There exists also at the date of this report ore down at the mines and on the dump valued at \$15,000. A crushing and sampling mill is at work to which is attached a complete assay office. In the Lillooet district the yield of gold has been good, but the work is principally carried on by Chinese from whom it is very difficult to obtain returns. In the Yale district a new and enormously rich mining section is reported, and of Granite City and the surrounding country it is remarked in the Report, "the country is almost untrodden and has vast mineral resources both in quartz and gravel that only await time to discover,—pluck and energy to develop." We note one deficiency in the Report which we hope to be supplied in future issues, viz: tables showing the yield and value of silver in the Province, as this is an interest second only to gold mining and one that is attracting considerable notice.

In the Similkameen Division of the Okanagan District, reference is made to the production of platinum, which last year reached 2,000 ounces, commanding from \$2.60 to \$3.00 per ounce, according to quality. It is stated as a remarkable fact that many thousand ounces of this rare metal have been thrown away by the miners as worthless, in consequence of the prevailing ignorance as to its value. Last year samples were sent to various places, but from insufficient data and few samples 50 cents per ounce was all the value set upon it. One replacer stated it was worth \$2.50 per ounce in Germany if confined in large parcels, but \$3.50 per ounce is at present readily paid for it in Portland, Oregon.

The output of coal in British Columbia appears to be annually increasing, 413,360 tons having been mined last year against 326,633 the year before. As the Pacific coast of the Dominion bids fair to become the coal station of the North Pacific Ocean, when navigation is rapidly assuming very large dimensions, the demand must soon become

limited, and the various cities of the Pacific coast of the United States will also draw their chief supply for domestic consumption from our mines. The principal exports of this fuel are now made to San Francisco, Wilmington and San Diego, in California; to Portland, Oregon; Alaska; the Hawaiian Islands; China and Japan. But the large cities now rapidly growing up, such as Seattle, Tacoma and other places, are now demanding a supply. The Nanaimo and Wellington Collieries are the main sources of supply, but the Kootenay district in the Rocky Mountains gives prospects of very extensive yields if the rich seams which there crop out abundantly are worked.

Among the minerals of this Province which apparently are very little taken into account as yet, are galena and copper. The want of a smelter probably has much to do with this. The present annual consumption of lead in Canada is of the value of \$250,000, and the import duty \$12 per ton. A large demand for lead exists in China, and a profitable trade with that country might be established from the Pacific coast if smelting were carried on in the Province.

It may be inferred from the general tenor of the reports from various mining districts, that placer digging can no longer be relied on for any remunerative returns, as they have been exhausted of their wealth in past years. But in new districts the gravel benches will afford a wide and remunerative field to those who first work them. For lasting returns quartz and ledge mining will be the main objects for the capitalist to venture upon, and the large extent of rich metalliferous country in British Columbia which has not yet been even prospected offer inducements for mining enterprise equal, or at least only second to the rich mining district of the American territories through which the same range of mountains extends, as afford to British Columbia its hidden wealth.

Nova Scotias' Prosperity.

Just as we go to press we are in receipt of the Annual Report issued by the Department of Public Works and Mines for the year 1887. This valuable work is, as usual, replete with interesting matter, but owing to lack of space we are unable to give it any extended notice until our next issue. A very noticeable feature however, is the very gratifying increase of \$21,600.28 in annual revenue over 1886. We commend the following figures to the careful study of the legislators of Ontario and Quebec.

1886.	
Prospecting Licenses.....\$	8896 72
Rents	3794 00
Gold Royalty.....	8550 16
Licenses to Search.....	2980 00
Coal Royalty.....	101,656 53
Licenses to Work.....	500 00
Costs and Fees.....	
Renewal of Coal Leases.....	479 50
	\$126,856 91

1887.

Prospecting Licenses.....	10567 56
Rents	4263 00
Gold Royalty	9420 77
Licenses to Search.....	2560 00
Coal Royalty	119,670 16
Licenses to Work.....	1025 00
Costs and Fees.....	885 70
Renewal of Coal Leases.....	60 00

\$148,457 19

Mining in the Mountains.

CALGARY, N.W.T., March 2nd, 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—The mining industry of British Columbia is attracting considerable interest out here now, and I have thought that perhaps a short description of the mines on Mount Stephen and around Field, of which I have a thorough knowledge, might prove interesting to your many readers.

These mines are situated 130 miles from Calgary, in the Kootenay District, and I may say, right on the line of the Canadian Pacific Railway. At Mount Stephen there is seen a lode on which there are four locations, viz: "Monarch," "Cornucopia," "Sunrise" and "Carleton" mines. The two first mentioned belong to Coffman Bros. & Co., and the last two to Mr. W. A. Allan, of Ottawa, and myself, each extending 1,500 feet in length by 600 feet in width. The first claim located was called the Monarch from which the lead takes its name, or it might be called the Mother lode. On this mine considerable work has been done. A tunnel has been run in on the vein about thirty feet, showing a vein from the foot wall to the hanging wall of about seven feet of solid ore. The ore is galena lead and silver, averaging by careful assay about twelve ounces silver, and over sixty-five per cent. lead. The foot wall is Black limestone, or, as geologists would say, Cambro Silurian limestone. The hanging wall is quartzite, showing a true vein of ore between two different formations. Lying west of the "Monarch" is the "Cornucopia," showing a body of ore in a vein about two feet wide, of the same character. The vein has been followed in about thirty feet, and it increases in width according as it is developed. Next and adjoining in the east is the "Sunrise" Mine, on which a shaft has been sunk about twenty feet, showing the same vein and the same character of ore. At the top the vein is small, but at the bottom it shows a well developed lead about two feet wide, increasing in width as depth is attained. Adjoining the "Monarch" on the west is the "Carleton" Mine, on which considerable difficulty was encountered in cutting a trail from the Monarch ground. This mine shows a large body of ore about eight feet wide, solid, on which assays have been made showing sixteen ounces of silver and over seventy per cent. lead. From the east end of the "Sunrise" Mine to the west end of the "Carleton" Mine, over one

mile, the vein shows ore in bodies along the whole distance, and I have no hesitation in saying that the Monarch vein or lode for distance is one of the best veins, so far as development, in the Dominion of Canada or on the Pacific coast. Many districts can show richer ore, but none such large bodies at the surface. I speak from experience, as a practical mining man of over twenty-eight years, spent in mining camps on the Pacific coast, and any miner who examines the vein will agree with me. As all those mines are situated about 1,000 feet up from the railroad there will be difficulty in building tramways to bring the ore down, as there is an inexhaustible supply of timber along the Kicking Horse river in front of these mines. All that is necessary, however, is capital and enterprise and the output will be astonishing. East of Mount Stephen lies Cathedral Mountain, on which there are two claims, the Carrie Mine and the Cathedral, both showing large bodies of ore, but containing some iron along with the lead and silver. These mines lie up high on the mountain. A good trail has been built for a mile or so, and the owners will complete it next spring. The formation is the same as Mount Stephen, and the vein lies parallel with the Monarch vein but higher up from the railroad. There is plenty of timber on the mountain side for all practical purposes. The Carrie Mine is owned by Calgary gentlemen.

North and across the Kicking Horse river lies Mount Field, on which are some good locations and mines; first among them being the Alpha, showing a body of ore about six feet wide to which a good trail has been built. The ore is of the same character as on Mount Stephen, except that it carries zinc in place of iron. In other locations the Comstock and Virginia show good indications of mineral and are on the same vein as the Alpha.

These mines comprise that portion of the Kootenay district which I have imperfectly tried to describe, but not to exaggerate. There are also other mines, and many will yet be discovered, as mining is but in its infancy in British Columbia.

I am happy to say people are waking up to the fact that this portion of Canada is rich in all kinds of mineral which, if taken hold of and properly developed by capitalists, will prove a source of great wealth. Now, if these mines were in the United States, they would have long since been taken hold of, but Canadians are only now waking up to the idea that they own in British Columbia mineral deposits as rich and great as the world has ever seen.

JOHN PATTIE.

The Development of our Mineral Resources.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—In my last letter to you on the above subject I dwelt more particularly upon the effect of the land laws, upon the development of our mineral resources, and perhaps a few further suggestions regarding the attainment of this most desirable end may not be amiss so I herewith give them for what they are worth.

Ever since my first acquaintance with the mining districts of the Dominion I have advocated the establishment of nuclei of small local museums at the various mining centres with a view to educating the people of the district to know the appearance of the useful minerals.

I have been much struck by the fact that in districts of very large extent the search for useful mineral deposits is left in the hands of

comparatively few, and when we remember how very close searching is required, and how very unfavourable are the conditions in most of our mining districts the wonder is not how little is found, but how much has been done by those few. Every one who has had anything to do with bush work knows well, that even in the rocky areas where the soil is either absent or only forms a slight patchy covering—the difficulties of seeing anything owing to the thick bush and to the rock being so universally covered up with moss, and with the debris of dead vegetation. When we realise this and how the search for mineral deposits and the determination of their nature and extent when found under such conditions requires so much greater expenditure of time, energy and money than in more open districts where in traversing the country one can see around for a reasonable distance, then we see that what we want is a much greater number of prospectors. More favourable regulations for the acquirement of claims would, as previously pointed out, encourage the influx from other parts of the continent of already trained men, but besides this I think a great deal might be done by taking steps to direct the attention of others, whose business already takes them into our mineral regions, to the search for veins, &c., the finding of which would be not only profitable to themselves but also to the country at large.

These wild sections of the country are continually being traversed by a small army of trappers, voyageurs, pine prospectors, lumbermen, etc., and all these men together with farmers, whose holdings are near rocky mineral areas, could doubtless be led to be continually on the look out for minerals and spend more or less of their time prospecting, which they, being right on the ground, could do at odd times and with little cost.

As a step towards bringing about this wider interest in the subject, I would then suggest that the town councils of such centres as Port Arthur, Sault Ste. Marie, etc., should apply through the proper channels to the Dominion Government for collections of typical rocks and minerals such as are now supplied by the Geological Survey to various colleges and other such public institutions throughout the Dominion. Having obtained this they should house it in a suitable room or rooms where it would be easily and continually accessible during reasonable hours and place it in the charge of some resident, such as I am sure could always be found to volunteer, who would arrange it to the best advantage, keep it in order, etc. Then if the residents of the town would take every opportunity to bring it to the notice of all such as would be likely to put the knowledge thus attained to use, I feel sure that much good would result.

Further, it would be a good thing to start a library of reference in connection with the collections so that not only would an eye knowledge of rocks and minerals be thus obtained, but the means of acquiring a wider and deeper knowledge of these subjects would be placed within the reach of all. A very good way to make a commencement would be to get, at the same time as the mineral collection was obtained, a set of the publications, both (maps and books) of the Geological Survey.

Thus we should have the nucleus of a local museum formed at little or no cost to the community, for the collections, etc., are supplied cost free for such public purposes, and there are doubtless always to be found everywhere some public spirited persons who would be willing

both to provide room, to house and also take charge of them.

Around this nucleus could be gathered collections illustrating other subjects and there might also very usefully be commenced in connection with it collections illustrating the local resources which would be very useful in interesting visiting capitalists and others whilst doubtless the library would be added to from time to time by donations of suitable books from various sources. In fact it would form a centre towards which with efficient management would gravitate many things which would be thus rendered useful to the whole public instead of remaining simply locked up in the possession of private individuals or lost for want of some recognized place to put them.

When I first made this suggestion, in 1884, after visiting the Lake Superior mining region, I also proposed that such collections should be sent to some of the chief Hudson Bay posts where they would come under the notice of the passing voyageurs and trappers which would perhaps lead to very useful discoveries in our great northern wildernesses which, owing to the disadvantages of climate and to the existence of so large a proportion of rocky lands, will probably remain wildernesses unless mineral discoveries cause the opening up of the country.

I am glad to see, from a letter just received from a gentleman to whom I made the same suggestion as above, that at one place steps are being taken to carry out this idea, and if similar results are attained in other places through the wider publicity given the suggestion through the mediumship of your excellent paper, I shall feel that I have not talked nor written in vain.

I remain, Sir,
yours, &c.,
ELFRIC DREW INGALL.

(Mining Geologist of Geological Survey of Canada. Associate Royal School of Mines of England.)

Strong Protest Against Chinese Labor in Pacific Collieries.

A well attended meeting of colliers was held recently in Victoria to consider the proposed amendment to the Coal Mines Act of the Province. Mayor Grant presided.

Mr. Williams, on coming forward, said he was a miner of twenty-five years' experience, and he had come to Victoria to give his views, more particularly on the Chinese question. His experience was that one Chinese were a dangerous element in a mine, and instanced two or three cases where accidents occurred through Chinese being unacquainted with the dangerous nature of gas. A Chinaman in a mine has a roving commission—can come or go where he likes—while a white man, according to the Mining Act, can only go where his working is. His opinion of the recent explosion was different to what was published in the newspapers, but, of course, he was only a poor miner and his opinion did not count for much. His experience, however, with all classes of men in mines, was that a Chinaman was the most stubborn and pig-headed individual in existence in coal mines. The miners had drawn up some amendments to the Coal Mines Act in their own interests which they hoped to have passed in the Legislature, and as the resolutions were framed to save life and property, anyone raising a hand against their law was an accessory to manslaughter should accidents occur in the future. He then referred to the workings of mines, and the danger of employing Chinese therein, and concluded by asking all

present to attach their names to a petition about to be presented to the Legislature.

Mr. Hanna, another of the delegation, and a miner of 24 years experience, spoke in the same strain, referring particularly to the necessity of doing away with the employment of Chinese in the coal mines.

Mr. West spoke briefly in support of the amendments, and hoped the petition would receive many signatures. It was not a question of politics, but a movement in the interest of human life, and could not be looked upon as class legislation. He was very sorry not to see more business men and politicians present, but if the question was properly understood the hall would have been crowded.

Mr. Campbell, a miner, said he was not a speaker of any merit, but he had had thirty years' experience as a miner, sixteen years in British Columbia and the rest in Scotland and the United States. The speaker then gave his opinion of the effect of employing Chinamen in the mines had. He said he had known of Chinamen lighting fires in the mines to warm themselves. This, he said, was very dangerous, for in the event of gas being in the mine, an explosion would occur without a moment's notice. His experience with Chinamen in the mines showed that they are very careless, and the men have come to the conclusion that the Chinamen have been the cause of the explosions in the mines. The miners hoped that the people of Victoria would sign the petition to dispense with Chinese labor entirely. Mr. Dunsmuir had stated that money was no object to him, and that he would do what he could to satisfy the white miners. The speaker said he had put a good deal of faith in Mr. Dunsmuir's remarks, but that gentleman was now trying to do away with the most vital clause in the amendments to the Mining Regulations Act.

Mr. McClymont said that, as was stated by previous speakers, this was not a political meeting, but simply to show the people of Victoria what the miners desire. He considered that any one who would not take this matter up and assist the miners would have murder upon his head. He did not believe in mincing matters. All know that the Government is controlled by one man, and the lives of those miners are in his hands. It rests with the people whether Mr. Dunsmuir is to have this control or not. If a man goes into the Legislature with an all powerful influence and works for his own personal advantage, he has betrayed the trust of the people who put him there.

Another miner addressed the meeting briefly after which the chairman invited the audience to come up and sign the petition. Eighty-three of those present responded to the call and signed their names.

The Unsafe Davy Safety Lamp.—According to Mr. A. H. Stokes, one of Her Britannic Majesty's Government inspectors of mines, the Davy lamp is no longer to be considered in the light of a safety apparatus, and from that point of view is henceforth to be regarded as useless. The Royal Commission appointed to report upon the "Mines Regulation Act," declared that the lamp is "unsafe in a current with a velocity of six feet per second, and, as Mr. Stokes says that the combined rate of the miner's walk and the necessary ventilation will constitute at least that amount of speed in the air, it must necessarily be banished from the mines. He adds that in his own experience many explosions and deaths have resulted from its use.

Mineral Output, 1887.

W. Hamilton Merritt, F.G.S., A.R.S.M.

Last year, in view of the absence of official statistics, I contributed a short paper to this section (a) on the mineral output of 1886. The statistics I collected were copied from *The Week* into *The Canadian Gazette* of London, Eng., which devoted a column to the subject, ending with the following:

Canada can point with pride to the fact that collections of her ores have taken the highest awards for quality and variety at many international exhibitions, while the encomiums passed by no less a British authority than Mr. Le Neve Foster upon the Canadian minerals at the Colonial Exhibition were evidence of the great value of the exhibits there displayed. Surely then it becomes of national importance that every facility should be provided for obtaining detailed and specific official information regarding the deposits, that they may be speedily developed. The Canadian Institute is not as yet a body whose voice will command the prompt attention of either the Dominion or Provincial Governments, but the cause it is forwarding is of such vital moment to the Dominion that we hope the authorities will take the matter in hand, and speedily pass into law such measures as will render possible the collection of reliable and concise information, and statistics relating to the mines, minerals and metallurgical interests of the whole Dominion.

Since the above was written we have been glad to welcome last month an advance guard to the expected, and hoped for, assistance from legislation in the shape of the statistical report on minerals for 1886, compiled by Mr. Eugene Coste of the Geological Survey. This doubtlessly is the result of a large and influential deputation of mining men and members of the House of Commons who gladly came together at my request to wait upon the Minister of the Interior at Ottawa in March, 1886. (See THE CANADIAN MINING REVIEW, March, 1886). And I think we shall be correct in giving our section credit for a recent Order-in-Council which has established a special section of the geological survey in accordance with our memorial presented to the Government last session, and following the lines laid down in the memorandum presented by the above mentioned deputation.

We must give the present minister credit for commencing the much needed reform, the desirability of which was laid before his predecessors without success.

The Departments of the Nova Scotia and British Columbia Governments, devoted to the mineral development of these provinces, are increasing their knowledge and efficiency as testified by their reports. Excellent work in acquiring information in connection with Ontario minerals is still being carried on by Mr. Blue of the Ontario Bureau of Industries.

We must welcome another important factor in the dissemination of information relating to our minerals and mines in the greatly improved condition in which THE CANADIAN MINING REVIEW of Ottawa has recently appeared. This journal has given our efforts, tending to the development of our mines and minerals, every assistance and has always supported the contention that extra legislation is advisable.

Among the public movements that concern our mineral developments the energy of the Toronto *World* deserves especial notice. This newspaper came to the inevitable conclusion that the Government of Ontario had been decidedly remiss in relation to the mineral development of the province, and has been doing excellent work in proving its point.

In view of the evident interest taken by our section last year in the statistical information contained in my paper of last year previously alluded to, I have again in a general way compiled from obtainable sources, a certain amount

of information in connection with the mineral output of the past year, 1887.

	Total.	British Columbia	N. W. T.	Manitoba	Ontario	Quebec	New Brunswick	Nova Scotia
Coal.....	1,998,080 tons.	413,370	60,000	700	1,521,000
Gold.....	1,133,709 dollars.	\$793,709	34,525	\$500,000
Gypsum.....	193,375 tons.	3,450	124,000
Iron Ore.....	73,347 " "	4,440	13,907	1,066	50,000
Mar. gneiss Ore.....	5,889 " "	1,385	520
Copper.....	5,237 dollars.	3,874
Silver.....	214,837 dollars.	\$215,035
Salt.....	65,800 tons.	65,800
Petroleum (crude) bls.	708,533 bls.	708,533
Phosphate.....	21,733 tons.	733
Asbestos.....	4,500 tons.	1,000
Mica.....	30,000 lbs.
Antimony Ore.....	174 tons.
Pyrites.....	35,000 tons.
Plumbago.....	7,180 cwt.
Barytes.....	3,000 tons.	3,000
Sand and gravel, building stone, marble, grindstones, lime, granite, serpentine, slate, flagstones, bricks, tiles								
and miscellaneous clay products, say.....								
Export of produce of the mine for 1887 (from Dominion Trade and Navigation Returns):								
To United Kingdom.....								
United States.....								
Other countries.....								
Total.....	\$2,000,000.	\$3,805,959

The total export of the product of the mines for 1887, as given by the Trade and Navigation returns, was a little short of that record in 1886. In the aggregate the production of mineral does not seem to have increased materially—notwithstanding that the output of coal, iron, salt and petroleum was larger—but while the quantity mined in one or two products may have fallen off temporarily, the result of the past year's work shows that the mining at large has been persistently continued in every department, and that prospecting and preliminary development has made enormous headway, particularly in the Rocky Mountains, and Selkirk, in the Nicolet Valley region, and in the Georgian Bay and Lake Superior districts.

This fact, in conjunction with the awakening public interest, will without doubt very soon show remarkable results, and we may hope will place our mining industries on the permanent footing which they should undoubtedly occupy.

The Effect of Good Management on the Profits of Coal Mining.—The following extract from an article by Mr. André in a recent number of the *Colliery Guardian* is very suggestive and instructive: "The reforms introduced into the management of the Anzin collieries in the north of France in 1884, which occasioned the great strike and raised the ex-collier and tavern-keeper Basly to the position of a member of the French Parliament, are beginning to show themselves in larger dividends for the shareholders and better wages for the men. The efficiency of the miner, that is, the average annual production per man, has been raised in three year-

from 206 to 286 tons, and increase of 38.8 per cent. This important reduction in the cost of production has so improved the financial position of the company that they are able to prosecute vigorously the exploratory works that had been commenced in more prosperous days, and thereby gradually to increase the output. There are now eighteen pits being worked, the average annual output from each of which is 129,800 tons." Among our own colliers it would be easy to show the difference which good or bad management makes in the cost of production, and the data to make such comparison is generally to be found in the annual reports of the companies, though it can be brought out into relief only by careful analysis and comparison of statements.

Economic Minerals of Algoma and their Locality. (a₂)

SILVER—Native and Argentite—Silver Islet, Jarvis Island, Rabbit, Beaver, Badger & Silver Mountain, and Whitefish & Atik Lake districts, and combined with copper, nickel and cobalt on Michipicoten Isle, St. Ignace, Nipigon Bay, Princess and Thunder Bays, Sudbury, on line of C.P.R., also.

GOLD—Native in vein in Heron Bay on line of C.P.R., Prince's location, Huronian and Highland mines, Shebandawan, Lake Superior, and in several well defined veins near Rat Portage on Lake of the Woods.

GALENA—In string veins in Black Bay (Townships of McTavish, Dorion and McGregor), Princess and Thunder Bays, Lake Superior, and New Silver District, south-west of Port Arthur.

ARGENTIFEROUS GALENA—"Victoria" and Cascade mines near the Sault Ste. Marie and on Echo Lake, Thunder Bay, and in the new silver district south-west of Port Arthur.

LEAD—At Silver Lake, Thunder Bay, vein of quartz and barytes holding galena. "Enterprise," Black Bay, Pointe Aux mines, Pigeon and Kaministiquia Rivers, Lake Superior.

COPPER—Sudbury on line of C.P.R., Lake Superior, Spar Island, Prince's location (4 feet vein), vitreous sulphuret with silver. St. Ignace and Michipicoten Islands; combined native copper and silver. Michipicoten Island; bay and river combined copper, gold and silver. Mica Bay, Otter Head, Pic River, Montreal River, Battle Island, Nipigon District, Pointe Aux mines, Black River and Black Bay.

IRON—Specular Iron Ore—The Wallace mine on Lake Huron, Desert Lake mines, Bruce mines, and at Killarney, Nipigon and Michipicoten districts and north shore of Lake Superior, magnetic iron ore. North shore of Lake Superior and westward at Geneflint Lake and Hunters' Island, both magnetic and hematite.

NICKEL—Wallace mine, Lake Huron "3 A" mine, Prince's location and Michipicoten mines, Lake Superior.

BARYTES—Permanent white—Lake Superior in a multitude of veins along the north shore, between Pigeon River and Montreal River.

JASPER—Northwest of Thunder Bay, Batchawanning Bay and north of Lake Huron.

SERPENTINE—Nipigon River.

SANDSTONE—Red and Brown for building, on Nipigon Bay (Isles Verte and Le Grange.)

AGATES—St. Ignace and Michipicoten Island, Lake Superior.

AMETHYSTS—Thunder Bay, coast and islands, Lake Superior.

CHLORASTROLYTES or Cats Eyes—Isle Royale, Lake Superior.

BISMUTH—Thunder Bay (north of "3 A") and at Echo Lake, near Sault Ste. Marie.

ANTIMONY—North Shore, Lake Superior, Garden River and Echo Lake.

GAS, NATURAL—Thunder Bay, Lake Superior.

MARBLE—Lake Nipigon, Sunshine Creek, C.P.Ry. west of Port Arthur, and at Garden River and Echo Lake.

CHERT, RIBBOND (for cameos)—Thunder Bay.

COBALT (for glass staining and porcelain painting, etc.)—Thunder Bay, Lake Superior.

RETINITE, PITCHSTONE and BASALT, (for making black glass)—North Shore of Lake Superior, between Nipigon and Michipicoten. Limestone (pure), Flack Bay, Echo Lake and northwestward from Thunder Bay, L.S.

WHITE QUARTZ SANDSTONE (for making glass)—North shores of Superior and Huron.

ALUM—On Slate River, Thunder Bay, Lake Superior.

SEATITE OR SOAPSTONE—Near Thunder Bay.

FLAGGING SLATE—Sawyer's Bay, Thunder Cape.

MOLYBDENUM (for dyeing purposes and calico printing.)—Terrace Bay and in certain rock cuts on C. P. R. road, north shore of Lake Superior.

ARSENIC—In various places on north shore of Lake Superior.

ROOFING SLATES—75 miles west of Port Arthur on C.P.Ry., on the Montreal River.

MANGANESE—North shore of Lake Superior at different places.

GYPNUM—North of Michipicoten and on the Moose rivers.

MICA (marketable)—On the Lake of the Woods east of Rat Portage, and within 20 miles of Port Arthur, Lake Superior.

LIGNITE—On the Rainy River, near Fort Francis, and on the Albany, north of Lake Nipigon.

TELLURIUM (a rare combination of gold and silver) found in the Huronian mine near Port Arthur.

ZINC—In immense deposit near Ross Port on the line of the C. P. R. east of Port Arthur.

FIRE CLAY and KAOLIN—Near Thunder Bay and Peninsula Harbor.

ASBESTOS—North of Poplar Lodge, Lake Nipigon, and near the mouth of Nipigon river.

Colliery Cage Props.—According to A. Demeure, at No. 5 pit of the Bascomp Collieries, the cages are double-decked, carrying two tubs on each deck. At the bottom of the pit they are received on a platform balanced so as to support the weight of the cage and empty tubs, but to sink when a loaded tub is run on, the movement being controlled by a powerful brake, so that the change of position is conducted independently of any handling of the engine. Meanwhile, the cage at bank has to be (1) raised, (2) lowered on to the props with the top deck level with the bank, (3) raised until the lower deck is slightly above the props, (4) lowered on to them, (5) raised to allow them to be withdrawn, (6) lowered away. In English practice, this would usually be conducted in the reverse order, the cage being (1) completely raised, (2), bottom deck lowered on to props (5) raised clear, (6) lowered away. In each case the engine has to be reversed five times. It was found that the cage at bottom was always loaded and waiting before the cage at top was ready, and it was to accelerate the latter that the Stauss system was adopted. In this system the catches are somewhat in the form of short bolts, resting on a steel bar or frame, the upper surface of which has an inclination of about 9°.

These bolts are hinged so as to give way to the upward passage of the cage, and are connected to the hand lever by a sort of toggle-joint which locks them into position, so that the weight of the cage applied on their upper surface cannot possibly force or slide them back, while, owing to the inclined surface on which they rest, they can be easily withdrawn by the lever without the necessity of first lifting the cage. The cage is (1) completely raised, (2) lowered until the bottom deck rests on the props, (3) the props are withdrawn and the cage lowered until the upper deck comes on to the props, (4) the props are finally withdrawn and the cage lowered away, the engine being reversed once. Mr. Stauss claims five distinct advantages for his apparatus:—(1) Economy of time. Experiments show that in the case above given this amounts to 13 per cent., with a corresponding increase in the amount of coal that can be drawn in a given time. (2) Economy of steam, as each reversal of the engines means an additional stroke of the pistons. (3) Less wear and tear of the rope. (4) Less wear and tear of the valve gear and moving parts of the engine. (5) The possibility of employing smaller engines, an advantage open to considerable question. In the case of existing plant, the size of engine cannot, of course, be reduced, and in putting down new plant the engine should always be powerful enough, in case of need, to raise the loaded cage unassisted by the partial counterbalance of the empty one. In cases where there is no balanced platform, the Stauss system is not so applicable (except in the case of single decked cages, where the gain is not so apparent), as it is only advantageous where the cage is changed by successive descents; and while the cage at bank is thus descending, the one at the bottom would, if worked simultaneously by the engine, by ascending stage by stage. Moreover, the rope must be kept taut, so as to avoid an undue shock when the cage is dropped by withdrawing the catches; and this manifestly cannot be done with both cages at once. As a necessary precaution, when the pit is standing, the hand-lever must be locked or chained, so that the catches cannot be willfully or accidentally withdrawn; and should the engine-man have occasion to leave his engine, he must always put the brake hard on.

Accidental Mining Success.—A rather strange and remarkable story is told in Idaho in connection with one of the principal gold mines of that territory. It is stated, says *Mining Industry*, that two daring and unscrupulous fellows, one having a rather creditable acquaintance in London, conceived the idea of floating a mining venture in England. The basis of operations was a 10-foot assessment hole, sunk on a worthless quartz vein. Artistically executed maps and plates of an ideal vein with workings were gotten up, together with views of a mill belching forth steam and smoke, and surrounded by innumerable quartz teams and the conventional piles of cordwood. The sanguine promoter of the enterprise then started for Europe and unfolded his great mining scheme, while his partner worked the wires from this side. The swindling pair were successful in catching a few fools, and securing a little money. Every week the "superintendent" telegraphed the results of the clean-up from the plates and mortars of the imaginary mill, and promptly returned the money received from stock sales by this promoter as the amount realized from the disposition of gold bars. Dividends were declared, the stock was advanced in price, and the Englishmen felt greatly

elated over their venture. It proved a picnic for the American partner in the scheme, but the promoter of the enterprise in England became frightened at the magnitude of the swindle and dreaded a final exposure and the consequent results. He wrote to his confederate in Idaho to look about and buy a mine for the company with a portion of their profits, which were now very large. A mine answering the description was not, however, so readily found, and especially as the man in Idaho was rather indifferent. Finally the climax began to approach when a few of the directors of the company announced their intention of visiting America and inspecting their wonderful bonanza. This brought the situation home to the "superintendent," who, at the urgent demand of his associate in England to protect himself, lost no time in scanning over the country for a suitable property. Finally one was found that very nearly answered the description of the visionary mine, and it was purchased, and in a few months it was made to conform in all essentials to the description forwarded, even including good ore faces, as new strikes were made that surprised everyone. When the promoter arrived with his party of Englishmen he was the most surprised and delighted man in the company, and the exchange of congratulations between the two partners was an event that neither will forget. The mine not only held out well, but continued improving, and paid dividends regularly, and is to-day one of the best gold properties in the Territory of Idaho. The Englishmen, it is stated, never learned of the deception practised on them, and would to-day invest a million pounds sterling upon the recommendation of the promoter; but the latter is making money enough out of the strangely acquired mine, and would not go through the experience of selling an imaginary mine again unless, perhaps, he should get broke once more.

Electric Coal Cutting Machine.—The application of an electric motor to impart motion to coal cutting machinery is proposed by Messrs. Bower, Blackburn & Mori, of Woodlesford, Yorkshire. The frame work or bed-plate of the machine is supported on wheels. Within the frame work is mounted or applied the electric motor, which may be of any suitable construction, and to this motor the electric motive force is imparted through suitable cables from a dynamo machine of any suitable tension. A rotary motion is transmitted to the shaft carrying the cutter bar through gearing. The lower part of the frame work, to which the upper part of the frame work is attached, forms a circular turntable, and is fitted so as to be capable of a rotary movement on the bed-plate, this rotary movement being effected by means of a worm, mounted on a shaft supported in the bearings, attached to suitable brackets, mounted on the bed-plate, and worm-wheel segment attached to the upper part of the frame work. By this means the cutter bar can be moved along by the attendant as the coal is being cut, and the proper feed given thereto. Although by preference the motor is carried on or attached to the coal cutting machine, the inventors would have it understood that such motor may be placed at any convenient distance therefrom, and motion transmitted from such motor to the machine by belt, chain, rope or other gearing, or by storage transmission or static induction. Suitable means may be employed for regulating the speed of the motor, and thus varying or adjusting the speed of the coal cutting machine.

Wire Rope Haulage and its Application to Mining.

By Frank C. Roberts, C.E., Philadelphia, Pa.

Continued from February Issue.

Having described the most important mechanical devices common to engine and gravity-planes, I will now consider the distinct features of each.

II. *a.* ENGINE-PLANES.—Planes of this class, especially when underground, are often denominated *slopes*, and are naturally divided into single and double slopes. In the former hoisting and lowering are distinct and separate operations, performed upon a single track (Fig. 7). Double slopes, on the other hand, provide for hoisting and lowering at the same time, and consequently necessitate three or four lines of rails (Figs. 8, 9 and 10).

On single engine-planes it is usual to employ a non-reversing engine, and, as in the case of the

single hoist, the slope may be operated by employing the power of the engine but one-half the time. In such instances the empty cars are allowed to descend by gravity, the drum running freely on the shaft for the time and being controlled by a strap-break or friction clutch. It is sometimes convenient to locate the engine at the foot of the plane, the hoisting-rope being supported along the side of the slope by rollers (Figs. 15 and 16) and led to the head of the plane, where it passes around a wheel of large diameter and, returning down the track, is attached to the car.

The single-slope system is peculiarly applicable where there are a number of side-entries located at different levels below the surface. In this case the train of descending cars may be stopped at the entry into which it is desired to switch some of the trucks, the train in the meantime being prevented from premature starting by a lock consisting of a timber pivoted and thrown over the rails. When the disconnection has been made, the signal is given and

the train descends to a lower level, where the operation may be repeated. In hoisting to the surface, the cars in the various side-entries are run to the main entry and, in a manner similar to that above described, switched to the main slope and connected to the rope.

An improved modification of the single plane is illustrated in Fig. 21. Here, for the accommodation of the empty or loaded cars, each side-entry has its individual parting or siding placed near the main entry, and in this way the plane is practically divided into as many separate planes as there are entries. Loaded cars are taken from each entry in succession, and the empties returned in the same order, the position of the end of the rope being indicated to the engineer by marks upon the rope, or better, by an indicator attached to the drum. Proper switches, etc., are located at the desired points, and the rope is guided into the entry by drums *D*, placed in the angles as shown. These drums have a face of two and a diameter of five feet. Guide rollers, *a*, are placed at suitable points.

Double Engine-Planes.—In double engine-planes, engines similar to those employed in double hoists are used, requiring, of course, reversing-gear and an efficient brake. The operation of these planes differs from the preceding only in the detailed arrangement of switches, sidings, etc. These devices may be readily understood by an examination of the various track-systems and other expedients already described.

II. *b.* GRAVITY-PLANES.—The valley of the Monongahela is celebrated for its gravity-inclines. Here the mine-adits are located at a considerable elevation above the railroads, the incline from the pit-mouth to the railroad being of such a degree that loaded mine-cars, descending by gravity, raise a corresponding number of empty cars. To this application of natural force the name "gravity-plane" has been given. Perhaps to the ordinary observer the profile of the gravity-incline is a matter of small moment, and yet this factor is important in securing a satisfactory operation. The plane should be slightly concave. Theoretically the curve is a

FIG. 22.

cycloid, the peculiar property of this curve being that a body falling along its lines will reach the lowest point of the plane sooner than by any other course, straight or curved. It can also be demonstrated that when the cycloid is employed, the weight of the two ropes is equalized at every point, so that the resistance from this cause is constant. On a straight incline a variable breaking force is required; but on a cycloidal incline the brake may be applied with equal force during the whole time of descent, and a uniform rate of motion insured.

It would, of course, be a difficult matter to build the profile of a plane so as to conform to cycloidal lines; but, for the reasons mentioned, it is advisable to approach as nearly thereto as possible.

The various track systems common to both engine and gravity-planes have been described above; but while the three and four-rail systems are similar in principles of operation, the single-track system (Fig. 7) as applied to gravity planes is modified to such a degree as to require special consideration. This modi-

fication consists in employing two tracts of different gauge, the narrower being placed within and below the wider (Figs. 22 and 23). The wider track is for the pit-cars, while the narrower serves as a roadway for what is termed the balance car, C. The latter is so proportioned in weight that it is sufficient to raise an empty car, and light enough to be elevated by the descending loaded car. To the balance car is attached a safety catch E, as shown in Fig. 23. When the rope breaks, or through any means becomes slackened, the lever E drops, and com-

ing in contact with the ties of the road-bed, prevents rapid and dangerous descent.

Gravity-planes are operated by either one or two wire ropes. Where a single rope is employed, it receives three or four turns around the head drum, in order to prevent slipping, and the ends are attached to the empty and loaded cars respectively. (In the single-track system one end is, of course, attached to the counter-

balance car). This arrangement is very crude and not to be recommended under any circumstances. There is an unavoidable sideward movement in the rope, which not only causes great inconvenience but is also the source of rapid wear to the rope. Where the employment of a single rope is necessary, it will be found more advantageous to employ a standard wire-rope grip-sheave. The latter consists in

an iron sheave, having its rope-seat composed of a number of hinged segments. These are arranged in such a manner that the pressure of the rope causes the upper part of the segments to close and grip the rope. The preferable method, however, is to employ two ropes. These may be operated in various ways. In the first instance, we may employ one drum, the rope winding and unwinding from opposite ends,

or again, we may have two smaller drums keyed to one shaft, each having its own rope. Both these expedients require that the two ropes shall pass off at opposite sides of the drum *i. e.* one at the top and the other at the bottom. Where economy of space is requisite at the heading, this becomes a very inconvenient arrangement. In order to avoid this difficulty two drums mounted on separate shafts and connected by gear wheels are used. In this manner it becomes possible to lead both ropes from the under or top side of the drums as may be desired. The most complete device is to employ two fusee-drums, placed end to end on one shaft with the brake-seat between them. These may be located at some distance back from the head of the incline. Two head-sheaves are here employed, over which the rope passes and continues down the incline.

In all gravity-planes it is necessary to employ a brake-apparatus attached to the rope drum in order to check (*b*) the speed of the descending cars. Any approved brake may be used for this purpose, care being taken to apply a device that may be operated speedily and with

little exertion. The speed of the drums must be entirely under control. The same precautions should be taken in proportioning a wire rope, to be used on inclined planes, as have been specified under hoists. Wire rope of six strands of seven wires each, laid about a hempen centre is the most serviceable on inclined planes. The wire in this grade of rope is coarser than in the 19-wired rope and is consequently better able to withstand the rough usage and surface-wear encountered in this application.

Fig. 39 illustrates the most approved design of swivel-chain-connection between the wire-rope and cars on inclined planes.

The stress in the rope when applied to inclined planes is dependent on the inclination to the horizontal. The following table will be of assistance in determining the stress; but it must be borne in mind that, while the table is based upon an allowance of 40 pounds per ton, for rolling friction, there will be an additional stress, due to the weight of the rope, proportional to the length of the plane.

Du Lievre.

Nothing could be more encouraging than the present outlook of the phosphate industry in this district. All the mines are being vigorously developed, giving employment to a large force of miners and laborers, and ore is being brought to the surface in great abundance. The mines have never been so productive as now, and when navigation is open many thousand tons of rich ore will be ready for shipment. There can be little doubt that the output during the coming season will be far in excess of any former year.

Frequent reference has been made in these columns to the constant improvements which have been made at the various mines, but at none of them are these more striking than at High Rock—one of the most productive properties in the district. The buildings, which include among others, commodious boarding and store-houses, stables, blacksmith's and machinist's quarters, and a very commodious and substantially built manager's dwelling and office, will shortly be augmented by the erection of twelve new tenements for the accommodation of the largely increased force to be put on during the coming summer. In the large tunnel (No. 11 pit) a staff of 100 men and four drills are taking out about 15 tons of ore per diem. The other pits on the top of the hill continue to turn out satisfactorily. In the cobbing houses another 52 men and boys are employed in connection with the recently introduced ingenious system of cleaning up the fine phosphate. This system, which was fully described in our December issue, continues to give every satisfaction: double the quantity of ore being separated from foreign matter in less than half the time taken by the old process, and as much as forty tons has been cobbled in one day by these large circular screens. About 2,500 tons of first class ore are now awaiting transportation. Mr. W. W. Pickford proposes to bring out from England a large number of miners during the summer, and an endeavour will be made to increase the force to at least 300 men. A little village of 35 families has sprung up in connection with these extensive mines.

Mr. Patrick Smith, the genial mine superintendent at High Rock, has been suffering from an old accident to his foot, and has temporarily resigned his position for a few weeks in order to seek medical treatment in Montreal.

James McCabe is preparing to take out a large quantity of phosphate from his mine on River du Sour, as he expects that the L. R. locks will be finished this year, thus allowing steamers to run to High Falls and leave him but one day's hauling from the mine, which is but a mile or two from Messrs. Ross Bros.' Ox Bow Farm.

Mr. Stewart is putting up a house on his lot near High Falls. He will open out a number of shows this spring. This gentleman owns quite a number of mining lots above the Chute.

Mr. S. P. Franchot reports that very satisfactory progress is being made at both the Emerald and the Central Lake Mines.

(To be continued.)

It may interest our readers to know that the exact quantity of ore shipped from Buckingham station last year amounted to 12,900 tons, as follows:—

	Tons.
High Rock.....	5,000
Dominion.....	2,600
Ottawa Phosphate Co.....	2,400
Union Mining Co.....	1,700
W. A. Allan.....	600
Lomer, Rohr & Co.....	600
Total.....	12,000

Preparations for a very active season are being made at the mines of the Canadian Phosphate Company. Arrangements are nearly completed for the construction of a tramway to the river's bank, and increased accommodation is being provided for the largely increased force which will shortly be put on by the new company. Captain Smith informs us that three new boilers and other machinery is to be put in, and everything done conducive to a large output during the coming season. A little over 120 men were employed last month.

The directors of the new company are:—Ed. Packard, jr. (Messrs E. Packard & Co., chemical and superphosphate manufacturers, Ipswich and London, and managing director of the Ulster Manure Company, Londonderry), chairman; W. H. Williams, President of the Vendor Company, New York; Thos. Oakeley, 2 Lombard street, London, E.C.; W. E. Couper (Messrs. Couper, McCarnie & Co.), 1 Fenchurch Avenue, London, E.C.; C. C. Hoyer Miller, Montreal and London. As has been already stated in these columns the agents of the corporation are Messrs. Miller & Co., Custom House Square, Montreal.

Mr. F. Stacey Shirley writes regarding his new process:—"Regarding the soluble product referred to, and about which I wrote you some time ago, the experiments are proving to be highly valuable, but a little too powerful to be used in great quantities, its extra strength will, therefore, be a feature for economy. I am getting some points together as testimony to the value of the plain raw phosphate, but only want such as is authenticated. If not in time for this issue, will send you full particulars for next after."

Some of the leading men interested in the Du Lievre Milling and Manufacturing Company are:—E. F. Childs, Congress street, Boston; F. S. Arnold, Providence, R.I.; W. H. Lum, New York; and F. Stacey Shirley, New Bedford, Mass.

Nothing of importance has taken place at the North Star Mines during the month. The mineral already shipped from this mine is of an exceptionally high grade, and in this particular there is no falling off in that which is now being raised. Like the others, arrangements have been made for a very large output during the summer.

Messrs. Poupore & Co. are pushing rapidly forward with the construction of the new lock and dam at Little Rapids—a work of immense importance to the miners on the river. A very substantial and commodious house has been erected for the lockmaster, and between 50 and 60 men are now employed on rock work, and on the retaining wall. Mr. F. M. Hamel is the engineer in charge.

Matters are very quiet at Little Rapids, and will continue so for a few weeks yet. As soon as the season opens the force will be increased and work conducted vigorously again. During the autumn much new ground was prospected and many promising deposits discovered. There is a large amount of reserve ore in sight on this valuable property.

We understand that Mr. A. F. Macintyre, of Ottawa, will do some work this summer on his lots immediately adjoining the Emerald Mine. On all of these lots a good deal of prospecting has been done. The soil has been stripped off in patches and also trenched in various directions, so as to expose the solid rock over an area of about three acres on the side of a south sloping hill about 200 feet high. The country rock is here the same as at the principal phosphate mines in the district. There is also a nearly white rock, pitted with small holes on the surface, which is regarded as a good indication in this region. In all the strippings and trenches green phosphate has been found. On the other lot, within a few yards of the Emerald property, among others, an opening eight feet long has been made into the rock, exposing a vein of solid green phosphate. A shaft has also been sunk to a depth of 25 feet, cutting through an inclined vein of green ore, with an average of about a foot as seen in the shaft. Several other openings also show very rich indications. An eminent geological expert writes thus about it:—"The phosphate deposits of the Emerald Mine, adjoining this part of the above lot, all run directly into it, and, judging by the forms of the excavations which have been made, in working downward their tendency is to increase in size in the direction of this property."

The manager of the Phosphate of Lime Company is going to build twelve new dwellings at the mines, and has already made arrangements for the delivery of the lumber requisite.

We have to express our thanks to Mr. W. W. Pickford, jr., Captain J. E. Smith, and Mr. Neil Cochrane for their extreme courtesy and kindness to our representative during a recent visit to these mines. Their generous hospitality will not soon be forgotten.

The attention of our readers is directed to the advertisement of Messrs. Dick, Ridout & Co. of Toronto. Miners in need of bags for their phosphates, cannot do better than give these celebrated manufacturers a trial.

Templeton District.

Visitors from the Blackburn Mine state that a very large quantity of very fine ore is on the dumps awaiting shipment.

The new machinery put in on the Templeton and Blanche River Company's property (the old Perkin's) is giving every satisfaction, and will largely increase their output.

Perth District.

Captain R. C. Adams, managing director of the Anglo-Canadian Company, who has been in England during the past few months, sailed from London on the 3rd inst. The snow has retarded operations at the Otty Lake mines, but Dr. Penrose states that everything is in good shape for extensive operations as soon as the season opens.

Kingston District.

Superintendent Harris and a large force are making very satisfactory progress with their Blessington mines. Increased accommodation is being provided for the largely increased force to be shortly added.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

The annual general meeting of shareholders of the Intercolonial Coal Co. (limited) was held at Montreal on the 7th instant.

The extreme scarcity of railway rolling stock continues and much dissatisfaction exists at the various collieries on this account. The output of coal in consequence is very much reduced.

The Drummond Mine is working daily, and when cars are not to be had the coal is banked. As soon as the summer shipments begin the large pile at present existing will very rapidly disappear. The company contemplate the reopening of their No. 4 slope, from which they will extract pillars. A hauling engine has been put down in their Scott pit, and the sinking of the slopes, in order to prove the quality of the coal, is being proceeded with.

The slopes of some of the provincial collieries are assuming great length. The main slope of the Drummond Colliery is over 3,300 feet long, that of the Acadia over 3,100 feet, and of the 'Vale' 2,600 feet. The 'Syndicate' slope at Spring Hill is down 2,000 feet. It is proposed to add 1,000 feet, which will make it 3,000 feet in length.

The Black Diamond Mine, formerly owned by the Nova Scotia Coal Company, has been reopened by a party of New Glasgow capitalists, who will put forward every endeavour to operate the mine successfully. This mine has been closed for a number of years. It is hoped the new company will meet with the success they deserve.

At the Albion Mines, the Acadia Coal Company (limited) are making preparations for the reopening of at least one of the slopes which have been closed since the explosion of 15th January. An effort will also be made to sink a slope to the deep of the famous Cage pit seam, and at the same time avoid contact with the old workings. It is also understood that the draining of the Foord pit is to be continued. With these works once more in operation, trade will boom at the Albion mines.

At the Vale Colliery a plentiful supply of cars appears to be all that is requisite to make things lively as the "McBean" and "Six Feet" seams are both being worked vigorously. There has been a large influx of Belgian miners, and from latest reports, more will soon follow.

At little Harbor, where prospecting has been carried on for some time past, a three feet seam of coal has been discovered. The parties conducting the work are confident that the seam will increase in thickness towards the deep, and they are in hopes that it is underlain by a larger deposit.

Nothing further has been heard of the reported discovery of coal at Antigonish, and little importance is now attached to the rumour.

The estate of the Steel Company of Canada, Londonderry, N.S., has been transferred to the Londonderry Iron Company of that place, by whom the business heretofore carried on by the Steel Company will be continued.

Official returns of gold crushed for February are :—

District.	Mill.	Tons Crushed.	Ounces Gold.
Whiteburn	The McGuire	34	142½
Waverly	Wallace (old Berkner)	5	2½

"	Miurs	200	35
Lake Catcha	Oxford	131½	379½
The following are additional returns for January :			
Dars' Hill	Dufferin	754	376
Brookfield	Brookfield	90	81

A miner named Alex. Fraser, working in the east mines of the Londonderry Iron Co., was crushed to death by a heavy fall of earth on the 6th instant. This appears to be a case for the mine inspector to investigate.

"We learn from a gentleman living at Sydney, C.B.," writes the *Critic*, "that a valuable seam of superior coal, five feet in thickness, has just been discovered near Fortune's Brook, south of the property formerly belonging to the Toronto Coal Company, and a little to the west of the seams that have been worked. It is close to a shipping place on the Bras d'Or.

New Brunswick.

Negotiations for the sale of the Stockton Manganese Mine are nearing a successful completion. The price to be paid for the property is \$55,000.

Prospecting for coal is being carried on near Shaw's Mill, Dunsonane, on the line of the I. C. R.

Mr. F. J. Alley's Manganese property at Glebe, Dutch Valley, will be vigorously worked in the spring.

One of the principal sources of manganese ore at present, is to be found on the properties of the Queen Manganese Mining Company at Markhamville, where very extensive "pockets" of ore have been opened. The following figures have been officially reported to us : Quantity ore mined in 1887, 813 tons of 2,240 lbs.; sold for blast furnace use and shipped to England, 505 tons; to United States, 53 tons; ore prepared for consumers' uses in chemical and manufacturing industries in the United States and Canada, 243 tons; average number hands employed in mines, 20; average number hands in works, 30.

Mr. D. Andrews, superintendent of the Moose Brook Manganese Mine writes: "I have sunk the shaft 35 feet deep, also drifted 12 feet east and west, and the changes are for the better. If it continues good going west, I shall have to sink the shaft 10 feet deeper in order to give us a chance to have the greater part of next month's work in backstopping, that means to be below our work, so that all the ore and rock will be much easier handled, and at less expense. I will continue taking out ore this month, then I shall sink and drift; that will probably take the best part of three weeks, and in so doing we will be prospecting new ground. Everything points that by sinking we shall strike new deposits. The ore that you saw on the dump looked

splendid after the rain, in fact much better than I expected to see there."

Mining licenses have been recently sold in the northern portion of New Brunswick on Crown Lands, and it is said valuable deposits of galena, manganese and iron exist thereon.

The Stockton manganese mine is about being placed in Baltimore, says the *Halifax Critic*, and no doubt vigorous measures will be taken to develop and ship the ore in large quantities. The price to be paid for the property is \$55,000.

Quebec.

The Graphite City mill is at a standstill.

Under the able superintendence of Mr. Neil Cochrane very satisfactory headway is being made at the British and Canadian Mica Company's mines. Mining both in the tunnels and on the outside of the hill is very systematically conducted, and a large quantity of very superior mica is being taken out and made merchantable. Since our last an enormous crystal weighing fully 280 pounds has been taken out. The demand for the product continues good, and Mr. Von Rehm, the manager, reports a brisk business at the Buckingham office.

At Black Lake the Anglo-Scotch Asbestos Company is building a factory and putting in machinery to crush their asbestos rock instead of cobbling it. There are a number of dwelling houses going up. The company have employed 15 men all winter, the average output being 1½ to 1½ tons per day.

Many improvements are being made at the Capelton Copper Mines, of which particulars will be given in these columns in a future issue.

The Hon. J. G. Ross, Quebec, Hon. J. A. Chapleau, Hon. Geo. Irvine and many other prominent men are largely interested in the asbestos industry.

Ontario.

We understand that negotiations are in progress for the sale of the Frontenac mica mine. This property is located on lots 4 and 5 in the 11th ranges, Township of Miller, and is favorably spoken of. A report on the property states: "The position of the mine is a gully between two mountains, the deposit forming a ridge in the gully. This ridge is 185 feet long, from 10 to 25 feet wide, and 20 feet in height. The rock is pure white quartz, the mica crystals showing the whole length of the ridge on top, and in various places on the sides. Surface crystals were removed from every part of the ridge, in sizes varying from 4 x 6 to 7 x 10 inches. An opening was made eight feet in width and six feet in depth. The crystals taken from this opening measured from 4 x 6 to 15 x 24 inches."

Very few men are now at work at the Bristol mines and the company do not intend to add to their present stock pile, which is now in the vicinity of 20,000 tons, until the railroad is extended to the mines, a distance of from two and a half to three miles. This extension the company are pushing and expect to have made early in the season.

Owing to the deep snow and severely cold weather, work was suspended at the Stobie mine—the property of the Canada Copper Company—on 1st December, but operations will be resumed again in the spring.

At the Copper Cliff mine and vicinity about eighty men have been employed in sinking the shaft, which has now reached a depth of something over two hundred feet, driving levels, using a diamond drill, etc., underground, and cutting timber and wood outside. Little stopping has been done, and consequently no large quantity of ore has been raised to the surface, but the mine is being opened up ready for this work.

The twenty-two tons of ore taken from the Richardson Hill, Eldorado, by Mr. Mark Powell and others yielded a 20¼ ounce gold brick.

Satisfactory progress is being made at Mr. D. G. MacMartin's mica mine. From latest accounts the drift looks well, and shews large quantities of mica.

The Imperial Land and Mining Syndicate has been organised by parties who have been making explorations on the north shore of Lake Superior, a few miles east of Sault Ste. Marie, in an unsurveyed Indian reservation, and from a point near Port Arthur, east to Sault Ste. Marie. They have gained perfect titles to 1,100 acres of land which are said to contain rich mineral. A force of men are now at work carrying on development work. In their exploratory work they have located several iron mining properties and found deposits of copper ore.

At the Robertsville mine, on the Kingston & Pembroke Railway, very little has been done lately. Good work has, however, been done with the Diamond Drill, and prospecting has revealed several very promising beds of ore, one over 16 feet thick, of a very superior quality—on the property. Captain Kitto is taking out timber and making ample preparation for vigorous operations during the coming year.

There are thirty-six known iron deposits in North Hastings, from all of which ore can be obtained in large quantities, and any one of which will prove paying mines, if properly worked.

There are also numerous deposits of lead, antimony, plumbago or graphite, pyrites, etc., suited to chemical works, besides many other kindred minerals. All that is wanted in this section is capital to open up these mines.

Specimens of mineral taken from the property of Mr. Thomas Storey, at Escott, have been assayed at Ottawa, and found to contain traces of gold and silver.

In a local sheet published from the office of the *Advertiser*, Petrolia, the following figures regarding the oil industry are given:—Number of wells pumping oil, 3,860; approximate number of wells drilled in 1887, 400; number of hands employed in oil pumping, 3,000; employed in refineries, 500; average cost of well, \$400. The total amount of capital invested is estimated to be little short of \$3,000,000. During the last six months of 1887 the output of crude oil was about 500,000 barrels, the largest quantity ever shipped from Petrolia in the same length of time.

On lot 20 in the first concession of Snowdon, seven miles east of Kinmount, are found promising deposits of magnetic iron ore, yielding over 60 per cent of metallic iron with very little

impurity. A considerable quantity of ore has been mined on this lot by different parties. The lot is owned by Messrs. Thomas Shortiss and Henry O'Brien, of Toronto. Mr. Wm. Myles, who bought a portion of this property, built a branch railway $6\frac{1}{2}$ miles long in 1879, from the Victoria railway up to lot 20, and this is likely to form the first link in the Irondale, Bancroft and Ottawa railway, a company having been chartered to build a railway through this district. Messrs. Parry and Mills, of Chicago, have built a charcoal furnace on lot 19 in the first concession of Snowdon. They have also constructed, in connection with it, a good dam and saw-mill on the Burnt river, but after expending about \$40,000 operations have been suspended for want of funds.

Port Arthur District.

BEAVER MINE.—The last shipment of ore concentrates from this mine—including \$9,000 in bullion—makes over \$330,000 exported as reported by customs officers to date, a very handsome shewing considering that there are many thousands of tons of rich ore in the dump and in sight yet, as well as many barrels of concentrates at the mill, which is now undergoing some further improvements. The working force has been reduced of late; among other reasons given is that Mr. Peters has given an option for one half interest for \$1,500,000. The officers report that the mine never looked better, and that the force was reduced owing to the stoping ground not being sufficiently developed to keep the mill going steadily with a full force.

The Porcupine Mine still has a small force at work pending the sale, it is understood, to a strong New York company. This is a promising mine and having such good neighbors as the Beaver and Badger is bound to attract capitalists who will doubtless readily invest if the owners do not stand them off by exorbitant figures.

The Badger Mine is still creating a sensation by its rich ore. Everyone is anxious for Mr. Eschweiler to erect the mill for which preparation is being made. He claims to have at last settled on a treatment which will give better results than have ever yet resulted with the ore peculiar to this district.

MINING LOCATION R, 135.—The miners who have been at work at this property, which lies about three miles north of Silver Mountain, report that at a depth of forty-four feet native silver was struck. For a considerable distance previous, low grade ore containing sulphide of silver was encountered. One of the mine owners has gone out to make an examination, meanwhile a company is being formed to work this claim steadily. The value of this property is greatly enhanced by having a magnificent water power along side of the mine.

Some Chicago capitalists, represented in Port Arthur by Mr. P. M. French, are preparing to work some silver claims near that town when the snow goes down enough to permit teams to haul the supplies.

The BIG BEAR claim, a short distance north-east of the Rabbit Mountain mine, will also shortly go to work.

SILVER MOUNTAIN MINE, and its neighbour, the Crown Point Mine, keep on making steady progress. As no assayer lives on the premises,

it is impossible to ascertain the average value of the ore which is very fluctuating in richness. It is uncertain whether the work for a mill will be placed on the ground before the Government road is fully completed.

NATURAL GAS apparently exists both at Port Arthur and at the Kaministiquia River in spite of geological expectations to the contrary. Should it be found in volume it will be of great service in securing the smelting works so long required at Thunder Bay.

We are officially advised, says the *Engineering and Mining Journal*, that Messrs. Morrison & Macfarlane, brokers in mineral lands, Duluth, Minn., have recently bought from original owners 1,200 acres, known as the Cariboo vein, situated in Black Bay, east of Port Arthur. The property has been indifferently developed. There is indication of a rich silver lead deposit running through the location.

Manitoba and North-West Territories.

Mr. James Reilly writes to the *Calgary Tribune* suggesting that the Dominion Government contribute to the development of the mining industry, either by founding smelting works at central points, under control of Department of Interior, or by liberal cash subsidies and other facilities.

Gold miners, working on the Saskatchewan this season, made from \$3 to \$5 a day. The cold stopped them Nov. 12th.

The Cochrane coal seam, worked by Major Vaughan, is improving much. It is 75 feet from surface and is now about level.

Haney & Henderson have a good prospect near Edmonton, the vein being 12 inches and carries silver and gold, with some platinum and iron.

The Galt Co. has advanced the price of their coal from 25 to 50 cents a ton, which means a daily increase in their cash receipts of over one hundred dollars.

The coal vein, south side Saskatchewan, near Battleford, is being worked. It is three feet thick, light, hard and in large lumps. It is four feet above river level.

A meeting of the shareholders of the Medicine Hat Railway and Coal Company (Limited) will be held in Toronto on 31st inst.

Small quantities of coal have been taken out from the Souris district. The *Moosomin Courier* writes:—"We have given it a trial and it burns equal to the Galt, but not quite so free; there is no difficulty in keeping up a good fire with it, and it throws a good heat. The coal used was taken from a ravine bank and about 100 feet in. A branch railway to these mines would enable vendors to supply this excellent domestic fuel throughout Manitoba and the Territories for about \$3.50 per ton. Settlers would do well to consult their own interests and pay a visit to these coal fields."

A North-West member says that great activity now prevails at the new anthracite coal mine near Banff. A trial slope is being sunk and has reached 330 feet deep. The seam is seven feet six inches, and the quality of the coal is the very best anthracite. The mine is being worked night and day, and six tons an hour are

being taken out of the trial slope. As soon as the new machinery is in place the daily output will be large, probably four hundred tons. Although the weather in the month of February was unfavorable, yet considerable shipping was done. About 97 carloads left the mines, 31 of which went to Winnipeg and 63 to San Francisco and the Pacific coast. The outlook for trade to California is of the most promising character. The extent of the market can hardly be realized, and will tax the energies of the company during the coming season.

Many of the Victoria settlers use coal taken from the banks of the Saskatchewan; it is said to be equally as good as that found at Edmonton.

British Columbia.

Work has been resumed in the west slope of No. 5 Pit, Wellington Collieries. This will render it possible to increase the daily output to about five hundred tons, or just half the output of coal prior to the explosion.

The East Wellington Colliery (Chandler's) is now operated entirely by Chinese labor.

The *Nanaimo Free Press* says that the bore being put down by Mr. T. D. Jones on what is known as the West Estate of the V. C. Co. has struck an excellent seam of coal. This property is contiguous to the Wellington & East Wellington coal properties. Mr. Jones had in use his diamond drill, which brought up an inch and a quarter core.

It is understood that the owners of the Cayoose Creek quartz claim have effected a sale of their property on a very satisfactory basis.

A bill was passed on the 29th ult. giving foreign mining companies power to incorporate under the laws of the county or State in which the members of the company reside and work mines in British Columbia, by registering there. These concessions are for the purpose of attracting foreign capital for developing resources in the precious minerals.

The Privy Council has granted British Columbia leave to appeal from the judgment of the Supreme Court of Canada in respect to the title to minerals in the railway belt of the province. Mr. Jeune, Q.C., in making the application informed their Lordships that the question was of the greatest importance. Attorney-General Webster, on behalf of the Dominion, admitted that he could not very strongly oppose the application, and the appeal will be heard at an early date.

"We understand," says the *Colonist*, "that it is the intention of Messrs. R. Dunsmuir & Sons to open up the Perseverance and Union coal mines in Comox, a stretch of land eight or ten miles in length. This will be worked from six or eight different points with shafts and slopes. Wharves will be built on Baynes Sound and a standard gauge railway constructed past the "Perseverance" to the "Union," a distance of about thirteen miles. The work will be commenced immediately and pushed so that coal will be shipped by next fall. As soon as the surveys are completed, which will take about fourteen days, railway work will be commenced and 600 or 700 men put on for construction purposes. Mr. Dunsmuir assured a reporter of this paper that he intends to open up the field so that the production will amount

to 2,000 tons per day at least. The opening up of these mines is of the greatest importance to every portion of Vancouver Island, and to the Pacific board, and the undertaking will involve the expenditure of a large amount of money."

What Natural Gas Has Done.—A review of the revolution which has taken place in Western Pennsylvania since the introduction of natural gas three years ago shows that the steel furnace capacity in twelve iron and steel mills has been increased 1,164 tons per day, or at the rate of 349,200 tons per year. In several mills the furnace capacity has been increased 200 per cent., and in one nearly 100 per cent. In 1884 the capacity of local mills making wrought iron pipe was 174,000 tons per annum, now it is 360,000 tons per annum, the greatest in the world. The production of one establishment in 1887 exceeded the total output of 1884. The product of the iron and steel wire mills from 85,000 tons per annum has increased to 103,000 tons. In the blast furnaces an increase of 245,000 tons has been obtained, while the coke field product is being enlarged 22 per cent. In the manufacture of railroad locomotives there has been an increase of 25 per cent. In the window glass trade an increase of 5,976,000 feet per annum has taken place. In the manufacture of plate glass the increase has been fully 100 per cent. The growth of the natural gas interest is among the most remarkable things of the age. There are engaged in the enterprise twenty-six companies, with a nominal investment of \$23,505,000, of which \$18,360,000 is invested in Pittsburg companies. Experts estimate the total displacement of coal by gas in Allegheny County alone at 20,000 tons daily, which is equivalent to 500,000,000 cubic feet of gas every twenty-four hours.

Emphatic Guarantees.

Which are Justified by an Extraordinary Public Experience.

TO THE PUBLIC:

Having branch houses and laboratories in seven different quarters and therefore having a world-wide experience, we, H. H. Warner & Co. justify ourselves in making the following statements:

OUR THEORY PROVED.

I.—For the past decade we have held that 39 per cent. of diseases originate in the kidneys which introduce uric acid into every organ, attacking and destroying first the organs which are weakest. We have also held that *if the kidneys are kept in perfect health most of the ordinary ailments will be prevented*, or, if contracted, cured. Other practitioners have held that extreme kidney disease was incurable. We have *proof to the contrary*, however, in hundreds of thousands of cases in every section of the globe. Warner's Safe Cure is the greatest specific known. Its reputation is established everywhere, and its influence surpasses all other medicines.

HOW DISEASE CREEPS ON.

II.—The kidneys being the sewers of the human system, it is impossible to keep the entire system in good working order *unless these organs are doing their full duty*. Most people do not believe their kidneys are out of order because they never give them any pain. *It is a peculiarity of kidney disease that it may long exist without the knowledge of the patient or of the practitioner*. It may be suspected if there is any gradual departure from ordinary health, which departure increases as age comes on, the kidney poison in the blood gradually undermining and destroying every organ.

SCIENTIFIC SPECIFICS.

III.—We do not cure every known disease from one bottle. This is *an impossibility*. Warner's Safe Remedies include seven scientific specifics, each one of which has a specific purpose which the others cannot fully perform.

RECOGNIZED STANDARDS.

IV.—Warner's Safe Remedies have been recognized by the doctors and the people all over the globe, even in countries most conservative and most opposed to the manufacture of proprietary medicines, *as standards of the highest excellence and worthy of the patronage of all people*.

STRONG GUARANTEES.

V.—We make the following unqualified guarantees:

Guarantee 1.—That Warner's Safe Remedies are *pure and harmless*.

Guarantee 2.—That the testimonials used by us are *genuine*, and so far as we know, absolutely *true*. We will forfeit \$5,000 for proof to the contrary.

Guarantee 3.—Warner's Safe Remedies have permanently cured many millions of people whom the doctors have pronounced incurable. People who were cured ten years ago report the cure *permanent and completely satisfactory*. Warner's Safe Remedies will sustain every claim, if used sufficiently and as directed.

VI.—Ask your friends and neighbors what they think of Warner's Safe Cure. We do not ask you to believe us alone.

YOUR FRIENDS AND NEIGHBORS.

MRS. JAMES BURNS of 18 Division St., Toronto, writes that her daughter was given up to die, by the best medical men in the city, from Bright's Disease of the Kidneys, but that Warner's Safe Cure not only saved her life but restored her to health.

L. A. BAKER, of Toronto, Supt. Fire Patrol Co. of Canada, suffered from lame back for three year. Physicians treated him for Bright's Disease, but he obtained no relief. Four bot-

tles of Warner's Safe Cure made a well man of him.

W. J. HAMILTON, of Amherst, Nova Scotia, was cured of hemorrhage of the kidneys after doctors failed to cure him and the last dying rites of the church had been given him.

MRS. HAYWARD, of 321 Church St., Toronto, was cured of Chronic Dyspepsia with six bottles of Warner's Safe Cure.

JOHN GIVES, of Galt, is a living monument to the power of Warner's Safe Cure over Enlargement of the Liver.

We could give thousands of similar testimonials. Warner's Safe Cure does exactly as represented.

VII.—We were forced into the manufacture of Warner's Safe Remedies in obedience to a vow made by Mr. H. H. Warner that he would, if the remedy now known as Warner's Safe Cure restored him to health, spread its merits before the entire world. In ten years the demand has grown so that laboratories have been established in seven quarters of the Globe. Not only is Warner's Safe Cure a scientific specific—it *cures when all the doctors fail*, thousands of the best of physicians prescribe it regularly, its power over disease is *permanent* and its reputation is of the most exalted character.

(a) Paper read before the Canadian Institute, Toronto.
(a½) Revised and corrected from "Clavos" in the Emigrant.
(b) From this term is derived the expression "checker house," applied to the shed covering the head-drums, in which the operation of "checking" is done.

AS the plans for the erection of the proposed Post Office at Prescott, Ont., are to be amended, intending tenderers are hereby notified that new tenders will be called for at a future date.

By order,
A. GOBEIL,
Secretary.

Department of Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the

head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

15th Dec, 1887.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for Hot Water Heating Apparatus, Experimental Farm, Ottawa," will be received at this office until Monday, 19th March, for the several works required in the erection of Hot Water Heating Apparatus for five residences at the Central Experimental Farm, Ottawa.

Specifications can be seen at the Department of Public Works, Ottawa, on and after Friday, 9th March, and tenders will not be considered unless made on the form supplied and signed with actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party declines the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 9th March, 1888.

EXTENSION OF TIME.

THE time for receiving tenders for Iron Staircases for New Departmental Buildings,

OTTAWA,

is hereby extended to THURSDAY, 5th April.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 12th March, 1888.

SEALED TENDERS marked "For Mounted Police Clothing Supplies," and addressed to the Honourable the President of the Privy Council Ottawa, will be received up to noon on Monday, 16th April, 1888.

Printed forms of tender, containing full information as to the articles and quantities required, may be had on application to the undersigned. No tender will be received unless made on such printed forms. Patterns of articles may be seen at the office of the undersigned.

Each tender must be accompanied by an accepted Canadian bank cheque for an amount equal to ten per cent. of the total value of the articles tendered for, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted the cheque will be returned.

No payment will be made to newspapers inserting this advertisement without authority having been first obtained.

FRED. WHITE,
Comptroller, N. W. M. Police.

INDIAN LANDS

LANDS IN THE UNDERMENTIONED localities are offered for sale to actual settlers through the following Indian Agents: On the Great Manitoulin Island, Lake Huron, Ontario; Mr. J. G. Phipps, of Manitowaning, is the Agent for the sale of lands in the following Townships on this Island: Assignack, Bidwell, Howland, Shequandah, Billings, Campbell, Carnarvon, Allan, Tehkummah and Sandfield, and in the Townships of Shequandah, Manitowaning and Shaftsbury (commonly called Little Current). Mr. B. W. Ross of Cockburn Island, is the Agent for the sale of lands on that Island and in the Townships of Gordon, Mills, Burpee and Barrie Island, and in the Township of Gore Bay as well as for those in the Townships of Robinson and Dawson, on Manitoulin Island. Leading roads have been constructed throughout the Great Manitoulin Island.

On the Saugeen Peninsula, Ontario, the lands in the Townships Amabel, Allenby, Keppel, Eastnor, Lindsay and St. Edmunds; as well as several Townships in the Peninsula, are offered for sale through Mr. William Simpson, Indian Lands Agent at Wiarton, County of Bruce, Ontario.

On the Garden River Reserve, Ontario, Mr. William Van Abbott, of Sault Ste. Marie, is the Agent for the sale of lands within this tract, and which are situated in the Townships of Macdonald, Laird and Meredith; also for lands within the tract commonly known as the Batchewana Bay Indian Reserve, and comprised in the Townships of Aweres, Fenwick, Kars, Pennethers, Dennis, Herrick, Fisher, Tilley, VanKoughnet, Tupper and Archibald. There is a leading road through these lands which affords ready communication with other parts of the country to intending settlers.

The condition of sale in respect to the lands within the Townships above described can be ascertained on application to the respective Agents.

(Signed) L. VANKOUGHNET

Deputy Supt. General of
Indian Affairs.

Department of Indian Affairs,
Ottawa, February, 1887.

NOTICE.

SALE OF COAL LANDS.

PUBLIC NOTICE is hereby given that Section 29, Township 24, Range 10, west of the 5th principal meridian, which is situated in the anthracite coal district, will be offered for sale at public auction at the Dominion Lands Office, Calgary, on Thursday, the 22nd day of March next, at the upset price of \$20 per acre.

The above land will be put up in two blocks, one being that portion to the north and east of the Bow River, and the other that to the south and west of it.

The terms of sale shall be one-fifth in cash at the time of sale and the balance in four equal annual instalments, with interest at the rate of 6 per cent. per annum.

The sale of this land will be subject to the regulations respecting Coal Lands. Payments must be in cash; scrip or warrants will not be accepted.

A. M. BURGESS,

Dep. of the Minister of the Interior.

Dept. of the Interior,
Ottawa, Feb. 28th, 1888.

NOTE.—No unauthorized insertion of this advertisement will be paid for.

VALUABLE PLUMBAGO AND OTHER Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

FOR SALE. VALUABLE Copper Mining Properties

— IN THE —

Eastern Townships

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
- 2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
- 3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
- 4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within $1\frac{1}{2}$ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only $2\frac{1}{2}$ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Carbuncle Hill Mine, Lots 2 and 3 R. 14, and 2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, $\frac{1}{4}$ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
- 10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

ESTIMATES GIVEN.

Orders Executed with Care under Personal
Superintendence.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area proscribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

FOR SALE

Valuable Phosphate and other Mineral Lands,
In the Township of Buckingham, County of Ottawa.
Patent for Mineral Rights direct from the Crown.
TITLE INDISPUTABLE.

S½ of 25 in the 12th Range 100 acres
S½ of 25 in the 11th Range 100 acres
Three lots, 26, 27, 28, in one Block, in the
11th Range 600 acres
(adjoining Gore of Templeton.)

Also a Circular Saw Mill situated on lot 26, 11th Range, in good working order, and sufficient water power to drive two other mills of the same capacity.

About 30 thousand cords of firewood, chiefly hardwood, may be obtained on these said lots.

The lands are in close proximity to the celebrated Emerald, Little Rapids, and other richly productive mines in the great phosphate region. Recent prospecting has disclosed rich and extensive veins of the mineral.

The property is located one mile from the navigable waters of the Du Lièvre River and nine miles from the Village of Buckingham, where the C. P. R., which two years ago built a branch line in order to secure the traffic of the industry, carries it to the port of Montreal.

Conditions and terms of sale may be known by applying to the proprietor,

The REVIEW is published purely in the interests of the Canadian Mining Industry, and its publishers will be thankful for any encouragement they may receive from those interested in its speedy development.

Visitors from the mining districts, as well as others interested in Canadian Mineral Lands, are cordially invited to call at our office.

Mining news and reports of new discoveries of mineral deposits are solicited.

All matter for publication in the REVIEW should be received at the offices not later than the 19th of the month.

Address all correspondence, &c., to the Manager of THE CANADIAN MINING REVIEW, Ottawa.

Please notify us of any irregularity in the delivery of your paper. The demand for the 'Review' is now so great that no spare copies can be had a few days after publication.

An American View of Commercial Union.

The *Iron Trade Review*, in a leading article comments upon the paper read lately by Mr. T. D. Ledyard, Toronto, thus:—

"Just so. There is no doubt of it, and it requires little foresight to prophecy that the admission of Canadian ores, free, would close American mines. But it may be just as well to remember that the principle of protection is intended to protect the American laborer, the miner, the sailor, the railway employe, and the American consumer does not object to the increased charge, knowing that the money remains 'in the family,' as it were.

Of course, Canada has some good ores along with her poor ones, and it is Canada's misfortune that her annual consumption of pig iron is barely 300,000 tons—about as much as is made in Cleveland in the course of a year; but it may be remarked that the United States is not yet ready for Commercial Union on a basis that will reduce the American labor market to the grade of Canadian wages."

Now it would not have this effect at all; the most we could hope to do for a long time would

be to replace a portion of the Spanish and foreign ores of which one and a quarter million tons were imported into the United States. Coming from the mouthpiece of the Lake Superior iron trade, we could not wish for a better certificate of the value and cheapness of our ores. This is a complete answer to those doubting Canadians who assert that our ores are comparatively valueless.

Natural Gas.

We commend Mr. Ami's paper on the sequence of the rock formations about Ottawa, given in another portion of this issue, to the attention of such of our readers as may be interested in the question of finding natural gas in this neighborhood. It has been prepared specially with a view to giving some geological information bearing on this problem, and the very useful table that accompanys it, undoubtedly throws valuable light upon the series of rock formations which will have to be traversed in boring for gas.

Mineral Production of Canada 1887.

The summary of the mineral production of Canada for 1887, by Mr. Eugene Coste, M.E., of the Geological Survey of Canada, has just been made public, and judging from the copy we have received, we are able to assert the fact that this summary will prove one of the most useful annual publications on Canadian mining results. The amount produced and the value are so plainly tabulated that with very little trouble a comparison can be made with the result of a previous year, and the state of the mineral market pretty well gauged by the comparison. The total value of the mineral production of 1887 shows an increase of \$2,429,712 over the previous year, but as a number of new products appear in the table for 1887 which are wanting in 1886, the total result is not a fair contention. In the quantities of general products there is on the whole a decrease, and the same may be said as a natural inference of the values. But in two or three cases there is a marked increase. For instance, in iron ore there is an increase of 6,522 tons, the increase in value being \$960,800. In pig iron there is an increase of 2,635 tons, the increase in value being \$128,424. In silver the quantity is not stated, but the value of the increase is given at \$112,512. These are the largest increases shown in the table, the other products varying probably according to demand or otherwise, and fluctuation of the markets. Mr. Coste states that the returns are subject to final revision, but they are issued in their present form "to meet the generally expressed desire for publication as soon as possible after the close of the year to which they relate." This early publication greatly enhances their usefulness, for the majority of similar publications are often so delayed as to be practically useless, except for future reference. We can

readily understand the difficulty of obtaining accurate returns from far distant mining towns early in the year, but enough information can be gathered respecting the minerals most in demand to approximately approach a fair result. As our mining industries are annually more and more developed and fresh products find their way into the markets, so the list will continue to increase, a fact remarkably apparent in this new issue of the summary already. Mr. Coste is doing a good work in acquainting the public with facts, and the thanks not only of the mining community but of commercial men generally are due to him for the labor evinced and the evident pains taken to tabulate in so summarized a form such a mass of information. Only those who undertake such work realise the labor in condensing copious information into a table occupying only a page. The figures presented are the pith of weeks of labor, and the more condensed such statements are the more valuable they become. The following is Mr. Coste's summary slightly abbreviated:—

NAME OF PRODUCT.	1887.	
	Quantity (a)	Value (b)
Antimony ore..... tons	434	\$18,960
Arsenic..... "	30	1,200

Superphosphate..... tons	493	25,943
Tiles..... thousands	8,555	136,112
Whiting..... bbls	500	600
Total.....		\$12,959,073

(a) Quantity marketed except when otherwise specified. The tons are of 2000 lbs.

(b) Market value less charges of transport from point of production.

Nova Scotia and British Columbia values have not been received but are estimated as above, except for grindstones.

(c) Quantity of fine copper manufactured from the ore of Capelton plus fine copper contents calculated from assay value in the other returns.

(d) Nova Scotia gold is estimated at \$19.50 an ounce and British Columbia gold at \$17 an ounce.

(e) This includes 6 rolling mills, 1 forge and also the Londonderry Iron Works. The returns from the 4 Montreal rolling mills and from another mill at St. John, N.B., have not been received, and, unfortunately, render this statement incomplete.

(f) The value of the Nova Scotia ore is estimated at only 25.00 per ton, as the returned quantity is thought to include a certain amount of low grade ore used in making paint.

(g) Crude equivalent of the quantity (7,905,666 imp. gallons) of refined oils inspected, calculated at 100 galls. crude for 38 galls. refined. The direct returns received from 13 refineries give the quantity of illuminating oils and benzine and naphtha manufactured during the year as:—10,732,395 imp. gallons, worth \$1,022,739 and the actual corresponding consumption of crude returned as:—763,933 barrels.

(h) Direct returns; the value is taken at an average of \$13.50 a ton at the mines. The production is divided as follows:—

From Ottawa County mines..... 18,955 tons
From Ontario mines..... 4,735 "

Total..... 23,690 "

which agrees very nearly with the Customs Department figure of export which is for the calendar year 1887:—23,152 tons with a declared value of \$433,217.

(i) In barrels of 280 lbs. it would be 429,807 brls. The value is that of the salt alone, exclusive of packages.

(j) Export returns plus \$116,318 estimated silver contained in the copper pyrites of the Capelton mines—together the total production is probably from six different mines.

(k) Return probably not quite complete.

We invite Correspondence upon matters consistent with the character of the REVIEW.

Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

Some Ontario Iron Deposits.

Toronto, 12th April, 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—The Snowdon Iron District, Township of Snowdon, County of Haliburton, contains several valuable deposits of iron ore. About 7 miles east of Kinmount, the Monck Road crosses an ore bed on lot 20, 1st con., where the first discovery was made; the ore is magnetic, yielding by analysis over 60 per cent. metallic iron with small amounts of impurities. There appear to be considerable quantities of ore here, and the railway passing through the lot gives good facilities for mining.

Ore from this district can be shipped very cheaply, either to Pennsylvania furnaces by all rail route, via Buffalo, or to Midland, on the Georgian Bay, by rail, and thence by boat to Chicago, cheap freights being obtainable in returning grain vessels.

Chicago is an immense consumer of iron ore, the North Chicago Rolling Mills alone using 1,700 tons a day, so that if a trade were once opened up in that direction, it would be likely to swell to large proportions.

Lot 27, in the 4th concession, shows on the north-east corner an exposure of magnetic iron ore 16 x 2½ feet, and a magnetic attraction 25 x 40 feet. On the west side is a vein where the attraction is over a space 40 feet wide by 690 feet in length, with 7 or 8 exposures of ore, and 100 feet further south a strong attraction 30 x 30 feet, with an exposure of iron sand and ore. The outcrops are on a hill 200 feet above the track of the Irondale, Bancroft and Ottawa Railway, which is about 1,000 feet distant. The ore may be mined by drifting tunnels into the hillside, and the ore loaded on the railway cars by tram-cars, which could be run down by gravity. The Burnt River runs directly in front of this ore range and affords good drainage.

The ore is of Bessemer quality, very free from impurities, as shewn by the following analysis by the chemists of two Pittsburg steel works:

Metallic iron..... 62.57 63.00
Titanium..... None. None.
Sulphur..... None. 0.025
Silica..... 3.1
Phosphorus..... 0.025 Trace only.

An exposure of limestone occurs on this lot, and there is plenty of timber for mining purposes. On lot 25 are several good shows of magnetic ore, an analysis of which is as follows:

Metallic iron..... 62.00
Titanium..... None.
Sulphur..... 0.025
Silica..... 1.7
Phosphorus..... Trace.

Between these two properties, on lot 26, in the 4th concession, is the Howland Mine, operated by Mr. C. J. Pusey. A shaft has been sunk here 80 feet, and is said to be in good ore, of which the following is an analysis:

Metallic iron..... 61.48
Phosphorus..... 0.01
Titanium..... None.

Other shows of ore occur on lot 26. This ore range extends for about three-quarters of a mile across these lots, and, being so favourably situated on high ground close to the railway, possesses peculiar advantages. In close proximity to this magnetic iron range on lot 24, in the 3rd concession, Snowdon, are deposits of limonite or brown hematite. This ore, although not Bessemer quality, would be useful for a local furnace and for ordinary castings.

Close at hand is excellent water power on a creek which flows into the Burnt River, and on which there is a suitable site for a blast furnace; the position also being favourable for obtaining an abundant supply of cheap charcoal.

Belmont Mine.—The following are extracts from a report made by Prof. Thos. Heys, of Toronto, of a large bed of magnetic iron ore on lot 19, in 1st con., Belmont, Co. of Peterboro':

"This lot is about four miles nearly due north from the Village of Blairton, and there is a fairly good wagon road to the mine. There is a clearance of about 20 acres, the remainder being covered more or less with timber.

The ore deposit is situated near the east side of the west half, about midway between north and south on the lot, and has been cleared and underbrushed. On this is an exposure of magnetic iron ore, with the soil stripped to a depth of 4 to 5 feet. The excavation shows what appears to be a solid bed of ore, with a westerly dip of 20 degrees.

The ore is strongly magnetic, considerable portions showing a compact ore almost free from rock matter, and very free from sulphur.

Two other excavations were examined, one about 60 feet to the south and the other about 120 feet to the east; the ore in these was overlaid with surface soil to a depth of 2 or 3 feet. The character of the ore in these appeared to be the same as in the other exposure, some hematite of fair quality showing on the easterly side.

The extent of the ore-bed, as shown by the dip-needle, is more than two acres, measuring about 250 feet from east to west, by 390 feet from north to south. It is covered by surface soil to a depth of 4 to 5 feet (in some places, perhaps, more), which can be easily removed.

The ore-bed can be easily drained, as it lies close to a creek which would carry off the water.

The location is convenient for the shipment of ore, being about six miles from the Blairton station of the Canadian Pacific Railway, on two miles of which the rails are already laid, being a portion of "The Cobourg, Peterboro' and Marmora Railway," thus leaving only four miles to

be constructed, the line for which is most favourable, over a level route with no engineering difficulties. "The Central Ontario Railway" runs about six miles east of the mine, in which direction there is also a most favourable route for a branch railway.

The facilities for obtaining hardwood and charcoal from the surrounding country are especially favourable from the close proximity of Belmont Lake and its tributary waters, including Crow River, which flows through lots 14 and 15 of the same range, within a mile and a-half of the mine.

A fine site for a blast furnace is found on Crow River, close to the branch railway line, on there is also a powerful and never failing water power.

Abundance of limestone for flux is found on these waters.

Judging from the ore exposures, the dip of the ore and the magnetic attraction in connection therewith, I consider the deposit to be very extensive, and there is no doubt it contains a large quantity of first-class ore, with no trace of titanium and practically no phosphorus or sulphur, while the rock matter "would be to a considerable extent self-fluxing."

Prof. Heys computes that this ore-bed contains at least one million tons of ore within 100 feet of the surface, and there should be no difficulty in producing 300 or 400 tons of ore a day.

A report made of the same property by Mr. F. D. Taylor, M.E., who has had large mining experience, contains the following:

"From the action of the dip-needle and from the three cross-cuts which had been cleared out showing an unbroken body of magnetic ore of an unusual width, I feel assured upon development it will prove one of the finest and largest iron mines on this continent. Although very high in metallic iron, it is by no means a refractory ore, and will be found in its working in the blast furnace that it will reduce very easily and not require above the average charges of coke to the ton

"In the opening and working of this mine, it can be made to yield profits from the commencement (as the stripping is so light), and should be mined by the use of compressed air drills at a cost of 50 cents per ton, as little or no culling will have to be resorted to.

"This is one of the very few mines that can be taken hold of and put on a paying basis at a small amount for dead work. The expenses required will be simply for equipment and general buildings."

An analysis of surface ore made by Prof. E. J. Chapman, of "The Toronto School of Science," gave metallic iron, 64.26; sulphur, 0.04; phosphorus, faint trace; titanium, none. The Professor remarking "This is an exceedingly good ore; not too dense in texture and rich in metal. It is well adapted for the Bessemer process."

An analysis of ore taken from about six feet below the surface, made by Mr. W. F. Druggan, Chemist of "The Scranton Steel Co.," showed metallic iron, 65.36; phosphorus, 0.002; sulphur, slight trace; silica, 4.5; the chemist remarking on the exceptional purity of the ore.

Since these analysis were made more of the ore-bed has been uncovered, and two pits sunk in different parts of the deposit. In November, 1887, samples of ore were taken from all over the deposit and an average analysis made by the Chemist of "The Joliet Steel Co.," which gave iron, 66.29; phosphorus, 0.024; silica, 3.19; manganese, .42; titanin acid, none.

An analysis made by Prof. Davenport Fisher, of Milwaukee, of ore taken about ten feet below the surface, gave iron, 68.88; silica, 3.18; phosphorus, 0.006; titanium, none.

These analysis show that the ore improves as it goes down, and that it is almost as perfect Bessemer ore as can be conceived.

On the construction of the branch railway into the mine, ore can be shipped conveniently to United States furnaces, either by all rail route in returning coal cars or by "The Central Ontario Railway" to the ore docks on Weller's Bay, and thence by boat to port, either on the south shore of Lake Erie or Lake Ontario.

If we had Unrestricted Reciprocity with the United States, Toronto would be an excellent point for a blast furnace, at which ore from this mine could be delivered for \$2 per ton, which would include mining and freight; or, if there was no duty, it could be delivered in Buffalo for \$3 per ton in returning coal cars, or in Pittsburg, Pa., for about \$4.50 per ton, and would probably be the cheapest Bessemer ore that could be obtained there.

I am, etc.,

T. D. LEDYARD.

Mineral Statistics.

OTTAWA, April 16th, 1888.

The Editor

THE CANADIAN MINING REVIEW:

DEAR SIR,—I was very surprised to see in your last number, page 31, a table by Mr. W. Hamilton Merritt pretending to represent the

mineral output of Canada in 1887. As this is not the first time that such tables have been published and circulated not only in Canada but in the United States and England, and as their complete incorrectness may have a very detrimental effect on certain mining industries and certain mining districts, I think it my duty to point out how unreliable these statistics are. In the following table of Mr. Hamilton Merritt, which you published in your last number, I have introduced the correct figures (according to official statements) on the second line for each product, so that a glance at the table might show at once that almost every figure in Mr. Merritt's table is wrong and that they are grossly so in several cases. To take only, for example, the case of the copper: it is certainly very injurious to the mines of the eastern townships to have it published, not only in Canada, but in the United States and in England, that they only produced in 1887 1,335 tons, when their real output was 38,772 tons. The same may be said of the phosphate mines of Ontario which have produced 4,735 tons instead of 733, as shown by Mr. Merritt; also of the mica mines antimony mines, &c.

I am, Sir, yours truly,

E. COSTE,

Mining Engineer to the Geological Survey, in charge Mining Statistics.

	Nova Scotia.	New Brunswick	Quebec.	Ontario.	Manitoba.	N. W. T.	British Columbia	Total.

.....	400

(a) On the second line for each product the tons are tons of 2,240 lbs.

(b) Export figure.

(c) We are only at liberty to give the total, but can say that there was much more produced in Ontario than in Quebec, and consequently that Mr. Merritt's figure is altogether wrong.

The Rock Formations of the Ottawa Valley and Natural Gas.

By Henry M. Ami, M.A., F.G.S.

In geology, as well as in other branches of physical research, it is often advisable and necessary to look back for a moment and consider the sum of evidence and facts which naturally accumulate in the work of investigation carried on in any particular district.

Much has already been published respecting the leading geological features of the Ottawa Valley. As far back as 1853 we find that Messrs. Richardson and Murray and other geologists, with Sir William Logan, carried on geological explorations in this district. The

results obtained by those pioneer geologists in Canada were embodied in the report entitled "Geology of Canada, 1863," and incorporated in the "Geological Map of Canada for 1866." This map gave the geographical distribution of the various geological formations in the Ottawa district, and the details of boundaries were laid down with such accuracy of detail as the facts at their disposal then allowed.

The eminent researches of Mr. E. Billings in strata about Ottawa are classic to every geologist and of incalculable value, especially with reference to the palaeontology or fossil evidence which they contain.

In the "Canadian Naturalist and Geologist," as well as in the "Decades of the Canadian Survey," Mr. Billings published many papers and described a series of crinoids and cystideans, which have been admired all the world over.

Investigations in the fossil *Eclmiodermata* of our rocks have been followed up successfully by his nephew, Mr. W. R. Billings, of our Club, and each year sees new and interesting results added to these researches.

Since the organization of the Ottawa Field Naturalist's Club, in 1879, renewed energy has been manifest in the completion of the geological history of this district, and a number of active workers have contributed not a little towards ascertaining the extent, distribution and other details respecting the various formations occurring about Ottawa.

In 1881, Dr. A. R. C. Selwyn, C.M.G., F.R.S., &c., the able Director of the Geological Survey of Canada, delivered a very timely and interesting address "On the Geology of the Ottawa Palæozoic Basin." (See Trans. O. F. N. C., Vol. III., p. 34, *et seq.*) There is there given a graphic, as well as instructive account of the various formations existing in the basin in question, which were deposited under such favourable circumstances in those old palæozoic seas.

During the past nine years, the writer has had many opportunities, both as member and leader in the geological section of the Club's work, to examine the geological formations of the district and enter into numerous details of structure, more interesting and instructive perhaps, than remunerative, nevertheless of considerable value in working out the geological history of Ottawa. With a view of giving in a concise and practical manner the result already obtained, it has been thought that a table or schedule might better illustrate the same than a detailed description.

The question of natural gas occurring or not occurring in the strata of the Ottawa district has been and is still being freely discussed—a

question of considerable import from an economic standpoint and one which has given rise to this paper, written with a view to giving those interested in the matter a general idea of the succession of the rock formations as they are known in this vicinity. There are many problems involved in discussing the likelihood of gas occurring in a certain district. The characters of the strata, its thickness, composition, mode of occurrence and its distribution have everything to do with the occurrence of gas. The result of experiments made in other parts of the world, and especially in the United States, show that gas occurs in rock of almost any age in the history of the earth, and in comparing the rocks of the Ottawa district with those of similar age and origin in the States which are known to afford natural gas, even there do we find questions of detail and structure coming in which prevent any one from making the rash statement that it does or does not occur here. For example, whilst it is well known that the Trenton formation in several places yields natural gas—nevertheless, it does so when the limestones of that rock-formation are dolomitic (Prof. Orton), which character we know does not apply to the Trenton as it is developed about Ottawa. It is also a remarkable fact that, besides the three great faults or dislocations indicated by Sir Wm. Logan ("Geology of Canada, 1863") to affect the geological structure of the rocks here, there are large numbers of smaller ones which constitute a more or less parallel series of breaks of great importance in working out the geological structure of the country, and which act as so many chimneys or openings whence natural gas may have been escaping for ages past, had the strata ever been impregnated with this substance. Whilst the

writer would be pleased to see natural gas occurring in large quantity and easy of access for manufacturing and other purposes, and whilst there are many points occurring in the geology of Ottawa which make it desirable that borings be made to ascertain if gas really does occur in paying quantities; nevertheless, the result of his researches lead him to conclude that there are undeniable evidences which point to the likelihood of gas not occurring in quantity about Ottawa. A bore sunk through the Hudson River, Utica and Trenton formations would soon reveal the fact of its occurrence, yes or no.

The following table has been prepared with a view of giving at a glance and in chronological order the different rock-formations met with. It does not by any means profess to be exactly accurate, but it has been drawn up from the evidence obtained in the field at the excursions and sub-excursions of this Club. These rock-formations divide themselves into three naturally grand divisions as they may be seen in the field, belonging to three different ages or epochs of the earth's history:

I. Laurentian or Archæan.

II. Cambro-Silurian or Ordovician.

III. Post-Tertiary or Post-Pliocene.

The local development of the second division, viz., Cambro-Silurian formations, include a series of formations which succeed in perfect unbroken sequence from the Hudson River formation above to the Potsdam sandstone below. For reasons, palæontological and stratigraphical, which it is not within the province of this paper here to discuss, the writer has placed the Potsdam and Calciferous formations along with the other overlying series into the Cambro-Silurian System, rather than class them in the Cambrian System.

TABLE shewing the Rock-Formations about Ottawa City, in their Natural Order.

SYSTEM.	FORMATION.	CHARACTER OF STRATA.	FOSSILS.	THICKNESS.
POST-TERTIARY	Alluvium, shell-marl, fresh water sands, lake and river gravels.	River and lake alluvium, sands and clays, shell-marl (white clays), ancient low beaches, stratified gravels.	Recent fresh water shells, plants and other organic forms. Pre-historic remains of Aborigines, along with <i>Castor fiber</i> , <i>Ariacus Virginianus</i> , <i>Limnæus galbana</i> .	Vary from 0 to 50 feet in different places.
	Saxicava Sand (marine)	Marine sands.	<i>Saxicava rugosa</i> , L. <i>Natica affinis</i> , Gmel. &c.	Vary from 0 to 6 feet and more.
	Leda clay (marine)	Chiefly stiff, blue clay, with occasional nodules, boulders and sandstone portions.	<i>Leda</i> (Portlandia) <i>arctica</i> , Gray. <i>Phoca groenlandica</i> and <i>Mallotus villosus</i> , insects, star fishes, &c.	Varies from 0 to 120 feet and more.
CAMBRO-SILURIAN or ORDOVICIAN.	Boulder clay	'Till,' 'moraine profonde,' glacial deposits.	No fossils yet discovered.	0 to 30 feet.
	Hudson River	Bluff-weathering calcareo-arenaceous shales and limestones.	<i>Zygospira Heali</i> , B. <i>Ambonychia radiata</i> , H. <i>Crytolites ornatus</i> , Con. <i>Modiolopsis pholadiformis</i> .	About 20 feet (known), probably thicker.
	Utica	Black or dark bituminous shales and limestones.	<i>Leptograptus flaccidus</i> , H. Orthogr. quadrinueronatus. <i>Triarthrus spinosus</i> , B. <i>Asaphus canadensis</i> , C., &c.	From 60 to 75 feet.
	Trenton	Nodular and evenly bedded for the most part light coloured limestones, with occasional shaly measures, in part bituminous.	<i>Prasopora Selwyni</i> , N. <i>Glyptocrinus ramulosus</i> , B. <i>Pleurocystites squamosus</i> , B. <i>Anazyga recurvirostra</i> , H. <i>Murchisonia bellicincta</i> , H. <i>Asaphus platycephalus</i> , S., &c., &c.	Between 400 and 500 feet.
	Bird's Eye and Black River.	Hard, compact, impure fossiliferous limestones (cement-rock).	<i>Tetradium fibiatum</i> , S. <i>Columnaria Halli</i> , N. <i>Maclurea Logani</i> , Salter. <i>Gonioceras anceps</i> , H. <i>Bathyrus extans</i> , H., &c., &c.	About 200 feet.
	Chazy	Limestones Shales Sandstones and sandy shales.	<i>Lingula Belli</i> , B. <i>Orthis imperator</i> , B. <i>Asaphus canalis</i> , B., &c., &c., &c.	20 } 30 } 200 feet. 150 }

Wire Rope Haulage and its Application to Mining.

By Frank C. Roberts, C.E., Philadelphia, Pa.

Continued from March Issue.

II. c. AERIAL PLANES (1)—It frequently occurs that the character of the route renders the construction of surface planes a matter of great difficulty and expense. To such cases the application of aerial planes has peculiar advantages. These planes consist of wire ropes extending between the points of desired communication. Upon these cables the carrying vehicles or carriages travel, the ropes serving as tracks. This system, as in the case of surface inclines, admits of single or double planes and may be operated by engine power or gravity, according to the conditions and requirements of the case.

Aerial inclines find frequent application in mountainous regions and in the hoisting of material from large open-cut mines or quarries. Fig. 24 shows a serviceable application of the single rope system. This system is especially adapted to quarry work where the loading point is continually shifting. As shown, the incline consists of a single wire rope, one end of which is made fast at the bottom of the quarry, while the other end passes through the head of a derrick or mast to an anchorage on the bank beyond. The hauling rope being fastened to one side of the carriage, passes downwards around the hoisting blocks and up again to the carriage, from whence it continues on to the hoisting engine. Attached to the main wire rope and immediately over the loading point in the quarry is located the stop block. (2) This block arrests the descent of the carriage beyond its position, but the hauling rope continuing to be paid out, the hoisting blocks are lowered into the quarry. Inclines of this character will readily hoist 150 to 200 tons per day.

Where the grades are excessively steep and large output is required, the double-rope system will be found very serviceable. The governing principles are similar to those of surface-inclines,

the two ropes serving instead of the surface track. Figs. 25 and 26 show this system as applied to the diamond mines of South Africa.

III. WIRE-ROPE HAULAGE.

Experience has clearly demonstrated that, where the output of a mine is sufficient to warrant the use of mules in hauling the product to the hoisting slope or shaft, the most economical method of underground transportation is obtained by the use of wire rope. So generally has this conclusion been accepted that, since its introduction a few years ago, the system has been extensively applied both at home and abroad. These remarks are especially true of the bituminous coal-regions of Pennsylvania, where there are but few mines of large output where one or another of the wire-rope systems is not in use.

Wire-rope haulage may be divided into three systems, viz: the tail-rope, the counter-rope, and the endless-rope systems.

III. a. THE TAIL-ROPE SYSTEM.—In this system the hauling-engine is located at a convenient point, generally the adit, and the *main* and *tail* ropes are attached to two rope-drums, seated on the engine shaft. The end of the main rope leading from the drum is attached to the forward end of a train of cars, while the tail rope, running along the side of the entry to the end of the line of tracks, passes around a sheave or wheel, so located that the rope is brought midway between the rails. The rope continuing between the rails is fastened to the rear of the train. In connection with each drum there is a friction clutch, by means of which one drum may be driven by the engine, while the other runs freely on the shaft. Thus, when a number of cars are drawn to the adit the *main* rope is wound on its drum while the *tail* rope is paid out. To take the empties back into the mine, the ropes are attached to each end of the train as above, the engine is reversed, and the tail-rope, now acting as the hauling rope, draws the cars back into the workings.

In application, this system naturally divides into two sub systems: 1st, that in which the

main entry only is operated by wire rope, the mining product being transported from the side-workings or entries to the haulage track by mules or gravity; and, 2d, that in which the side-entries also are operated by wire rope, the haulage-system in this case extending to all parts of the mine. One of the best systems of the former class is illustrated in Fig. 27, and is in use in one of the coal mines on the Monongahela River. The circumstances of location are such that it is necessary to place the engine and drums at a point intermediate between the two terminals, and not, as is usual, at one or the other end. This makes it necessary to employ two tail-sheaves, one at the parting A, and another at the parting B. The main rope is fastened to the drum M, and passing off is led around the tail-sheave at B, and attached to the forward end of the train at C. The tail-rope, on the other hand, is fastened to the drum T, and is led thence around the tail-sheave A and attached to the rear of the train. The main rope is supported between the rails by 6-inch rollers, about eighteen feet apart; and the tail rope is supported overhead along the sidewalls by rollers supported from the hanging-wall or roof of the pit. The rope is guided around curves by 12-inch wooden sheaves, arranged as shown in Fig. 18. At the sharp bends, guide-sheaves 4 feet in diameter are placed, and guard-rails are introduced at the sides of the track to prevent the derailing of the cars due to the angular pull of the rope at this point. The engine is double-acting, with 10-inch by 12-inch cylinders, and 4-foot diameter drums, geared 1 to 5½. The road is approximately 3,300 feet long, and its daily capacity is about 750 to 900 tons. The wire rope employed is steel, 7 wires to the strand: the main rope being 7/8 of an inch in diameter, and the tail-rope 5/8 of an inch. In this instance the coal is hauled by mules from the side-entries and branches to the general parting. When a sufficient number of cars have accumulated, the main rope is attached to the forward end of the train and the tail rope to the rear end, and the train is hauled to the tippie. This is the simplest form

of the tail-rope system, and were that system thus limited to the operation of one line, much less might be said in favor of it. To transport the mining product to the main entry with mules, and then transfer it to the rope system, is less economical in every way than to extend the operation of the rope-haulage system to the various workings. The additional first cost of a complete system is very slight, but the advantages gained in economy and convenience are multiplied. Each entry is here provided with its own separate rope passing around a tail-sheave at the end of the working, and supported in the usual manner by rollers. The rope is of such length that the two ends reach to the main entry, and, when not in use, rest on the ground. Again, the rope in the main entry is divided into as many sections as there are entries or branches, the connections being arranged at such distances that when the train is at the tippie one set of these connections is opposite each side-entry or branch. In this manner, when it is necessary to haul a set of cars into any particular one of the side entries, the connections of the rope in the main entry opposite the side-workings to be operated are detached, and the engine end of the main rope is attached to the extremities of the side rope which, as before mentioned, extends into the side working. When the connections have thus been made, we have what corresponds to the original continuous rope; but, in this case, the tail-sheave for the rope is located in the side-entry.

Figs. 29, 30 and 33 illustrate the usual methods of arranging the side-entry ropes. Fig. 33 shows the arrangements permitting the changing of the rope when the cars are at the adit. In this case, when it is desired to haul a set of cars into the side entry the main rope is detached at A and B, while the entry rope-ends C and D are connected to A and B, thus forming a continuous rope passing into the entry. Figs. 29 and 30 illustrate other arrangements, both of which are based upon changing the rope connection when the cars are near the side-entry, and not, as in the former case, at the terminus of the system. In Fig. 30, the guide-wheel W is placed under the main track, to permit the free passage of the rope, and the connections being severed, as before, one end of the entry-rope is attached to the train and the other to the main rope; and in this manner the side entry is operated as shown. The dotted lines at A show the position of the cars while the disconnection is made, B showing the train after passing into the entry. Fig. 29 shows an arrangement whereby but one disconnection is made in the main entry-rope, namely at A, the head of train. The end B of the entry-rope is here attached to the car and the end A of the main rope, being free, is drawn a little further by the engine and attached to the end C of the entry-rope. In both of these latter arrangements, where the road is not level, the disconnection is, of necessity, made while the rope is under a severe stress, thus rendering disconnection a difficult matter. This is not true of the method illustrated in Fig. 33, as the ropes are here disconnected while the cars are at the end of the system and the rope is consequently free from stress.

When operating a side-entry by either of the arrangements illustrated in Figs. 29 or 30 it is customary to facilitate disconnection by employing what are known as "knock-off" links. Figs. 34, 35 and 36 illustrate three devices that have given great satisfaction. Fig. 38 shows a shackle-joint, which is frequently used in making the connections between the sections of rope.

The usual method of locating the tail-sheave is illustrated in Fig. 31.

When it is found necessary to locate intermediate loading points in the main or side-entry between two terminals, the arrangement illustrated in Fig. 32 will be found convenient. Suppose a branch to a side entry at X and it is found necessary to have a switch station for loaded and empty cars at X. The empty cars coming from the direction A, the rope ends C and D are knocked off at these points, and the empties run on siding E. The rope extremities are now about opposite the front and rear cars of the loaded train at F, and can be attached at the forward and rear ends and hauled to the adit. Other dispositions of tracks and switches are sometimes employed, but none that have proved themselves so efficient.

The rope is taken around curves by either of the two methods illustrated in Figs. 17 and 19. The main rope is supported as usual by rollers, placed between the rails and the tail-rope by rollers along the side of the entry, such as are shown in Figs. 15 and 16.

Figs. 40 and 40a show the improved types of tail-rope hauling-engines manufactured by the Ottumwa Iron Works, Ottumwa, Iowa. That

illustrated in Fig. 40 is known as a *single two-drum engine*. It consists of two engines with cranks at right angles, coupled to a common shaft carrying two pinions meshing in turn with two spur-wheels keyed to the drum-shaft. There are two drums, one for the main and the other for the tail-rope. This type of engine is adapted for location at either end of a haulage-plant.

It is sometimes very desirable, owing to the relative position of the workings, to place the hauling engines in the center of the mine and to operate the rope system in opposite direction from that point. To such conditions the engine illustrated in Fig. 40a is admirably adapted. Four rope drums are provided, enabling the operation of two separate and distinct tail-rope systems.

The motion of the drum in both the foregoing engines is controlled by an improved cone friction device, the operation of which is simple and effective. These engines are also provided with automatic indicators, the purpose of which is to enable the operator to determine the position of the train at any moment, and consequently to govern all stoppages, and provide for variations

in grade. I append a table of the tractive power of these engines.

<i>Tractive Power of Hauling Engines (Approximate)</i>									
Cylinders.		Pipes.		Drum Specifications.			Load in tons of 2000 lbs., on a grade of		
Diameter in inches.	Stroke in inches.	Diameter of steam inches.	Diameter of exhaust inches.	Diameter in inches.	Length in inches.	Capacity of each in feet of rope.	Diameter of main rope, inches.	Diameter of tail rope.

FIG. 40.—Two-drum Reversible Hauling Engine.

desired to run the cars direct to A the cars are detached from the rope just before reaching the entry B, and pass this point by their momentum; the rope is again gripped and the cars are drawn to switch E.

(To be Continued.)

Estimating Mine Values.—It may not be impossible to establish some basis upon which the valuation of mines should rest. At any rate it is a subject which should be more generally understood, because it is in the direction of placing mining upon fair and just grounds, and seeks to prevent the expenditure of more money upon mines than they are reasonably worth. As a rule there is little danger of a mine being over-estimated. It is probable, however, that any such a basis would not be satisfactory to those who expect to realise enormous profits from dealing in mining stocks, instead of being satisfied with the actual yearly profits obtained from a mine. Eventually, no matter how they are twisted and turned, all the factors in the mining problem are resolved into these three: cost, production and risk. It is not impossible to state the two first mentioned with something like mathematical exactness; the latter must necessarily depend upon a variety of circumstances, peculiar to each case, though a few general rules applicable to all cases, might be formulated. It is this factor of risk which causes the English investors to place so great a value upon the record of a mine. They correctly argue that a fairly well developed mine—if a fissure vein—is well high uniform in its characteristics, and that its future production can be judged from its past. Consequently the record of a developed mine is considered nearly if not quite erasing the factor of risk, leaving it a problem which involves only cost and production, in which the future of both can be stated with a reasonable degree of certainty. That our English friends have not always been correct we know from the fact that they have purchased mines, because they had a record, but which were almost exhausted. Some of them have also learned that the question of management is intimately connected with the risk factor. Whatever may be said to the contrary the record of a mine should be given a prominent place in estimating values, though it should never be forgotten that every ton of ore extracted to make that record, by just that amount reduces

the aggregate of the contents of the mine; and when all those contents are gone the mine is worthless. It is this question of risk which is the stumbling block in establishing a basis for values. But the cost and production factors are too often largely neglected. Cost includes not only the first cost of the mine, but interest on the money, the cost of development, if any be necessary, and the cost of extracting and marketing the ore. Production should not only pay all of these expenses, but provide a sinking fund to pay back the original investment before the exhaustion of the mine, and should pay a profit in addition to offset the question of uncertainty; and that profit should be, more or less, just in proportion to the extent of the risk. An illustration of how cost, production and values were in one case correctly estimated, came to the notice of the editor very lately. Seven years ago a report was made upon a mine which at that time had a shaft nearly 200 feet in depth and drifts both ways from the shaft at 50, 100 and 150 feet from the surface. These drifts aggregated 750 feet in length and opened up a vertical block of ground, which measured 150 x 250 feet. The thickness of the ore was 2 feet, and the measurements of the shoots indicated that about one-half of it was pay ore, having an average assay value of \$32 per ton. This ground, then, would yield 3,750 tons of ore having a total assay value of \$120,000. The cost of stoping and hoisting was placed at \$3 per ton, and the cost of shipping to market and treatment was placed at \$15 per ton, while the discount on the assay value of 10 per cent. was \$3.20 per ton. This, then, made the cost of obtaining each ton \$21.20, or \$79,500 as the total cost of obtaining \$120,000, leaving a profit of \$59,500. As one year was required for the extraction of the ore, the interest on the investment, amounting to \$6,000 per annum, was deducted, leaving the total net profit of \$53,500. The mine then was worth at least that much, as could be determined with a reasonable degree of certainty. But now comes in the calculation of the value of the chance to find more ore in the mine than that shown in the reserves. It was the factor of risk. The ore shoots presented every appearance of permanency, or continuity from one drift to the other. As the vein was covered with "slide," nothing could be told from surface indications regarding the probabilities of finding ore in the lode beyond the drifts. Assuming

that the ore should continue in value and quantity at depth as it was shown in the drifts, and allowing for increased cost of working as depth was gained, each ton of ore below the lower workings would give a net return of \$6, and the yearly product could be made to reach 5,000 tons, giving a yearly return of \$30,000 net. Of course, the ore might, in the unseen portions of the mine, decrease in quantity or quality, or both, and it might, on the other hand, improve in one or both ways. The assumption, however, considered all that could be hoped for, and ordinary prudence dictated that the estimates should be cut in two, making the yearly income of the mine \$9,000, after deducting for interest on investment. Out of this \$9,000 had to come whatever amount was desired to set aside for the sinking fund, and the profit to pay for the risk. The life of the mine was placed at ten years, during which time the sinking fund would have to amount to \$50,000, or \$5,000 per year, leaving \$4,000 yearly profit to offset the risk. Seven years have elapsed, and the purchasers have just given the information that the mine has paid for itself, besides interest on the money invested, and gives as good promise of future profits as it ever did. The incident is noted to show one method of arriving at mine values; incidentally, it shows two other opportunities of profit in mining; one is for the man who takes a good prospect and intelligently develops it into a mine, and the other is the chance which exists for the investment of money in legitimate and profitable mining.

Ventilation with Mine-Gas.—The Cincinnati Colliery, near Pittsburgh, is ventilated by mine-gas—that is to say, the fire which gives the upward current in the upcast shaft is a mine-gas flame. Formerly coal was used; but it having been found that a clay seam in the mine gave out a considerable quantity of gas, it was decided to use the gas for ventilating purposes, thus compelling fire damp to do useful work. Pipes are sunk in the clay, and the gas rising in them is collected and conducted in pipes to the bottom of the upcast shaft, where it is burnt.

E. GAUJOT,
MINING ENGINEER,
BELLEVILLE, ONT.

PHOSPHATE.

In General.

The question of using ground phosphate in the raw state still continues to attract considerable attention, and Professor Saunders is now making preparations for an elaborate series of tests on the Government Experimental Farm during the coming season, the results of which will be made public. The manure question is one of the most important connected with agriculture, and whatever will tend to an increased production of crops must necessarily demand the attention of the agricultural community. Phosphate rock has now, to a great extent, been substituted in place of bones in the manufacture of superphosphate and commercial fertilizers, by treatment with sulphuric acid, for the purpose of rendering it soluble. Phosphoric acid, as contained in crude phosphate, has been considered insoluble in water, but water containing carbonic acid, ammonia, or common salt, has the power slowly of liberating the phosphoric acid from its basic lime, and rendering it soluble for plant food. But the slower operations of water to render the phosphoric acid available for crops, can be largely increased by mixing the pulverized material with fermented manure, or peat. This system has for several years been carried on in the United States, in connection with cotton and tobacco plants, both of which being very exhaustive to the soil, require very stimulating fertilizers to restore the growing properties essential for plant life of the land. It is to be hoped that our farming community will see the necessity of adopting some measures for keeping the land required for the growth of cereals, up to its standard, by using fertilizers, and it does seem anomalous that this rich natural product at our very door, should be shipped away to the United States and Great Britain without its value being recognized by our own farming community.

Mr. John Dyke, Canadian Government agent at Liverpool, in his annual report to the Minister of Agriculture, makes special reference to last year's British market. He says: "The total export from Montreal during 1887 has been 20,349 tons against 19,298 tons in 1886. Prices have rather gone back somewhat, owing to trade depression, and a large supply of low grade phosphates; 80 per cent. strengthened as the year advanced, and closed firm. The average price for the year is about 1 per cent. per unit, ex-ship, United Kingdom. A good proportion has gone to Germany and also to Ireland at proportionately higher prices, but has not compensated for the additional freight that had to be paid. Lower grades have been selling at 9½d. for 75 per cent., and 8d. for 70 per cent. The future outlook for Canadian phosphates is favorable, one shilling to 1s. 1½d. could now be obtained for 80. per cent. for this next season. There are slight signs of prices strengthening. South Carolina phosphate (which is used largely by manufacturers here) has slightly varied in price. The average for the year is about 7½d. per unit, ex-ship, United Kingdom. Belgian phosphates have been sold at lower prices than hitherto, 40 to 45 per cent. ranging from 5d. to 6d., and 50 to 60 per cent. from 6½d. to 7½d. per unit, ex-ship here. Of a newly discovered phosphate (Somme) only

moderate quantities have as yet been offered, but sales have been made at 10½d. for 70 to 75 per cent., ex-ship here. The new source of phosphoric acid from basic slag has attracted considerable attention. This material contains somewhere about 17 per cent. of phosphoric acid, equal to 35 per cent. tribasic phosphate. It is found when reduced to fine powder to be easy of assimilation by plants, especially where the soil is of a peaty nature, and can supply the necessary carbonic acid to assist in the solution of the phosphate. In Germany the use of this has been rather large where there are big tracts of land, and it can be used to advantage. To a limited extent it is being introduced into Ireland and other parts of the United Kingdom at comparatively cheap prices."

The Government topographical survey of the phosphate region of the Ottawa Valley, begun last summer by Messrs. E. D. Ingall and J. White, will be resumed in a few weeks. It will be remembered that this important work was somewhat abruptly terminated last season by the severe accident to one of these gentlemen at the Little Rapids Mine.

A prominent shipper who has just returned from Great Britain states that the present outlook of the fertilizer industry there is much brighter than it has been for years. Manufacturers, however, feel the loss of the American superphosphate trade which has fallen off in two years from 40,000 to nil. It seemed absurd to send the rock to England and bring it back manufactured.

Market.

Markets seem strong for 80 per cent. and over, but lower grades are difficult of sale owing to the competition of the French phosphates. The Curacao, which is the principal opponent of our high grade, is not being produced this season. This strengthens our market materially. The demand for our ground phosphate, 60 to 65 per cent., is increasing in the United States and quite a quantity can be placed there.

Du Lievre.

Owing to the almost impassable state of the roads and the consequent cessation of traffic both up and down the river, our notes from this district are necessarily fewer than usual.

The management of the High Rock Mining Co. purpose utilizing the electric light to illuminate their workings next fall.

The Dominion Mining Co. intend pushing their operations strongly this season. They will engage a larger number of men than they had expected to, having struck some rich phosphate seams.

Negotiations are going on just now for the sale of some phosphate lands in this district, which, if successful, will result in a large amount of capital being brought into operation.

Mr. W. H. Dickson will do some phosphate mining shortly on his lots in the 5th and 6th ranges.

Templeton District.

We are informed that the Templeton and Blanche River Company, of Montreal, will shortly increase their capital stock. A little over 150 tons of good ore at present awaits shipment from their property.

It is rumoured that the celebrated Goldering property has been sold to American capitalists, and that mining will shortly be resumed on these lots.

As soon as the snow leaves the ground the Anglo-Canadian Company will further explore their lots in the Gore of Templeton and Wakefield.

Perth District.

At the Otty Lake Mines, the Anglo-Canadian Company is changing its operations to contract work instead of day labor.

Kingston District.

Captain W. D. Moore, of Hurley, Wisconsin, who, sometime ago purchased 2650 acres of mining lands in this district, has had a number of men under the direction of Mr. J. Sloan, prospecting, taking out timber, and making other preparations for the commencement of active operations at an early date. All the necessary buildings to accommodate a large force will be immediately erected, and the latest and most approved machinery will be put in before the 1st of June. The surface indications are rich and abundant, and a number of pits and shafts have been opened. Mica and magnetic iron is also found on the property.

Work on the Foxton property has been carried on during the winter with satisfactory results, about 200 tons of ore having been mined and hauled to Kingston. The vein continues to improve as depth is attained.

MINING NOTES.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

Operations at the various collieries are still much retarded by the inability of the Inter-Colonial Railway to furnish adequate rolling stock, and mainly on this account managers have not been looking up new business. When spring opens, and the English through traffic begins to slacken off, more coal will be moved.

At the Drummond Colliery great preparations are being made for an active season. The company has secured a large portion of the Grand Trunk contract at an advance over last year's prices. Freights are somewhat higher, however, which will counterbalance the advance in coal. The shipments from this mine are expected to figure close upon 1000 tons per day.

At the Vale Colliery both pits are working full time, banking when cars are not to be had. This company has also secured considerable trade this season with the upper provinces. Although heretofore most of their coal has gone to the I. C. R. and to local consumers, it is much sought after by iron workers for smelting, and gas producers for working iron and steel. The company are sinking a new lift, 600 or 700 feet, to the deep on the McBean seam, and have unwatered the six foot seam which was allowed to fill up at the time of the strike. About 60 pairs of men are working on this seam, mostly Belgians. About 100 of these men have been imported to work these mines, and it is said that they are doing well.

At the Acadia Mines, work is dull, owing to scarcity of places—so it is said. Some alterations are being made in the hoisting gear, new boilers are being put in, and in a few weeks the company will be in a position to do a large output.

The parties, who have acquired the Black Diamond Mines, from the N. S. Coal Co., have relaid the travelling slope, and utilized one of the old locomotives as a hoisting engine. The present output is in the neighborhood of 50 tons per day.

Since the explosion in January, everything is very dull at the old Albion Mine. The "Tom" pit is working, but owing to lack of places and scarcity of men, very little coal is coming up. A large number of miners have left for the North-West, and others are going in a few days. The recent accident, and the condition of the adjacent mines, surrounded as they are by fire and water, has made the men timorous and unsettled, and it will be some time before a large quantity of coal will be got. Nothing has been done on the 3rd seam, since the explosion, beyond blowing down the roof of the air way connecting No. 1 and 2 slope, this, it is hoped, will enable them to shut off the slope in which the fire is located, and perhaps save the other, if the fire has not penetrated too far into it. Investigations will shortly be made to find out the condition of this slope. The work of unwatering the Foord Pit continues, but owing to continued heavy rains, very little progress has been made.

Work at the Springhill Mines is reported to be very dull. It is rumoured that the company has lost some of their large contracts. The "syndicate" pit is closed down and the others working short time. All sorts of reports are current as to the cause, but nothing definite is known beyond the fact that the company has not sold as much coal as usual.

One of our correspondents writes: "All the talk in mining circles here is about the Commission appointed to investigate the recent explosion at the Albion Mines. Most people think it is only a dodge of Mr. McColl, M.P.P., to curry favor with the miners, and secure their vote. There are no experts on the committee, which is composed of members of Parliament, who have called two or three witnesses who know as little about the matter as they do themselves. A good many think the whole affair a farce."

A charcoal furnace is being built on one of the iron properties up the East River by an Englishman who has done considerable prospecting. It is said the ore is of a very superior quality. Considerable ore has been shipped to the N. S. Steel Co. at New Glasgow and proved of excellent quality.

The total yield of gold for the past month has been 218 ounces. Some of the mines are doing very well. Edgerton and Rawdon are working full time. Edgerton will turn out 80 ounces, the product of 20 men.

A good deal of prospecting will be done at Fifteen Mile Stream this season, as that locality is looking up.

A force of prospectors will be sent in as soon as spring opens, and a crusher will be built on the Twelve Mile Brook.

Large areas have been taken up on the Twelve Mile Brook, and at Sheet Harbour, and valuable discoveries are reported at the old "Board Camp Mines."

Probably the first manganese mine in Canada was opened at Fanny Cape in Hant's County nearly 30 years ago, and was for a number of years the first mine in America, but it has gradually failed; has changed hands a number of times, and has never been a very valuable property to any of its owners; the output now is small and of inferior quality compared with the ore raised in New Brunswick.

Manganese ore in small quantities has been raised about Walton in Hant's County, but never in quantities to warrant vigorous operations being carried on.

There is also a mine in operation near Truro which is producing a small quantity of fair quality ore. This mine has recently changed hands and may now be operated more successfully. It has not, heretofore, been a bonanza.

The Crow's Nest Gold Mining Company (limited) has been organized in London with a capital stock of £100,000, shares £1 each, to purchase the mining property and estate known as the Crow's Nest Mines, or otherwise to acquire and work the property.

The total amount received by the mines department last year, from coal royalties, was close on \$120,000. Spring Hill takes the place of honor with \$30,000, followed by Sydney Mines with \$18,084; Acadia, \$12,600; Gowrie, \$11,776; Intercolonial, \$11,500; International (B. Port) \$7,296; Victoria, \$6,635; Caledonia, \$6,230; Glace Bay, \$5,976; Reserve, \$4,833; Block House, \$2,654; Chignecto, \$854; Halifax Coal & Iron Company (C. B.) \$573; Grant & Co., \$102, and Ontario \$60.

New Brunswick.

We are indebted to our correspondent for the following brief sketch of the Markham Manganese Mines: "These mines were opened by the late Wm. Davidson of St. John, about 26 years ago, worked by him a year or two, then sold to a Boston syndicate, who operated the mines up to about 1873, when they were sold to the present proprietors. Major Markham has had the management of them since 15th April, 1866—22 years. About 30,000 tons of Manganese has been shipped—about $\frac{2}{3}$ to Europe and $\frac{1}{3}$ to United States. I understand these to be the only Manganese Mines on this continent that have been in steady operation for more than a few years. The mines are situated south-east of Sussex Station on the I. C. R. and are reached by a good turnpike road."

In Albert County, ore of excellent quality is found, but it has not yet been discovered in paying quantities.

A manganese mine has been in operation in the parish of Waterford, King's Co., and a small quantity of ore has been raised, but the mine has not been profitable and is now closed.

Ore has also been discovered in parish of Studholm, Kings Co., about eight miles north of Sussex Station, said to be in large quantities; it is also said that the property has been bonded to American Capitalists for a large amount but we are told no sale has yet been made.

The Montreal Manganese Company of St. John are chiefly engaged at present in prospecting their property, and we are informed that they have an extensive deposit of rich ore, particularly at their East Mountain Mines, Onslow. Last season two jigs for cleaning the ore were worked, and these will again be worked this season by steam power.

Quebec.

Mr. Parker C. Choate, of the Bartlett Smelting Works, Portland, and Mr. Brigham, representing New York and Boston capitalists, have, during the past few weeks, paid two visits to the South Ham Antimony Mine. Mr. Choate has had a quantity of the ore smelted, which he pronounces very pure, being free from tin, arsenic, copper, zinc or lead. He is of opinion that large quantities of the ore can be taken out and profitably crushed, concentrated and smelted on the spot. If successful in their negotiations with Dr. Reed, the owner, works will be at once put up for the manufacture of metallic antimony.

It is reported that Mr. Charles Lionais has sold the Hervey Hill Copper Mine, in the Township of Leeds, to a Glasgow syndicate, and that extensive preparations are being made to work the property on a large scale. The car loads of the ore taken out last fall have been pronounced first class, averaging 40 per cent. metallic copper.

There are numerous enquiries in this section of the country for the purchase of copper locations, and many of the old mines will again be opened up if the present market price continues.

The price of chromic iron with other substances, having increased in value, we are informed that the deposits of Leeds, Thetford and South Ham are to be worked extensively during the summer. Part of the ore will be sent to Birmingham, Alabama, where the mineral is extensively used in the manufacture of steel.

We understand that during the past three months the average quantity of marketable mica taken out of the Villeneuve mines has been close upon six hundred pounds per month, and from latest accounts the production promises to exceed that amount during the present month. Mr. Neil Cochrane has all hands working on the outside slopes, work in the tunnels having been abandoned for the present. Large crystals of a very superior quality continue to be taken from the very surface. About thirty men are at present employed at these mines.

The new cobbling factory and other works being erected at considerable outlay by the Scottish Canadian Asbestos Co., are rapidly nearing completion. When in operation the new system will, it is thought, result in the saving of many thousand dollars in the manipulating and manufacturing of the mineral.

The weather has been very backward of late in the Asbestos Mining District and not much has yet been done. Things are being got in shape for active operations, which will be prosecuted vigorously after 1st May, but not very much can be done before that date as there is still considerable snow in the vicinity. There is a good and steadily increasing demand for asbestos. Prices keeping firm, with an upward tendency at this season.

Mr. Alexander Ward will shortly open up the property owned by Mr. H. W. Johns of New York, on lot 26, range A., Coleraine.

Captain Williams of the Rockland Slate Quarry will also develop an asbestos property on lot 32, Range B, owned by Mr. Arthur Murphy.

Our correspondent also states, "that parties are here from Paris and Germany enquiring for asbestos and asbestos mines. They speak in the highest praise of the quality of the Canadian mineral."

The following estimate of the asbestos output for 1887 may be taken as correct:—

	Tons.
Asbestos Packing Co.....	850
Johnson & Co.....	520
Argyle Can: Asbestos Co.....	340
Scottish ".....	210
Frechette Mining Co.....	220
King Bros.....	120
Irwin, Hopper & Co.....	90
Coleraine Mining Co.....	50
A. H. Murphy.....	10

An exchange writes. "There are two inherent evils in asbestos mining in Canada which prevent this industry being as profitable to the miner as it would at first sight appear. The exorbitant price charged for mining locations by their proprietors, or by the promoters of the companies destined to work them, causes an amount of outlay of capital that seriously cripples the resources of the company and renders the dividend payable often infinitesimal, even if the mine turns out a paying one; and secondly, a doubt always exists as to whether (in view of the uncertain nature of the veins of chrysotile) underground mining will pay expenses after the surface deposits are exhausted and quarrying is no longer possible. With these two drawbacks in view there is always an element of uncertainty present in asbestos mining, and as a consequence it is difficult to divert Canadian capital in this direction."

Capitalists on the look out for an investment in mineral lands in the Eastern Townships cannot do better than read carefully the masterly report on the geology of the counties of Compton, Stanstead, Beauce, Richmond and Wolfe, written by Dr. R. W. Ellis, and recently published by the Geological Survey. Great progress has been made in the development of this section of the Province, evidenced by the construction of the several lines of railway which centre in the Town of Sherbrooke, as well as by the opening up of hundreds of miles of settlement roads, by which large areas, formerly inaccessible, have now become comparatively open to investigation. The report comes from so eminent an authority and contains so much important information bearing on the mineral resources that it cannot fail to be of immense practical value to the district.

Ontario.

Our Red Rock correspondent writes: "The Town of Nipigon is located on the line of the C. P. R., and situated within a few yards of the river of the same name. Plenty of minerals abound in this vicinity. The river banks and lake shores have been explored to a considerable extent and several locations are taken up. Iron in large quantities has been discovered, silver is known to exist, and gold bearing quartz has been found."

Our Belleville correspondent writes: "A couple of days ago I had an opportunity of examining the Richardson Mine, and I would ask your readers to accept with caution very much of what has been said lately about the recent finds at this property. About sixty feet, south by east of the old shaft, a new one has been started on what appears to be the beginning of a vein having a leader under a granite hanging wall, dipping north at an angle of about 78°, and another leader on an apparently foot wall dipping at an angle of about 70°. There is a false horse between the two leaders, the footwall being felsite rock. This shaft is 26 feet deep, and at the bottom the two leaders are coming together very rapidly. This may form a vein or run out altogether, as the whole Richardson Hill is a big upheaval or dyke, and has no regular formation. The matrix of the two leaders, or would be veins, is a hornblende rock, having the appearance of gneiss; this same formation is visible in the old shaft, near the place where the old celebrated pocket was first struck, and here the rock shews considerable free gold. This rock as well as the ore coming out of the new shaft is being taken to the stamp mill at Bannockburn.

At the Robertsville Mines, Wm. Roach is still prospecting with a diamond drill. The results are said to be satisfactory.

A correspondent to the *Emigrant* thus describes the Vermillion Gold Mines recently discovered in the Sudbury district, and patented Messrs. R. J. Tough and Jas. Stobie:—

"This discovery was made in the township of Denison (lot 6 in the 14th concession), about 23 miles south of Sudbury Junction, within 2 miles of the Sault Ste. Marie branch, on the west side of that line. It consists, at date of my visit (March 10, '88), of one strongly defined gold-bearing quartz vein, in the green slate, apparently close upon the junction of the granite, which prevails to the east. This particular lode is distinguished from another lode or outcrop as "No. 2." The "No. 2" vein has been traced for a distance of 89 chains, or the entire width of two lots. Its magnetic direction is north, 52 E., dipping south-east 73 degrees. The average width of this vein is 22 to 36 inches. The gangue is fine grey and white quartz, rich in native gold. A shaft is being sunk, and it has now attained a depth of 30 feet. From this, an intermediate distance, splendid nuggets of gold have been extracted, and average samples of quartz give results ranging from \$200 to \$1,000 to the ton of 2,000 lbs. Nor is this free gold confined to the vein: on the contrary the country rock on either side appears impregnated with it for a distance, in places of over 6 feet. Excavation work here at date of inspection was as follows: depth, 15 feet; length, 120 feet. A sample of pyrites from this lode, or deposit, assayed \$17 in silver, and also a percentage of nickel; while the gold ranges from \$36 to \$1,500, to the ton 2,000 lbs. Beyond the work already described nothing has been done on this location. A log shanty for the accommodation of the miners stands on the production of No. 2 vein, at a distance of 700 feet from the shaft. Owing to the great depth of snow (nearly 5 feet) it is difficult to closely examine the topography or geology of the country. The surrounding country generally is, however, high and rolling—with frequent exposures of granite and green slate. Most of the township has been overrun by fire, but a large percentage of the burned pine-tract is yet sound. The soil is clay loam and clay subsoil. Dennison township is in Algoma District. It is traversed by the Vermillion River and by the "Sault" branch of the C. P. R. A stock company has been formed to work this mine. The principal Canadian owners are the original investors with several Chicago men, including a Mr. Foster and Hill. Their organization is not yet complete."

Port Arthur District.

The usual break up of the roads in spring has temporarily interrupted communication with the mines. The Beaver, Badger, Silver Mountain, Caribou and Crown Point mines are working steadily with nothing remarkable to

note, and so soon as travelling is good a strong force will be at work at the Peerless, Little Pig and Palisades mines.

The Government bridge over the Kaministiquia River on the road to the mines has now been thoroughly renovated and strengthened at a cost of several thousand dollars, and a gang will soon be at work completing the road substantially as far as Whitefish Lake to enable those who have prospects further to the south-west a chance to go on with development.

The surveys performed for the Government last winter extended as far as the famous Hunters Island iron region, which is undoubtedly a continuation of the famous Vermillion iron range, and has been taken up in large tracts by our enterprising American cousins.

There is a steady demand both from England and the States for both mining and other lands in the vicinity of Port Arthur.

General McArthur has returned from Chicago and has gone down to Nipigon Bay to inspect his sandstone quarries, where he has a force of thirty men at work getting out this handsome stone, which is now in good demand in Chicago and elsewhere.

Application has been made for a monopoly of the supply of natural gas to the town of Port Arthur.

The very interesting article on the Rocks of Lake Superior, by Peter McKellar, read before the Royal Society of Canada, is a most valuable addition to our mining knowledge, and coupled with the writings of Messrs. Ingall, Coste and Lawson, of the Geological Survey, afford a good insight into the Thunder Bay mining region and its resources.

Manitoba and North-West Territories.

Mr. W. Case, experienced in locating oil wells in Pennsylvania, has found oil in considerable quantities, at a depth of 50 feet, in the Riding Mountain district. The party examined a district three or four miles square, at a point about eighteen miles from Lake Dauphin and about fifty miles from Strathclair Station. From the appearance of the rock strata and various surface indications, this gentleman is convinced that this is an oil district.

Mr. James Coffman has a gang of miners working on one of the claims recently sold at Tunnel Mountain. The claim is across the Kicking Horse, north of the track. Mr. De Wolf is at present negotiating with him for the construction of a 50-foot tunnel to be put in the Monarch Mine, and as it is almost sure the contract will be let a lively time is expected in that vicinity this year. Joe Buchard has gone to work with a gang of men on his claim, which is a continuation of the Coffman lead. The same gentleman will begin work at the Ottentail about the 10th of the month.

The miners are very anxious to see a smelter erected for the reduction of the ore, and would be glad to see it built in Calgary, which is their natural base for supplies.

British Columbia.

Advices from Victoria report that 2,727 acres of coal lands in the Nanaimo and Cedar districts have been bonded in London. This tract of land is said to be amongst the finest coal

and mineral deposits on Vancouver Island, and as they are contiguous to the Vancouver and Wellington mines, being the same quality, need no further reference to their value.

In conversation with a number of Yukon miners we learned that nearly all of them held the opinion that the wash gold found on Forty Mile creek and the Tananah on the northeast, and Copper river on the southwest. They believed that if the prospectors going up the coast would ascend to the headwaters of the latter stream, they would find as good, if not better, diggings than those on Forty Mile. The Rocky Mountain range cuts through the Coast range above Copper river, and it was near that point they should look for the fountain head, as it is a well established fact that the richest mines in America are found in the main Rocky Mountain range.—*Alaska Free Press.*

The following letter, under date of 6th April, from Dr. A. R. C. Selwyn, Director of the Geological Survey, has been received by Dr. G. W. Orton, Winnipeg, and explains itself:—

"I am in receipt of your letter of 3rd inst., asking me to give you in a general way my opinion of the prospects of mineral development in British Columbia. In reply I may say that I have always considered the region from the Fraser River eastward to the Kootenay & Columbia valleys one of exceedingly great promise for the discovery of rich mineral bearing veins. The chief, though not the only reason I have for this opinion is that the geological structure and conditions there correspond with those to the States of Idaho and Eastern Montana, two of the largest gold and silver producing states of the Union, having produced respectively in 1886, according to the Mineral Statistics of the United States, as under: Idaho—gold, \$1,800,000; Silver, \$3,600,000; Montana—gold, \$1,425,000; silver, \$16,825,000. There seems no reason why corresponding results should not be attained in British territory over corresponding areas. I have myself traversed the region in several directions and last summer I spent some days examining some of the mines opened near McIlwaine on the line of the C. P. R. and all I saw tended strongly to confirm the opinion above expressed, as also do the assays of numerous specimens from the region made in the Survey Laboratory by Mr. Hoffman. A list of some of these is appended for your information."

A Genuine Smoke Consumer.—There is now in operation at the works of the C.P.R., Canadian Rubber Company, waterworks, etc., Montreal, an excellent device for the consumption of smoke, indeed it is pronounced by the first authorities in the country to be the best for the purpose that science has produced. As exhibited at the C.P.R. and waterworks no smoke issues from the stack except at the moment of firing or "pushing back," when a thin stream of colored vapor issues, and ceases when the fire doors are shut. The apparatus is very simple—consisting of iron deadplate damper and air chambers—which are placed at back of the bridge any night after day's work and in a few hours a certain regulated quantity of air from the ashpit is taken by the adjusted damper into the air chamber and passing out therefrom in finely divided streams mixes with the gases at the point where they are most highly heated, igniting them and consuming what would otherwise pass into the stack, in the form of black smoke. It is difficult to conceive of any objection to such a device. It is simple, inexpensive, cannot get out of repair, needs no attention when once set, augment and equalizes the heat, improves the draft and must save a large percentage of coal. If Cape Breton coal gives off 16 per cent of smoke and this is utilized as fuel instead of escaping into the atmosphere the saving is clear. Again, the deposit of soot is done away with, which presses the heating power of the boiler plate. Evaporation tests

with Scotch coal shew 11 oz. water per 1 lb. coal. In the externally fired boilers so much in use its action is such as to reduce the issue of black smoke from seven minutes at firing to about one minute's emission of a brownish vapor. The fire chambers of this type are so varied in construction and size that the effect of the consumer is not so pronounced as in the flued type where it is as near perfection as is possible. With first class testimony as to its thorough efficiency we see nothing to retard manufacturers from adopting it; no time is lost in attaching it; the furnace proper is unmolested; no holes are made in the plate; no steam jet is used; by moving adjusting rod and closing damper the flue is as before application of the consumer and the dense smoke issues. By opening it the discharge ceases. It will be readily seen that if one stack smokes at firing and another does not a considerable percentage of heat goes into the atmosphere in the former case, and in the latter it is used, representing coal saving. The inventors and patentees are Messrs. Dobson & Brodie of Montreal, engineers, who also undertake the planning and setting of new boilers in such a manner as to cause the heat to travel five times in flued and four times in tubular before going into the stack. We understand that this firm are exclusive agents for Smalley's patent piston which is causing so much stir in shipping circles in Europe, a description of which we will give in an early issue.

Strange Things About Steam.—When water once begins to boil, it is impossible to raise its temperature any higher; all excess of heat is absorbed by the escaping as so called latent heat, and is given out again when it condenses. We often speak of seeing the steam escaping from the spout of a kettle, but this is incorrect; steam is an invisible vapor, and we can no more see it than we can air. What we do see are the minute drops of water into which the steam condenses on coming into the cool air. If we boil water in a glass flask, we shall notice that nothing can be seen in the interior; and by observing the steam escaping from a kettle, we shall notice that there is quite a distance between the end of the spout and the point where the cloud becomes visible. This cloud of steam is of exactly the same nature as the clouds which float in the sky, and which are formed by the condensation in the cool upper regions of the steam or aqueous vapor present in the air.

Electric Light in Coal Mines.—More than 2,000 electric lamps are now in use in the coal mines of England. There is a disadvantage attending the use of incandescent lamps in mines, inasmuch as they offer no indications of the presence of fire damp.

First Discovery of Coal—The interesting statement has been made by the United States Geological Survey that the first definite discovery of coal in North America can be credited to Col. Wm. Boyd, who made a report May 19, 1701, to the Colonial Council of Virginia, in which he relates the discovery of coal in the Richmond basin. The coal, however, was not worked for general sale to the public, until between 1770 and 1780.

Ontario to the Front!

A Matter of Vital Importance.

The following unsolicited opinions from your friends and neighbors, men and women, whom you know and respect, ought to carry conviction

to any doubting mind. The words of gratitude are from those who have been afflicted but are now well, and the persons giving them are naturally solicitous that others, troubled as were they, may know the means of cure. There is no reason why you should be longer ill from kidney, liver or stomach troubles. You can be cured as well as others. Do not longer delay treatment, but to-day obtain that which will restore you to permanent health and strength:

296 McNab St. North, Hamilton, Can., Nov. 2, 1886.—I had been suffering for over twenty years from a pain in the back and one side of the head and indigestion. I could eat scarcely anything, and everything I ate disagreed with me. I was attended by physicians who examined me and stated that I had enlargement of the liver, and that it was impossible to cure me. They also stated that I was suffering from heart disease, inflammation of the bladder, kidney disease, bronchitis and catarrh, and that it was impossible for me to live. They attended me for three weeks without making any improvement in my condition. I commenced taking "Warner's Safe Cure" and "Warner's Safe Pills," acting strictly up to directions as to diet, and took thirty-six bottles, and have had the best of health ever since. My regular weight used to be 180 lbs. When I commenced "Warner's Safe Cure" I only weighed 140 lbs. I now weigh 210 lbs.

Wm. S. Furber

ST. CATHERINES, Ont., Jan. 24th, 1887.—About six years ago I was a great sufferer from kidney disease, and was in misery all the while. I hardly had strength enough to walk straight and was ashamed to go on the street. The pains across my back were almost unbearable, and I was unable to find relief, even temporarily. I began the use of "Warner's Safe Cure," and inside of one week I found relief, and after taking eight bottles, I was completely cured.

W. E. Ludwig

Manager for American Express Co.

TORONTO, (18 Division Street,) Sept. 17, 1887.—Three years ago last August my daughter was taken ill with Bright's disease of the kidneys. The best medical skill in the city was task'd to the utmost, but to no purpose. She was racked with convulsions for forty-eight hours. Our doctor did his best and went away saying the case was hopeless. After she came out of the convulsions she was very weak and all her hair fell out. The doctor had left us about a month when I concluded to try "Warner's Safe Cure," and after having taken six bottles, along with several bottles of "Warner's Safe Pills," I saw a decided change for the better in her condition. After taking twenty-five bottles there was a complete cure. My daughter has now a splendid head of hair and weighs more than she ever did before.

Mrs. Jas. Burns

CHATHAM, Ont., March 6, 1888.—In 1884 I was completely run down. I suffered most severe pains in my back and kidneys, so severe that at times I would almost be prostrated. A loss of ambition, a great desire to urinate, without the ability of so doing, coming from me as

it were in drops. The urine was of a peculiar color and contained considerable foreign matter. I became satisfied that my kidneys were in a congested state and that I was running down rapidly. Finally I concluded to try "Warner's Safe Cure," and in forty-eight hours after I had taken the remedy I voided urine that was as black as ink, containing quantities of mucus, pus and gravel. I continued, and it was not many hours before my urine was of a natural straw color, although it contained considerable sediment. The pains in my kidneys subsided as I continued the use of the remedy, and it was but a short time before I was completely relieved. My urine was normal and I can truthfully say that I was cured.

Moore

GALT, Ont., Jan. 27, 1857.—For about five years previous to two years ago last October, I was troubled with kidney and liver trouble, and finally I was confined to my bed and suffered the most excruciating pain, and for two weeks' time I did not know whether I was dead or alive. My physicians said I had enlargement of the liver, though they only gave me temporary relief. Hearing of the wonderful cures of "Warner's Safe Cure" I began its use, and after I had taken two bottles I noticed a change for the better. The pains disappeared and my system seemed to feel the benefit of the remedy. I have continued taking "Warner's Safe Cure" and no other medicine since. I consider the remedy a great boon, and if I ever feel out of sorts "Warner's Safe Cure" fixes me all right.

I weigh twenty pounds heavier now than ever before.

John Jones

Inventor of the Maple Leaf Lance-tooth Cross-cut saw.

(1) I understand that Mr. E. Gybon Spilsbury will present an exhaustive paper at the next meeting of the Institute upon the subject of wire-rope tramways. For this reason I will not particularize the details of this system of declines, but simply mention some of the more important features. Mr. Spilsbury has also kindly examined the copy of this paper, and I am especially indebted to him for information in connection with aerial inclines.

(2) The loading-point may be changed by varying the position of the stop-block.

CHARLESWORTH & CO.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands

FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

FOR SALE. VALUABLE Copper Mining Properties

— IN THE —

Eastern Townships

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
4th. Mining Rights in same vicinity on.... 250 "

All of the above properties lie within $1\frac{1}{2}$ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only $2\frac{1}{2}$ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Carbuncle Hill Mine, Lots 2 and 3 R. 14, and 2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, $\frac{1}{4}$ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

TO THE CANADIAN VOYAGEURS

—OF THE—

NILE EXPEDITION, 1884-1885.

NOTICE is hereby given that a decoration known
as "The Khedive's Bronze Star," granted by
His Highness the Khedive of Egypt to those who
served with the Nile Expedition of 1884-85, will be
distributed to members of the Canadian Voyageur
Contingent by the persons, and at the places, as
under:—

Caughnawaga Detachment,
B. de Lorinier, Esq., Caughnawaga, P. Q.
Manitoba Detachment,
By T. R. Burpee, Esq., Land Com'n Office,
Winnipeg.
Three Rivers,
By the Postmaster, Three Rivers.
Peterboro', by the Postmaster, Peterboro'.
Sherbrooke, by the Postmaster, Sherbrooke.
OTTAWA, by CAPT. COSTIN,
Dept. Railways and Canals.

In every case applicants must be accompanied by
some person to testify to their identity—and sign
as a witness to the applicant's receipt of the decoration.

HENRY STREATFEILD, Capt.,
Military Sec'y to the Gov.-Gen'l.

Governor-General's Office,
Ottawa, April 4th, 1888.

TENDERS.

SEALED TENDERS, marked "For Mounted
Police Provisions and Light Supplies," and
addressed to the Honorable the President of the
Privy Council, Ottawa, will be received up to
noon on Tuesday, 15th May, 1888.

Printed forms of tenders, containing full infor-
mation as to the articles and approximate quan-
tities required, may be had on application at any of
the Mounted Police Posts in the North-West or at
the office of the undersigned.

No tender will be received unless made on such
printed forms.

The lowest or any tender not necessarily ac-
cepted.

Each tender must be accompanied by an ac-
cepted Canadian bank cheque for an amount equal
to ten per cent. of the total value of the articles
tendered for, which will be forfeited if the party
declines to enter into a contract when called upon to
do so, or if he fails to complete the service con-
tracted for. If the tender be not accepted the
cheque will be returned.

No payment will be made to newspapers insert-
ing this advertisement without authority having
been first obtained.

FRED WHITE,
Comptroller N. W. M. Police.

INDIAN LANDS

LANDS IN THE UNDERMENTIONED
localities are offered for sale to actual
settlers through the following Indian Agents: On
the Great Manitoulin Island, Lake Huron, Onta-
rio; Mr. J. G. Phipps, of Manitowaning, is the
Agent for the sale of lands in the following Town-
ships on this Island: Assinack, Bidwell, How-
land, Shequandah, Billings, Campbell, Carnarvon,
Allan, Tehkummah and Sandfield, and in the
Townplots of Shequandah, Manitowaning and
Shaftsbury (commonly called Little Current). Mr.
B. W. Ross of Cockburn Island, is the Agent for
the sale of lands on that Island and in the Town-
ships of Gordon, Mills, Burpee and Barrie Island,
and in the Townplot of Gore Bay as well as for
those in the Townships of Robinson and Dawson,
on Manitoulin Island. Leading roads have been
constructed throughout the Great Manitoulin
Island.

On the Saugeen Peninsula, Ontario, the lands
in the Townships Amabel, Albemarle, Keppel,
Eastnor, Lindsay and St. Edmunds; as well as
several Townplots in the Peninsula, are offered for
sale through Mr. William Simpson, Indian Lands
Agent at Wiarton, County of Bruce, Ontario.

On the Garden River Reserve, Ontario, Mr.
William Van Abbott, of Sault Ste. Marie, is the
Agent for the sale of lands within this tract, and
which are situated in the Townships of Mac-
donald, Laird and Meredith; also for lands within
the tract commonly known as the Batchewana
Bay Indian Reserve, and comprised in the Town-
ships of Awere, Fenwick, Kars, Pennefather,
Dennis, Herrick, Fisher, Tilley, VanKoughnet,
Tupper and Archibald. There is a leading road
through these lands which affords ready com-
munication with other parts of the country to
intending settlers.

The condition of sale in respect to the lands
within the Townships above described can be
ascertained on application to the respective
Agents.

(Signed) L. VANKOUGHNET

Deputy Supt. General of
Indian Affairs.

Department of Indian Affairs,
Ottawa, February, 1887.

SEALED TENDERS addressed to the under-
signed and endorsed "Tender for Post Office,
&c., Aylmer, Que.," will be received at this office
until Monday, 14th May, 1888, for the several
works required in the erection of Post Office at
Aylmer, Que.

Specifications and drawings can be seen at the
Department of Public Works, Ottawa, and at
Ritchie's Hotel, Aylmer, on and after Tuesday,
24th April, and tenders will not be considered
unless made on the form supplied and signed with
actual signatures of tenderers.

An accepted bank cheque, payable to the order
of the Minister of Public Works, equal to five per
cent. of amount of tender, must accompany each
tender. This cheque will be forfeited if the party
decline the contract, or fail to complete the work
contracted for, and will be returned in case of non-
acceptance of tender.

The Department does not bind itself to accept
the lowest or any tender.
By order,
A. GOBEL,
Secretary.
Department of Public Works,
Ottawa, 20th April 1888.

Department of Inland Revenue.

An Act Respecting Agricul-
tural Fertilizers.

The public is hereby notified that the
provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on
the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold
subject to the conditions and restrictions therein contained—the main features of
which are as follows:

The expression "fertilizer" means and
includes all fertilizers which are sold at
more than TEN DOLLARS per ton, and
which contains ammonia, or its equivalent
of nitrogen, or phosphoric acid.

Every manufacturer or importer of
fertilizers for sale, shall, in the course of
the month of January in each year, and
before offering the same fertilizer for
sale, transmit to the Minister of Inland
Revenue, carriage paid, a sealed glass
jar, containing at least two pounds of
the fertilizer manufactured or imported
by him, with the certificate of analysis
of the same, together with an affidavit
setting forth that each jar contains a
fair average sample of the fertilizer
manufactured or imported by him; and
such sample shall be preserved by the
Minister of Inland Revenue for the pur-
pose of comparison with any sample of
fertilizer which is obtained in the course
of the twelve months then next ensuing
from such manufacturer or importer, or
collected under the provisions of the
Adulteration Act, or is transmitted to
the chief analyst for analysis.

If the fertilizer is put up in packages,
every such package intended for sale or
distribution within Canada shall have
the manufacturer's certificate of analysis
placed upon or securely attached to each
package by the manufacturer; if the fer-
tilizer is in bags it shall be distinctly
stamped or printed upon each bag; if it
is in barrels, it shall be either branded,
stamped or printed upon the head of
each barrel or distinctly printed upon
good paper and securely pasted upon the

head of each barrel, or upon a tag secure-
ly attached to the head of each barrel;
if it is in bulk, the manufacturer's certi-
cate shall be produced and a copy given
to each purchaser.

No fertilizer shall be sold or offered
or exposed for sale unless a certificate of
analysis and sample of the same shall
have been transmitted to the Minister of
Inland Revenue and the provisions of
the foregoing sub-section have been
complied with.

Every person who sells or offers or
exposes for sale any fertilizer, in respect
of which the provisions of this Act have
not been complied with—or who permits
a certificate of analysis to be attached to
any package, bag or barrel of such fer-
tilizer, or to be produced to the inspectors
to accompany the bill of inspection of
such inspector stating that the fertilizer
contains a larger percentage of the con-
stituents mentioned in sub-section No.
11 of the Act than is contained therein
—or who sells, offers or exposes for sale
any fertilizer purporting to have been
inspected, and which does not contain
the percentage of constituents mention-
ed in the next preceding section—or who
sells or offers or exposes for sale any fer-
tilizer which does not contain the per-
centage of constituents mentioned in the
manufacturer's certificate accompanying
the same, shall be liable in each case to
a penalty not exceeding fifty dollars for
the first offence, and for each subsequent
offence to a penalty not exceeding one
hundred dollars. Provided always that
deficiency of one per centum of the am-
monia, or its equivalent of nitrogen, or
of the phosphoric acid, claimed to be
contained shall not be considered as
evidence of fraudulent intent.

The Act passed in the forty-seventh
year of Her Majesty's reign, chaptered
thirty-seven and entitled, "An Act to
prevent fraud in the manufacture and sale
of agricultural fertilizers," is by this Act
repealed, except in regard to any offence
committed against it or any prosecution
or other act commenced and not con-
cluded or completed, and any payment
of money due in respect of any provision
thereof.

A copy of the Act may be obtained
upon application to the Department of
Inland Revenue, as well as a copy of a
Bulletin which it is proposed to issue
in April, 1888, concerning the fertilizers

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

FOR SALE

Valuable Phosphate and other Mineral Lands,
In the Township of Buckingham, County of Ottawa.

Patent for Mineral Rights direct from the Crown.
TITLE INDISPUTABLE.

S½ of 25 in the 12th Range 100 acres
S½ of 25 in the 11th Range 100 acres
Three lots, 26, 27, 28, in one Block, in the
11th Range 600 acres
(adjoining Gore of Templeton.)

Also a Circular Saw Mill situated on lot 26, 11th
Range, in good working order, and sufficient water
power to drive two other mills of the same capacity.

About 30 thousand cords of firewood, chiefly hard-
wood, may be obtained on these said lots.

The lands are in close proximity to the celebrated
Emerald, Little Rapids, and other richly productive
mines in the great phosphate region. Recent prospect-
ing has disclosed rich and extensive veins of the mineral.

The property is located one mile from the navigable
waters of the Du Lievre River and nine miles from the
Village of Buckingham, where the C. P. R., which
two years ago built a branch line in order to secure the
traffic of the industry, carries it to the port of Montreal.

Conditions and terms of sale may be known by apply-
ing to the proprietor,

CONDUCTED BY - - - B. T. A. BELL.

OFFICES:

UNION CHAMBERS, 14 Metcalfe St.
OTTAWA.

Vol. VI.

MAY, 1888.

No. 5.

Mineral Production, 1887.

In our article last month it was stated in
error that there had been an increased produc-
tion of iron ore during the year of 6,522 tons of
a value of \$128,424. The figures should have
read:—

1887—76,330 tons of a value of\$146,197
1886—69,708 " " " 126,982

increase of 6,522 " " "\$ 19,215

The mistake occurred, as many of our readers
will have noted, through the transposition of the
figures under the head of "Iron" (e).

Sampling Phosphate.

Some method of drawing accurate samples is
greatly needed in this business. There is some
uncertainty in chemists' analysis, though experi-
ence is rendering their results more uniform
than has been the case. But the selection of a
sample is usually a contest between buyer and
seller as to which can select the most unfair
specimens in either direction. Luck or knowl-
edge frequently enables one party to get the
advantage of several per cent. over the other,
and dealers in phosphate consider that when
sampling time approaches they must prepare
for a contest of wits or a gambling game.
Ashes, which are imported in much smaller
quantities than phosphate, are honoured with a

Government inspector who determines the quality. Some such arrangement must be made to arrive at the value of phosphate before it will be a satisfactory business to either buyer or seller.

The Development of Our Iron Mines.

The import of iron into the United States from Spain during the fiscal year ending 30th June last was 522,719 tons, or nearly one half of the whole quantity of that ore imported. From Canada, i.e. Ontario and British Columbia, there were imported, from the former 18,340 and from the latter province 10,002 tons, or in all 28,342 tons. The Spanish mines are rapidly giving out, and the material question will be with the American iron workers, whence they shall replace the supply. The question, moreover, does not affect the United States alone, but England will have to cast about for a fresh source for her steel supply, and in that enquiry our Canadian hematite will probably be prominently brought forward. This event might result in some of the English firms removing their works here. The Canadian market is too limited and our population is too scattered for a remunerative manufacture of ore at home for our own markets. Michigan and Wisconsin owe a large amount of their prosperity to the iron mining industry they carried on, the market value of the ore in the former State alone being over twenty million dollars last year, the greater part of which was expended amongst miners, and in teaming and shipping the ore. The duty on the ore from Canada alone prevents the same results in our iron producing districts, for we have a larger mineral tract of country than Michigan, and our ores are equally rich if not superior. What Canada requires is blast furnaces, at convenient points, and a central coke furnace, and with these in operation we should have not only employment for thousands of hands, but thousands of dollars would be distributed amongst our people, now denied to them while the duty remains what it is, or rather in other words, for want of reciprocity.

The stupid cry raised in certain quarters—for it is nothing but stupidity to stand in the way of natural trade—that unrestricted reciprocity means political degradation to Canada, is the barrier against the development of our iron deposits. We do not, in taking up mining questions, take either one side or other in politics—that is not our sphere—but we do look to the best interests of the mining community, and our object is to place their interests before them in the true light. The question may be raised by some, how are blast furnaces to be carried on when the transport of coal is taken into account. This can be answered by the simple reply that charcoal can be abundantly manufactured close to almost all, if not at all the deposits of iron ore; and as regards a market under existing laws, take the case of Nova Scotia where iron and coal are contiguous, but where is the market for a large output? Take

off the duty, and Nova Scotia could not smelt fast enough for the demand. The majority of our iron districts in Ontario are within 200 or 300 miles of Buffalo, and even without smelting works the ore could be easily transported there, whilst from Lakes Superior and Michigan there is a distance of 1,000 miles for conveyance, and yet ore is carried thence to various points in Pennsylvania at a remunerative return. We hoped that a previous article in these columns on this subject would have drawn out new ideas from some of our readers, and opened a correspondence on the matter, and we still hope this effect will be produced. If Canada is to look to her minerals as one of her paying resources, and that they are such if they could only be marketed is a self evident fact, our legislators will have to amend the present state of trade relations between Canada and the United States, as far as minerals are concerned, and the result will astonish not only themselves, but the iron market of the world. Throw open the markets to us, and there is nothing to prevent us turning out as much ore as Michigan and Wisconsin, smelting equally with Americans and circulating through this industry alone money to such an extent that prosperity would prevail in districts where now a stray labourer only makes even a precarious living. When the iron trade flourishes there is general prosperity; when it languishes there is stagnation. We advocate in this commodity at least, reciprocity, and we mean to keep this advocacy before our readers.

The Ontario Commission.

The want of a complete report on the mineral resources of Ontario has long been felt, and in response to the general wish, on the 14th of March last a resolution was carried in the Legislative Assembly, on motion of the Hon. C. F. Fraser (acting for the Hon. T. B. Pardee, Commissioner of Crown Lands) authorizing the Government to appoint a Royal Commission to investigate and report on this subject. Acting on this resolution, the Council on the 8th instant appointed the following gentlemen a Commission for the above purpose:—

John Charlton, M. P., Chairman; Robert Bell, B.A.Sc., M.D., LL.D., F.G.S., Assistant Director of the Dominion Geological Survey, Ottawa; Wm. Hamilton Merritt, Mining Engineer, Toronto; William Coe, Proprietor of Iron Mines, Medoc; Archibald Blue, Deputy Minister of Agriculture, Secretary of the Commission.

The Commission has been chosen without reference to politics, and it is universally conceded, both by Liberals and Conservatives, that an excellent selection has been made.

Mr. Charlton has long been favourably known as a public man. His business ability is undoubted, and his great experience and extensive knowledge of public affairs will be of much value to the Commission. In addition to these advantages, Mr. Charlton is a man of affable manners,

courteous, quick at perception, and a good writer.

Professor Bell, a native of Ontario, is the oldest member of the Dominion Geological Corps, having been connected with the staff for upwards of thirty years, a considerable portion of which have been spent in Ontario, and our present knowledge of the geology of this Province is largely due to his labours. His extensive acquaintance with the rocks of the continent in general, will be of great service in the present instance. He has made a special study of the economic minerals of the country, and is well versed in the history and statistics of all the mines which have ever been worked in Ontario. Dr. Bell was Professor of the Natural Sciences in Queen's University for five years, and the experience which he must have gained there in instructing students, and clearing up their difficulties on geological questions, will now prove of service to him in preparing a report which may be easily understood and which, we think, should be as free as possible from technical terms. Full of enthusiasm for Canada, we feel confident that Dr. Bell will strive earnestly to meet the wishes of the people of his native Province in connection with the development of her vast mineral wealth.

Mr. Merritt, another Ontario man, is a mining engineer who has taken much interest in the mines and minerals of the Province. He has already done much good service in calling attention in his writings to the mineral deposits of Canada. He has also for the last year or two collected and published numerous statistics of mining in Ontario. At one time he was engaged in mining gypsum on the Grand River. In connection with the present enquiry, Mr. Merritt will be able to give us an account of what has been done in the development of the minerals of the Province from a mining engineer's standpoint.

Mr. Coe will prove a valuable addition to the Commission in consequence of his knowledge of mining and railway building. He has been more particularly engaged in the iron industry, which should claim the serious attention of the Commission, especially with a view to the smelting of our iron ores and the manufacture of iron and steel under the protection now afforded by the tariff. As a business man of large experience, and from his extensive connections with mining men, he is in a position to do much to promote the objects contemplated by the present enquiry.

Mr. Blue, the Secretary of the Commission, is too well known as the painstaking Secretary of the Ontario Bureau of Industries, and as Deputy Minister of Agriculture, to require any praise at our hands. The accuracy and thoroughness with which he has performed his duties in the past are a sufficient guarantee that his present work will be well done.

The Commissioners met the members of the Government by appointment in Toronto on

Saturday, 12th inst., when it is understood a programme was agreed upon, the particulars of which, however, have not been made public.

We regard the appointment of this Commission as very opportune and a highly important step in the right direction. The action of the Government in the matter has met with universal approval throughout the country. We have no doubt that every facility will be afforded the Commissioners, in their investigations, by the owners of mines and mineral lands, and the publication of their report will be looked forward to with the greatest interest. We presume that it will embrace a sketch of the geology of the Province with special reference to economic minerals, and accounts of the principal mining districts. The Commissioners should also consider any suggestions which may be made with a view to improving the facilities for access to new mineral lands. They will no doubt consult the wants of the mining community in general and endeavour to meet them as far as possible.

Home Use of Phosphate.

The feeling is growing on every hand that it is absurd to be exporting this richest of all fertilizers while our country is full of worn out lands. Farms are constantly being abandoned in Ontario and Quebec, and families emigrate to a life of hardship in a western wilderness for the sake of newer soils, when knowledge of the means of enriching the old lands would preserve their homes in affluence. It is not a lack of the existence of knowledge either that is at fault, for the knowledge has been gained and many communities are profiting by it, but the fault lies in lack of zeal on the part of those who should be the people's instructors, and also in lack of enterprise by commercial men who might spread the education to their own profit. Now that experimental farms are being undertaken in Canada, it is to be hoped that no niggardly policy will prevent the widest distribution of information as to the results obtained. No subsidy or protective tariff can compare for a moment, as a means of benefitting the country, with a system that would promote the production from its lands. An increase in the fertility of the soil would add to the wealth of the country more than any conceivable number of manufacturing industries could do, and this result would be secured without robbery or injustice to any unprotected interest.

Georgia has been admitted to possess the poorest soil of any of the Southern States, and twenty years ago its worn out lands could be bought for \$3 per acre. But knowledge of fertilizing has been extended and these same lands now command a market value of \$30 per acre, and the State now leads the South in the quantity and quality of its farm products, its cotton equalling that produced on the famous Red River bottoms of Louisiana. The same improvement could occur in the Province of Quebec.

The agricultural editor of the Boston Post

says: "To incorporate daily a certain amount of fine ground phosphate of lime into the fresh barnyard manure, by scattering it over the manure pile, or to compost them for some months previous to their designed application is a universally endorsed practice. The good economy of applying these phosphates in a finely divided state to the compost heap has been illustrated again quite recently by Prof. H. C. White, of Georgia." This gentleman put finely ground Carolina phosphate into a compost heap and after about half a year "a careful estimation proved that one-third of the phosphoric acid had been rendered insoluble in soil water. The commercial value of the phosphoric acid had been increased not less than 46.4 per cent."

Many United States farmers now keep finely ground phosphate constantly on hand, and daily spread it in the stables and stalls to absorb the urinary excretions and become mixed with the manure. A most valuable fertilizer is thus secured at small expense. Here is this natural fertilizer placed by nature at our doors, and we are not sufficiently intelligent or enterprising to make use of it. A great opportunity exists in this direction for both the philanthropist and the capitalist to work, and secure the blessing due to him "who makes two blades of grass grow where only one grew before." The Department of Agriculture and the Agricultural Societies should spread information about commercial fertilizers, and some wide-awake men should seize the opportunity to prepare and sell them in Canada.

This is a most important matter for our miners, as well as for our farmers, and we are fully justified in calling attention to it in these columns. Every pound of phosphate that can be mixed in Canada is needed on her own soil, and should be sold here instead of being transported thousands of miles and often sacrificed in competition with inferior foreign products, or through losses by those "tricks of trade" that are so notable a feature of modern commerce.

Mineral Development Company.

We have received the prospectus of a newly formed enterprise, under the title of "The Mineral Development Company of Ontario," (limited), with a capital of \$200,000 in 40,000 shares of \$5 each, with its headquarters in Toronto. According to its prospectus, the objects of the company are not to operate in mining, in the proper sense of the word, but to explore and develop to a marketable point mining locations in Canada, and to place them for sale. It is considered, and justly we think, that a company will be in a far better position to do this, than individuals. There are frequent instances of parties owning land in which there is every reason to believe, from analogy, that mineral deposits exist, but who have not the means to explore, nor the knowledge that would direct them where to look, or,

even if they did find indications, who might not be in a position to develop such indications, and to ascertain the value. Such parties have been known to sell their mining rights for a mere bagatelle compared with the real value of the output obtained by the purchaser, and when too late regret their inability to have explored further and developed what indications they knew of. At a juncture like this, such a company as the above steps in, and on very reasonable terms undertakes to ascertain the value of the lands, and to find a purchaser, thus limiting any possible loss, and greatly increasing the prospect of gain. With the names of such men as H. S. Howland, Sandford Fleming, and T. C. Keefer as directors, amongst other well known men of standing, the character of the Mineral Development Company of Ontario may be considered as no "wildcat" scheme. Its Secretary is Mr. Alex. Rankin, 20 Toronto Street, Toronto.

Algoma Indian Lands.

Our readers will be interested to learn that the last official act performed by the late lamented Hon. Thomas White was in the interests and for the benefit of the mining community. The new mining regulations for the disposal of Indian lands in Algoma, issued by the Department of Indian Affairs, were thought in some particulars to be prejudicial to the speedy development of the mineral resources of that district and with a view to their adjustment a deputation from Sault Ste. Marie waited upon the Superintendent-General of Indian Affairs.

At his last meeting of the Privy Council—held on the Saturday when he first took ill,—Mr. White brought the matter up, and on his recommendation the laws were amended as follows:—

1. That section 3 be amended by fixing the area of a mining location at 160 acres instead of 40 acres as therein stated.

2. That section 7 be amended by providing that in cases where the survey is not made by the purchaser, the deposit for a survey of a location be \$100 instead of \$50 as therein stated.

3. That sections 81 and 82, reserving a Royalty to the Crown of four per cent. on the sales of the products of mines, and requiring returns by the grantee of all products of his mining location, be annulled.

4. That form "D" of said Regulations be amended by striking out the provision therein respecting the payment of Royalty.

5. That the price of land shall be three dollars per acre.

6. That the 5th clause of the said Regulations be rescinded, but that the right to purchase a location shall be limited to twelve months from the date of obtaining the agent's receipt, as provided in sub-section "C" of section four.

SITUATION WANTED as Foreman Engineer at Mines. Sixteen years experience erecting, repairing and running Hoisting, Pumping and Air Compressing Engines and machinery. Would undertake, in connection with above, the duty of Time and Store-keeper or Outside Overman. References if required. Address "Engineer," office of THE CANADIAN MINING REVIEW.

The Prospector's Soliloquy.

"To dig, or not to dig, that is the question ;
Whether 'tis wiser in the deed to follow
The lodes and bearings of aniferous metal ;
Or to keep watch upon the claims of others,
And, by attention, jump them ?—To sink,—to blast,—
No more ;—and, by a shot, bring forth to light
Gold, pure gold, and the hundred usual signs
That indicate it,—'tis a consummation
Devoutly to be wished. To sink,—to blast :—
To blast ! perchance to burst ; ay, there's the rub ;
For dynamite speaks truth, and barren quartz,
When fused has run its length, stands forth in all
Its nakedness. There's the delay
Of new machinery, the cost of it,
No water power, wood too dear for steam,
The assayer's test, a partner's contumely,
Nor signs of proffered help, the road to clear,
The insolence of office, and the sneers
Which drive a man to think of seeking death
At the drill-hole's mouth, and quit the world, hoist
On his own petard. Who loves backwoods life,
To grub and rough it with weary thoughts of home,
But that the chance of something turning up,—
The unexpected nugget, to grasp which
All prospectors strive,—captures the fancy ;
And reconciles us to discomfort now,
To reap rewards when we are old and grey ?
Buoyed up by hope, both hearts and nerves are steeled ;
And thus, that he who seeks shall surely find,
Brings to our minds both joy and sweet content ;
And mighty works of great scope and daring,
This end in view, are carried out in fact,
Not dreamt of all day long."

LETTERS TO THE EDITOR.

We invite Correspondence upon matters consistent with the character of the REVIEW.

Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

Asbestos Output—1887.

MONTREAL, April 27, 1888.

The Editor

THE CANADIAN MINING REVIEW :

SIR,—We note per your April issue received to-day, that you give the output of the Anglo-Canadian Asbestos Co.'s mine for 1887, as 340 tons only.

This is an error. The actual output to 29th October, when we closed down for the winter, was about 540 tons, and 100 tons additional were taken out during the 12 months ending that date.

We also note that you make no mention of Mr. Jeffery's mine at Danville, the product of which must have been at least 400 tons.

We are, etc.,

IRWIN, HOPPER & CO.

Iron Smelting in Ontario.

TORONTO, 17th May, 1888.

The Editor

THE CANADIAN MINING REVIEW :

"There is a tide in the affairs of men, which taken at the flood, leads on to fortune."

SIR,—The above quotation seems peculiarly applicable to the iron industries of Canada at the present time. Our mines are being so developed that we can speak with certainty about the supply of ore ; we can get fuel for coke furnaces from the States at a cheap rate, or from Nova Scotia at a rate which, if not cheap as regards the furnace-man's idea, still allows a moderate profit on the manufacture of iron.

The iron consumers throughout the country are suffering under the imposition of an enormous duty, which has been imposed with the view of forcing the establishment of blast furnaces in Ontario especially, or else of nursing the Nova Scotia industry at our expense, the freight from Nova Scotia to Toronto being at the same time as bad as a special tariff operating against the interests of the Ontario manufacturer. It has come to this—we must seize the opportunity to start furnace work in Ontario and so give our manufacturers cheap iron ; or the tariff must be at once removed. When I say we must seize the opportunity, I do not mean that a furnace could not be run if the existing duties were taken off, but the manufacturers accustomed to the use of Summerlee, Langloan, Salisbury and various other brands of English, Scotch and American irons would not take the trouble to give Canadian iron a fair test if they could get the others just as cheap. Under existing circumstances we can give them Canadian iron \$2.50 to \$3.00 cheaper than foreign iron, and they will gladly try it and do their best to make it answer the purpose ; meanwhile the furnace manager getting a more thorough knowledge of their needs, will work to meet them, so that very soon it will be a matter of indifference to all parties whether the duties are removed or not, because the furnaces in Ontario can afford, once they get in good running shape and understand the mixture of ores needed, to under sell the American furnaces. One difficulty, however, exists, and it rests with the owners of the Canadian iron mines to remove it ; that is, they must show their willingness to dispose of their ore, or of their mines, if they will not mine the ore themselves, at a fair and reasonable rate. Their motto should be "live and let live," but if they want everything and choose to play a stubborn part in this matter it is useless to do anything in the blast furnace line. I knew a man some eight years ago for whom I tried to sell an undeveloped iron mine. I had a purchaser for it, but as soon as the owner saw a chance to sell (what might, for all he could tell, have been a worthless property) he at once asked \$20,000 cash for it. That ended the transaction. If this sort of spirit still actuates Canadian mine owners, Ontario will never make a pound of iron "until" (as an old friend of mine remarked in connection with the above transaction) "there have been a few first-class funerals in the country."

Yours obliged,

SAMUEL D. MILLS.

The Profits of Asbestos Mining.

THETFORD, QUE., May 15, 1888.

The Editor

THE CANADIAN MINING REVIEW :

SIR,—I note in your valuable issue for April a quotation from an exchange stating that the exorbitant prices asked for mining locations, and the uncertain nature of the veins of the mineral, are two inherent evils which prevent the industry from being so profitable as it would at first sight appear. As a statement of this kind may be misleading, will you kindly allow me space in your columns to give a few facts in connection with this most important and rapidly increasing branch of our mining industry.

Proprietors of asbestos lands are offering their locations at reasonable prices and conditions. Lands in this district can be purchased at from twenty to fifty thousand dollars, which will yield on an average from 250 to 300 tons of ore per annum (according to the size of the location), for at least twenty-five years. The

cost of mining and preparing the mineral for the market may be fairly stated at \$25 per ton, and as at present the demand is very much greater than the supply, especially for the first quality, which commands from \$80 to \$100, the simplest calculation will show what a capital investment there is for the miner. Other owners are working them at royalties of from \$6.00 to \$8.00 per ton, and here the miner, who only pays for what he takes out, runs little or no risk.

It is the promoters, brokers and middlemen who ask for exorbitant prices and act detrimental to the best interests of the industry. They do not invest a dollar. They get properties bonded to them at reasonable figures, and ask *twice*, often *four* times as much as they have the property bonded for. The immense profit these parties make, no doubt causes the "outlay of capital which seriously cripples the resources of a company," but such profits can not be charged to legitimate mining.

I have been grieved to see many desirable investors victimized by these middlemen, who have not only sold them mining locations at absurdly high prices, but have spent thousands of dollars of their money in ill-adapted and impracticable workings, and on useless and expensive machinery, for which they in their capacity as agents receive large commissions from the manufacturer.

These men are the curse of any mining community, and investors would do well to give them a wide berth and deal with principals only. Extravagant and inexperienced management, large salaries, grand houses, and surface workings which produce *no ore*, would ruin the best mining property in the world.

On the other hand, companies which have gone carefully and economically to work have for years past, and are now, making over 100 per cent. clear profit on their investment, and these mines are improving and look better every day. There is little room to fear of the exhaustion of the surface deposits by quarrying for many years to come. The asbestos bearing hills rise for many hundred feet above the level of the present workings, and extend, as far as yet known, for a distance of ten miles over a district from the Thetford mines, south to beyond the Coleraine or Black Lake mines, affording ample ground for development for many years to come. (See Reports Geological Survey, 1885-6; also Crown Lands Department, Province Quebec, with accompanying maps of the Serpentine formation.)

I can say very little yet about underground mining. Any expert can easily see, by walking along the open cuts, that the richest ground is below his feet, and if he makes enquiry he will be told that in this neighbourhood the various companies contemplate bringing deeper cuts from lower levels to the place of the present workings, for they are certain it will pay to do so. The Boston Asbestos Company have, during the past winter, sunk a shaft on one of their open cuts, which has proved very profitable, yielding ore in quality and quantity superior to any yet found in the quarries. This was done with a view to test the ground in depth, and give employment to the miners during the winter, as work can not easily be carried on during the inclement season. The result of this experiment has proved so satisfactory that all the others declare that they will sink shafts next winter, so that asbestos mining will soon be carried on all the year round.

So regular are the profits of the Thetford mines, and so bright are their prospects that to-day I am certain they could not be bought for

less than a million dollars.

I am, etc.,
"ASBESTOS."

[In estimating the value of asbestos lands the quality of the output from the various mines must be considered. For instance, if we compare Thetford with Black Lake, we find that in the former a very large percentage of ore ranks as first-class, with a small percentage of second-class only, while at Black Lake, on the other hand, the bulk of the ore is seconds and thirds with a comparatively small percentage of firsts. The market value of these may be fairly stated as: 1st, from \$80 to \$100; 2nd, from \$40 to \$50; 3rd, from \$10 to \$15 or \$20. It is gratifying to observe that the percentage improves as the quarries increase in depth and the rock becomes more solid.—EDIT.]

The Canadian Phosphate Co. (Ld.)

The statutory meeting of the Canadian Phosphate Company, Limited, was held at the Cannon Street Hotel, London, on 12th ult., Mr. Edward Packard (the chairman) presiding.

The Chairman said: This meeting is convened in accordance with our articles of association, and is what is called the statutory meeting; I believe the object of it is to give the shareholders an opportunity of meeting their directors. I am glad to inform you, gentlemen, if you are not acquainted with it, that the company has been successfully and fairly floated; that the whole of the share capital is subscribed for, and I believe we are in thorough going order. The property has been taken over by the company, the titles have been duly investigated and found to be in proper order, and the property has been transferred to the company. When the directors first took over the management of this business, we felt it incumbent upon us to make ourselves thoroughly acquainted with it in every respect, and with its possible requirements. In accordance with that idea, one of our directors, Mr. Millar, kindly undertook in a somewhat inclement season to make a journey to Canada, with a view to visiting the mines. With some 10 ft. of snow at the mines this might have been thought a useless journey; but it will require very few words from me to show that it was by no means so, because by his taking it we shall be able to adopt measures which will develop the property much earlier than we could otherwise have done. The expense incurred was not a heavy one, and I feel sure the shareholders will join with me in thanking Mr. Millar for his exertions on that occasion. (Hear, hear.) The thermometer at the time registered 25 degrees below zero, so you will appreciate the physical disabilities under which he laboured. Of course, it was necessary that the output of the mine should be, as far as possible, increased, and with that view we have taken steps which will, we believe, ensure a considerable increase in the output from the mines over and above what would have been possible had we not taken those steps at that juncture. Had we waited till the snow cleared away it would have been almost impossible to have placed the large quantity of machinery in position till the snow came again next year. Mr. Millar will be able to answer any questions so far as relates to what he saw at the mines. The reports received from the mines are as satisfactory as could be expected under the circumstances. The whole prospect of the company is extremely favourable, and there is no reason, in any shape or form, to think but what the success of the company will in the end be considerable. (Applause.) I believe the principal object of the meeting to-day

from a business point of view is to appoint an auditor. I am not aware of any other important business there is to bring before you, but we are here to answer any questions that the shareholders may desire to put to us. (Applause.)

Mr. C. C. Hoyer Millar: I shall be very happy to make a short report on the result of my journey. In accordance with the wishes of your board of directors, I left England on January 7, reaching New York on the 16th, where I called upon Mr. Williams, the president of the Union Phosphate Company, from whom your property was acquired, and who is a director of the present company. I conferred with him at great length as to the future conduct of the mines and the business of the company. From New York I proceeded to Montreal, and during my stay there made arrangements with the Canadian Pacific Railway for the more economic handling of the output from the mines. From Montreal I travelled by rail to Buckingham, driving the remainder of the distance in a sleigh up the River du Lièvre to your property. As almost the entire output of phosphate up to date has been obtained from the Star Hill Mine, I will first describe to you what has been done there. The principal work consists of two large pits, called the Big Pit and the Bridge Pit. These two are situated within 150 ft. of each other, and are working on the same lead of phosphate. The Big Pit is about 90 ft. deep, 50 ft. wide and 70 ft. long, and is crossed by a very good deposit of phosphate, and though from time to time, as the work proceeds, the amount of phosphate actually in sight at one time varies very much, I may say that the pit is looking far better than it did when I visited the mines during the summer of 1885. Hitherto the excavating has been pure quarrying, but drifting is now being done on both sides of this pit, and I hope that all the work here will very soon be under shelter, which will not only mean an economy in working expenses, owing to the fact that less dead rock will have to be moved, but will also make a most material difference in the work done during the winter months, at which time the frost and snow prove a great hindrance. The Bridge Pit is, at the moment, not being worked, but on the disappearance of the snow mining will be resumed here, and in several smaller pits, which are let alone during the winter owing to the expense and difficulty of keeping them free from snow. The Dugway and Ruby Mines are practically untouched, though the prospecting pits show good deposits of phosphate. In the spring attention will be turned to this portion of your property. On the Williams Mine work was only begun last spring; but the two pits (Parquets and Lapoints) are both doing well and producing phosphate steadily. This mine is pronounced by the experts to be the most valuable part of the property, and your company is now turning its particular attention in this direction. Since possession was taken a new barn and stables, sleeping-house for 100 men, boarding and cook houses have been built, and at the present moment a very large cobbing-house for dressing the ore (which will be the largest and most complete on any phosphate mine in Canada) is in course of construction, and will shortly be finished. We have also made arrangements for building a tram-road for the transport of the ore to the river, as the inequalities of the ground render summer haulage impossible. From the steep slope of the hill where the sinking is going on, the ore can be economically handled and the native rock got rid of, and in the spring the scope of operations at this point will be greatly increased. . . It may here be mentioned

that the phosphate runs in a series of pockets connected by small strings or leads of ore, and the cost of production varies in accordance with the size of these pockets. By working in several places at one time the cost of production per ton in the various pits is about equalised. Cost of transport from pit's mouth to ship's deck in Montreal is 11s. per ton. Turning now from the phosphate to the management of the mines, I have much pleasure in saying that your company has secured the services of Captain J. E. Smith, who has been associated with the management since the mine was actually commenced. Captain Smith is above everything the most practical and economic manager that could be wished for, having previously worked for many years in the great mining centres of the United States. He is a large shareholder in the company, and has its interests well to heart, so that you may feel thorough confidence in him. In conclusion I would state that in the opinion of those best qualified to judge, you are the possessors of a most valuable property, of which but a very small portion has yet been touched, and it is beyond the possibility of doubt that as the huge cornfields of Western Canada and the United States get their richness exhausted they will require replenishing with chemical manures, which in turn will cause a great increase in the demand for Canadian phosphate, which is a trade admittedly in its infancy, and one whose expansion is certain. (Applause.)

Mr. Wingfield asked what were the shipments in 1887 that yielded, as stated in the prospectus, 84 per cent. on analysis.

The Chairman said he had personally examined the analysis, and could answer that it was correct. It might be interesting to a competing company to know the shipments, but he could hardly give the information.

In reply to another shareholder, the Chairman said that the output for the week ending March 17 was 60 tons, and for the following week 64 tons; and they were continuing to make satisfactory progress.

A Shareholder: What steps have been taken to secure a Stock Exchange quotation?

The Chairman: We have not actually taken the steps necessary at present, but they will be taken forthwith. (Hear, Hear.)

Mr. Barriston then moved that Messrs. Hibbard, Bull & Co., of 17 King's Arms-yard, Chartered Accountants, be appointed auditors of the company at a remuneration of 20 guineas for the first year.

A Shareholder seconded the resolution.

Mr. Wingfield proposed Mr. Griffiths, of the firm of Deloitte, Dever, Griffiths & Co., but the amendment was not seconded, and the original resolution was put and carried.

The Chairman said that that concluded the business. They had done their best so far, and would continue to do their best for the interests of the shareholders, and he had no doubt that they would be able at their first annual meeting to declare at any rate some dividend to the shareholders.

A vote of thanks to the Chairman closed the meeting.

A Large Lump of Coal.—One of the largest lumps of coal ever mined in the Monongahela Valley was taken from J. S. Neel's Cincinnati mines, near Monongahela City, lately. The block measured 7 feet 8 inches long, 3 feet 5 inches high, and 3 feet 7 inches wide. A temporary track was laid to the river, and the big piece of coal loaded in a boat for Cincinnati.

FIG. 40a.—Double Four-drum Hauling Engine.

Wire Rope Haulage and its Application to Mining.

By Frank C. Roberts, C.E., Philadelphia, Pa.

Continued from April Issue.

In this system it is of course necessary that the rope be kept taut, and for this purpose artificial tension is introduced. This is usually obtained by passing the rope round a wheel and supporting the latter upon a carriage to which is attached a weight, hanging over a pulley by a chain or rope. Fig. 42 illustrates this arrangement. The rope varies somewhat in length on account of changes of temperature and elongation due to working under tension, and this device permits such variations without detriment to the tractive force or to the rope. An addi-

tional tension device is usually applied to the engine-drums, as will be shown hereafter.

Much time and ingenuity have been employed in devising convenient grips for attaching cars to the moving rope, but those which have been found the most serviceable in mining operations are of the simplest character and among the first employed. Fig. 43 illustrates a grip which may be employed when it is desirable to start and stop the cars without interrupting the motion of the rope. Two levers, B and C, acting on a pivot, K, with jaws, D, for gripping the rope, are actuated by the link A. In order that the grip may pass over the supporting rollers, it is necessary that the rope, when gripped, be elevated above the rollers. To this end, the U-strap, F G, is attached to the bumper of the car, and the grip-levers, B and C, are provided with

lugs H. A chain E forms the link between the grip and the car, by means of which motion is transmitted to the car. In the illustration I have supposed the grip in its lowest position, about to seize the rope. The operator, standing on the bumper at the front of the car, now presses the lever A and closes the jaws D. The rope, moving in the direction of the arrow, carries the grip with it until the chain E is taut. By this horizontal motion of the grip the lugs H, resting and moving on F, are raised to the level of G, and the grip and rope are likewise elevated. In this manner the supporting pulleys may be passed without difficulty.

Where starting is performed at stated points the following device may be employed. A grip similar to the foregoing is fixed by a bolt at K to the bumper of the car. The jaws are about

FIG. 42.

FIG. 43.

FIG. 44.

FIG. 43a.

$1\frac{1}{2}$ inches above the level of the rope when resting on the supporting rollers. In order to enable the grip to clasp the rope when starting a train, counterweighted supporting rollers are placed at convenient points. These pulleys raise the rope at the desired points to the level of the grip, and their vertical motion permits the passage of the grip without difficulty. Referring to Fig. 41 it will be seen necessary to introduce these pulleys at points H and Y. In many mines it has been found more convenient to adopt such arrangements that the rope is stopped for attaching and detaching. For this

purpose I would recommend the device illustrated in Fig. 44.

When there are no side-entries to be operated it will be found convenient to employ a grip-car or "dilly." The most approved form of this device is that used at the Imperial Mine in the Monongahela region. This consists of two vertical double-grooved drums, mounted on a truck running on the mine-tracks. The hauling-rope is brought under the dilly and passed over the forward drum and half-way round the rear one. This is repeated and the rope then continues to the terminus. The motion of the drums is

governed by friction-bands. When the dilly is stationary the drums revolve freely, but when it becomes necessary to impart motion to the dilly the friction bands are tightened, and, coupling being made to the cars, the train is drawn out. Supporting rollers are placed in this system about 20 feet apart, and are usually 6 inches in diameter and from 12 to 18 inches long. When the single-track system is employed, the rollers supporting the loose rope are of the same diameter, but from 6 to 12 inches in length.

Fig. 45 illustrates what I consider the most approved design for an endless-rope hauling-

FIG. 45.

ngine. It will be seen that there are here two drums placed tandem. The rope is first passed over the larger and then over the smaller drum. Many times as may be found requisite to secure the necessary tractive force. The motion of the larger or hauling drum is controlled by a friction-clutch. The motive power is furnished by two engines, actuating a pinion meshing with a spur-wheel keyed to the drum-shaft. The "idle" drum rests on sliding bearings, and slack rope may be taken up by drawbolts as shown.

In proportioning the size of wire-rope requisite for a haulage plant, the factors mentioned under the head of hoists and inclined planes must be taken into consideration in this connection also. In the tail-and-counter-rope systems, the stress upon the rope is direct, and is due simply to weight and friction. In the endless-rope system, however, we have another factor to consider, namely, the amount of artificial tension introduced to prevent the slipping of the rope upon the drums. The tension depends, of course, upon the number of times the rope is passed over the hauling drum. In the case of the machine illustrated, where the rope has four half-wrap-pings around the drum, it is necessary to allow 20 per cent. more stress in the rope than in the case of the counter-or-tail-rope system.

Much surface-wear is encountered in this application of wire-rope; and for this reason it is advisable in all cases to employ the best steel wire rope, composed of six strands of seven wires each laid about a hempen center. The table on page 36 gives the various data concerning this class of rope.

CONCLUSION.

In designing a wire-rope plant of any description, it is necessary, in order to obtain economical results, to proportion the details of the system in accordance with results derived from theoretical calculations. The engine-power, the sizes of ropes, drums, supporting rollers and curve-sheaves, as well as the position of the latter with reference to each other and the line of the road, should all be based upon direct calculation. The scope of the present paper does not permit a discussion of the mathematical principles involved; but it may be declared that observation and experience have in every case supported these theoretical investigations.

Wire-rope has taken, by its own merits, a very important part in the development of the mining resources of the United States; and it is to be hoped that the few pages here submitted may contribute something towards a still further advance in the direction of economical mining operations.

In General.

The lawsuit of Alexander Fraser, of Westminster, vs. the Department of Public Works of Canada was heard before His Honour Judge Burbridge in the Exchequer Court on the 12th ult. Fraser owns some 19½ acres of phosphate lands on the north half of Lot 8, 1st Range of Portland East, and claims from the Government the sum of \$10,000 expropriation for his phosphate property, which adjoins, and has been partly taken up by the Government for the construction of the new lock and dam on the Lièvre River at Little Rapids. A large number of mining men were called as witnesses, including Messrs. Eugène Coste, M.E., Geo-

logical Survey, S. P. Franchot and Captain Henwood of the Emerald Mines, Captain Macnaughton, Buckingham, Demers Brosseau, and others. A good deal of interesting evidence was adduced, but, being altogether too voluminous, it has been impossible to reproduce even a small portion of it here. His Honour took the case to *avizandum*, and judgment will be given in a day or two.

There are now in operation in South Carolina fourteen fertilizer factories, employing 885 hands, with a capital of \$3,852,000. The value of last year's product was \$3,396,000. Major E. Willis, Charleston, gives the following interesting particulars in a recent Report:

"The activity of the fertilizing industry has not been confined to this city, nor to the State, for there are many manufacturing in other Southern States that use the South Carolina phosphates for the manufacture of fertilizers. The business of these concerns is prosperous. This business is a boon to railroads and steamship lines. The shipments for the past three months, from Charleston alone, required over 1,500,000 sacks to hold the material. Over 2,062,500 pounds of burlaps were used in making the sacks, and over 11,250 cars were required to transport them, filled with fertilizers, over the railroads. The Charleston companies will consume, in making the year's supply of fertilizers, over 70,000 tons of phosphate rock, and nearly half as much sulphur, besides kainit, marl, potash, blood, fishscraps, bone black, azotin, nitrogen, tankage, cotton seed meal, and other materials.

Markets.

Nominal quotations by cable from England are 1s for 80%, 10d for 75% and 8½ for 70%, all with 1-5d per unit rise. Large sales have, however, been made at 11¼d per unit, with some small lots at 11½d. The raisers of Carolina phosphates have been making arrangements for getting better prices by concentrating sales, and an advance of ¾d per unit is being asked. It is hoped this will strengthen the market for Canadian lower grades which have felt the competition of French and Carolina phosphates. Montreal prices range from \$11 to \$15 f.o.b. according to quality.

Freight.

Large engagements of tonnage have been made for the season at 6s 3d to Liverpool. The regular lines are asking 7s 6d, but outside boats will soon be arriving and lower rates are expected. There will probably be an ample supply of tonnage during the season.

Du Lièvre.

Everything seems now to be favourable for the transportation of phosphate, of which there is a large quantity awaiting shipment at the various mines. The steamer Agnes commenced running on the 30th ult. and is doing a large business, while the Eva is kept busy towing phosphate down to the railway at the Landing.

The Plumbago Mill at Graphite City is again at a standstill. It may not be generally known that this is really a good property, but apparently in the wrong hands. It is not likely to be run this summer. It would cost something in the neighbourhood of \$5,000 to put it in good working condition.

The grinding mills at Bassin-du-Lièvre expect to start very shortly; the first operations will be on 100 tons of ore from the High Rock Mine. These mills have been closed down since last fall.

Rumour has it that Mr. A. F. MacIntyre, of Ottawa, has succeeded in floating a company to operate his property adjoining the celebrated Emerald Mines. The lots were originally owned by the Buckingham Mining Company.

Mr. Wm. Macintosh is opening out his lots on the 8th range of Denholm. Some 200 yards have been stripped showing a well defined vein of the mineral.

The annual general meeting of the Dominion Phosphate and Mining Company was held at Montreal on Tuesday, the 15th instant. The attendance was not so large as might have been expected. The doings of the company during the year were regarded as most satisfactory. Messrs. Chas. Kyte and W. A. Nicholls, two of the New York directors, visited the North Star Mines on Thursday, and were very much pleased with all they saw there. Under the able management of Captain Williams a good output has been made. Many new and rich shows have been opened and at present everything looks very promising. The present main shaft is down about 600 feet.

The Canadian Phosphate Company have commenced their shipments, and between four and five hundred tons have been hauled down the river. Captain Smith is pashing along with the construction of the new train line, and is providing ample accommodation for a largely increased force of workers. A new cobbing house 32 + 60 will be erected, and an endeavour will be made to secure a suitable tug boat and new scows to facilitate the movement of their output. Some new hoisting plant has been added during the month.

Close upon 600 tons of ore have been sent down from the High Rock Mines. At the time of our visit some difficulty was experienced on account of the dump pile still being in a frozen condition. Mr. Pickford has things well in hand at the mines.

Captain Henwood has between 40 and 50 hands working at the Emerald, producing a steady output. Shipping will be commenced at an early date.

The Little Rapids Mines look as well as ever; and here too a goodly quantity of ore awaits transportation.

Mr. S. P. Franchot reports favourably of his Central Lake Mines.

Templeton District.

Mr. Trimble and several directors of the Templeton & Blanche River Company, paid a visit to their mines on Thursday, the 17th inst., and found all the pits and openings looking well. Mr. Wm. Cassils, the President, has a large and very rich specimen of the mineral, weighing several hundred pounds on exhibition at his Montreal office.

Perth District.

Several parties are at present prospecting phosphate lands in the neighbourhood of Sydenham.

Mr. John Claxton, who has recently acquired the mining rights for the Conolly lot, has a number of men working and is meeting with encouraging success. Under the old management the property produced some 600 tons from surface workings, but as soon as enlarged operations became necessary the pits were abandoned. Mr. Claxton is a miner of experience, having been for a number of years at the Lake Opimicon mines.

Mr. James Foxton is working briskly on his location. Eight pits in all are being operated,

and at one point a tunnel 4 + 6 on a 15-inch vein of red phosphate is being driven into the hill. The shows in No. 1 pit are very promising.

Captain Moore, of Hurley, Wis., is expected on his newly acquired lots in a few days. His machinery will be in place by 1st of June, and operations will then be commenced with vigor.

Bush fires have commenced in alarming proximity to the Otty Lake Mines owned and operated by the Anglo Canadian Company.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern share holders and the public.

Newfoundland.

The Tilt Cove Copper Company, Limited, has been organized, with a capital stock of £160,000, shares £2 each, to lease or purchase mining properties at Tilt Cove, Newfoundland, granted to the vendors by the trustees of the estate of the late Charles Fox Bennett, June 24th, 1886, and made between Thomas Reynolds Smith, Charles Thomas Bennett and Arthur James Williams Bennett of the one part, and John Taylor of the other part.

Nova Scotia.

Work at many of the collieries has been slack for some time past, but probably not more so than is generally the case prior to the opening of navigation. Steamers are now daily expected at the wharves.

The Black Diamond Colliery is being worked steadily, and present indications are such that the company may look upon their enterprise as a success. It is the intention to drive a level drift from a point some 1,500 feet down the old slope to a seam, supposed to lie about 200 feet below the one at present worked; this will enable the management to prove the value of their second seam in the most economical manner possible.

At the Drummond Colliery every preparation has been made to meet the season's demand which, it is thought, will be in excess of former years. No. 4 slope has been put in good working order and mining can be commenced there whenever necessary. Preparations have also been going on in the old slopes from which a very large output may be expected. The sinking of slopes in the Scott pit is being pushed forward with vigour, and by the end of the present month will have reached a depth of 500 feet from the bottom of the shaft.

At the Albion Mines very little coal is at present being raised. The reopening of the slopes closed by the explosion has been suspended until sufficient water has been run into them to fill the opening between the two slopes; when this is done the work of reopening will be resumed. In draining the Food pit many difficulties have been encountered. The pumping engine can not be used as the pumps are not yet in running order, and owing to the damaged condition of the shaft the hoisting of the water is frequently interrupted. The sinking of the new slopes to the depth of the Cage pit seam is being continued day and night, and employers and employed look hopefully forward

to the successful reopening of this valuable and far famed seam.

At the Vale Colliery active operations are being conducted at both mines. Notwithstanding the influx of Belgians, good miners are still in demand. The latest arrivals here are a number of Welsh miners.

At the Springhill Mines things still continue dull, and many of the men are seeking employment. Early in the morning of the 13th inst. a fire occurred at the south slope, better known as the "Syndicate." Although it looked serious at one time the flames were subdued and no very serious damage was done. The slope has been idle for some time. Miners passed through the stables a few hours before, and found everything all right. This pit is free from gas and the origin of the fire is wrapped in mystery.

Latest advices from Bridgeport state that shipping has not begun yet owing to the coast being blocked with ice. Judging from appearances one is forced to believe that it will take a few days before the coast is sufficiently clear to admit of steamers getting into port.

Banking was suspended at Cow Bay during the last week in April. It is estimated that there are from 12,000 to 15,000 tons on the piles.

The *Stellarton Trades Journal* says: "The coke ovens are in full blast and turning out a superior quality of coke. There will be an addition to the number of ovens soon. Coke making may turn out an important industry in Cow Bay."

In addition to the work now being done in this district by the "Malaga Mining Company (Limited)" the *Critic* is informed that a crusher is about being erected on the Hall areas, which have been purchased by an American syndicate. Mr. Hall and Mr. Caldwell have lately been in the city arranging for the erection of the stamp mill. Indications point to the conclusion that this district will cause considerable stir before long.

From a lengthy advertisement in the *Royal Gazette* we gather that Charles R. Palgrave, of London, England, is the lessee of the gold areas situate at Hurricane Island, East Division of Isaac's Harbor Mining areas. That Mr. Palgrave means business is made evident from the fact that he is applying under the Act for authority to enter upon the land and prosecute mining, the ownership of the realty being uncertain. From all accounts gold mining in Guysborough County is to be vigorously prosecuted the coming season.

The following are the official gold returns so far received at the Mines Office for the month of April:—

District.	Mill.	Tons	Ounces
		Crushed.	Gold.
Darr's Hill.....	Dufferin.....	780	276½
Oldham.....	Oldham United.....	153	53
Waverly.....	Wallace.....	7	2½
Caribou.....	Moose River G. M. Co.....	183	92
Rawdon.....	Rawdon United.....	200	46½
Whiteburn.....	The McGuire.....	38	175
Stormont.....	Tributers.....	150	251½
Sherbrooke.....	No. 5.....	73	16

Londonderry despatches state that there is quite an excitement in town over the reported discovery of a very valuable seam of coal about half way between the blast furnace and Lon-

donderry station. It appears that a Mr. Patriquin and a practical Scottish miner went out in search of coal a few days ago, and after one and a-half hard days' work they struck, as he says, not a few bits of coal, but a big seam. As soon as it was discovered, they immediately covered it up, and Mr. Patriquin has secured the right of search, and will likely proceed at once to unearth the valuable deposit. It will be remembered that some two years ago there was a small company formed to dig for coal, and after they had expended some \$2,000, got discouraged and abandoned the search, and now Mr. P. has found what they were looking for, only a few yards from where they were digging.

New Brunswick.

Owing to suspension of Messrs. W. C. Pope & Co., of Boston, who are largely interested in the manganese mines at Markhamville, these mines are temporarily shut down, but Major Markham expects to have the mines and works in operation again very shortly.

It is said that Col. Dunnville—who has great force in organization of joint stock companies—has taken hold of the Mineral Vale Mine. He will probably succeed in making a sale of the property which has excellent prospects.

Capt. Alley, of Bar Harbour, Me., has commenced work again on his manganese property, in Parish of Waterford, with a small force.

The New Brunswick Government made a small appropriation during last session for the development of the mineral resources of the Province, but your correspondent has not yet heard how the amount is to be expended. A portion of it should certainly go towards exploring some of the salt deposits of Kings County.

Quebec.

The prospectus has been issued in London of Bell's Asbestos Company, to take over the business of John Bell & Son and buy and work the freehold deposit of asbestos at Thetford, Hayden and Belmina, Province of Quebec. The capital of the company is £200,000 in £5 shares. Only £100,000 will now be issued with £70,000 five per cent debentures, the latter redeemable at 15 premium at annual drawings. The company buys the Belmina estate from the firm at £8,394, Thetford at £41,300, and Hayden at £8,000.

The syndicate which purchased the mining rights on the "Nailon" property, near Buckingham, with a view to gold mining, will commence sinking a shaft there in the course of two or three weeks. The parties are determined to go through with it, and anticipate a handsome return for their investment.

Captain Bothwell, Buckingham, holds the following certificates of analysis from specimens of ore taken from his property:—

27th Sept., 1887, by Prof. J. T. Donald, Montreal, gold, 42 oz., 11 dwt., 16 grs. per ton.
7th October, 1887, by Prof. J. T. Donald, Montreal, gold, 1 oz., 9 dwt. per ton.
28th October, 1888, by Prof. J. T. Donald, Montreal, gold, 19 dwt. to the ton.
1st April, 1888, by J. T. Gore, State Analyst, Utah Assay Office, Helena, Montana, found 6.854 oz. of gold to the ton of 2,000 lbs, or gold value to ton of ore of \$141.68.

The Villeneuve Mica Company's mines continue to make steady output of merchantable mica.

Ontario.

The Kingston & Pembroke Iron Mining Co. has shipped its first cargo of ore since navigation opened, consigned to one of the largest consumers of ore in Pittsburg. If the ore is satisfactory, they agree to take all the product of the Willer mine.

A deposit of merchantable mica, said to be of good quality, is reported to have lately been found at Smithville, near Hamilton. A shaft is being sunk, and the value of the find will soon be known.

The Hopkins well at Port Colborne, Ont., was torpedoed a few days ago, and there is now an abundant supply of natural gas, sufficient, it is said, to run a large factory if applied as power.

The Copper Cliff mine at Sudbury is yielding very rich ore in immense quantities as the result of the trial shaft which was sunk during the past winter.

The Provincial Government intend having a big mineral exhibit at the Centennial Exposition of the Ohio Valley and Central States, to be held at Cincinnati from July 4 to Sept. 28. It is 100 years ago since the Ohio Valley was first settled, and the Exposition is in honour of the event. Mr. A. Blue, of the Agricultural Bureau, has been entrusted with getting up the exhibit, and acting under instructions from the Government he will make it as large and diversified as it is possible.

A local exchange says that Mr. R. Tough, of Sudbury, has returned from Chicago, where he sold to American capitalists a part of his interest in the gold mine, known as the Tough & Stobie claim, for the sum of \$32,000. His visit to Chicago was made chiefly to purchase machinery for the use of the company in working the mine referred to. He succeeded in securing a five stamp mill, with all its appurtenances and other machinery required in gold mining operations, all of which will arrive at Sudbury in a few days. He reported that the cost of this will amount to \$70,000. The extraordinary value of this mine has profoundly interested the mining fraternity of America in the mineral deposits of Nipissing and Algoma, and these districts will be thoroughly explored by experienced prospectors this coming season.

At the Bristol Iron mines work has been, and is still, suspended until proper transportation facilities for the moving of the ore can be granted either by the C.P.R. or the Pontiac Pacific Railway, the mines being located about midway between these roads. During the present Session of Parliament the Pontiac and Renfrew Railway Co. secured a charter for a new line to connect the C.P.R. and P.P.R. by way of the Bristol mines, and the company expect that if the Government grants aid to any railway enterprise this year, this new line will not be overlooked. As it is of the utmost importance to the counties of Pontiac and Renfrew that these productive mines should be vigorously developed, nothing short of a railway—the distance from either line is only three miles—will suffice for the proper handling of the product of the mine. Parties from Montreal have been visiting the mines lately, with the object of establishing smelting works, but we understand no definite action has yet been taken in the matter.

In reply to an enquiry as to the recent gold discoveries reported in the Cartier district,

Dr. Selwyn, Director of the Geological Survey, writes us as follows :—

"I could not possibly say whether the gold discoveries you refer to will or will not turn out valuable. I only know that a number of persons have been prospecting in that region, and some have brought in samples of quartz said to have been found there. Some of these are very rich in visible free gold, others on assay gave variable, but small quantities of gold per ton, while in yet others no trace could be found. Geologically speaking, I may say that the rocks are similar, and probably of the same age as others elsewhere in which paying gold veins have been found, and it is highly probable that some of the veins will prove valuable, and others too poor to work. This can, however, only be determined by practical working tests in each case. Cartier township is a few miles N.W. of the C. P. R. Crossing of the Vermillion River, and the rocks there resemble closely the gold bearing rocks of Nova Scotia, so much so, indeed, that I have repeatedly told enquirers that I considered that district a very favourable one in which to prospect for gold, and the most likely places are near and around any granitic masses."

Port Arthur District.

News from the mines is very scanty at present, owing to the almost impassable state of the roads. The melting of the snow, which fell to such an enormous extent last winter, has swelled every little stream into a torrent, and almost cut off communication with the Silver Mountain Section.

The Beaver and Badger mines pursue the even tenor of their way satisfactorily as usual, there being nothing new to report from them.

Silver Mountain, West End, appears to be at last likely to come to the front and take its place among the working mines. Messrs. Nichol & Falco representing, we believe, Chicago capital, have been for some time endeavoring to secure this property, and it would appear that their negotiations have come to a satisfactory conclusion from the announcement made in the *Sentinel* that Mr. Nichol had just started (18 May) for the "West End," taking tools and supplies for working, as far as such supplies can be forwarded at present. No property in this district has ever offered a more encouraging prospect than this, and we trust and believe that the working of it will result in greatly increasing the confidence of those who have already invested in the district.

Manitoba and North-West Territories.

The special Mackenzie River Committee of the Senate, over which Dr. Schultz has so ably presided, will send an exploration party to the district; and accompanying it will be a naturalist to investigate the natural products of that great region, both as regards its vegetable as well as its mineral products. In the person of Mr. James Macoun the charge of making extensive collections both of the flora and fauna of that great basin has been entrusted. He is a son of Prof. Macoun, whose researches in the natural history of Canada are well known. Mr. Fawcett, D.L.S., has charge of the topographical part of the exploration.

Mayor Stewart, of Ottawa, President of the Canadian Anthracite Coal Company, reports a force of 160 men at work at the Banff mines. The daily output is about 400 tons. A new seam about 7½ feet thick is being developed. Shipments to San Francisco during the past

five months, when the first shipment was made, amounts to over 10,000 tons, and there are the brightest prospects of the trade being largely increased.

British Columbia.

By the arrival of the steamer *Dunsmuir* last evening we learn, says the *Free Press*, that the work at the Comox Mines of Dunsmuir & Sons is progressing rapidly. Already three miles of the railway line have been cleared and the logs burned. The steamer *Pilot* took up a scow laden with machinery and rails for the new mines. The machinery will be hauled over the old road to the mines. The opening of the seam of coal is progressing vigorously. Mr. Bryden, the manager of the Wellington collieries, and Mr. Jas. Dunsmuir are at the mines superintending the work.

Work is progressing steadily at the Nicola Mines, sinking and drifting. The vein is now down 125 feet and increasing in width and richness, being 200 per cent. better at the present time than when work was commenced a short time since.

MISCELLANY.

Canadian Iron Mines.—(1) In spite of the proverb that comparisons are odious, it is well to learn a lesson sometimes in this way, especially in commercial matters. Glancing at the comparative development of the mineral resources of this country and of the United States, we are struck at once with a sense of the absurdity of the difference. We have in the States the mineral area known as the Lake Superior region where the mining interests have been largely developed. The output of iron ore in this section has risen from 3,000 tons in 1854 to 3,179,511 tons in 1886, and this year will probably overrun 4,000,000; a very large proportion, certainly two-thirds, of this, goes to furnaces distant 500 to 700 miles from the mines. The trade also is chiefly in the same direction, so that there is not much return freight. In Canada we have deposits of equal value and from 100 to 300 miles nearer to the furnaces. What development have these deposits received? We could ship ore to these furnaces and get return freights of coke or coal wherewith to run furnaces at the mines or at any convenient points on the lines of railway or on the shores of Lake Ontario. In the State of Michigan there are 26 furnaces; 15 of these were in active operation in 1886, and made a total output of about 140,000 tons of pig iron; many of these furnaces are between 300 and 400 miles from the mines. How many furnaces have we in Ontario? There are furnaces in and near Detroit, which, besides getting their ore from the Lake Superior region, have to bring their charcoal 150 to 200 miles by rail. In Ontario we can place our furnaces within from 10 to 30 miles of the mines and have our charcoal made at the furnace, or supply them with coke and coal as above stated. Some people object that we cannot keep furnaces going in Canada without protection against the United States. What protection have the Michigan furnaces against the rest of the furnaces in the United States? All we want is a fair field and no favour. Others object that we have not the proper mixture of ores wherewith to run satisfactorily, especially on carwheel

iron. Being a practical furnace man and well acquainted with the Canadian ores, I can positively state that we have what is needed and of first class quality. The fact is that we have every natural advantage, and the only thing that prevents the development of our mines and the kindred industries to an extent of which few can form any idea is the unfortunate fiscal separation from our neighbors across the line. In what condition would the State of Michigan with her mineral and timber resources be if she had been protected from the rest of the States? Just as Canada is, and perhaps worse, though it is hard to imagine anything worse as regards mining matters.

The Analysis of Natural Gas.—Professor C. Phillips (2), in a report on the chemical composition of natural gas, states that in analysing the various gas samples the method he adopted was as follows:—The determination of the carbon and hydrogen existing in combustible form was conducted by combustion over copper oxide in a porcelain tube, kept at a bright red heat, the carbonic anhydride and water formed being collected and weighed. For the absorption of the water, sulphuric acid of 1.71 specific gravity, followed by phosphoric anhydride, was employed, and for the absorption of the carbonic anhydride a solution of caustic potash in glycerine. The gas was carried through the red hot porcelain tube by a slow current of dry nitrogen. No oxides of nitrogen could be detected in the condensed water. For the determination of the nitrogen in the gas a porcelain tube filled with copper oxide was heated strongly, and after the air present had been carefully expelled by carbonic anhydride, 100 cubic centimetres of the natural gas under examination was allowed to flow slowly through the tube, being carried forward by a current of carbonic anhydride. The gas being burnt, the residual mixture of carbonic anhydride and nitrogen was collected in the ordinary manner over caustic potash, and the nitrogen measured. The nitrogen so obtained was then treated again in a similar manner, to ensure the complete combustion of the other gases with which it was originally in admixture. In only a few cases, however, was the nitrogen collected after the first combustion found to be impure. The tests for oxygen on 100 cubic centimetres of gas, using an Elliott apparatus, and caustic soda and pyrogallie acid as the absorbent, were in all cases negative. The author, therefore, found it necessary to conduct the tests at the gas wells. A slow current of gas taken directly from the well or main was caused to flow successively

through solutions of caustic potash and pyrogallie acid for ten minutes, in order to expel dissolved air. The two solutions were then mixed without stopping the current of gas, which was continued for some time longer. If the mixed solutions then exhibited a brown colour, it was considered that the presence of oxygen was established. For the determination of the free hydrogen the method of Hempel was adopted: 100 cubic centimetres of the gas to be examined was freed from carbonic anhydride and washed with strong alcohol until the higher hydrocarbons were removed, this operation being performed in an Elliott apparatus having a water-jacket. The residual gas mixed with two or three times its volume of air, was then passed over asbestos coated with 30 per cent. of palladium sponge at a temperature of 90 degrees C. By this treatment the hydrogen alone is burnt, provided the higher paraffines, including ethane, have been previously removed by alcohol. From the contraction of volume after passing the palladium, the proportion of free hydrogen is easily determined. The method is very accurate when methane is the only hydro-carbon present, but is inaccurate in the presence of ethane and the higher members of the series. When these are present, the washing with alcohol must be long continued. The olefines, as a group, and carbonic oxide are much more easily determined in natural gas than the paraffines and free hydrogen. The olefines are rapidly absorbed and removed by bromine water, and carbonic oxide by cuprous oxide, these reagents being used in the order named. Unfortunately, however, they are also solvents, in less degree, for the paraffines ethane, propane, &c. Hence, a gas perfectly free from carbonic oxide and the olefines is liable, on being washed with bromine and cuprous chloride solution, to undergo a reduction in volume, which may lead to a wrong conclusion. For the determination of the olefines and carbonic oxide the following process, based on their solubility in cuprous chloride, was therefore employed:—At the gas well a stream of gas was caused to pass slowly for two hours or more through 100 cubic centimetres of a solution of cuprous chloride. A quart flask provided with a glass delivery tube and a funnel tube reaching to the bottom was then filled with boiled water, and the cuprous chloride solution poured into the flask through the funnel tube. The flask was then heated, the water boiled for three hours, and the gas evolved collected. The gas so collected was transferred to an Elliott apparatus and the olefines and carbonic oxide absorbed as before described. For the detection of ammonia

the gas at the well was caused to bubble through water purified by distillation with sulphuric acid and potassium permanganate. This was afterwards tested by Nessler's solution. The author observes that the test for ammonia should be made in the case of an examination of natural gas, as solid masses of ammoniac carbonate are reported to have been thrown out from the pipes leading from gas wells in the Murfreesville gas field. The author also describes the manner of calculating the results of the analysis, and the method employed in taking the gas samples.

Ontario to the Front!

A Matter of Vital Importance.

The following unsolicited opinions from your friends and neighbors, men and women, who you know and respect, ought to carry conviction to any doubting mind. These words of gratitude are from those who have been afflicted but are now well, and the persons giving them a naturally solicitous that others, troubled as well they, may know the means of cure. There is no reason why you should be longer ill from kidney, liver or stomach troubles. You can be cured as well as others. Do not longer delay treatment, but to-day obtain that which will restore you to permanent health and strength.

296 McNab St. North, HAMILTON, Can., Nov. 2, 1886.—I had been suffering for over twenty years from a pain in the back and one side of the head and indigestion. I could eat scarcely anything, and everything I ate disagreed with me. I was attended by physicians who examined me and stated that I had enlargement of the liver, and that it was impossible to cure me. They also stated that I was suffering from heart disease, inflammation of the bladder, kidney disease, bronchitis and catarrh, and that it was impossible for me to live. They attended me for three weeks without making any improvement in my condition. I commenced taking "Warner's Safe Cure" and "Warner's Safe Pills," acting strictly up to directions as to diet and took thirty-six bottles, and have had the best of health ever since. My regular weight used to be 180 lbs. When I commenced "Warner's Safe Cure" I only weighed 140 lbs. I now weigh 210 lbs.

Mos. S. Furber

St. Catherines, Ont., Jan. 24th, 1887.—About six years ago I was a great sufferer from

CHARLESWORTH & CO.

kidney disease, and was in misery all the while. I hardly had strength enough to walk straight and was ashamed to go on the street. The pains across my back were almost unbearable, and I was unable to find relief, even temporarily. I began the use of "Warner's Safe Cure," and inside of one week I found relief, and after taking eight bottles, I was completely cured.

W. E. Kung

Manager for American Express Co.

Toronto, (18 Division Street,) Sept. 17, 1887.—Three year ago last August my daughter was taken ill with Bright's disease of the kidneys. The best medical skill in the city was tasked to the utmost, but to no purpose. She was racked with convulsions for forth-eight hours. Our doctor did his best and went away saying the case was hopeless. After she came out of the convulsions she was very weak and all her hair fell out. The doctor had left us about a month when I concluded to try "Warner's Safe Cure," and after having taken six bottles, along with several bottles of "Warner's Safe Pills," I saw

a decided change for the better in her condition. After taking twenty-five bottles there was a complete cure. My daughter has now a splendid head of hair and weighs more than she ever did before.

Mrs. Jas. Penn

CHATHAM, Ont., March 6, 1888.—In 1884 I was completely run down. I suffered most severe pains in my back and kidneys, so severe that at times I would almost be prostrated. A loss of ambition, a great desire to urinate, without the ability of so doing, coming from me as it were in drops. The urine was of a peculiar color and contained considerable foreign matter. I became satisfied that my kidneys were in a congested state and that I was running down rapidly. Finally I concluded to try "Warner's Safe Cure," and in forty-eight hours after I had taken the remedy I voided urine that was as black as ink, containing quantities of mucus, pus and gravel. I continued, and it was not many hours before my urine was of a natural straw color, although it contained considerable sediment. The pains in my kidneys subsided as I continued the use of the remedy, and it was but

a short time before I was completely relieved. My urine was normal and I can truthfully say that I was cured.

W. E. Kung

GALT, Ont., Jan. 27, 1887.—For about five years previous to two years ago last October, I was troubled with kidney and liver trouble, and finally I was confined to my bed and suffered the most excruciating pain, and for two weeks' time I did not know whether I was dead or alive. My physicians said I had enlargement of the liver, though they only gave me temporary relief. Hearing of the wonderful cures of "Warner's Safe Cure" I began its use, and after I had taken two bottles I noticed a change for the better. The pains disappeared and my system seemed to feel the benefit of the remedy. I have continued taking "Warner's Safe Cure" and no other medicine since. I consider the remedy a great boon, and if I ever feel out of sorts "Warner's Safe Cure" fixes me all right. I weigh twenty pounds heavier now than ever before.

NOTICE.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Indian Supplies," will be received at this office up to noon of THURSDAY, 7th June, 1888, for the delivery of Indian Supplies during the fiscal year ending 30th June, 1889, consisting of Flour, Bacon, Groceries, Ammunition, Twine, Oxen, Cows, Bulls, Agricultural Implements, Tools, &c., duty paid, at various points in Manitoba and the North-West Territories.

Forms of tender containing full particulars relative to the Supplies required, dates of delivery, &c., may be had by applying to the undersigned, or to the Indian Commissioner at Regina, or to the Indian Office, Winnipeg.

Parties may tender for each description of goods (or for any portion of each description of goods) separately or for all the goods called for in the Schedules, and the Department reserves to itself the right to reject the whole or any part of a tender.

Each tender must be accompanied by an accepted Cheque in favour of the Superintendent General of Indian Affairs on a Canadian Bank, for at least five per cent of the amount of the tender, which will be forfeited if the party tendering declines to enter into a contract based on such tender when called upon to do so, or if he fails to complete the work contracted for. If the tender be not accepted, the cheque will be returned.

Each tender must, in addition to the signature of the tenderer, be signed by two sureties acceptable to the Department for the proper performance of the contract.

The lowest or any tender not necessarily accepted.

This advertisement is not to be inserted by any newspaper without the authority of the Queen's Printer, and no claim for payment by any newspaper not having had such authority will be admitted.

Van Duzen Steam Jet Pump.

MINING.—Our \$16 Pump preferred to a \$200 Steam Pump.

STATE OF MAINE ASSAY OFFICE,
F. L. BARTLETT,
PORTLAND, ME., June 21, 1883.

"GENTLEMEN,—The No. 5 'L' (\$16) Steam Jet Pump I purchased of you I have used for raising water from a mining shaft fifty feet deep. I set it to draught twelve and force thirty eight feet. It worked very well indeed, although I was obliged to carry steam 150 feet from the boilers and in weather often below zero. I carried 75 pounds of steam at the boiler, and the Jet Pump took the place of a No. 3 K (\$200 Piston Pump), that I had to remove.

"Yours truly, F. L. BARTLETT."

**VALUABLE
PLUMBAGO
AND OTHER
Mineral Lands
FOR SALE,
IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.**

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

**FOR SALE.
VALUABLE
Copper Mining Properties
— IN THE —
Eastern Townships.**

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within $1\frac{1}{2}$ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only $2\frac{1}{2}$ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Carbuncle Hill Mine, Lots 2 and 3 R. 14, and
2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, $\frac{1}{4}$ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

Department of Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting **AGRICULTURAL FERTILIZERS** came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than **TEN DOLLARS** per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the

head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one *per centum* of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

**TENDERS.**

SEALED TENDERS, marked "For Mounted Police Provisions and Light Supplies," and addressed to the Honorable the President of the Privy Council, Ottawa, will be received up to noon on Tuesday, 15th May, 1888.

Printed forms of tenders, containing full information as to the articles and approximate quantities required, may be had on application at any of the Mounted Police Posts in the North-West or at the office of the undersigned.

No tender will be received unless made on such printed forms.

The lowest or any tender not necessarily accepted.

Each tender must be accompanied by an accepted Canadian bank cheque for an amount equal to ten per cent. of the total value of the articles tendered for, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the service contracted for. If the tender be not accepted the cheque will be returned.

No payment will be made to newspapers inserting this advertisement without authority having been first obtained.

FRED WHITE,
Comptroller N. W. M. Police.
Ottawa, March 20th, 1888.

**INDIAN LANDS**

LANDS IN THE UNDERMENTIONED localities are offered for sale to actual settlers through the following Indian Agents: On the Great Manitoulin Island, Lake Huron, Ontario; Mr. J. G. Phipps, of Manitowaning, is the Agent for the sale of lands in the following Townships on this Island: Assiginack, Bidwell, Howland, Shequandah, Billings, Campbell, Carnarvon, Allan, Tehkummah and Sandfield, and in the Townships of Shequandah, Manitowaning and Shaftsbury (commonly called Little Current). Mr. B. W. Ross of Cockburn Island, is the Agent for the sale of lands on that Island and in the Townships of Gordon, Mills, Burpee and Barrie Island, and in the Township of Gore Bay as well as for those in the Townships of Robinson and Dawson, on Manitoulin Island. Leading roads have been constructed throughout the Great Manitoulin Island.

On the Saugeen Peninsula, Ontario, the lands in the Townships Amabel, Albemarle, Keppel, Eastnor, Lindsay and St. Edmunds; as well as several Townships in the Peninsula, are offered for sale through Mr. William Simpson, Indian Lands Agent at Wiarton, County of Bruce, Ontario.

On the Garden River Reserve, Ontario, Mr. William Van Abbott, of Sault Ste. Marie, is the Agent for the sale of lands within this tract, and which are situated in the Townships of Macdonald, Laird and Meredith; also for lands within the tract commonly known as the Batchewana Bay Indian Reserve, and comprised in the Townships of Aweres, Fenwick, Kars, Pennefather, Dennis, Herrick, Fisher, Tilley, VanKoughnet, Tupper and Archibald. There is a leading road through these lands which affords ready communication with other parts of the country to intending settlers.

The condition of sale in respect to the lands within the Townships above described can be ascertained on application to the respective Agents.

(Signed) **L. VANKOUGHNET**

Deputy Supt. General of Indian Affairs.

Department of Indian Affairs,
Ottawa, February, 1887.

**Notice to Contractors.**

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Post Office, etc., Prescott, Ont.," will be received at this office until Thursday, 31st May, 1888, for the several works required in the erection of Post Office at Prescott, Ont.

Specifications and drawings can be seen at the Department of Public Works, Ottawa, and at the office of E. Jessup, Esq., Collector of Customs, Prescott, on and after Saturday, 12th May, and tenders will not be considered unless made on the form supplied and signed with actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party declines the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEL,
Secretary.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

FOR SALE

Valuable Phosphate and other Mineral Lands,
In the Township of Buckingham, County of Ottawa.
Patent for Mineral Rights direct from the Crown.
TITLE INDISPUTABLE.

8½ of 25 in the 12th Range 100 acres
8½ of 25 in the 11th Range 100 acres
Three lots, 26, 27, 28, in one Block, in the
11th Range 600 acres
(adjoining Gore of Templeton.)

Also a Circular Saw Mill situated on lot 26, 11th
Range, in good working order, and sufficient water
power to drive two other mills of the same capacity.

About 30 thousand cords of fir wood, chiefly hard-
wood, may be obtained on these said lots.

The lands are in close proximity to the celebrated
Emerald, Little Rapids, and other richly productive
mines in the great phosphate region. Recent prospect-
ing has disclosed rich and extensive veins of the mineral.

The property is located one mile from the navigable
waters of the Du Lievre River and nine miles from the
Village of Buckingham, where the C. P. R., which
two years ago built a branch line in order to secure the
traffic of the industry, carries it to the port of Montreal.

Conditions and terms of sale may be known by apply-
ing to the proprietor,

Superstitious Regard of Asbestos.

M. R. H. Jones, of London, England, who
has just published an interesting little brochure
on "Asbestos: Its production and use; with
some description of the Asbestos mines of
Canada," is responsible for the following story:
A Londoner, who had left the old country to
seek a better fortune in the Dominion, found
employment on arrival in one of the
large yards on the St. Lawrence, where
strength and activity, supplemented by great
courage, soon secured him a good
position. It so happened, however, that one
evening, on returning from their daily toil to
their common apartment, some of his fellow-
workmen saw him deliberately throw himself
into a seat, kick off his boots, and then pull off
his socks, and having opened the door of the
stove, coolly fling them in on to the mass of burn-
ing wood. Possibly no particular notice would
have been taken of this, judged as a mere act
of folly and waste on the part of the new-
comer; but when, almost immediately after-
wards, they saw him open the stove door again,

take out the apparently blazing socks, and, after giving them a shake, proceed just as deliberately to draw them on to his feet again, that was a trifle too much! Human nature could not stand that. Consequently the horrified spectators, having for a moment looked on aghast, fled precipitately from the room. To them the facts were clear enough. This, they said, was no human being like themselves; such hellish practices could have but one origin. If not the devil himself, this man certainly could be no other than one of his emissaries. So off they went in a body to the manager and demanded his instant dismissal, loudly asseverating that they would no longer eat, drink, or work in company with such a monster. Enquiry being at once set on foot, it turned out that sometime before leaving England the man had worked at an asbestos factory, where he had learned to appreciate the valuable properties of this mineral; and being of an ingenious turn of mind, he had managed to procure some of the fiberised material and therewith knit himself a pair of socks, which he was accustomed to cleanse in the manner described. He was, as has been said, an unusually good workman, consequently his employers had no wish to part with him. Explanation and expostulation, however, were all in vain; nothing could remove the horrible impression that his conduct had made upon the minds of his superstitious fellow workmen; go he must and did, nor could the tumult be in any way allayed until he had been dismissed from his work and had left the yard."

Great Britain's Mineral Production.—As a raiser of minerals, Great Britain still maintains the proud position of being in front of the United States or any other nation. The quantity of iron ore raised in the States last year is estimated at eleven million three hundred thousand tons, against ten million tons in the previous year. It is interesting to observe that in Great Britain the quantity of ore mined in 1886 was fourteen million one hundred and ten thousand tons; the exact figures for 1887 are not available. Turning now to coal, the facts of the case show yet more in England's favour. The coal raised last year in America is returned as thirty-four million six hundred and forty-one thousand tons from the anthracite seams, and eighty-five million five hundred thousand tons from the bituminous seams, making an aggregate production of one hundred and twenty million one hundred and forty-seven thousand tons. The returns of the inspectors of mines for Great Britain give a gross tonnage of one hundred and sixty-two million one hundred and twenty thousand tons. The position which America has attained as an iron and steel and mineral producer should not be cause wholly for envy, but rather of admiration—for is not America the child of the mother country?

FOR SALE.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlaid by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Minerals and Geology of Ontario and Quebec.

Chapman's Minerals and Geology of Ontario and Quebec, a copy of which is before us, is the most valuable manual of its kind which has made its appearance in Canada to the geologist and student, and is evidence of the deep interest taken by its writer in that branch of study—a study which, from the attention now being given to our mineral resources, promises to become the most valuable from every point of view, whether of the capitalist or the man of scientific pursuits. A similar work on a small scale preceded the present publication, but the exigencies of the times demanded and have called forth this new work in which the subject matter of the previous edition has been greatly extended. The properties by which minerals are determined are clearly stated, with descriptions of the same, and so plainly is this effected that the name of any ordinary mineral met with in Ontario and Quebec can be easily ascertained. The geological features of the two provinces are accurately described, and paleontology is so well placed before the reader with the means of studying it, that fossils need no longer be the sealed book they hitherto have been with the collector and the student. The whole is embellished with cuts and plates, which materially help those using this handbook to determine for themselves various specimens of a doubtful nature. A complete index, which acts as a table of reference is found at the end of the book, and besides being of great use as a table of contents, it forms also a list of the mineral products of the provinces which it embraces. To the prospector and the mining engineer the work must prove of great value; and in the Port Arthur district, amongst the Buckingham phosphate miners, and wherever iron deposits are being worked, we predict its usefulness will create a ready sale and active demand for it. In part III, the section devoted to mineral veins, is especially worthy of notice, and the various theories as to their origin, formation and existence are carefully written, and throw much light on a long vexed question. In part V, the section devoted to the Lower Ottawa district is of great interest to us locally, and the fossil fish and other organic remains found in the vicinity of Green's Creek, and in the boulder clay of the surrounding country are treated of. Geology as a study is more deeply followed by the present genera-

tion, than by their forefathers, to whom the surface soil was of greater value for their farming purposes than the underlying strata, whose hidden treasures were unknown to them. But with the progress of the country, education has progressed also, and the desire is now manifest on all sides to gain an insight into these natural resources of wealth which nature has so long ago stored up beneath our feet, waiting only the prying eye of science to explore. Professor Chapman's book will materially aid this search, and a careful perusal of its pages will save much unnecessary labour in prospecting where the signs he gives are wanting; whilst the knowledge given by indications pointed out by him will lead with a little care and discretion to the finding of mineral veins in places probably unlooked for or passed by from want of that knowledge. The value of this book to the public at large is far superior to the ordinary reports published by the Geological Survey, for while the latter deal with areas and sections of country from a scientific point of view, they convey no recommendations as to the probable results, or to richness and extent of mineral deposits. This volume in fact contains the pith of those reports, embellished with the writer's own ideas and deductions, and is in so concise and readable a form that its very size contributes to add to its usefulness. We consider it a handbook which should be in every library, and which no one interested in mining matters should be without. The publication is well got up, and although some of the cuts, particularly the fossils, are a little indistinct, the type, paper and binding are all good and would compare favourably with any English production. The publishers are Copp, Clark & Co., Toronto.

Natural Combustible Gas.

The Report of the Commissioner of Crown Lands of the Province of Quebec for 1887, just received, states that the gold mining license fees last year amounted to \$23, while the expenses incurred in their collection, and for the maintenance of police in connection therewith, reached the sum of \$2,416.80. The yield of gold is not stated.

The Report contains, in addition to the ordinary appendices on its transactions, a very interesting and exhaustive report by Mr. J. Obalski, Government Mining Engineer, on natural combustible gas, and the gas resources of the Province of Quebec, a subject which at the present moment is engaging general attention and which is worthy of more than a mere passing notice.

Mr. Obalski gives it as his opinion that the discovery of gas in a district would immediately raise the value of property considerably, while new industries would spring up there, especially should facilities be afforded them in the shape of cheap land and cheap gas. Opinions, he says, vary as to the origin of natural gas. Some admit that it is produced by the decom-

position of animal or vegetable organic remains accumulated since the earliest geological period. Others, whom he styles the practical class, hold that it is formed continuously by chemical reaction in the earth where hydrocarbons are formed which pass off into the higher parts when they find outlets and porous rock to absorb them. The companies, however, operating in natural gas maintain the first theory, and foresee exhaustion in time; to remedy which, it is proposed to manufacture artificial combustible gases at a very low cost.

Amongst the conditions under which workable accumulations of gas are likely to exist are the presence of organic remains in the rock, strata porous enough to store oil or gas, impermeable above and below, and with wrinkled or elevated parts where gas may collect. The principles are also laid down that as gas and oil have a common origin, they must be found in the same regions in variable proportions. In Ohio the gas is found in the Trenton limestone, composed of fossil shellfish, and Mr. Obalski remarks, by the way, that it is this formation in which the Province of Quebec is interested. The reason why the strata must be wrinkled is that if they were perfectly even the gas would be spread over a considerable surface, and no great repositories could exist. This is called an *anticlinal*, and in the Pittsburgh region of Pennsylvania all the rich gas wells are found on anticlinals, whilst outside of them the wells are poor. The gas is stored in its repositories under considerable pressure, and it is owing to this that it can be conveyed in pipes to long distances, the decrease in pressure being estimated about four lbs. to the mile. The mean pressure ranges from 375 to 500 lbs. and upwards at the repositories. Gas borings are similar to those made for oil, and to exclude water, an absolute necessity, special tubing and contrivances are employed. Judging from an estimate of similar work in the States, boring 2,000 feet through such rock as it is expected would produce gas in the Province of Quebec, with tools and tubing, would cost \$3,000. Boring, he says, is the best test in exploring, with judgment and regard to natural conditions. In boring in Ohio for gas, petroleum was struck; and on this point Mr. Obalski says: "In our Province we find ourselves placed in identical circumstances, and it is a matter of no doubt to me that we shall also find petroleum." After mentioning various points in the valley of the St. Lawrence where natural gas has been discovered, one boring at St. Gregoire being 1,115 feet, and another at Maisonneuve 1,500, he points out the fact that the Trenton limestone along the valley of the St. Lawrence, overlaid by the Utica, Hudson River and Medina schists, covered again by a layer of alluvium from 50 to 80 feet thick is favourable, wherever the limestone is covered and does not crop out on the surface, for the production of gas; and he adds that he is "thoroughly convinced, and his special study of the subject justifies him in expressing the

belief, that rich gas and petroleum districts exist in the region indicated by him." He believes that driving borings down to the Trenton limestone will give the best practical results, rather than working at random. Mr. Obalski states that when natural gas was discovered in the valley of the St. Lawrence the attention of the Geological Commission was called thereto, but it attached no importance to the fact. Now the whole utility of the Geological Survey ought to consist in aiding to develop any important discovery, and its report thereon would be of great importance to parties interested. This subject we commend to the notice of the Director of the Geological Survey. We further hope this short review of Mr. Obalski's report will draw out some remarks from our local geologists, and that their opinions may be given as to the probability of borings in this immediate vicinity yielding results that could be utilized here for manufacturing or illuminating purposes. We shall be happy to publish any such communications as being of great importance, not only to this vicinity, but to the community at large.

Government Assayists.

We are authorised by the Department of Interior to contradict the rumor that the Dominion Government have under consideration any proposal to establish Government Assayists at the various mining centres. Such a step, however desirable, is not at present contemplated.

Timber and Mineral Exhibit at Glasgow.

Recognising the importance of the opportunity offered in the International Exhibition recently opened at Glasgow, the Minister of Agriculture, in conjunction with Sir Charles Tupper, has secured one of the courts opening from the main gallery of the building, and this has been set apart wholly for the display of Canadian exhibits. The importance of this step will be readily admitted when it is remembered that Scotland has, from the commencement of the development of our country, supplied a most desirable class of settlers, many of whom have been in almost every walk of life, largely instrumental in helping Canada forward to the position in which she finds herself to-day. Like other portions of Great Britain, Scotland is at present suffering from agricultural and commercial depression, and it is certain that the opportunity thus afforded of examining the samples of our products will be largely taken advantage of, with the result that much useful information will be disseminated, and an impetus given to emigration from that portion of the United Kingdom. It is worthy of note that, although Canada has taken part in exhibitions in France, Belgium and England, this is the first occasion in which she has taken part in any exhibition in Scotland, and there can be little doubt of the wisdom of this step, which will give Scotchmen

an opportunity of judging for themselves of the capabilities of our country and of its great natural resources awaiting development. In an excellent mineral exhibit a sample block of Bituminous Coal is shown from Lethbridge Mines, in the district of Alberta, North-West Territory. It is taken from a seam 5 feet 2 inches in thickness, and lies in a field of great extent, which is computed to contain 5½ million tons to the square mile. A sample of the Anthracite Coal from the mines of the Canadian Anthracite Company in the National Park District of the Rocky Mountains is also shown. According to recent explorations this seam extends over a distance of 16 miles, and is found varying from a few inches to 40 feet in thickness. The metals embrace samples of iron, gold, silver, copper, lead and other ores, principally from mines in British Columbia and the eastern portion of the Dominion. A large obelisk represents the output of gold in British Columbia during the last twenty-five years, and a smaller one represents the yield in Nova Scotia during the same period.

The forest wealth of the Dominion is admirably displayed in a trophy of the woods of New Brunswick, which also serves to illustrate the growth of the Eastern Provinces generally. This trophy, which is about 30 feet in length, and 10 feet in height, has for its base 15 blocks of timber in the bark, comprising the kinds of greatest commercial value. The coniferous varieties being represented by hemlock, red and white pine, spruce and cedar; and the deciduous varieties embracing black and white birch, rock and scarlet maples, beech, black and white ash, red and grey oak, butternut, elm, basswood and poplar. The upper reaches of the trophy show polished samples of the boards and cross sections of these varieties, and an inclined frame running along the middle of the trophy is composed of samples of 30 smaller varieties of trees such as are for use in decorative work, and for other purposes. Besides this trophy, samples are shewn of the fir, maple, oak, yellow cypress, yew and arbutus, grown in British Columbia, while the dimensions of the Douglas pine of that Province are illustrated by means of a 45 inch cube of that variety, which was cut from one of the trees, which, until recently, occupied the town site of Vancouver, the terminus of the Canadian Pacific Railway.

"The Colliery Engineer."

A welcome addition to our list of exchanges this month is the *Colliery Engineer*, published monthly by the Colliery Engineer Company, at Shenandoah and Pottsville, Penna., under the joint editorship of Messrs. Thos. Jas. and Rufus J. Foster. The typographical appearance of the *Engineer* is good; its editorials are ably written; the descriptive and technical articles cover a wide field, and are contributed by thoroughly competent writers; while the selected matter is valuable and well chosen. We have to express our thanks to Mr. Rufus Foster for his courtesy in so kindly furnishing the cuts illustrating the article in this month's issue on "Untimbering of Stalls," which has been reproduced from this excellent journal.

LETTERS TO THE EDITOR.

We invite Correspondence upon matters consistent with the character of the REVIEW.
Be as brief as possible. The writers name in all cases required as a proof of good faith.
One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.
We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

The Profits of Asbestos Mining.

THETFORD, QUE., 12th June, 1888.

The Editor

THE CANADIAN MINING REVIEW :

SIR,—Referring to my letter in last month's issue on this subject. In the prospectus of the recently formed Bell's Asbestos Company, the net profits of Mr. Bell's asbestos business are stated as : in 1885, £7,990 2s. 4d. stg. ; in 1886, £9,133 1s. 5d. ; in 1887, £15,859 5s. 7d. This alone shows the immense business done in asbestos, and as Mr. Bell is one out of a dozen, we can form some idea of the profits on the whole industry.

Yours, etc.,
"ASBESTOS."

General Geology of the Metalliferous Deposits of the Region North-West of Lake Superior.

By Andrew C. Lawson, M.A., Ph.D.

A brief statement of the broad relations which exist between the occurrence of the more valuable economic minerals and the various geological formations in the country north-west of Lake Superior may be of interest to those familiar with that region, and of practical service to those engaged in prospecting. Many of the facts are not new to students of the geology of the region, nor to old prospectors ; but they are not likely to be known to new men coming into the country. They are, therefore, given here, not as any contribution to our accurate knowledge of the features of the region, but as a *resumé* of salient facts which should be recognized by men in any way engaged in exploring for minerals.

The rock formations of the provincial districts of Thunder Bay and Rainy River are first separable into I. Archæan ; II. Post-Archæan (non-fossiliferous, so far as yet known).

The Archæan is easily separable, as every gold prospector in that country knows, into two main divisions, each composed of very different rocks from the other. These, though often much involved by the disturbances which have affected the crust of the earth, can be shewn by careful field study and mapping to be related to each other as upper and lower. They are, therefore, for convenience designated as Upper and Lower Archæan. The Lower Archæan is what is ordinarily known as Laurentian, and is made up almost entirely of a few kinds of granite and gneiss. These are geologically the lowest rocks known in the region.

The Upper Archæan comprises the various schists, greenstones, felsites, agglomerates, &c., which have ordinarily been known as Huronian. The studies of the writer in different parts of the region have shewn that this Upper Archæan is distinctly separable into at least two geological series of rocks ; and as there are some grave doubts as to the correctness of correlating either one of these series with the Huronian of Lake Huron, local names have been applied to them which will be of service till sufficient evidence

has been collected to settle the question of their proper correlation—a question which is at present exciting considerable interest among geologists, both in Canada and in the United States, owing chiefly to the valuable investigations of the late Prof. R. D. Irving, of the United States Geological Survey. To avoid for the present, therefore, this question of correlation, these two series are known as the Keewatin and the Coutchiching series. The latter is geologically the lower of the two, and is developed in great volume on Rainy Lake, Naneukan Lake and Nequaquon Lake. It is composed, so far as known, entirely of mica schists and fine grained, evenly laminated gneisses or feldspathic mica schists, with metamorphic minerals such as garnets, staurolite, &c. The series is remarkably evenly bedded, and all the evidence points to its being a series of metamorphosed sediments, no volcanic rocks being recognised in its entire thickness.

The Keewatin series is of wide distribution, and is the most interesting from an economic standpoint of the Archæan formations. It is ordinarily known to prospectors as the "green slate formation." In more precise, yet very general terms, it is composed of hornblende schists, greenstones or greenish altered traps, soft fissile green schists, more or less chloritic, quartz porphyries and the allied rocks, felsites, felsite schists and sericite schists, some clay slates, micaceous slates and mica schists, quartzites, grey-wackes and great thicknesses of greenstone and felsitic agglomerate. The Keewatin series, made up of more or less lenticular strata of these rocks, forms sharply folded troughs sunk into the Laurentian gneiss or resting upon the intervening Coutchiching schists. These troughs form on the surface belts which traverse the country in various directions. These belts have been traced more or less continuously from the Lake of the Woods to Thunder Bay, and, to anticipate, they are the gold-bearing rocks of the region. The Post-Archæan of the region includes the Animikie and the Keweenaw or Nipigon series.

Thus, beginning at the top of the geological column and going downwards, we have the following scale of formations, all of them of enormous thickness:—

Post-Archæan	{ Keweenaw or Nipigon.
(non-fossiliferous)	{ Animikie.
	(Profound geological break or interval.)
Archæan	{ Upper { Keewatin.
	{ Lower { Coutchiching.
	{ Laurentian.

Each of these five different assemblages of rocks is peculiar with reference to the occurrence of economic minerals. So far as experience teaches the Laurentian gneiss and granite is the most barren of all the formations of the region. Economic deposits do not, as a rule, occur in it, and this fact has become so well known that prospectors spend no time searching for gold in the "granite" country, but get back to the "green slate" or Keewatin rocks as soon as possible. There are, however, in many parts of the country veins of coarse pegmatite which traverse the Laurentian, and some of these will doubtless be found to yield white mica in sufficiently large sheets to be of value.

The rocks of the Coutchiching series are equally barren and are prospectively good, so far as the writer knows them, only for mica in the coarse granites which traverse them in certain parts.

The Keewatin rocks may be said to be rich in the various ores of the metals and in native gold, although it is only occasionally that they are sufficiently concentrated in nature to be of

economic value. The more prominent metalliferous deposits are gold (native and probably also as telluride), silver with the gold, magnetite, copper pyrites, iron pyrites and mispickel, with also galena and zinc blende.

The Post-Archæan Animikie is known to the miners as the "black silver bearing slates," the most prominent and characteristic metal of this formation being silver either native or as sulphide. Other metals are associated with it, but play usually a quite subordinate rôle in the vein deposits. The silver is quite as characteristic of the Animikie as the gold is of the Keewatin. Iron is also a characteristic metal of the Animikie just as it is of the Keewatin ; but while it occurs in the latter as magnetite, usually it would appear with some titanium in it, which lessens its value or renders it worthless if it be in considerable quantity, the iron of the Animikie is usually in the condition of hematite, and appears to occur in beds at the base of the series, associated with jasper and chert. Hematite, however, probably also occurs abundantly in the Keewatin rocks.

The still higher Keweenaw or Nipigon series is known as the Copper-bearing series and is characterized by great deposits of native copper.

It is a very difficult matter to suggest an explanation yet of the fact that these different formations should be so characterized by the presence of different economic metals, and although there are considerations which enable us to understand the peculiar relationship, no attempt will be made to go into them here. But the one great fact should be noticed that all the formations which are so characterized by the occurrence of peculiar metalliferous deposits are more or less abundantly made up of volcanic rocks, and that the formation of the deposits in question is intimately associated with the presence of these.

In the Coutchiching series, where we have no evidence of volcanic rocks, but a series of schists, evidently the result of the metamorphism of a great series of sedimentary strata laid down in a time of quiescence, we have no metalliferous deposits. In all the series above the Coutchiching volcanic rocks abound and so do metalliferous deposits. How is it with the Laurentian? Here we have an immense assemblage of rocks all the evidence concerning which points to their having solidified from a hydro-thermal fusion. They are plutonic rocks that have crystallized from a magma. How is it that we find no metalliferous deposits in them? The simplest explanation of this fact, and the one which is in accord with all the other facts which have come to the writer's notice in his study of the region is this: The Coutchiching and Keewatin series being eminently stratified and in one case made up of sedimentary rock and in the other of alternations of sedimentary and volcanic rocks must, *a posteriori*, have had a hard floor of some sort upon which they were deposited. As the strata accumulated upon this floor, to the depth of many miles, the floor sank within a zone of such temperature that it was fused. Along with the fusion of the floor there were included portions of the Coutchiching and Keewatin rocks. This fusion gave rise to a magma upon which rested as an unfused crust the rocks now known to us as the upper Archæan. Various disturbances and movements served to emphasize the sharpness of the line between the unfused rocks and the magma. This same disturbance seems to have facilitated the shattering of the crust in places so that very many detached pieces of it near the contact were caught up in the magma.

and retained there up to the time of solidification. These two processes, viz: the detachment of fragments of the crust so that they became imbedded in the magma, and the penetration of the same magma within the cracks of the crust gave to the contact of the upper and lower Archæan its eminently brecciated character. The solidification of this magma gave rise to the Laurentian gneiss and granite. Those rocks of the upper Archæan which are closest to the contact of the Laurentian, display the most pronounced metamorphism, while those which are farther from it are as a rule least altered.

Now by the fusion of this floor any metalliferous deposits that may have existed in it, in consequence of its being perhaps partly built up of volcanic rocks, would become disseminated through the whole magma and in any portion of it would be in too minute proportion to be detected by ordinary means. Of course if the floor upon which the Countiching and Keewatin rocks were deposited was the original crust of the earth then we would hardly expect metalliferous deposits to be segregated in it, and its refusion by sinking would not alter it in this regard.

The Untimbering of Stalls.

By Andre Dumont, Professor of Mining at the University of Louvain.

The support of the galleries and of the intervening stalls is often a considerable item in the cost of output per ton of coal. In Belgium the cost of timbering generally varies between 0.60 fr. (1) and 1.20 fr. per ton of coal extracted. In France the cost is from 0.30 fr. to 2 fr. In England—thanks to the condition of the strata and to the methods of working—it only costs from 0.20 fr. to 0.30 fr. In these different countries exceptional circumstances have now and then caused the price of timbering to overstep the limits which we have just indicated, and they have sometimes risen to 3 or 4 fr. or fallen to 10 centimes and under.

In short, the timbering is generally heavy in consequence of the yielding nature of the surrounding ground, principally the roof. It may be added that even in good ground the expense of timbering is of importance in proportion as the thickness of the bed increases. It would never do to proportion the length only of the props to the height of the roof; it is necessary also to give to them a section in relation to their length.

The quantity of wood which is every year buried in the workings, and which is entirely lost, is considerable. We have not the exact statistics of the wood consumed in the Belgian coal mines, but we believe that it shows an annual expenditure of about eight million francs. For a long time the question of supports has engaged the attention of coalowners, and they have made serious efforts to reduce the figure of the prime cost in the column of "timbering."

In bad ground the insufficiency of the supports has caused many accidents, and any direct economy has had to be given up. Certain owners have secured themselves against an exaggerated expense by an agreement for furnishing the necessary timber, based upon a rate per ton. This system does away with one of the cares of supervision, but it is nearly always burdensome for the owner. Before abandoning the galleries and filling them up again, it is occasionally the rule to draw out a part of the framework. But is this system of untimbering regularly carried out? Undoubtedly not. And

FIG. 1. SCALE $\frac{1}{100}$.

who would think of compelling the filler-up to save, at the peril of his life, an old frame, rotten, of which perhaps not one piece would be used again? Are we to imagine him working at the mouth of a blind alley, the exhausted ceiling of which no longer holds for a considerable length, save by a state of equilibrium, which would not allow of the slightest derangement? Such a work would only be carried on easily by assuring the retreat of the miner by a supplementary support sufficiently strong to bear the weight of the earth when put in motion. And what expense then would be incurred in order to draw out an amount of timber of which three-fourths would be solid per cubic metres at the pit's mouth as broken wood.

In back currents, and badly ventilated air passages, where the timber, unless it be of oak, rapidly decays, or is consumed by dry rot, we have come, as well as in heavy ground, to the exclusive use of iron for the frames and even for the casing, and there is already a great saving in the cost of repairs. But as to the stalls, no serious progress has been realized to this day. We have had the Johnson buttress, and the Anzin screw; the last named, the use of which is known, has been in some request, but its numerous disadvantages have caused it to be abandoned by its most enthusiastic admirers. It could only be used with security in light ground, free from fissures. Besides, under great pressure, and above all in beds which were somewhat inclined, the screw bent and it was sometimes difficult to draw it out again. It was not, moreover, without a liability to mislead, and as the price was rather high, this mode of support did not, in the end, produce any economy on the old system of timbering.

In certain cases they draw out as they can, it will be said, here and there, a piece of stall boarding, but what saving can that represent? Besides, except under the most minute surveillance, we believe that these arrangements are more theoretical than practical, and it is not in the filled-up stalls of Belgium that they will be followed to the letter. In the large stalls and the open spaces of English mines, a partial untimbering is done, but the object of this operation, being exceedingly dangerous as it is prac-

ticed, is not so much for the sake of economy as to facilitate the falling-in of the roof when it is slow in doing so. In France, in the working of thick beds by the horizontal system several special miners go over the front of the part filled in and contrive to draw out about 80 per cent. of the poles, when they are paid about 25 per cent. of their value. As for the props, which are about 2.30 metres (2) in height they are often abandoned.

M. Baily, divisionary engineer of the Compagnie de Marles, whose technical services bring him distinction by the numerous improvements that he has already introduced in mining art, has just bestowed an important benefit upon the mining industry. He has attained in, we think, a most satisfactory way, the desideratum indicated by the title of this article. The untimbering of stalls is from this time possible in almost every case, and it can be practiced with economy and security.

The importance of such a fact is evident; it has already been proclaimed in France by the mine owners and by the body of miners. With us, without doubt, the method of which M. Baily is the inventor, will be still better received if it is borne in mind that the conditions of working are much less favorable than those of most of the French basins. Many Belgian mines have a cost of output hardly inferior to the selling price, while the difference for the most favorably situated amounts at the most to 80 or 90 centimes. (3) Now, by this system of untimbering, the cost of output is lowered by 10, 20 or 50 centimes per ton. Great profit will, therefore, result not only to the owner, but also to the miner.

It is of consequence then to introduce this method in our workings as soon as possible, and it is in order to aid in doing so that we take the following description of it from the record of the Union.

M. Baily's system of support is mixed. It is constituted of metallic lengthening bars supported by wooden props. The shape and dimensions of the lengthening bar will vary according to circumstances. However, M. Baily has arrived at a certain type which we will give further on, and which seems likely to

FIG. 2. SCALE $\frac{1}{10}$.

suit the majority of cases. In his first attempts he made use of two flat pieces of iron separated at regular intervals by a clamp, which ran through the joint-bolt. This lengthening bar was very simple and inexpensive, but it was not sufficiently rigid when placed edgewise, but easily lost its proper shape under the heavy weight of bad ground. He has since then used the cross-girder *M*, and then *I*. Finally, he has adopted the cross-girder *H* placed flatwise. The resistance of the materials seems to indicate that it would be more advantageous from that point of view to place it edgewise. Nevertheless practice favors the arrangement adopted by M. Baily. Indeed, the method of placing it flat is more easy, demands less care, and is done more rapidly. The cross-girder well wedged up to the right of the props cannot upset so easily as when placed edgewise. Under the pressure of the roof the last named often gives way, and is twisted. The making it straight again is then

upset, and the support is destroyed. By the flat position none of these inconveniences accrue. Under the pressure of the roof the projections of the lengthening bar penetrate into the head of the wood, this fitting in is so strong that it would be impossible to upset the timber transversely without splitting it throughout, and the operation of untimbering longitudinally, according to the Baily method, is sometimes only possible by disengaging the drop at the foot. The lengthening bar placed flat does not require so much height, which is an appreciable advantage in thin beds.

Lastly, when the pressure of the soil is too great a crack is produced to the right of the props in the two upper projections, with a detonation similar to the discharge of a gun. At this moment the resistance of the frame is still intact, and forewarned, the miners have time to strengthen the propping, or to take such other measures as are expedient.

FIG. 3. SCALE $\frac{1}{10}$.

difficult and requires it to be withdrawn from the mine. The lengthening bar placed flat is inflected in such a way that the deformation is slight, the lengthening bar is used again by turning it upside down, when its resisting power is greater still. If the curvature is too pronounced the miners themselves straighten it by grappling it between two props, and pressing on the projecting part in the way desired. If the piece is bent several times it is straightened by means of a small hand machine invented by M. Baily, which is very simple, and which, with the help of two men, will straighten twenty lengthening bars an hour. The method of placing them flat better preserves the props. It has been noticed that in galleries where the usage of old rail as lengthening bar has been introduced, the pressure of the rail often splits the wood longitudinally or carries away one of the projections between which it is held. In both cases it is

The cross girders which M. Baily usually employs are 80 by 45 millimetres, (4) and 8 millimetres in thickness. Four metres in length is considered most convenient. The lengthening bar is of No. 4 iron. Iron of good quality is essential if vexation is to be avoided. The weight is 8.75 kilogrammes (5) per metre, or 34 kilogrammes per lengthening bar, and the prime cost 1.30 fr. per metre. The lengthening bar of 4 metres is supported by three props, which are always more than 80 millimetres in diameter. The head of the prop is not embellished but sawn straight.

The Placing of the Lengthening Bar.—The setting is very easy. Two men take hold of the bar by the ends, and place it against the roof, a third man props it in the middle, then finishes alone the propping of the ends, after taking care to put good wedges to the right of the stays. The setting of the ashler pieces is done as in the ordinary system of support. In the ways and

FIG. 4. SCALE $\frac{1}{10}$.

false ways shorter lengthening bars are used, supported by two props. The lengthening bars of the way are not taken out.

The Removal of a Lengthening Bar.—The middle timber is first knocked down by striking the head of it longitudinally, or by disengaging it at the foot. The end props fall next, and both lengthening bar and props are quickly drawn out. These operations must be performed under the shelter of neighboring lengthening bars. In any case the miner will not be able to remain under a portion of roof which is deprived of support. That is a principle which must not be departed from, and which constitutes one of the rules of the method. It will frequently happen that the part of the stall comprised between the way and the ventilating pillar will correspond with the length of a lengthening bar, and the miners, in order to pull down the end props and pull out the cross girder, will place themselves under the protection of the support of the ways. If the length of the stall is such that it requires the use of two lengthening bars they will be arranged so as to leave a space between them, which the embankment will lengthen somewhat. This will receive the support of a way, and it will be untimbered when beating a retreat. If the ground is good, support in the false way may be dispensed with, the size of which is only large enough to allow the miner to work free from danger.

(To be continued.)

New Chemical and other Works at Capelton.

As many of our readers are aware considerable improvements have been taking place during the past year at the Capelton Copper Mines, owned and operated by Messrs. G. H. Nichols & Co., of New York. For the following interesting description of these operations we have to express our indebtedness to the *Engineering and Mining Journal* of New York:

Messrs. Geo. H. Nichols & Co., of 41 Cedar street, New York, who are the owners both of the Albert mines and Capelton Chemical Works, as also of the Laurel Hill Chemical and Copper Works on Long Island, showed their good judgment and their faith in these mines when, during the depression in the copper market, instead of abandoning the properties, they determined to meet the difficulties by introducing every labor-saving appliance they could, and so improving their whole plant that they would be able to continue the mining, concentration and shipping of their ores to this city at a profit, even during the most unfavourable state of the markets. This work of the entire reconstruction of their whole plant is now finished, and all the departments are running most successfully, and a short description of the new works will not be uninteresting.

The vein is being worked now from three shafts instead of one as heretofore. The shafts, which are numbered 1, 2 and 3, are respectively 800, 500 and 150 feet deep; they are all inclined at an angle of about 60° and cut diagonally through the ore chutes of the great deposit. The ore mineral is a mixture of copper and iron sulphides in a gangue of quartz and talc. Each of the three shafts has been most thoroughly equipped with first-class machinery. Numbers 1 and 2 are worked by large automatic dumping skips, operated by a 150 horse-power double drum engine, and number 3 shaft is run by an independent 50 horse-power engine.

The new crushing and concentrating mill is situated exactly over No. 1 shaft, and is so connected by surface incline planes with shafts 2 and

3 that the ore from all these shafts is delivered automatically to the dressing floors, and crushed, sized and concentrated without any but mechanical handling, except at the picking tables, where boys do the actual sorting. The whole design of these works reflects the greatest credit on Messrs. Copeland & Bacon, contractors for the plant, and Mr. Earle C. Bacon, who is the consulting engineer for the company, and from whose designs and under whose direction, aided by the superintendent, Mr. Richard Penhale, the work has been so successfully carried out. The crushing and concentrating mill is run by a 100 horse power cut-off engine, supplied with steam from a battery of 400 horse-power boilers. In addition to the mill engine, these boilers supply steam for two large air compressors, an Ingersoll and a "Norwalk Compound," which supply and run 18 drills underground.

The ore coming from the three shafts is first dumped from the automatic skips on to a "grizzly," with the grates set three inches apart: below this "grizzly" is a second one with the grates set one inch apart. All the material which will not fall through the upper "grizzly" is fed direct to the large 30 by 15 Farrel foundry Blake crusher, from which the ore is discharged on to the second "grizzly" with the fines from the first "grizzly." What passes through the one-inch bars goes on down to the concentrators, but all the material between 1 inch and 3 inches is fed to an endless picking table. Boys are stationed on each side of this table and pick out the lean and barren rock. The lean ore goes to a 20 by 6 crusher and thence to two sets of 30 inch Cornish rolls and from these to the concentrators, while the clean and rich ore is discharged over the end of the travelling table and fed to two 20 by 6 crushers, from whence it drops into bins and is ready for shipment. The fines from the screens and the lean ores from the tables are conveyed to the double compartment plunger jigs, of which there are six, and the concentrates are conveyed into bins for shipment. The ore from these bins is then fed automatically again into the buckets of a wire rope tramway, which carries it down the mountain side and delivers it direct into the railroad cars, 4500 feet from the mine. This tramway, which has also proved a very great success and a source of great economy, was built by the Trenton Iron-Works of Cooper, Hewitt & Co., of New York. The capacity of the mill and tramway is 300 tons per day. The fines from the mines are conveyed by tramway to the chemical works at foot of the hill and made into sulphuric acid. This is probably the most complete sulphuric acid plant on this continent. It will thus be seen that practically, from the time the ore is first loaded into skips at the bottom of the shafts, its progress through all the different operations of sizing, crushing, separating, concentrating and transporting to railroad is entirely automatic.

Both the designing and carrying out of the whole plan is worthy of great commendation, and is an example of mechanic skill well worth examining and following by mining engineers in general.

Cost of Colliery Surveys at Westphalia.—It is stated that at the 194 collieries of the Westphalian district, during the years 1850-1 and 1882, the average annual expenditure on the preparation of mine plans and on other mine surveying operations amounted to £9,323 16s. This sum represents an average of 17 cents for every 100 tons of coal raised, or fifty cents for each workman employed.

In General.

The following shipments of Canadian ore have been made from Montreal from 18th May to June 9th. 1888:—

Date.	Ship.	Destination.	Shippers.	Tons.
May 18	s.s. Oxenholme	Liverpool.	Wilson & Green..	550

Judge Burbidge will not give his decision in the case of Fraser v. The Queen for a few weeks yet.

Markets.

The British market quotations stand at 11½d., with a fifth of a penny rise.

Templeton District.

The celebrated Blackburn Mine is undergoing some improvements in its workings and is producing a steady output of first class mineral. A large quantity of ore has been shipped since the season opened.

Messrs. Gillespie & Patterson will shortly resume operations on their property.

The Templeton and Blanche River Company's main shaft has reached a depth of eighty feet, where a well defined vein is yielding rich ore, and gives most promising indications as the workings increase in depth.

Kingston District.

Captain Boyd Smith arrived in New York from Great Britain on 2nd instant. A good force is working the Blessington and St. George's Mines, and the output is most satisfactory. At Blessington one of the shafts is yielding a very good iron ore. Every preparation has been made for extensive operations during the summer. A large number of new shows have been opened. A shipment of 200 tons will be made in a few days from the St. George's Mines to Philadelphia.

Du Lievre.

The shipments from the High Rock Mines continue very large, something over 1,500 tons having been shipped during the past month. This company is building a freight shed at Buckingham landing. On Monday, the 11th, 55 tons of high grade ore was taken out of No. 11 pit, the result of one blast. How is this for a record?

The Dominion Mining Company have an immense quantity of phosphate at their landing place ready to ship; their shipments will probably amount to 4,000 or 5,000 tons this season. It is believed that this company will re-open their workings at the "Lansdowne" Mine, adjacent to Mr. S. P. Franchot's property.

The Canadian Phosphate Company's output for the week ending 16th instant was close upon 150 tons. Captain Smith proposes to put a new steamer on the river to facilitate the moving of his company's output.

A party named Carriere has eight or nine men working a phosphate find in the vicinity of Donaldson's Lake, and claims that it is in the interests of an American firm located at Chicago. Nothing wonderful has turned up in the way of discoveries so far. There seems to be a little mica intermixed, but it is all small stuff, and black at that. Felspar occurs here and there.

The grinding mills at Seabury are busy again. Mr. Hunton, the manager, reports that 100 tons of 60 per cent. are being ground for the High Rock people, to be distributed in the United States. The North Star Mines are also having a similar quantity crushed for the new chemical works of Messrs. G. H. Nichols & Co., at Capelton.

A number of new openings at the Emerald give excellent promise of good returns.

At the Little Rapids Mines two new openings on the east side of the hill have met with good results, while the drifts between the shafts "A" and "B" expose a mass of very rich ore. The owners of this property will continue exploration and development for a few months longer, when the extraction of the mineral for the market will begin in earnest. Judging from a recent inspection, there must be several thousand tons of phosphate now in sight.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

Reports from Halifax state that John R. Bothwell of New York has interested several New York capitalists in the purchase of a number of Cape Breton coal companies, which are to be consolidated into one management. Among the companies selling to the syndicate are the Sydney & Louisburg Coal and Railway Company, the International, and the Caledonia Company. It is also likely that a number of collieries now owned in Halifax will be taken into the consolidated company.

A new 15 stamp water mill constructed by the Truro Foundry Company has been put in operation at the Moose River Mines and gives every satisfaction. Mr. Touquoy has a large quantity of quartz ready for the crusher, and as a result of 4½ days' work with the new mill secured a bar of gold weighing 80 tons of quartz.

At the Lake Lode Company's properties in the Caribou district 106 ounces of gold were got for the first fortnight's crushing in May, and it is thought that 100 ounces more has been obtained up to the 1st of the present month. The leads are now yielding quartz well filled with coarse gold.

The opening of navigation has not been productive of steady work at some of the Pictou County Collieries. At the Dunsmuir mines there has been much idle time, owing, it is said,

to an insufficiency of vessels to carry the coal to Montreal. It is a pity that this should be so, as no expense has been spared preparing for a large output, and the management is now in a better position to fill orders than it has been for a long time past. In one day, recently, no less than 1100 tons of coal were shipped from these mines. Operations have been resumed in the No. 4 slope, giving employment to between 30 and 40 men and boys.

The Black Diamond Mine is still working steadily, doing a local trade. The output though not large is steadily increasing. More machinery for the further development of this mine is expected shortly.

Messrs. Russell and Fraser, along with Alex. Purvis, late underground manager at the Drummond Colliery, are prospecting in the neighbourhood of Westville, and it is reported that they have discovered a seam of coal. Nothing definite is, however, yet to hand to confirm the report.

At the Albion mines, the Acadia Coal Company continue to push vigorously the opening of some of their valuable properties. In the new slopes, which have been closed since the explosion in January last, extensive explorations have been made with very encouraging results, and the opening of at least one of these slopes may be looked for in the near future. The sinking of the new slope to the Cage Pit seam has been much impeded by a "step," but this has now been got through and the working goes on as hitherto. The draining of the Flood Pit, although frequently interrupted, continues, and the bottom of the shaft will soon be reached when pumping will have to be resorted to before much further progress can be made.

Notice is given by the Commissioner of Works and Mines that on the 5th day of July he will declare forfeited a number of gold mining leases in the 15 Mile Stream district, unless it can be shown that the requirements of the law have been complied with. This is as it should be.

A gold brick valued at \$2,000, the result of three weeks work, has lately been sent by the Egerton Gold Mining Company to the Glasgow Exhibition.

A destructive fire at the East Rawdon Gold Mines, on the 12th instant, destroyed thirty buildings, including seventeen dwellings, store, the company's office and store room, and the crusher and hoisting gear. The loss is estimated at over \$30,000.

The following are the official gold returns so far received at the Mines Office for the month of May:—

District.	Mill.	Tons Quartz.	Oz. Gold.
Dar's Hill,	Duffell Mining Co. . . .	875	376
Oldham,	Oldham United	68	39
Lake Catcha,	Oxford	115	158½
"	J. Anderson	1	78
Shebrooke,	Stonmont	112	263

A meeting of the shareholders of the Amherst Coal and Mining Company was held at the mine on the 12th. S. H. Holmes, D. L. Patrick, D. J. Patrick and Wm. Patrick were elected Directors for the ensuing year; William Patrick, elected Secretary and General Manager; and F. B. Robb President. The meeting of shareholders stands adjourned until 26th instant.

New Brunswick.

Major Markham has completed arrangements for continued operations at his Manganese mines pending a settlement of the estate of Messrs. W. C. Pope & Co., and the mines have accordingly been reopened and work resumed.

The annual meeting of the Westmoreland and Albert Mining and Manufacturing Company was recently held in Moncton, N.B., at which Mr. H. R. Emerson was elected president, and Mr. E. B. Chandler was re-elected secretary. The property of this company is situated at Rockland, N.B., and consists of oil and shale works. It is understood that negotiations are pending which will probably lead to the active working of the property by American capitalists. The company has been reorganized with this end in view and to complete the negotiations.

The work of prospecting in New Brunswick is steadily going on in different counties, principally in Albert, Kings, and some others. New finds are being continually brought to light, and several new deposits of manganese have been discovered in Kings and Albert Counties.

Amongst the mines that are at present being worked is the New Brunswick gold and silver mine, in King's County, about 8 miles from Waterford. The ore is silver and copper, and the width of the vein at the surface is 30 feet, with well-defined walls. There are other veins on the property, and with the careful outlay of capital it should prove a paying investment.

Quebec.

We have to acknowledge a first-rate specimen of clear amber mica from Mr. H. A. Church's property near Chelsea.

Extensive mining operations are being successfully carried on this season at the Beauce gold fields. Recently a nugget weighing 8½ ounces and valued at \$124 was, with much coarse gold, taken out of a claim recently opened on the River du Moulin, about one mile from St. Francis Church.

Ontario.

By the explosion of two torpedoes in the 500 foot gas well shaft of the Collingwood Rock Well Company at Collingwood on the 1st inst., the flow of gas was increased. There are indications of the presence of gas in West ward also, and the company is going to sink a shaft there.

The Canada Copper Company's mines at Sudbury are developing nicely and producing a satisfactory output. A number of new buildings are in course of erection at the mines.

Mr. J. B. Miller is reported to have made a rich discovery of silver in the Sudbury district. Specimens assayed by Mr. Willmet, of Sault Ste. Marie, gave 182 ounces of silver to the ton.

Col. Robert Hill, A. C. Buell, J. B. Kirk, A. N. Young, E. H. Reed and Volney W. Foster, Chicago capitalists directly interested in the Denison gold finds, paid a visit to their property during the month. On their return to Sudbury a company was organized under the title of the Vermillion Mining Company of Ontario (under the Joint Stock Companies Act) with a capital of \$240,000. All the capital is allotted, half of it being given for the property.

One assessment of five per cent. has been made. The following is the Board of Directors: B. E. Charlton, of Hamilton (President), A. G. Duncan, of Sudbury (Vice-President), John Oliver, of Chicago, (Secretary-Treasurer), Robert Hill, of Chicago, E. H. Reed, of Chicago, Henry Ranger, of Sudbury, and V. W. Foster, of Chicago. At the mines, which are superintended by Mr. A. G. Duncan, a number of buildings for the accommodation of the men have been erected. Thirty men are at work, and a small three stamp mill is kept running night and day. The company own 2,800 acres.

The Orillia News-Letter continues to hold out the promise of the existence of coal in that neighborhood, and calls on public-spirited citizens to assist in ascertaining the truth. Over \$600 has been subscribed by a few persons to make the test; they are asking the people of the town to make up another \$600. Just what the reasons are for making the assertion that a bed of coal underlies the County of Simcoe we cannot say other than that an expert, a native of the county, who has wide experience elsewhere, has made a surface examination and found good indications.

At the annual meeting of the K. & P. Railway and Mining Company, held recently, the following officers were elected for the ensuing year:—Henry Sibbett, of Brooklyn, president; B. W. Folger, vice-president; D. L. Gibbons, secretary and treasurer; and a board of directors composed of the following: Henry Sibbett, Brooklyn; F. S. Flower, W. E. Cooper, D. L. Gibbons, H. S. Hollister, New York; W. G. Pollock, Cleveland; W. R. Stirling, Chicago; and F. A. Folger, Kingston. A statement presented showed the available assets to be \$90,000, and for the past year on mining operations, \$10,000 net profit was realized. No dividend was declared. Several American firms have asked to be supplied with the ore, and one of them, the Carnegie Bros., of Pittsburg, have asked for 500 tons per day.

The attention of mine owners and operators, quarrymen, and managers of reduction or manufacturing works, is directed to the advertisement in another place, regarding the Centennial Exposition to be held at Ohio from July 4th to October 27th. Every effort is being made by Mr. Blue to have Ontario's mineral wealth represented by a first-class exhibit, but he cannot very well do this unless he receives the hearty co-operation of all in any way interested in the growth and advancement of the mineral wealth of the province. At present there is every indication that the Ontario exhibit will be large and varied, and we trust our readers will assist him in this undertaking as far as possible by sending their private collections of minerals, or by sending specimens from their mines. Such an exhibit cannot fail to do good to the mining industry of the province.

We have received a copy of the prize list, just issued, for the Tenth Industrial Exhibition, to be held in Toronto from the 10th to the 22nd of September next. Any of our readers, who may think of sending contributions to the mineral exhibit, for which an excellent prize list is provided, can readily obtain a copy of the printed list by dropping a post card to Mr. H. J. Hall, the Secretary, at Toronto. The prospects of the success of this year's exhibition are very promising.

At the Bristol Iron Mines the engineers have started work on the short line of railway necessary for the development of the property. Mr. Hiram Robinson, one of the Directors, is confident that everything will be in good working order at an early date. New calcining furnaces will also be put in operation.

Re Cartier gold discoveries our correspondent writes: "I have made enquiries in this matter and find that a man named Joseph O'Harze, living at Larchwood, has found gold and silver in the vicinity of Cartier Station, and I understand the find to be important. I believe that parties willing to invest capital in mining in this district can secure some good locations with every prospect that they will turn out remunerative. At all events the district here will bear inspection. There are a good many prospectors out now and capitalists have experts in the field. It is said that some of the properties will shortly be taken up by English capitalists."

Manitoba and North-West Territories.

Not the least interesting portion of Mr. J. B. Tyrell's report on the region of Northern Alberta is the chapter on economic minerals. Regarding the coals and lignites he writes:—"The enormous deposits of coal and lignite that underlie an area of more than 12,000 square miles in the western part of this district must be considered as first in value and importance among its economic minerals." The only true bituminous coal yet found within the district is that outcropping in the neighborhood of Bow River. On the north side of that river only one seam—two feet ten inches thick—was observed. If the thickness of the coal on the south side be taken as seven feet and the dip be assumed to decrease gradually to the eastward, the seam would contain about 9,500,000 tons to the square mile. There is reason to believe that the bed extends north and south of the known outcrops for many miles. Nearest in character to the bituminous are the lignitic or semi-bituminous coals found on the Red Deer river at the eastern edge of the foot hills. There is an irregular seam at the Rocky Mountain house varying from 8 to 2 or 3 inches thick. Probably other and thicker outcrops may be found in the vicinity. There is an important seam in the North Saskatchewan above the mouth of Buck creek, which in one place is fifteen feet thick. The area may be underlain by some 140,000,000 tons of lignite coal. Another area yields probably 150,000,000. All through the Edmonton series in fact there are seams of greater or less extent, many of which will be opened as the country becomes developed. Compared with American coal, the quality of our Northwest lignite can hold its own. Many samples from the seams above mentioned may be favorably compared with these of eastern America, while generally they are quite equal to those of Colorado, Wyoming and other western states.

The output of coal from the Lethbridge Mines for the month of May was close upon 500 tons per diem.

The Local Legislature of Manitoba offers to loan to the C.P.R. \$7,500 per mile, so that the company may experience no difficulty in extending their Southern and South Western branches into the Souris District. The completion of these lines would undoubtedly prove of much benefit to the province in the opening up of the large coal deposits of the Souris River. This coal is of very good average quality and is suitable for general use

and for steam purposes. One great fault, however, is the large amount of hygroscopic or contained water which greatly exceeds that found in bituminous coal, and which causes the lignite to slack and crumble to some extent on exposure to the atmosphere. Another is the percentage of ash, which is greater than that contained in higher grades. Practical men, however, contend that both these faults can be largely counteracted by improved methods of preparing the coal and by alterations on existing stoves and grates. The coal burns well, gives a good strong heat, and can be laid down cheaply throughout the province. The development of these deposits will prove of immense value to this comparatively treeless province.

Operations at the gold mines of the Lake of the Woods has been commenced.

H. G. McMicken, Winnipeg, has just returned from his gold location, seven miles east of Rat Portage. He and his partners have put up a house there; have a gang of workmen; and drilling outfit on the spot. They have traced some very fine leads right across their property, and are getting out several car loads of ore which they will ship to Omaha next week to have it reduced and its exact value determined. So far all they had to go on was a number of assays which resulted very favourably.

The Dauphin Oil Company has been formed in Winnipeg to work the petroleum said to have been recently discovered in the Riding Mountain District, north of Minnedosa. A board of seven directors consisting of the following gentlemen were elected: Dr. Clark, C. Stewart, C. F. Brown, T. G. Mathers, T. G. Moore, C. O. Wichenden, F. H. Schofield, A. R. Anderson, W. L. Harrison and W. P. Johnston. Mr. Case, an expert with twelve years experience in the Pennsylvania oil regions and four years in Ohio, states that he examined the district in winter and traced the oil by the discoloration of the snow. Whenever the snow was discovered, the ground underneath was not frozen, a fact which is quoted as a sure indication that oil was present in large quantities. It is further stated that there are better indications of oil on the surface in the Lake Dauphin district than could be found 200 feet below the surface in Pennsylvania, and that the shale exposed on the sides of the hills by land slides was so saturated with oil that it could be ignited with a match and would burn freely. The surface oil, which is said to have been struck, is on top of a rock bed, and the rock will have to be bored to reach the genuine or rock oil. The new company has resolved to make application to the Legislature immediately for letters patent of incorporation under the provisions of the Joint Stock Companies Act. The capital stock has been placed at \$100,000, divided into shares of \$25 each.

The Manitoba Oil Company, which owns property in the same district, has decided to resume operations this month.

Mr. George Bradford, M.E., of London, England, passed through Ottawa during the month on his way to the North-West, where he will examine and report to an English syndicate on the coal deposits of that region.

British Columbia.

E. A. Mackenzie & Co., of Jamieson Creek mines, some twenty miles north of Kamloops, have bonded their property to a California

syndicate, who have agreed to expend between \$3,000 and \$4,000 on the property within ninety days. If the syndicate desire to purchase the property at the conclusion of the option they have agreed to pay to each of the three owners the sum of \$15,000. The ore looks well and the prospects are encouraging.

The *Colonist* is our authority for the following from Illecillewaet—Corbin & Kennedy are breaking the trail over the mountain, and expect to be running their pack train bringing out ore in about a week. It is quite improbable that the wagon road up the North Fork will be attempted as the appropriation is only \$3,000, and the government ask that seven miles of road be completed before they will give this amount. The cost of these seven miles will be at least \$7,000.

McGillivray & Co. are working upon the Silver-tip mine, and report a well developed vein, with ore of the same class as the Lanark.

The Selkirk Co. will soon have their pack train running and shipping several tons of ore daily.—The Lanark looks splendidly, large deposits of ore showing up in different portions of the mine.

The Hon. Robert Dunsmuir states that four shafts are at present being sunk on his New Comox mines:—The prospect shaft on the eight-foot seam is being widened for the purpose of making it an air shaft. There is a great deal of work to be done, and it is doubtful whether coal will be shipped this fall or not. The line is graded for several miles, and its whole length will be ready for the rails by the time they arrive from England.

The Nicola Mining Company's shaft is down 153 feet, the ore body at that point being 3½ feet in width, the quality improving as depth is attained. The ore carries more gold than silver, averaging about \$60 to the ton of the former and 25 ounces of the latter. It is the intention to sink to a depth of 200 feet.

The President of the Hamilton Powder Company has been in Vancouver, and, with characteristic enterprise, has decided to erect a magazine for their business at a point a few miles from Hastings. The C. P. R. has agreed to construct a switch to the magazine from the main line, which will facilitate the receipt and delivery of their explosives.

The Mount Ceniz tunnel, the property of the Perry Creek Gold Mining Company, has been driven in anew about 400 feet, and it takes only 100 feet more to reach the face of the canyon which impeded the old working. The Kootenay pioneer, Mr. W. Fernie, who originally opened this tunnel, gave his opinion only a few weeks since that as soon as the rock is reached enough gold will be taken out to pay expenses, and after getting through the canyon a very big find may be expected.

The British Columbia Smelting Company (limited) has been registered in London, England, with a capital of £65,000, divided into 65,000 shares of £1 each, for the purpose of carrying on the business of miners, and to win, get, mine and work ores, minerals and metallic substances and compounds of all kinds, smelters, refiners, and dealers in bullion, metal, and other products of smelting.

The mining season at the various camps is being turned to account with great spirit. The extent and character of the minerals are now thoroughly known and it only requires the presence of the requisite facilities in the shape of smelters, to create a new era for the province. A great deal of discussion is now going on as to the proper localities for the reducing works, a point which outsiders would suppose to be easily settled. If smelters are to be erected in this province, they should be as near as possible to the place where the ore is taken from the mine. The mere site of the smelters, so far as surrounding conveniences are concerned, is a very secondary affair; the chief requisite is shortness of carriage from the mine to the smelter.

Latest advices speak highly of the outlook of the Lanark mines, Ill-cillewaet. The work performed during the winter and spring has uncovered a very rich body of ore. A tunnel has been run lengthwise upon this ore body, extending about 115 feet, with a width of 8 to 25 feet, and a depth of 20 feet, proved, and probably 15 or 20 feet deeper. Ninety feet below this a second tunnel has just struck the same body, but narrower. It seems to widen out as the body goes into the mountain. Still lower, at a further depth of 150 feet, the contract vein with narrower veins of galena, has been discovered cropping out on the surface, and a third tunnel will probably soon be started to explore this depth. Mr. Tilton, the superintendent of the work, is now preparing to ship ore, and hopes in a week or two to be shipping five tons per day of first-class ore. With the number of animals at present available by the company, about 40, there is much more ore in sight than they can pack out during the summer. The yield of this galena ore is perfectly uniform—and the result of the season's work will astonish those who have no faith in *results* in British Columbia mines. It is very satisfactory to the company to know that every extension of the underground work exposes large deposits of paying veins. Several English and American experts are expected at the mines this summer to watch the smelting, and it is thought they will invest their money in the enterprise.

Something About Explosives.—All quarries have a certain amount of covering which must be removed before the stone can be taken out. This deposit is either a part of the stone which has become disintegrated by the

weather or is a later deposit. The first consideration in removing this deposit, or "stripping," and in forming a quarry face, is to get the broken stone out of the way as quickly and cheaply as possible regardless of its size. For this purpose no especial skill is required in the management of the explosive, but for breaking rock which is to be used, much skill and knowledge are required in order to reach the best results. Furthermore, a knowledge of the particular stone which is being worked is necessary. Every quarry has its peculiarities and must be worked according to the best method for that peculiar stone.

The use of a sudden explosive, like dynamite, is to be avoided. The effect of such explosives is to shatter the stone in many directions, as does a blow from a hammer. Coarse gunpowder is better. Repeated light charges of powder covered with sand are much better than heavy charges tamped in tight. A rock may be detached without breaking by means of often repeated light charges, which would be badly broken were a single heavy charge strong enough to detach the rock employed. Where a heavy charge is employed the shape of the bottom of the drill hole influences the direction in which the rock will split to a greater extent than does the rift. When light charges are used, the bottom of the drill hole influences the direction of the breakage, but to a less extent. Much rock has been wasted through a lack of knowledge on this point. If one examines the bottom of a drill hole which has been made with a steel bitted percussion drill, it will never be found round, and a hole made with a hand drill is always triangular at the bottom. A charge will ordinarily break the rock in three directions corresponding with the shape of the bottom of the drill hole. In the sandstone quarries of Portland, Conn., they have controlled the blast very successfully by the use of the following device:

Deep holes from ten to twenty or more feet in depth are drilled with a diameter of ten to twenty inches. These holes are made by machinery, and the direction of the blast is determined by placing the charge of powder in cannisters of tin, shaped according to the kind of blast required. These cannisters are placed in the drill holes and tamped in with sand so that the effects of the blast are the same as though the holes were the shape of the cannister. Where a break across in a straight line is desired, the cannister is made of two pieces of sheet tin, the edges being left unsoldered and the ends covered with paper or cloth. A horizontal cross section would show the cannister bounded by two minor segments of a circle. The blast is

in the direction of a plane passing through the edges of the cannister. Where the shape of the blast is not considered a great waste of rock necessarily follows.

In most quarries where the shape of the rock is to be considered, powder is only used to detach large pieces which are further worked up by means of wedges. The drill hole is put down to the depth to which the rock is to be broken and light charges of powder are employed. Afterwards a heavy charge is employed which forces the block forward. As every rock has a different structure, the direction of cleavage planes influences the management of the blast. There must be at least one free end to allow the rock to move out to the face. Where the ends are cut off by natural joints they are called "end joints;" horizontal joints, called "bottom joints," are more common.

It sometimes happens that the bottom joints occur only at great intervals. The Penryn quarries, in California are of this kind. Here they cut an underblast along the first bottom joint from one end joint to another. A line of lewis holes is put down 15 or 20 feet from the face and the blast breaks out the block between the joints and down to the bottom joint which is about eighty feet from the top. Such blasts act more like wedges than ordinary blasts and are capable of breaking off blocks containing 100,000 cubic feet of stone.

For quarrying sandstone in the larger quarries powder is not often used. Granite is less liable to be injured by the use of explosives than softer stone, but even in quarries of this class of stone, blasting is not often used except for detaching large blocks which are removed by other means.

Deep Boring for Coal.—The deepest bore-hole in the world is said to be at Schladenbach, near Kotechau Station, on the railway between Corbetta and Leipsic, and has been undertaken by the Prussian Government in search for coal. The bore-hole, which in January, 1885, had reached a depth of 4,600 feet, was commenced in June 1880, but left after a years work, recommenced at the end of 1882, and is still progressing.

Chlorination of Zinc Ores.—The Iron Silver Mining Company, of Leadville, Colo., has entered into a contract with the Omaha & Grant Smelting Company for the erection of a plant in connection with the latter company's works, to extract the zinc from the ores mined by the Iron Silver Company. The process is an experiment, the success of which will be of immense importance to Leadville. It will

CHARLESWORTH & CO.

consist of a partial roasting of the ore for desulphurizing, and then an application of electricity to a chlorination process, which will precipitate the metallic zinc and leave the residue a free smelting ore. It is the application of Plattner chlorination to zinc instead of gold ores.

Slag Fertilizers.—The manufacture of basic slag manure is proceeding steadily, and a much larger market might be found for steel-works' waste if greater quantities could be readily ground. The Staffordshire Steel Company have now three grinding mills at work turning out 200 tons per week, and the heavy stock which was laid in during the autumn months is now going off rapidly to the order of London fertilizing contractors. The selling price to the local agriculturists is 40s. to 45s. per ton, as against 55s. or 60s., which has to be paid for phosphates.

Trustee's Sale.

Anthracite Coal Lands.

To settle controversy among parties in interest I will sell to the highest bidder at public sale, at my office in St. Paul, Minnesota, on the 22nd day of June, 1888, at 11 a.m., 1,240 acres of anthracite coal lands, located about one mile from Canmore Station, on the Canadian Pacific Railway, Province of Alberta, described as follows:—

The NE $\frac{1}{4}$, NE $\frac{1}{4}$ of NW $\frac{1}{4}$ and NE $\frac{1}{4}$ of SE $\frac{1}{4}$ of section twenty (20), the W $\frac{1}{2}$ of NW $\frac{1}{4}$, SE $\frac{1}{4}$ of NW $\frac{1}{4}$, SW $\frac{1}{4}$ and W $\frac{1}{2}$ of SE $\frac{1}{4}$ of section twenty-one (21), the N $\frac{1}{2}$ of NE $\frac{1}{4}$ and SE $\frac{1}{4}$ of SE $\frac{1}{4}$ of section thirty (30), and the W $\frac{1}{2}$ of NE $\frac{1}{4}$, SE $\frac{1}{4}$, NE $\frac{1}{4}$, NW $\frac{1}{4}$, E $\frac{1}{2}$ of SW $\frac{1}{4}$ and SE $\frac{1}{4}$ of section thirty-one (31), all in township twenty-four (24), range ten (10), west.

Terms: one half cash within thirty days, remainder in two equal annual payments with 7 per cent. interest.

A deposit of 10 per cent. required at the time of sale. This is the best block of coal lands in the Bow River Valley. For further particulars address

E. F. DRAKE, Trustee,
St. Paul, Minn.

WARNER'S SAFE CURE

ST. CATHERINES, Ont., Jan. 24th, 1887.—About six years ago I was a great sufferer from kidney disease, and was in misery all the while. I hardly had strength enough to walk straight and was ashamed to go on the street. The pains across my back were almost unbearable, and I was unable to find relief, even temporarily. I began the use of "Warner's Safe Cure," and inside of one week I found relief, and after taking eight bottles, I was completely cured.

W. E. Hugg

Manager for American Express Co.

THE GREATEST

CHATHAM, Ont., March 6, 1888.—In 1884 I was completely run down. I suffered most severe pains in my back and kidneys, so severe that at times I would almost be prostrated. A loss of ambition, a great desire to urinate, without the ability of so doing, coming from me as it were in drops. The urine was of a peculiar color and contained considerable foreign matter. I became satisfied that my kidneys were in a congested state and that I was running down rapidly. Finally I concluded to try "Warner's Safe Cure," and in forty-eight hours after I had taken the remedy I voided urine that was as black as ink, containing quantities of mucus, pus and gravel. I continued, and it was not many hours before my urine was of a natural straw color, although it contained considerable sediment. The pains in my kidneys subsided as I continued the use of the remedy, and it was but a short time before I was completely relieved. My urine was normal and I can truthfully say that I was cured.

J. M. Oode

Regulates Every

GALT, Ont., Jan. 27, 1887.—For about five years previous to two years ago last October, I was troubled with kidney and liver trouble, and finally I was confined to my bed and suffered the most excruciating pain, and for two weeks' time I did not know whether I was dead or alive. My physicians said I had enlargement of the liver, though they only gave me temporary relief. Hearing of the wonderful cures of "Warner's Safe Cure" I began its use, and after I had taken two bottles I noticed a change for the better. The pains disappeared and my whole system seemed to feel the benefit of the remedy.

WARNER'S SAFE CURE!

SAFE CURE

TORONTO, (18 Division Street,) Sept. 17, 1887.—Three year ago last August my daughter was taken ill with Bright's disease of the kidneys. The best medical skill in the city was tasked to the utmost, but to no purpose. She was racked with convulsions for forty-eight hours. Our doctor did his best and went away saying the case was hopeless. After she came out of the convulsions she was very weak and all her hair fell out. The doctor had left us about a month when I concluded to try "Warner's Safe Cure," and after having taken six bottles, along with several bottles of "Warner's Safe Pills," I saw a decided change for the better in her condition. After taking twenty-five bottles there was a complete cure. My daughter has now a splendid head of hair and weighs more than she ever did before.

Mrs. J. S. Burns

BLOOD PURIFIER.

296 McNab St. North, HAMILTON, Can., Nov. 2, 1886.—I had been suffering for over twenty years from a pain in the back and one side of the head and indigestion. I could eat scarcely anything, and everything I ate disagreed with me. I was attended by physicians who examined me and stated that I had enlargement of the liver, and that it was impossible to cure me. They also stated that I was suffering from heart disease, inflammation of the bladder, kidney disease, bronchitis and catarrh, and that it was impossible for me to live. They attended me for three weeks without making any improvement in my condition. I commenced taking "Warner's Safe Cure" and "Warner's Safe Pills," acting strictly up to directions as to diet, and took thirty-six bottles, and have had the best of health ever since. My regular weight used to be 180 lbs. When I commenced "Warner's Safe Cure" I only weighed 140 lbs. I now weigh 210 lbs.

M. S. Furlong

Bodily Function

I have continued taking "Warner's Safe Cure" and no other medicine since. I consider the remedy a great boon, and if I ever feel out of sorts "Warner's Safe Cure" fixes me all right. I weigh twenty pounds heavier now than ever before.

John Gruen

Inventor of the Maple Leaf Lance-tooth Cross-cut saw.

Cures Most Diseases

Poison in the Blood, only Curable by

VALUABLE PLUMBAGO AND OTHER Mineral Lands FOR SALE, IN THE TOWNSHIP OF BUCK- INGHAM, COUNTY OF OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Fairway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

FOR SALE. VALUABLE Copper Mining Properties — IN THE — Eastern Townships

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
- 2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
- 3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
- 4th. Mining Rights in same vicinity on.... 250 "

All of the above properties lie within 1½ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only 2½ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Caruncle Hill Mine, Lots 2 and 3 R. 14, and
2, 3, 4 R. 15, 718 acres. Same class of ore as is found
in the Ascot properties above described, but yielding a
higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, ¼ Lot 25 R. 12, 50 acres, with
dwelling houses, smith's shop, ore sheds and office, large
winding and pumping steam engine, with boiler, winding
and pumping gear, and about forty fathoms Cornish lifting
pumps complete, railway tracks, ladders, etc., situated
three miles from Grand Trunk Railway. A considerable
amount of mining work has been done at this mine. A
well defined vein richly charged with vitreous purple
and yellow sulphurets of copper traverse the entire
length of the property, five feet in thickness, yielding 8
to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This prop-
erty for the most part is unexplored, but copper is found
on the greater part of the property. On one of the lots
a vein about twenty feet in width has been found. Sam-
ples of the ore have yielded as much as 22 per cent.
of copper, being also rich in sulphur. Other samples of
pyrites from the same property, free from copper, have
yielded as high as 48 per cent. of sulphur. The only
drawback to this property is in its distance from the
railway, it being about four miles from Garthby Station,
Quebec Central Railway. A new line is chartered,
however, which, when built, will run directly through
the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler,
pumps and appliances. Within three years after this
mine was first opened it produced nearly \$500,000
worth of copper. It is situated about half a mile distant
from the stations of the Grand Trunk and South Eastern
Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
- 10th. Bolton Mine, two miles from Eastman Station,
Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

ESTIMATES GIVEN.

Orders Executed with Care under Personal
Superintendence.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same: but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

FOR SALE

Valuable Phosphate and other Mineral Lands,

In the Township of Buckingham, County of Ottawa.

Patent for Mineral Rights direct from the Crown.

TITLE INDISPUTABLE.

8½ of 25 in the 12th Range 100 acres
8½ of 25 in the 11th Range 100 acres
Three lots, 26, 27, 28, in one Block, in the

11th Range 600 acres
(adjoining Gore of Templeton.)

Also a Circular Saw Mill situated on lot 26, 11th
Range, in good working order, and sufficient water
power to drive two other mills of the same capacity.

About 30 thousand cords of firewood, chiefly hard-
wood, may be obtained on these said lots.

The lands are in close proximity to the celebrated
Emerald, Little Rapids, and other richly productive
mines in the great phosphate region. Recent prospecting
has disclosed rich and extensive veins of the mineral.

The property is located one mile from the navigable
waters of the Du Lievre River and nine miles from the
Village of Buckingham, where the C. P. R., which
two years ago built a branch line in order to secure the
traffic of the industry, carries it to the port of Montreal.

Conditions and terms of sale may be known by apply-
ing to the proprietor,

Rubbing it in.—How many years does this
progressive and Liberal Government of Ontario
intend to allow to pass before Fraser in Brock-
ville, Hardy in Brantford, Mowat in England,
and the Rosses going to the States or elsewhere,
will learn what is transpiring in the Ontario
mining country? How long a time is to be
lost before this Government will issue the pro-
clamation and open up the country to the poor
man? From Sudbury, southwest along the
Canadian Pacific, we have as rich a country in
mining wealth as California. Instead of it
being open to the inhabitants, it is reserved for
capitalists and friends of the Government.
Look at the names of those who are the
owners in the township of Denison? Is there
one working man on the list? Yet in Califor-
nia the discoverers received what they found.
In Canada they only prospect other people's
land. The law is good enough if the Govern-
ment would put it in force, but they are either
so neglectful or so ignorant that they do not
know enough to proclaim it.—*Empire.*

The Recovery of Gold from Refractory Ores.—A new process for the recovery
of gold from refractory ores has been patented
by Mr. J. H. Pollok, assistant to the Professor
of Chemistry at the University of Glasgow. It
is said to be cheaper than other processes, the
comparison being that while by older processes
the extraction is only 80 per cent., and the cost
20s per ton, by this process the cost is put at
6s 6d per ton and the extraction at 97 per cent.
A great many experiments have been made in
the Glasgow University, in the presence of
Principal Caird, Sir William Thomson, Profes-
sor Ferguson, Dr. Stewart and others; and most
favourable opinions have been expressed by
scientific and practical men as to the value of
the patent. In one experiment 9,000 grains of
tailings were treated, and out of 330 grains of
gold present 320 were extracted, the residue
containing only 10. Samples of ore from
New Zealand, South Africa, Queensland and
Victoria have been successfully treated. Pro-
fessor Ferguson writes that the process is
specially applicable to "light" gold, is a rapid
one, that the apparatus is of the simplest kind,
and there is nothing about it to get out of
order; that the cost of materials for the extrac-
tion runs from 4s 6d to 6s per ton; and that
the gold is almost entirely extracted.

CHEMICAL APPARATUS! OF EVERY DESCRIPTION.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlain by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Solid Petroleum as Fuel.—Experiments are being carried on in Russia with the view of finding a process, at once practical as well as desirable, on the score of economy and cleanliness, of solidifying the petroleum used as fuel. According to the report made to the Russian Government by Dr. Kauffmann, who has had the principal charge of these experiments, a successful method of accomplishing the desired result consists simply of heating the oil, and afterwards adding from 1 to 3 per cent. of soap. The latter dissolves in the oil, and the liquid on cooling, forms a mass having the appearance of cement and the hardness of compact tallow. The product is hard to light, burns slowly and without smoke, but develops much heat, and leaves about 7 per cent. of a hard black residuum.

A Mining Mystery.—In the whole history of coal mining never has so strange a bit of news as the following been printed. "A short time ago a Goole firm commenced to work one of the thin seams of coal at Worsbro' Dale, a short distance from the Edmunds Main Colliery, by means of a dry-hole. In the course of their work the men were surprised to find they had no water to contend with. For some time it was conjectured that the workings connected with the Barnsley seam at the Edmunds Main Colliery were taking this water. This, however, turned out to be not the sole cause, for much to the surprise of the miners, they broke into some old workings, and found that the same seam had been got. The most singular part of the story is that there were no indications on the surface that the coal had been won at any time, and no person living can remember coal being got there. At the same time nothing is known by the owners of the minerals that they had been got at that place. Much interest is being evoked by the incident."—*Sheffield Independent.*

Business Principles Essential to Success.—The mining for gold and silver, copper and lead, can be, should be, nay, must be put and maintained upon the same footing or business management as the best managed of the railroads and the best managed of the coal mining enterprises of Pennsylvania. But mining enterprises worthy of consideration must start upon the basis of meritorious mineral properties more or less developed, with a valuation, in the outset, to those investing money in their exploitation, honestly or equitably adjusted between all the parties interested. Mere prospect holes should not be so incorporated, and the shares thereof floated upon the market at a price which gives a money value of from one hundred thousand to five hundred thousand dollars to 1,500 by 600 feet of barren scoria and other rock rubbish. There is an abundance of good mineral properties to be had by proper seeking, at reasonable prices, the development of which to a profitable stage is an assured business matter if the same care, judgment, energy and earnestness of purpose shall be brought to bear to that end which are regarded essential for success in any other business enterprise. And while this is the absolute fact, at the same time, it can be rightly claimed for mining enterprise that in

no other undertakings is there such chance for making a great deal of money upon a comparatively small investment as from mining ventures.—*Financial Record.*

New Method of Controlling the Pressure of Natural Gas.—Mr. C. N. Payne, manager of the Buffalo Natural Gas Company, has invented a method of controlling the pressure of natural gas that appears likely to prove a complete success. From the main that supplies the city he had constructed a pipe of equal strength and size which connects with and penetrates a boiler six feet in height and six feet in diameter to within eight inches of the bottom. Into this enough water has been poured to cover the mouth of the pipe, which is open, with twelve inches of water, which corresponds with a pressure of 4 7-10 ounces. From the boiler a pipe similar to a smoke stack also extends and any pressure in excess of the 4 7-10 ounces immediately forces the gas through the water and it escapes through the pipe smoke stack into the air. A water gauge on the outside of the tank shows the exact amount of water in the tank. Evaporation of course lessens the amount of pressure; for without any water in the tank the gas would nearly all escape. A local paper also describes another device that is being exhibited and tested there by Dr. G. A. Scroggs, of Beaver, Pa., of the Beaver Manufacturing Company. Its arrangement is said to be of the most simple nature, controlling a cut off which completely closes both when the pressure gets too low or too high. It is regulated so that it closes when the pressure falls below two ounces or goes above six ounces, the latter being the highest pressure used in houses burning the gas in Buffalo. In this way there is almost absolute safety, as it does away with the danger of escaping gas in either event. The device, however, can be fixed so that it will control the gas at a pressure running up into the pounds. It is automatic of course and Dr. Scroggs says it meets with the entire approval of Mr. Payne, who has ordered a number of them for use in Buffalo.—*Progressive Age.*

Recognition of Bravery.—On the 5th ult. the Masonic fraternity of British Columbia unveiled a handsome monument to the memory of Samuel Hudson, a member of the order, who lost his life in an attempt to rescue the miners in No. 1 Shaft, Nanaimo, after the disastrous explosion of May 3rd, 1887. The monument was erected in the Nanaimo Cemetery, and is ten feet high. It consists of a broken pillar firmly set on a double base, and is an imposing structure. On the base is the following inscription:

"Erected by the Masonic Brethren to the memory of Samuel Hudson, aged 37 years, who died May 3rd, 1887, in a brave attempt to rescue coal miners after the terrible explosion in the No. 1 Shaft, Nanaimo."

Mr. Hudson heard of the disaster, hastened from Wellington, and formed one of the searching and rescuing party that went into the burning mine. Venturing too far from the air current, he was overcome and suffocated before he could be taken to the surface by his comrades. Such instances of bravery and philanthropy are worthy the highest honors, and the Masonic fraternity of British Columbia has fittingly bestowed on him a deserved honor.

WANTED—Situation as Foreman Engineer at Mines. Sixteen years experience erecting, repairing and running Hoisting, Pumping and Air Compressing Engines and machinery. Would undertake in connection with above, the duty of Time and Storekeeper or Outside Overman. References if required. Address "Engineer," office of THE CANADIAN MINING REVIEW.

Asbestos and Its Uses.

Asbestos has been aptly described as a physical paradox. It has been called "a mineralogical vegetable; it is both fibrous and crystalline, elastic yet brittle; a floating stone, which can be as readily corded, spun, and woven into tissue as cotton or the finest silk." In general terms it may be said to be a fibrous variety of serpentine, closely allied to the hornblende family of minerals, the Canadian variety of which is called by mineralogists "chrysotile." In the local vernacular of the mining districts this is *pierre-à coton* (cotton-stone), perhaps as expressive a term as can be found. Its constitution and properties have been known for ages. The ancients, we are told, believing it to be a plant, made a cere-cloth of it, in which they were accustomed to wrap the bodies which were to be burned on the funeral pyre, so that the ashes might be retained, separate and intact, for preservation in the family urn. It is related of Charlemagne, that having a cloth made of the material, he one day after dinner astonished his rude warriors by throwing it in the fire, and then withdrawing it cleansed and unconsumed. For centuries asbestos was regarded merely as a mineral curiosity, and, in spite of its indestructibility by fire, it is only within recent years that it has developed into a valuable article of commerce, the first modern experiments in the use of it practically extending no further back than 1850. Now, however, it is put to many important uses, as in the manufacture of different kinds of packing for engineering work, millboards, felts, lubricants, paints, fireproof cloth, roping, etc., etc. These are fully and ably described in an interesting little work, "Asbestos and Its Uses," recently published by Crosby, Lockwood & Co, London. The author, Mr. R. H. Jones, resided for some time in the Eastern Townships, and it is evident from a perusal of his book that he possesses an extensive knowledge of the mineral, and is fully conversant with the many uses to which it is now being put, while his interesting descriptions of our mines is a feature of excellence which will be appreciated by all interested in the growth and advancement of the industry in this country. Discussing the relative merits of the Canadian and Italian varieties of the mineral, Mr. Jones says: "I think we may safely conclude that both possess undeniably good qualities, and that there is an ample field for both, inasmuch as the peculiar properties which render one kind unsuitable for some particular purpose are often precisely those which best adapt it for another. Each variety will assuredly make its own way and take its proper place in public estimation, as

"further experiments and greater experience in the use of it shall bring its special value more prominently to light. Ample proof has been given of the valuable qualities of Italian asbestos; and if any proof were needed of the intrinsic value of its Canadian competitor, nothing more would be required than to point to such houses as that of John Bell & Son, of London; of Wertheim, of Frankfort; or of the John's Manufacturing Company, or of the Chalmer's-Spence Company, of New York, whose world-renowned manufactures are made of Canadian asbestos alone. The essential characteristics of both sorts are alike in this respect, that they are absolutely indestructible by fire, or even when exposed to the action of any known acid; the Canadian variety possessing in addition, in a very high degree, that strange peculiarity (which is also claimed for one of the Italian sorts), and is common also to plumbago and soapstone, of being a self-lubricator. Good Canadian fibre is known at once by its soft, greasy, soapy feeling, and one of the leading New York firms claims for its products, made entirely of Canadian asbestos, that they will resist even the flame of the blowpipe; and further asserts that this mineral transcends all previously thought of materials for fire-proofing, in that it is not only absolutely indestructible by fire, but that its power of resistance cannot be worn away or diminished by lapse of time or hard usage, as invariably happens in the case of such applications as tungstate of soda."

Regarding its use, Germany is a very large consumer. In France the consumption is not so great, although manufacturers in that country are now beginning to stir themselves, especially in regard to some very valuable kinds of paper, which they are making entirely out of Canadian fibre; and Paris has now set the world an example by the adoption of the Chevalier Aldinis' plan of clothing firemen in a dress of asbestos cloth. America, however, is the country where the most rapid strides are being made in the development of every branch of this new industry, and there also the Canadian fibre is alone used. A considerable quantity of it is made use of in England in the arts and manufactures, but, Mr. Jones thinks, England lacks in some degree the readiness which is found on this side of the ocean in the adaptation of new materials and new methods of work.

Carbo-Dynamite.—This is the most recent addition to the already lengthy list of explosive compounds. Carbo-dynamite is not hygroscopic, water apparently having no action upon it. This freedom of exudation points to its use in fiery mines. It is claimed that the large volume of steam generated at the moment of explosion not only extinguishes any flame which might have been produced, but also adds considerably to the effect of the shot. It does not produce any fumes of a deleterious nature. It is further claimed that the explosive force can be regulated, that its manufacture is simple and inexpensive, and that the price does not exceed ordinary dynamite.

LETTERS TO THE EDITOR.

We invite Correspondence upon matters consistent with the character of the REVIEW. Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

The Mineral Resources of Canada.

OTTAWA, 21st June, 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—The statement in the *Engineering and Mining Journal* of New York, 9th June, to the effect that "Canadians are ignorant of most of the vast mineral riches their country contains, and comparatively indifferent to what they do know," is incorrect and misleading, and the person who penned such a statement can only be regarded as measuring the knowledge of others by his own.

I have no hesitation in saying, considering the area of the country, the limited population, and the difficulties of access to large portions of it, that the minerals of Canada, and where to seek them, are as well, if not better, known than are those of any similarly situated and equal area of country in the world.

That many of these deposits are not yet developed is quite natural, and is due neither to "ignorance" nor "indifference," but arises chiefly from the circumstances above referred to.

Those who, without knowledge, write such articles as have recently appeared in some of the papers, and been quoted in others, do not seem to see that their statements are self-contradictory.

The late Senate Committee made no investigations in the country, and was, therefore, entirely dependent on existing knowledge for any facts it may have adduced. Its function was, however, not the less useful in the direction of giving wider publicity to these facts, most of which, however, had already been ascertained through the explorations of the Geological Survey, and can be gathered, by anyone desirous of doing so, from the reports and maps that have been published by the Survey, or in special cases by personal or written application to the Director.

The mineral resources of Canada, though great, are not exceptional, and, except in some minor details, do not differ from those of other countries.

They are being steadily explored, and gradually developed *pari passu* with the opening up and settlement of the country.

To attempt to do so in advance, or under manifestly adverse circumstances, results in large outlay and no immediate return, and from this rule, in every new and unsettled country, gold, precious stones, and a few other minerals, in which small bulk represents large value, alone are an exception.

The indifference referred to, so far as it exists, arises from the knowledge and keen appreciation of these facts possessed by Canadians, and in many instances it is the outcome of experience generally dearly bought by following the advice of the practical miner, instead of that of the scientific and not less practical geologist. Yours, &c,

ALFRED R. C. SELWYN.

Director of the Geo'l Survey of Canada.

The Dominion Mining Laws.

The Editor

THE CANADIAN MINING REVIEW:

I have read your valuable journal with a good deal of interest. In your issue of February there appears a letter by "Canadian"—who, by the way, seems to speak with a good deal of authority—on this question. On his statement, whoever he may be, I would like to know how he explains the following case if there are no "speculators, or land sharks, etc," interfering with the rights of discoverers. Having made a discovery of a mineral substance used in manufacture or trade not known to have hitherto existed in Canada, I had the claim surveyed and plan furnished by a Dominion Land Surveyor, also affidavits testifying to the facts of the discovery, and the claim approved of by the Hon. Sir D. L. Macpherson, the then Minister of the Interior, as contained in Department File Reference No. 6583 T. and M. How does it come that this claim is not settled if there are no "speculators or land sharks" interfering with the rights of discovery in this case since the 21st of May, 1883?

I am, yours respectfully,

PETER MACGREGOR.

Phosphate of Lime in the Chazy Formation about Ottawa.

By Henry M. Ami.

In the "Report of Progress" for 1851-52, published by the Geological Survey of Canada, under Sir Wm. Logan's administration, the last named eminent authority describes (p. 28) the occurrence of nodules at the base of the calcareous strata in the Chazy formation, and points out several localities along the Ottawa River where these 'phosphatic nodules' may be found. An analysis made by Dr. Sterry Hunt of the Hawkesbury nodules gave the following results:—

Phosphate of lime (bone earth).....	44.70
Carb. of lime.....	6.60
" magnesia.....	4.76
Per ox. of iron and trace of alumina....	8.60
Insoluble silicious residue.....	27.40
Volatile matter.....	5.00
	97.56

The following notes are given by Sir Wm. Logan respecting their mode of occurrence:—"Small black phosphatic nodules are mentioned by Mr. Murray as occurring at the base of the Chazy limestone. On the 33rd lot of the 7th concession of Lochiel, where they were sparingly disseminated in the rock, they occur in precisely the same stratigraphical place, on the rear of the 10th lot of the 1st concession of West Hawkesbury, where they are rather larger, but still in sparing quantity. As the nodules, however, when separated from the rock, hold, according to the analysis of Dr. Hunt, a large amount of phosphate, they would probably render the limestone beds in which they occur of more than ordinary value, to be burnt for agricultural application when lime is required, as the phosphate can scarcely fail to be of additional service. Small black phosphatic nodules exist also in their sandstone beds interstratifying green slates at Grenville. * * *

"Brown nodules of the same description, but larger in size, occur in a conglomerate, supposed to be of the same age as the Grenville beds, at Allumette Falls on the Ottawa."

Similar nodules have been found in different formations, and were formed at different periods

in the earth's history. They are not unfrequently met with in shales holding abundance of Lingulae, and the fact that the shells or hard parts of those creatures were phosphatic in composition evidently accounts for the prevalence of phosphatic materials in the beds which hold their remains in abundance.

In examining the series of the geological formations, as they are developed at Ottawa, no one can fail to recognize the dark brown or chocolate coloured shales, which crop out at Aylmer, the Hog's Back, Skead's Mills, Lower Gatineau Ferry, Hemlock Lake, Green's Creek and elsewhere, as constituting a well-defined series of strata, whose position is intermediate between a calcareous or limestone formation above and a sandy or arenaceous formation below. Looking closely into these shales they are seen to teem with the remains and fragments of Lingulae, which, as stated above, are pre-eminently phosphatic in their chemical composition.

The great abundance of these fossil shells and their nature leads one naturally to arrive at the same conclusion that Sir Wm. Logan arrived at, viz: that such beds as hold these might afford a fertilizer.

Prof. Saunders, of the Central Experimental, has already kindly expressed his desire to have these shales analyzed at the 'Laboratory' in order to ascertain their real and practical value as a fertilizing agent. Experiments might also be made on crops, and the result would be looked forward to with no small interest.

It may thus appear that 'phosphate of lime' may be found in tolerable abundance and quite at hand, but belonging to a series of strata essentially different in origin and mode of deposition from those rocks which are well-known to afford the mineral *apatite* or phosphate of lime in the Templeton and Buckingham districts, north of the Ottawa. There is no doubt, however, in the case of the phosphate in the phosphate bearing shales of the Chazy formation, that they are purely of organic origin. That mineral having been secreted and deposited in the usual manner round the outer edge of the creature's mantle, as has been nicely pointed out by various writers on the subject. Whether or not the *apatite* from the Laurentian system is of organic origin is a doubtful and open question; sufficient to say, that previous to the deposition of the Chazy formation phosphate of lime existed in solution and otherwise, so that one of the oldest genera of shells—the genus *Lingula*—found abundant material wherewith to build its skeletal parts, which are to a great extent composed of phosphate of lime, and the presence of these *Lingulae* makes the shales of undoubted value.

Mineral Resources of Nipissing and Hudson Bay.

In connection with the projected Nipissing and James Bay Railway, a few notes may be interesting on what is already known of the varied mineral resources of the country between Lake Nipissing and the salt water which lies at a moderate distance due north of it, and also as to the great mineral wealth of Hudson's Bay itself.

It is well known to geologists that the Huronian rocks constitute the great metaliferous system of Canada, as well as of the States of Michigan, Wisconsin and Minnesota. Their equivalents in other countries likewise produce a variety of metallic ores. On the other hand, the Laurentian rocks on the Hudson's Bay side of the watershed, at all events, have not yet af-

forded any indications of useful minerals. So that the Huronian areas of a geological map are those in which alone we may look for mineral wealth in the region in question.

With the exception of one interruption, the Huronian rocks extend all along the north shore of Lake Huron from the St. Mary's River to Killarney, and it was from their extensive development in this region that they derived the name Huronian. From this shore line, as a base, has traced these rocks continuously to the north-eastward as far as Lake Temiscaming and thence, beyond the watershed to the country lying northeast of Grand Lake on the Upper Ottawa, whence they are continued in the wide belt of similar rocks which reaches to the south end of Lake Mistassini. A great area of igneous rocks belonging to this system lies to the south of Lake Abitibi. The late Mr. Walter McOwat of the Geological corps showed that the Huronian rocks also extended to the northward of this lake, and in 1877 Mr. A. S. Cochrane traced the same rocks for a long distance down the Abitibi River.

Starting from Lake Nipissing, the line of the projected railway would run for a short distance on the Laurentian rocks, but it would enter on the great Huronian area before reaching Lake Temagami. Thence it would continue upon these rocks past Lakes Temiscaming and Abitibi and to a point midway to the south extremity of James Bay, or for nearly two thirds of the entire distance. The last few miles would be upon the level Devonian rocks near the commencement of the extensive basin of this formation which occupies a vast tract of the westward of James Bay.

The gold bearing rocks of the Township of Denison constitute a belt of the Huronian system, and as these rocks have a uniform northeast strike in this region they pass about Lake Temagami, where gold and silver are also known to occur, and they no doubt cross the Montreal River and run far to the northeast. A very large deposit of argentiferous galena is now being worked on Lake Temiscaming. Between Lake Temagami and Montreal River is a lake, about twenty-five miles long, which Dr. Bell surveyed last summer, and to which he gave the name of Lady Evelyn Lake. Here a vein of argentiferous galena, and veins of copper with more or less gold and silver, were discovered. Asbestos was also found in the same neighborhood. Iron ore was reported by Mr. McOwat at the Quinze Rapids, and although the quality at this place was not very good its occurrence there is interesting, as showing that the Huronian rocks maintain their iron-bearing character in that direction, and richer deposits may be confidently looked for. Roofing slates of fair quality are found in abundance on the Mata-betchewan River and Lake Temagami.

The copper strata of Sudbury begins at the old Wallace mine on Lake Huron, and after passing through Sudbury and Lake Temagami, reaches the Montreal River, where deposits of richer ore have lately been found on Bay Lake. It has been met with again on the Blanche and is known to exist near the height of land east of the canoe route between Lakes Temiscaming and Abitibi. Further to the northeast, it was found, still rich in copper, by the late Mr. Richardson of the Geological Survey, a short distance southwest of Lake Mistassini. Among the minerals most in demand at the present time is the fine silky asbestos, such as that of Coleraine and Thetford in the Province of Quebec. Last year this valuable substance was discovered near the head waters of the Montreal River.

If Moose Factory were the objective point on James' Bay, the line would pass near the large iron ore deposits of the Mattagami River and not far from the lignite and gypsum beds of the Misinaibi and the main Moose River. In any case it would be easy, in that level country, to construct a short branch line to the iron deposits.

When the line once taps the salt water, the shores of a vast sea, which Dr. Bell has happily styled the Mediterranean of the New World, are at once rendered accessible. The east and west shores of this sea each measure about 1,000 miles in length. Those of Roe's Welcome, Fox Basin and the Southampton group of islands, would make at least 2,000 miles, and the two sides of Hudson's Straits another 1,000, or a total of upwards of 5,000 miles of coast line. It is impossible to imagine that the varied resources of this great length of seashore would not afford a considerable traffic. Confining our attention, however, for the present to the mineral resources, Dr. Bell has already pointed out the existence of undoubted wealth of that character in these regions. He has found gold and silver at two places on the east main coast and upon what he named the Ottawa Islands of Mosquito Bay, a thick band of lead-bearing limestone at Richmond Gulf and inexhaustible deposits of fine manganese iron ore on a number of the islands near the coast beyond Whale River. Indications were also found of copper, zinc, molybdenum, asbestos and other useful minerals. Anthracite is also known to exist, but Dr. Bell does not think it is in large quantities.

On the northwest side of the bay, the Haronian rocks are very extensively developed all the way from Eskimo Point to Chesterfield Inlet, and Dr. Bell has enumerated a long list of the various rocks to be met with in that region. Large veins of auriferous iron pyrites and deposits of copper ore, of which, however, little is known, have been found nearly opposite to Marble Island, and free gold in quartz has been discovered at Repulse Bay. Sheet mica is said to exist in great quantities at Chesterfield Inlet, and it was reported some years ago that an American vessel carried a cargo of it to New York. Indications of fine clay ironstone have been noticed by Dr. Bell in many places as derived from the rocks of the immense Devonian basin west of James Bay, which is more extensive than the whole western peninsula of Ontario.

In Hudson's Straits, the geologist whom we have so often quoted has found traces of gold in quantity on the south side, and on the north shore large quantities of a very fine variety of mica in wide sheets, plumbago and pyrites; and the Eskimos report the existence of iron ore in several places in that region.

With such an array of facts it is evident that the projected line of railway has the prospect of a large traffic in minerals. Indeed we know of no line which, in proportion to length, at all equals it in this respect. And it must be borne in mind that the discoveries we have enumerated have been made after only a comparatively small amount of exploration. Very much more is naturally to be expected when a thorough search shall have been made.

Rock Drills Run by Electricity.—Electricity has been successfully applied, as a motive power, to rock drills. The advantage claimed is, that by using it at the heading, the long lines of steam or compressed air pipes usually employed are entirely avoided, and that the stoppages in the work are less frequent.

The Utility of Waste Sawdust as Fuel for Roasting and Smelting our Iron and Other Ores.

The Report of the Select Committee of the Senate appointed to enquire into the extent of the sawdust and refuse deposits from the saw-mills and their effect upon the Ottawa river is before us. This blue book is mainly of interest to the mining community on account of the evidence given before the Commission bearing on the economic importance of the waste produce of the lumber industry as a fuel for roasting ores. Mr. John Stewart, of Ottawa, a mining engineer of wide experience in this and other countries, was examined closely on this important question, and as his evidence contains some valuable information, we reproduce it in full for such of our readers as may not have an opportunity of reading the Report for themselves:

BY HONOURABLE MR. CLEMON:

Q. What is your profession? A. I am a mining engineer.

Q. How long have you been in this section of the country? A. Three and a-half years.

Q. Are you conversant with the saw dust question on the Ottawa? A. I understand a little about the uses to which it might be applied.

Q. Will you give the Committee the benefit of your knowledge of that subject? A. It might be utilized in a small way for the manufacture of paper pulp, and making compressed vessels—pails, tubs and vessels of that kind—and for making brick. It has been utilized for those purposes in Canada; but the large application, almost a Dominion one, as it applies to all the Provinces, it can be used for the manufacture of gas by treating it in proper furnaces, for the roasting of ores and re-heating of iron. The heavy matter from the mills could be made into charcoal, and the products of distillation in the process of making the charcoal will pay for the carbonization of it. That could be used in blast furnaces. The sawdust or fine material can be either manufactured into gas or into charcoal, and compressed into bricks if necessary. It has been done on a small scale. It has been experimented on and proved to be practicable, but not to any large extent as yet. It has been used in the manufacture of gas for the last 20 years in Sweden, and the Swedish association of iron merchants presented the inventor of those furnaces with the sum of \$10,000 for his ingenuity. The Michigan lumbermen utilize their sawdust in the manufacture of salt. They live in a salt region, and they bore wells and get salt springs, and evaporate the brine by burning the sawdust and converting the brine into salt.

Q. Do you know how Mr. Rathbun disposes of his sawdust? A. He uses it all in that way. He makes gas and lights the town of Deseronto, and he makes charcoal, which he sells. There is nothing wasted from his mills.

Q. As an engineer, do you think this sawdust could be utilized profitably? A. I can see no difficulty in it, any more than in the handling of the same number of tons of iron ore, not so much, because you can elevate the sawdust in elevators. You can convey it in a traveller, but you have got to shovel or handle iron ore. Even the sawdust that is now in the river, some of it could be taken out and could be used in a furnace; because sawdust coming direct from the saw, from wet logs containing 45 per cent. of water, can be utilized in that way. That was pointed out in the report of the Geological Survey by Dr. Sterry Hunt, I think, in 1870.

Q. Then in your opinion there is no practical difficulty in those sawmill men utilizing their sawdust and preventing it from going into the river? A. If they make sufficient arrangements for it, there is not.

BY HONOURABLE MR. SMITH:

Q. Did you ever see a sawmill driven by water-power from which the sawdust did not go into the river. A. I do not remember seeing it on the St. John River.

BY THE CHAIRMAN:

Q. Did you ever see it anywhere? A. Yes, the Miramichi sawmills burn their sawdust, but I cannot say that they are driven by water. It is not sufficient to destroy sawdust; the lumbermen ought to make use of it. It is putting it to a wrong use even to burn it. They ought to make it into charcoal.

BY HONOURABLE MR. BOTSFORD:

Q. To make sawdust into charcoal? A. Yes.

Q. Would that not be an expensive process? A. They can do so. They can compress it into bricks in the same way as is done with fine coal dust. In Belgium and the north of France the coal is a poor lignite. It slacks itself or is slacked with water to wash out the sulphur, it is then dried and compressed in brick machines under strong pressure and formed into solid bricks. I have seen a piece of charcoal compressed from refuse cedar and pine at Deseronto, and to a person who did not know, it is like a piece of cast iron.

Q. Would not that be an expensive process? A. No. Senator Archibald can give the expense of that process. It would not be any more expensive than compressing coal dust, which is done down in Cape Breton with the dust from the refuse of the coal mines of that part of the Province.

BY HONOURABLE MR. MACDONALD (B.C.):

Q. What do they mix with it? A. They take a little pitch, but a better means of cementing it is the refuse from the starch factory. Instead of letting it go into the river, they use the refuse from a starch factory, one per cent. of which is sufficient to form a good bond mixed with charcoal.

Q. Would not earth do? A. A clay containing silica would not be desirable; it would need to be a clay containing lime, which would form a slag. The iron which would be manufactured in this way is just the same as the Swedish iron, the finest quality made in the market. If the market of Canada was not large enough—if we manufactured more than the market would take, we could export it, because the United States have to import that quality of iron from Sweden. In fact, charcoal iron has been exported from the Province of Quebec in years past. I think, on a rough estimate, the amount of refuse from the mills here might be put down at something like thirty thousand tons of coal per annum.

BY HONOURABLE MR. BOTSFORD:

Q. Would not the process of making that refuse in to coal be greater than the value of the coal after it was manufactured? A. No, it is not an expensive process, because it burns itself. The sawdust is fed from a large hopper, and falls down on a furnace bed, and that is passed off into gas into chambers; thence it passes off into a reservoir where it would be either brought to the furnaces for the roasting of ore or furnaces for re-heating iron. It is only in the expense of handling. Of course you have got to handle fuel of any kind if you are to roast ore or heat iron, so that the expense is not any greater than coal. Then in the manufacture of charcoal the products of distillation would pay for the expense of it, so that you would have the charcoal for nothing. One of the products is pyroligneous acid, woodspirit, etc., and there are several other products, the result of distillation and carbonization. It is not iron ores alone to be roasted by that gas, the sulphur ores, the large deposits of which we have in this country can be very economically treated with the gas made from sawdust, because gas is a better roasting agent than fuel. That could be used for the manufacture of sulphuric acid for the treatment of our phosphates in the manufacture of superphosphate so that instead of shipping the crude apatite to England, we would manufacture it in this country and ship it in a manufactured state.

BY HONOURABLE MR. HAYTHORNE:

Q. And we could use it on our farms? A. Yes, and use it on our farms.

BY HONOURABLE MR. BOTSFORD:

Q. Do you reside in Ottawa? A. Yes.

Q. Have you seen the explosions which take place under the ice? A. I have seen them in summer—small explosions, never any large ones—when I have been out boating.

BY HONOURABLE MR. CLEMON:

Q. You have been on the river often and seen the deposits of sawdust in the river? A. Yes.

Q. Have you seen deposits of any extent? A. Yes; I have seen large banks of sawdust.

Q. What is the effect of that on the navigation of the river? A. If it continues it will certainly obstruct navigation; the river will have to find a new channel. The rays are being filled up now and afterwards the channel will get filled up and the river will eat in on the banks.

Q. Have you observed the effect of the sawdust on the fish? A. It covers the spawning beds and it gets into the gills of the fish and of course they will not come up the river.

Q. Have you observed the effect of the decomposing sawdust on the health of the community? A. The gas that comes from it is much the same as the nasty marshy gas which comes from the swamps of ague malarial districts. It is produced from the same cause—the decomposition of vegetable matter.

Q. It is poisonous in its nature? A. It is, in excess. It is light carburetted hydrogen gas, and when it mixes with oxygen from the atmosphere it is explosive.

By HONOURABLE MR. HAYTHORNE:

Q. You think this mill refuse can be removed by the proprietors of these mills without incurring any extra cost to them? A. To some it would involve more cost than others, but I cannot see any more difficulty in handling it than in handling the same amount of iron ore. I do not think that the majority of the lumbermen are against the utilization of it; the thing is to get them all harmonious—one mind.

Q. Does it require united action? A. It requires united action to make it a success—to get them all to unite and have it utilized in the way I have referred to.

Q. Supposing they united, would the result be a profit to them or a loss? A. It would be a profit. If they will give all the waste from the mills, I can get a company to take hold of it, that is to say, as soon as they work their mills, if they will give all the product of their mills to a company.

By THE CHAIRMAN:

Q. You mean in the way of sawdust? A. In the way of sawdust and slabs; if they will give all the waste from the mills, I can get a company that will take it away and use it.

By MR. CHRISTIE (*Counsel for Lumbermen*):

Q. Have you not been sometime engaged trying to get the lumbermen to go into a company? A. Yes, I have spoken to them.

Q. In that case, giving a company, you would be interested in getting the sawdust not put in the river of course; can you tell me any place on this continent where sawdust has been used for smelting iron? A. I said Rathbun had utilized it and had compressed it—charcoal has been made.

Q. I mean the sawdust? A. It does not matter whether you make charcoal from wood that has come from the sawmills or not, it is charcoal.

Q. Do you know any place in the world where sawdust has been used in smelting iron, directly or indirectly? A. I can say for sawdust—not in this country, but it has been used in Sweden.

Q. Will you tell me the places in Sweden where it has been used? A. It has been used all over Sweden and Norway.

Q. Tell me one place? A. Carlstadt and Monkfords.

Q. Tell me any one person that has ever used it? A. It has been used by M. Lundin, the inventor of the furnace.

Q. Does he not smelt the iron from gas? A. He uses the sawdust to make gas to roast the iron ore and to reheat it. Charcoal is used in the blast furnace.

Q. Has it been used for smelting iron here at all? A. Gas has been tried in the United States. It is not impossible to do it, but it has never been done so far—not with natural gas.

Q. I mean gas from sawdust? A. Not in the blast furnace, but in the heating, roasting and re-heating of iron it is better than any other fuel.

Q. Can you tell me any place where sawdust of this quantity has ever been used at all for, say, a pulp mill? A. I can say that in Michigan it has been used to a very large extent for the boiling of brine.

Q. You mentioned a pulp mill? A. I said there were the small applications.

Q. I suppose the output of the mills at the Chaudiere for one week would supply all the pulp used in Canada in a year; would it not supply all the paper required in Canada for ten years? A. I do not know the paper industry, but that is a small matter compared with the iron.

Q. You say that the sawdust produced each season at the Chaudiere is equal to 30,000 tons of coal; can you give us an idea of what it would cost to convert that into charcoal—from actual experience I mean, not theory—can you tell us anything? A. It depends on machinery. I think it costs two and a half cents a bushel.

Q. Do you know that from experience? A. Yes.

Q. Where is it done at two and a half cents a bushel? A. It has been done in Canada here.

Q. Where? A. In the Province of Quebec.

Q. At what place? A. At the St Morrice, and Drummondville Forges, near Three Rivers.

Q. In any quantity? In large quantities.

Q. What would you call a large quantity? A. Thousands of bushels—that is for the burners—the cost of manufacturing.

Q. What would be the cost of handling and manufacturing, say in Ottawa here—it would have to be removed a distance from the mills I suppose? A. That is a matter of detail that it is not necessary to go into.

Q. You could not tell the Committee what it would cost. A. I can tell them if they wish.

Q. But you do not know now what it would cost? A. I have not got all the figures, but I have the papers at home that will show it.

Q. To manufacture this sawdust for anything useful that you mention, would it not be necessary to convey it at least half a mile from the mill? A. In transporting it on a railway if you move it a few hundred feet it would not cost much more to move it a mile.

Q. How much would it cost to move it from the mills? A. When it is lifted by an elevator into a little car, and that is dumped into a bin which is higher than the railroad track, the bin doors open and the railroad car is filled. The car has a false bottom. The train comes along and takes the waste. The cars with false bottoms run over other bins at the smelting works, the bottom is opened and the refuse is dropped into a series of bins that will hold fifty or one hundred thousand tons. Then that is conveyed to the kilns or to the sawdust furnace by small cars. There is not any more difficulty—not as much as in handling iron ore.

Q. Can you tell me what would be the cost per ton of moving it a mile? A. Freight on the Intercolonial Railway and other railroads—

Q. I do not mean that; what would it cost per ton to move this material a mile? A. It is like any other freight, one cent a ton per mile.

Q. So you think the mill owners could move it from their mills at one cent a ton per mile? A. Yes.

Q. Moving it a mile you would estimate the rate the same as if it were carried 100 miles? A. Yes, that is the rate on the Intercolonial Railway.

Q. Do you think the railway would take it at that rate for that distance? A. I think so.

Q. But you could not give me an idea what it would cost per ton to manufacture this—the absolute cost? A. I do not think it is necessary to go into all the details of it here, because I would be giving away information that has cost me a great deal of time and labor to find out, and if I am giving it away to the public I am giving it to people who will not thank me for it.

Q. Then you are interested in having the sawdust utilized? A. Yes, deeply interested.

By HONOURABLE MR. SMITH:

Q. Supposing this change was absolutely necessary, how long would it take, a year or more, to get all the necessary apparatus in working order? A. It would take one winter at least—this summer and one winter.

Q. Could it be all done in a year or 18 months? A. I should say it could.

By MR. CHRISTIE:

Q. Would it require any alteration in the mills? A. It might take a little longer, because you have got to erect your furnaces and smelting works.

Q. That could only be done in summer? A. It would take perhaps two years before it could be all in operation.

Q. Would it require any change in the mills at the Chaudiere? A. Yes, some more and some less.

Q. But it would require some change in all of them? A. No, not all; it would not require to change the mills, but it would be necessary to put in additional machinery.

Q. Do you know any experience that has been had in roasting iron ore with sawdust at the Gilmour mill? A. That was a family matter which was mismanaged.

Q. But it was tried, was it not? A. Yes.

Q. Was it a failure? A. That has nothing to do with the matter, it has been successful in the United States and other countries where it has been tried.

Q. As a matter of fact was it not a failure when it was tried here? A. That has nothing to do with the case in point.

Q. Do you know as a fact that it resulted in a failure there? A. I know that some lumbermen have failed in business, but the gentlemen who are conducting the business here now are not failing.

By HONOURABLE MR. HAYTHORNE:

Q. You say the supply of mill refuse is greater than would be required for paper making? A. Yes.

Q. Is it not a fact that pulp is used for a great many purposes besides making paper? A. Yes.

Q. And that these purposes are increasing day by day and year by year? A. Yes, but the use of it that way is so small compared with the quantity that would be required for roasting and heating ores and smelting that it is hardly worth taking into account. It is a very small industry.

Deep Coal Mining.—The total depth of the André Shaft of the Poirier Company in the Charlevoix district is 3,133 feet. The maximum daily output is 500 tons. Hoisting is done in one lift. The ascent is made in 80 seconds. Ventilation is effected by an Guibaud fan, delivering 30 cubic meters per second.

The Untimbering of Stalls.

By Audre Dumont, Professor of Mining at the University of Louvain.

(Continued from June issue.)

Methods of Untimbering.—After having described the system of supporting the roof, it is now necessary to explain the method of untimbering. There are three methods suitable for different circumstances, which can be described and brought to bear on the three following cases:

1. Good soil in embanked stalls, only requiring head props, without lengthening bars or ashler pieces.

2. Bad soil in embanked stalls, requiring strong support and careful casing.

3. Soil of all descriptions in stalls not embanked or only incompletely so.

First Case.—We will take for example the working of an upright stall with the way in the middle. We will suppose that the width of the stall comprised between the way of the air passage corresponds to the length of a lengthening bar (about 4 metres). The miners have advanced 3-4 (Figs. 1 and 2) of 1.20 metres and placed the larger of lengthening bars (4) in front of the stalls.

The support allows the filling up to be pursued a greater distance, and we have therefore four courses of lengthening bars, 1, 2, 3 and 4. Before retiring, the day shift of miners set a course of lengthening bars in the last section which is not embanked. At the following "shift," the way cutters having made the wall prepare to fill up the section 1-2. In order to do that they must knock down the timber intervening between the lengthening bars 1 and R; then they prepare the filling-up just below the lengthening bar, 1; they fell down the end props of this lengthening bar, and draw out immediately props and bar. They then finish the filling-up firmly as far as the vicinity of the lengthening bar, R; prepare it under this one, then take it away in the same manner, and lastly continue the filling-up as far as the lengthening bar, 2, which will become lengthening bar 1 for the next shift. The different phases of the work are represented by figs. 2 and 3. In reference to the first case the method of untimbering is based on the following rule: Never take away a lengthening bar before the filling-up has been properly done up to that bar and has been prepared below it. The operation of untimbering conducted in this way cannot fail. Besides, the security of the miners is complete, for the distance which separates the lengthening bars 1 R and 2 being 0.60 metre at the most, the miners are never exposed to a portion of roof which has been deprived of support.

Second Case.—This is one that is met with most frequently. The work of the miner is the same as in the first case, with the exception that he will have to put a casing to the roof. At the night "shift" of miners, fillers-up commence to take away the immediate props of 1 and R. Nevertheless, if the ground is too bad they will not take away the props of R until the second phase of the work. Next, they prepare the filling-up as far as below lengthening bar R. They knock down the end timbers of 1, complete the filling-up as far as the vicinity of R. Figs. 4 and 5 give the first phase of the work.

They next prepare the filling-up as far as below 2 (the intermediate props of R having been taken away) then they take away R as before, and fill up firmly as far as the vicinity of No. 2.

FIG. 5. SCALE $\frac{1}{10}$.

At the next shift when taking away 2, it is possible to pull out the greater part of the ashler pieces which rest on Nos. 1 and 2. In this case the rule to observe is—never take away a lengthening bar before having filled up as far as this bar, and having prepared to fill up as far as underneath the following lengthening bar.

Third Case.—When the opening of the bed is such that the cutting of the way is of no use or furnishes soil in insufficient quantities, and which, moreover, cannot be supplied by earth used for keeping in repair, one is obliged, in order to fill up the stalls, to bring down, at great expense, earth from the surface. Then the work of untimbering is of the same character as in one of the cases which we have just described. But, if circumstances will not allow the owner to work profitably by means of embanked stalls, then he has recourse to cutting out the coal so as to leave behind gaps made by working. This is usually called working by blasting. The Baily method has the advantage of immediately causing the blasting, and of not leaving behind immense open spaces, which are the cause of many inconveniences well-known to the miner.

The work of the miner is still the same as in the preceding cases. As for the untimbering, it is done by a company of special workmen. This work evidently demands a certain dexterity. The men engaged in untimbering first place before No. 2 a double lengthening bar R supported by five props (fig. 6). This lengthening bar is not indispensable, but the placing of it is so rapid that it is best to use it. The object of this lengthening bar is to limit the breaking of the earth at the moment of blasting; besides, after taking away No. 2, it will sustain the ends of the following section. They next place the wooden lengthening bars R 2, 50 metres and supported by three props. The last named and the corresponding lengthening bars are provided with small cords, which hang down in the stall. The men then knock down the intermediary props, 1 R and 2: then, standing in the ways, they bring down the end props and pull out all the pieces quickly. For several instants the wooden lengthening bars will sustain the roof of the whole section. In order to avoid this last support being broken and lost in the crush or fall, they hasten to bring it down by means of tools with long handles, and seek to save the timber by pulling the small cords. This last operation often succeeds, but M. Baily does not consider the untimbering a failure if several pieces are lost in the falling of the earth. The rule for security in this third case is that the pulling down of the iron lengthening bars and their props may not be proceeded with until an immediate fall of the roof is provided against by means of a secondary form of support in timber. Also in certain kinds of ground it would be well to limit the breaking of the roof by a double metallic lengthening bar strongly propped. We have taken for an example the work in an upright stall. The methods followed in the inclined stalls are the same with the

exception that in steep inclinations the embankment is graduated in the plane of the bed, making it at the bottom of the stall the width of the whole of the section. The stability of the embankment is in this way better assured. It is seen by this description that the support which was formerly lost may now be drawn out. The stalls produce, however, a little loss. For instance the wood will break under the pressure. The lengthening bars will crack to the right of the wood. In the last case they are cut and made to serve as lengthening bars for the way. For all that, the loss is but small. The stall ways will demand but little repairing, thanks to the resistance of the lengthening bar, and to the rule prescribed by M. Baily to shave off the bottom of the timber diagonally. This method of untimbering has been applied for nearly six months in the coal mines of Marles, and has there yielded splendid economical results; and what is also of importance wherever the Baily system of support has been adopted, they have had neither accident nor falling-in where previously they were rather frequent. This seems at first sight paradoxical, and yet it is only natural. In stalls filled up by the old method, the ground always gives way before the complete collapse of the supports, which are buried there. The consequence is that it leaves several sections behind, between the roof and the embankments, an open space which occasions at first loss of air, and is then the cause of falls reaching as far as the front of the stall. By the complete untimbering the fall of the roof on the embankments is occasioned immediately; the settling down is more complete; the loss of air and the subsequent falls are avoided. It is not surprising, then, as we have seen at Marles, that ground which has formerly been known as very bad no longer bears that character in the stalls which are worked according to the Baily method. For instance, the Rosalie seam 0.90 metres in thickness, was absolutely unworkable, as the roof of it was so shifting. Thanks to the Baily

system, several working places have been established there, which are regularly worked, and the support of which only costs 0.30 fr. per ton. The use of this method is advantageous in cutting the coal. In the Therese seam, which is 1.60 metres in width, and which is worked by blasting, the price of cutting, which previously was as high as 0.60 fr. per truck, has gone down at the three last payments to 0.40 fr., 0.41 fr., and 0.42 fr., or 32 per cent. reduction. In the embanked stalls, the price of cutting has diminished generally 10 per cent., or about 1.25 fr. per ton. This abatement is explained first by the suppression of the working and transport of the timber. Next, by greater facility in the work of the miner. In reality, he feels more secure in the stall, and slightly forces the progress of it; he is less inconvenienced by the propping, which is reduced to two-thirds, and has greater facility for hewing the coal. He is not compelled to leave his work a dozen times in order to strengthen the support which is giving way, and his task is more easily achieved. The price for the cutting of the ways has not changed. If, on the one hand, the untimbering is an additional trouble, on the other hand the embanking following the face of the work at greater intervals, is no longer limited by carefully constructed openings. The price of placing the frames for the way has diminished from 1.20 fr. to 0.95 fr. It is not to be doubted that increase of production procures economy in the other services of the mine. But the greatest economy results from the untimbering and from the decrease in the cost of repairing the ways. It varies with the nature of the surrounding ground and the thickness of the seams. In good ground there will always be economy, but it may be very small; nevertheless in such a case the Baily system of support would not be the less to be recommended. In reality, less woodwork is put to good ground, and the miner is often surprised by accident. The Baily lengthening bar will prevent these, and it is therefore a great advantage. What does it matter if the system of support be rather more complicated than the simple head props when the former may be drawn out while the latter are lost? In bad ground, on the contrary, a saving of 70 to 90 per cent. may be made, as has been the case at Marles in certain stalls. Generally it may be estimated at 50 per cent. At the St. Emile Pit all the stalls are actually provided with the Baily form of support.

The following comparative table shows the consumption of wood at this pit both before and

FIG. 6. SCALE $\frac{1}{10}$.

FIG. 7. SCALE $\frac{1}{16}$

after the adoption of this method of untimbering :

Years.	Consumption per ton extracted.		
	Wood.	Iron.	Total.
1883	0.87	0.87
1884	0.85	0.85
1885	0.95	0.95
Average	0.89	0.89
1886	0.67	0.05	0.72
1st to 15th January, 1887..	0.72	0.72
16th to 30th January, 1887..	0.73	0.13	0.86
1st to 13th February, 1887..	0.50	0.24	0.74
14th to 27th February, 1887..	0.45	0.40	0.85
1st to 13th March, 1887....	0.43	0.37	0.80
14th to 27th March, 1887....	0.40	0.10	0.50
28th Mar. to 10th Ap'l, 187..	0.49	0.01	0.41
11th to 24th April, 1887....	0.40	0.40

The average for 1883 to 1885 amounted to 0.89.

The Baily method was introduced at the end of 1886 in a certain number of stalls only. Just after the middle of January, at the end of the trial, all the stalls were successively fitted up. During this period the total consumption was but little reduced, owing to the fact that the working was entirely destitute of the necessary material, and that an iron lengthening bar naturally costs much more than a wooden one. The consumption of iron will remain relatively important, for some time yet, for the ways absorb a good deal. Nearly all the stalls are upright, and when several have reached a certain height, and their ways can be untimbered, then the expense in iron will be minimized. At present the expense is no more than 0.50 fr., in spite of the use of a form of support, which is at first rather costly. It is estimated that in the making of new stalls the total cost would not go beyond 0.30 fr. or 0.35 fr. We consider these estimates as well founded.

Markets.

The English and Continental markets are fairly firm, and sales could no doubt be made at the moment at 11½d. per unit, with one-fifth of a penny rise for 80% guaranteed, 9½d. for 75% and 8½d. for 70%, ex-ship Thames, Mersey or Clyde. Charleston River phosphate is at present being quoted at 8d. per unit, which is 1d. better than a few months ago. We do not look for any great change in the above figures.

Freight.

Freights are at present about 7s. to 7s. 6d. to London, and 6s. 3d. to Liverpool by regular liners, but less would no doubt be accepted by the "tramps." Tonnage to Hamburg is quoted from 10s. to 12s.

Shipments.

The following are the phosphate shipments from Montreal for month ending July 10th, 1888:—

Date.	Ship.	Destination.	Shippers.	Tons.
June 15	Wandaham	Hamburg	Wilson & Green	168
" 22	Govino	London	Lomer, Rohr & Co	481
" 23	Lake Winnipeg	Liverpool	Millar & Co	300
" 30	Fleming	London	Millar & Co	318
" 30	Lake Superior	Liverpool	Lomer, Rohr & Co	100
" 3	Grasshopper	Hamburg	Wilson & Green	149
July 4	Oxenholme	Liverpool	Lomer, Rohr & Co	657
" 6	Cynthia	Bariow	Lomer, Rohr & Co	150
" 1	Cuce	Glasgow		150
Total				2,472

In General.

Dr. Saunders, Director of the Central Experimental Farm, writes to us as follows regarding the experiments at present being made by the Government in the matter of phosphatic manures:—"The experiments with phosphates consist of tests of the fine ground apatite applied to plots of wheat and corn, the apatite in its crude state being used alone on some plots, on others apatite mixed with nitrate of soda, and on others with nitrate of soda and wood ashes. Similar experiments and combinations are being tried with the treated phosphate, that is to say, superphosphate, made from mineral phosphates. It is proposed that these experiments should be continued year after year on the same plots of land with the same fertilizers, and it is to be hoped that a few years' trial will suffice to determine with some measure of accuracy the actual benefit to be derived from each application to the crops under treatment. Another year we shall apply these fertilizers also to experimental plots of grasses, roots, clovers, etc., and also endeavor to test the value of these fertilizers by such other methods as may suggest themselves. I shall be glad at any time to give you any further information you may desire on this subject, and regret that I have been unable to furnish you with this information earlier."

South Carolina's mineral production consists chiefly of phosphates, and the output of the mines last year was more than three times as great as the value of all the precious metals produced in the Southern States for the same period. Phosphate mining was unknown in 1860. In 1870 the production of rock was 19,989 tons, in 1880, 150,162 tons, and in 1887, 432,757 tons. About 200,000 tons of this rock was manufactured into fertilizers in the United States, and the consumption of fertilizers in South Carolina has increased from 70,000 tons in 1880 to 96,000 tons in 1887, and it will doubtless reach 120,000 tons in 1888.

From Bulletin No. 4 recently issued by the Department of Inland Revenue it is evident that the trade in fertilizers is steadily increasing

in this country, as 40 samples have been sent in for analysis. In 1886 the number was 27, in 1887, 31. In spite of the 20 per cent. import duty levied on fertilizers it appears that foreign manufacturers have furnished 17 of the 40 samples for 1888. These come chiefly from the States, and are imported into the Lower Provinces. From this it is plain that the farmers there are not particular to local manufacturers. The fertilizers offered by the latter are just as high in price as those from the States, but do not test nearly as high in ammonias, phosphoric acid and potash. On the other hand the Ontario manufacturers offer goods of much better quality, generally superior to those imported from the States, and at lower prices. It would consequently appear that an excellent market for the fertilizers made in Ontario might be opened up in the Lower Provinces if the manufacturers would only send their travellers there.

The Fertilizers Act requires that every ammoniated superphosphate shall contain at least 5 per cent. of soluble phosphoric acid and 2 per cent. of ammonia, and that every acid phosphate or dissolved bone shall contain at least 8 per cent. of available phosphoric acid. An inspection of the figures in the table given shows that five fertilizers do not come up to the standard, and consequently their sale at any higher price than \$10 per ton is illegal. One of these five is made in Ontario. In a former report, dated 20th December, 1886, attention was called to the large amount of money which farmers pay for the ammonia in these fertilizers, and which might be saved if sufficient care were taken to preserve that contained in barnyard manure.

A rumour that judgment had been given in the case of *Fraser versus the Queen* is untrue. Judge Burbridge's verdict will not be made public until September.

Du Lievre.

Everything is going along very well and great progress is being made with the improvements at the Canadian Company's mines. The tram-line is nearing completion, and will be in working order by 1st August. The steam tug "River Belle" has been purchased, and fitted up with new machinery will commence hauling in a few days. The construction of the large new cobbing house is also completed, and the new machinery for it will be in place and in full working order by the end of the present month. The output from the pits has increased considerably, and Messrs. Millar & Co. inform us that the weekly average output may be fairly stated as 140 tons per week. About 80 men and boys are employed.

Mr. T. Lanson Wills, who has been sent out from England to manage the mining branch of the Company's business here, has taken up his residence at the mines. He is a chemist who has had much practical experience in phosphate mining at Bordeaux and the West Indies.

The Government Geological Survey is making rapid progress with the topographical work of this district. Mr. White and his party are now located as far up the river as the High Rock mines.

Mr. S. P. Franchot has some thirty men working on the Central Lake Mines. A number of pits have been opened, and the output of ore is fair.

Development work at the Little Rapids Mines continues with very favorable results. A new show of high grade ore is reported to have been uncovered since our last.

The Phosphate of Lime Company have already shipped close upon 4,000 tons from their High Rock Mines. A little over 3,000 tons of this has been "firsts," shipped on contract to Europe, while the remainder has been forwarded to U.S. points. 160 men and boys are employed. The large tunnel (No. 11) continues to yield a large output. No. 29, an open cutting made this season, has also proved very productive. Some half dozen new shows are also being worked on a small scale, but insufficient machinery at these places greatly hinders the work of development. The tram line has undergone much improvement since last year, and at the terminus a "cutoff" and pier has been constructed to facilitate the handling of their second quality output. A large number of new buildings have been erected for the accommodation of the miners and their families, a new storehouse is being built, the general offices rearranged, and altogether many improvements are apparent at these ably managed and well conducted mines.

We regret to state that an accident, which resulted fatally to one of the miners, occurred this month in No. 29 pit. The unfortunate man was struck on the head by a piece of rock being hoisted by the derrick and died a few days later. This is, we believe, the first fatal accident at High Rock.

The North Star Company have some extensive improvements in contemplation, including the construction of a tramline from pits to the landing, and the erection of a crushing mill at the latter point. A fair average output is being maintained.

The Emerald is still yielding good ore, but the output is comparatively small. A rumor is current in Buckingham that these mines have passed into the hands of the High Rock people, but so far we have been unable to get any confirmation of the statement.

The water in the river has fallen to such an extent that only lightly laden scows and small steamers can get over the Little Rapids. It would appear that navigation at this point (L. R.) has been somewhat impeded by the work constructed last summer. As yet no recommencement of the work has been made, but it is said operations will be resumed in two or three weeks.

Templeton District.

Mr. Jackson Rae is working in a small way on his property.

The Templeton & Blanche River Company continue to meet with an encouraging output at their mines. Mr. Trimble, the Managing Director, is now in Great Britain, it is said, with the object of placing the property in the hands of a larger syndicate.

The Blackburn Mine is working briskly with a large force. Several thousand tons of ore have been shipped. An inclined shaft, to be operated by wire rope plant, is in course of construction. Mr. Blackburn states that he is well pleased with the appearance of the mines, and regards the daily output as very satisfactory.

Perth District.

Work on the Anglo Canadian Co.'s Mines at Bobb's Lake and Otter Lake is being vigorously pursued upon the contract system, and considerable quantities of ore are being taken out.

The Foxton mine is looking very well. The shaft is down about 94 feet, and the vein continues to improve in size and quality. From 3 to 5 tons per day is being taken out with a force of about ten men.

Kingston District.

The Stornington Mining Company have shipped 376 tons of No. 1 to Hamburg. The operations of the Company have been seriously retarded by the recent destructive fire which completely destroyed their boarding, clobbering and engine houses and office.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

There is a good prospect of recovering No. 2 Slope at the Albion Mines, where the explosion took place in January last. A pit was sunk 40 feet on the cross-cut between No. 1 and 2 slopes and the roof blown down; an exploring party descended No. 2 slope and for a short distance into No. 1, encountering heavy falls in No. 2, some of them 30 feet high. No. 1 is very hot, and is no doubt still on fire. A permanent stone wall between the two slopes has been built, and the work of cleaning up and retimbering No. 2 is being proceeded with. A small winding engine has been erected in place of the one lost at the fire. It is thought that coal will be coming out of No. 2 pit by the beginning of the year.

At the Foord pit pumping is still going on. Cages are now down to the rubbish at the bottom of the shaft, and the pumps will now have to be set to work there in order to remove the balance of the water. It will be a long time yet before any coal can be mined in this pit.

At the new "English" slope operations are proceeding fairly well. The sinkers have got through the "step," which proved to be a downthrow of some 22 feet, and the coal is recovered on the other side. Considerable bottom will have to be taken up for a distance of one hundred feet on the angle of the slope in order to get below the step. The slope is down some 150 feet, but the total depth when finished will be in the neighborhood of 1,300 feet.

Work has only been fair of late at the Drummond Colliery, mainly owing to want of tonnage, but when pits did work a very large quantity of coal was shipped. Some large "Time" boats are used this season by the company, but it is found that the smaller boats are more profitable and convenient.

Scarcity of tonnage to carry coal for Upper Province orders has also had a depressing tendency on work at the Vale Colliery. The management employ very large boats—some of them over 3,000 tons—to forward their output. The new sinking in the McBean slope is going

down well, and the coal maintains its usual good quality. The company are now supplying the St. John Mills, as well as the Steel and Forge Companies at Trenton. At the "Six Foot" seam work is progressing as usual.

The Black Diamond Colliery is working full blast, and 75 tons a day are being raised. Sufficient orders have been obtained to keep these mines busy all season. We understand that some 20,000 tons of Intercolonial Railway contract have fallen to the share of this company.

At the Acadia Mines work has not been up to the usual standard, and about three-quarter time only is made.

The Intercolonial contract for 200,000 tons of coal has been let, but little or nothing is known here about the awards, beyond the fact that very little of it has come to the Pictou County Collieries. In a district where so many people are dependent upon the coal industry for their livelihood, this result is much to be regretted and will be keenly felt.

The following are the official returns for the month of June, so far as received at the Mines Office:—

District.	Mill.	Tons	Oz.
		Crushed.	Gold.
Sherbrooke.....	Miners.....	200	41
Salmon River.....	Dufferin G. M. Co's...	850	220
Waverley.....	McClure.....	118	47

Stormont.....	Hurricane Tributaries...	152	190½
Renfrew.....	Empress.....	100	42
Wine Harbour.....	Napier.....	70	58

The Edgerton gold mine is looking up. 102 ounces was brought in last month for 15 men. This is a very good showing. There are lots of other equally good properties awaiting development. All that is wanted is good honest practical management and a little capital.

At the "Board Camp," Sheet Harbor, prospecting is being pushed forward with vigor. A crusher will shortly be added to the plant. Some very rich leads have been found in this locality, but parties are very reticent about their finds. New Glasgow people have taken up one hundred acres in the district, and four good leads are reported on the property. If this is so a boom may be looked for at "Board Camp."

The new crusher at Moose River gives every satisfaction. Mr. D. Touquoy has brought to Halifax three bars containing 332 ounces from about 400 tons of quartz, the produce of four months' work.

Mr. McKam and his syndicate are expected in a few days to look over the iron ore deposit at East River. Considerable work has been done uncovering the leads and making a good show of the different beds. The quality of this ore is unsurpassed, being brown Hematite, carrying over 70 per cent. of metallic iron. Report says that Mr. Bennett, of New York, is one of the principals of the syndicate.

At the Gowrie Mines, C. B., work is not so brisk as in recent years; only four boats are kept running as against six last year, and consequently the men are losing between five and six days in a month.

The Nova Scotia Steel Company, with headquarters at New Glasgow, are applying for supplementary letters patent increasing their capital stock from \$300,000 to \$1,000,000, and extending their power so as to enable the company to manufacture steel and iron in all their branches, and articles consisting of iron or steel, in whole or part; and changing the name to the "Nova Scotia Steel and Forge Company (Limited)."

The *Critic* states that "the recent forfeitures of gold-mining properties made by the Hon. Commissioner of Mines has caused quite a brightening up of titles, and many owning property in other districts are looking to see if their districts are to be called up soon. Many are saving themselves from the stroke of the lash by surrendering their old leases and taking out new titles. Let the cleaning-up process go briskly, and have the anxiety over."

New Brunswick.

Manganese mining is being prosecuted with considerable success by the Manufacturing Mining Company of St. Martins, N. B. Good pockets are being discovered in the various drifts opened, and the ore is of first-class quality and considerable in quantity. It is believed this is one of the most valuable manganese deposits in the Maritime Provinces, and its owners intend energetically prosecuting its development.

Quebec.

Mr. H. A. Church, of Chelsea, is doing some development work on his mica property.

On that portion of the Bell Company's property known as the Hayden Estate, in Coleraine, roads are being made and a large number of buildings are being erected. A gang of miners will be at work in a few days. The Belmina portion of the estate will not be touched this year. Altogether the prospects of the Bell Company are most favorable.

The Johnston Co., Wards, Ross Co., and King Bros. are all doing a good business, shipping large quantities of ore by Boston to United States and European points.

The new crushing and cobbing machinery erected by the Scottish Asbestos Company is now in complete working order, and a test on an extensive scale is to be made this week. If successful similar machinery will be put up at the Thetford Mines. All the large dumps there will then be worked over, and it is thought that a very large quantity of asbestos, which at present does not pay to cob by hand, will be reclaimed.

The Scottish Canadian, Anglo Canadian, Frechette, and Danville Mines are all busy and making a fairly good output.

The Harvey Hill Copper Mines in Leeds are being more systematically worked, and are yielding a fair quantity of first class ore, some of it assaying 70 per cent. metallic copper with a good proportion of silver. English experts, who examined the mines during the past month, say that they are well pleased with the appear-

ance of the property. Our correspondent adds that it is understood that several hundred men will be immediately put to work to open up the property on a large scale.

The rumour that Mr. J. N. Greenshields, of Montreal, and other capitalists, had sold their copper property in the Eastern Townships is premature. Negotiations, however, are in progress for a transfer of the property, and full particulars will be given when the transaction is complete.

Captain Bothwell has resumed the developing of his gold property on the Du Lievre. A gang of men are at work in the pit, which has now attained a depth of twenty feet. The present appearance of the mine is very promising. Farther assays will be made by Dr. Donald in a day or two.

By a fall of rock at the New Rockland slate quarries, on the 14th instant, one man was killed and two others slightly injured.

A new find of asbestos is reported to have been made in the Township of Portland, near the High Falls. The indications point to an abundant supply of the mineral. Samples before us show a fine silky fibre, from a half to two inches in length. Mr. W. A. Allan, of Ottawa, has secured the mining rights to what, to all appearance, is a very valuable find. A number of men are presently at work developing the property.

An important discovery has been made in Garthby, on the property of Mr. Wm. Farwell, Manager of the Eastern Townships' Bank, Sherbrooke. The large deposits of iron pyrites and copper found on Lot 22, 1 Range, North, and so favourably reported on by Sir Wm. Logan (Geol. of Canada, 1853), has been traced for nearly two miles in a south-westerly direction to the Township of South Hann. This is most important, showing as it does that a true vein exists at this point. Eleven openings have been made on the strike of the lode, all showing rich ore.

The greatest activity prevails at the various asbestos mines. The demand for the mineral continues good. Parties are buying up all the small lots of "seconds" and "thirds" as they cannot get any of the first quality, all of which was contracted for last winter.

The Bell Asbestos Company (Limited), of London, England, are taking out of their Thetford Mines, on an average, sixteen tons of "Firsts" per day. About one hundred men and boys are employed. A large number of new buildings are in course of construction, and the mines are being equipped with an extensive plant and machinery, which is expected to be in full working order by the 15th of August.

Ontario.

The Thornbury Oil and Mining Company, which was formed in November, 1886, by seven of the business men of Thornbury, Ont., commenced boring about four miles from there a couple of weeks ago, and are now down about 500 feet. A very strong flow of natural gas has been struck, and it is estimated that at least 2,000,000 cubic feet escapes every 24 hours, or enough to supply a town of 20,000 inhabitants with light and fuel. It is the intention of the company to sink a well for gas in Thornbury immediately where the formation

is the same as where operations are now being carried on. The present well is on the grounds of a summer resort, and the gas can be utilized to light the hotel and grounds and greatly enhance the beauty and value of the property. The company have the exclusive right to bore over a large tract of country where the indications seem to be of the best.

The Grand River Plaster Company having decided to establish calcine works in connection with their business at the gypsum mines, two miles from Cayuga, a kettle is to be put up capable of turning out from seventy-five to one hundred barrels of calcine per day.

The Terra Cotta Company is a new concern recently formed at Milton, Ont., with a capital stock of \$20,000, for manufacturing terra cotta, pottery and other goods, of a new kind of clay recently discovered near that place. This clay is of two colors, and is said to become almost as hard as stone when exposed to the atmosphere.

Nothing in the way of mining is being done at the Bristol Iron Mines, pending the construction of a branch railway from the Pontiac P. J. Railway from Wyman's Station to the mines. The engineers have located the road, and this week about seventy men have commenced grading. Next week about 300 men are expected to be on hand. It is thought that in about six weeks the road will be ready for rails.

The *World* is our authority for the following: A wealthy syndicate of Milwaukee and Chicago capitalists have purchased over a thousand acres of mining lands near Goulais Bay, and about fifteen miles west of Sault Ste. Marie. They commenced exploratory work last fall. They encountered a vein of mineral and have gone down on it for about ten feet and an average sample of the rock taken from it at this depth assayed \$17 in gold to the ton. The rock is of such a soft character that it can be crushed with proper machinery and the mineral separated, on a large scale, at from \$3 to \$4 a ton. Gold has also been found in a rich silver vein at Gros Cap and in the copper ore of the Korah mountain mine, both near the Soo. Silver ore seems to be the predominant mineral of the district. At Gros Cap a very large vein can be traced for a mile or more, which carries a large percentage of silver.

Progressive Age states that Mr. C. A. Ashburner, the Pittsburgh geologist, has gone to Ontario to explore a natural gas field for a Canadian company. He will locate the wells, and they will be drilled under the direction of the Fuel Gas Company of Pittsburgh.

Sudbury District.

Work at the Vermillion Mining Co.'s property is progressing at both shafts. At No. 2, or the shaft in quartz, a depth is attained of about fifty feet, and some drifting has been done at the forty feet level. Many beautiful specimens have been taken out at all depths, and the general output carries a good value in gold. No addition has been made as yet to the three stamps. The shaft known as No. 1 is now over thirty feet deep, and of very large proportions. At the bottom a very peculiar ore, or rather mixture of ores, is found. Lying side by side are good chalcopryrite, a mineral that appears to be half way between millerite and pyrites; and a peculiar deep purple ore, containing 30 per

cent. copper. This latter carrying a little gold and some rare metals of the platinum group, besides Tellurium.

Mr. McKenzie is here at present, and among other duties will examine Lot No. 7 of Con. 4, in Denison. He is not yet prepared to develop veins on this property, but before long will have men at work there. The veins of the Vermilion Mining Co. cross this lot.

The McConnell copper belt, we regret to say, lies idle, the owners, instead of developing this promising property, and proving its value, preferring to sit and wait for some one to pay them a big figure for it undeveloped.

In Lorne your correspondent has washed gold from quartz in two lots, and found an average sample from one vein to carry about four ounces of gold per ton. From another vein he selected stuff yielding over one hundred ounces of gold per ton. This was taken from the crevice between vein and hanging wall.

The Canada Copper Co. have twenty-five men at work at the Stobie Mine. They are clearing the hill, and will quarry from the level of the track, removing the hill for some distance.

At the Copper Cliff and Eyre Mines work progresses as usual, and a fine stock of good ore is being accumulated for the smelting plant. Ground is being cleared for the smelting plant, and everything points to an early start.

A mile and a half from the Stobie Mine, to the north, is a most promising copper mine, which your correspondent had the pleasure of visiting recently. The body of copper appears to be of great extent and appears at the surface throughout the length and breadth of the hill, for 250 by 400 feet.

Port Arthur District.

News from this quarter for the past month has been of a most encouraging nature.

The Beaver mine has just placed in position a new hoisting apparatus of an improved pattern, and everything is working in a most orderly and satisfactory manner. The ore being taken out at present is of a low grade, with occasional rich streaks. Improvement is visible everywhere, both inside the mine and out.

The Badger Mine, about one mile from the Beaver, is at present taking the lead as regards rich ore. The output is almost all bonanza ore.

\$10,000 to the ton is quite common. The silver generally occurs as a sulphide, but some of the choice pieces are fairly saturated with native silver. The management have just completed a good waggon road to connect with the Beaver Mine. The mill will probably be complete in six weeks—considerably in advance of the requirements of the mine, which is not by any means in shape to keep a mill supplied.

The "Shuniah Weachu" or Silver Mountain East End Mine is now turning out good milling ore from the four hundred foot level in No. 3 shaft, where the vein is now twelve feet wide. Under the able management of Capt. Thos. Tretheway the company have at last succeeded in finding the extension eastward of their main vein on the lower ground near the eastern boundary of their property. Where found it was being augmented by another vein running north-easterly, each vein being about four feet wide, and carrying ore ranging from \$10 to \$500 to the ton. The vein carries a large percentage of zinc blende associated with galena and iron pyrites. The junction of the two veins, it is expected, will give a large quantity of very rich ore, and as the vein is easily accessible and in the vicinity of the compressor, it is likely that development will be pushed vigorously, the cost of extraction being inconsiderable.

The "West End" Silver Mountain Mine is being put in shape with vigor and skill. The principal work consists as yet in the erection of suitable buildings for a large force. What little work has been done in the vein, where a bed was being prepared for the shaft house, has revealed very rich ore. This shaft is a continuation of a pit from which a ten ton test gave \$160 to the ton. As the vein is well situated in a side hill a great work will be done so soon as mining is in full swing.

The last candidate for publicity is the Caribou Mine under Capt. Rothwell. The vein has been struck in the lowest tunnel on the side hill and some very fine ore extracted at the first shot. The management are enthusiastic over the strike, and the growth of this new but most promising mine will be watched with much interest. It is situated a short distance south-west of the Beaver Mine.

A good waggon road has been built from Whitefish Lake to 264 T, which is worked by the West End Silver Mountain Co. Development is not yet begun; buildings are being put up and material collected.

Manitoba and North-West Territories.

Prospecting for coal is being conducted on the banks of the Assiniboine, a short distance west of Minnedosa.

At the Lake of the Woods work is still being carried on at the Sultana Mines. It is reported that an offer has been accepted for the claim, through Mr. A. Pugh, St. Paul, by which a company has been formed with a capital of \$2,000,000, and that half a million is to be paid to the present owners in cash, and that they are to be given another half million stock in the company.

A number of mining men are out making a survey of Quarry Island, which is immediately opposite the Sultan Island. They think the rich vein extends to it and are now at the necessary work preparatory to sending down an application for it.

St. Paul dispatches state that Mr. A. Pugh has returned from the Lake of the Woods, where he went to investigate the gold discoveries on an island in the upper part of the lake. In an interview he exhibited specimens of the ore he collected while there. In these specimens the gold is easily seen by the unaided eye, and the rock is free milling ore, none other being in sight. Other specimens taken from different parts of the island were sent to the State university, where they were assayed and found to contain \$286, \$462 and \$160 of gold to the ton of ore respectively, and a small per cent. of silver. This is very rich, the cost of reducing it being very small. Gold was discovered here several years ago, but until within a few weeks the land has been part of an Indian reservation, and consequently nothing could be done with it. But now the Indians have released it, and fourteen capitalists from Manitoba have obtained possession of 400 of the 450 acres in the island, and value the property in its undeveloped state at \$2,000,000. Mr. Pugh, Dennis Ryan, and other St. Paul capitalists, are now conducting negotiations with the owners of the property with a view to uniting with certain Chicago parties in the purchase of a half interest in the property and working it. Some years ago gold was discovered in the vicinity of the Lake of the Woods and a stamp mill was erected to reduce the ore. But after excavations had been extended below the water level refractory ore was found, which could not be reduced in this country, and was not rich enough to pay for shipping abroad. Even if this should prove to be the case with the island

CHARLESWORTH & CO.,

42 Front St. East,

TORONTO

33 Wellington St. East.

WHOLESALE MANUFACTURERS AND DEALERS IN

BOOTS, SHOES, RUBBERS, SPORTING BOOTS, TRUNKS, VALISES, Etc.

Will be pleased to supply Miners' or Lumbermen's Boots, Long Rubber Boots, &c., &c.

Our Patent FELT LAPLANDER is the best FELT BOOT made, as it is WATERPROOF as well as WARM.

We can supply any particular style if supplied with a sample, and shall be pleased to cater to the wants of mining and lumbermen's camps.

CORRESPONDENCE SOLICITED.

CHARLESWORTH & CO.

mine there is enough rock above the water line to make the fortunes of a hundred men, if the richness shown in these specimens continues. These are the words of Mr. Pugh. The rock on the island rises to a point of 100 feet above the water line.

A special general meeting of the shareholders of the Medicine Hat Railway and Coal Company will be held at Toronto on the 18th of August, for the purpose of authorizing the directors of the company to issue bonds of the said company, pursuant to section 93 of the Railway Act of last session, and also of the Act of incorporation of the said company, and ratifying any contract made for the construction of the said railway.

British Columbia.

At a meeting of the Selkirk Mining Company, it was decided to immediately proceed with the construction of an aerial wire tramway from the Lanark mine to the Canadian Pacific Railway, a distance of $1\frac{1}{4}$ miles. This tramway will be capable of delivering 60 tons of ore in 12 hours.

Exports of coal from the Nanaimo coal district for May were 26,946 tons, valued at \$134,730. One shipment of 1,415 tons was for Honolulu.

It is said that miners in the Yukon country, while working the placers, find large quantities of platinum, which they throw away, believing it to be of no value. Mr. K. Valentine, of Juneau, has been authorized to purchase a large quantity for an eastern firm, as a test of its quality. He will pay \$2 an ounce. Upon being tested and found to be equal to the best quality, a higher price most certainly will be paid.

From the accounts of the Vancouver Coal Mining & Land Company, Limited, it appears that the gross profit for the year 1887 was £15,461, and the expenditure £26,269, leaving a net loss of £10,808. The report to be submitted on the 29th instant states that the direct financial loss to the company from the explosion at the mine in May last was £11,066, which was less serious than the directors had anticipated. The contracts existing at the time of the disaster have nearly all been carried out, the purchasers having granted extra time for delivery.

New Process for Reducing Iron Ores.

—A process of reducing iron ores has been patented by Mr. Gustaf M. Westman, of Stockholm, Sweden. In addition to the reducing furnace, regenerating or carburetting furnaces are employed, with a circulating blast engine, affording means for reducing the ores by means of carbonic oxide, by passing the carbonic oxide through a charge of ore, drawing off the gases from the charge, and passing them over glowing coke, cooling the gases, and then superheating them, after which they are again passed over or through the ore to be reduced, thus saving fuel without injuring the quality of the product.

E. GAUJOT,

MINING ENGINEER,

BELLEVILLE, ONT.

Van Duzen Steam Jet Pump.

MINING.—Our \$16 Pump preferred to a \$200 Steam Pump.

STATE OF MAINE ASSAY OFFICE,
F. L. BARTLETT,
PORTLAND, ME., June 21, 1883.

"GENTLEMEN,—The No. 5 'L' (\$16) Steam Jet Pump I purchased of you I have used for raising water from a mining shaft fifty feet deep. I set it to draught twelve and force thirty eight feet. It worked very well indeed, although I was obliged to carry steam 150 feet from the boilers and in weather often below zero. I carried 75 pounds of steam at the boiler, and the Jet Pump took the place of a No. 3 K (\$200 Piston Pump), that I had to remove.

"Yours truly,

F. L. BARTLETT."

Address for further particulars,

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt, it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area, which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Batterssea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

For information apply to

WM. H. DICKSON,
160 Waller St., Ottawa.

H. E. DICKSON,
Russell House, Ottawa.

FOR SALE. VALUABLE Copper Mining Properties

— IN THE —

Eastern Townships

TOWNSHIP OF ASCOT.

- 1st. Clark Mine, Lot 11, R. 7 Ascot 187 acres
2nd. Sherbrooke Mine, part Lots 12 and 13,
R. 7 Township of Ascot..... 329 "
3rd. Belvidere Mine, part Lots 9 and 10, R.
9 and 10, R. 8 Ascot 292 "
4th. Mining Rights in same vicinity on..... 250 "

All of the above properties lie within $1\frac{1}{2}$ miles of the Village of Lennoxville, at the junction of the Grand Trunk, Canadian Pacific and Passumpsic Railways, and have been developed to a considerable extent, and veins opened 6 to 20 feet in width, yielding 3 to 5 per cent. of copper, also silver, and 35 to 40 per cent. of sulphur. These mines are only $2\frac{1}{2}$ to 3 miles distant from the City of Sherbrooke, and evidently are of the same class of ores found at Copelton, only four miles distant, owned and worked by the Orford Copper and Sulphur Company, and by Messrs. G. H. Nichols & Co., of New York, which have proved so remunerative.

TOWNSHIP OF ORFORD.

- 5th. Carbuncle Hill Mine, Lots 2 and 3 R. 14, and
2, 3, 4 R. 15, 718 acres. Same class of ore as is found in the Ascot properties above described, but yielding a higher percentage of copper.

TOWNSHIP OF CLEVELAND.

- 6th. St. Francis Mine, $\frac{1}{4}$ Lot 25 R. 12, 50 acres, with dwelling houses, smith's shop, ore sheds and office, large winding and pumping steam engine, with boiler, winding and pumping gear, and about forty fathoms Cornish lifting pumps complete, railway tracks, ladders, etc., situated three miles from Grand Trunk Railway. A considerable amount of mining work has been done at this mine. A well defined vein richly charged with vitreous purple and yellow sulphurets of copper traverse the entire length of the property, five feet in thickness, yielding 8 to 40 per cent. metallic copper.

TOWNSHIP OF GARTHBY.

- 7th. Fifty-six lots of land, 2,938 acres. This property for the most part is unexplored, but copper is found on the greater part of the property. On one of the lots a vein about twenty feet in width has been found. Samples of the ore have yielded as much as 22 per cent. of copper, being also rich in sulphur. Other samples of pyrites from the same property, free from copper, have yielded as high as 48 per cent. of sulphur. The only drawback to this property is in its distance from the railway, it being about four miles from Garthby Station, Quebec Central Railway. A new line is chartered, however, which, when built, will run directly through the property.

TOWNSHIP OF ACTON.

- 8th. The Acton Mine, 100 acres, with engine, boiler, pumps and appliances. Within three years after this mine was first opened it produced nearly \$500,000 worth of copper. It is situated about half a mile distant from the stations of the Grand Trunk and South Eastern Railways.

- 9th. Brome Mine, part Lots 2 and 3 R. 4, 50 acres.
10th. Bolton Mine, two miles from Eastman Station, Waterloo & Magog Railway, 400 acres.

The above properties formerly belonged to the Canadian Copper and Sulphur Company, and were acquired by the present owner at sheriff's sale, giving an indisputable title thereto.

The whole or any portion of the property will be sold at reasonable prices.

Department of Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the

head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chapter thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

Centennial Exposition

—OF THE—

Ohio Valley and Central States,

CINCINNATI,

July 4th to Oct. 27th, 1888.

The Province of Ontario will be represented at this great Exposition with an exhibit of its Minerals and Mining Products, embracing the

Precious Metals, Economic Minerals, Building and Monumental Stones, etc., etc., etc.

All expenses of freight and exhibition will be borne by the Government, and as the time for making a suitable collection of articles is short it is hoped that persons interested in the display of the Province will co-operate in making it as large and full as possible.

Owners or managers of mines, quarries and reduction or manufacturing works are invited to communicate with the undersigned at Toronto, by whom full instructions respecting the exhibits will be given.

Articles intended for the Exposition should reach Toronto not later than the 20th of June, when they will be examined and classified for shipment to Cincinnati.

A. BLUE,

Commissioner for Ontario.

Department of Agriculture,

Toronto, 8th May, 1888.

INDIAN LANDS

LANDS IN THE UNDERMENTIONED localities are offered for sale to actual settlers through the following Indian Agents: On the Great Manitoulin Island, Lake Huron, Ontario; Mr. J. G. Phipps, of Manitowaning, is the Agent for the sale of lands in the following Townships on this Island: Assinack, Bidwell, Howland, Shequandah, Billings, Campbell, Carnarvon, Allan, Tehkumma and Sandfield, and in the Townships of Shequandah, Manitowaning and Shaftsbury (commonly called Little Current). Mr. B. W. Ross of Cockburn Island, is the Agent for the sale of lands on that Island and in the Townships of Gordon, Mills, Burpee and Barrie Island, and in the Township of Gore Bay as well as for those in the Townships of Robinson and Dawson, on Manitoulin Island. Leading roads have been constructed throughout the Great Manitoulin Island.

On the Saugeen Peninsula, Ontario, the land in the Townships Amabel, Albemarle, Keppel, Eastnor, Lindsay and St. Edmunds; as well as several Townships in the Peninsula, are offered for sale through Mr. William Simpson, Indian Lands Agent at Wiarton, County of Bruce, Ontario.

On the Garden River Reserve, Ontario, Mr. William Van Abbott, of Sault Ste. Marie, is the Agent for the sale of lands within this tract, and which are situated in the Townships of Macdonald, Laird and Meredith; also for lands within the tract commonly known as the Batchewar Bay Indian Reserve, and comprised in the Townships of Aweres, Fenwick, Kars, Pennefather, Dennis, Herrick, Fisher, Tilley, VanKoughnet, Tupper and Archibald. There is a leading road through these lands which affords ready communication with other parts of the country to intending settlers.

The condition of sale in respect to the lands within the Townships above described can be ascertained on application to the respective Agents.

FOR SALE

Valuable Phosphate and other Mineral Lands,

In the Township of Buckingham, County of Ottawa.

Patent for Mineral Rights direct from the Crown.

TITLE INDISPUTABLE.

S½ of 25 in the 12th Range 100 acres
S½ of 25 in the 11th Range 100 acres
Three lots, 26, 27, 28, in one Block, in the
11th Range 600 acres
(adjoining Gore of Templeton.)

Also a Circular Saw Mill situated on lot 26, 11th Range, in good working order, and sufficient water power to drive two other mills of the same capacity.

About 30 thousand cords of firewood, chiefly hardwood, may be obtained on these said lots.

The lands are in close proximity to the celebrated Emerald, Little Rapids, and other richly productive mines in the great phosphate region. Recent prospecting has disclosed rich and extensive veins of the mineral.

The property is located one mile from the navigable waters of the Du Lievre River and nine miles from the Village of Buckingham, where the C. P. R., which two years ago built a branch line in order to secure the traffic of the industry, carries it to the port of Montreal.

Conditions and terms of sale may be known by applying to the proprietor,

Proposed Scheme for Keeping Mines

Clear of Inflammable Gas.—Mr. Gilbert

McPherson* proposes to effect this object (1) by draining the coal of its gas before it is worked out, while the bords are being driven; (2) by removing the pillars according to a plan by which the goaf is kept clear of inflammable gas. The first of these plans has never been tried, but the second has been successfully applied in one instance. In the first scheme it is proposed to exhaust the gas from the coal, before it is worked out, by artificial means (the ordinary system of ventilation being still employed) so that it could give out no gas while being taken down. This is to be effected by laying down the shaft from the surface a small column of pipes, and laying throughout the mine a system of gas-draining tubes, a small branch being carried into every working-place. In the centre of each working-place a hole would be drilled to the depth in each case which experience would determine for each particular seam. Into this a tamping block or plug would be inserted and screwed up so as to make it air-tight, and a connection made between it and the draining-tubes by means of a small India-rubber hose, distended with wire, united to the tubes and the tamping plug by union couplings of the simplest description. On the surface an air-pump of suitable dimensions would require to be erected and connected with the column of pipes. When the whole connections were made and the air-pump started, the air contained in the holes drilled in the coal would be exhausted and a partial vacuum formed, when the gas in the surrounding coal would be swept into the drain-pipes owing to the atmospheric pressure forcing the air through the pores of the coal, the air in its passage becoming charged with inflammable gas. In the second scheme it is proposed to remove the bords after a system that the author illustrates, by which, instead of beginning to remove them in the usual method, an air-course is first arranged round their district, and this air-course is maintained till every bord is removed. In the stoppings on the side of the main air-course, which are of the usual description, three-inch wooden tubes are built in at suitable intervals, and by means of these miniature air-courses a quantity of air sufficient to ventilate the goaf constantly circulates. This method has been successfully tried in a mine belonging to Messrs. Galloway & Co., at Hurlford. There can be no doubt that by keeping the goaf free from inflammable gas a very great danger is removed.

CHEMICAL APPARATUS! OF EVERY DESCRIPTION.

Glass, Porcelain, Stoneware, Platinum, Crucibles of every sort, Analytical Scales and Weights, Fine Chemicals and Reagents, including Volumetric Solutions. Every requisite for Analysis or Experiment. For Sale by

LYMAN, SONS & CO.,
384 St. Paul St., Montreal.

Illustrated Catalogue mailed on receipt of 10c. or Business Card.

Electric Lighting Craig System.

CRAIG & SONS—Constructors of Electric Light Apparatus for the Illumination of Cities, Towns, Villages, Public and Private Buildings, Mines, Workshops, etc. (by the Incandescent System). Also Electro-plating Apparatus, Material for Electric Light, etc.

CRAIG & SONS,
Ste. Cuneconde, Montreal.

Food for the Hot Weather

THIS IS WHAT

Johnston's

Fluid Beef

CLAIMS TO BE:

When the Appetite fails; when the Stomach rejects all kinds of food; when the System is run down; in cases of MENTAL and PHYSICAL OVERSTRAIN, causing Debility,

Johnson's Fluid Beef

Will supply STRONG NOURISHMENT that can be retained and thoroughly digested by the Weakest Stomach; it will give TONE to the Stomach, restore waste from whatever cause, and supply FOOD FOR BRAIN, BONE AND MUSCLE.

Contractors! Quarrymen! Miners!

TRY THE NEW Blasting Machine.

No. 1 will fire 5 to 8 holes.—Price \$17.00.

No. 2 will fire 20 to 30 holes.—Price \$25.00

Easy to Operate, Strong, Durable,
Reliable.

NO EXPENSIVE REPAIRS.
Will fire any make of Exploders.

JAMES MACBETH & CO.,

Manufacturers of Exploders and Batteries.
128 MAIDEN LANE, NEW YORK CITY.
For sale by leading Powder Co's and dealers.

FOR SALE.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlain by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

REAL ESTATE AND FINANCIAL AGENT.

Special attention given to Mining properties, having unusual facilities for disposing of same if really good. Shipper of Butter and Cheese to England; liberal advances made thereon. Money to loan on first mortgage or other property of any description. Valuable Copper Mine on hand for sale.

Production of Cast Iron.—The *Revue Universelle des Mines* gives the following particulars of the world's production of cast iron, which may be of interest to our readers:—In 1880 the production of cast iron of the whole world was 838,000 tons, in 1885 it was 19,406,000 tons. During the period comprising between 1865 and 1886, the increase of production, calculated for the year of greatest production was: In the United States 456 per cent.; in Germany 237 per cent.; in Austria 152 per cent.; in England 76 per cent.; in France 64 per cent.; in Belgium 63 per cent.; and in Sweden 53 per cent. Great Britain produces more than the United States, which in return consumes more cast iron than steel. The consumption of the United States is at the present day one-fourth of the cast iron and one-third of the steel produced by the entire world. The diminution of cost of production effected in modern times by the improvements carried out in processes of manufacture is wonderful. Thus, a gross of steel pens, which are to-day sold at Birmingham for 4d., formerly cost £7 to produce. This industry is so important that a single manufactory at Sheffield now weekly sends to Birmingham 20 tons of rolled steel to be converted into pens.

An Engineering Feat.—An engineering work of singular magnitude and importance has just been inaugurated at Arques, near St. Omer, in France. The undertaking so successfully inaugurated is the work of Mr. Edwin Clark, C.E., of Great Marlow. The *Colliery Guardian* says: the work comprises a canal lift, superseding the series of ordinary locks, which at present so seriously impede the traffic on the large canal system communicating with Belgium. The Continental canals are on a much larger scale than our own, the canal boats usually carrying from 210 to 230 tons. The ground at this particular spot rising very rapidly, there are five or six locks in close contiguity, involving great loss of time and great cost in their management. By this invention of Mr. Clark's the canal boats are now lifted the whole height of nearly fifty feet at one operation, occupying only a few minutes of time, and no loss whatever of water. This singular machine consists practically of a gigantic hydraulic press, whose piston is 3 ft. 3 in. in diameter and 50 ft. in length, by means of which the boats themselves,

actually afloat in an enormous tank or reservoir, are bodily raised or lowered, water and all, to the required height. This reservoir is in reality an actual length of the canal itself, made of wrought iron plates, separated from the rest of the canal by iron gates, which are opened when it is raised into its proper position at the required height. There are two such presses, the one descending while the other is ascending, and they thus balance each other, and no steam engine or other mechanical power is required, although the weight lifted at each operation, including the water and the loaded barges, is very nearly a thousand tons. Sixteen hundred barges have already been lifted prior to this public inauguration, the task being performed by a single man, whose only work is the opening and shutting of a small valve, and the operation only occupies a few minutes. A smaller lift on this principle was erected by Mr. Clark some years since in Cheshire, and was then patented, but he has just completed a still larger lift in Belgium, which will be opened during the present month. The same system is now being adopted in Canada for transporting sea-going vessels across the isthmus which intervenes between the Bay of Fundy and the Gulf of St. Lawrence.

Grindstones.—A correspondent of an eastern paper gives a description of a visit to the Bay of Fundy and along the shores, where the grindstone quarries are located. The superintendent of the quarry says when the tide is out his men go down at the rocky shore and work out near the water. At low tide the men on the shore drill some holes in the ledge, put in powder, and blast out great pieces of rock. When the tide rises again they float out big logs and empty barrels over where the loosened rocks are. When the water goes down again they fasten a big rock to the raft with heavy chains so when the tide again rises it lifts up the raft and the rock with it. Then they tow as near the shore as they can. If it is the right kind and size for a millstone, sometimes it is allowed to lie there until the workmen, with stone chisel and hammer, work it into proper shape. At other times, by means of a derrick, it is drawn out on the wharf. Then it is rolled on a track and hauled to the factory.

In Reply to Dr. Selwyn.

ST. IGNACE, Mich., Aug. 16th, 1888.

SIR,—I noticed in the last copy of the REVIEW a letter from Dr. Selwyn repudiating the idea that Canadians are ignorant of the value of their mineral resources. I regret to say that my experience proves the existence of that state of ignorance. I failed in getting a blast furnace company started in Toronto chiefly on account of the dense ignorance of everything connected with the Canadian iron deposits shown by almost all the business men on whom I called in connection with the above project. Numbers asked if I would not be obliged to bring ore from the States for the furnace. One leading business man refused to listen to anything on the subject because "there are no iron ores in Canada." Out of one hundred and thirty leading men on whom I called, only seven showed an intelligent knowledge of the Canadian ores. They all knew more or less about Sudbury; but the large majority were surprised to learn that there were plenty of iron deposits within 200 miles of Toronto. The work of the Geological Survey is unnoticed by the greater portion of the public. Yours, etc.,

SAMUEL D. MILLS.

Electricity as a Mining Power.

One of the chief factors in the near future of mining operations, is destined to be the electric transmission of power, the adoption of which will be found in the long run to be both profitable and economical. In localities where fuel is scarce and transport difficult, steam power is unprofitable, and as regards water power, many obstacles of locality and position interfere to prevent its use. But the method recently discovered of transmission of power to a distance at an economical rate will practically take the place of both steam and water. The Sprague Electric Motor system guarantees to transmit any desired horse power five miles or more, and to use the language of the prospectus before us, "is easily handled, can be applied at any angle, requires little attention, does away with the smoke and noise of the steam plant, vertical shafting, piping, &c., necessary in mining, and so saves the great loss of power incidental to the use of the same." The use of this motor at Big Bend on the Feather River, Butte Co., California, instances its power and usefulness. An electric circuit of 18 miles is established there, at 11 desirable points along which circuit, feeders are run out to Sprague motors, placed at the points on the river bed where power was required for pumping, hoisting, &c. These being perfectly flexible can be easily extended either way for a mile from the point of intersection with the main conductor, and the requirements are obtained by the expenditure of a small amount of money compared with the value of the end obtained. In Richmond, Va., the Union Street Railway Co. use this electric motive power for at least 20 miles successfully under the most difficult conditions, and for a protracted and exacting service. It is now no longer a matter of doubt, but is proved by actual operations, that by its use rich but hitherto unproductive mining property may be profitably developed. Careful estimates have been made by the Sprague Co. which show a good margin of profit in the delivery of water power transmitted from one to twenty miles. There is a location in Michigan now worked by compressed air, where the proportion of power utilized only amounts, after the loss in transmission, to 35 per cent., whilst the Sprague motor system guarantees to deliver at the mine 70 per cent. Again, freezing in winter and the wear and tear attendant on compressed air machinery is done away with. Nearly the same data of cost and loss of transmission of pneumatic power apply to steam energy, whilst the loss of power in transmission by wire for one mile is shown by experience not to exceed 10 per cent., so that taking 100

at the dynamo, and allowing 10 per cent. loss there, 10 per cent. of 90 by transmission, and 10 per cent. by reconversion at the motor, 70 per cent. of the generated power is the net delivery for work. Taking its place with the other electrical appliances of the mine, such as lighting, &c., it will enable all mining operations to be carried on by transmitted energy of some at present wasted water power one to twenty miles distant. Aspen, in Colorado, gives practical evidence of this, where the motor is used for hoisting, and for driving a stamp mill. As a traction power its operation is evidenced in an electric tramway at the Sugar Refinery Works, East Boston, Mass., where loads averaging 10 tons per trip, each trip occupying five minutes are drawn, where ordinary horse power only drew a load of one and a half tons, averaging 15 minutes, and the dynamo lighting the premises runs the motor. For hoisting, pumping, stamping, hauling and ventilation of mines the Sprague motor will be invaluable, and for efficiency and economy this electric transmission of power seems to be the most valuable discovery of the day. The cost of an electric power plant, as compared with any system of air compression is not over 40 per cent. (and nearly the same figure applies compared with the cost of transmitted steam energy) of the present cost of working under ordinary methods. The offices of the Sprague Electric Motor Company are 16 and 18 Broad Street, New York.

Chapman's Assay Notes.

A pressure of matter on our columns last month crowded out a notice of the second edition of the above manual by Professor Chapman of Toronto. This work, which the author in its title page styles "Practical instructions for the determination by furnace assay of gold and silver in rocks and ores," is almost too much condensed, as the information it conveys is very valuable, and would bear more detailed explanation, especially for the younger students in that branch of mineralogy. The author has evidently noticed this himself when he states in the preface that "the work being intended for use in the laboratory" the student will see for himself many of the details which are omitted. It must be borne in mind that the assays explained are not of metals, but of rocks and mineral ores for the detection and determination of any gold or silver that may be present in them. Directions for selecting samples for assay are given, which if properly followed, would save much disappointment, for it not unfrequently happens that the best samples are picked out for assay, and consequently a result is obtained quite misleading and not all in accordance with the general yield of the rock or vein from which they have been forwarded. This direction especially is well worthy of notice. The various processes of assays are described, and as a handbook to accompany actual manipulation, the work in question has much to recommend it. Professor

Chapman's researches are so well known, that his name alone gives an authority to any emanation from his pen, and we recommend the possession of this manual to all concerned in this interesting branch of mineralogical study. It contains a few additional paragraphs beyond what is to be found in the first edition of the handbook, and the original tables have been revised. It is published by the Copp Clark Co. Toronto, and is neatly got up in cloth.

Ontario Mineral Exhibits at Cincinnati

We have before us a descriptive Catalogue of the Mineral Exhibit of the Province of Ontario, at Cincinnati, collected and placed under the direction of Archibald Blue, Deputy Minister of Agriculture of that Province, such exhibit having formed a place at the Centennial Exposition of the Ohio Valley and Central States, which opened on the 4th July last, and which will remain on exhibition to October 27th next. In the introduction, the invitation for the Government of Ontario to take part in this Exposition is alluded to as showing the kindly sentiment which prompted it, "especially in view of the fact that, once parts of one territory, Ontario and Ohio are neighboring commonwealths of almost equal age, largely similar in climate, products and institutions, peopled by the same great race, and having a common record of pioneer annals." A synoptical sketch of the mineral resources of the province, with its geological features prefaces the catalogue, and statistics of the mining industry and its products, together with exports and imports of the products of the mine, give a most comprehensive idea in the smallest possible space of what Ontario is doing. Mr. Blue remarks in speaking of the extent and richness of many of the mineral deposits of Ontario that "their nearness to the great manufacturing cities of the United States is an assurance of their future value." The appendix to the catalogue contains directions to the public for the transaction of business with the Crown Lands Department, and for the purchase of land under the Mining Act. The text of the latter is given also in full, and a list of the economic minerals of Ontario with the localities in which they exist, arranged in scientific order, both being especially useful for reference. The catalogue by means of these additions beyond a bare list of exhibits has thus been made a concise mineralogical handbook of the natural resources of the province, and besides its usefulness as a guide book to visitors to the Exposition, its contents will tend to draw attention to the great resources we naturally possess, and is really by that means a very useful adjunct to the propaganda in circulation for immigration purposes. The concise yet comprehensive description given by Mr. Blue is well worthy of remark, and is a new departure from the old style of catalogue, simply explanatory of the objects exhibited, which may with good effect be used in similar works hereafter published by governments, corporations, or individuals.

LETTERS TO THE EDITOR.

We invite Correspondence upon matters consistent with the character of the REVIEW.
Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

Mr. Shirley's New Process of Treating Crude Phosphate as a Fertilizer.

NEW BEDFORD, Mass., Aug. 18th, 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—Some time since I promised to furnish you with an account of the results obtained from using the crude ground phosphate after being treated by the process of which I gave you some information in the early part of the year. Press of business has prevented my being able to give this subject attention until now, but the delay has not proved any detriment to the progress of the trials, and only confirms the results as being the more assured than if it had been reported on at an earlier date.

The tests have been only on a limited scale, but the results have been so marked that it has put the value of the material as a fertilizer beyond all question. On tender house plants it must be used most sparingly, otherwise it forces the growth so as to make the plant overgrown and weak; the trial on some celery beds has proved a marked success, the heads being fully 20 per cent. larger without destroying the crisp tenderness which is so desirable in this plant. Several nurserymen are taking the matter in hand, and are following up a series of tests, so that by the fall I hope to be able to give full and specific directions for all purposes to assure its proper use and to obtain the best results, as with an article of this kind the abuse of it might probably do it more harm in its introduction than good. From experience thus gained we look to the reserve power of the so called insoluble portion of the material to be of lasting benefit to future crops, as by the process of disintegration which is constantly going on, especially during the winter months, the ground will be rendered richer and ensure beneficial results in the following season. It will, of course, take several seasons to make its merits known and convince the skeptical of its true value; but, with the qualities contained in this article, its continued use will remove all doubts and make it the accepted medium for fertilizing in the future. If once thoroughly introduced the demand will continue to increase.

Trusting the material will become as widely known as it deserves for the benefit of all engaged in the phosphate industry.

I am, yours truly,
FREDERICK S. SHIRLEY.

GEOLOGICAL SURVEY CAMP,
DU LIEVRE RIVER,
Ottawa County, 19th Aug., 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—In your last issue appears a statement regarding the work I am now prosecuting in this district under instructions from Dr. Selwyn, the Director of our Survey, which gives a very erroneous idea of its nature and objects.

In view of the new material brought to light

by the developments made during the last few years on the phosphate deposits, and the greater facilities for study now afforded by the opening up of the industry of the district, it has been deemed to supplement the work already done in this direction by the Survey by undertaking a further detailed investigation into the nature of these deposits and of the rocks associated with them.

The topographical measurements now being made by my assistant, Mr. Jas. White, are undertaken simply with a view to the collection of data sufficiently detailed and accurate for the construction of a map on the large scale necessary for the working up and representation of the geological details brought to light by the investigation commenced last month.

I am, Sir, yours, &c.,
ELFRIC DREW INGALL,
Mining Geologist
to the Geological Survey of Canada.

Soluble and Insoluble Phosphates.

A. H. Ward, Boston.

Another comparative experiment with phosphate made by the Pennsylvania State College Experiment Station confirms experiments made by the New Jersey Experiment Station and many others, and shows that the less soluble and cheaper forms of phosphoric acid are likely to prove equal or superior to the more costly soluble acid phosphates.

The results of these various experiments should be well known by the various experiment stations, and, if they are known, what justifies them in making so great a difference in value as 400 per cent. between soluble and insoluble phosphates? It all comes out of the farmers.

A bulletin of the Pennsylvania State College Experiment Station gives the results of experiments made with phosphates in a four-crop rotation in the years 1883-7, the first year's crops being grown without manure, to determine the relative fertility of the several plots. The plots were twelve in number, each of them one-twentieth of an acre in extent, and the soil is what is usually called limestone clay. Oats were grown in 1883, and the product showed considerable variation in the fertility of the several plots. Taking 100 as the average of all, they ranged from 91.62 to 114.52, eight being under the average and four over it. The rotation was in the order of wheat, grass, corn and oats, and the fertilizers were applied to wheat and corn only—the grass and oats getting the residual effects. Two plots were unmanured throughout the experiment, and from the results of these the values of the fertilizers were computed. The experiments were made to study the effects of different forms of phosphoric acid, and to guard against failure from a lack of any of the elements of plant food, each of the plots, except the two unmanured ones, as treated to 200 pounds of muriate of potash and 240 pounds of sulphate of ammonia per acre. They were thus supplied with nitrogen, potash, sulphuric acid and chlorine, while the limestone soil contained a vast excess of lime, magnesia and iron above what the crops could possibly use. Two of the plots received no other manuring, and the remaining eight were treated in pairs as follows:

1. 200 pounds dissolved boneblack, the phosphoric acid largely soluble.

2. 200 pounds dissolved boneblack, previously treated with lime; phosphoric acid largely reverted.

3. 150 pounds fine ground bone.

4. 150 pounds ground South Carolina phosphate; phosphoric acid largely insoluble.

These fertilizers were all standard articles of trade. Now for the results. Of the 56 single cases recorded, 36 show unmistakable gain resulting from the use of phosphoric acid, six show a probable gain, eight a doubtful gain, and the remaining six an apparent loss. But the results give no satisfactory proof that one form of phosphoric acid is superior to another. It would appear, however, that a limestone soil is not the most suitable for a phosphate fertilizer, owing to the circumstance that it precipitates the superphosphate so quickly as to prevent due distribution to the roots of plants. A comparison of the results obtained in the experiment with the results of other experiments appears to justify the conclusion that "upon lime soils, upon very light sandy soils, and upon pure peat soils, the less soluble and cheaper forms of phosphoric acid are likely to prove equal or superior to the more costly soluble acid of the superphosphates. But the director of the Pennsylvania station wisely enjoins caution in departure from established practices. A few simple and inexpensive trials of reverted or insoluble phosphates on a small scale would readily show one contemplating their use whether they were likely to prove profitable under these circumstances or not. No general rule can apply to every soil."

Mining in Newfoundland.

The first copper mine was opened in Newfoundland in the year 1864. So rapid was the development of copper mining that in 1879 the total ores of copper and nickle exported amounted to \$4,629,889, and Newfoundland reached the position of sixth among the copper producing countries of the globe. The first copper mine opened was at Tilt Cove, situated on the north side of Notre Dame Bay, six miles south-west of Cape Joan, and two hundred and twenty-five miles north-west from the City of St. John's. Here the coast is very high and precipitous, and Tilt Cove is formed by a narrow opening which widens into a circular space in which there is a small fresh water lake. This space is surrounded by steep hills and rocks, and with the exception of the narrow opening to seaward, does not exceed three-eighths of a mile in diameter. In this space and on the west side of the neck of land separating the sea from the small lake, mining operations were commenced, the workmen's houses, offices and stores being around the small lake. At the close of 1879 this mine had yielded 50,000 tons of copper ore, valued at \$1,572,154, and nickle ore worth \$32,740. It was eclipsed in 1875 by Bett's Cove mine, from which in four or five years no less than 125,556 tons of ore were taken, valued at \$2,982,836.

The price of copper began to decline and went down lower and lower, there being a glut in the market. Tilt Cove mine became less remunerative, and mining was carried on in a languid way for a time and finally was discontinued. The general impression was that the best of the workings had been exhausted and that little ore remained. In all, it had yielded 70,000 tons of ore. In 1878, a new and wonderful deposit of copper ore was discovered at Little Bay, which left all previous discoveries in the shade. It presented great facilities for working, and here mining was and still is carried on upon an extensive scale. Tilt Cove was almost forgotten and was believed to be "played out." It was placed on the market

by its proprietors who were still impressed with its value, and believed that far more ore still remained than had been extracted. The price of copper, however, was low and for a time no purchaser appeared. At length the French copper syndicate took the field, and the price of ore bounded upwards. The mine was speedily purchased for £80,000 sterling, certain parties having an agreement which gave them the option of buying at that price. The speculation was a lucky one for them. A few weeks afterwards they sold it to the representatives of the syndicate for £160,000 stg., or \$768,000. Workings have recommenced vigorously, and this summer a large number of miners are at work. The explorations of experts have proven that the main deposits of the ore have hardly been touched, and that a vast quantity of ore awaits future operations. Once more we have a confirmation of the statements made during many years past, that this island will one day be a great mining centre, its undeveloped mineral resources being very great.

This mining property at Tilt Cove is an instance in point. At the beginning of this year, and in view of purchasing, a mining engineer of experience was sent out from London to report on it. In his report he says that in what is known as the East mine there is a mass of copper and iron pyrites of extraordinary dimensions.

"This has been cut by an adit level, driven from the north slope of the hill in a southeast direction, through massive chloritic and micaceous schists and slates 430 feet when the north wall of the mass was found, bearing north 45 degrees east (nearly) and having a slight underlay to the northwest. The mass of pyrites has been cut at a right angle to the north wall 136 feet without finding the south wall. It has been opened from east to west 62 feet over all, and there is no appearance of an end of it in any direction. The whole mass is quite homogeneous; there is no mixture of any rock matter in any part of it. There is at present room for men enough to break 2,500 tons a month, and which amount may be increased as the vein is farther opened out. The vein may be driven till the south wall is found; and the height from the adit to the surface, in the centre of the mass, is about 100 feet, a large portion of which would be available as soon as the shaft can be got through it. By the present system of working I estimate the cost of putting the ore on board ship at \$2.50 per ton. This includes all and every expense."

Even this is not all. The same property includes another called the "Long Pond Mine," two miles west of Tilt cove, where there is an extensive vein which has only been slightly explored. A shaft has been sunk on it thirteen fathoms, and seventy tons of ore carrying 11 per cent. of copper has been shipped from the stuff broken in sinking. Another mining engineer of high standing said in his report: "It would be difficult to find a mining property, in any other part of the world, with such an enormous amount of mineral in sight; and I see no signs of exhaustion notwithstanding several hundred thousand pounds worth of ore have already been extracted."

The mine first worked, the profits of which during the whole time of working amounted to £60,000, is now full of water, but it is not improbable that it will be pumped out and the workings resumed. But there are lying around this old mine, immense dump piles which have been thrown away. An engineer has estimated these piles at 200,000 tons, out of which could be picked 50,000 tons which would give 5 per cent. of copper; and a further treatment would reduce it to 20,000 tons of 12½ per cent. copper one for shipment or smelting. He calculates that a clear profit of £12,500 sterling would be realized on the treatment of these dump piles, which had been thrown aside as useless rubbish.

When a single mine, and by no means the

largest, yields such returns as these, can it be doubted that in the future this island will be the scene of large mining operations? It is in connection with the serpentine series of rocks that these copper ores are found, and that series covers 5,097 square miles. Lead and silver ores have also been found in many localities, and gold has also been discovered, but as yet only in small quantities. The copper ores, however, are by far the most valuable and extensive. Professor Stewart, an American expert of eminence, said in his report, after visiting the mining region: "I have never seen finer copper ore in the course of my experience. The character of the rocks in which it occurred was such as to give an absolute assurance of perpetuity in the working. Judging by the laws which govern mineral deposits, the depth of the veins in many places is such as to render them practically inexhaustible. I have not seen a more promising field for copper anywhere."

Markets.

Prices in the United Kingdom and the continent remain about the same as quoted in our last issue.

Shipments.

Phosphate shipments from Montreal for month ending August 18th, 1888:—

Du Lievre.

The navigation of the Lievre river at Little Rapids is causing no end of trouble and expense to the phosphate miners of the district. The contractors of the new lock and dam are very tardy in their operations, and up to the present have so bungled what little work they have done as to completely alter the channel of the river at this point. At present very lightly laden scows have great difficulty in getting over, and the shipments from the mines are consequently very much retarded. The tardiness of the contractors in the construction of these very desirable works is the theme of many bitter remarks at the mines.

During July about 1,300 tons of high grade and 400 tons of "seconds" were shipped from High Rock for the English market. The pits look well, and everything goes on much as usual at these mines. Shipments for August have been very much hindered by low water at the Rapids. A telephone from the main buildings to the landing, a distance of a mile and a half, has recently been constructed.

A little girl, the daughter of one of the miners, had a portion of her hand blown off a few days ago, at these mines, by the explosion of a cartridge.

The tramline and other improvements at the Canadian Phosphate Co.'s Mines are rapidly nearing completion. A goodly quantity of ore has been mined. The management have, we believe, struck good ground at a depth of 140 feet in their "big" pit. From 160 to 170 men are employed.

A very large quantity of "seconds" awaits shipment at the Dominion Co.'s wharves.

We are requested to state that there is no truth in the statement that the Phosphate of Lime Co. are negotiating for the purchase of the Emerald.

Perth District.

The Anglo-Canadian Phosphate Company continues to meet with success in mining on the contract system at the Otty Lake Mines in North Burgess, and the Bobb's Lake Mines in Bedford. At the latter place four men took out 52 tons in five weeks, and their success has brought in a number of contractors, all of whom so far have readily found good shows. A considerable proportion of the phosphate obtained consists of crystals. The company have had prospecting done on the lots at the west end of the Gore of Templeton, and a number of promising shows have been opened. These are being let out to contractors to work, and a good output is expected. It is proposed to call the property "The Lake Tassie Mines."

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

At the Drummond colliery operations have been very seriously retarded by a "crush" (a difficulty frequently met with in extracting pillars). Every effort has been made to find work for the men thus thrown out of employment.

The Acadia Company have extended their main hoisting slope down to the new lift which was sunk some time ago. This makes the main slope at this colliery the longest in the province hoisted by one lift, the total length being over 3,000 feet.

At the Albion mines the work of sinking the English slope to the Cage Pit seam is still continued, although rapid progress cannot be recorded. The pumps at the Foord Pit are still out of order, and although the water in the pit has been reduced to within 40 feet of the bottom, months will probably elapse before the bottom is seen.

Since our last the diver working at the buckets of the Foord pit pump met with a curious accident which nearly cost him his life. While down in the pump shaft he missed his rubber wrist-bands, and was returning to a temporary stage which had been erected, to put them on, when nearing the top of the ladder he missed his footing, and fell back head-first into the water. In his endeavors to right himself he got fast under the air pump platform. The three men who were attending the diver, finding that they could not extricate him from his perilous position, decided that the only chance of saving his life was to hitch the rope of the winch engine to the life line around his body. The engine was started, and by a steady pull landed the diver safely on the pump platform. He escaped without injury, excepting a slight bruise in the back, caused by the force of the engine tightening the life line.

A discovery of coal is reported from Five Islands. Mr. Nickum, of St. Louis, Mo., one of four American capitalists owning large timber limits in the vicinity, has engaged Mr. Edward Wilkinson, an experienced miner, who holds a manager's certificate, to open up the new seam.

Recent newspaper despatches state that the Lawson coal mine near Meccan, Cumberland Co., has been sold to Montreal capitalists. We are in a position to state that the rumour has no foundation in fact.

In boring for water at Spring Hill mines, two large seams of coal were found in a southeasterly direction from the present, in a locality where the existence of coal had been unsuspected. This discovery will add greatly to the value of Spring Hill properties.

At Chignecto mines two seams have been recently struck at the outcrop—both of good size, neither of which had been previously discovered or worked, it is believed, on that area. They give promise of being good coal. In this connection speculation is again rife as to the probable existence of another field of coal south of any of the Joggins seams hitherto prospected.

Mr. Wadsworth has brought in from his Caribou mines, a fine brick of 214 ounces from 111½ tons.

We understand, says the *Critic*, that a wealthy English syndicate, introduced to this country by Mr. James C. Ashton, has purchased the Lochaber Gold Mine from Mr. John H. Anderson and others. The Lochaber district is a comparatively new one, situated between the Fifteen Mile Stream fields and the Salmon River Mine. No mine has hitherto been worked there. The prospecting shafts look very well, and show a good body of ore which should yield at least one ounce of gold to the ton. A stamp mill will be erected at the mine forthwith. Six cwt. of ore sent to England for treatment produced the extraordinary result of twenty-eight ounces of gold to the ton. Notwithstanding the fact that test assays are not always the best guide as to the value of a mine, we know enough of this one to predict such a satisfactory return that more English capital will be attracted to these long-neglected gold fields. Mr. C. H. Cox, of Liverpool, who represents the syndicate, is an artist of no ordinary ability, and his pencil, brush and camera have been kept busy during his visit of inspection. Some of his sketches will appear

in one of the English illustrated papers, and they will no doubt convey to the stay-at-homes some idea of our beautiful Nova Scotian scenery. If this second precious infant of Mr. Anderson's proves as healthy and flourishing as his first (the Oxford Mine, Lake Catcha), it will only be just recognition of his long and untiring services in striving to place the gold mining industry of the province upon a sound and firm basis.

Mr. D. Rattie, superintendent of the Dufferin Mine, Salmon River, is the first one to arrive with July gold. He brought in 279 ounces.

A bar weighing 141 ounces is the result of the first crushing at the Northup mill, Central Rawdon.

Work at the Greener-Ingraham iron seam, Cape Breton, is being actively pushed. Three shafts have already been sunk, one to a depth of 15 feet, which contained 14 feet of ore. They have also traced the lead to the shore. A wharf is about being erected for the shipment ore, and in about three weeks those in charge expect to be in a position to raise 100 tons per day. They have recently opened two other shafts quite a distance apart and have found the ore equally as good.

New Brunswick.

The coal fields of the Grand lake region of New Brunswick are said to be practically inexhaustible and should be explored. The rapid increase of railway mileage in this province makes it especially desirable that the facts respecting her coal be scientifically and thoroughly tested by boring.

Quebec.

The natural gas wells at St. Gregoire were visited recently by Dr. R. C. Selwyn, Director of the Geological Survey of Canada, says the *Montreal Star*. The doctor is quoted as saying that there is a strong flow of gas at the wells, and that the gas burns well and the supply is large. He thinks that a thorough examination of the gas supply should be made. The proprietors, it is said, are negotiating with American capitalists with a view to have them take hold of the well for the purpose of utilizing the gas. The gas was discovered in 1885 by Mr. Porier, M. P., of St. Gregoire, who organized a small company and sank a shaft on Mr. Trudel's property, which yielded a fair quantity of gas from a depth of 115 feet.

Very valuable deposits of porcelain clay are shortly to be worked by Mr. E. Duval, merchant, of St. Peter street, Quebec. A professional analysis has been made of some of the product taken from near the surface and good results are promised. The works will be opened back of St. Urbain, near Baie St. Paul. Samples shown promise exceedingly well.

Operations have been resumed at the Nailon Gold Mine, near Buckingham, seven or eight men having been set to work, with Mr. John Haley as foreman. A shaft is to be sunk to a depth of twenty feet, which, it is thought, will penetrate the richer portion of the workings. The syndicate are more than ever convinced that they have struck a good thing, judging so from the increased richness of the output. If the results of the next assay prove encouraging they will put on a large force of men and work the thing for all it is worth.

Ontario.

The oil well on the property of Mr. J. Lalonde, located about a mile north of the railway at Comber, near London, is steadily overflowing. The oil, which is of black color, and very thick, comes from a depth of 1,300 feet. Mr. Lalonde puts up about half a barrel per day.

The Hungerford Marble Company shipped during the month two cars of Bridgewater marble to Chicago.

At the cleaning up on Tuesday, the 10th instant, of a lot of seven tons of rock from the Richardson Gold Mine, the yield was found to be from \$40 to \$60 per ton, which is highly satisfactory. The prospect is so encouraging that additional capital will be invested and a crushing mill erected.

Sudbury District.

On Friday, 10th instant, the Ontario Mining Commission visited the Vermillion Mining Company's property at Whitefish, and while there made observations and took evidence in Denison. There were present Messrs. A. Blue, Dr. Bell, W. H. Merritt and Monaghan. On Monday, the 13th, they began operations in Sudbury, meeting here Mr. Coe, and being joined next day by Mr. Charlton. While here they visited the several mining locations under the Canada Copper Company, and took evidence of several of their officers, as well as that of prospectors and others engaged in this district. The evidence of Dr. C. D. Peters, General Manager, was complete and concise, as well as most interesting. Among prospectors several were examined, and the information was elicited that Mr. James Stobie was developing two properties, one of argentiferous galena, and one of a pyritous ore with galena carrying a good value in silver and gold. That Mr. Kettle had a good promise in argentiferous and auriferous galena. And that others had made discoveries of veins of copper, the nickel-bearing pyrrhotite, and gold quartz, as well as galena. They visited the Stobie, the Copper Cliff, and Eyre (now Evans) mines. In each of these locations development is progressing most favourably, and stock fast accumulating for the smelting works, which Dr. Peters hopes to have in running order by November.

The Vermillion Mining Company are now developing three shafts, one in copper and two in gold. At the copper shaft the surface material yields considerable gold, besides some metals apparently of the platinum group, which are also contained in the copper and nickel ore at the bottom. The management are sinking through this deposit which will be developed by drifting at a later date. No. 2 shaft is being enlarged, and a new shaft, No. 3, is being sunk on a very promising vein within a quarter of a mile of No. 2, to the south-east. The vein matter of this shaft yields about \$18 per ton in silver and gold. This company have adopted the praiseworthy policy of permitting prospecting on their property (about 2,000 acres) on payment of a royalty.

In Graham, Chicago parties have been sometime at work, and are now meeting with encouragement. This, we hope, will rapidly develop into a well paying gold quartz.

Many prospectors have returned now that the fly season is past, but there is still room for many more, and we hope to see things assume a more business-like aspect before long.

A statement in some of the daily papers to the effect that the new smelting works to be erected by the Canada Copper Co. will cost \$1,500,000 is contradicted by Mr. R. Hedley in the *World*. He writes:

"In conversation to-day Dr. Peters said he should be very sorry if it cost one-thirtieth of that figure. An instance of the cost of the erection may be cited to show how absurd such statements are. A year ago the Calumet and Hecla finished their new smelting and refining plant at Lake Linden, Mich. They have a complete smelting and refining plant of the most substantial kind. Their buildings are mainly of stone, and no expense was spared to make them perfect in utility and appearance. They include fine docks with every facility for loading and unloading. The cost of this beautiful plant was \$500,000."

Port Arthur District.

There has been an unusually large influx of mining men into this region during the past month, the stages to the mines being crowded daily.

The Mining Commission appointed by the Ontario Government are expected to reach Port Arthur on the 19th instant, when a large amount of valuable mining information will be obtained.

Some of the more promising silver finds are quietly changing hands. There have also been a few sales of cheap properties.

There is a large amount of iron lands on Hunters Island being located, and an odd location for gold.

The continued favourable development of the Beaver, Badger, Silver Mountain, Silver Fox, Caribou and Crown Point Silver Mines assures the success of silver mining as a permanent industry.

There is considerable stir in the lead region east of Port Arthur, around Black Bay. Several of the properties are being developed by capitalists who have them bonded with a view to purchase at large figures.

Numerous prospects are being worked on a small scale for silver by private parties of small means, some of which will eventually attract the necessary capital to make them worthy of a name.

The Government are gradually settling the various disputed claims which were up before their Commissioner, and the successful applicants are consequently jubilant.

Manitoba and North-West Territories.

Letters patent of incorporation have been applied for by the "Sebaskong Lumber and Mining Company," with a capital of \$22,000 and chief place of business at Rat Portage.

British Columbia.

The shipments of coal for the month of July from the twin ports of Nanaimo and Departure Bay, are the largest yet attained in the history of coal mining in the Nanaimo District. The total shipment amounted to 40,158 tons, loaded into 26 vessels. This amount does not include the Provincial trade, such as supplies to the local steamers, and the home consumption of the Province. The value of the exports of coal for the month of July is placed at \$140,553 for custom purposes. This increase in the shipment of coal has caused a corresponding increase in the number of residences erected in Nanaimo and the Wellington settlements.

The news that has arrived by way of Victoria, B.C., of the explorations of Mr. Ogilvie, who, while surveying the far North-west of Canada on behalf of the Dominion Government, wintered on the Yukon, is very gratifying. He explored the Yukon for 700 miles and found it very rich in gold and silver, some of the miners making large sums. This result is only a fresh instance of the fact that the more Canadian territory is explored the richer it is found to be. This is the case even in localities which have been supposed to be most unpromising. The British Columbian "sea of mountains," of which we once heard so much, turns out to be exceptionally rich in minerals, clothed with luxuriant forests, with which fertile agricultural lands are interspersed, while its coasts teem with fish of the most valuable kinds.

* The Coalfields of Cape Breton.

By E. Gilpin, Jr., F.G.S., F.R.S.C., Inspector of Mines.

The popular idea is that a coal mine is a hole in the ground, and a coal field a section of country uninteresting from heaps of coal refuse, and the unpolished manners of its inhabitants.

A closer survey, however, shows that the "hole in the ground" exercise the highest engineering and technical skill of those who conduct the operations connected with sinking them, and extracting the coal with the minimum of cost. The manners of the miners, if marked with a certain reserve toward strangers, are those of men whose occupation differ from the callings of ordinary humanity; and among themselves they are friendly and charitable and ever ready to dare the dangers of the mine if a comrade calls for help. When the figures of the statistician show that the power and wealth of a nation is directly measured by the number of tons of coal it produces and consumes, the subject acquires a general and vivid interest. Coal fields seem to be a special gift of Providence to nations, and curiously enough the English-speaking races have the lion's share of coal fields, and have well availed themselves of their privileges.

The extraction and exportation only of coal however is not a permanent source of wealth. The treasures of the mine resemble more those of the forest, than the treasures of the field and of the sea. Every ton of coal when it leaves the country represents, in most cases it is presumed, a certain amount of profit, but its removal increases the cost of the extraction of the next ton, and like a tree of the forest it cannot be replaced. It must be used locally to smelt the ore, forge the metal, ply the loom, or to build the multifarious machinery demanded to-day, before its true value is seen. One man can dig a ton of coal, but two must toil before it has yielded up its many items of power, or heat, or light. Take the mother country, did she export all her coal, and close the myriad factories supported by it, her position would be vastly different.

The few introductory remarks I am permitted to make should however be directed rather to the geological than the economic side of my paper.

Could the student carry himself backward, beyond the time of Confederation, to the period of the formation of the Cape Breton coal beds, and take his stand on the granitic hills of Cape Dauphin, at the entrance of the Bras d'Or lake, his eyes would wander over a view widely different from that of the present day. Instead of the rolling hills covered with spruce undergrowth, and occasional ridges of hardwood which now stretch eastwardly from Sydney to the shores of

the ever-encroaching Atlantic, he would see, mile upon mile, a dead monotonous level, with here and there dull sluggish reaches and swamps of dark peaty waters, while overhead the rays of a sun warmer than that now allotted to us, could scarce dissipate the clouds of vapor it kept drawing from the heated water and steaming soil.

On a nearer approach, this uninteresting country, which we would compare to some of the tidal marshes of the Bay of Fundy, is found to be covered with the densest of vegetation. No modern forest, tropical or temperate, reproduces the curious scene. A closer study, however, would detect some trees bearing a fanciful resemblance to plants now growing in the earth. There was one tree specially beautiful, its towering stem sometimes nearly one hundred feet in height, was fluted like a temple column, and crowned by magnificent fern-like fronds, a mysteriously-developed tree fern. Its roots descending into the marshy ground radiated, divided and sub-divided until they could suck nourishment rapidly for the great tree above with its quick growth and frequent branch-making.

There is also another tree with peculiarities now characteristic of the "club mosses," but its branches were flung wide in the air, and it appeared to the casual observer like a mighty pine.

Yet another curious plant recalls our "mare's tail," but its fluted bamboo-like stems were often forty feet high.

In those pre-historic forests of twenty millions of years ago, there was scarce a temptation for the little children to wander as Babes in the Woods, for nature, rioting in luxuriant growth, did not deign to captivate by the exhibition of the fleeting colors and fragrances which poets have sung and nations admired. In vain would search have been made for any plant now called national: the rose, the thistle, and even the humble emblem of our Province, all were wanting, and perchance only the mosses and fungi relieved the sombre colors of that "Dismal Swamp."

In vain would the hunter, so far as the records of the rocks inform us, have searched for his prey, in the air, or by land, or by sea. Locusts, beetles, scorpions, nondescript frogs or newts, all labored in their task of subduing, consuming and consolidating the great masses of vegetation. However, it must be said that these remarks are based on negative evidence only, the plants and insects from which our imagination has reconstructed so curious a page in the history of mother earth, are few in number, and owe their preservation as fossils to peculiar circumstances. There may have been many other organized helpers in the great scheme on the hills and highlands surrounding the marshes, and imagination may depicture the graces and beauties and the melodious sounds of an untrodden land.

Such were some of the curious forms that were crowded in the battle of life which left victors and vanquished preserved for our sole benefit. The plants grew and fell, and were buried, the water of the swamps allowing but a tardy decomposition, until a deep peaty mass accumulated. The sub-soil, a clay or loam, was filled with rootlets until perhaps no further mineral nourishment of silica or of potash, etc., was available. Long years this swamp, devoid of living vegetation, lay gradually undergoing changes consisting chiefly of elimination of water from the vegetable matter, until some oscillation of level, perchance a change in the current of some by-gone river unnamed and

unsung deposited on its partly hardened surface a layer of silt or mud. This went on until hundreds of feet of sandstone, shale, coal, fireclay, etc., are now presented. The accumulating mass in the slow course of time became firm. Pressure, the internal heat of the earth, chemical laws of change all combined to make the peaty mass a layer of carbon with a small percentage of ash, and of bituminous forming matter; the sand layers were cemented by silica into hard sandstone, the mud into bituminous or carbonaceous shale; and the ancient soil well robbed of its alkali; and silica became fireclay.

Almost without exception every bed of coal the miner explores has immediately below it a bed of fireclay often filled with carbonized roots. The coal bears in its structure the evidence of its vegetable origin, for under the microscope can be seen in it, fruits, flowers, and particles of wood fibre, etc. Above the coal comes the roof usually of shale or sandstone, often bearing in it at the junction with the coal bed, layers of ferns, pressed and preserved as in a herbarium; or a full length tree of that ancient forest showing in its flattened stem clearly and distinctly its species, etc., and recalling with its darkened color the logs found in our peat swamps.

We have now briefly traced the coal seam to its full growth, but had nature gone on adding the coral, the chalk, and all the varied and immense layers of subsequent formations this precious heritage would have been like an estate in chancery, pleasant to think about, but a thing unattainable, for we could not have sunk shafts some four or five thousand feet to provide our fuel.

The process of nature which has laid these stores of fossil fuel close to the surface in Cape Breton is one as yet little understood by geologists, but it is a subject fascinating from its grandeur, and to its operations do we owe all our mines. There have been elevations and depressions in the earth's surface ever since its creation, caused by internal forces, contraction of its crust, accumulation of sediments, or what not, we see the effect, and bless the hand that guided the cause. In the Sydney district it appears that the old, old rocks, the granites and gneisses of Coxheath, Boisdale and St. Ann's were forced slowly and gradually upwards. This motion forced a tilting of the strata holding the coal so that they inclined to the east-ward. This was continued until the "Atlantic" of that date came in upon the land, and had boundaries approximating those of the present day.

(To be continued.)

*Transactions of the Mining Institute of Scotland vol. ix, pp. 138-145.

†From "The Carboniferous of Cape Breton;" a series of papers read at Halifax.

Van Duzen Steam Jet Pump.

MINING.—Our \$16 Pump preferred to a \$200 Steam Pump.

STATE OF MAINE ASSAY OFFICE,
F. L. BARTLETT,
PORTLAND, ME., June 21, 1883.

"GENTLEMEN,—The No. 5 'L' (\$16) Steam Jet Pump I purchased of you I have used for raising water from a mining shaft fifty feet deep. I set it to draught twelve and force thirty eight feet. It worked very well indeed, although I was obliged to carry steam 150 feet from the boilers and in weather often below zero. I carried 75 pounds of steam at the boiler, and the Jet Pump took the place of a No. 3 K (\$200 Piston Pump), that I had to remove.

"Yours truly,

F. L. BARTLETT."

Address for further particulars,

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests; and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

James Reed,

Reedsdale, Megantic, P. Q.

A Hand-drilling Contest.—A drilling contest at Evergreen Lakes, near Leadville, Colo., on 29th ulto., between N. Meyer and John Ahern, resulted in the former drilling a drive back hole in granite 20¾ inches in fifteen minutes, and the latter 17¼ inches in the same space of time.

Miners' Hospitals.—A sum of \$60,000 has been appropriated by the State for three cottage hospitals for miners in the bituminous coal regions of Pennsylvania. The hospitals are to cost \$20,000 each. One will probably be located in Connellsville; another will go to the Mercer coal fields, while Clearfield will get the third. They will be large enough for, perhaps, thirty beds.

New Electric Drill.—An electric drill weighing 100 pounds, and that makes a hole three feet deep in hard anthracite in 30 seconds, and one six feet deep in 1½ minutes, is the latest thing in electric drilling machines. It is designed by Mr. W. M. Schlesinger, and made by the Union Electric Company of Philadelphia.

The Profits of a Great Mine.—As an example of how profitable mining investments may be, we give the magnificent example of the celebrated Calumet and Hecla mines. The original assessments were \$15 a share on the Calumet and \$25 a share on the Hecla, each of which had 20,000 shares. This would account for only \$800,000 paid in, but it is generally stated that the total amount of money paid in on the consolidated stock was \$1,200,000. The mine has paid in dividends no less than \$30,850,000, or about \$25 for every \$1 paid in, or about \$1.20 a year on \$1 invested. This, however, is not all; out of surplus earnings immense sums have been invested in additional property, and in gigantic (though in great part unsuitable or unnecessary) machinery. So that the property to-day is selling at the rate of about \$30,000,000, which would represent at least another \$25 on the \$1 invested. An investor who contributed to the original assessments, held his stock until the present time, and sold out this week, would therefore have received \$50 for every dollar he originally paid in.

Securite.—The new famous explosive, emits a spark in exploding, but this spark is harmless, not possessing sufficient energy to explode inflammable gases or coal dust. By the action of the organic salt the spark is almost instantly extinguished. In the tests mentioned, the flameless "securite" was exploded in vessels containing the most highly explosive mixture of gas and air, and, in some cases, this combined with coal dust, but, while gunpowder invariably causes their explosion, the flameless "securite" did not ignite the gas, or the coal dust, and it was demonstrated to be safe, even under more severe tests and conditions than are ever present in mining operations.

Steel Manufacture in Nova Scotia.

Mr. J. H. Bartlett, M. E., (1) Montreal, sends the following description of the Nova Scotia Steel Works:—New Glasgow ranks among the most enterprising and progressive towns in the Maritime Provinces. It is situated at the head of navigation on the East River, which flows into Pictou Harbor. The famous Pictou coal mines are in the immediate vicinity, with all of which New Glasgow is connected by rail. The town is also connected with the Intercolonial Railway at Turo, by the Pictou Branch, with the Straits of Canso by Eastern Extension, and with Pictou by the Stellarton Pictou branch. With such an advantageous position and surrounded by a fine agricultural country, it is hardly a matter of surprise that New Glasgow is outstripping its sister town, Pictou, the shire town of the county. The principal iron works are at Trenton, about a mile below New Glasgow. Indeed the village of Trenton has grown up around the works since their establishment. The Nova Scotia Steel Works, which were established in 1882, have invested in them a paid-up capital of \$280,000, two-thirds of which stock is owned by citizens of New Glasgow. Some of the stock is also owned in Halifax, Pictou, Montreal and other places—Sir D. A. Smith being one of the Montreal shareholders. The works occupy about ten acres of land—the main building, 410 feet by 130 feet, covering over 80,000 feet. Extensions are being made to the buildings, which will cover 25,000 feet additional. Nearly two miles of railway track are in operation in and about the works, which will be largely increased by sidings not being laid down. The principal items of plant are the following: Two open-hearth steel-melting furnaces—one 15 and the other 20 tons capacity; five re-heating reverberatory furnaces; two re-heating Siemens gas furnaces. The machinery comprises one 26-inch cogging mill, fully equipped with live rolls, hot billet shears, etc.; a 22 inch sheet mill; a 17-inch nail-plate mill—these are driven by a pair of compound condensing engines of twelve hundred horse-power; a 16-inch bar mill; a 9-inch merchants' bar mill—these are driven by a high pressure engine of 800 horse-power; plate and cropping shears; one steam travelling crane of 10 tons capacity; a number of steam hammers—in all, there are 40 steam

cylinders in operation in the works from the 30 inch cogging mill engines down to 6-inch cylinders; one heavy roll turning lathe, driven by an independent engine. In the steel spring tempering department are heating and annealing furnaces, drop hammers and all other plant necessary for the rapid production, in large quantities, of springs and teeth for agricultural implements. In another department are the necessary shears and punches for the production, on a large scale, of railway fish plates, both bar and angle; tie plates, plow plates, etc. In the machine shop are all the usual and necessary plant for such an establishment, such as planers, lathes, drills, etc. The product of the works consists largely of steel for agricultural implements, together with the usual sizes of merchants' steel, in rounds, flats and squares, with angles and special sections. A large quantity of spring steel is also made. Rivet steel, of specially low carbon, is also manufactured, besides tramway and pit rails; nail and plough plate, and large quantities of "sections." The works are well supplied with water, the New Glasgow system having been extended to Trenton. Being situated, as already stated, on the Pictou Branch Railway, and along side the East River, the company has excellent facilities for shipment of products, both by rail and water. The bulk of the output, however, passes over the I. C. R. for consumption in the Upper Provinces. In 1884 the shipments from the establishment were only 2,270 tons; last year, 1887, they amounted to about 6,000 tons, and when the plant now being put in is completed, the works will have a capacity of 12,000 tons, and no difficulty is anticipated in disposing of the increased production. Gold and silver medals are held by the company from Dominion exhibitions. At the present time there are 225 men on the pay list, and the monthly pay is about \$3,000. The number of men will be increased to 300 when the additions to the works are completed. The company are paying dividend's, both on its original and preferential stock. Its success is due largely to the fact that the directors are hard-headed, practical business men, while the managing director has a practical knowledge of the requirements of such an establishment, and gives close personal supervision to all departments of the work.

Nova Scotia Collieries.

From a report printed by the Department of State at Washington, giving colliery statistics of Nova Scotia, for 1887, we obtain the following facts: Number of collieries 19; of this total, 3 belong to the Cumberland Company, 4 to the Pictou Company, 11 to the Cape Breton Company and one to the Inverness Company. At all the collieries there were employed above ground 1,885 skilled laborers, 680 laborers and 586 boys, the total number of labor days being 733,824, which is equal to 233 days worked by each employee during the year. There were employed above ground, 372 skilled laborers, 635 laborers, and 154 boys, the total number of working days being 304,820, or 262 days for each employee. There were employed in construction, 81 skilled laborers, 11 laborers and 3 boys, the average number of days worked by each being 245. The total number of persons employed underground, above ground and in construction, was 4,367. The average number of tons produced per cutter, ranged from 162 to 1,186. The average number of tons per day during the year, by each colliery, ranged from 27 tons to 1,622 tons. The number of days each pit was worked, ranged from 106 days to 296.

The Canadian Mining Review

CONDUCTED BY R. T. A. BELL.

OFFICES:

UNION CHAMBERS, 14 Metcalfe St.

OTTAWA.

Vol. VI. SEPTEMBER, 1888. No. 9.

Judge Burbidge's Verdict in the Frase Case.

The lands, the expropriation of which gives rise to the present claim, are situated in the Township of Portland, in the County of Ottawa and Province of Quebec.

They consist of three portions of lot number eight in the first range of the said township, and were required by the Crown for certain public works in course of construction on the River du Lievre.

One parcel containing eleven one hundredths of an acre was situated on the south bank of the said river, and formed part of the south half of said lot number eight.

A second parcel containing 5.03 acres was situated on the north bank of said river, and also formed part of the south half of said lot.

The third parcel containing 14.43 acres, and adjoining the parcel last mentioned, formed part of the north half of said lot.

I shall refer to these several parcels in the order named by the letters A, B, and C respectively.

The plan and description, by the depositing of which the Crown acquired title to these parcels, were deposited in the office of the Registrar of Deeds for the County of Ottawa on the first day of August, 1887. By a notice dated December 9th, 1887, and filed with the registrar of this court on the 5th day of January, 1888, the Minister of Public Works notified such registrar of his readiness to pay to the persons entitled the sum of two thousand two hundred dollars, which in his opinion was sufficient compensation. The notice required by the Expropriation Act having been duly published, Alexander Fraser filed a claim to the compensation money, alleging that he acquired title to the said lands by deed on or about the first day of February, 1888, and that the amount offered by the minister was insufficient, and claiming forty thousand dollars. By the statement in defence the Attorney General denied that the claimant acquired title to the said lands on or about the first day of February, 1888, and alleged that he was not entitled to such compensation money.

To this the claimant replied that by virtue of the deed mentioned he was entitled to any compensation money which might be found to be payable to the person from whom he purchased the said lands, and issue was joined thereon.

On the trial claimant put in evidence: (a) A deed of parcels, "A," "B" and "C," from Donald McMillan, Angus McMillan and others to the claimant, bearing date February 1st, 1888, and registered on the 8th day of the same month. (b) A deed dated June 10th, 1865, and registered April 2nd, 1887, from Duncan McMillan to Angus McMillan.

The description of the several parcels mentioned in the deed from Donald McMillan and others to the claimant, corresponded exactly with that used in the plan and description deposited by the Minister of Public Works in the registry office on the first of August, 1887.

The land mentioned in the deed of 1885, from Donald McMillan to Angus McMillan, is described as being the eastern half of lot number

eight in the first concession of Portland. This deed was made, subject to certain charges, for the benefit and support of the grantor and his wife. In his evidence Angus McMillan states that his father, Donald McMillan, was possessed of said lot number eight for some twenty-two years before 1885, and that since that date he (Angus) had under his deed, aforesaid, been in possession of that portion of the lot which was north of the river, including parcels "B" and "C," the description in the deed being alleged to be an error. He also stated, the portion of lot eight, which included parcel "A," had been in the possession of his brother, Duncan McMillan, one of the parties to the deed to the claimants, for some twenty-seven years, being previously thereto in possession of their father.

At the conclusion of the claimant's case, I was of opinion that he had never acquired title to the lands in question, and that the deed to him from Donald McMillan and others was not an assignment of the compensation money due from the Crown, even if as against the Crown such compensation money could be effectually assigned. It was, however, perfectly clear, from the evidence, that the McMillans intended that the claimant should, as against the Crown, stand in their stead, except so far as the question of costs was concerned. It became unnecessary, however, to come to any conclusion on the questions as to whether or not the claim could have been and had been assigned, as, on motion of counsel for the claimant, I made an order to add the McMillans as parties, and this being done, the latter appeared and agreed to be bound by the proceedings taken, and consented that any moneys awarded herein should be paid to the claimant, Fraser.

With reference to the compensation, it will be seen from the evidence that the property, part of which was expropriated, was used as a farm and as a stopping place for travellers.

It is clear, too, I think, that apart from this the property on August 1st, 1887, had an additional value by reason of the indications of phosphate therein.

With reference to the value to the owner of the portions expropriated, apart from the chance of phosphate being found therein in paying quantities, the witnesses did not in their estimates thereof differ more than is usual in such cases. Angus McMillan, for the claimant, places their value at \$1,900.00, and for the defendant McNaughton, Brazeau and Woods at \$3,000.00, and Holland and Carroll at \$2,000.00.

With reference to their value for mining purposes, the estimates made by the witnesses, as was natural, differed more widely. Angus McMillan gives an unsatisfactory account of an offer of \$3,000.00 for the mineral rights in the property, and a more unsatisfactory account of a refusal of \$10,000.00 for the same. The general result of the evidence given by Stanislaus Franchot, is that on August 1st, 1887, the property expropriated might be considered to have been fairly worth \$10,000.00 for mining purposes. Robert Henwood, who did not see the property until February, 1888, and after the contractor for the Government had made excavations on the bank of the river at the place where the vein of phosphate was exposed, valued the property from \$20,000.00 to \$40,000.00. Mr. Henwood stated that while he could not put a value on the property as of August 1st, 1887, he estimated such value at \$10,000.00.

For the Crown it was shown that the vein of phosphate, the existence of which gave value to the property, had been partially but unsuccessful-

fully developed, and had been abandoned. Archibald McNaughton who, although called by the claimant, is, so far as this part of his evidence is concerned, to be treated as a witness for the defence, stated that he would not have given \$1,000.00 for the mineral rights in the property. Andrew Holland testified that he would not have risked more than \$5,000.00 therein, while Brazeau says that if he had owned the property he would have sold the portions expropriated for \$6,000.00, but would not have given that sum for them.

Apart from this we have the fact that the McMillans sold to the claimant for \$6,000.00. It might happen that one would accept evidence of this kind with suspicion, but in this case there is nothing to lead one to suspect that the sale was a pretended one, and made for the purpose of giving a value to the property.

Mr. Hogg, for the Crown, contended that as the claimant on his own case was not entitled to recover against the Crown, and as the McMillans did not file any claim, it was not open for them to attack the sufficiency of the amount offered by the Minister. It is possible that I did not give sufficient weight to this consideration in making the order to add parties, but having made that order, I think it was open to the claimants or any of them, to question such sufficiency. Looking again at the evidence, I think that Franchot's experience entitles his views to very careful consideration. It is to be borne in mind, however, that the value to the owners on August 1st, 1887, of the mineral rights in the properties expropriated was (as it still is) speculation and that it depended upon what was then known in respect to them. For the purpose, therefore, of fixing such values, the opinions of such witnesses as McNaughton, Holland and Brazeau, who had known the property, and who had had some experience, though not as great, or exactly of the same kind as Franchot's, are also to be carefully weighed. On the side, too, of their lower estimates, is the sale by the McMillans to Fraser, as well as the facts that this property was on the line of travel, that the indications of phosphates, such as they were, were readily observable at a short distance from the house, which was used as a stopping place, and that apart from the abortive attempt of Garrett & Roberts to develop the mine, there was evidence of no more substantial negotiations for the sale of such mineral rights than the alleged transaction with the stranger Barker.

On the whole evidence I think that \$6,000 is the maximum sum at which I would be justified in assessing the compensation moneys. If Fraser's purchase had been one in the ordinary way of business, either for the purpose of developing the mine, or for speculation therein as a mining property, and not an attempt to speculate in a claim against the Crown, I would have had less hesitation on this point. I assess the compensation money to be paid in this matter at \$6,000, to which will be added interest from August 1st, 1887. Each party will pay his own costs.

The Sudbury Copper Mines.

The following evidence, given by Dr. Peters, of the Canada Copper Company, before the Ontario Mining Commission, contains some interesting information regarding the working of these mines. We reproduce it from the *Globe* :—

The ore throughout the country is uniform as far as I have seen. Whether it would pay for copper alone would be a toss-up. If coke could be got at \$6 a ton, a reasonable dividend

might be paid under good management. Mining would cost \$2 a ton, breaking 30 cents, calcining 50 cents, and smelting into matte \$2.50—that is, assuming a large quantity to be treated. A ton of matte containing 25 per cent copper would be worth \$40 to \$45 in the United States market; that is, taking into account the duty, but not the transport. If we were smelting for copper we would use ore with a higher percentage of that metal. The present price of nickel is 65 cents a pound, which I consider to be rather high; if it was 25 to 30 cents much more of it would be used. The present consumption is about 1000 tons annually, and that is principally used for plating. I think we might sell it with a handsome profit at 25 to 30 cents. I think there is an ample supply of ore here.

It is a hard country to prospect, as the rocks do not crop out well. If this was in the United States thousands of prospectors would be here on the strength of what has been already done. There seems to be some connection between the deposits in this section, but I do not think they could be called fissure veins. I would describe them as forming a mineralized belt, with the minerals concentrated at certain points. I think the Canada Copper Company have sufficient stock of ore on hand to represent every dollar they have expended here, and to build the smelting works besides. Of course, that is only an opinion, but it is based on pretty good evidence.

Dr. Peters said openings have been made in the Stobie, Evans and Copper Cliff mines, as well as at four or five other places to prove veins. At the Copper Cliff mine some \$25,000 or \$30,000 have been expended. We have sunk down about 350 feet on the vein, and drifts have been run at right angles to the shaft some 600 feet, besides which a great deal of surface clearing has been done. On the Evans vein the shaft has been sunk to a depth of 85 feet. At the Stobie mine two tunnels, 30 or 40 feet, have been run in, and a considerable quantity of ore has been quarried. There is at this mine a three-drill compressor, a large stone-breaker, the necessary pumps, etc. At the Copper Cliff we have a six-drill compressor, a large hoisting engine, a rock-breaker, a rock-house for separating ore, several pumps, and all necessary machinery. As regards the Evans mine, a three-drill compressor will be set up in about a week, also a breaker, which is on its way, and there will be erected a very large rock-house.

The company have not yet attempted to treat the ores, but about 3,000 tons have been shipped for treatment elsewhere. It smelts easily, but the combination of nickel and copper has not been met with before in such quantities as to require separation in a wholesale way. The only other mine of the kind in America is the "Gap" mine, of Pennsylvania, and there they use the old European way of dissolving in acids, which would never do for our works.

The process I approve of for treatment of our copper ores is the old German blast-furnace method, modified to suit American conditions. You first sort the ore, break it to the proper size, pile it upon wood in large heaps, and then set fire to the wood. It burns for two or three months, sending forth the sulphurous acid gas till about three-fourths of the sulphur is gone. The ore that originally carried 35 or 40 per cent should come out with 4 or 5 per cent. The iron is changed into oxide of iron, and is just like common iron ore, having lost its sulphur and taken up oxygen instead. The ore is then put into the blast furnace, treated on

the same principle as pig-iron, and the sulphur combines with the metallic constituents which form the matte.

The composition of the matte may be 30 per cent sulphur, 20 per cent nickel, and 20 to 25 per cent copper. Six tons of ore will produce one ton of matte. We are not yet in a position to say which of our mines is the most valuable, but as they now look I think the Evans promises to be better than any other. It carries about the same amount of nickel as the other mines, but the ore is more massive, and apparently there is a larger body of it. I think the Evans will show, taking an average of the whole mass, $3\frac{1}{2}$ per cent nickel, 3 per cent copper, 40 per cent iron and 24 per cent sulphur, leaving say 30 per cent of rock. I consider the company justified in putting up large works, and have so advised them this spring. As a rule I only advise the erection of reducing-works when I see enough ore mined to pay their cost, and that is the case here. We shall have to get the matte refined elsewhere.

The sending of a large quantity of nickel matte into the States has never yet been tested, but Americans are so much more ready to alter their plant and undertake any new thing of the kind than Europeans that I think we shall be able to do better in the United States than anywhere else. In shipping to the States we have to pay duty on the metal that is of most value in the matte. Were the duty taken off it would of course be an advantage to that extent, unless the price falls and upsets the gain. I think we can dress a good deal of our ore to 20 per cent, and, speaking in the aggregate, I think it will show $2\frac{1}{2}$ per cent nickel, and 3 per cent copper. I understand that before I came here three shipments were made, one of which went to England, two to the United States. The company did not realize one dollar a ton on the shipment to Swansea, the charges were so exorbitant there. The ore carried 12 per cent of copper, and the nickel in it was worth \$35 to the ton. But the smelters allowed nothing for the nickel, and on the thousand tons smelted there was a loss of \$35,000, a large quantity of which was shipped from the Copper Cliff. We figured up that the charge for smelting was \$50 a ton, whereas our eastern men only charge \$10 per ton.

Shipments.

The following are the Shipments from Montreal for month ending September 12th, 1888:—

Date.	Name of Vessel	Destination.	Shippers.	Quantity.
Aug. 21	Henry IV.	Bordeaux.	Le mer, Rchr & Co	400

The very small quantity shipped is accounted for by the scarcity of phosphate tonnage from Montreal.

In General.

Mr. T. W. Hotchkiss, American Consul at Ottawa, has kindly furnished us with the following particulars relative to the value of phosphates shipped from the Ottawa district to different points in the United States. The quantities were all ground phosphate.

Phosphates exported for fiscal year ending 30th June:—

1884.....	Nil.
1885.....	\$775
1886.....	\$1,106
1887.....	\$5,467
1888.....	\$6,913

Perth District.

The Anglo-Canadian Co. are doing well with contract work at the Otty Lake Mines, North Burgess, and the Bobb's Lake Mines, Bedford, Ontario. At the latter, during the past month, 11 men and two boys mined, cobbled, and piled ready for market 150 tons of high quality phosphate, this mine being peculiarly rich in crystals. At Otty Lake 13 men mined 74 tons, this being about the average output of our best mines—six tons per month per man. Work was begun also for this company at their Lake Tassie Mines in the Gore of Templeton, and they are endeavouring to procure more men to take out phosphate there by contract.

Freights.

Owing to the rise in ocean freights and the diversion of tonnage from the St. Lawrence to Atlantic ports, where higher rates prevail, there is a scarcity of phosphate tonnage from Montreal. Twelve shillings and sixpence is asked for London, and the supply of room is very limited. There is a good deal of phosphate yet to go forward to fill contracts, besides some that is as yet unsold.

Markets.

Freights from Charleston have advanced considerably, and Carolina phosphate, which has been sold in England at 6 $\frac{3}{4}$ d. per unit, is now worth 9d. there. This occasions more demand for Canadian low grade phosphates, and considerable quantities of sixty to seventy per cent. might be sold. In the past few years the demand has been almost wholly for eighty per cent. Canadian, and our mines have been carefully selecting their ores and keeping up the quality, so that the supply of the lower grades is limited. The price at the main English ports is 8 $\frac{1}{2}$ d per unit for 70 per cent., with $\frac{1}{2}$ d per unit rise. For outports $\frac{1}{2}$ d more could be had. The price for 80 per cent. phosphate is nominal at 11d. and 11 $\frac{1}{2}$ d. per unit, as there have been no transactions in this grade lately. The French phosphate from the Somme district continue to be largely used in England in preference to all others, and as they analyse from 70 to 75 per cent., they are formidable competitors with Canadian, especially as they are softer, and are sold in a condition that requires, as a rule, no further grinding. It is believed, however, that the supply is limited, and that in two years, if the present rate of production is continued, it will be exhausted. The demand from the United States for Canadian phosphate is steadily increasing, and that market promises to furnish an important outlet for the production in the future.

Kingston District.

The present depth of the shaft at the Foxton mine is 115 feet. The vein is from 8 to 15 feet wide and improves as increased depth is obtained.

Lievre District.

Since our last, 140 tons of ground phosphate have been shipped to Chicago by the Du Lievre Milling and Mining Company of Seabury.

The demand for ground phosphate is steadily increasing. The mills of the Du Lievre Company are kept very busy, and night gangs have

been put on in order to work the mill, night and day, to its fullest capacity. We understand that the management have in contemplation the trial of a new grinder which promises to double the output. The management, we are glad to say, have a large number of orders on hand, and the new machinery, it is thought, will barely meet the demand for their ground phosphate, which seems to be growing in a most encouraging manner.

At High Rock the management have struck one of the richest shows ever found at these productive mines. Ninety tons of high grade ore were mined recently in one day.

The Canadian Company's Mines also never looked better. A fine show has been uncovered at the Dugway, and a very rich vein, 17 yards long by 4 yards wide, has recently been opened up, and gives promise of an abundant output of firsts. The new wire rope tramway has been completed and is giving satisfaction. The steamer River Belle has been refitted with new boilers, etc.

Captain J. E. Smith, for the past six years general superintendent of the old Union Co.'s mines, and later of the Canadian Company, has resigned his position, and will in future reside in the States. The familiar figure of the genial Captain will be missed on the river.

At North Star Mines there is a good force at work and large quantities of phosphate are being shipped.

We are glad to note an improvement in the quantity of output from the Emerald.

Mr. W. C. Kendall, of Bassin du Lievre, is reported to have opened up some exceedingly promising shows on his lots up the river.

At South Uniacke a new crusher is approaching completion.

At the Malaga District, Queen's County, the Malaga Mining Co. have started their new mill, and it is confidently expected that this locality will replace Sherbrooke, which was the leading district for many years. The Provincial Government have given a large sum to assist in placing Malaga mining within easy reach of the seaboard by building a short-cut road.

At Lochaber, on the Sheet Harbor waters, an English company, represented by the manager of the Halifax Cotton Factory, has contracted for the immediate delivering of a 20-stamp mill.

No new discoveries of gold are reported, the unusually wet weather having kept the prospectors out of the woods.

Further explorations in the Pictou Iron Districts have shown a 15 foot bed of red hematite in an area belonging to Mr. S. H. Holmes, of Halifax.

The red hematite property owned by Messrs. Greener & Ingraham is being opened up to permit shipments of some trial cargoes. The ore is reported to be high in iron and low in phosphorus, and as being admirably adapted for the American market.

The gold mines of Nova Scotia continue to show fair yields, the returns from seven mines for the month of August giving 567 ounces of gold from about 1,280 tons of quartz rock put through the crushers. Some new mines have recently been discovered, and it is expected the output of the present year will show an increased activity in this branch of mining.

New Brunswick.

The Grand Lake Coal Company has been organized, with a capital stock of \$200,000; shares \$100 each. The chief place of business is to be Chipman, Queen's County. The incorporators are Dr. Louis G. DeBertram, of New York, John P. Illsey, of Philadelphia, engineer; Thomas M. Williamson, of Buctouche, Kent County, civil engineer; Edward W. Clark, Jr., Edward E. Denniston, C. Ford Stevens, all bankers of Philadelphia.

Quebec.

Large specimens, some of them weighing 9 ounces, have been brought in from the McArthur gold property at Beauce.

The first meeting of the shareholders of Bell's Asbestos Company was held on Wednesday afternoon, 15th ult., at the Cannon-street Hotel, London, under the presidency of Mr. John Bell. The chairman said the company had completed the transactions for acquiring the asbestos mines in Canada, and they had now possession of one-third of the world's supply of the kind of asbestos known as Bell's asbestos, which was capable of being woven or spun into a material like flax. The company had already 15,000 customers among the general public on their books, and the material they traded with was of such a unique and important character that its use would sure to be soon applied to purposes at present unknown. The trade is expanding day by day, and he looked forward to the time when the use of this fibre, which is a fibre unique in every part of the world, unconsumable and incorruptible, will extend to a variety of pur-

poses that are unknown now; and whatever may be the good or evil fortune of their ordinary trade as manufacturers, the corporation was rapidly approaching the time when the produce of these mines will themselves constitute a permanent and splendid dividend on the capital of the corporation. A meeting would be held at the close of the year for the presentation of accounts and the declaration of a dividend.

So pleased were the shareholders with their interim dividend of 7s. 6d. per share, and the encouraging statement that the chairman was able to lay before them, that not a single question was asked. It should be borne in mind that this dividend of 7s. 6d. per share, or at the rate of 15 per cent. per annum, does not include any of the Canadian profits, which will come into the second half-year, and there seems, therefore, every probability that future dividends will be at a higher rate, for the company, as stated at the meeting, can now take front rank not only as manufacturers, but also as producers of the raw material. Mr. John Bell is a gentleman most thoroughly versed in the subject of asbestos and its uses, and was the first to spin it into yarn for weaving into cloth. The various specimens of crude and manufactured asbestos exhibited at the meeting were examined with much interest by the shareholders.

Mr. John Bell, President of the Company, has, since the meeting, arrived in Canada, and is at present visiting the company's properties in the eastern townships. Dr. James Reed, of Reedsdale, accompanied Mr. Bell on his tour through the mining districts.

There are stirring times at the Graphite City Plumbago mines near Buckingham; some twenty men are employed in rebuilding the mills, etc., under the superintendence of Mr. W. C. Kendall. A substantial new stone-built engine-house, 45 by 25, is also being built. The whole of the buildings are to be put in first-class condition. The tramway to mines is also to be rebuilt, and will be ready for next season's business. The most improved machinery will be used in crushing the material, which can be done at a much less cost now than with the old style of battering rams, formerly in use but now out of date.

Ontario.

The new terra cotta works being built at Deseronto by the Rathbun Company will be the largest in Canada. The main building is 252 feet in length and 77 feet wide. The south-east extension is 180x40 feet, with three storeys, and is chiefly used for drying purposes. The south wing is 170x96 feet, three storeys high. Part of its ground floor is fitted up with hot-air tunnels for drying red brick; the other floors are used for drying terra cotta ware. In the south wing the different floors give an area of 38,760 feet for drying purposes, and this, added to the 21,600 feet in the main building, gives a total area for drying purposes of 60,360 feet. A large trestle runs through the entire length of the main building, on which runs the railway cars carrying in clay and fuel for the works. The new burning kiln has been finished, and will contain about 80,000 bricks. A track runs south of the large burning kiln for convenience in loading cars for shipment of material.

The grading of the line of the Pontiac & Renfrew Railway, which is being built with the special object of tapping the Bristol Iron Mines, will be completed, ready for the rails, by the end of the present month.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

The following are the official returns so far received at the Mines Office for the month of August:—

District.	Mill.	Tons Crushed.	Ozs. Gold.
Sherbrooke....	Miners.....	200	43½
Rawdon.....	United M. Co.....	65	28
Stormont.....	Island G. M. Co.....	252	294½
Wine Harbor..	Napier.....	68	42½
Lake Catcha..	Oxford G. M. Co.....	173	200½
Salmon River..	Dufferin.....	890	252
Uniacke.....	Nicholls.....	106	15
Millisgate....	Owens.....	3	4
Moose River..	D. Touquoy.....	351½	59½
Cariboo.....	Lake Lode M. Co.....	99	102
South Uniacke.	Withrow.....	35	35½

Mr. E. Gilpin, Jr., Inspector of Mines, writes us as follows: "Our gold mining has not been very brisk this summer, but as several mines are approaching completion, I am in hopes that the returns will be increased before the fall."

The Northup Mines, at Rawdon, has had its plate crushing and the returns show about three ounces to the ton.

The Craig Gold Mine, in Tudor, has been bonded to Toronto parties for six months. This is a good property. The vein is about seven feet wide, and has been traced for a distance of about 800 feet. Assays made in Toronto and New York have given \$25 and \$33 in gold respectively.

Some parties have purchased the tailings of the Consolidated Company and are now washing and amalgamating them and are doing well.

The natural gas well at Thorold has now reached a depth of 320 feet. Work is very much retarded by water. Casing is now being put in to obviate this difficulty. The drill has struck, in addition to rock, the strata of salt; and at the depth of 230 feet a layer of apparently good soft coal twelve inches in thickness.

Gold is reported to have been found on lots 25 and 26 in the fourth concession of Storrington.

Sudbury District.

The Canada Copper Company have now six piles of copper ore burning, four of 250 to 300 tons, and two of 450 tons to 500 tons. Forty of the seventy-five feet of chimney is built, foundations for boiler and engines are ready, and everything points to rapid completion, and a start at smelting before winter. The Jenckes, Machine Co., of Sherbrooke, Que., are building the water jacket smelting cupola, which will be sent up here in sections. In mining, the management report an output last month of 3,000 tons of good smelting ore. The Copper Cliff has a depth of 385 feet on the dip, and a total length of drifts and cross-cuts of over 800 feet.

The Evans has a shaft 80 feet deep, at the bottom of which they have completed 30 feet of drifting. All this, shaft and drift is in good solid ore. In addition to this they have 100 feet face of good ore for quarrying.

At the Stobie the owners are still quarrying in ore, of which they have an enormous body.

Your correspondent has before mentioned the Ducharme property, in Bleazard, to the north of the Stobie. The owner is at work with two men at present, and is making an open cut into the hill from the lowest point. This should, if appearances are not deceptive, soon show up a large body of good mixed sulphides.

The directors of the Vermillion Mining Company held a meeting at their property on the fourth of the month. A. J. Duncan resigned his position as manager, but still assumes control of affairs pending his replacement.

Mr. Jas Stobie recently sold a property on the Vermillion River, in Creighton, to Buffalo parties. The ore is a pyritous one, carrying good value in gold and silver, and will be worked to its best advantage.

Port Arthur District.

Great activity exists among prospectors and investors, and likely properties are being bonded with a view to development, but no marked improvement can take place in the mining region until operations on the railway to the mines are resumed. While it costs \$2.50 a hundred to take supplies and outfit into the silver properties west of Silver Mountain, none but the very richest silver outcroppings will be worked, and these only in a superficial manner, until the roads enables heavy machinery to be brought in.

The pumping and hoisting machinery for the Silver Mountain West End Mine is now on its way out, and when in place good progress will be made on this most attractive property. The principal shaft is being sunk in a point where the vein is about sixteen feet wide.

The East End Mine vein still holds out over six feet wide with abundance of metal, especially on the lower workings to the east.

Crown Point Mine still keeps a good showing.

The Beaver Mine has lately produced some very fine ore from the lowest levels, and is encouraging the management to look for another big haul.

The Badger still keeps the lead with surpassingly rich ore. The vein is small but valuable.

The Elgin Mine is under the control of Capt. Hooper, Superintendent of the Beaver Mine, who is putting matters here in a business shape, with a view of giving the property a good test.

The Silver Fox (264 T) is still progressing very slowly—the erection of the necessary buildings requiring most of the attention.

Negotiations for the sale of the Atik Lake and Silver Glance (R 230) locations still continue. The owners feel they have a good thing and are willing to wait for a railway if a reasonable cash offer is not forthcoming.

Development in the Black Bay lead mines is being pushed with good results, and the output of building stone (sandstone) from Nipigon Bay to Chicago is continually increasing.

The lands of the Silver Islet Consolidated Mining and Lands Company, which were sold by order of the Supreme Court of New York at public auction, in New York, on the 19th inst., were purchased by Mr. J. B. Anderson, of the American Exchange, National Bank, for \$5,000. Mr. Anderson refuses to state for what purpose this property, which is extensive, has been purchased. It is probable that he is simply the representative of parties who wish to conceal their identity.

British Columbia.

The Nanaimo *Free Press* reports that Messrs. Wm. Tree, Geo. Tippet, Alex. Easson and Richard Prouse returned on Thursday last from Texada Island, where they had discovered valuable ledges of silver, copper, and iron ore. The discoverers brought with them several bags of specimens, rich and beautiful in appearance. The ledges are situated on the Nanaimo side of Texada Island, and a mile north of the Texada Iron Mine, now being worked by the Irondale Smelting Works Company, of Puget Sound. Several different ledges were discovered and prospected for a distance of over a mile, with every indication of extending for miles further; in fact, the discoverers are of the opinion that the upper end of the island is a mass of minerals. The ledges will pay from the surface, and they are but a few yards from deep water, where large vessels can lay and take in cargoes of ore, at the lowest possible expense. The discoverers have already recorded ten claims of the size allowed by law. Specimens of this ore have been sent to San Francisco for assay, and the returns are of the most favourable character. Some of the ore

was also sent to the Government Assay Office, but no returns have yet been received. Local experts pronounce the samples rich, one large piece being almost pure copper.

We invite Correspondence upon matters consistent with the character of the REVIEW.

Be as brief as possible. The writers name in all cases required as a proof of good faith.

One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.

We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

Our Mineral Resources.

TORONTO, 12th September, 1888.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—A letter from Mr. Samuel D. Mills, in the last number of THE REVIEW, mentioning the ignorance of Canadians of their own mineral resources, suggests a few remarks. Such ignorance is unfortunately too prevalent. There are probably not a dozen people in Toronto who know anything about the iron ores which are found within 150 miles of their city, or who take any interest in them. Within the last fortnight I have received a letter from the General Manager of "The Cambria Iron Co.," in which he says: "Enclosed are analyses of the two qualities of ore you sent me. They are both first-class ores for making Bessemer metal or fine steel. They are unusually low in phosphorus and very high in iron, being:

	Metallic iron.	Phosphorus.	Sulphur.	Silica.
No. 1.	68.85	0.008	Traces	1.96
" 2.	69.99	0.012	"	3.10"

These ores come from a large deposit not much more than 100 miles from Toronto, from which several hundred tons a day could be easily mined.

An analysis by Professor Chapman of another ore about 125 miles from Toronto gave iron 63.68, sulphur 0.03, phosphorus trace.

An analysis made by "The Bethlehem Iron Co." of ore from the Paxton mine in Lutterworth Township, less than 110 miles from Toronto, shows 60 per cent. iron, very low in phosphorus, and no sulphur, the chemist remarking, "This is an excellent Bessemer ore."

Prof. Chapman makes two analyses of different ores from Township of Galway, about 110 miles from Toronto, viz.:

	Metallic iron.	Phosphorus.	Sulphur.
No. 1.	62.87	0.01	Slightest trace
" 2.	62.60	0.008	Slight trace

Two analyses of other Galway ores made by Messrs. Heys and Rice gave:

	Metallic iron.	Phosphorus.	Sulphur.
No. 1.	65	0.04	0.02
" 2.	70.40	Trace	Trace

There is no Titanium in any of these ores

The railway freight to Toronto should not exceed 60 or 70 cents per ton, and the mining of these ores should not exceed \$1.50 per ton, so that the cost laid down in Toronto should be less than \$2.25 per ton, or much less than half what similar ores cost in Chicago.

Yet Chicago is one of the largest iron and steel manufacturing centres in the States, while not a ton is smelted in Toronto.

I can show samples of over 40 magnetites and about 25 hematites, all from different deposits in Canada, received within the last year, so that our country is remarkably rich in the extent and variety of its iron ores. All that is wanting is the enterprise to mine and ship them to market.

Yours, etc.,

T. D. LEDYARD.

The Coalfields of Cape Breton.

By E. Gilpin, Jr., F.G.S., F.R.S.C., Inspector of Mines.

(Continued from August issue)

Had the uplifted edges of the older rocks been straight, like a ruler, the coal-bearing strata would have dipped uniformly away from them, and remained parallel throughout the district. But nature abhors a straight line, devoid of beauty save to the mathematician. Owing to underlying spurs of the older strata projecting beneath the coal measures the uplifting of the former produced transverse subordinate tilting in addition to the general or continental inclination to the east. The effect of this has been to throw the seams into a series of curves, having the ocean as a secant. Taking the coal seams of the Sydney district as they are met at Cape Dauphin they are seen ridged up against the Syenite of the Cape, then lessening in the steepness of their dip they range across the Big and Little Bras d'Or to Sydney Harbor, where their inclination is about four degrees. As they cross the harbor they turn more to the north-east, and dip steeply until they turn again with the regular dip and run into the sea at Lingan. Emerging again they stretch in a regular curve for miles across Glace Bay Brook and Basin, and turning again toward the north-east with increasing dips enter the sea at the north head of Cow Bay. Hitherto the transverse subordinate foldings have not been marked enough to interrupt the continuity of the strata enclosing the coal beds, but here the upward movement has brought lower rocks to the surface, and there is an interval of rocks which do not hold coal seams.

In Cow Bay the same forces have formed another basin, called a synclinal, the seams dipping down on the Long Beach side and up again on the Gowrie side. But the axis or general inclination of the trough is still to the eastward.

Finally, the seams of the Cow Bay district, after crossing the narrow strip of land forming the north side of Mira Bay, pass under the Atlantic and are lost beyond the three mile limit.

Speculation as to the original extent of this coal field is profitless, if interesting. But we do know that, reasoning from a fair basis of facts, we have now but a remnant of the great coal field of the Gulf of St. Lawrence. When we consider the fringes of coal fields, and of carboniferous strata which occur around Cape Breton, on the west side of Newfoundland, in the Magdalen Islands, and along the northern shores of Nova Scotia and New Brunswick, we can scarcely realize that over that great gulf the forests of the Carboniferous once spread, amid the voiceless and sullen lagoons of the mysterious country.

Owing to sudden pressure or other causes, the movements of the coal-bearing strata are sometimes accompanied by breaks or faults. Often great blocks of strata, miles in extent, thousands of feet in depth, and weighing myriads of tons, have been raised out of the continuity of the coal field, so that the miner suddenly finds in front of him a wall of stone. His coal bed has vanished, cut off by the irresistible force of the great lever which is continually raising and depressing continents. Much trouble is often experienced in finding the lost bed of coal, which is sometimes moved many feet away. In the Cape Breton coal field the faults are few and of little moment,—a fact which not only reduces the risk and expense of mining, but encourages the capitalist and engineer in starting new pits. There are few coal fields of which it can be said, as in Cape

Breton, that any seam can be located at any point inside the boundaries of the coal district with a margin of error not exceeding a few feet.

The question has often been asked me, "are the seams of the Cow Bay, Sydney, and Glace Bay districts distinct, or are they the same seams interrupted by the sea as the flexures of the strata approach and leave the shore. The answer is that they are the same seams although somewhat changed in character and size as they range over some twenty-five miles of country. The seams are identified by the thickness of the masses of intervening strata, some peculiarity of roof or floor, etc., etc. The Geological Survey have tabulated the seams of the different districts, and as their conclusions do not appear to coincide with the opinions of any of the critics, it may be assumed that they are pretty near the mark. The question, however, is one of geological rather than of economic interest, as the coal seams all vary slightly in their quality at intervals of a few miles.

Coal.

Having outlined the distribution of the Carboniferous of Cape Breton as laid down on the excellent maps of Mr. Fletcher's reports to the Geological Survey, the next task is the consideration of the minerals characterizing it. The principle minerals are coal, gypsum, limestone, and iron ore. As the first named is the most important, I venture to dedicate this paper to its consideration, and propose to describe the remaining minerals, together with those found in the other geological horizons, at a future time. This will prove more convenient for reference, as several of them, notably the iron ores, are common to several ages. In this Island coal beds are found most abundantly in the productive measures, but there are important deposits in the millstone grit. There are also beds of coal in measures referable possibly to the upper coal measures, and in the Richmond district coal occurs apparently in conjunction with the marine limestone measures. Examples are not wanting in other countries of valuable deposits of coal in these divisions of the Carboniferous, but so far as our information goes we are not warranted in looking to them as important sources of this mineral in Cape Breton.

I have already alluded to the fact that it is difficult to draw with distinctness the line separating the productive from the millstone grit measures, and will therefore consider the coals without regard to their geological position, a factor little affecting their composition.

Speaking in general terms, the Cape Breton coals are bituminous and coking. Many of the seams yield large volumes of gas of good quality, provided that a reasonable care be exercised in screening and picking. For domestic purposes they have proved acceptable wherever offered, as they kindle readily and leave little ash. For house use public opinion has selected the Sydney mines' main seam as the typical coal of the Eastern district.

These coals have been largely used for marine and railway steam raising, and compare favorably with any foreign competitors. They may be ranked between the best Welsh and the best Newcastle steam coals, judging from analyses and the reports of practical tests on English and French men-of-war. The tests recorded appear to prove the contention that the evaporative power of a coal is in proportion to the total amount of carbon contained in it, and that the greater the gas value the less the amount of water it is capable of evaporating. It is to be regretted that a series of rigid tests

of the coals now worked could not be made by an impartial authority, as they would undoubtedly show that with proper handling their evaporative powers are surpassed by few coals now used for marine boilers.

For coke-making these coals are well adapted, as they yield, from practical tests, a fuel excellently suited for iron and copper smelting. The adoption of any cheap form of washing would free the coal from the admixed stone and pyrites, and present a coke superior to that of Durham and Connellsville.

In presenting the following set of analyses of Coals of the eastern district I have followed the tabulation of the Geological Survey, altho' it differs from that of several writers, and have not attempted the correlation of the Gardner, Carrol, and other seams found underlying those at present being worked.

Pursuant to this arrangement the Hub and Crandal seams are grouped together. Next in descending order comes the seam known locally as the Block House, Harbor, Victoria and the Sydney Mines worked by the Block House, Glace Bay, Victoria, and Sydney Collieries. Below this comes the most extensively worked seam of the district known as McAuley, Phelan, and Lingan and worked by the Gowrie, Ontario, Caledonia, Reserve, Bridgeport and Lingan mines. The next seam to be noticed is that known as the South Head, Ross and Collins. Below this comes the Gardner, Tracey, Carrol and other seams to be again referred to.

The Hub seam is not now worked. Altho' its land area is limited, it has an extensive submarine development. It was well adapted for gas making, and yielded 9,500 cubic feet of 15 candle gas per ton. The following analysis will serve to show its character.*

Volatile matter.....	33.21
Fixed Carbon	63.94
Ash.	2.85
100 00	

The following table shows the composition of the second seam :

	Block House.	Harbor.	†Inter-national.	Victoria.	Sydney.
Moisture.....	.60	.80	.87	.75	1.26
Vol. Comb. matter, slow coking....	29.48	27.85	35.41	26.85	33.84
" " " fast " ..	31.58	29.40		32.13	35.51
Fixed Carbon, slow coking.....	65.56	67.05	58.56	68.13	60.78
" " " fast " ..	63.46	65.50		62.85	59.11
Ash	4.35	4.50	5.16	4.27	4.11
Sulphur	2.63	2.32	trace.	1.70
Specific gravity.....	1.29	1.29	1.31

*Analyst unknown.

Unless otherwise specified, the analyses in this paper are by the writer.

†Analyst Professor Chapman.

The coals referred to above are generally laminated with a pitchy lustre, and carry a good deal of mineral charcoal on the deposition planes. The primary planes cut those out of deposition at high angles, but the secondary planes are not so regular. The primary planes usually hold films of carbonate of lime and iron, which is less frequently present in the secondary planes.

The gas values vary from 8,200 feet of 8-candle power at the Sydney Mines to 10,000 feet of 16.5-candle power at the Block House workings. The gas values of the seam apparently increasing towards the south, while the northern openings produce, as at the Victoria and Sydney mines, an article better adapted for steam and domestic purposes.

As few ultimate analyses have been made of Cape Breton coals, the following of the Block House seam made for the Admiralty (analyst unknown) is of interest:

Carbon.....	82.60
Hydrogen.....	4.79
Nitrogen.....	1.20
Oxygen.....	4.10
Sulphur.....	2.51
Ash.....	4.80

The following is the result of a trial of the Sydney coal made by the American Government in 1844, and, so far as the writer is aware, it is the only practical test ever made of the evaporative power of any Cape Breton coal:

Moisture.....	3.13
Volatile combustible matter....	23.81
Fixed carbon.....	67.57
Ash.....	5.49

Lbs. of steam to one of coal from
212°..... 7.90

Ash and clinker—per cent.... 6.00

*Theoretical evaporative power 9.25

The following table shows the composition of the ashes of the above coals:

Block House. Harbor. Victoria. Sydney.†

Iron peroxide..	45.621	63.355	56.543	51.33
Alumina.....	3.250	8.280	6.456	4.84
Insoluble silicious residue..	35.110	21.872	27.500	29.57
Manganese.....	1.930
Magnesia.....	1.100035	.23
Lime.....	5.425	4.640	2.598	3.05
Sulphate of lime.....	10.98
Sulphuric acid..	6.750	2.126	3.790
Phosphoric acid..	1.960	.514	.691	trace.
Alkalies.....	trace.150	trace.
Chlorine.....	trace.	trace.

99.156 100.787 99.693 100.00

The coal of the third seam to be noticed as worked at the Gowrie Colliery is black with a grayish tinge. On fresh surfaces the lustre is bright and pitchy, with very fine laminae of jet-like coal, and a good deal of mineral charcoal on the deposition planes. This coal sometimes exhibits four cleavage planes, sometimes holding films of calc spar. Coal tolerably compact, with nearly black powder and little visible pyrites. This description answers for it throughout the district, except at the Reserve and Bridgeport mines it is more pitchy and lustrous.

(To be continued)

*From Regnault's formula.

†Analyst, H. How.

‡In this and following analyses alkalies are estimated only when in quantity.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for Penetanguishene Works," will be received at this office until FRIDAY, 19th October next, for the construction of work at Penetanguishene, Ontario, in accordance with a plan and specification to be seen at the Department of Public Works, Ottawa, and on application to H. H. Thompson, Esq., Mayor of Penetanguishene.

Tenders will not be considered unless made on the form supplied and signed with the actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 13th Sept., 1888.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tenders for Post Office at Brampton, Ont.," will be received at this office until Tuesday, 9th October, for the several works required in the erection of Post Office at Brampton, Ont.

Specifications can be seen at the Department of Public Works, Ottawa, and at the office of Messrs. Beynon & Manning, Brampton, on and after Tuesday, 18th September, and tenders will not be considered unless made on the form supplied and signed with actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, Sept. 15th, 1888.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

What every Farmer should Read.

The introduction of commercial fertilizers marks a new epoch in the history of agriculture. Their general acceptance in common farm practice is equivalent to a new force. They have revolutionized the mode of agriculture as thoroughly as steam and electricity has revolutionized transportation and commerce. A barren soil can be changed into one of exceptional productiveness through the judicious application of those elements of Plant Food which are wanting in it. Fields not only can be brought to their maximum producing power, but what is more still, they can be kept there, so that year after year abundant harvests may be removed from them; for, thanks to commercial fertilizers, what is withdrawn by one crop from the soil can now be replaced into it before the rising of the next, thus ensuring the conditions on the existence of which remunerative harvests depend. Acres which the plough had abandoned in hopeless despair have been again added to the area, on the products of which nations live and thrive and prosper. The tiller of the soil who, fifty years ago, earned by the sweat of his brow a scanty subsistence for himself and his family, returns to prosperity, if not to wealth. The self-same acres which hardly supplied food and raiment for the peasant proprietor and his children, now furnish him the means of educating his offspring, of purchasing improved agricultural implements, of adorning his home, of living in comfort at his fireside, and of laying aside, by thrifty management, a penny for rainy days. The marvellous ease and rapidity with which France paid off the enormous war indemnity of five millions of francs has justly taken the world by surprise. Yet, in a large measure, it was due only to the wealth which the sons of France knew how to derive from the land they live on, by a generous and intelligent method of farming. Nearly all European countries show a marked increase in the fertility of land worn out by centuries of cultivation, and often poor by nature.

To what else can this be ascribed, if not to a practical recognition of the value of artificial manures?

The importation of guano into Great Britain has increased from 2,881 tons in 1841, to 152,961 tons in 1861, while contemporaneous with it, grew up an enormous demand for superphosphates and other fertilizers, reaching an annual aggregate of 250,000 tons. These figures should convince the most skeptical mind that the phenomenal growth of this industry was caused by a no less phenomenal, though perfectly legitimate, demand on the part of the cultivators of the soil for its products.

In the United States the development of the fertilizer industry began at a later date than in Europe. The almost unlimited extent of territory in the North and North-West enable this country to draw resources which were not open to the densely populated countries of the Old World. Besides, the vast stretch of land brought for the first time under the ploughshare, was then possessed of almost boundless fertility, and gave at first enormous returns. Rich soil

placed there by nature, yielded very remunerative crops, and the necessity of parting with a policy of waste, incident to every new country, and of adopting one of strict economy in its stead, was not felt for some time. These and other reasons retarded somewhat the progress of scientific agriculture in this country. Nevertheless, the laws of demand and supply, with regard to the soil, apply here with the same inexorable force as everywhere else, and thus the day arrived when the New England States found themselves compelled to abandon the primitive ways of agriculture, which had exhausted the land for well-nigh two centuries, and to resort to a more rational, more intelligent, more scientific method of raising crops. Appropriating the accumulated experience of the European countries, the use of commercial fertilizers was there inaugurated, and soon spread over all States on the Atlantic seaboard, so that the consumption in 1875 has been estimated at over 100,000 tons of superphosphates alone. Since then rapid strides onward have been made; yet, as will be seen, much remains still to be done in that direction.

As far back as 1797 a recommendation of President Washington emphasizes the position which agriculture in this country occupied, in his estimate, in the following words: 'That the encouragement of agriculture is an object highly worthy of public attention, as it constitutes the most useful employment of our citizens, is the basis of manufactures and commerce, and is the richest source of national wealth and prosperity.' Again: 'On a view of the state of agriculture in the United States, it will be found that though it has made considerable progress in some parts, yet there are many important principles and valuable improvements, known and practised in other countries, to which most of the American farmers and planters are utter strangers. It may also with propriety be remarked, that the science of agriculture is in its infancy, and is susceptible of much greater improvement than it has yet received in any country. To introduce into our own the improvements of other countries, and to lay the foundation for discoveries which shall essentially contribute to the happiness of mankind, is an object worthy the attention of the legislature of a free people.'

Here is clearly expressed, with a strange foresight into the future, that the United States is, above all, an agricultural country, whose main resources lie in the broad acres scattered with such liberal profusion over the length and breadth of the land. The mineral wealth, great as it is, loses much of its significance when held up against the wealth for which no laborious and expensive digging down into the very bowels of the earth is required, but which can be gathered in profusion right on the surface.

It will thus be seen that abundant and remunerative crops are beyond question the main source of wealth and prosperity. They are the means of bringing the money of all nations into the country, to be reinvested in manufacture, in commerce, and in whatsoever promises a profitable employment for capital. A prosperous condition of agriculture is the condition without which no prosperity in manufacturing industries can last. What the harvest sucks from the willing bosom of mother-earth, that, and nothing else, constitutes in all countries, and at all times, the most solid, the most reliable, and the most unfailling, because the only true source of a nation's welfare and advance. However, it is not enough to give merely mental assent to the correctness of this universally recognized axiom; it is necessary to go further and to carry out

in practice the injunctions which flow from it. From what has been said, the paramount importance of the maintenance of the fertility of the farming lands is evident. A rough glance at the marvellous increase in the production and exportation of cereals seems to convey the idea that a corresponding increase in the producing capacity of soil has taken place. But this is not the case. On the contrary, the area on which crops are being raised has been increased; but, speaking in general, the productiveness of the land has decreased. That the fertility of the soil, over large and productive areas of this country, has suffered appreciable diminution within the past decade, there can be little doubt. Carefully compiled statistics prove that the soils of the New England States, though they have been under cultivation for well nigh two hundred years, and though they were surpassed in natural productiveness by the rich virgin soils of the West, and showing an increased percentage of returns, while the latter become from year to year less productive. Now, it is very important to learn why this is so; and the plain reason is simply that a reckless way of farming is practised in the Western States; while the New England States, profiting by the lessons of European countries, have struck out upon a new method of farming, and take great pains to put into the ground the requisite amount of plant-food for each crop.

Nevertheless, there are not a few who believe that the farmers would be better off without commercial fertilizers than they are with them. To this opinion no stronger evidence to the contrary can be adduced than the fact that the most intelligent farmers began to use them in the first place, and have ever since continued to use them. And the supposition is perfectly preposterous and untenable that any farmer, with but a grain of common sense, will continue to use what proves to him not a source of profit but a source of loss. As it is possible to own treasures, and to waste them, nay, to throw them away, so it is not only possible, but, in individual instances, sometimes, no doubt true, that no benefit may accrue to a farmer from manufactured fertilizers. But, on investigation, it will always appear that the fault must be found with something else than with what he used. Commercial fertilizers do not pretend to be an absolute, an infallible guarantee for a remunerative harvest—an error which is not unfrequently entertained; for the preparation of the ground, the time of their application, the quantity in which they are applied, the season, whether wet or dry, propitious or unpropitious, and a variety of other causes, may neutralize the beneficial effects the elements of plant-food would not have failed to exert under more favourable circumstances. Commercial fertilizers possess only this value, that, judiciously applied, they make large and paying harvests possible, where these without them would be impossible. Their unquestioned merit consists in this, that they enable the farmer to derive profits from lands, even, which without them promise no return for the labour entailed by cultivation. And, as a matter of fact not unworthy of record, the cotton-growing region has been extended by their use fifty miles beyond the limit where it was considered possible to raise that staple. The negative testimony of many failures has therefore no weight when science, supported by the experience of European countries and by an overwhelming majority of intelligent, practical farmers, bears witness to the efficacy of, and the beneficial results derived from commercial fertilizers.

The trade in this indispensable necessity has demonstrated its right to exist, and it deserves fully the recognition which lately begins to be accorded to it. In every direction its work and influence have proved highly advantageous. Of offensive and dangerous matters it made willing servants for the common good; valueless articles acquired a value, and were added to the list of commercial commodities. Wherever the products of the trade obtained, large returns put money into the farmers' pocket, enriching not only the land, but, through it, the owner likewise.

It is, therefore, no exaggeration to say that the agriculture of the future depends upon the growth and development of the fertilizer trade. For it depends upon supplies of plant-food brought from sources outside the farm, and prepared for the farmers' use by those who make it their business to do so, and who must, in order to succeed, bring to it not only a large capital, but likewise science as a handmaid, skill, and business talent as absolute requisites. The progress of this industry measures the true progress of this country, and promises results which it is impossible to foresee at this day. It opens up a wide vista of changes and improvements. It heralds the awakening of agricultural thought, and has partly awakened it. And with thinking comes improvement, comes better tillage of the soil, comes better stock, comes larger crops, better profits, and lastly, a higher moral and intellectual standard.

The practical question to which each farmer or planter must frame his own answer may be summed up as follows: Whosoever enters upon the cultivation of land opens, as a matter of fact, an account with the ground he undertakes to till, as with a bank. When he takes possession of fields, either by purchase or inheritance or exchange, the ground contains certain deposits of phosphoric acid, of potash, or nitrogen, etc. The raising of every crop is practically making a draft upon these deposits. As banks do not honor drafts if the amount of credit does not equal the amount of the draft, so the ground is unable to honor the drafts unless the deposits enable it to do so. The more liberal the deposits made in bank, the greater the balance to the credit. So with fields. The more generous the supply of plant-food deposits, the greater can drafts be made in the way of expected harvests. Let no one suppose that Nature refuses to honor drafts. Nature knows not of stinginess: but it obeys simply the universal law, that it is necessary to have in order to be able to give, and that it is necessary to receive in order to be able to return. Nature is generous. Improve the land by fertilization, and the value returned by Nature invariably surpasses the value of the outlay to make the ground fertile.

A Penny Saved is a Penny Earned.—To incorporate daily a certain amount of fine ground phosphate of lime into the fresh barnyard manure by scattering it over the manure pile, or to compost them for some months previous to their designed application, is a universally indorsed practice. The good economy of applying these phosphates in a finely divided state to the compost heap has been illustrated again quite recently by Professor H. C. White of Georgia.

The compost heap was prepared of 40 parts of earth, 34 parts of fine ground phosphate and 31 parts of cotton-seed meal, and the mixture kept moist with water.

The compound was made in June, and tested

in February. A careful estimation proved that one-third of the phosphoric acid had been rendered soluble in soil water, the commercial value of the phosphoric acid had been increased not less than 46.4 per cent.

It is quite safe to assume that fine-ground Canadian phosphate of lime treated in a similar way with fresh horse manure or turf, and kept moist with urinary excretions, would have given even still higher pecuniary results.

Yet, with these facts before them, some farmers not educated, purchase superphosphates with the soluble phosphates, valued at 8 cents per pound by the experiment stations, when the insoluble phosphates by the same authorities are valued at 2 cents a pound, a difference of 400 per cent. which the farmer can save at the expense of a little time, and a very small amount of labour. A penny saved is a penny earned. A word to the wise is sufficient.

Home Use of Phosphate.

The feeling is growing on every hand that it is absurd to be exporting this richest of all fertilizers while our country is full of worn-out lands. Farms are constantly being abandoned in Ontario and Quebec, and families emigrate to a life of hardship in a western wilderness for the sake of newer soils, when knowledge of the means of enriching the old lands would preserve their homes in affluence. It is not a lack of the existence of knowledge either that is at fault, for the knowledge has been gained and many communities are profiting by it, but the fault lies in lack of zeal on the part of those who should be the people's instructors, and also in lack of enterprise by commercial men who might spread the education to their own profit. Now that experimental farms are being undertaken in Canada, it is to be hoped that no niggardly policy will prevent the widest distribution of information as to the results obtained. No subsidy or protective tariff can compare for a moment, as a means of benefiting the country, with a system that would promote the production from its lands. An increase in the fertility of the soil would add to the wealth of the country more than any conceivable number of manufacturing industries could do, and this result would be secured without robbery or injustice to any unprotected interest.

Georgia has been admitted to possess the poorest soil of any of the Southern States, and twenty years ago its worn-out lands could be bought for \$3 per acre. But knowledge of fertilizing has been extended and these same lands now command a market value of \$30 per acre, and the State now leads the South in the quantity and quality of its farm products, its cotton equalling that produced on the famous Red River bottoms of Louisiana. The same improvement could occur in the Province of Quebec.

The agricultural editor of the Boston *Post* says: "To incorporate daily a certain amount of fine ground phosphate of lime into the fresh barnyard manure, by scattering it over the manure pile, or to compost them for some months previous to their designed applica-

tion is a universally endorsed practice. The good economy of applying these phosphates in a finely divided state to the compost heap has been illustrated again quite recently by Prof. H. C. White, of Georgia." This gentleman put finely ground Carolina phosphate into a compost heap and after about half a year "a careful estimation proved that one-third of the phosphoric acid had been rendered insoluble in soil water. The commercial value of the phosphoric acid had been increased not less than 46.4 per cent."

Many United States farmers now keep finely ground phosphate constantly on hand, and daily spread it in the stables and stalls to absorb the urinary excretions and become mixed with the manure. A most valuable fertilizer is thus secured at a small expense. Here is this natural fertilizer placed by nature at our doors, and we are not sufficiently intelligent or enterprising to make use of it. A great opportunity exists in this direction for both the philanthropist and the capitalist to work, and secure the blessing due to him "who makes two blades of grass grow where only one grew before." The Department of Agriculture and the Agricultural Societies should spread information about commercial fertilizers, and some wide-awake men should seize the opportunity to prepare and sell them in Canada.

This is a most important matter for our miners, as well as for our farmers, and we are fully justified in calling attention to it in these columns. Every pound of phosphate that can be mined in Canada is needed on her own soil, and should be sold here instead of being transported thousands of miles and often sacrificed in competition with inferior foreign products, or through losses by those "tricks of trade" that are so notable a feature of modern commerce.

Raw Phosphates.

Previous to the year 1770 it is difficult to find any record of the use of bones for agricultural purposes. In 1740 their value for a top-dressing for grass lands was accidentally discovered at Sheffield, where a heap of bone shavings, scrapings, &c., was buried in a field with marvellous results. The mechanical division of bones in their raw state was difficult, and so costly that it precluded their use in any other form than crushed. Liebig, some fifty years ago, found that by the application of sulphuric acid to bones it reduced them to a finer state of division than could be done by then known mechanical means. This application is often called dissolving bone in acid. There is no clear solution. It is a mere breaking up, it is a softening, pap-forming process, and bone in this state would more appropriately be called bone pap. The bone is merely so far reduced that, when rubbed between the thumb and finger, no grit is felt. Bone cannot all dissolve, for the sulphuric acid, when added rightly, unites with the lime of carbonate and phosphate, and forms with that insoluble sul-

phate of lime or plaster. It is this which gives the grayish-white look to the bone porridge. At the present time comparatively few bones are used for fertilizing purposes; phosphate rock, phosphorite, apatite and coprolites having been substituted generally in place of bones in manufactured superphosphates and commercial fertilizers. Where originally it was impossible to get raw bones ground fine by machinery, that difficulty does not exist with phosphate rock, phosphorite, apatite and coprolites, as they are all easily reduced to an impalpable powder at a low cost with the present machinery now in use, and it has been found by repeated experiments by competent authorities that if the phosphates are ground to an impalpable powder, they are as available to crops as if they had been treated with sulphuric acid, the carbonic acid of the soil and the soil water being as efficient a solvent as the sulphuric acid. In saying that phosphoric acid is insoluble it is meant that it is insoluble in pure or distilled water. Water which contains carbonic acid, ammonia, or common salt (and all water contains one or more of these), has the power of liberating the phosphoric acid from its base lime and rendering it available to roots. The action is slow, but it is sufficient, and it is more rapid the finer pulverization of the phosphate. In fact, phosphates treated with sulphuric acid, to render them insoluble before, but not after they are applied to the soil and sold under the name of superphosphate, when applied to the soil reverts or goes back to its original condition, this is generally admitted, but it is soluble in the acids of the soil in the same manner as are the phosphates ground to an impalpable powder. It is estimated that 400,000 tons of sulphuric acid, 50° strength, are used annually in the United States to convert insoluble phosphoric acid into soluble phosphoric acid, and that this quantity will be doubled during the next five years. As it requires about a ton of sulphuric acid of this strength for every ton of phosphate rock containing sixty per cent. of phosphate of lime, it is readily seen that the sulphuric acid will cost more than the phosphate of lime, and reducing the quantity of phosphoric acid in the resulting superphosphate one-half. Certainly this is a most costly way for the farmer to obtain the phosphate of lime, finely divided so that the acids of the soil can act upon it. The present machinery in use is by far the cheapest method, for in addition to the great cost of the sulphuric acid, and the necessary expenses attending its use, there comes the expenses of transportation, which has been doubled by the addition of the sulphuric acid. It is claimed by some that for tilled and quick growing crops (it is conceded that it will for grass and winter grains) the phosphoric acid will not be liberated as fast as the crops require it from the phosphate when in an impalpable powder; but there can be applied at the same cost four times the quantity of phosphoric acid in phosphate of lime in an impalpable powder, than there can be

in phosphate of lime treated with sulphuric acid, and there can be no question but that with using four times the quantity as much phosphoric acid, if not more, will be as available for the growing crops as if one-quarter part was used that had been treated with sulphuric acid; again, the additional three-quarters used is not lost, but becomes assimilated in the soil for the drafts of future crops upon it. But we are not confined to the use of sulphuric acid or the slower operations of nature to render the phosphoric acid in phosphate of lime immediately available for crops. It has long been known that fermenting manure or peat with phosphate of lime powder scattered or mixed through it would render the phosphoric acid at once available. This certainly is a better as well as a cheaper way for the farmer to procure soluble phosphoric acid, than to get it in phosphate of lime, treated with sulphuric acid at four times its first cost and the expenses for transportation doubled. The theory of scientific agriculture is based upon a complete knowledge of soils, plants, animals, and manures, and it is evident that until these elements are thoroughly understood, no attempts at improvement or plans for increased production can possibly be successful. The manure question is the most important one connected with agriculture or horticulture. With fine ground phosphates as the basis of operations, we can now obtain complete manures for any culture, made according to any formula, and containing in a readily assimilable form all the ingredients called for.

Ottawa as a Mining Centre.

It has been predicted that with the waste which for many years has been taking place in cutting and preparing timber in our forests, and from the want of any systematized forestry regulations, the time is not very far distant when the lumber trade of Ottawa will shrink into very small proportions from the want of material, and that the large and costly establishments now employing, in this vicinity, so much labour and capital will materially curtail their operations, and practically suspend work on a large scale. The question which naturally arises is, how will Ottawa be affected by such a result? The country surrounding the Capital is not an agricultural district compared with Western Ontario, and manufactures are only in their infancy. But just at the very time when this apparently bad outlook looms up, a new industry appears and is assuming such proportions that there is every reason to believe it will, before many years elapse, become the leading enterprise of central Canada, and afford employment for hundreds of busy hands. This industry is mining and utilizing the product of the mine. The whole country north of Ottawa, wherever the Laurentian range of mountains is met with, possesses mineral wealth of one kind or another. Iron, plumbago, galena or lead, phosphate or apatite, asbestos and mica, all are there, and in rich profusion. Few persons, beyond those engaged in

mining enterprises, are aware of the richness of this section, and the wealth that has been lying at our very doors for years past, waiting only the hand of man for development. It is of untold value. The plumbago mines at Buckingham, a few years ago, gave every promise of becoming one of the largest industries in Central Canada, but mismanagement and waste curtailed their operations, and the large crushing mill on Donaldson's Lake being destroyed in the great bush fires which swept that section of the country, crippled that industry for the time being. These works, however, are now to be utilized again, and the yield of the mineral is of so pure a quality and so easy of access that the only wonder is that they have not commenced operations before. The enormous proportions the phosphate industry has assumed are well known both in Europe and at home here, and United States capitalists are investing largely in phosphate lands and phosphate operations. Not only, as at first, is the mineral mined and shipped, but crushing and pulverizing works are now in operation, and a demand for ground phosphate has arisen amongst the fertilizer companies on the shores of Lake Erie, and elsewhere, which bids fair to shortly revolutionize the trade in rock phosphate by shipping only the ground material. Water power is the only cheap motor for works of this nature, and the mighty power of the Chaudiere Falls, which hitherto has been confined to the manufacture of forest products, will contribute its share to the development of mineral wealth as well. The iron deposits which abound in this vicinity will prove as valuable in the near future as the gold-bearing quartz in the lands where the latter is worked. The iron of this district is known abroad for its excellent qualities, comparing as it does with the finest Sheffield steel, and one mine alone, in the townships of Templeton and Hull, is estimated by Professor Chapman to contain 6,300,000 tons, equal to a daily output of 100 tons of ore, or 60 tons of metal, during a period of a century and a half.

The iron deposits in Bristol are also now a centre of attraction, a number of capitalists having taken them in hand, and the only requisite to perfect a large iron trade in our midst are smelting works, which time will certainly bring about. Taking into consideration these facts, he who reads the future will see visions of mining industries and their attendant factories supplanting the timber trade, when forest products will require to be handled miles away from their present location. As the demand for timber yearly drives the lumberman further and further up the head waters of the Ottawa and its tributaries, the mills will have to be located nearer to the place of production, and railway facilities for the transport of square timber and deals now penetrate the lumber district to such an extent, that the material loaded on the cars for Quebec now passes by Ottawa in transit, instead of as formerly being floated here as a distributing point, where it could be rafted or

sawn and shipped in its manufactured state. Where is the rafting that only a few years ago filled the bay below Parliament Hill with its industry? Where are the raftsmen whose stalwart forms filled Sussex street and Lower Town during the summer months? Gone with the advance of railways to other points which demand them. But the miner is gradually filling their place, and although his presence is not yet felt to any extent in the streets, yet we think the banks could tell us something of the large transactions done with him, and of the heavy drafts the pay roll of the mines requires monthly. The settlers on the Lievre and Gatineau who were virtually in the power of the large lumber firms, and who sold their produce to those firms for whatever they could get, are fast acquiring money from the demand the mines make for farm produce of all kinds; and this not for one firm only, but the competitive demand of the various mines enables the producer to ask and obtain a fair value for his hay, his roots, and produce generally. To the mining industries must Ottawa look in the near future for its trade, and although lumber has done much to build up the manufacturing industries of the Capital, mining will do still more, and be a permanent source of wealth when the pine tree will be as scarce in the Ottawa district as it now is in Western Ontario.

The Phosphate Trade of Canada.

Revised from Vol. V., No. 6, of THE CANADIAN MINING REVIEW.

There are probably very few persons beyond those interested in the industry who know what Apatite is, or to what uses it is applied, and when they are told that the shipments of crude rock in 1887 reached the large amount of 23,690 tons, of an estimated value of \$319,815, and that they are annually increasing, they will naturally seek some information respecting it. Apatite is the crystalline form of phosphate of lime, used largely for the manufacture of superphosphates when treated with sulphuric acid. It is only within the last few years that attention has been given to its existence in Canada, although the late Sir William Logan cites its existence in certain localities. Specimens of it, and very pretty they look in a cabinet, might have been seen in museums or in private collections, but the great wealth it would bring to the country was little thought of, and mining it on any large scale would, till quite recently, have been looked upon as a waste of money. To-day, however, it is taking its place as one of the foremost industries in Canadian mining, and with the exercise of care and judgment apatite mining affords a handsome return to those who engage in it. This industry, moreover, adds to the general wealth of the country, by the circulation of money in the purchase of agricultural products to feed the miners, for boats and railways transporting it to the seaboard for shipment, to the vessels which carry it across the Atlantic, and to the brokers and commission merchants who handle it before it reaches its British purchasers.

Prof. Boyd Dawkins, an eminent geologist, who, when in America with the British Association, visited the Ottawa County mines, stated in a paper read by him at Manchester, on his

return, that in his opinion phosphate was "one of the most important resources of Canada."

When Liebig, in the year 1840, compelled the agricultural community to accept his views of exhaustion and restoration of the soil, and that the constant removal therefrom in the harvest of the inorganic elements of plant food, notwithstanding the rotation of crops and the old system of manuring, was a robbery of the soil, which enriched the present at the expense of the future, he may be said to have been the founder of an industry which has assumed constantly increasing proportions ever since. That industry is the manufacture of fertilizers or superphosphates, and the demand for materials from which these can be manufactured led to a search for, and consequent working of, natural deposits in which phosphate of lime preponderated. It is not our intention to go into the question of fertilizers further than to state *en passant* that in supplying the nutritive elements of plants in the form most favourable for absorption and assimilation, the whole art of manuring consists, and that as ordinary manure does not always contain the two most important inorganic elements of plant food, phosphoric acid and potash, sufficient for plant use, the needs of mankind demand the employment of artificial fertilizers along with or as a substitute for farm-yard manure.

Dr. Dawson, the assistant-director of the Geological Survey of Canada, in a paper read by him before the Ottawa Field Naturalists' Club, in 1884, reviewed very concisely how phosphorous was essential to all living tissues whether vegetable or animal, and in following the transmission of that substance from the soil to the plant, from the plant to the animal, and from the animal again to the soil, he further pointed out that this cycle of nature is interfered with and broken by the massing of population in large towns where the phosphates and other substances valuable to agriculture are lost. He also cited statistics of the amount of phosphorous actually contained in the grain annually shipped from the port of Montreal, estimating it for this purpose in the form of phosphoric acid. Wheat contains eight-tenths per cent. of this, or about sixteen pounds to the ton, and a very little calculation will show annually the enormous amount carried away, and a still further calculation, based on the average quantity (about two-tenths per cent.) contained in ordinary soils, gives the amount of phosphate of lime required to restore and maintain the fertility of the fields. With these statistics the necessity is evident of having sources of supply of phosphates, the most available of which are concentrated natural deposits. The questions that follow are: What is the nature of them? Where do they occur? How have they been formed?

To the first of these questions let us take Dr. Dawson's own words: "The concentration of phosphates in nature is generally found to have been brought about by organic agency," and he then cites as the first example guanos, composed essentially of the excrements of seabirds. These are divided into two classes, nitrogenous and phosphatic. In the former, which belongs exceptionally to dry climates, the organic matter, converted by decomposition into ammonia salts, remains as part of the mass, but in the latter the rain has removed the soluble ammonia, leaving the phosphatic matter. This is the case with the West Indian guano, and the coral rock, penetrated with hollows and tissues, has become so permeated with phosphatic accumulations that it is known as phosphatic rock. The deposits in the South of France, known as

Bordeaux phosphates, are looked upon as of a similar origin, the higher parts, the plateaus of Jurassic limestone in which it is found appearing to have formed at one time an archipelago in a tertiary sea, like the West Indian Islands of our own time. This phosphate rock, however, is of very modern origin geologically speaking. Coprolite beds, such as the phosphate rock of South Carolina, have their origin in a different source, and are traceable to the accumulations in shallow tidal estuaries of ancient seas, of molluscs, bones and other marine organisms massed together by concretionary action, and forming layers similar to the well-known mussel beds on many parts of our sea coasts to-day. But the expression coprolite, applied as it is to Carolina phosphate, is erroneous. It should only be applied to the fossil excrements of various animals, notably the saurian monsters of the antediluvian shores, and which are so abundant in the eastern counties of England that coprolite pits have been worked there for many years. Crystalline phosphate or apatite is new, different in appearance from the preceding, and Dr. Dawson remarks, speaking of it, that in the Laurentian rocks of Canada are sediments deposited in the earliest seas of which we have any trace, but which originally resembling those of later seas, have been so completely altered that their materials have entered into new combinations, and have by igneous action become entirely crystalline, resembling now the original deposits as little as do the crude ingredients of glass the finished product. In substantiation of this theory limestones thus acted on would assume the crystalline character of marble, beds of a peaty or coaly nature would pass into graphite or plumbago (crystalline carbon), and phosphatic layers would appear as crystalline calcic phosphate or apatite. All these substances are found in contiguous zones or belts in the Laurentian rocks near Ottawa, an evidence pointing directly to the correctness of this theory. The greatly disturbed character of these rocks explains the irregularity of their deposits, as layers which, before the great folding and kneading together caused by igneous and volcanic disturbance may have possessed regularity and uniformity, have been so dislocated and upset as to lead to the production of large pockets and irregular masses, connected only by narrow and twisted seams, so narrow sometimes as to appear as isolated portions.

The principal sources of supply may be stated as follows:—The West Indies and other islands of the Caribbean Sea, supplying what is known to the trade as Sombreiro phosphate, or rock guano as it is sometimes called, of high quality; Navassa, from its impurities can only be used for a lower grade of superphosphate; Maracaibo, or Mark's Island, is of very high quality; St. Martin's Island, of good quality; Araba Island yields a variable quality, and Pedro Keys and other small islands yield an uncertain supply. In the Pacific Ocean, Baker, Jarvis, Howland, Malden and Starbuck islands afford a high-class rock guano. In the South of France the Ardennes region affords what is known as Bordeaux phosphate, so called from the port from whence it is chiefly shipped. The valley of Lahn, in Nassau, yields what is known as German phosphate. The eastern counties of England, Cambridgeshire, Bedfordshire and Suffolk, produce coprolite of high quality. Boulogne, in France, yields coprolite, used largely for mixing with materials of a higher grade. South Carolina, in the United States, produces large quantities of phosphate known

as Charleston rock, of a low grade, but very largely used, its composition being easily attacked by acid.

Crystalline phosphate of lime or apatite, the purest form which is at the manufacturer's disposal, is now becoming more and more sought after owing to its high percentage and greater purity, and Canada will, from present appearances, be the chief source of supply. Norway furnishes an excellent quality of this material, but the supply is limited. Spain produces large quantities of apatite, and in Extremadura and the neighbouring districts of Portugal large deposits have been known to exist for some years, but have only recently been worked to any extent. The above-mentioned places are the only known sources whence apatite is obtainable, and as a consequence the great value it assumes from its limited sources of supply must be at once apparent.

In his report on the County of Hastings, in the Province of Ontario, in 1871, Mr. Vennor, late of the Geological Survey staff, called attention to large deposits of apatite existing there that had been quarried on and off for over 20 years. The richest of these occur in the township of North Burgess, where a number of "openings" were worked with fair returns. These deposits he named respectively "the North Burgess Basin," and "Bedford, Storrington and Loughboro Basin." Analysis of specimens taken from these in different localities gave as an average 88 per cent. of phosphate of lime. The mineral has now been discovered more or less all through the district lying north of Kingston and Belleville, and although mining is now carried on there on scientific principles, it is as yet in its infancy as far as that part of the country is concerned.

The Laurentian Mountains of the Province of Quebec seem to offer greater advantages than elsewhere for this species of mining, especially in the district lying northeast of Ottawa and within a radius of 30 miles from the Capital. This Laurentian range meets the eye when ascending the river St. Lawrence from the sea, and runs parallel to it on the north shore, and diverging somewhat east of the confluence of the Ottawa River, follows the coast of the latter westward by north, sending a spur across it near Portage du Fort, which penetrates the Kingston district alluded to before. The natural formation of these mountains is far from being conducive to agriculture, the country presenting a succession of small isolated, rounded, rocky hills, alternating with numerous lake basins. The rocks, though concealed in the valleys by considerable depths of alluvial soil, are seen in the hills to be hard and undecayed. After the first growth, which covers these hills in a state of nature, has been cut, the undergrowth is apt to be destroyed by fire, and the comparatively thin layer of soil is laid bare, which, being soon washed away by the rains, exposes the rock and renders the region sterile. With the exception of straggling settlers here and there in the valleys, all this district had been left as valueless till the discovery of the presence of apatite brought it into notice, and land, which was held by the Crown at 30 cents an acre, was bought up by speculators, and realized fabulous prices for mining purposes. The latter is carried on principally in the townships of Buckingham, Templeton, Wakefield, Hull, Derry, Portland, and Bowman, the two former being the chief fields of present operations. Exploration shows that apatite is to be found in a much wider district than the above mentioned, the zone containing it running in a north-easterly direc-

tion from the Blanche River across the river Lievre into the adjoining country east, and then taking a curve backwards in a north-westerly course. The belt is very productive and yields a very fine quality of apatite.

Dr. Sterry Hunt, who has made a persistent study of the Laurentian rocks for upwards of thirty years, says the question of the continuity of the deposits is important. Veins fitting fissures in the rocks are sometimes continuous for great lengths and to great depths, but their extent varies. Inclined beds of the material, which once were horizontal sheets inclosed in strata that have since been folded or convoluted, should be as persistent in depth as in length and when traced in the outcrop for hundreds of feet may be expected to continue downwards as far, unless a turn of the enclosing strata brings them up again to the surface. He urges, therefore, deep mining for permanent success, and the experience of the past couple of years proves the correctness of his theory.

Up to 1886 the majority of the workings were superficial, consisting rather of shallow pits or large quarries. The reason for this is traceable to the fact that apatite in its crude state finds a ready sale at all times, even in small lots of five or ten tons. Consequently farmers and others opened pits and trenches for the purpose of extracting what mineral was within easy reach, and with satisfactory results, but so soon as the opening attained a depth at which work became difficult from the want of appliances for hoisting, or from the inflow of surface water, the pit was abandoned for a fresh outcrop close by, and the same process was repeated. The very abundance and value of the mineral thus led to its careless and wasteful handling, and retarded for some time its legitimate growth. With the advent of capital matters assumed a different aspect, and the old unbusinesslike system of mining which characterized the first attempts in the Ottawa district has been abandoned, and deep mining is now engaged in with great promise of abundant returns. The investment of foreign capital, and the organization of powerful companies composed of men of practical business ability and intelligence, together with the introduction of steam power and improved machinery, economy in the management of the mines and the necessity of shipping only a high grade of purity, have now placed these works on a sound and permanent basis. One American company has sunk a shaft on their property to a depth of over 600 feet, passing through several deposits of pure phosphate and following the connecting vein which narrowed at certain depths to no greater thickness than a man's thumb. At this depth they struck a productive deposit on which they have continued working, running drifts laterally, and turning out a large yield of apatite of high standard.

The great advantage the Buckingham mines possess is their contiguity to navigable waters, the mines in the majority of cases being situated near the River Lievres. This is a slow, sluggish stream, very deep and only at one point in its course (known as the Little Rapids) where boulders occur and a ledge of rocks crosses the channel, is any obstruction offered to navigation. This is at present obviated by the use of flat bottomed scows carrying the apatite, being towed to the head of the rapids by a small steamer, where they are let loose to float over it, much in the same way as cribs of timber are sent over the Ottawa "slides," or over the rapids of the Ottawa and St. Lawrence rivers. At the foot of the rapids the scows are taken in tow by another steamer which tows them to a landing

AUTOMATIC Refrigerator Co'y

MANUFACTURERS OF

HANRAHAN'S Patent Refrigerators.

The above Cut is a representation of the celebrated AUTOMATIC REFRIGERATOR, specially adapted for the preservation of Fresh Meats, Milk, Butter and other perishable articles. It has a thorough circulation of DRY COLD AIR. No one article will take taste from another. All are kept in the same chamber.

Stock Sizes kept always on hand.

Special Sizes for HOTELS, GROCERS and BUTCHER'S USE made to order on shortest notice.

ALSO DEALERS IN

Pine and Hardwood Lumber.

A general assortment of Dressed Lumber and House Finish, kept always in stock, consisting of Flooring, Sheeting, Clapboards, Shingles, Laths, Battens, Mouldings of every description. Turning. Band Sawing and Scroll Sawing of all kinds done on the premises.

Special attention paid to Custom Planing, Matching and Resawing.

at Buckingham Village, where a short branch line of the Canadian Pacific Railway has trucks waiting alongside the river, into which the mineral is transferred, and conveyed thence direct by rail to Montreal, where the cars on arrival, traversing the line of docks, run alongside the vessel which is to receive their contents. The Government, recognizing the rapid growth and increasing importance of the industry, has at present under construction a large Lock and Dam, which, when completed, will obviate this difficulty and greatly facilitate the transportation of the ore, at the same time enabling the miners to handle their output at a minimum. The cost of floating the mineral down the river ranges from 30 to 50 cents, according to distance, the freight by rail to Montreal costs about one dollar and twenty-five cents per ton. Ocean freight ranges from three shillings to seven and six pence sterling, although there are times when from want of freight vessels will carry the mineral as ballast free of charge. The value of the crude material in Liverpool ranges from eighteen to twenty dollars, and from these figures it is easy to see what a profit there is in prosecuting this industry. But it is only by the outlay of large capital in developing and getting operations into thorough working order that this end is attained. The first year seldom leaves any margin, owing to the heavy outlay for plant, buildings, etc. But in the case of two companies, at least, one English and the other American, it is known that after the first year's outlay a large dividend was declared and paid to the shareholders.

Care has to be taken that the quality shipped is of a proper standard, and not mixed grades. The qualities are known to the trade as firsts, seconds and thirds. The best quality averages from 80 to 88 per cent. of tribassic phosphate of lime, the general run of the apatite shipped ranging from 75 to 85 per cent. The present basis of value for 80 per cent. mineral is about 11d. per unit, with a rise of one-fifth of a penny for each additional unit. To secure an even grade, dressing is resorted to under the name of "cobbing." This is necessitated by the intrusion of mica, pyrites, pyroxene, and carbonate of lime, all useless materials which have to be got rid of, except where large masses of pure apatite have been brought to the surface. Cobbing consists of the separation by hammers and hand picking,—an easy operation owing to the softness of the apatite as compared with extraneous substances—in a building known as a cobbing house partly open at the sides. On one side of this, through or around the interior of which solid tables or stands are located, are empty tram-cars or waggons, into one of which the refuse is thrown as broken off, whilst the apatite thus cleared is thrown into another receptacle on the other side. Boys and old men are employed at this work, and they earn from 50 to 75 cents per day, being paid mostly by piece work. This process has been greatly facilitated by the recent introduction of revolving screens, jigs, and other improved machinery, now adopted by all the leading mines.

The various forms in which the apatite of the Ottawa district presents itself are in crystals, sometimes of very large dimensions, in masses varying from compact to coarse granular; in strata of a lamellar texture, and in a friable variety which is abundant, known as sugar phosphate. Phosphate crystals consist of six sided prisms with complete pyramidal terminations, though often possessing one pyramidal termination and one basal plane. In size they vary greatly, viz: from those of less than half of an inch in length and corresponding thickness,

weighing only a portion of an ounce, to those of many hundredweights. A large and almost perfectly formed crystal from the Little Rapids mine may be seen in the collection of the Geological Survey's Museum at Ottawa.

The usual color of crystals is green. Some, however, approach white, while others are of a pink, yellow or violet tint, and others nearly black. The color appears to be purely accidental and is due to various impurities mechanically mixed with the minerals. Thus the red and brown varieties contain minute crystals of hematite; the blue and green, scales of chlorite; and the yellow and blue owe their tints to organic substances.

Having now given an idea of what apatite is, and of the Ottawa district in which it is worked, it may be well to describe some of the larger mines in that locality. The Emerald Mine, one of the earliest opened, has been one of the most productive, and is worked on thoroughly scientific principles. It is situated some 9 miles from Buckingham Village, is owned by the Ottawa Phosphate Company, and has changed hands several times, each succeeding purchaser paying higher prices, the last sale clearing the owners over \$50,000, before any large works such as are now carried on there were undertaken. Drifts are now in the side of the hill to the main shaft, by means of which the refuse as well as the mineral are run out on tramways. The Little Rapids Mine is a very valuable property, some 3 miles north of the previous mine. A large number of openings have been made on the property, all of which have yielded very good returns. Several deep shafts, two of them extending to a depth of over 200 feet each, have been sunk and drifting carried on at various levels with great success. This mine is owned by Mr. W. A. Allan, of Ottawa. It is well equipped with the latest and most improved machinery. A well constructed tramline from the pit's mouth to the river landing was built last year. The North Star Mines, owned by an American company, contiguous to the previous mine, is yielding good returns for the outlay on them, and it is here that the deep shaft of 600 feet, previously mentioned, has been sunk. All the above mentioned mines lie on the eastern bank of the Lievres. Some 8 miles further up, on the left or western bank, are to be found the High Rock Mines. These are probably the most extensive of all, and belong to the Phosphate of Lime Company, of London, England, under the management of Mr. W. W. Pickford. The property owned by this company covers 1,200 acres. The profits of the three years, 1882-3-4, were sufficient to cover all the outlay and to admit of a dividend of 25 per cent. on the capital stock, besides setting apart \$10,000 as a reserve. The principal operations are conducted in their large No. 11 tunnel, and as an instance of the abundance of this mineral in the workings at this point, it may be said that no later than on the 11th of June last, 55 tons of high grade ore were taken out from one blast. At present the yield is richer than at any previous time since the mines were first operated. A large number of openings are also being worked on different portions of the property. The annual output from these richly productive mines may be fairly stated as at 7,000 tons per

annum. Tramways along the face of the mountain, on which these works are situated, carry the refuse to points where it is easily dumped into ravines and so away from the site of any probable future openings. The offices, and buildings for the miners' accommodation, are scrupulously looked after, and the company has provided a reading room well supplied with books, papers and periodicals for their employees' use when not working. The mountain is some 1,900 feet above the sea level, and the view is very fine, the Laurentian hills in all directions rising one above the other till lost in the blue haze of the distance, whilst at the foot of the mountain is a natural beaver meadow, fringed with trees, and nestling as it does amongst the mountains gives an air of quiet and repose in contrast to the busy scene of the works going on above it. The number of men employed by this company ranges from 100 to 150. The Canadian Company's Mines adjoin those owned by the High Rock people. This company was organized in London in the beginning of the present year, with a capital of 110,000 shares at £1 each, and now operates the property formerly worked by the Union Company of New York. The property includes some 1,285 acres, and embraces the Star Hill, Williams and Ruby mines. The latest machinery and the most modern appliances are used; many new buildings have been erected, including a large cobbing house, with revolving screens; and a wire rope tramway from the pit to the landing is at present under construction. The escarpment which forms the walls of this ravine shows the course of numerous veins of the mineral all trending eastward and running into the mountain, and the main works are carried on by literally quarrying the hill side, and cutting it away in solid masses. Three years ago on the site of the Canadian Company's mines there was nothing but rock and unbroken forest; to-day there are numerous dwellings, substantial offices and storerooms, tramways and good roads. The number of men employed here ranges from 100 to 125.

There are numerous other mines being worked all through the apatite district, especially in Templeton, where both Canadian and American capitalists are interested, and new mines are being opened. In the Templeton district may be mentioned the celebrated Blackburn Mine, the oldest and most productive in this section, the Templeton and Blanche River Company, the Canada Industrial Company, the Anglo-Canadian Company, and Mr. Jackson Rae's mines. Extensive operations are also carried on at the Otty Lake Mines, in Perth; by Mr. James Foxton and others at Sydenham; and also by Captain Boyd Smith and others in the Kingston district. The description given of the mines above mentioned, however, shows sufficiently the magnitude of the various enterprises.

The following table of shipments, for each calendar year respectively, from Montreal, of crude Canadian apatite to be used in the manufacture of superphosphate abroad, gives a fair idea of the yield of the mines of the Ottawa district, as the greater portion of it is derived from them, the Kingston district only furnishing a comparatively small yearly amount.

1880.....	7,500 tons.
1881.....	10,307 "
1882.....	15,556 "
1883.....	17,160 "
1884.....	20,461 "
1885.....	21,876 "
1886.....	19,345 "
1887.....	20,319 "

The question may naturally arise why such a

commodity should be sent abroad to be manufactured when apparently it could be treated here and shipped in a condition ready for use, thus adding to our own industries. The reason for this, however, becomes obvious when we ascertain that the pyrites, out of which the acid for dissolving the apatite is not found in quantities sufficient to supply works on any scale within any reasonable distance of the mines. The cost of transport of pyrites would probably exceed the freight of the crude mineral to Europe, where, from the numerous chemical works existing, acid can be purchased far cheaper than it could be made here. Again our Canadian apatite enters largely into competition with a lower grade phosphate from other quarters in the superphosphate works across the Atlantic. When a demand shall have arisen amongst our own farmers to compensate by the use of phosphatic fertilizers the soil for the loss it undergoes by the constant removal of crops, especially in districts where cattle raising is not largely carried on, superphosphate works may be started with a show of success, in spite of all difficulties. In his Report for 1883 the Minister of Agriculture remarks:—"experience goes to prove that for the production of cereals of every description as well as for the strengthening and renewal of worn-out lands, no available fertilizer is known that can produce such beneficial results as phosphate when subjected to a chemical process."

A curious feature in the apatite trade of Canada is that, although a very large amount of American capital is invested in our mines, almost the whole of their product finds its way to Great Britain, and that a large amount both of crude and manufactured phosphate is exported thence to the United States. There is every reason to believe that both these articles are Canadian produce reshipped, and the explanation given for this by Mr. Torrance, late of the Geological Survey staff, is that it is simply due to the conservatism of trade, as American dealers were in the habit of importing from Britain long before our Canadian deposits were worked, no efforts have since then been made to direct from here into fresh channels a trade which was commenced with the English market by men more familiar with that than with the American.

A wealthy American company commenced operations last year at the junction of the Lievres and Ottawa rivers for grinding and pulverizing crude phosphate, either for acid treatment or for use in the pulverized state. These works are capable of grinding 50 tons per day, and an idea of the fineness of the work done may be formed from the fact that the powder has to pass through an 80 mesh bolt and blowers for separating the mica, leaving only a phenomenal quantity of that worthless and troublesome ingredient. The company have made arrangements by which the ground article can be delivered at cities along the south shore of Lake Erie, where all they can manufacture has been contracted for at a rate of freight of \$1.40 per ton.

In conclusion, Canadians are an agricultural class of people. The essentials for starting Canada's growth are force and material. The climate affords the forces, light, warmth and water; the material, lime, potash, ammonia and phosphate are at its very doors; and with these there is no reason why it should not be one of the most productive countries of the world, if it only uses in a rational manner the means which nature has provided for it.

Johnston's Fluid Beef!

The Great Strength Giver.

The claims of this preparation are made on the **SOLID BASIS OF FACTS.**

It contains all the **NUTRITIOUS** and **STRENGTH-GIVING** elements that meat itself supplies.

FOR THE SICK there is no food that can be taken which will strengthen and invigorate as effectually. The weakest stomach can retain and digest it.

It is **THE MOST PERFECT FORM OF CONCENTRATED FOOD.**

AS A WINTER BEVERAGE it will be found to be **WARMING AND INVIGORATING.**

A steaming hot cup of Johnston's Fluid Beef is the greatest heat generator, that will supply lasting warmth and vigor.

Crude versus Acid Phosphate.

The use of mineral phosphate as manure began in consequence of the discovery by Liebig, in the year 1840, that sulphuric acid made it soluble. It is supposed that the effect of the acid upon the mineral is the same as extreme pulverization, and that in this minute form the particles become available for plant food. When the pulverized phosphate is mixed with about an equal weight of sulphuric acid it becomes soluble in water; but it is stated that all agricultural chemists now concede the fact that when soluble phosphoric acid comes into contact with the soil it immediately, or speedily, becomes insoluble. The authority of the eminent chemists Stillwell and Gladding, Thenard and Delaine, is given to support this point. If this is the case it would seem that the only reason for using the acid is that it may produce a finer sub-division of the particles than can be obtained by machinery, and when mills are secured that will effect extreme pulverization the use of the acid may be proved to be unnecessary. In the United States about \$5,000,000 worth of sulphuric acid is used every year in the manufacture of fertilizers. It is generally admitted that the acid of itself possesses no productive power, while many assert that it is positively injurious; but it is its indirect action in preparing the plant for assimilation that is supposed to warrant its use. It gives such an offensive odor that fertilizers compounded with it cannot be kept in general stores, and thus the distribution of fertilizers is hindered. If it is shown that the crude phosphate alone, or combined with other effective plant foods, is serviceable as a fertilizer, this expense and many difficulties will be overcome. The cost of mineral manures will be reduced one half, and an immense impetus will be given to the mining of phosphate and its extensive use by the farmers upon the worn-out fields that are everywhere craving its renewing and stimulating effects. For several years past Mr. Andrew H. Ward, of Boston, has ardently and persistently advocated the use of crude phosphate without acid treatment, and he possesses a mass of testimony in support of his theories that appears to thoroughly confirm them. From this formulæ the Economic Fertilizer Co., of which Messrs. Butler, Breed & Co., of Boston, are agents, prepare fertilizers without sulphuric acid, and are *slowly* but *surely* bringing them into use. Mr. Ward frequently addresses the farmers upon this theme and also writes extensively for the newspapers. From recent articles contributed by him to the *Boston Globe*, we quote some testimony from the highest authorities as to the value of crude phosphates as a manure. Professor Storer, of the Agricultural Department of Harvard College, in his recent valuable work entitled "Agriculture," says, "It has repeatedly been proved by experiment that plant roots, that are abundantly supplied with nitrogenous and potassic food, can readily obtain phosphoric acid from powdered phosphatic guano, and even from powdered rock phosphate, and several observers have noticed that many of the natural phosphates are attached to an appreciable extent in the compost heap. One great trouble in regard to superphosphates is that most of them cannot be kept for any great length of time without suffering deterioration. The soluble phosphoric acid contained in them is liable to go 'back,' as the term is, or to 'revert,' as is sometimes said, to an insoluble state. English chemists think so little of reverted phosphoric acid that they put no value upon it. The pound

of useful phosphoric acid can generally be bought for the least money in the form of finely powdered phosphate rock, such as is sold under the name of 'floats.' In many situations farmers would probably find an advantage in using this material, either directly upon soils surcharged with humus, or perhaps in composts, as well as by treating it with sulphuric acid. With regard to the manner in which the phosphoric acid which has become fixed in the earth is made soluble again for the use of plants, it is sufficient to say that among the various means by which this result may be accomplished the action of carbonic acid water, and of the acid juices exuded by plant roots are conspicuous." There are, withal, special situations, soils and crops where an instructed farmer might find it profitable to use a cheap insoluble phosphate rather than the costly soluble product prepared from it.

Sir J. B. Lawes, the highest agricultural authority in Great Britain, says, "Although phosphates under every possible form have been under experiment here for forty years, I have nothing conclusive to bring forward in regard to the great superiority of soluble over insoluble phosphates."

Director George H. Cook, in the sixth annual report of the New Jersey Experimental Station, for 1885, says: "The more difficult the solubility of these phosphates the less their price; while on the other hand it is claimed that under certain, and not unusual conditions, the lower priced ones will give the largest returns in increased crops. A more useful work could hardly be undertaken by the Experiment Station than a series of field experiments for the purpose of testing these claims."

"In the trials begun in 1885 at this station, in the case of five experiments out of the eight on different forms, the phosphate being used with potash and nitrogen compounds, the increase of crop was greater with the more insoluble phosphate than with the more expensive superphosphate, and that in three of these five cases the 'floats,' the cheapest of all, did the best work—goes a little way, at least, toward showing that the superphosphate may have had its day." Mr. W. H. Bowker, in his lecture on "Homœopathy and Agriculture," says: "There may be places where insoluble phosphates can be advantageously applied, as upon lands covered with fruit trees or devoted to grass. Perennial plants, like grasses and trees, no doubt extract phosphoric acid more readily than annual plants, owing to their numerous and well-developed roots. Winter grains, especially wheat, from the long time it occupies the ground, and its growth in the fall, may also be benefitted by an insoluble or partially insoluble phosphate." Calling attention to these statements, Mr. Ward says that in 1884 more than four-fifths of the cultivated land in New England was comprised in the hay crop, while the pasturage adds a vast acreage. If it be admitted that the crude phosphates are serviceable even to grass alone, an incalculable field is opened for their use.

There is no subject of greater importance to Canada than this one, and it is to be hoped that our Agricultural Bureau will give earnest attention to experiments that may tend to supply our farmers with a cheap and effective fertilizer, easily obtained, pleasant to handle, and inviting confidence by its simplicity. This would render more "protection" to agriculture than can be obtained from any amount of fiscal legislation, and would utilize extensively the valuable phosphate deposits which Canada has the good fortune to possess.

Dominion of Canada

FREE FARMS FOR MILLIONS

200,000,000 Acres

Wheat and Grazing Lands, for Settlement, in

MANITOBA AND CANADIAN NORTH-WEST.

Deep soil, well watered, wooded and richest in the world—easily reached by railways. Wheat—average 30 bushels to the acre, with fair farming.

The Great Fertile Belt

Red River Valley, Saskatchewan Valley, Peace River Valley, and the Great Fertile Plains, Vast Areas, suitable for Grains and the Grasses, largest (yet unoccupied) in the world.

VAST MINERAL RICHES—GOLD, SILVER, IRON, COPPER, SALT, PETROLEUM, ETC., ETC.

IMMENSE COAL FIELDS—ILLIMITABLE SUPPLY OF CHEAP FUEL.

Railway from Ocean to Ocean!

ROUTE—Including the great Canadian Pacific Railway, the Grand Trunk Railway, and the Intercolonial Railway, making continuous steel-rail connection from the Atlantic to the Pacific Ocean through the great Fertile Belt of North America and the magnificently beautiful scenery of the North of Lake Superior and the Rocky Mountains.

New Route from England to Asia, wholly through British territory, and Shortest Line through America to China, Japan, Australia and the East. Always sure and always open.

Climate the Healthiest in the World.

The Canadian Government gives Free Farms of 160 acres to every male adult of 18 years, and to every female, who is head of a family, on condition of living on it, offering independence for life to every one with very little means, but having sufficient energy to settle.

Further and full information, in pamphlets and maps, given free on application by letter, post free, addressed to *Department of Agriculture, Ottawa, Canada*, or to *High Commissioner for Canada, 9 Victoria Chambers, London, S. W., England*, and all Emigration Agents.

Ottawa, September 19th, 1888.

FOR SALE.

List of Choice (selected) Class 1 Farm Lands in the Birtle District, Manitoba.

			6,400

The above lands are well watered, and were specially selected by an experienced Manitoban for the present owner.

The Canadian Pacific Railway runs within near distance; the Great North-West Central Railway runs directly through the centre of Township 14, Range 23, and within easy distance of the other lots, and, in addition, the Manitoba and North Western Railway runs through Township 17, Range 23, so that farmers in this vicinity have their choice of outlet.

These lands will be sold in quarter sections or *en bloc* to suit purchasers. A magnificent chance for any gentleman desiring to go into profitable farming. The surplus yield of wheat for export this year (1888) is estimated at twenty million bushels, besides a large yield of barley, oats, &c. All Government lands in this vicinity have been sold. The district in which these lands are situated is immediately in the centre of the great wheat growing belt.

EASY TERMS OF PAYMENT.

NO CASH DOWN REQUIRED.

RECENT OPINIONS OF THE PRESS.

The following extract is from the *Toronto Empire* of recent date:

Some idea of the immensity of the harvest in Manitoba may be gathered from the large demand for men existing there at the present time. A Westbourne, Man., despatch of August 27th says: "Men are very scarce. We hear that \$2.50 a day, with board, is offered."

From Meadow Lee the report is: "Good farm-labourers seem to be very difficult to get."

Mr. Metcalf, at the Intelligence office of the Dominion Government at Winnipeg, says he could place 700 labourers during harvesting operations if he only had them. The demand is very great, good men very scarce.

The *Winnipeg Sun* of August 25th says: "A number of farmers from the surrounding country are in the city daily looking for farm hands to assist in reaping the present crop. Good, experienced hands are scarce, and consequently high wages are being paid."

A. C. Fraser, Mayor of Brandon, writes of that district: "Wheat will yield 25 to 35, oats 50 and upwards, and barley 40 to 50 bushels per acre. The present prospects for settlers in Manitoba are first-class. Our country has some drawbacks, but, as far as my experience goes, is one of the best on the American continent. There are particularly good openings in this district for cheese and butter factories."

A. G. McDougall, secretary County Dennis Agricultural Society, Virden, says: "Wheat will yield about 36 bushels, oats 45 bushels, and barley 40 bushels per acre. Settlers round here, with a crop this year like last, should be in a very prosperous condition."

Mr. Thomas Nicholl, Reeve of Oakland, Manitoba, writes of the district in which he lives: "The yield of wheat will be 25 bushels, of oats 45, and of barley 40 bushels per acre." Speaking of the present prospects for settlers in that part of the country he says: "There are some homesteads open yet, but they are inferior. There is plenty of land for sale at from \$5 to \$7 per acre, and every man who is careful succeeds at farming here. I had the experience in Ontario of going upon a new farm, and must state, for the benefit of those who have to make a new start in life, that to buy land east at a high price, or go upon timbered land to make a home, is a great mistake while prairie lands are to be had. In choosing a location in this country buy in S.E. Manitoba if you can, and there is plenty yet. Ontario people all succeed here. Very few are dissatisfied."

Mr. D. Peters, Reeve of Douglas, Man., writes: "Wheat will yield 25 bushels, oats 50 to 70, and barley 45 bushels per acre. The present prospects for settlers are the best ever known. Everything is prospering well."

Mr. John Lowe, Deputy Minister of Agriculture, returned from a trip to Manitoba to-day. Like all recent visitors to that wonderful country, he was simply charmed by the crop prospects. Everybody, he says, has the best farm, and it is expected that there will be fully 20,000,000 bushels for export. As a sample of crop growth, he says that at the Lowe farm, near Morris, a cow broke into a field of oats, and while standing among them nothing could be seen but the tip of the animal's horns. Mr. Lowe was in Manitoba when the cold dip took place, and bears out the reports of *The Empire* correspondent that the quantity of wheat injured by the frost will be infinitesimally small.

Every Canadian farmer has heard and read much about the vast resources and capabilities of the great North-West, but a personal inspection of the country is much more valuable than second-hand information, be it ever so reliable. Before forsaking the old, but probably overcrowded, homestead in Ontario, the farmer wants to satisfy himself that a removal farther west would be a change for the better. It is for the benefit of these people principally that the Canadian Pacific Railway Company are running excursions, and the farmers have not failed to appreciate the advantages they afford. The crowd was so great last night that several additional cars had at the last moment to be hitched on so as to make provision for everyone. Major Peel, the travelling passenger agent of the C.P.R., saw the excursionists safely aboard, and then Mr. W. T. Bocknell took charge of the party. He will accompany them to their destination, which is Langenburg, on the Manitoba and North-Western, and 200 miles west of Winnipeg.

Ottawa *Free Press*, 10th August, 1888:

Mr. A. Mutchmor, of the firm of Mutchmor, Gordon & Co., has just returned from a ten weeks' sojourn in Manitoba. He reports the crops in the prairie province the best he ever saw in any country in the world. With the exception of one or two localities the frost has not injured the grain to any extent, and as harvesting commenced generally in the province on the 20th inst., the danger is now past, except to very late grain, the proportion of which is very small, as the farmers are all alive to the importance of very early sowing and planting to avoid early frosts. Farm lands are in great demand and a number of sales made, especially in Southern Manitoba on account of the rich fertile soil and proximity to the best markets. Through competition in freight rates to Duluth or Port Arthur, five cents per bushel extra at these terminal points, enhances the value of every acre of land in these localities in the same proportion, and this advantage will exist for years to come. With the exception of a few jealous and disappointed individuals interested in other railway schemes of their own, for which they have been expecting aid from the local Government, the contract now under consideration by the Legislature between the Government and the Northern Pacific Railway Company is generally regarded with favour as the best that can be made at present in the interest of the province as a whole, for the reason that it is the only channel through which competition in freight rates can be secured for the present crop. A reduction of eight cents per bushel is promised, but suppose it is only five cents per bushel upon the surplus of the present crop, it will more than pay the cost of the railways now under construction. This is the standpoint of Premier Greenway and Attorney-General Martin, and it will be found to be the popular one in the province, as it appeals directly to the pockets of the people, by insuring them a better price for their grain. Thousands of dollars will be invested in farm lands in the prairie province this fall, and no safer and better investment can be made, as a tremendous immigration is bound to take place from all parts of the world within the next year.

Canadian Fertilizer Industry.

The only attempts so far made to utilize Canadian phosphate at home have been at the fertilizer factories in Brockville and Smith's Falls, Ontario. The factory at Smith's Falls was established originally for the manufacture of chemicals of various kinds, but a few years ago the production of fertilizers was tried as an experiment, and as a very good article was made, with no adulterations, it got a good name and the demand has been steadily increasing. Mr. R. J. Brodie, a graduate of McGill College, has charge of the works. Mr. Brodie states that he makes the sulphuric acid from pure sulphur. He gets rid of the hydrofluoric acid gas, which is produced by the action of the sulphuric acid on the apatite, by a simple arrangement of wooden chimneys, thus solving a difficulty which has embarrassed many persons in their first efforts to use Canadian phosphate. He makes a "complete fertilizer," that is, a mixture of the three principle ingredients of plant food, namely: phosphate, potash and ammonia. The demand is growing in a very encouraging manner, for when a farmer tries it once he generally comes back for more. Mr. Brodie says he could sell many thousand tons the coming year if he could make it, but the factory is small and the facilities not very great.

There is evidently a large and extending field in this direction both for profit and usefulness. The soil of the older settled Provinces of Canada has become impoverished by many years of cropping without replenishment, and districts that once yielded great stores of grain now only afford the scantiest pasturage. If one was animated only by patriotic and philanthropic zeal he could render no greater benefit to his country than to

enter on a missionary crusade to enlighten the farmers to the value of mineral manures; or if he likes to make his benevolence profitable to himself let him supply the article with which the farmer may prove the truth of his teachings. The establishment of fertilizer factories in Canada and the education of the farmer in the use of manure is a cause that invites the best attention both of the capitalist and of the Government.

Soluble and Insoluble Phosphates.

A. H. Ward, Boston.

Another comparative experiment with phosphate made by the Pennsylvania State College Experiment Station confirms experiments made by the New Jersey Experiment Station and many others, and shows that the less soluble and cheaper forms of phosphoric acid are likely to prove equal or superior to the more costly soluble acid phosphates.

The results of these various experiments should be well known by the various experiment stations, and, if they are known, what justifies them in making so great a difference in value as 400 per cent. between soluble and insoluble phosphates? It all comes out of the farmers.

A bulletin of the Pennsylvania State College Experiment Station gives the results of experiments made with phosphates in a four-crop rotation in the years 1883-7, the first year's crop being grown without manure, to determine the relative fertility of the several plots. The plots were twelve in number, each of them one-twentieth of an acre in extent, and the soil is what is usually called limestone clay. Oats were grown in 1883, and the product showed considerable variation in the fertility of the several plots. Taking 100 as the average of all, they ranged from 91.62 to 114.52, eight being under the average and four over it. The rotation was in the order of wheat, grass, corn and oats, and the fertilizers were applied to wheat and corn only—the grass and oats getting the residual effects. Two plots were unmanured throughout the experiment, and from the results of these the values of the fertilizers were computed. The experiments were made to study the effects of different forms of phosphoric acid, and to guard against failure from a lack of any of the elements of plant food, each of the plots, except the two unmanured ones, as treated to 200 pounds of muriate of potash and 240 pounds of sulphate of ammonia per acre. They were thus supplied with nitrogen, potash, sulphuric acid and chlorine, while the limestone soil contained a vast excess of lime, magnesia and iron above what the crops could possibly use. Two of the plots received no other manuring, and the remaining eight were treated in pairs as follows:

1. 200 pounds dissolved boneblack, the phosphoric acid largely soluble.
2. 200 pounds dissolved blackbone, previously treated with lime; phosphoric acid largely reverted.
3. 150 pounds fine ground bone.
4. 150 pounds ground South Carolina phosphate; phosphoric acid largely insoluble.

These fertilizers were all standard articles of trade. Now for the results. Of the 56 single cases recorded, 36 show unmistakable gain resulting from the use of phosphoric acid, six show a probable gain, eight a doubtful gain, and the remaining six an apparent loss. But the results give no satisfactory proof that one form of phosphoric acid is superior to another. It would appear, however, that a limestone soil is not the

most suitable for a phosphate fertilizer, owing to the circumstance that it precipitates the superphosphate so quickly as to prevent due distribution to the roots of plants. A comparison of the results obtained in the experiment with the results of other experiments appears to justify the conclusion that "upon lime soils, upon very light sandy soils, and upon pure peat soils, the less soluble and cheaper forms of phosphoric acid are likely to prove equal or superior to the more costly soluble acid of the superphosphates. But the director of the Pennsylvania station wisely enjoins caution in departure from established practices. A few simple and inexpensive trials of reverted or insoluble phosphates on a small scale would readily show one contemplating their use whether they were likely to prove profitable under these circumstances or not. No general rule can apply to every soil.

Directions for Composting Muck or Peat.—Take $1\frac{1}{4}$ cords peat, which, as dug out, will weigh about 11,225 pounds, and, well dried, will lose three-quarters in bulk, and weigh about 2,500 pounds. Add to this quantity 100 pounds of soda ash and 1,200 pounds of fine ground raw phosphate. After all these ingredients are mixed together, it is left in a heap to heat and ferment, which generates carbonic acid and ammonia, both of which act on the raw phosphate, rendering it soluble. The compost, after lying about six weeks, will have fermented, and should be shovelled over, when it is fit for use, and by exposure and evaporation the weight will be reduced to about 4,000 pounds, or two tons. The following shows cost and constituents of two tons peat compost: Peat, $1\frac{1}{4}$ cords, as dug out, \$2.00; raw phosphate, fine ground, 1,000 lbs., \$4.00; soda ash, 80 per cent., 100 lbs., \$3.00; labour, \$2.00; total cost for two tons, \$11.00

Ground Phosphate.—A conviction of the utility of the application of crude phosphate to the soil is steadily gaining way. Experiments with Canadian phosphate at Newport during the past season have shown a marked effect upon grape vines in hot-houses, and its effect upon garden plants has been established beyond dispute. Many small manufacturers are glad to get the ore in the pulverized state for treatment with acid, and there seems to be much encouragement for the erection of grinding mills. In the future it is probable that the high grade ore will be selected for shipment abroad in the crude state, and all the low grade ore will be ground and raised in quality by freeing it from mica and other impurities. The market for this will be found in the United States and Canada. More active exertions ought to be made by the Department of Agriculture to impress upon farmers the desirability of using phosphoric manures. It is thought that Kingston affords a favourable site for the erection of phosphate grinding mills. Coal can be had cheaply there, and the phosphate can be brought to it at low rates by the Rideau Canal, and exported as ballast in the lake schooners. It is likely that this enterprise will be undertaken before long, and will have a marked effect in stimulating the phosphate industry.

The Fertilizer Trade in South Carolina.—The activity of the fertilizing industry has not been confined to Charleston, nor to the State, for there are many manufactories in

other Southern States that use the South Carolina phosphates for the manufacture of fertilizers. The business of these concerns is prosperous. This business is a boon to railroads and steamship lines. The shipments for the past three months, from Charleston alone, required over 1,500,000 sacks to hold the material. Over 2,062,500 pounds of burlaps were used in making the sacks, and over 11,250 cars were required to transport them, filled with fertilizers, over the railroads. The Charleston companies will consume, in making the year's supply of fertilizers, over 70,000 tons of phosphate rock, and nearly half as much sulphur, besides kainit, marl, potash, blood, fishscraps, bone black, azotin, nitrogen, tankage, cotton seed meal, and other materials.

In those parts of Europe where the sugar beet is largely grown—Belgium and Denmark, for instance—no fertilizer has been found equal to phosphate, and the same remark might well be applied to the grain producing farms of our older provinces. The rigid inspection to which the crude materials is subject in England tends greatly to keep up the standard of our shipments, and the high percentage of Canadian phosphate will always secure for it a foremost place and an eager demand. Prof. Dawkins, comparing the phosphate obtained from various countries, states the percentage that Canada yields, out of a mean of analysis, is 87.52 of tribassic phosphate of lime.

Phosphate of lime (apatite) was first discovered in Burgess, Ontario, in 1847. In 1860 the first shipment of the mineral was made, amounting to about 100 tons.

The earliest discovery of apatite in the County of Ottawa was made in 1829 by Lieut. Ingall, of the 15th Regiment, while engaged in certain geological explorations. Mining operations were not engaged in until 1873.

The entire phosphate beds of South Carolina, so far as discovered and defined, have been estimated to cover an area of 240,000 acres. It was not known that the rock possessed any commercial value until the year 1865.

Department of Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,

15th Dec., 1887.

NEXT DOOR TO W. BORTHWICK.

L. T. having taken over a large surplus stock of FINE TEAS, is prepared to sell for the next Fortnight at 20 per cent. off ordinary price.

MONEY ORDERS.

MONEY ORDERS may be obtained at any Money Order Office in Canada, payable in the Dominion; also in the United States, the United Kingdom, France, Germany, Italy, Belgium, Switzerland, Sweden, Norway, Denmark, the Netherlands, India, the Australian Colonies, and other countries and British Colonies generally.

On Money Orders payable within Canada the commission is as follows:

If not exceeding \$4	2c.
Over \$4, not exceeding \$10	5c.
" 10, " " 20	10c.
" 20, " " 40	20c.
" 40, " " 60	30c.
" 60, " " 80	40c.
" 80, " " 100	50c.

On Money Orders payable abroad the commission is:

If not exceeding \$10	10c.
Over \$10, not exceeding \$20	20c.
" 20, " " 30	30c.
" 30, " " 40	40c.
" 40, " " 50	50c.

For further information see OFFICIAL POSTAL GUIDE.

Post Office Department, Ottawa.
15th Sept., 1888.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Post Office, Goderich, Ont.," will be received at this office until Monday, 15th October, 1888, for the several works required in the erection of Post Office, &c., at Goderich, Ont.

Specifications and drawings can be seen at the Department of Public Works, Ottawa, and at the office of the Town Clerk at Goderich, Ont., on and after Wednesday, 5th Sept., and tenders will not be considered unless made on the form supplied and signed with actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same, but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees, in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

Ontario Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square, containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

BOOKSELLERS,
Stationers, Bookbinders and Printers,
OTTAWA.

Cost of Quarrying.—From a paper upon the cost of excavating and handling rock, read recently before the Western Pennsylvania Mining Institute, we excerpt the following:—"The average weight of a cubic yard of sandstone or conglomerate in place is given as 1.8 tons, and of compact granite, gneiss, limestone, or marble two tons, or an average of 1.9 tons, or 4,256 pounds. A cubic yard when broken up ready for removal increases about four-fifths in bulk, and one-fourteenth of a cubic yard, or 177 pounds is a wheelbarrow load. Experience shows that with wages at \$1 per day of ten hours, 45 cents per cubic yard is sufficient allowance for loosening hard rock. Soft shales and allied rocks may be loosened by pick and plow at a cost of 20 cents to 30 cents per cubic yard. The quarrying of ordinary hard rock requires from ¼ pound to ½ pound, and sometimes ½ pound, of powder per cubic yard. Drilling with a churn driller costs from 12 to 18 cents per foot of hole bored. Upon these data Mr. Rigly estimates the total cost per cubic yard of rock in place, for loosening and removing by wheelbarrow (labor assumed at \$1 per day of 10 hours), as follows: When distance removed is 25 feet total cost equals \$0.537, when 50 feet \$0.549, when 100 feet \$0.573, when 200 feet \$0.622, when 500 feet \$0.768, when 1,000 feet \$1.011, and when 1,800 feet \$1.401. This is exclusive of contractor's profit.

When labor is \$1.25 per day, add 25 per cent. to the cost prices given; when \$1.50 per day, add 50 per cent., and so on. In handling by cart, the cost of loading, which will be about 8 cents per cubic yard of rock in place, and the additional expense of maintaining the road, must be added. Allowing, then, 851 pounds as a cart load, the total cost per cubic yard is estimated, when removed 25 feet, at \$0.596, when 50 feet at \$0.599, when 100 feet \$0.603, when 200 feet \$0.617, when 500 feet \$0.655, when 1,000 feet \$0.717, and when 1,800 feet \$0.940.

A New Calculating Machine.—One of the most ingenious of recent American inventions is a calculating machine called "The Computometer." It is the work of a resident of Chicago and with its aid the most complicated mathematical computations can be made with great accuracy, ease and swiftness. The instrument is 14½ in. long, 7½ in. wide, 5 in. high, and weighs 8 lbs. It can be placed upon an ordinary table. It differs from all other machines of this character, as it can be worked with type writer keyboard. This machine performs large multiplications in a second of time. It was recently tried by the official experts at the Treasury at Washington. Various examples not previously known to the inventor were given to him for the testing of his apparatus, as well as to experts detailed from the treasury. The machine always surpassed the experts in speed and was invariably correct. The inventor was given an example like the following:—Suppose you bring £234 from England to New York, where the rate of exchange is 484½ dols., what is the American value of your money? In one second of time this marvellous calculating machine recorded the correct answer of 1,134-60¾ dols.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlaid by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Apply to

ALEXANDER CAMPBELL,
Annapolis Royal, N.S.

12th, 1888.

Terrible Experience of Miners Shut up in a Coal Mine.—Last month two men employed at the Draper Colliery, Gilberton, Pa., had a very trying experience by being 'closed in' by a fall for a period of about twelve hours, most of which time they were in doubt as to whether they would be rescued. The men were engaged in robbing a pillar and were at the face of the workings when a fall behind them closed the breast and cut them from the gangway. This occurred about 9 o'clock in the morning, but the fact that the men were closed in was not discovered until 4 in the afternoon. Mine Inspector Stein happened to arrive at the colliery about the time the discovery was made and at the risk of his life went into the workings adjacent to where the men were entombed and discovered that they were living and well, but without light. He remained and directed the work of rescuing the men from their perilous position, which was accomplished about three hours later at the risk of the lives of the force of about 30 men who took part in the work. During their imprisonment the men cut a heading four feet long into a pillar, into which they went for safety. Most of the work was performed in the dark as their light became extinguished for want of oil soon after the fall occurred. The men say they had a terrible experience.

The Great Explosives.—The composition of some of the modern high explosives is as follows:—Dynamite—75 parts of nitro-glycerine and 25 of infusorial earth. Dualine—80 parts nitro-glycerine and 20 of nitro-cellulose or gun cotton. Rendrock—40 parts of nitro-glycerine, 40 nitrate of potash or soda, 13 of cellulose and 7 of paraffine. Giant powder—36 parts of nitro-glycerine, 48 of nitrate of potash or soda, 8 of sulphur and 8 of resin or charcoal. Mica powder—52 parts of nitro-glycerine and 48 of pulverized mica. Tonite—52½ parts of gun cotton and 47½ of nitrate of baryta. Blasting gelatine—82 parts of nitro-glycerine and 8 of gun cotton. Atlas powder—75 parts of nitro-glycerine, 21 of wood fiber, 5 of carbonate of magnesia and 2 of nitrate of soda. Rackarock—77.7 parts of chlorate of potash and 22.3 of nitro-benzol.

The Transvaal Gold Output.—For the Witwatersrand district as reported by the local newspaper, to include July, has been as follows:

	Ounces.	Value.
January	11,289	\$197,557 50
February	12,169	212,957 50
March	14,706	257,355 00
April	15,853	267,427 50
May	19,022	332,535 00
June	16,318	269,297 00
July	19,963	349,352 50

Total of district \$1,886,432 00
Monthly average 269,490 28

For the same period the product of the De Kaap field was 109,242 ounces worth, say, \$1,738,114.

Mineral Production of France.—Provisional returns of the mineral production of France in the first six months of the year give the output of coal, including anthracite and lignite, at 11,077,721 tons, an increase of 798,734 tons as compared with the same period of 1887. The production of pig iron was 821,824 tons in 1888, and 764,643 tons last year; of wrought iron, 428,076 tons, and 378,897 tons in the two years respectively; and of steel, 239,624 tons and 240,313 tons.

The Canadian Mining Review

CONDUCTED BY B. T. A. BELL

OFFICES:

UNION CHAMBERS, 14 Metcalfe St.
OTTAWA.

Vol. VI. OCTOBER, 1888. No. 10.

Mineral Wealth of the Great Mackenzie Basin.

The report of the select committee of the Senate appointed to enquire into the resources of the Great Mackenzie Basin has appeared in the form of a blue book, containing a large amount of very valuable information regarding a comparatively unknown district of Canada. That part of the report which principally concerns the readers of the CANADIAN MINING REVIEW, however, is the space devoted to minerals and mines. The evidence on this point given before the committee shows that very little is known of the mining capabilities or of the minerals of the district east of the Mackenzie River and north of the Great Slave Lake. But from the evidence elicited respecting the country west of the Mackenzie, and of the rivers there joining it, the Peace and the Liard, the fact appears that there are between 150,000 and 200,000 square miles of territory which may be considered auriferous. In addition to this, west of the Rocky Mountains gold bearing rocks are met with over an area some 1300 miles long with an average breadth of from four to five hundred miles. Gold, the report says, has also been found on the west shore of Hudson Bay. On the upper waters of the Liard and Peace rivers silver exists, and on the Coppermine River, the very name of which is significant, copper is found. Through the same section of country iron, graphite, mica, gypsum and asphaltum are found, while the petroleum area is so extensive as to justify the belief that the main supply of this article for the whole northern part of America will be produced there, and that shipments of it to Great Britain and Europe will eventually contribute a large part of the ocean traffic which sooner or later must come in and go out via Hudson Bay and Straits.

Salt is found quite extensively in some parts in a pure state, and in others in crystals equal in purity to the best salt rock and in highly saline springs. A curious feature in this connection is the fact that petroleum and salt deposits occur mainly near the line of division between deep water navigation and that fitted for lighter draft vessels, thus giving them possibly a greater commercial value. The report, in speaking of the coal and lignite deposits of the district, says that when the time comes for reducing the iron ores of the Mackenzie Basin, and the transportation of its products by steam sea-going or river vessels, this fuel will be found to be of great value.

Although some years may elapse before the district referred to becomes part of the inhabit-

ed area of Canada, it is some satisfaction to know that there is evidence of abundant mineral wealth there, and that a source of fuel, especially valuable to northern climates, is available for years to come. Judging from analogy, the Mackenzie River Basin will be to Canada what Siberia is to Russia; and as the climate of Siberia has been erroneously recorded as the extreme of cold, although really much like Canada as a whole, so our great north-western river basin will be found correspondingly suitable for settlement, and its mineral wealth will probably be the inducement that will first draw a resident white population.

Minerals and Revenue. — Sales and Lease Systems.

According to the report of the mining statistics branch of the Geological Survey of Canada, the total mineral production of the Dominion may be estimated at \$15,000,000 for 1887. If all this mineral wealth was made a revenue producing power, as is done in the Provinces of Nova Scotia and British Columbia, at say a rate of Lease or Royalty of five per cent, the total income would be \$750,000, which for purposes of illustration of the benefit that can be derived from this source might be portioned out as follows:

Nova Scotia,	\$100,000
New Brunswick... ..	100,000
Quebec,	100,000
Ontario,	100,000
Manitoba.. .. .	100,000
North West Territories ..	100,000
British Columbia	100,000
Geological Survey	50,000
	<hr/>
	\$750,000

In practice, however, under the Lease or Royalty System:— Nova Scotia receives yearly \$126,000, and British Columbia receives yearly \$60,000 to \$70,000, amounts that are yearly on the increase, while under the policy of the sale of minerals, as practiced by the other governments, who at present do not seem to regard our mineral wealth as a revenue producing power, this increase does not take place, as the capital or revenue producing power passes from government control and the compulsory condition of development or working is optional with the purchaser. It is true that some revenue is received from the Sales system but it is not equal, nor can it be compared to the ever increasing revenue that would accrue from Lease or Royalty, with a compulsory condition of yearly and continuous development. Hence it is that holding mineral lands on speculation is the rule under the sale system, and working towards national development, is the system under Lease or Royalty, and as the latter is the British Crown Lands Policy, it ought to be worthy of example for all colonies claiming a loyal allegiance to British laws and customs. The

system of reservation for a time, and then letting the minerals pass from Government or State control, is the United States system, and works well enough so long as development goes on, but that being optional with the owner, after the government has parted with it, work is not in all cases carried on, and interests are bought up to control a section of country, or class of mineral and this unconstitutional tenure prevents others from acquiring the right to work old claims. This is now a cause of complaint in many parts of the Western States, but under the Lease or Royalty system work has to be done to hold the claim, and however small that may be, new discoveries are bound to be made. Under this system too, inspection is more easily enforced for the permanent and continuous working of mines and the securing of safety to the lives of miners, while litigation and costly law suits are the exception not the rule as in the present system of unconditional and irresponsible ownership. Under the Sales system a certain area is conveyed unconditionally, embracing other minerals than that for which it is purchased, and for which the owner has no use, or does not know the use, and these consequently remain unworked; but under the Lease system only the class or vein he discovers or acquires is leased, and any other minerals or veins can be worked or leased to others, and so it is that the largest possible amount of industry to the country is secured on this plan. In all countries where government control and inspection, with compulsory development on the Lease or Royalty system is in force there does mining flourish. As an example we might mention the State of Mexico, where minerals are made the chief source of revenue, under geological conditions similar to the Canadian Northwest, but not so favorable nor as good as regards climate and other conditions. If a policy of compulsory development was enforced, and it ought to be enforced, there can be no doubt of the future wealth and prosperity to be derived from our rich inheritance of mineral wealth in the Provinces of Ontario, Quebec, New Brunswick and the great Northwest Territories. We commend to the attention of our readers the able paper by Mr. Arthur Strauss, on "Foreign Mining Laws," reproduced in this issue of the REVIEW from the Transaction of the Mining Institute of Cornwall.

The Excelsior Copper Mining Co.

Cable advices from London announce the formation in that city of the Excelsior Mining Co. (Limited), with a capital of £450,000 sterling, shares of £1 each, to acquire and work the Harvey Hill Copper mines situated about seven miles from Broughton station on the Quebec Central Railway. The directors of the new corporation are: Lord Elphinston, London; Sir James Marshall, London; Col. Mattison, London; P. A. Appleyard, Vice-President Halifax Joint Stock Bank; with the Hon. H. Mercier,

Premier of the Province of Quebec; Hon. W. W. Lynch, Q.C., D.C.L., ex-Minister of Crown Lands, Province of Quebec, and J. W. Green-shields, Advocate and Crown Prosecutor, Mon-treal, Canadian directors. Mr. J. N. Green-shields, the vendor, receives £10,000. Applica-tions are invited for £150,000 shares. These mines were at one time extensively worked by the English and Canadian Mining Company and are situated on Lot 17, Range 15 of Leeds, County of Megantic, and are on an elevation of about 400 feet above the Bronghton station of the Que. Central R.R. The road on which the principal buildings and the shops are built is on the brow of the hill at about 100 feet below the summit. The property comprises 2,800 acres in fee simple and 1301 acres of mining rights. Part of the lands are said to be good for farming and part are thickly wooded with birch, maple and spruce, of great value for building and for fuel. The copper ores at this locality occur both in courses of veins and in beds. The strata are here for the most part, finely micaceous slates, which from their unctuousity are often called talcose, but are generally not magnesian. The courses as described by Sir William Logan are really irregular and interrupted veins, which do not coincide with the strata either in dip or strike. The bearings of eight of them are from north, to N. 20° E., while others run nearly eastward. Their underlie is generally to the westward, at from fifty to nearly ninety degrees. These veins which appear to have filled up fissures in the slates, are more or less lenticular in shape. Some of them have been traced for as much as 100 fathoms on the surface and are occasionally six or seven feet wide in the thickest part, thin-ning out however, both horizontally and verti-cally. Assays have been made from various quantities of the ore as follows:

Messrs VIVIAN & SONS, Swansea (May 7, 1888)	
Metallic Copper.....	61 per cent.
Silver.....	5 oz. to the ton.
ALSO	
Metallic Copper.....	56 per cent.
Silver.....	5 oz. to the ton.

No. 3. Produce of Gold.....	Silver... 2 oz. 10 dwts.
Per ton of 20 cwts. of ore.	

The property has been prospected on a large scale in by-gone years, as may be seen by the numerous surface openings, shafts, drifts and an adit. There are twelve shafts, four of which

have been recently worked along with the cross-cut or adit. For a description of these workings and their plant and machinery we cannot do better than quote the words of Mr. J. Obalski, Government Mining Engineer, of the Province of Quebec, who closely examined the property for the new company.

The American Shaft has a depth of 240 feet, is strongly timbered and covered over by a frame building 30 feet 6 inches by 25 feet 6 inches, with boiler house adjoining thereto, and is surrounded by a twelve feet high fence of one hundred feet by eighty feet area. The machinery there consists of a steam hoist and its boiler, and a Cameron Steam Pump. I descended and inspected the shaft. I found several quartz veins intersecting it about 100 feet from the surface. No drifting having been done thereon I could not judge of their importance. At the 240 feet level I found a drift 10 feet by 7 feet by 6 feet on the N. E. side. Therein was seen the beginning of a vein carrying copper ore, commonly known as "Grey Silver" ore. The vein at this point was about 2 inches, and now at a depth of twelve feet shews a width of eighteen inches, and carries the same rich copper ore throughout. This vein which dips westerly gives great promise of immediate good returns.

The Cross-cut or Adit.—I visited and inspected this for a distance of 900 feet from the entrance to the No. 2 Shaft, which is intersected by it. I found several quartz veins that would warrant being thoroughly prospected. At 247 feet from No. 1 Shaft I found two drifts, one running south-west the other north-east from the Adit. The north-east drift seems to have been cut a distance of sixty feet for the purpose of following a quartz vein. At the end of this drift a shaft has been sunk below the level of the Adit to a depth stated to be about 50 feet, and from information gathered from men who had worked therein it seems that ore was struck at its bottom. In the south-west drift which has been run on the same vein as in the other drift, drifting has been carried on for about sixty feet and it has been stoped out about 18 feet in height. The portion of this vein now in view shews rich "Copper glance" and "Erubescite." Much may be expected by sinking on this vein.

No. 2 Shaft:—Stratified Bed, known as Bed Rock Ore:—I descended to the 90 feet level of this shaft and there found that the stratified bed had been stoped out on both sides of the shaft. On the N. E. side the stoping has been done for a distance of about 25 feet by 20 feet upwards on the bed for a height of six feet. The bed proper at that point averages about four feet and widens on the incline westwards. On the S. W. side the stoping has been done for a distance of sixty feet and about fifteen feet upwards on the bed to a height of twelve feet. The bed here shows rich copper ore for a height of about eight feet at the base of the stoping. On examining the side of the slope it shows plainly that the quality and quantity of the ore in the bed improves on its downward course. The bed seems to be the same as is met on the surface east of this No. 2 shaft. At about 500 feet westward of No. 2 shaft it seems that the bed has again been met in the Douglas Shaft at a depth of 86 feet, and likewise at the Kent Shaft which is 1020 feet westward, in the 120 feet level thereof. These two shafts being full of water I could not examine them, (see Sir Wm. E. Logan's report relative to the Kent Shaft). Ore found on the dump of the Douglas Shaft is of the purple variety. I also found in the 90 feet level of No. 2 shaft above the stratified bed and evidently running parallel thereto for a distance of about fifty feet, a quartz vein averaging one foot in thickness and carrying rich purple copper ore.

The McGee or Hill Shaft, and Poulin Shaft.—These shafts are situated about 400 feet west of the Kent Shaft—were formerly separate, but were recently connected by an 120 feet incline on the vein. The McGee is 23 feet and the Poulin is 32 feet in depth, the latter having been sunk lower down on the Hill is 29 feet lower than the McGee. The vein now to be seen at the bottom of the McGee shaft was traced and mined into prior to the sinking of the said shaft, for a distance of about forty feet, and in sinking the shaft on the incline the vein thinned out by a fault in the strata and the work was then abandoned. Last October Mr. Lionais, then proprietor, continued work on this vein and had been only a few days so engaged when the vein widened out and this incline was continued on the vein towards the Poulin, simultaneously with the sinking of the Poulin Shaft, and stoping from the Poulin towards the McGee. The Poulin Shaft at the time Mr. Lionais began to sink it was only 27 feet deep, but after deepening it some three feet the same vein which occurred in

the McGee was encountered and stoped on as above stated. The Poulin Shaft has now a depth of 32 feet, and shows besides the vein above mentioned, two other branch veins carrying rich purple ore. The vein now exposed, between the Poulin and McGee averages about four feet in thickness and is remarkably fine, showing fully one foot of solid copper ore, and the remainder of the vein matter rich in disseminated copper. The operations in these shafts warrant great expectations and foremen miners of former companies agree in predicting most favorable results.

Besides the above mentioned works which I have inspected, there are other shafts known under the names of the "Sables," the "Kent," the Douglas, the "Freemont," the "Harvey Hill" and the "Whiteburn." These shafts are full of water but the timbering has been rebuilt recently and they all seem to be in good condition. From conversations with foremen miners who were in charge of these shafts they say that copper was found and taken out of all of them, with the exception of the "Whiteburn," which was sunk with the view of ventilating the "Fanny Eliza" Mine. The "Fanny Eliza" vein is said to have been one of the richest ever worked by the old company. The rock is nearly everywhere sufficiently solid not to need timbering. Certain openings which I visited, and abandoned for over 20 years did not require any timbering. Water is not abundant in the workings on account of the altitude of the Hill and was bailed out formerly by horses with whips. The conditions of the workings is therefore very good. Good miners, both English and French Canadians, can be had in the neighborhood. Around the mines on the Company's property are to be found dwelling houses for Manager and workmen, workshops, forges, stables, scale building, one large engine and boiler house of stone and brick containing four boilers and a one hundred and fifty horse-power engine.

The "Fanny Eliza" vein now under water, which has been followed and stoped out for a distance of 1053 feet as shown on plans at the Mine is—as seen when the work was stopped by the old company—in a condition to be profitably worked.

The above remarks shew plainly that these are not accidental deposits, but are rather a wide field of fissures filled with mineral and interstratified beds. The sinkings have not exceeded a vertical depth of 672 feet below the summit of the Hill, (Extremity of the incline on the Fanny Eliza) and 250 feet on the brow of the Hill. It seems therefore probable, and I have every reason to believe that in sinking deeper, other veins and stratified beds may be encountered, and established by Assays of former and present outputs which show the ore to be remarkably rich and free from impurities. In looking over the Assay Book of the old Co., I find that the Assays of a great number of shipments of Bed Rock and vein ores give from 20% to 50% of metallic copper.

Shipments.

The following are the Shipments from Montreal for month ending October 18th, 1888:—

Date.	Name of Vessel	Destina-tion.	Shippers.	Quan-tity.

Hamburg	365
Glasgow	4-5

In General.

Messrs. Parent Bros., Montreal, will sell by auction on 15th Novem'ber, a large number of phosphate lots making a total area of 5,000 acres, in the township of Portland West, the property of "La Compagnie Francaise des Phosphates du Canada."

Du Lievre.

Sir John Johnstone and Mr. W. W. Pickford (of Pickford and Winkfield, of London, Eng.) paid a visit during the month to the Little Rapids mines and expressed themselves as well pleased with the present appearance of the mines, and the large bodies of ore exposed. At present but a small force is employed, principally uncovering new shows and improving the property. 127 tons of high grade, consigned to Pickford & Winkfield, London, were shipped last month.

Latest advices anent the operations at the mines of the Canadian Phosphate Co. are as follows: **STAR HILL**—The west sink of the big pit has been continued by hand and steam drilling through favourable looking pyroxene rock carrying small branches of apatite, and the management are expecting daily an improvement in the yield of phosphate. The last drift has been advanced to the south east, following a good course of phosphate, which holds out very fine and strong. This week's work has been chiefly hand drilling on the head drift, but a new steam drill was set working on the night of the 7th inst., being a little stiff at first and in consequence of the great distance from boiler (about 250 feet) the drill does not attain the duty which it should do, and to rectify this we have to put in a steam pipe of larger diameter. At west drift, now 20 feet, work continues in good phosphate ground and is now well under shelter for winter work. The east drift is also yielding its normal proportion of apatite. **MCANDREW'S NEW OPENING**:—Work has been commenced by derrick and gives much promise of becoming a very important pit in future.—**NEW DUGWAY**: Steady work has been carried on here by a few men and drilling and hoisting by horse derrick. This deposit improves as we uncover the face rock, and the quality and the massive character of the phosphate is the finest I have seen. We shall probably have an important pit here.—**POINTS**: The northwest drift and stopes have been advanced under difficulties, but in splendid phosphate bearing ground during this week, the phosphate making upwards as well as down. With the difficulty to procure miners and hand millers required for advancing the head drift, the steam drill has not been working advantageously. This is a very fine pit, but depreciated little at present by the infiltration of water.—**BEAVER MEADOW**: The surface stripping has commenced on east of this pit by a team and a rough scraper working 1½ days, and labourers are now continuing to remove the overburden of gravel and boulders of which there is about 1 ft. to 7 ft. depth.—**NEW CUT**: Much dead work has been done here but the new ground opened up justifies our former good opinion and stopes of it. The present small output must not be regarded as a measure of the capacity of this working, since we are purposely leaving the phosphate in the bottom for the present, in preparing the disposition of the quarry for running steam drill more advantageously as soon as we have a machine at our disposal. 4 steam hoists on pits, 2 hoisters on tramways, 5 steam mills in constant operation, etc., may be mentioned as some of the machinery now in operation at the mines. Equipped with new boilers,

etc., the towing capacity of the "River Belle" now gives every satisfaction. A new boarding house, magazine store house, root house, stables and barn, manager's house and offices (which will include a chemical laboratory) are in course of erection and a number of new tenement houses will probably be erected during the winter.

Templeton District.

The North American Phosphate Company, with head offices at Montreal, has recently been formed to acquire and work phosphate lands in the Township of Templeton. The directors are:—Ex-Ald. Dupuis, President; Albert Holden, merchant, Montreal, Vice-President; Arthur Gagnon, financial agent, Montreal, Secretary-Treasurer; R. Prefontaine, Q.C., M.P., Chas. H. Walters, S. Lachance, all of Montreal, Directors; Arthur M. Perkins, Managing Director. The capital is \$18,000. The property includes lots 17 and 18 in the 8th, S½ of 18 and 19 in the 9th, and S½ of 18 and 19 in the 10th. An acre and a half has been stripped, and phosphate is at present being taken out of a small surface pit.

The Templeton and Blanche River Company of Montreal have suspended operations on their property for the present. Mr. Trimble, the managing director, was out at the mines lately taking an inventory of the plant, machinery, etc. We understand an endeavour will be made either to increase the capital stock of the company or to place it on the market.

Mr. Jackson Rae's mines are reported to be looking well, and a satisfactory output, with a small force, is being maintained. The new pit is down 40 feet and looks well. 150 tons have been shipped.

The Canada Industrial Company have 120 tons ready for shipment.

The new works at the Blackburn mines are nearing completion. The new cut is nearly through. The management have struck a vein going through, which is yielding largely. At present from 10 to 15 tons of ore per day is being mined.

Perth District.

Messrs. Taylor & Wilcox, of Cleveland, O., are reported to have made a large purchase of phosphate lands near Perth.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

With the closing of navigation the winter prospects of the Pictou coal mines are not very encouraging, the Springhill mines having secured the lion's share of the government contract, while the Intercolonial, Acadia, and Black Diamond companies have only secured some 15,000 tons each. This quantity will keep the Black Diamond mine pretty well employed as its daily output is small compared with that of the Intercolonial and Acadia Co's. mines.

The shipments from the Drummond have been exceptionally large despite the difficulties the management has had to contend with. It is doubtful whether operations will be continued

at their No. 4 slope during winter as preparatory work must be pushed forward at the New Lift. A little work has been done in the third seam discovered some time ago.

At the Albion every effort is being made to re-open the whole of their valuable mines. The new slope, the scene of the explosion in January last, is being successfully opened up, and the building of the new Bank House is being rapidly pushed forward. One of the engines has been placed in position, and a Dominion Safety boiler is about to be added to the boilers at present in use. At the Vale Colliery the six-foot seam has not been working for some time, but the old slope or "McBean" seam, has been working fairly well, and a new lift is now being sunk there which, when complete, will make that slope 3,000 feet deep.

The seam of coal discovered at Five Islands, Colchester County, and reported in a recent issue, proved to be but a few inches thick but of most excellent quality. Prospecting has been vigorously followed up by Mr. Wilkinson, with the result that he has discovered the outcrop of a larger seam although at the time of writing he had not got it sufficiently opened up to justify him in making a report. It is to be hoped that it will turn out well as the parties interested will spare no expense in development, and will make things "hum" in that part of Colchester County.

Work still keeps brisk at the Gowrie collieries, C. B. A large number of sailing vessels are calling for cargoes and fill up the interval between the arrival of the steamboats. The slack dump is on fire and causing trouble in keeping it from spreading. The shipments of slack have fallen off this year. Though the coke ovens consume large quantities there is scarcely room for the large quantity at present banked.

The reported sale of the Amherst coal property has no foundation in fact, and its announcement in the columns of the local newspapers has caused much annoyance to the parties interested.

From the prospectus of the Colchester Coal Mining Co. (Limited), which has been formed provisionally with a view to testing and developing what is believed to be a valuable coal deposit near Onslow, about eight miles from Truro, we learn that the following are the provisional directors:—Wm. S. Muir, M.D., of Truro, M.D., President; D. J. Thomas, Esq., Gardiner Clish, Esq., Capt. Edward Archibald, of Truro, N.S., and E. A. Charters, of Sussex, N.B. The Solicitors of the company are Messrs. Longworth and Layton, of Truro, and Secretary-Treasurer, Mr. George Ross, of Truro. The company is formed with a capital of \$50,000 in 1,000 shares of \$50 each, and 200 shares of the Treasury Stock are set aside for sale as special or preference shares to raise the required amount for prospecting and development. These shares, \$50 each, are given to first subscribers at \$20 in four instalments of \$5 each, and the first payment of \$5 when the share is taken, and remaining calls if required at regular intervals thereafter at the instance of the provisional directors.

At the Springhill mines, the company are putting down two bore holes, between five and six hundred feet, at the back of North slope,—a six inch and a two inch hole,—for the pur-

pose of sinking another "lift." They intend to place an engine on the top and run a hoisting rope down the larger hole, and the smaller one for a rafter wire. This will do away with sending steam down the pit, thereby keeping the roof good and strong.

A meeting of the shareholders of the Londonderry Iron Company has been held in the office of Messrs. Gillespie, Patterson & Co., Montreal, at which the provisional directors submitted their report. The following board of directors was elected:—Sir George Stephen, Bart., Hon. Donald McInnes, Messrs. A. T. Patterson, John Turnbull, James A. Gillespie, Sir Charles Tennant, Bart., and A. McClelland, the latter two gentlemen being of Glasgow, Scotland.

The last clean up of ten days' crushing at the mill of the Malega Mining Company has resulted in a brick of 250 ounces, worth \$5,000. The result of the first clean up after 23½ days' crushing, was 450 ounces, the yield of 350 tons of ore.

Forty-five tons of quartz crushed on the Withrow property, South Rawdon, have yielded 93¾ ounces of gold.

An important discovery of bituminous coal is reported to have been made at a point eight miles north of the mouth of Diligent River, Parsboro.

350 ounces of gold valued at \$7,000 is given as the result of 16 days' crushing at the mill of Northup mine, Central Rawdon.

The returns from Sherbrooke were 56¾ oz. gold from 255 tons crushed.

The Egerton Gold Mining Co. returns for September 79 oz. of gold from 200 tons quartz crushed.

M. T. Foster, C. Perkins, and others, have bonded the property at West Caledonia, owned by Messrs. Parker and Ford, and are now prospecting it under the supervision of Mr. LeClair. Extremely rich boulders were found on this property last season. Mr. LeClair, although much hindered in his efforts by the excessive rains and depth of surface, has found several promising leads.—*Critic*.

Reports received just as we go to press announce that No. 4 slope at the Drummond coleries have shut down for the winter, the last steamer leaving with cargo for Montreal, on 18th instant.

The following are the gold returns so far received at the Mines Office for September:—

District	Mill.	Tons crushed.	Ozs. Gold.
Sherbrooke	255	56¾
Darrs Hill	850	224
Caribou	120	44½
S. Uniacke	45	43½
Whiteburn	35	119½
15 Mile Stream	200	79
Stormont	15	18½
Kempt	4	3½
Wine Harbour	75	45½
Central Rawdon		
Co.	80	364
Lake Catcha	128½	103½
Oldham	116	101

Ontario.

Port Arthur District.

There has been quite a rush of explorers, prospectors, &c., during the past month to secure all that could be located before snow falls, when such work cannot be carried on to advantage. The principal surveys are along the Silver belt north of Whitefish and Arrow Lakes along the projected railway route. The greater portion of the surveys were for Americans, chiefly from Minnesota, who are now fairly well convinced that the rich silver region does not cross the boundary into their state.

The Silver Mountain "West End" mine has got its new hoisting and pumping apparatus in good shape and is making a grand shewing both in the main shaft and about 1000 feet further east where another shaft has been commenced, and is now down some 20 feet.

The "East End" although showing occasional bunches of rich ore, is looking better than it has for many months past. Work was delayed for a few days at No. 3 shaft by the breaking of the crank of the big hoisting engine. A small shipment of rich ore has just been made to the owners in Liverpool. This mine has recently been visited by some of the shareholders from England, who expressed themselves as well pleased with the outlook.

"Crown Point" mine is still trying to rival its famous rival to the south, the "Shuniah Weachu" mine. Lack of capital still continues, however, a great drawback.

The Beaver Mine was unfortunate in losing by fire their magnificent shaft house &c., on top of the hill. It will probably take a couple of weeks to put things to right again. Advantage can however, be taken of other openings so that work will be carried on pretty much as usual.

The Badger Mine is reported to have realized about \$70,000 from their last shipment of ore to New York, and are still adding to their pile of bonanza ore. It is by far the richest producer at present.

A couple of rich veins have been struck recently, one west of Silver Mountain, and one north of the Beaver Mine, but for obvious reasons cannot be publicly particularized at present.

More iron lands have been taken up in the Thunder Bay district, but nothing will be done in the Rainy River district, until the decision of the Privy Council next month, in the matter of the ownership of Minerals & Timber, which is claimed by both the Dominion and Provincial Governments.

Captain Plummer, lately in charge of the bonanza "Granite Mountain" mine in Nevada, is about to take up his residence in Port Arthur. He is reported to be "well fixed" and eager to try his luck in this district.

Sudbury District.

Mr. Elward D. Peters, of the Canada Copper Company, writes as follows regarding the report of his evidence given before the Ontario Mining Commission, an excerpt of which was reproduced in our last issue:—"The article consists of my answers to some scores of questions, con-

densed into a few paragraphs, and applies rather to the deposits at large scattered throughout the district, than to any special mine, except where so stated. I do not feel at liberty to give the exact grade of the ore mined by the Canada Copper Company, but it certainly varies very considerably from the figures here given, which referred mostly to the entire body of ore as mined from the average undeveloped deposits in this section."

Manitoba and North-West Territories.

Sir A. T. Galt has given notice that he will apply to parliament for an act incorporating "The Alberta Railway and Coal Company," with power to construct and operate a line of railway from the railway of "The Northwestern Coal and Navigation Company, limited," near Lethbridge, in a southerly direction to the international boundary line; and to connect with the railway of any company in the territory of Montana, and to lease the railway of such company or otherwise to make arrangements for the joint operation of the same, with power to amalgamate with or otherwise acquire the property of "The Northwestern Coal and Navigation Company, limited."

British Columbia.

At a meeting of the Eureka Silver Mining Company, held recently in Victoria, the vacancies on the board of directors were filled up. The new board is constituted as follows: Hon. Hugh Nelson, Hon. John Robson, C.E. Pooley, J. Van Bramer, R. P. Rithet, Wm. Dalby and G. W. Haynes. An effort will be made to reorganize the company and place it on a better basis. The mine is situated on Hope Mountain and is said to be of undoubted richness.

During the month of September the coal shipments from Nanaimo and Wellington amounted to 49,908 tons of coal, being nearly 4,000 tons in excess of the July shipments, which were the highest reached at that time. For custom purposes the coal is valued at \$4 per ton, making a total value of coal exports for September of \$176,000. These shipments do not embrace the coal taken to Vancouver for the use of the China steamers, nor the provincial trade. The coal was exported in twenty-five vessels, the greater bulk going to San Francisco. In addition to the coal shipments, the steamer Ferndale took to the Irondale smelting works at Port Townsend, 1700 tons of Texada Island iron ore for the month of September, the value of the ore for export purposes being \$3 per ton, thus swelling the total by \$5,100.

Correspondence from Donald report a rich discovery of galena, carrying gold and silver at Toby creek. Assays are said to be high.

The Selkirk Mining Company still continue developments on the Lanark, one of their best properties at Illicillewaet.

Mr. R. G. McConnel, of the Geological Survey, has returned to Ottawa from the Yukon country. He states that the mineral prospect along the Liard, below the mouth of the Dease is not encouraging. The old mining camps are, with very few exceptions, deserted and no new ones have taken their places. The mineral resources of the great Slave Lake region he reports indifferent but the supply of petroleum appears to be almost inexhaustible.

The Coalfields of Cape Breton.

By E. Gilpin, Jr., F.G.S., F.R.S.C., Inspector of Mines.

(Continued from September issue)

The following analyses will serve to show the composition of this coal at the Collieries operated on it from Cow Bay to Sydney Harbor:

	Cow- rie.	Cale- donia.	Re- serve.	Lin- gan.
Moisture50	.92	.52	.75
Vol. Comb. Matter, slow Coking.....	28.13	28.62	34.21	34.61
Vol. Comb. Matter, fast Coking.....	31.41	30.31	37.60	37.26
Fixed Carbon, slow Coking.....	66.01	64.02	59.73	61.39
Fixed Carbon, fast. Coking.....	62.73	62.33	56.34	58.74
Ash	5.36	6.43	5.54	3.25
Sulphur	2.71	1.10	1.25	1.35
Specific Gravity ...	1.31	1.33	1.28	1.29

The ashes of this coal vary in color from light to deep red.

The gas values of this seam vary from 8,900 to 9,500 cubic feet of gas, of from 13 to 15 candle power, and a good Coke is left.

The following ultimate analysis of the coal from the Reserve mine, made at the Royal School of mines, will prove of interest:

Carbon.....	77.41
Hydrogen	5.47
Nitrogen. }	
Oxygen. }	9.30
Sulphur.....	2.47
Water	1.00
Ash	4.35

The following analysis of the Coke from this mine is from a report of Mr. E. D. Peters, on practical tests made by him in experimental smeltings of Coxheath copper ore, and it may be remarked that a better article would be produced if the manufacture was conducted on a large and systematic scale.

Moisture	1.03
Carbon.....	90.04
Sulphur.....	.70
Phosphoric Acid..	trace
Ash	8.01

The ash of this seam presents the following composition,

	Lingan Mine.				Reserve Mine.	Caledonia Mine.
	Top.	Middle.	Bottom.	Average.		
Iron Peroxide	35.66	1.57	27.75	21.66	21.810	11.853
Alumina	9.07	6.08	4.91	6.69	8.110	4.206
Silica	43.07	79.06	48.62	57.05	68.330	65.734
Lime	6.13	8.34	11.83	.93	915	7.151
Manganese.....	5.73	3.08	6.52	5.11	480	.950
Sulphuric Acid.....						4.283
Alkalies97	.37	.56		2.150
Magnesia34				trace	1.260
Phosphoric Acid.....						2.725
Chlorine.....						trace
					99.645	100.306

The following is the composition of the lowest of the seams worked to any extent. The coal is usually compact and lustrous with fine laminae. Some specimens show mineral charcoal, while others are free from it.

	S	South Head.	Emery.	†Collins.
Moisture	1.767	.65		
Vol. Comb. matter, slow coking	28.000	32.21		
" " " fast	28.833	34.80		
Mixed Carbon, slow coking	62.263	63.49		
" " " fast	61.430	60.90		
Ash	7.970	3.65		
Sulphur	2.641	2.41		
Specific gravity...	1.382	1.28		

The ash of this seam, as worked at the Emery Colliery, has the following composition:—

Iron peroxide.....	38.764
Alumina	1.336
Silicious residue.....	50.673
Lime	4.200
Manganese	trace.
Magnesia	1.015
Sulphuric acid.....	4.030
Phosphoric acid.....	.012
Chlorine	decided trace.
Alkalies	do.
	100.030

During the examination of the ash of this coal numerous small rounded quartz pebbles the size of a pea were noticed. The following analysis shows the ultimate composition of the seam as worked at the Schooner Pond Colliery (analyst unknown.)

Carbon	78.10
Hydrogen	5.48
Oxygen and nitrogen	7.81
Sulphur.....	2.49
Water.....	2.67
Ash	3.45
	100.00

The coals from this seam are claimed to be good for steam raising, and to give off less smoke than the overlying coals.

The following analysis will serve to show the character of the best known seams opened below those referred to above.

Tracey seam, of Mira Bay, (analy. Geol. Survey.)

Moisture	22.35
Volatile combustible matter ..	30.09
Fixed carbon ..	66.61
Ash98
	99.915

Mullins' seam, south side Sydney Harbor:

	ft.	in.
Coal	2	0
Shale.....	0	4
Coal.....	4	0
	6	4
Volatile matter	31.4	
Fixed carbon	62.4	
Ash	6.2	

This analysis was made some years ago by Dr. Dawson, and he remarks: "This coal has some of the properties of cannel. It has great heating power and yields much dense carbonaceous gas."

In the Glace Bay section, a few feet below the Hub seam, is a bed of cannel coal one foot two inches thick lying on nine inches of ordinary

bituminous coal. The following analysis was made by Dr. How:

Moisture83
Volatile combustible matter.	30.07
Fixed carbon.....	44.42
Ash	24.68
	100.00

BROAD COVE DISTRICT.

In the Geological Survey Report for the year 1874, there is a description of the Broad Cove coal field, and a set of analyses made by Dr. Hoffmann, of the Survey, which are given here with his remarks, in a condensed form:

	7 ft.	5 ft.	4 ft.
	Seam.	Seam.	Seam.
Moisture.....	4.02	7.78	8.45
Vol. Comb. Matter, slow Coking	20.17	27.67	28.36
" " " fast " ..	25.39	34.51	36.52
Fixed Carbon slow Coking	70.41	52.87	56.94
" " " fast " ..	65.18	46.03	48.78
Ash	5.40	11.68	6.25

These coals do not soil the fingers. They are black, with pitchy lustre, banded, with uneven fracture. The powder of the five and of the four feet seams when boiled in caustic soda imparts a brown color to the liquid, this with the percentage of water would make them approach in character to brown coal, although they occur in strata of carboniferous age. The coal from the largest seam does not color a solution of caustic soda and is more closely allied with the typical carboniferous coals. Zinc blende was observed as a film in this coal. These coals are said to produce little smoke when burned in marine boilers.

PORT HOOD DISTRICT.

As yet but little mining has been done here, and the qualities of the coals have not been settled by practical experience. The Geological Survey Report, 1876-77, page 469, gives a report on the coal of the lower or 7 feet seam.

It appears to resemble in its general characteristics the Broad Cove coal, and yielded on analysis:—

	Fast	Slow.
	Coking.	Coking.
Moisture	4.02	4.02
Volatile combustible matter	38.81	34.86
Fixed carbon	49.65	53.60
Ash (purplish red).....	7.52	7.52

The coal is said to contain rather above the percentage of sulphur usually found in Cape Breton coals.

I have no analysis of the Chimney Corner coals. They are not as bright as many of the eastern coals, but are good steam coals.

Reference has been already made to the area of millstone grit extending from Sydney up the valleys of the Mira and Salmon Rivers. These measures show several outcrops of coal beds apparently underlying large tracts of country.

The beds are known only by natural outcrops, and no attempt has been made to ascertain if other beds are present. They do not exceed two feet in thickness, and, as the route of the Cape Breton railway will not follow these rivers as was expected at one time, they will probably not receive any attention for many years to come.

The following analysis is from the Canadian Geological Survey:—

Moisture	1.53
Volatile combustible matter....	20.16
Fixed carbon.....	47.49
Ash	30.82
	100.00

At other points the coal is reported by Mr. Fletcher as yielding an inconsiderable amount of ash. Another outcrop of coal in this district is interesting, as it presents in the Lower Carboniferous conglomerate the evidences of an origin identical with that of the more important seams of the productive measures. It yielded.

Volatile combustible matter...	17.80
Fixed carbon.....	29.04
Ash.....	53.16

About eight miles from Baddeck, at Hunter's Mountain, is an outcrop of coal similar in composition and mode of occurrence to that just mentioned. The coal is irregular, varying in thickness from a few inches to two feet. It is divided by numerous cleavage planes, sometimes coated with galena.

At East Bay, in the marine limestones and marls, pockets occur holding calc and fluor spar and patches of bright cubical coal yielding on analysis;

Volatile matter.....	36.72
Fixed Carbon.....	46.64
Ash.....	16.64
	100.00

For comparison with the seams of coal of economic value the following analysis of coal from a fossil carbonized tree in millstone grit measures in the same district may prove interesting:

Volatile matter.....	34.9
Fixed Carbon.....	59.9
Ash.....	5.2
	100.0

Coke firm and vesicular.

Some years ago a good deal of interest was aroused by a statement that active work was being performed on a seam of anthracite coal at McAdam's Lake, near the head of East Bay. The bed occurred in red and gray shales and conglomerates of the lowest division of the Carboniferous. It, however, proved to be little more than a coaly shale, lustrous and resembling the poorer anthracite coals of the United States. On analysis it yielded:-

Volatile Matter.....	17.80
Fixed Carbon.....	29.04
Ash.....	53.16
	100.00

Notwithstanding the large amount of ash the coal yielded a firm and porous coke.

Irregular pockets and beds, or rather seams, of hard compact coal are frequently found in the carboniferous of this Province. The mineral frequently breaks irregularly, does not soil the fingers, and resembles anthracite. On a closer examination however these coals are found to be either highly carbonaceous shales, or compact semi-anthracite coal—its more volatile ingredients being lowered in amount by the hardening, etc., the containing strata have undergone. Considerable sums of money have been spent in testing and prospecting these deposits, but so far the results have not been at all satisfactory.

RIVER INHABITANTS COAL DISTRICT.

I am not aware of any recent analysis of the coals of this district. Little systematic mining has been carried on for a number of years, and the writer is obliged, like Mr. Fletcher, to refer to the report made a number of years ago by Dr. Dawson to the Government of Nova Scotia.

He gives the following analysis of the Little River four feet seam:—

Volatile matter.....	30.25
Fixed carbon.....	56.40
Ash.....	13.35
	100.00

and remarks that it is more bituminous than the Sydney or Pictou coals, and should prove practically a good domestic and gas coal.

He also gives the following analysis of the eleven-feet seam found at Sea Coal Bay:—

Volatile matter.....	25.2
Fixed carbon.....	44.7
Ash.....	30.1
	100.00

The amount of ash given in this analysis would make the coal of little use for ordinary purposes. I am informed, however, by parties interested, that it by no means yields this large percentage of ash, and that the other seams are apparently of excellent quality. These beds are very well situated, as the harbor remains open all winter, and they will no doubt be re-opened whenever the conditions of the coal trade hold out more promising inducements to the miner. I have no analysis of the coal found at the head waters of the inhabitants river.

From the analysis I have given it will be seen that the island of Cape Breton furnishes Coals adapted for every purpose. They are largely used for steam raising in locomotive and marine boilers, and as their qualities become better known they will be a favorite railway fuel. For gas making and domestic purposes they have established a good reputation. In connection with the various schemes mooted for iron and copper smelting in Cape Breton it is encouraging to note that practical tests have shown that an excellent coke can be made from them. At present the low price obtainable for coal, and the presence of large mines in the eastern district, will operate against developments in other parts of the Island. But it is to be hoped that the discovery of metallic deposits in the districts surrounding the western and southern coal beds may lead to the erection of works drawing their fuel from local sources, and the projected railway from the line of the Sydney and Hawkesbury Railway to Broad Cove will give this part of the island an outlet to good shipping ports.

Foreign Mining Laws.

Arthur Strauss.

As there has been recently a good deal of discussion about amending the mining laws, and more particularly the laws relating to mine leases, I think the time opportune to lay before you some peculiarities of the Foreign Mining Laws. You will find that many of them, although they may work well in other countries, are totally inapplicable to this country, but you will notice some which may with advantage be adopted or assimilated here. I purposely shall endeavour to make as few comments as possible but simply put the plain facts before you; for with the present agitation going on, I am anxious not to say in this institute, devoted to science and research, anything that might savor of political bias. I must leave you to draw your own conclusions and confine myself simply to the act of giving you the materials where-with you may form your own opinions. It would naturally take too long to give you the full details of the mining laws in fore-

ign countries. I shall therefore content myself in pointing out to you the material differences, and while briefly referring to all countries, shall particularly dwell on the German law, for the German law is the most complete, and almost in every particular different to the English. It therefore affords the greatest features of interest and study. In speaking of the laws of a country, I shall also take the rule and not the exception; for almost in every part of Europe we find certain provinces which do not share the general law of the land, and in order to put some system into my address, I shall try to direct your attention step by step to the position of adventurers to landlords, adventurers amongst themselves, adventurers to miners, and lastly, miners among themselves.

The basis of the German law is free mining, that is to say the minerals belong to the nation, or, as others explain it, are things without an owner, and everybody has a right to dig for minerals anywhere, subject to certain restrictions which will be fully discussed hereafter. This principle of free mining can already be found in the Roman law, where it prevailed in some provinces. I beg to refer you to the collection of imperial edicts under Emperor Theodosius, in the year 438. There is an edict under Emperor Constantine of the year 320, to the Consul of Africa, giving permission to all men to dig for ores wherever they please. In the year 363, under Julian, this was extended to the whole of the orient, and in the year 376 to other provinces. In the year 382 there is an edict that all miners have to pay one-tenth to the state and one-tenth to the original landlord, while the most curious edict is of the year 393, showing that even then mining laws could be abused, unless carefully drawn up. The order runs thus: "We have been informed that certain people, under the pretence of digging for ores, sink deep shafts for the purpose of damaging the foundation of other people's houses. Therefore, in future, permission will be refused to dig for ores under buildings, so as to prevent the practice of forcing the owner to sell his house cheap, on the pretence of a discovery of mineral wealth under the same, and thus abuse a law made for the common weal, to the detriment of another man's property." The general rule, however, in the Roman law was, that the mines belonged to the Crown, and were let out to the miners for a high royalty.

In England, as you are aware, the maxim of the law is that the soil belongs to the owner to an indefinite extent, upwards and downwards, whatever is in a direct line between the surface of any land and the centre of the earth. He therefore, who is entitled to the soil, is, according to this doctrine, also entitled to the minerals beneath the soil. But when, as it sometimes happens, the title to minerals is distinct from that of the soil, and vested in different persons, the owner of the minerals would *prima facie*, have no right to interfere with the surface, but the English law invariably accompanies a right to property with the necessary means for its enjoyment, and upon this principle the right to mines implies a right to work them and to the use of as much of the surface of the land as may be necessary for the purpose of effectually carrying on mining operations. We have evidence from the year 1198, in a document which is still in existence and in perfect preservation, among the records of the Exchequer, that the Cornish miners enjoyed certain rights and privileges, and in the remarkable charter of 1305, under Edward I., the ancient franchises and liberties of the tanners were confirmed. They consisted

chiefly of freedom from personal molestation and from servile obligations, exemption from the jurisdiction of other courts in all matters as between themselves and as between themselves and strangers, together with an extensive liberty of mining according to ancient custom. The earliest reliable proof, however, of the ancient custom of tin bounding is the charter of King John, granted by that monarch in the third year of his reign (1202) to the tinnors of Cornwall. This custom, which approaches free mining very closely, was confirmed by all the Stannary Parliaments held since; the latest in the 26th or 27th year in the reign of George II., and has not been revoked by any acts of parliament since; on the contrary, we find it repeatedly confirmed. Through the scarcity of wastrel land it has, however, become more or less obsolete. Lord Brougham as counsel for the plaintiff in *Rowe v. Brenton*, is reported to have explained the ancient custom of tin bounding in the following manner: "That the miners had a right to go upon the lord's or the freeholder's tenement, and cut bounds, that is to say, to cut up a turf so as to form a mark upon the surface or area of the soil, which those people called bounds. The miner then, at the Stannary court gave notice to the lord, that if the lord would not work the tin mines under these bounds, he, the miner who proposed to do so, claimed the privilege. Accordingly, this notice was given in three successive courts, according to the usage of the Stannary laws passed, and if at those three courts, the lord, who had the first right to work the tin mines under his soil, would not work them, the miner, through that process, acquired a right as against the lord, and that is what is commonly called bounds." A clear description of the custom was also given by Lord Deuman, in the case of *Rogers v. Brenton*. His Lordship said: "There can be no doubt that this is most remarkable, fulfilling every requisite of good custom. In substance it is this: The mine is parcel of the soil, but it is a parcel which to discover and bring to the surface may ordinarily require capital, skill, enterprise, and combination, which, while in the bowels of the earth, is wholly useless to the owner as well as to the public, the bringing of which into the market is eminently for the benefit of the public. If, therefore, the owner of the soil cannot or will not do this for himself, he shall not be allowed to lock it up from the public, and therefore, in such case (unless when by enclosure he may seem to have devoted the land to other important purposes inconsistent with mining operations), any tinner, *i.e.* any man employing himself in tin mining, may secure to himself the right to dig the minerals under the land, rendering a certain portion of the produce to the owner of the soil." The idea of the minerals belonging to the public and not to the individual underlies this definition. It is not my province to go further into this ancient custom of tin bounding, to which reference is only made here to show that the spirit of free mining, as will be unfolded to you presently, seems to have pervaded Cornwall from very remote times up to the present moment. The oldest document still extant in Germany which proves the ancient right of free mining, is dated 24th March, 1185—a contract between Bishop Albrecht, of Trent and the miners, and it has prevailed there ever since, until the last general law, passed in the year 1865, fully confirms and particularises it. Though I purposely refrain from giving any opinion upon free mining, I am entitled to give you an interesting discussion which took place in the French Chamber of 1791. A commission was appointed to enquire into the mining laws,

and in the sitting of 20th March, 1791, the Deputy Regnould D'Epeney brought in the new law which embodied free mining, and recommended it in a speech of which the following is an extract:—

"Landed property was originally created through a general division or through labour, and it is clear that the object of such a division could only be to give food to individuals and their cattle.

This division could not possibly have reference to minerals which were hidden in the earth, and not discovered till long after the State was established, for their necessity and value were yet unknown. If the thus acquired property did not refer to minerals, the existence of which was undiscovered, thus evidently they were not included in the division, and if undivided, what is the result? You must perceive that these minerals never had an owner, that therefore they remain a property of the nation, and therefore every nation has the right to dispose of them. As it is further admitted that the minerals are situated in the earth in such a way that they never or but seldom correspond to a single property, they cannot possibly be a complement to a single property, they must rather be taken as everybody's property, they are at the disposal of the nation, for it is certain that such things as have no owner belong to the nation. According to this principle nobody may call himself the owner of the mine, nobody can have any right to a mine but such as the nation concedes to him." To this Humboldt Lamerville made a spirited reply on the following day:—"He contended:—"The nation would become a caretaker instead of an impartial sovereign. It is one thing to subject an entire property to the common weal, and another to make a property uninhabitable and sacrifice it to the common weal. The nation may take all my property against payment if they deem it useful, but let it not in a dangerous manner assert itself as my co-proprietor in one and the same property, by taking the minerals and leaving the surface to me. The State has only once recognized the right of the first occupier, that is, when society was established; the State has no right to alter my legal holdings now. Moreover, the miners who would covet the same deposit of minerals would be led to dispute and strife. It is enough that the scourge of war should be spread on the surface of the globe, surely you don't want the terrible scourge of a subterranean war, which could hardly be pacified by the sword of the law. By conceding to the discoverer the right of the property, you do not help the poor, you would create discord among the rich and foment new disputes."

The famous Mirabeau concluded the debate by a memorable speech on the same day:—"He said: "Society, in its first stage, permitted the attainment of landed property for the purpose of agriculture, building, and for that purpose only the surface was given. The original proprietary right could not possibly refer to minerals 1,200 feet deep. They cannot be a complement to the soil, and are moreover, by their course, unfit to be concluded in the partition of the surface." He then pointed out how difficult it is to get a proprietor to go to the expense of working a mine, for, after all, he may find the true vein under his neighbor's property. He further argued that the proprietor seldom has the capital to work a mine, and that adventurers experience sufficient difficulty to defray the expenses of working without paying any extraordinary value for the land, and concludes that, if you give the landowners the right of the minerals,

the mining industry would suffer and come to a speedy end. The Act was consequently passed on 28th July, 1791. We now come to the German Law. It distinctly states that owners of property have no right to the minerals, and there are heavy fines or imprisonment against the appropriation of minerals, even on your own property. The French Law expresses it differently, but it comes to the same thing. It says: "The moment the concession of a mine is granted, that mine property is distinct from the surface, and is considered a new property. Everybody has a right to dig for minerals, except under streets, railways, and churchyards. It is allowed to dig on other people's property, except under their buildings, or within 200 feet thereof. The owner's permission is requisite, but should he refuse it, the Mining Courts force him to grant it, unless he can show good reasons to the public safety for refusing his permission. Should the forbidden area of 200 feet within his building not be situated in his own property, he has no right of interference. The digger is bound, if required, to pay yearly in advance any damage that may accrue, and to return to the owner the ground after he has finished with it, paying him the depreciation in value. The landlord may demand security for depreciation in advance. In case of dispute about damage, the mining authorities have to settle the amount without appeal. Having discovered the minerals, the miner has to apply to the Mining Court for a concession. The application is advertised in the official newspapers. The demand note has to state the exact hour when it was handed in, and must contain the petitioner's name, a description of the mineral for which the concession is asked, a description of the land required, and the name of the mine. The concession is granted provided the minerals are found really to exist, and provided no other parties can claim a prior right. A new concession for an abandoned mine is granted without inspection, unless it is notorious that that the abandonment was owing to the mine being worked out. The moment a concession is asked for, it is plainly marked on the official map, which is open to the inspection of the public. Should several demands for concessions be handed in simultaneously, then the landlord, if one of the claimants, has the prior right, barring him, the man who regularly explored the ground has the preference to the man who discovered the mineral by mere chance. The adventurers, for we may now call so the parties who have obtained the concession, are bound to work the mine if, by their not doing so, the public interest is endangered. The mine has to be worked according to a working plan, which has to be submitted for approval to the mining authorities. Objection is only raised if the working is considered insecure. The adventurers may, however, appeal to the Board of Trade if they consider the objections ungrounded. Should the original plan be changed, such change to be notified to the authorities. If a mine is worked contrary to the approved plans, the authorities may fine the adventurers, or have power to close the mine. The mine may only be worked under the management of duly qualified persons. The managers' names must be submitted to the mining authorities, who make them pass an examination before qualifying them. The managers are personally responsible for working the mine according to the plans handed in, and for all other rules and regulations which exist as regards the working of mines, safety of boilers, etc., etc., and are fined for any transgression. The royalty in Germany is 2 per cent. to the Government, but

nothing on iron, as it was found that even such a small royalty on iron might impede the industry. In *France* free mining is likewise of ancient date, and included a general liberty of search in all uncultivated places, and a right to work mines whenever the owner, after distinct notice, delayed for three months to work them himself. Such are the prominent features of the various edicts, until the law of 28th July, 1796, the discussion on which has been mentioned before, declared that the mineral wealth of France below the depth of 100 feet was the property of the nation, to be disposed of by the Government in the general interest of the public, and unfettered by any claim from the owner of the soil, who, however, was entitled to preference. The law of 21st April, 1810, declares the property in mines to be distant from the soil, which cannot be explored without a concession of the Government. According to this law, the French Government has a right to grant the concession to whomsoever it pleases, and acknowledges no right of preference in the owner of the soil, or the first discoverer of the minerals, but the first discoverer has, nevertheless, a claim upon the consideration and good will of the Government. The mine owner has to pay double the usual rent for the surface property required, and double the amount of real damage done to the landowner. If the works should deprive the landowner of the use of his ground for more than a year, or unfit it permanently for cultivation, the explorer must buy the plot, for a sum not to exceed double its value, before the occupation. The royalty in France may change every year, but is not allowed to exceed, and generally amounts to, 5 per cent. of the net produce of the mine, to be paid to the State. Over and above, however, the government makes an additional charge of 10 per cent. to form a relief fund for accidents.

The law of *Belgium* closely resembles that of France, but by a law of 2nd May, 1837, a preference is given to the proprietor of the soil to have the first concession for exploring minerals situate under his own land; but two conditions are attached to this preference: First, that the proprietor satisfies the mining authorities that he possesses the necessary funds for exploring the mines and carrying on the undertaking; the other, that the land can be profitably worked. It also differs from the French law, in so far as the latter does not allow any shaft to be sunk within 300 feet of an habitation without consent of the owner, while the Belgium law merely confirms this, provided the 300 feet are within the owner's land and not in adjacent property. In addition to the 5% royalty to the state, a royalty from one to 3% is paid to the land owner, the mining authorities fixing the exact proportion according to the richness of the mine.

In *Austria* the same free mining exists, and the mining authorities settle the amount of the damage for devastated land. A concession is easily obtained; it is, however, only granted for one year, when it must be renewed and made absolute, after sufficient proof has been given that the researches have been successful. No special royalty is paid either to the landlord or to the state, but the income tax, and particularly the provincial or municipal taxes, are very heavy.

In *Spain* free mining prevails. The concession is granted by the civil governor of the province, after satisfactory proof that the minerals exist. The landowner has to be compensated for the damage, and no shaft may be sunk within 40 yards of any building, or within 1,400 yards of fortified places. The surface

owner has preferential rights, provided he undertakes to commence working within thirty days. The Government royalty is very small, and is levied at so much per acre.

In *Sweden* and *Norway* we also find free mining, but here the owner of the ground is entitled to participate to the extent of one half in the mining and the profit derived thereof. The land required by the mine is valued in proportion to the highest value of other ground in the neighbourhood. No tax is paid for the working of a mine either to the government or any private individual.

In *Italy* there is no universal legislation respecting ownership of mines, but free mining generally prevails, except in sulphur mines, which can only be worked by the owners of the soil. The law of 20th November, 1859, now governs the mining industry in most provinces. Minerals can only be worked by virtue of a government concession, and from the date of the act of concession the mineral ownership becomes distinct from the ownership of the soil. The concession does not exceed two, or at furthest three years, and may be at any time revoked in case of the suspension of working. Questions of priority, or of property, between contending applicants, are decided by the ordinary tribunals. The royalty payable to the state is generally 5% of the net produce of the minerals. This tax may be converted for a definite period into a fixed annual tax. The government may remit, in whole or part, the tax payable, in case of heavy expenditure, extraordinary work, or on account of damage suffered from accident, not imputable to negligence.

It would be impossible to go here into the laws in force in the *United States*, owing to the numerous statutes and mining regulations existing in the different districts, often inaccessible, and, more frequently, various, indefinite, and conflicting. For instance, there are not less than 500 mining districts in California, 200 in Nevada, and 100 each in Arizona, Idaho, and Oregon, each with its set of written regulations. The main objects of the regulations are to fix the boundaries of the district, the size of the claims, the manner in which claims shall be marked and recorded, the amount of work which must be done to secure the title, and the circumstances under which the claim is considered abandoned and open to occupation by new claimants. The right of private ownership in minerals extracted from the soil is recognized in nearly all the States and Territories. All such minerals belong to the owner of the land, and the government claims no royalty.

We thus find in nearly all European States, free mining, and I must not omit to mention that the miners have the same right and claim on watercourses, roads, and other matters necessary for their industry, as they have on the land.

Throughout the Continent mines are worked either by individuals or by ordinary limited liability companies, as the system of unlimited companies is almost entirely unknown there. If more capital is required it is generally raised by further issue of shares or by debentures.

In Germany, however, we find a system very similar to our cost book system, and just because it is similar but not identical, it is interesting to study wherein it differs. The adventurers there can make their own articles of association and regulations, which, however, must be confirmed by the holders of at least 75% of the shares. The object of having such a large percentage is thoroughly to protect the minority, and to prevent a few large shareholders taking

advantage of their position at the cost of the minority. Adventurers are bound to pay their share of the cost, and of the liabilities incurred in proportion to their shares. Creditors of a mine can only levy distress on the property of the mine, but have no claim against individual adventurers. You have, therefore, this difference that each adventurer can only be made to pay his original share of the liabilities, and not his partner's share, should the latter be unable to fulfil his engagements; at the same time the management cannot commit the adventurers unto very extensive liabilities, as creditors, knowing they have only the machinery and other moveable assets to look to, are careful in their dealings. As a rule, there are either 100 or 1,000 shares, which may, however, be subdivided into tenth parts. A certificate is issued, but the shares cannot be transferred without a return of the certificate. At a general meeting each share has a vote. No voting can take place unless the invitation to the meeting distinctly stated the object on which a vote may be taken; simple majority decides, but more than half the number of shares must be represented at the meeting. Should such a number not be present, another meeting must be convened, which may then finally decide, irrespective of the number present. A majority of at least 75% of all shares, however, is necessary for any vital decision, such as the sale of the mine, consolidation, or liquidation. Any shareholder has a right to appeal against the resolution of the shareholders in the ordinary tribunals, on the plea that the resolution is not to the real advantage of the body of adventurers. While the decision of the tribunals is pending, the resolution of the meeting may be duly carried out without responsibility to anybody, but if the plea is properly made out, the tribunal may rescind the decision. As you are aware, such an interference of the tribunals in the decision of a company, even if in accordance with their own by-laws, is not at all rare in this country, for you constantly find the Court of Chancery interfering in arbitrary decisions of club committees, even if the aggrieved member is bound by the rules of the club to submit to such a decision. The adventurers are bound to name to the mining authorities one or two persons, who represent the company in all judicial and other matters. These representatives, corresponding to a committee here, are bound to see that the books are properly kept, and to show them to every adventurer at any time he may require. This committee has to call a general meeting at least once a year, or at any other time, if asked to do so by shareholders representing 25% of the shares. Adventurers are liable for any responsibilities incurred by the committee in the name of the mine, and the committee themselves are free from all personal liability in the matter, unless they exceed their authority. Shares may be abandoned as here, and the adventurers may, as here, either sell the abandoned shares or retain them. The mine can only issue special rules for the workmen, which are not in conformity with the law of the land, such as the imposition of fines, etc., with the approval of the mining authorities. Unless specially arranged before hand to the contrary, a fortnight's notice to quit must be given, either by employee or employed. Miners can only be dismissed without notice, or before the specially arranged contract expires:—

1. For theft, embezzlement, repeated drunkenness, gross disobedience, or continued obstinacy.

2. For acting contrary to the rules laid down by the mining authorities for the working of the mine.

3. For actual violence or verbal abuse of their superiors.

4. If incapacitated for work, or inflicted with an infectious disease.

Miners are allowed to leave without notice :—

1. If they are physically incapacitated to do their work.

2. If actual violence has been used against them by their employers.

3. If they do not receive the promised or contracted wages.

The employer is bound to give a character to a leaving miner, and should any accusation be made therein, the miner has a right to have the matter examined by the mining authorities. Employers are not allowed to engage miners who have previously worked in other mines without inspecting their character.

Then we have the usual strict regulations with regard to employment of children, which are the same for mines as for all other manufacturing.

Employers are bound to pay the miners in cash, and not in goods. They may, however, supply the miners, in deduction of their wages, and with the consent of the miners, with housing, fuel, food, and the necessary tools. A list of miners employed, with full particulars, must be kept in the counting-house, open for inspection to the mining authorities. The law makes Friendly Societies amongst the miners compulsory. These Friendly Societies may embrace other workmen in the neighboring districts, with the consent of the mine owners or adventurers, for this term is now synonymous. Clerks, managers, and all other employees, are admitted in these miners' Friendly Societies. The mine owners, together with properly chosen delegates of the miners, have to draw up the rules and regulations of these Friendly Societies. These rules must be approved by the mining authorities, who may only interfere if they contain provisions contrary to the general law of the land.

The miners may become full members if—

1. They have been members for a certain specified period.

2. They are not beyond a certain specified age.

3. They are free from all sickness, which presumes that they were invalids before joining.

After being full members they are entitled—

1. In case of illness to free doctor and medicine; they are not allowed to choose the doctor themselves, but must accept the doctor of the Society.

2. A sick allowance during the time of illness, provided their illness is not caused by a gross negligence of their own. The allowance lasts for thirteen weeks, after which time, if not cured, they receive the ordinary allowance of invalids.

3. An allowance for cost of burial.

4. An allowance as invalids during lifetime, unless they are incapacitated through gross negligence of their own. This allowance is, however, stopped as soon as the miner is fit for work again, and the convalescent invalid is bound to take any work which his physical capacity allows him to execute.

5. A pension to the widow for life, unless she marries again.

6. Support for the education of children of deceased members and invalids up to their fourteenth year.

Members who are not full members are entitled only to doctor, medicine, and sick allowance; further, to costs of burial and invalids pensions, in case of accident while at work. Either a single mine, or several mines combined, may have these Friendly Societies, and the

allowances are to be decided by the committee of these Societies.

The allowance cannot be transferred by the recipient to third parties, nor can they be put a stop to by legal process. Both the mine owners and the miners have to contribute to the societies. The contributions of the miners may be regulated either in proportion to their wages, or a corresponding fixed sum. Mine owners must contribute at least 50% of the amount paid by the miners in their employ. The mine owners are bound to see to it that the miners pay their contribution, otherwise they are made themselves responsible for the deficiency; they are bound to supply the Friendly Society with a list of the men in their employ. The committee consists of a certain number, to be fixed by the Society; half are chosen by the mine owners, and the other half by the miners. The committee is bound to look to the proper execution of the rules, and has the care of the money, and chooses doctors, chemists, etc. The committee is under the supervision of the mining courts, who send an inspector to every meeting to watch over their proceedings. The committee may, instead of supplying such patient who has a family with doctor and medicine, send him to the hospital, with his consent, or even without his consent, if in their opinion proper care cannot be bestowed upon him in his own home, and patients without a family they may send to the hospital in any case.

If a man with a family is sent to the hospital, and the family is dependent on his earnings, half the usual sick money must be paid to his family. The usual allowances are, during time of sickness, a labourer's ordinary wages as customary in the district; two-thirds of ordinary wages for invalids; in case of death, 20 day's ordinary wages for burial expenses; for the widow 20 per cent, for each child under fifteen, an additional 15 per cent, and if the child loses its mother 20 per cent of the ordinary day wages. For such incapacitated persons as have been dependent on the workman during his lifetime, 20 per cent of his wages until he or she is no longer in need of such support. Power is given to the committee to impose fines upon their members if they are guilty of any transgression of their rules, necessarily imposed for the purpose of securing safety to human life.

You will see the rules of these compulsory Friendly Societies differ materially from the ordinary English Friendly Societies, and I hope to have an early opportunity of explaining to the mining community the usages in force in the voluntary English societies.

(To be continued.)

Amber Deposits of the Baltic.—It is a somewhat peculiar geological fact that the only place in which amber deposits are known to exist in payable quantities is in the head of the Baltic Sea. It has been ascertained that the vent of Amber extends from the west Russian shores of the Baltic to Denmark, Norway and Sweden. Formerly the supply was obtained mainly through the agency of storms which tore up the amber lying at the bottom of the sea and caused it to be thrown on shore. Within the past quarter of a century, however, mechanics have been applied to the pre-existing methods of obtaining amber economically and with despatch. The most profitable strata have been found in the vicinity of Memel, and it is stated that there are now 20 large dredging boats con-

By instructions received from "La Compagnie Francaise des Phosphates du Canada," the hereinbelow described Mining Lands and Mining Rights will be offered at auction in the Real estate Rooms of

PARENT BROS.

46 ST. JAMES STREET, MONTREAL.

—ON—

Thursday, the 15th November next,

At TWO P.M.,

In the Township of Portland East.

Lot 13, in first range. West $\frac{1}{2}$ of lot 2 and north half of lot 3 in 2nd range; also mining rights of lots Nos. 1 and 2 in 3rd range, and of south half of No. 1 in 4th range and fee simple of west half, west half of lot 2, and north half of lot 3, in 4th range. Mining rights of lots 3, 7, 10, of north part of lot 1, in 6th range; and fee simple of lots 8, 9, 22 and 24 in same range. Also fee simple in lots 7, 8, 9, 10, 21, in 7th range, and 6 and 30 in range 8; and mining rights in lot 12 same range. Fee simple in lots 9, 13, 19, 20 and 4, 5, 30, 31 in 9th range, and mining rights of lot 17, and of south part of No. 16 in same range. Mining rights of lots 27 and 28, in 7th range. Fee simple of lots 9, 10, 11, 16, 17, in 8th range.

Township of Portland West.

Lot No. 20 in the 4th range and mining rights in lot 3 in range 10.

Township of Templeton.

Lot 3 in range 13.

Making a total of some 5,000 acres of the finest phosphate lands in the world.

Show pits have been opened almost all over these lands, bringing to light exceedingly rich deposits.

Printed copies of government and engineers' reports will be sent on application.

Lots to be sold separately to suit purchasers.

PARENT BROS.

stantly at work for at least eight hours out of the 24. Further to the west the amber is obtained by divers, who go down with diving apparatus and remain below for four or five hours. Each diver has a little bag round his neck and a peculiar hook, with which he pulls up the sand, and every piece of amber that he finds is thrown into the bag. But that is only one way of obtaining amber. The stratum of green sand in which it is found exists in some places for about 30 miles inland, and the valuable material is mined. In the amber mines there are about 40 miles of passages, while 700 men are employed in the various departments. The miners simply cut the sand and load it in trucks; it is

then brought to the surface where it is thrown into a long trough filled with rushing water, which separates the amber. The latter is caught by nets of various sizes, is then cleaned by machinery, and assorted according to its quality and purity. Although the consumption of amber is considerable, there are few substances for the supply of which mining and dredging operations are required (though it should be borne in mind that amber is not a mineral proper, but a fossil resin) about which so much ignorance prevails.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersca Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

Department of Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly

stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one *per centum* of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale*

of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,

15th Dec., 1887. Commissioner.

ONTARIO

Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square,

containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any minerals is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

T. B. PARDEE,

Commissioner.

Department of Crown Lands, Toronto.

SEALED TENDERS, addressed to the undersigned and endorsed "Tenders for Addition, etc., of Post Office, at Coburg, Ont.," will be received at this office until Saturday, 10th November, 1888, for the several works required in the erection of an addition, etc., in the Post Office at Coburg, Ont.

Specifications can be seen at the Department of Public Works, Ottawa, and at F. A. Muirson, Law Office, Coburg, on and after Tuesday, 16th October, and tenders will not be considered unless made on the form supplied, and signed by the actual signatures of Tenderers.

An accepted Bank Cheque payable to the order of the Minister of Public Works, equal to 5 per cent. of the amount of the Tender, must accompany each Tender. This cheque will be forfeited if the party decline the contract, or fail to complete the work contracted for, and will be returned in case of non acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By Order

A. GOBEIL,

Secretary

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.

The Stanley Coal Heading Machine.
—Mr. Stanley, of the Haunchwood Brick and Tile Co., England, has invented a new coal heading machine, which is at work both on the bank and in the mine. This machine is made to cut an annular groove around the face of the heading, leaving a core which either falls or is got off as the work proceeds. The machine can cut a heading in about one fourth of the time which would be occupied if the work was done by hand labour. It will cut through the hardest material, such as thin bands of ironstone, without difficulty. Experiments are said to have demonstrated in a satisfactory manner the utility of the machine.

The Most Ancient Tin Mine in the World.—The Great Work tin mine, West Cornwall, which has recently been reopened, is undoubtedly the most ancient mine in the world. It is recorded that the Phœnicians came here for tin, and the public records show that the mine has been worked, with slight intervals of cessation, for the past 300 years. The value of the property is indicated by the extent of the workings, upon which no less than £390,024 has been expended, whilst the ore produced realized on sale £628,706. Although no fresh ground was opened tin of the value of £100,000 and upwards has, during the past 20 years, been obtained from the surface and shallow workings. The contents of the prospectus are interesting, showing, as they do, what this property, which is not more than 180 fathoms in depth, has done. The lift is a mile and three-quarters in length, on the course of the lode, and in some places a mile in width, embracing an area of 720 acres. Underground the levels have been driven in the aggregate about 30 miles.

The use of Steel Supports in Mining.
—In a paper recently read by Mr. A. L. Steavenson, M.E., before the North of England Institute of Mining Engineers, it was stated that the result of a trial on a large scale of steel beams in the iron mines in the Cleveland district was entirely favourable to their adoption from the points of both economy and security. In the mines in question the expenditure for timber is about \$50,000 a year, even when not working full time, and the average life of the timber in consequence of dampness was not more than two years. Out of nearly 200 tons of steel now in use only one beam has failed, and it is demonstrated clearly that in strength the advantages gained where the roof is heavy are marked, fewer pieces being required and a much better and neater arrangement can be effected with a clearer road, owing to the smaller size and number of props. After an experience of three and a half years the work seems to be in perfectly good condition, so that permanence is effected instead of frequent renewals. Including the packing material and all labour, the average cost of six steel board end crossings was £5 4s. 1d., for timber, or an increase of 36 per cent. which increased cost is considered amply compensated by the advantages gained

FOR SALE.

A COAL MINE IN CAPE BRETON,

Area, 970 acres, underlaid by 6 or 7 beds of the best Coal in Nova Scotia. The property is estimated to contain from 50 to 60 million tons of Coal. No Coal Mine can be more easily or cheaply operated. The angle of dip is 6 degrees, and the rock stratification is remarkably even and without fault or break.

Apply to

ALEXANDER CAMPBELL,
Annapolis Royal, N.S.

12th, 1883.

The Deepest Coal Mine.—The Saint-

Andre du Poirier mine claims to be the deepest coal mine in the world. It has a royalty of 864 acres and a yearly production of 200,000 to 250,000 tons. There are two coal drawing shafts, the one 2,952' deep, the other 3,083' deep. The first shaft is being deepened to 3,149'. Each of the pits is being ventilated by a Guibal fan working in a second shaft. A remarkable feature in the workings at these mines is the comparatively low temperature experienced. The maximum temperature is 75° F., and it is very often considerably lower; the air passing along the "face" is not warm. This tends to show that elevation of temperature is by no means the greatest obstacle in working very deep mines. The four seams worked at Saint-Andre vary from 1' 8" to 2' 7½" in thickness; the working faces are 50' wide. The daily output per underground workman is eighteen hundredweight. It seems that with an average selling price of 7s. 1½d. per ton, the mine makes a profit varying from 9½d. to 1s. 9d. per ton. This is a striking testimony to the efficiency and economy with which the operations must be conducted. The daily output of the Saint-Andre shaft is from 300 to 350 tons. This is an old shaft, only 9' 10" in diameter. It has been sunk in several stages as the upper seams became exhausted. It is provided with wooden guides, and six tubs are lifted at once. The winding is done with flat steel ropes, of non-tapering action, weighing 20 lbs. per yard. Ropes of the tapering sections were formerly used, but were found liable to break at the change of section. The ropes are wound on ordinary drums. The ascending speed is at least 33' per second, 120 tubs being lifted per hour. The engine is verticle, with two cylinders and 400 horse power.

Abusing Machinery.—There is no economy in running machinery for all it is worth, without proper care in cleaning adjusting and oiling. It is not the greatest amount of work which can be got out of a machine in a given time that always constitutes good economy, but the greatest amount of work with the least wear and tear. Over-speeding is one of the faults, but because over-speeding beyond a certain limit to the manifest injury of the machine is not considered good practice, it does not follow that there is good economy in reducing the feed below a speed which will render the machine incapable of turning out a reasonably good day's work. There is no more economy in pushing a machine beyond its powers of endurance without proper care in adjusting, oiling and cleaning, than there would be in constantly urging a horse forward with loads far beyond his strength, without necessary food and care. In either of the cases named the result will be practically the same.

A Progressive Canadian Province:—

Fifty years ago the population of Nova Scotia was less than 200,000; in 1871 it was 387,800; in 1881 it was 440,572, and now it is estimated at 490,000. Its yield of coal has increased from a little over 100,000 tons in 1837 to nearly 1,500,000 in the past year; while even in spite of the development of iron ship building, its wooden ship building has increased four fold in the past thirty years. Its fishery products have increased in fifty years from \$895,000 to \$9,000,000.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

Manager.

Steam Pump Practice.

By HIRAM R. JONES.

[From the American Machinist.]

If a suction pipe is obstructed; too small or too long, the pump will be "starved," so to speak, and if the velocity of the plunger is greater than the inflowing water, there will be a partial vacuum formed between them, and on its return stroke the plunger will strike the advancing water with great violence, producing a severe shock and strain on the valves and joints of the pump and pipes.

A partial remedy for this evil is to put a large air chamber on the suction pipe near the pump. This will make an elastic cushion of air for the incoming water to come into contact with, and so not to strike the returning plunger with so hard a blow. But while a suction chamber is always an advantage, it will not stop the pounding if the average of the volume of water is not enough to follow in close contact with the plunger. In this case the proper remedy is to put in a larger suction pipe.

Many a good pump is blamed for not doing its work smoothly, when the only trouble is a restricted supply of water. In some situations, in order to bring the pump under the immediate charge of the engineer, it is necessary to use a very long suction pipe. In such cases it should always be one or two sizes larger than the pump connection calls for, and the water should flow to the pump from a head, or have a very moderate lift.

Should there be a leak in the pipe, so as to allow air to enter, the plunger will act something like the case just mentioned, but instead of the plunger striking with a solid blow, it will impinge against the air cushion formed. The first part of the return stroke will be very quick, but will gradually slow down to its normal speed as the imprisoned air is compressed, but without severe shock, as in the former case.

If the suction pipe is short and vertical, and has a leak in it, the pump will discharge about the same quantity of air at each stroke, but if it runs a long distance horizontally, and the leak is near the far end, the action of the pump will be spasmodic, sometimes getting solid water, and then great pockets of air will flow into it, causing it to dance back and forth for several strokes before it will get water again. If the pump is working against a heavy pressure, and there is much clearance, air will sometimes come in in such large quantities that the stroke of the plunger will not be sufficient to compress it enough to lift the discharge valves, and the return stroke will not expand it enough to produce vacuum enough to lift receiving valves. In this case, the action of the pump will be very much like compressing and releasing a spiral spring between the palms of the hands. When a pump works this way, engineers say "she has lost her water." Should this happen, close the valve in discharge pipe, and open the pet cock until the air is out, and water appears.

As what is going on inside of pumps and pipes is hid from the sense of sight, our knowledge of their diseases depends very largely on the action of the piston, and the sounds produced—the causes of which we must reason out. We can see them only with our mind's eye. If pumps and pipes were transparent, we could see the air moving along always in the highest place it can find, like the bubble in a spirit level. Fill a glass bottle with water nearly full, cork it, tip it about in various positions, and the relative positions of air and water are readily seen.

I would suggest, right here, that makers of philosophical school apparatus make pumps and engines of glass, in order to show what is going on inside. Make long suction pipes, short ones, small ones, large ones; provide leaks in them in various places, to be controlled at will. Make vertical curves with elevations and depressions, to show how air traps impede the flow of water. In this way, the flow of water and pump action, can be shown, and much more clearly than it can be described without this aid.

All pumps with high lifts or long suctions should have a foot valve *just above the water level*, and have it so arranged that it can be got at for examination or repairs without breaking the pipe connections.

A primer is very convenient. It is simply a small pipe with a valve in it, connecting the discharge pipe with suction. By this means the pump and suction can always be charged and ready for instant use, should it stand for some time unused. It should be closed when pump is working.

It will also serve to detect leaks which might occur, and would not show up were there no way to put pressure on suction pipe.

A *very small leak* in a suction is an advantage, as it keeps the air chamber charged, which would otherwise become filled with water as the air became absorbed by it. In pumps that are perfectly tight—a rare occurrence—a pet cock should be provided below the receiving valves, to admit air occasionally, if the pump begins to pound.

Hot water or boiler feed pumps have diseases peculiar to themselves. When water is heated to about 100 degrees Fahrenheit it will begin to boil in a vacuum, and produce steam with an increasing pressure as the temperature rises, until the boiling point in the open air is reached, when the pressure of the steam will just equal that of the atmosphere. Now the sucking action—so called—of a pump is not such as to *pull* water into itself as you would pull a boat towards you with a rope, but simply to produce a partial vacuum by moving away from the water and allowing it to follow after, forced in by whatever pressure there may be on it, whether atmospheric or otherwise.

Water heated nearly to the boiling point in the open air has just pressure enough on it to keep it from producing steam. To show what would be the result of trying to pump this water, we will introduce a case in practice. Suppose that it is attempted to pump it from a heater or cistern, the water level of which is two feet below the pump. Now to force this water into the pump will require an additional pressure of nearly one pound on the surface of the water, or what would be its equivalent, the removing of the same amount of pressure from the surface of the water standing in the suction pipe. Suppose that we start the pump and remove nearly one pound of pressure as indicated. The result will be that the water immediately boils and produces steam, and we would pump steam instead of water. If the speed of the pump is increased slightly we pump both steam and water, and with not very smooth action either, for this steam, unlike the air, would be condensed by the returning stroke of the plunger, and what little water may have entered with the steam will be met with a blow like a steam hammer. The remedy is to raise the level of the water, or lower the pump so that the water will have some head or fall to pump. The action, as above described, will sometimes occur when the water level is as it should be, but suction pipe too long, too small, or contracted by valve elbows, etc.

In preparation—A SYNOPSIS OF MINING GEOLOGY.

WANTED.

General Superintendent of Mines to work Asbestos property in the Eastern Townships. Applicants must be experienced. Preference given to a good man having experience in the working of Asbestos mines. Address full particulars and references to "ASBESTOS,"

CANADIAN MINING REVIEW OFFICE.

Vol. VI. NOVEMBER, 1888. No. 11.

Foreign Analysis of Phosphate.

The most unsatisfactory feature in the Canadian Phosphate trade is the manner in which the quality of shipments made to Europe is determined. It is customary to sell the Phosphate with a guarantee that the quality shall not fall below a given standard. This was, in the earlier days of the industry, seventy per cent. of phosphate of lime, but the standard has been raised to 75 and 80 per cent., and any lot falling below that guarantee is rejected and then bought in, as a rule, at a lower price. By the time the quality is determined the phosphate is usually in the possession of the buyer and the seller is therefore at his mercy, for if the new terms are not accepted the cost of removing and reselling involve a loss perhaps greater than the reduction that is proposed. So great are the advantages of these rejections that the buyers are very strenuous for high guarantees; and the uncertainties of analyses give many chances to secure good bargains. Every shipper has his stock of grievances to relate and we know of one case in which, on a falling market, a loss of \$3,000 was made on a single shipment in consequence of its having analyzed in England a trifle under the guarantee.

Probably there are few businesses in the world conducted on so radically unjust a basis. To send goods to a foreign land and put them into the hands of the buyer before their value is determined, is an act which must be characterized as folly when we consider that trade, under its present competitive conditions, is merely civilized warfare and each combatant is bound to take every advantage that law and custom will permit. The obvious course is to determine the quality before shipment, and to do this in a manner to satisfy the foreign buyer, it would be necessary to appoint a Government sampler and analyst. Ashes have an official inspector, although the total exports of this article from Montreal in 1887 were 3,384 barrels as against 20,349 tons of phosphate exported.

Many accusations have been made against the fairness of European sampling and analyses, and stories are related of the bribery of the men having charge of the selection of the sample. A careful investigation of the methods employed in sampling cargoes warrants the assertion that this is as fairly done as the recognized system permits, but as not more than two per cent., if as much, is ever taken for a sample, there remains a chance of variation which can hardly be obviated until the trade

changes to the shipment only of pulverized phosphate,

We regret to say, however, that the accuracy of the analyses is often open to question. By observation of the certificates of various analysts it becomes known in time which of the chemists are usually more favorable or otherwise in their results and they become known as "high" chemists or "low" chemists. The sample from the ship is, as we have said, usually chosen impartially, the method being to set aside one tub, basket or bag in each hundred or fifty as may be decided upon, the men in the ship's hold having no knowledge as to the choice. After this reserved quantity is ground the buyer's, seller's, and agents send samples in sealed bottles to their respective chemists. Naturally the buyer chooses a "low chemist" and the seller takes a "high chemist".

A comparison of the analysis of the total shipments made in one year by a Canadian shipper is instructive. The results were as follows:

	Buyer's Chemist.	Seller's Chemist.
Cargo No. 1	80.99	82.52
" No. 2	73.58	76.10
" No. 3	74.57	78.14
" No. 4 (part)	75.98	77.58
" No. 4 (balance)	76.24	77.28
" No. 5 (part)	{ 79.43	81.21
" No. 5 (balance)	{ 77.89	81.51
" No. 6	80.463	{ 75.75
" No. 6	78.63	{ 77.36

Thus in only one case out of eight were the buyer's chemists higher than the seller's. The differences show, in the first place, how great is the chance of variation and what risks are run by giving a high guarantee; and, secondly, these figures indicate either that chemistry is a science that discriminates in favour of the patrons of its priests, or else that wrong results on one side or the other are obtained. It is due to the eminent chemists concerned to say that they are above suspicion of unfairness, unless we may attribute to them an unconscious bias in favour of their employers, but we prefer to think that different methods of analysis are employed and the morality lies with the principals who select "high chemists" and "low chemists" to do their work, and after all this is only "business."

But we submit that this feature of the phosphate trade needs remodelling and that the determination of qualities should be placed beyond the influence of competition. Chemists should also agree upon some uniform method of analysis, so that a variation by two analysts of 3 to 4 per cent upon the same sample should not occur.

Prof. Sterry Hunt, in his paper read before the British Association on "The Study of Mineralogy," advocated a system of mineralogy based on the successive forms which are imposed upon matter: (1) The chemical form, or composition; (2) the mineralogical form, or physical state; (3) the crystalline form, being the most accidental.

We invite Correspondence upon matters consistent with the character of the REVIEW.
Be as brief as possible. The writers name in all cases required as a proof of good faith.
One dozen copies of the issue containing his communication will be mailed free to any correspondent on request.
We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

Natural Gas in Canada.

Ottawa, 2nd Nov., 1888.

The Editor

SIR,—My attention has been called to an article in No. 8, Aug. 24th, of the *American Manufacturer*, under the heading "LITTLE NATURAL GAS IN CANADA."

It appears to be a report of an interview with Mr. E. C. Beardsley, of Pittsburgh, who has been visiting the gas fields of Canada.

We are not informed what gas fields he visited, and he refers only to certain wells in the Province of Quebec.

He goes on, however, to say "There is no hope that there will ever be found in that country, any gas wells which would be considered at all valuable producers by the companies operating here." Now, this is, it seems to me, an exceedingly rash and hasty opinion, and while it may prove correct as regards Quebec and Ontario, it is certainly not correct as regards the North-West, as is proved by the well at Langevin Station, on the C. P. R. 247 feet above the sea, where the gas has been poring out with great force from a depth of 1151 feet, for more than four years. However, I for one, and doubtless many others of your readers would be interested in learning what reasons Mr. Beardsley can give for the opinion he expresses and, why he thinks the Trenton and other formations of central Ontario, which underlie the Niagara formation there, as they do in the Ohio Gas regions, should not prove equally productive of natural gas or petroleum.

I am, dear Sir, yours truly,
ALFRED R. C. SELWYN,
Director Geol. Survey of Canada.

The Utility of Waste Sawdust.

Ottawa, 19th Nov., 1888.

The Editor

SIR,—The recent investigation into the sawdust nuisance was referred to in a late issue of your journal, and now the evidence at Deseronto before the Ontario Mineral Commission proves that this fuel can be economically made useful at a profit to the lumbermen. The point that interests the large majority of your readers is the economic and useful application of the large and valuable fuel supply of the several Provinces of the country now wasted both in the woods in cutting timber and logs, making roads &c., and in the manufacture of the logs at the sawmills into lumber. This waste is equal to about one-half of the yearly produce of the saw-logs and timber from the forests annually produced in the various lumber districts, and is equivalent to many hundred thousand tons of coal. Now are the mine owners mindful of their interests in allowing this natural and yearly produced fuel supply to go on unused? Now that protection by tariff on imported iron has been adopted by the Government it behooves

the owners of our mines of iron and other ores requiring roasting or smelting to come to a clear understanding of this waste of a fuel supply admirably adapted for their purpose and cause measures to be taken to have it utilized for the joint benefit of the timber makers, saw mill owners, and themselves, and indirectly the whole community. An authority says:—"Either the mill owners must burn the refuse or remove their mills."! They do not require to move their mills or destroy this fuel. In Ottawa two of the mills would be expensive to alter but the others would not cost so much, and it will pay well for all of them to have the necessary changes made. The mill waste can be utilized, not destroyed either by fire or water, and the mill owners will reap the benefits of a wise trade economy as is done in several instances by other lumbermen.

The destructive burning of sawdust to get rid of it is a system of waste contrary to the conservation of energy or fuel wherever it is practised, and the Government, aided by the lumbermen and mine owners, should take an interest in having the "burning nuisance" stopped, and made a means of wealth in place of loss as at present. There has been at least twenty years of demonstration in the utilization of sawdust in the roasting of iron ore and reheating iron in Europe. Saw mill waste has been used with economy and success in the manufacture of iron in the United States. Charcoal has been used for smelting iron ore in Canada since 1735, and the St. Maurice furnace at Three Rivers "is the oldest active furnace on the American continent."

If more demonstration is required that too can be furnished. The view taken of this subject seems to incline more to the evil that has been done (a fact which is only too apparent on many of our largest rivers in each province), while the good that can be accomplished with the economic use of it as a fuel is not considered, or is treated as a secondary consideration, when it is the all important ore. Let each district having ores to calcine, roast, or smelt, send a petition to their member of Parliament to have the wasted fuel supply of their district both in the woods in cutting timber and logs, making roads &c., and at the sawmills, made available for their use and let it begin at Ottawa.

I am etc.

ENGINEER.

The Copper Syndicate.—English papers state that a new contract has been entered into between the Copper Syndicate and the copper producers which is to take effect at the expiration of the agreement now in existence, that is, at the end of three years from the time that it was entered upon. The terms of the new contract are:—"According to the arrangements at present in force, the syndicate takes the production of the mines at a minimum of £62 10s. per ton in the case of the Rio Tinto; of £64 for the Calumet and Hecla; of £65 for the Mason and Barry, and of £70 for the Tharsis and the Cape Copper Companies. Further the syndicate pays the cost of storage, assurance, etc., and after receiving £5 per ton on account of its services, shares all excess profits with the companies. According to the new combination, the syndicate binds itself to take all the copper produced by all the companies, at a uniform price of about £72 10s per ton. It further abandons its claim for £5 per ton in excess of the minimum price, and shares equally with the companies in the profits remaining after all expenses have been paid."

In General.

The quantity of phosphate exported from the Ottawa Valley to the United States for the quarter ending 30th September last, was 700 tons, of a value of \$7,080.35. This quantity, which was all ground, was shipped to Buffalo and Chicago.

The chief competitor with Canadian phosphate of late has been the Somme phosphate. It is now stated that these deposits are limited in extent and will soon be exhausted. Mr John D. Frossard has lately returned from France, and states that he has been commissioned by one of the largest fertilizer manufacturers there to report on Canadian phosphate mines with a view to the consideration of their future source of supply.

Du Lievre.

Dr. Francis Wyatt, a prominent analytical chemist, and associate editor of the *Engineering and Mining Journal* of New York, has lately paid a visit to the mines in this district. He states that an increasing interest on the part of American capitalists is being taken in our phosphate industry, and a considerable development may be looked for from that quarter, in the near future. Dr. Wyatt, we understand, will make a report on the industry to wealthy capitalists seeking investment, and from all we can learn, his statement will be most favourable to the district.

A portable engine pump has lately been added to the plant at the Little Rapids mines. A small staff is kept on development work.

The locks at this point are again under construction. "Ante-Humbog" writes to the *Ottawa Free Press* protesting against the excessive delay in carrying out this work, to the detriment of the important mining operations being conducted on the river, and draws attention to several instances of flagrant carelessness and inefficiency as exemplified in the present condition of the works. During our visits to this section we have heard many bitter complaints from the miners on this subject. A great deal of annoying delay in forwarding shipments has been directly caused by the alteration of the channel through the careless construction of one of the piers, and by stones from the excavation having been projected into the only navigable channel. It is nearly two years since this comparatively small work was first commenced, and surely it is high time that some more vigorous and energetic action was taken. Mr. W. J. Poupore, one of the contractors, has since written a very lame explanation of the delay, but in view of the recent developments of the Frazer case, his letter partakes very largely of the nature of a farce.

Mr. E. D. Ingall, Mining Geologist to the Geological Survey has recently returned from the field of his labours in the Du Lievre phosphate region. We understand that notwithstanding the unfavourable weather experienced, the investigation he has had in hand, namely, the study of the nature of the phosphate de-

posits and their associations with the enclosing rocks, has been well advanced. At least another season's field work however will be required before sufficient evidence will have been accumulated upon which to base conclusions, which will be of any use to the community interested, and which shall advance our knowledge of these matters beyond the point at which previous investigators in the district have left it. In this work he is being assisted by Mr. Jas. White, who is doing the necessary topographical work for the construction of a large scale map, upon which the results obtained may be shewn.

The High Rock Mine is producing large quantities of high quality ore from pit number eleven. Lately, special preparation was made for a large blast and shots were fired in 10 holes simultaneously by the electric battery. 100 tons of phosphate were blown out and the show still looked as well as ever.

The Phosphate of Lime Co.'s steamer "High Rock" has met with a serious accident which will unfit her for further work on the river this year. It is fortunate that the casualty occurred so late in the season. We understand the whole damage is fully covered by insurance.

The Canadian Phosphate Company is doing well both at the old Star Hill Mine and the new Ruby Mine, which is being fitted up with suitable appliances for effective work under the new manager Mr. J. Lanson Wills, an English mining engineer of good education and large experience. He has been connected with phosphate production for several years both in the Island of Aruba in the West Indies, and also in France. It is encouraging to have men of this stamp engaging in the Canadian phosphate industry, for although its peculiarities make experience the first essential for its successful prosecution there is doubtless great advantage to be derived from scientific knowledge. Many mistakes and much wasteful efforts have been occasioned by the too common contempt for "theory" which is characteristic of practical miners. A union of both knowledge and experience makes the successful miner, always allowing of course for the prime essential in underground explorations—luck!

A German miner, named Robert Lange, had his right leg badly crushed by a fall of rock at the Canadian Company's mines. Although the limb is severely injured, the doctors hope that amputation will not be necessary. He is receiving every care at the Protestant Hospital, Ottawa.

The Dominion Company are meeting with great success at the North Star Mine. Work has been discontinued for a time on the deep pit in order to test other portions of the property, and the new workings are proving exceedingly rich. According to various reports, from 600 to 1,000 tons are being produced monthly. Owing to the low water in the Lievres River and the non-completion of the canal, which seems doomed to be delayed for still another year, the Company was unable to ship all of its output this season and is now forwarding to Montreal 1500 tons of fine ore to be stored there during the winter, so as to be ready to take advantage of the cheap freights that usually offer at the opening of navigation.

The Emerald Mine is pursuing work which will further increase the output of this remarkable property, which has up to the present been the most productive acreage in Canada.

The Central Lake Mine continues to be advantageously developed by the veteran phosphate miner Mr. Peter Powers, under the direction of its owner Mr. S. P. Franchot. Over a dozen pits have been opened on good bodies of phosphate, and a tunnel is now being driven to strike a number of veins that appear on the surface of a hill.

The Anglo Canadian Phosphate Co. has had some prospecting done on the High Falls Mines, which adjoin the Central Lake property and additional shows have been found besides the many that have already been opened. On one of their properties in Wakefield a show has been found by the noted prospectors, the brothers Tenpenny, who are so confident of its extent that they have made a contract to work it and will at once erect buildings and open roads.

An immense bed of quartz exists on this property which was declared by Mr. H. S. Vennor to be auriferous and recent examination confirms this opinion. Capt. Adams has lately visited the place and taken a variety of samples and we shall be able to report the result in our next issue.

Templeton District.

Dr. Mahon Hutchinson and Mr. Kasson, representing Chicago capitalists, have lately been examining phosphate lands in this district with a view to purchase. They also visited the mines in the Lievres district and were very favourably impressed with the large industry at present being carried on there.

Mr. C. B. Falardeau, of the Canada Industrial Company, is in negotiation with Chicago capitalists relative to the sale of his mines.

The cutting for the new inclined tramway at the Blackburn mines is nearing completion. This work has opened up several new veins which are yielding paying quantities of the mineral.

Perth District.

At the Otty Lake and Bobb's Lake Mines, the Anglo Canadian Co. continue to have good success with their contract work. At Bobb's Lake especially the deposits are turning out numerous and easily worked, so that an output of 10 to 12 tons per month, per man, is being steadily maintained. Last month an average force of 15 men all told, put out 158 tons. The men are clearing \$2.50 per day for themselves.

Kingston District.

We note that the Ontario Mining Commission, who, by the way, are collecting much valuable information and doing excellent work throughout the province, have had their attention directed to several valuable properties at present being worked in this district, and among them the mines owned and operated by Capt. Boyd Smith at Eagle Lake, near Tamworth. Here one shaft has been sunk to a depth of 140 feet. The width of the vein, or rather the pay streak, opens out to 12 or 15 feet and then pinches to almost nothing. The phosphate obtained is red and green. The average of the shipments is about 84 per cent. This location was originally taken up for iron, and about 600 tons of the finest magnetic ore have been taken out, but the formation does not appear to favour

the existence of iron to any large extent, and the greater part that has been raised has been taken out in mining for phosphate. From the Eagle Lake property Capt. Smith has shipped 3,200 tons, the principal part going to the United States. Capt. Smith considers the American market the most promising for Ontario phosphate. As compared with England and Germany, there is a considerable advantage in the matter of freight, while the price is about the same in Philadelphia as in England. As regards duty, all fertilizers are admitted free to the United States. All this looks well for the future of the Canadian phosphate interest, whose present proportions and future possibilities are but imperfectly known. There can, however, be no doubt about it that, properly worked, there is lots of money in it.

Mr. Wadley, who has secured an option on Mr. J. W. Trousdale's property near Sydenham, will sink a 75 foot shaft as a test.

At the Foxton pits, Sydenham, about 300 tons of high grade phosphates are ready for the ice. The shaft is now down 125 feet, showing a vein from 12 to 15 feet wide and drifts S.W. by N.E. of main shaft are opened. A steam hoist has recently been added to the plant. Additional accommodation has been provided for the miners, and a store house and magazine have also been erected.

Drifting has been carried on at Mr. Hibbards' tunnel at Ell Lake for a distance of 70 feet.

Messrs. Spalding & Kirwin's tunnel is being worked day and night. The proposed length of this tunnel is 640 feet, of which 80 feet is already driven.

The American Consul at Kingston informs us that 314 tons of phosphate have been shipped from this district to United States points for the present year.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Newfoundland.

Copper mining in the north is going forward with much spirit and energy, the price of copper being high. At Tilt Cove mine it is expected that a thousand men will be employed this winter. Smelting works are in course of erection. At Little Bay copper mine 500 miners are at work, and 1,100 men employed. In other localities it is expected that new mines will be opened next year. As mentioned in a recent letter an important discovery of magnetic iron ore has been made at St. George's Bay, in proximity to the coal beds of that region, which are still unwrought. A sample of the ore has been sent to New York, and on analysis proves it to be of the best quality. The attention of mining capitalists has been attracted to it and a first-class mining expert has been sent to examine and report on the deposit. He arrived by last steamer from New York, and is now on his way to St. George's Bay. Should his report be favorable, abundant capital will be forthcoming to work this mine, and as coal is at hand, there

can be no doubt that it will be utilized. There is thus the prospect of extensive iron works springing up here. Our correspondent is assured on high authority that the quantity of this splendid ore is immense. Already a second deposit has been found in the same locality and a grant secured. A well informed gentleman who examined the ore here, and has much skill in that line, states that there was nothing equal to it, or even like it, found in the Dominion. The very finest steel is manufactured from this ore. The presence of coal at hand adds greatly to the importance of the discovery. A half-breed who had known the secret for years, but kept it to himself rigidly, was at length induced to tell what he knew to his employer and to conduct him to the spot. It is said that an iron fever is setting in in Bay St. George.

Nova Scotia.

With the exception of the "Drummond," which only worked three days last week, the various collieries throughout the province continue to work full time, and a very fair output of coal is being maintained. Orders are not coming to hand with so much regularity, but most of the collieries are at present well supplied.

The operations carried on at Five Islands by American Capitalists under the direction of Mr. Wilkinson, have not yet resulted in any valuable discovery, but the indications appear very encouraging and prospecting is being vigorously carried on. No. 1 drift has been driven 90 feet, and in that distance cuts three seams of coal of first class quality. These seams are small but experienced men have no doubt but that to the dip workable seams will be found. Drift No. 2 was only driven a short distance before a fourth seam was found; this was somewhat larger than the others and coal taken from it has been tested and is very highly spoken of. No. 3 Drift has been commenced, and at last reports was in some 70 feet in dark fire clay. The company seems inclined to spare no expense in order to prove the value of their extensive property.

At the Intercolonial Company's mines work is dull, but it is thought that the winter's operations will be better than predicted. No effort will be spared by the management to bring about such a desirable state of affairs.

At the Black Diamond colliery about one hundred tons a day are being shipped. It is gratifying to know that the owners are meeting with deserved success in the opening up of an abandoned property. They are at present drifting from near the bottom of the present pit to prove a new seam which is said to extend into their property.

At the Acadia mine (the property of the Acadia Coal Co., limited) work is going ahead briskly, and the management are turning out all the coal they can.

At the Albion mine (owned by the same company) work is not so good, and at the north and south sides of the Macgregor pit the men are only working every other day, and three quarter time at that. Coking coal is furnished from this pit to the Londonderry iron mines. At the Ford pit the management expect to have the big pumps going by the end of next week, when the unwatering of this pit will be continued, and it is hoped without intermission. At the English slope the sinking is going down fast, and the

coal is said to improve to the deep; the depth at this point is 800 feet. A new Dominion safety boiler and other machinery has been erected at the third seam. It is expected that the seam will be ready for a large output by the beginning of the year.

At the Vale colliery the new lift has been sunk 600 feet and levels broken off; coal if anything a little higher, and of excellent quality for steam and furnace use. The output from the McBean slope last month was some 450 tons per day.

At Springhill the miners are experiencing dull times; only one slope is working, owing to two of their slopes being "drowned out." More constant work will be had when the water is out of the slopes.

It is claimed that a valuable seam of coal has been discovered at Brookdale, twenty-three miles west of Spring Hill, but owing to the faulty nature of the ground and the very wet season, little can be said about it as yet.

At the Joggins, work is steady and about 150 tons of coal is shipped per day, mostly railway and local land sales.

There is considerable excitement in iron and copper just now on the Grant Area, East River. Capt. McVicar has 14 men at work mining and shipping the ore to Eureka Station, and from there by rail to Londonderry. The ore is pronounced by the Londonderry people to be of very superior quality, and it is a wonder no one takes more interest in these valuable iron properties.

In the Guysboro Specular mines some work has been done and the veins traced for a long distance. The ore carries 73% of metallic iron and of the very best quality and free from acids. No doubt work will be resumed in the spring on an extensive scale.

At the gold mines work is fairly brisk. Edgerton is doing about as usual and turning out 100 oz per month for about fifteen men's labour.

Dr. McMillen and others have been prospecting their property on a large scale at Sheet Harbour, near the Board Camp diggings and have uncovered four valuable veins all showing gold. They have 72 areas, and as this property is on the Salmon River belt, great things are expected from it.

It was thought at one time that this season's shipping at Cow Bay would not reach or exceed that of last year, but it has turned out otherwise. Up till date the shipments are considerably in excess of those to the same time last year. The miners too have made a better average pay than last year. The "Ashdene" has left with her fourteenth cargo. She will make one more trip. This vessel carries a cargo of 1500 tons, and when her last cargo for the season is shipped she will have carried the large quantity of 22,500 tons. The "Glendale" will overtake fourteen trips, carrying 1,400 tons on each occasion.

The shipments at the Reserve mines are also in excess of those for the same period last year.

The shipments from Caledonia Mines for the nine months ending Sept. 30th, reached the high figure of 87,000 tons, several thousand tons in excess of shipments for same period of last year.

An average shipment of 22,000 tons per month, for four months, is a remarkable good one. A considerable quantity more of coal is expected to be shipped previous to the close of navigation. During the coming winter the levels will be extended, and it is also the present intention to sink the deeps.

Mr. J. H. Coldwell, of the Minneapolis Mining Company, has purchased of Amos and Busby Fisk and Richard Hunt, the property known as the Fisk leads, on the Molega barrens for \$9,000.

The Rabbitlead on the property of the Molega Mining Company is supplying good quantities of 2½ oz. ore to the crusher. This is a fine lead that appears more promising with every blast.

New discoveries of gold are reported from North Brookfield and West Caledonia.

As a result of 17 days crushing 207 ounces of gold were milled from 43 tons of quartz at the Withrow mine, South Uniacke.

The Dufferin Mining Company returns 267 ounces from 600 tons of quartz crushed as its yield for the month of October.

The yield at the Touquoy property, Moore River, for last month was 54½ ounces of gold from 380 tons of quartz crushed.

The Oxford mine returns for October are 144½ ounces from 149 tons crushed.

The Whiteburn Company report for the same period 213½ ounces from 80 tons quartz.

The following are the official returns so far received at the Mines Office for the month of October.

District.	Mill.	Tons Crushed.	Ozs. Gold.
Sherbrooke,	Miners,	200	54
"	Goldenville,	40	5
Darrs Hill,	Dufferin Mg. Co.,	650	267
Cariboo,	Touquoy,	380	54½
"	Montreal Co.,	302	49
"	Caffrey Mill,	8	10
Uniacke,	Withrow,	46	217½
Lake Catcha,	Oxford,	149	144½
Whiteburn,	Whiteburn Co.,	80	113½
Fifteen Mile Stream,	Egerton G.M. Co.,	170	74
Stormont,	Rockland,	396	386
Renfrew,	Free Claims,	40	25½

The unusually wet weather of the past spring, summer, and autumn months, has interfered greatly with the labors of gold miners. Mines usually almost dry have been flooded with surface water, while in others the pumps which before were of sufficient capacity to keep the water down, have had to be replaced with more powerful ones. This has caused delay, and it speaks well for the richness of the mines that, in spite of these great drawbacks, the yield of gold has been so large. If returns continue to come in to the Mines Office as large in proportion for the balance of the year, the prospects are that the total yield for 1888 will exceed that of the past year.—*Critic*.

New Brunswick.

The Markhamville Manganese Mines and mills are in active operation, upwards of forty hands are employed in and about the mines. Major Markham has just returned from the west, he attended a meeting of "The American Institute of Mining Engineers" at Buffalo. He also sold considerable high class ore to various manufacturers in the western and east-

ern cities. He is now shipping 260 tons of blast-furnace ore by schooner from St. John to Philadelphia.

Capt. Alley has a few men still working at the Glebe Manganese Mine in Waterford; the captain certainly deserves credit for his courage in sticking to this property in spite of many discouraging elements.

The N. B. Gold and Silver Mining Co. have a No. 5 Blake pump with boiler and steam and water pipes at Sussex station, on the way to their mine at Philamaroo. This pumping plant is supplied by McAvity & Sons, St. John, the proprietors of the famous Boiler-Feeder which is rapidly displacing all other kinds, in this neighbourhood.

A gentleman from Boston has during the summer been operating in a small way the several times-abandoned manganese mines on Quacco head, in St. John County, but our correspondent believes no shipments of ore have yet been made.

The Baltimore people who bonded or bought the Stockton manganese mine have not yet taken possession; neither is the Equity suit which Mr. Gould instituted against the property settled. Hence nothing is being done at the mine this year.

The Freeze copper mine, in Albert County, is still at rest. The parties having the property bonded appear to have failed in effecting a sale in London. This is to be regretted, inasmuch as the mine is said to be a valuable one, and the owners, having expended a large amount of money already, are unable to continue the operations.

Quebec.

Notwithstanding the unfavourable weather a large quantity of asbestos has been taken out this season, but although the output shows a marked increase over former years, the supply of the mineral has not been equal to the demand particularly for the first and second qualities, and many manufacturers have been obliged to use "seconds" entirely. The prices have also gone up and we are informed that firsts are now selling at \$95, while seconds realize from \$50 to \$60.

Another correspondent writes: "The long continued wet weather this season has seriously affected the working of the Asbestos mines and the output is considerably under what it would have been with a fine dry season. There has been a good demand for the output all of which has been placed at advanced prices. This fact has caused considerable excitement in the district and some new properties have been opened up, but only a limited quantity of surface asbestos has been produced from these. The asbestos business is increasing steadily, but there is as yet, no fabulous consumption of the mineral as some people in the district imagine and the supply, so far, has been about equal to the demand, this season's restricted output being the means of our getting advanced prices."

The output from the Anglo-Canadian Asbestos Company's mines will be about 200 tons to date, this season. Operations have been confined to sinking and doing some further exploratory work, and the management have uncovered some

of the largest and best veins ever discovered on this property, one of these from bottom of pit measuring over 7 inches in width. This system of working required only a limited staff of hands, hence the smaller output.

The Bell Asbestos Company will take out 1200 tons. Air compressors, steam, drills and the latest labour saving appliances are now in use at their quarters, and it is estimated that their profits on the present season's work will figure close upon \$50,000.

The Johnson Company have also done remarkably well, the shareholders clearing a large amount on the season's operations.

King Bros. who make a specialty of clobbering and cleaning their ore to perfection, and in this way obtaining the very best prices, have sold their entire output and must also clear many thousand dollars. Their mines are in splendid working condition at present and reflect great credit on the manager, Mr. W. King, M. E.

On account of the low lying location of their property, the Ross Ward Co. have suffered much by the wet weather, which has greatly retarded their operations and consequently greatly reduced the output from what it must have been under more favourable conditions. They have, however, done fairly well.

Some twenty men are employed at the plumbago property on the Lievre. It is expected that the mills will be working by next June.

The Villeneuve Mica and Mining Company of Buckingham has closed down their mines at High Rock for the winter. Mr. Von Rehm, the manager, leaves shortly for Europe.

We have received some fine samples of ore from the Lawn Silver Mine, owned by Messrs. J. & C. Russell, Renfrew. Two shafts are being sunk on the property, and the ore increases in quality as depth is attained.

The surface openings on the property of H. A. Church, in the Township of Cawood, show a number of large crystals of excellent quality of mica, and give good encouragement for further development.

Messrs. J. & C. Russell, Renfrew, have taken out 200 tons of iron ore from their Bristol mine.

Mr. Louis Wertheim, the largest asbestos manufacturer of Frankfort, Germany, accompanied by his son, Mr. Ed. Wertheim, has been visiting several asbestos properties in the province with a view to purchase. We are informed that he has taken over Dr. Reid's property in Coleraine, consisting of 100 acres, paying in cash \$40,000. He is also negotiating for a further purchase of 300 acres in Range A of Coleraine. Captain W. L. D. Learmonth has been left in charge of the property. An extensive working plant, consisting of steam drills, air compressors, 100 horse power engine, derricks, &c., is being purchased, and every effort is being made to work the property on a large scale. Operations have begun and will be continued during the winter. Mr. Wertheim is greatly pleased with the appearance of our asbestos mines, and speaks very highly of the quality of the mineral, which he has been importing largely for some time.

Ontario.

It is reported that a rich find of gold has been made on the location owned by Mr. Isaac Moore, Ottawa, about 2½ miles from Straight Lake Station, on the line of the C. P. R. Mr. A. C. Lawson, of the Geological Survey, has just returned from that district, and has brought with him a number of samples, which are being assayed by Dr. Hoffman.

"The Wahnapiatae Mining Company," with a capital stock of \$30,000, divided into \$1,000 shares, has been incorporated under the Ontario Joint Stock Act. The promoters are A. M. Dodge, the big New York lumberman; James Scott, Toronto; G. F. Marter, M.P.P., and J. W. Hartman, of the same place. The company will carry on general mining business in the district of Nipissing.

It is expected that the main vein of the Connolly mica pit near Sydenham will be tapped in a few days.

A commodious boarding house is being erected at Smith & Lacey's Ell Lake mica mines. Some fine mica is at present being taken out. During the winter new steam pumps and hoisting machinery will be put in, together with several new buildings. The same firm has recently opened a white mica property near Caladar. The vein has been traced by surface outcroppings for a distance of one and a half miles.

Port Arthur District.

The Badger mine, which all along has produced large quantities of "bonanza" ore, has again struck it rich at the bottom of the shaft. The extremely rich streak has now widened out to eight inches. The wonderful development of this mine is attracting great attention. It is an instance of the best goods being done up in small parcels—the vein being much narrower than any of the other working mines. Dr. Brent, from Alaska, is now testing the output at this mine. His return to this region gives much satisfaction.

The Beaver and Elgin mines continue developing in a satisfactory manner, and the "Shuniah Weachu" is occasionally striking bunches of rich ore, which give promise of eventual great results. Its neighbour to the west, the Silver Mountain "West End," is giving more than satisfaction to its fortunate owners.

The other silver mines are keeping hard at work, but have nothing special to note.

A public meeting has been called for the 19th December at Port Arthur to discuss railway matters and promote the construction of the first fifty or sixty miles through the silver region.

Mining men are impatient to learn the decision of the Privy Council of England with reference to the disputed ownership of minerals and timber in the Rainy River region. A decision was expected on the 18th inst.

F prospecting for both silver, gold and iron still continues brisk, no snow having fallen as yet to interrupt explorations.

The promised geological chart of this region from the Geological Survey office is eagerly looked for.

British Columbia.

The fire in the No. 2 level of the Southfield mine, Nanaimo, after causing a delay of nearly a week, is now considered extinguished. The work of replacing the fan, engine and house at the air-shaft is well under way, and it is confidently expected by the management that the Southfield mine will soon be again in full blast.

During the month of October seven cargoes of iron ore, amounting to 1,995 tons have been taken from Texada Island to Port Townsend, where it is being manufactured into pig-iron for shipment to San Francisco. The duty on this ore was \$1,496.25.

The Oyster Harbor Coal Mining Co. are about to continue their explorations for coal with a new and powerful Diamond drill which is now on the way from Chicago.

Mr. Samuel M. Robins, superintendent of the Vancouver Coal Company, has commenced the construction of new loading wharves in front of Cameron Island, and which will connect with the present wharves of the company. The new wharves will have a frontage of over 300 feet and will thus increase the loading facilities of the company fully 100 per cent. The increased output of coal from the company's several mines has made the necessity for greater loading facilities. The new wharves will be fitted up with the most modern appliances in the shape of shutes, etc., to ensure the quick dispatch of vessels.

An examination for managers' certificates, under the Coal Miners' Regulation Act, 1877, will be held at Nanaimo, on 1st December next.

Enough is known of Porcupine creek, which is 18 miles from Donald to prove it good placer ground. It is easily accessible from the railroad; the bed-rock in places is not deep; the dirt gives returns almost from the grass roots, and there is plenty of water. Every man who has returned from the camp reports the discovery claim as unquestionably rich—good for \$20 a day to the man at least. If that be true there are other claims likely to be just as good. At present some thirty claims have been staked off and recorded. Lumber is being whipsawed for sluice boxes, and the actual work of opening up claims is already under way.

At Tunnel mountain, three miles from Field work is being pushed in preparing the ground for working the mine successfully, and ore has been shipped to Vancouver. A tramway to conduct the mine with the railroad track is under way, the ore cars and other material being expected daily. John Barr, of Anthracite, has the contract for building bridges over the Kicking Horse between the mine and Field. The company have a large ore body in sight, and as soon as they begin shipping in earnest, the outside world will awaken to the fact that there is at least one producing mine in the Kootenay district.

This district is close to the Columbia river and four miles down stream from Jubilee mountain. W. J. Irying has several locations on the butte. On one of them, the Silver King, the ledge crops out to a width of over twenty feet. He has struck the foot wall but not the hanging wall. From an assay made July 12, at St. Paul, Mr. Irwin got a return of \$22.40 in silver, a trace of gold and 2½ per cent in copper to the

ton. The ore is easily worked, and if concentrated will undoubtedly pay largely. Mr. Irving would like to dispose of an interest in these claims, the money received to be expended in development work.

Reports are coming in of rich and extensive discoveries recently made in the mountains back of Windermere and on Toby creek. The ore carries a large percentage of copper, and from \$28 to \$93 in silver to the ton. The ranchmen of that section are all out on the mountains, either prospecting or doing assessment work.

The Petroleum Fields of Ontario.

ROBERT BELL, B. A., S.C., M. D., LL.D.*

The recent discoveries of natural gas and petroleum, by boring artesian wells in north-western Ohio and in western Pennsylvania, have given a new importance to the study of certain geological questions in connection with these products. In addition to the comfort and convenience arising from a cheap and abundant supply of natural gas for domestic purposes, the economy in power which it affords for manufacturers gives such an advantage to the towns fortunate enough to possess it that others cannot compete with them; and thus population and wealth are drawn to the sources of natural gas. A comparison of the Ohio gas and oil region with the petroleum field of Ontario, will, therefore, be interesting at the present time, in order that we may the better understand and generalize on what has been accomplished up to the present time, and be in a position to reap the benefits of the experience both of our neighbours and ourselves. The writer has endeavoured, in the following pages, to bring together and compare some facts and observations which may throw additional light on the subject. The present paper will also contain the latest statistics and other information in regard to the present condition of the petroleum industry of Ontario, including the methods employed in the production and refining of the oil. For the information of those not familiar with the history of the subject, it will be necessary first to notice very briefly, the discovery of petroleum in Ontario, and the progress of its economic development. More than forty years ago, the occurrence of petroleum in Western Canada and in the Gaspé Peninsula, was described in the early reports of the Geological Survey of the provinces and specimens of the oil, still in its Museum, were collected in both these regions by the late Sir William Logan. Although at that time no use for the substance was known in Canada, except as a supposed remedy for rheumatism and for spavin in horses, Sir William, with characteristic sagacity, foresaw that it might some day become of use in this country, as it had long ago proved to be in the east. About the beginning of 1860, following the introduction into the province of illuminating oils distilled from coal and shale, and when attention was recalled to the existence of natural oil and "gum-beds" in the County of Lambton, in the west, and in Gaspé in the east, some gentlemen visited our provincial geologist at Montreal for the purpose of obtaining information on the subject. Before entering on a discussion of the matter, Sir William took them to the show-case containing bottles of the dark fluid from both of the above regions and said, "Gentlemen, I have been waiting for you for the last twenty years," and then proceeded to give them the benefit of his knowledge of a matter with which he was, even then,

quite familiar, but which was new to almost every one else in this country.

The petroleum field of Ontario may be described, in a general way, as situated near the south-western extremity of the province, and on rocks of Devonian age, overlaid by a considerable thickness of drift. The "gum-beds" above referred to, are situated on the level and wet clayey land in the southern part of the Township of Enniskillen, and in the northern range of Dawn adjoining; and in 1860 some oil was obtained by digging wells in the clay at this locality—one of them sunk by James M. Williams, of Hamilton, reaching the rock.

On February 19th, 1861, W. James Shaw astonished the country by striking "rock-oil" in an artesian well which he sank in the shales and limestones beneath the drift clay at this place, to which the name of "oil springs" was now given, and which soon became a large village. It was here that the great-flowing wells were struck in the winter of 1860-61. The oil then escaped so rapidly that many thousands of barrels were lost before it could be controlled or the means provided for saving it. When the writer visited the locality in the spring of 1862, the trunks of the trees over a considerable extent of low ground, were blackened to a height of several feet by the oil which had temporarily flooded the neighborhood. The drift clay is here from seventy to eighty-five feet in thickness, and is followed by 170 to 185 feet of soft bluish drab shale or marl, the "soapstone" of the drillers. This is succeeded by a corniferous limestone, into which the wells were sunk only about ten feet, or to a total depth of 260 feet from the surface, where the best flow of oil was obtained. In 1886-87, many pumping wells were producing oil at a depth of about 100 feet below this level.

Soon after this discovery of petroleum in the underlying solid rock at Oil Springs, wells were sunk a little to the north of the centre of Enniskillen, where surface indications of oil had been observed. A considerable number of them proved to be flowing wells, and they afforded large quantities of petroleum for several months, but one by one they were all at length reduced to pumping wells, and as the number of borings increased, the average yield of each diminished, or the wells gave out altogether. Since that time, however, the total quantity of oil produced each year has been kept up or increased by constantly sinking larger numbers of new wells, the process of well-boring and pumping having been greatly simplified and cheapened.

The corniferous limestone, having been supposed to be the oil bearing stratum in Enniskillen, and the same formation being found to contain petroleum in its cavities in various parts of south-western Ontario, boring for oil in these rocks was soon commenced at random in numerous localities underlain by this formation before the distribution or mode of occurrence of the fluid was known to be governed by any law. These efforts resulted in finding petroleum in small quantities in widely separated places, as well as in the more productive amounts which were discovered at Bothwell, twenty-three miles south-east of Petrolia; in Oxford, east of London; and near Tilsonburg in Dereham, in the country between London and Long Point. The general want of ultimate success of these enterprises, except in Enniskillen, and the low price of oil, soon confined operations to that township. By degrees the area of the petroleum field came to be pretty accurately defined. Before this had been accomplished all sorts of theories had been indulged in as to the course which the supposed "oil-bearing belt" should take, and later as to the form and extent of the productive territory.

Meantime, the mode of occurrence of petroleum and its relations to geological structure were being investigated elsewhere.

The anticlinal theory in connection with the accumulation of gas and petroleum was first mentioned to the writer by the late Sir W. E. Logan in the autumn of 1860. He was then in the habit of comparing the filling of a soda-water bottle with gas and water to the process which he believed went on under the impervious strata of an anticlinal. But this idea seems to have originated with his colleague, Dr. T. Sterry Hunt, who mentioned it in a lecture delivered in Montreal and published in the *Gazette* of that city on March 1st, 1861. According to this hypothesis, gas and oil, following hydrostatic laws, accumulate at the highest points, or the domes, along anticlinal folds. All the transverse joints and fissures, and the spaces or channels between beds in deep-seated, unaltered, sedimentary rocks, are believed to be filled with water. The particles of gas and oil, as they are generated or become liberated in bitumeniferous rocks, naturally tend to rise through these waters unaided, perhaps, by earth-tremors and earthquake jars and shocks, such as are common in Canada and the northern United States. Downward projections and irregularities in the forms of the water spaces would arrest the gas and oil till these receptacles became filled to overflowing. Ultimately the lighter fluids from all points, following upward the slopes of the strata, would accumulate in largest quantities under the summit of the dome. The gas would take the highest place, the oil the next, while the water would be forced downward to an extent which would counterbalance the elastic force of the gas and the weight of the accumulated petroleum. The compressed gas would force back the oil and water alike from all the upper spaces. If the crown of such an anticlinal dome were tapped by a bore-hole from above, the gas would of course escape first, followed by the oil, and then by the water. This is what actually takes place in productive oil regions, and experience in Canada, the United States, Galicia, Baku, Burma, etc., has shown that the accumulations of petroleum are connected with anticlinals in the manner just described. The more extensive the anticlinal, as to either breadth or depth, the greater are the quantities of gas and oil which become collected, as the result of what may be called the larger drainage area. Profitable supplies of petroleum and gas are, therefore, not to be looked for on anticlinals of small extent. We know, from analysis of average samples, the approximate amount of oil which hydrocarbons in a given weight or bulk of rock, are capable of yielding by artificial means, but even the most moderate of these calculations show a proportion of oil and gas, far in excess of that which has ever been taken from the richest areas in productive fields; and it must be remembered, too, that most of this has, no doubt, been originally derived from other areas at greater or less distances from those actually drawn upon.

It is evident, therefore, that only a small proportion of the hydrocarbons actually present in petroleum-bearing strata ever become converted into the liquid or gaseous form by natural processes. As already stated, experience has proved the correctness of the anticlinal theory in regard to petroleum and gas; and this fact has become useful, not only to point out probable localities for their occurrence, but also to indicate large areas in which, from the attitude of the beds, it would be useless to look for them, although they may be constantly forming in the strata, the unfavorable indications for their ac-

cumulation being altogether due to geological structure. An essential condition for the retention of the petroleum in the situations which have been described, is that the reservoir must be covered by an impervious stratum, such as a considerable thickness of shales, clays or marls to hold them down. When this is not the case, or where the anticlinal fold has been too sharp and has become fissured, vast quantities of gas and oil have in many instances escaped to the surface, or have saturated the higher porous strata, as, for example, the remarkable and very extensive Petroleum-bearing sand-beds of the Athabaska district, in the North-West Territories of Canada. Another necessary feature for a productive oil-field is a sufficient body of porous or fissured and channelled rock for storing the accumulated oil. This may be the oil-producing formation itself, or it may be a non-productive rock lying above the source of the oil or below the impervious cap. Sometimes, leading fissures or joints and spaces between beds communicate with a vast number of other fissures or channels, and when one of these, or a branch closely connected with it, happens to be struck by a bore-hole, a great reservoir of the pent-up oil may be freely let out. In the commoner case of small fissures, it is now customary in Enniskillen, when the proper depth has been bored, to explode a torpedo in the bottom of the hole, in order to open new channels for the oil, before attempting to pump at all. The conditions necessary for a productive oil-field, are, therefore: (1.) An anticlinal or a dome-like structure on a large scale, in unaltered sedimentary strata. (2.) Deeply seated petroleum-forming rocks of considerable volume. (3.) A stratum of porous, fissured or channelled rock, which may be either coincident with or above the oil-producing beds, sufficiently thick to store the petroleum. (4.) An impervious layer of argillaceous rock to prevent its escape.

It is not to be supposed that petroleum may be found at all points along anticlinals over oil-producing strata, even where the conditions are favorable for sealing it down. In addition to the main anticlinal line, there must be a secondary upheaval, so as to produce a dome or an elevation, at the crown of which the oil may gather and rest. The process by which petroleum is thus concentrated may be compared to a reversal of the drainage of streams of water into a central basin or pond, the attitude of the petroleum basin being inverted, owing to the difference in the specific gravities of the fluids. On the map of a country, therefore, the forms of oil-producing areas are found not to follow long lines, but to occur in insolated areas, or to be "spotty," as this mode of distribution is called by the well-drillers. The oil wells at present worked in the township of Enniskillen belong to two distinct areas of permanently productive territory. That of Oil Springs is of small extent, and lies between the village of the same name and the south line of the township. The once celebrated "Hendricks Spouting-well" is just across this boundary line in the township of Dawn, but it is a little outside of the area which has proved to be continuously productive for twenty-seven years. The oil field of Petrolia begins a little to the south-east of the centre of Enniskillen, and extends in a west-north-westerly course, taking in the north-east corner of Moore, nearly to the centre of Sarnia township, a distance of twelve to thirteen miles, with a breadth of between two and three miles. The central belt of this area, one mile or less in width, is the most productive. A third oil-bearing area has lately been found a little to the north west of the centre of the

township of Euphemia. The first well in this "territory" was put down about July 1st, 1886, and up to November 1st of that year, nearly twenty wells had been sunk, but only four were in operation at the latter date, when about 1,000 barrels of oil had been produced. The petroleum is here found at a depth of 255 feet from the surface, in what is called the "upper show," which will be again referred to. The Euphemia and Oil Springs areas lie in a straight line, running west north-west, or parallel to the longer axis of the Petrolia area, but the general bearing of all these together would be north-west and south-east, or in the direction of the Bothwell area already alluded to.

(To be continued.)

Foreign Mining Laws.

Arthur Strauss.

(Continued from October issue.)

Frequent reference has been made in this paper to the State mining authorities, and it is essential to know how these authorities or mine courts are constituted. They consist of the Board of Trade, the mining courts, and the mine inspectors.

There is an inspector for each mining district, whose duty is more particularly to see that the laws of public safety, and other matters, are properly carried out. The inspectors are under the supervision of the Mining Courts, the Courts themselves, however, examine and grant all concessions. Appeal is allowed from the inspector's decision to the Courts, and in some cases from the Courts to the Board of Trade. No relations of the inspectors are allowed to hold shares in mines. The inspectors have to watch over the safety of all buildings and shafts, etc., as well as the preservation of life and health of the miners, etc. Should the inspector apprehend any danger, the Mining Courts send a warning to the committee of the mine, but should the danger be pressing, the inspector, has power to order immediate action for the prevention of accidents; if not obeyed, the inspector may carry out the necessary work himself, and charge the mine with the cost. In case of accident or death, the inspector has to be immediately informed of it. The inspector then orders immediate measures of relief, and steps to prevent further injury, and the mine as well as all surrounding mines, have to assist him in every way. The inspector has further to see that the mine is worked according to the plans, and his expenses are paid by the mine. Heavy fines are imposed if any of the rules and regulations are infringed.

If I have transgressed too much on your patience by giving all these technical details, my excuse must be that I consider the laws relating to mines and minerals of unusual importance, but especially to those in this country who are more immediately affected by them—to the prince as a large landed proprietor, and possessor of extensive mineral rights; to the landowner, who may be called upon at any moment to establish his right, resist obtrusion, abide by the acts of his agents, or to give compensation for injuries done by them or his workmen; to the adventurer, who expends his capital in exploring the hidden treasure of the soil; to the merchant, whose dealings must be conducted in accordance with the peculiar laws and customs which prevail in particular districts; and to the labourer and artisan, who, on the one hand, are subjected to civil and criminal proceedings for acts of omission as well as commission, wilfully incurred in the course of their employment, and, on the other, have a remedy for grievances or

injuries to which they may be subjected by oppression, negligence, or commands of their employers. From those, indeed, who have neither time nor capacity to enlarge their views beyond the contracted sphere in which they are appointed to move, a superficial acquaintance with the laws under which they labour is all that can be expected, but for those on whom greater obligations or duties are imposed, a knowledge of the law as it exists in all foreign countries is, in my humble opinion, indispensable.

Mr. John Tonkin: Are dues paid abroad on net or gross amount?

Mr. Strauss: On net.

Mr. W. Rowe: That means on profits?

Mr. Strauss: Yes, after costs are deducted.

That is generally the case all over the continent.

Captain Charles Craze related his experience of mining in Germany. There the Government inspectors met the managers of a Government district and arranged dues. For instance, in 1875 and 1876 lead was £12 a ton. The Government authorities met the managers of the district, and, instead of fixing £12 a ton, fixed £10 as a basis of calculation. They also allowed 7½ groschens (or 15s.) per ton for dressing, so that dues were really paid on £9. 5s., when £12 was being received for the ores. The dues paid were two per cent. on £9. 5s.

Mr. James Wickett: That is not on profits?

Captain Craze: No, it is on all ores raised, that is on gross receipts.

Mr. Strauss said the Government gave the miners the option, either to pay 2 per cent. or to agree to fix upon a certain stated sum.

Captain Josiah Thomas: Is the percentage never above 2 per cent.?

Captain Craze: No, never.

NATIONAL COLONIZATION

Lottery!

UNDER THE PATRONAGE OF

THE REV. FATHER LABELLE.

Established in 1884 under the Act of Quebec, 31 Vict., Chap. 36, for the benefit of the Diocesan Societies of Colonization of the Province of Quebec.

CLASS D.

DRAWINGS ON THIRD WEDNESDAY IN EVERY MONTH AT 2 P.M.

Prizes value \$50,000

Capital Prize: 1 Real Estate worth \$5,000.

LIST OF PRIZES.

1 Real Estate worth	\$5,000	\$5,000
1 Real Estate worth	2,000	2,000
1 Real Estate worth	1,000	1,000
4 Real Estates	500	2,000
10 Real Estates	300	3,000
30 Furniture Sets	200	6,000
60 Furniture Sets	100	6,000
200 Gold Watches	50	10,000
1000 Silver Watches	10	10,000
1000 Toilet Sets	5	5,000

2307 Prizes worth..... \$50,000

Tickets, \$1.00!

Offers are made to all winners to pay their prizes cash, less a commission of 10 p. c. Winners' names not published unless specially authorized.

S. E. LEFEBVRE, Secretary.

Office: 19 St. James St., Montreal, Can.

Mr. H. P. Vivian: Do the Government inspectors ever interfere with the working of the mines?

Mr. Strauss: No—or very little. The managers, knowing how strict the laws are, usually conform to them. There is very little clashing. Captain Craze said when he went to Germany he found the shaft in the mine was sunk twelve fathoms perpendicularly. At the 14 they struck the lode, which had an underlie north of three feet in one fathom. They sunk on the course of the lode. When the inspector visited the mine he objected to this. Captain Craze understood the matter was optional. The inspector wanted the shaft to be sunk down-right. The inspector fetched two other gentlemen from Bonn, and

they said, "How will you fix your skip-roads and your pump lifts if you do not sink down-right," and he (Captain Craze) explained to them how they overcame that difficulty in Cornwall, and the result was, the inspector did not compel them to sink a down-right shaft, and they continued on the underlie, but the inspector could, and did, compel them to fill up all old workings with stuff sent down from the surface.

Mr. Strauss said much that Captain Craze had referred to was alluded to in his paper. For instance, he had said, "In case of any change in the mode of working, notice must be sent to the authorities."

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersea Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

Department of Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly

stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "An Act to prevent fraud in the manufacture and sale

of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers.

E. MIALL,
Commissioner.

15th Dec, 1887.

ONTARIO

Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square,

containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

T. B. FARDEE,

Commissioner

Department of Crown Lands, Toronto.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for McGregor's Creek," will be received at this office until Friday, the 23rd November next, for the construction of pile protection work at McGregor's Creek, town of Chatham, Kent County, Ontario, in accordance with a plan and specification to be seen at the Department of Public Works, Ottawa, and on application to Mr. A. McDonnell, C.E., P.L.S., Chatham.

Tenders will not be considered unless made on the form supplied and signed with the actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party declines the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 29th October, 1888.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

A. M. BURGESS,

Deputy Minister of the Interior.

The Sulphur Mines of Sicily.—The United States Consul at Palermo, states, in a recent report, that although sulphur exists more or less in all countries, Sicily is the only place where it is produced on a large scale, and that island accordingly commands the market. The mines have been worked there for over 300 years, but until 1820 the export was confined within narrow limits. At present the number of mines in Sicily is about 300, nearly 200 of which, however, are said to be destined to stop shortly owing to want of capital. It is estimated that the Sicilian sulphur deposits amount to 30,000,000 tons, and the annual production is about 400,000 tons. If the former estimate be true, and the rate of production is maintained, Sicily will be denuded of sulphur in about 75 years. The royalties vary from 12 to 45 per cent., according to the quality of the ore and the facilities for producing the sulphur: 25 per cent. may be taken as the average. There is a land tax of 36 per cent. of the net income, and the export duty is about 8s. per ton. The lessees receive from 10 to 40 per cent. of the sulphur produced. The external indications of the presence of the sulphur are the appearance of gypsum and sulphurous springs. Frequently several borings have to be made to get at the seam, but when it is found the passages or galleries follow it, and are therefore most irregular. When the miners detach the ore from the surrounding material, vast cavities are often 1-ft which have to be supported on pillars of rock, which often give way, with disastrous results. Water is the greatest difficulty in the way of the miner, and pumps are constantly necessary. At one time miners were allowed to dig where they pleased, with the result that one mine often fell into or upon another, and accordingly a law has been passed requiring plans of the mines to be deposited in a public office. The total number of mining laborers is said to be 25,000; as a rule they can neither read nor write, and are described as indolent and dishonest. They frequently sleep in the mines or the open air, according to the weather, and they violently oppose a relief fund for the families of those who die in the service, because from 1 to 2 per cent. is deducted from their wages to maintain it. There are seven different qualities of sulphur, which are decided by color and not by test. Between 1840 and 1860 the Sicilian sulphur industry was at its zenith; it was free from official interference or taxation, and sulphuric acid was derived exclusively from the sulphur. But science soon discovered that it could be obtained from iron pyrites, and, indeed, it is said that two-thirds of the sulphuric acid used in England is manufactured from pyrites. The decrease in price produced by this discovery caused many of the mines to suspend operations. —*Colliery Engineer.*

The Last of the "Great Eastern."

A three-days' sale by auction of the entire vessel and her fittings has taken place at Liverpool. The catalogue contained 893 lots, and as a rule satisfactory prices were obtained. The hull and fittings realized over £43,000, the copper bringing \$2,960, the gun metal, etc., £4,800, brass £3,980, lead £4,185, outer iron plates £12,500, inner iron plates, beams and rivets £12,300, and anchors about £300. The engines and engine fittings sold for about £10,000 in addition, bringing up the total to more than £50,000. The breaking up of the steamer will commence on January 1st, will occupy a year, and will, it is estimated, cost in labor from 10s. to 15s. per ton of material.

ALEXANDER CAMPBELL,
Annapolis Royal, N.S.

12th, 1888.

Coal in the North-West.—Mr. Maltby, an eminent mining engineer of Chicago, who has been prospecting for coal and examining locations in Alberta and British Columbia during the summer for the C. P. R. Company, was in the city Tuesday on his way to Montreal to submit his report to the directors. Mr. Maltby states that he has been working chiefly on the Crowfoot Creek, fifteen miles east of Gleichen, and a few miles north of the C. P. R. A shaft was struck in that locality a couple of years ago, but as it filled up with water and as the operators had no machinery to pump it out the work was abandoned. Mr. Maltby continued this shaft to a depth of 470 feet, penetrating four seams of coal, the first being eighteen inches thick, the second nine inches, and the third and principal one nine feet. Mr. Maltby mined the last mentioned seam and took out several car loads of coal, which were tested in the C. P. R. locomotives with highly satisfactory results. This bed of coal, Mr. Maltby says, extends from near the C. P. R., where outcroppings are seen, to the Red Deer River, a distance of thirty-five or forty miles. The coal is similar to the Lethbridge coal, but while it has a strong blaze, it does not emit any smoke, and is suitable for steam or domestic purposes. Mr. Maltby made an examination of the coal at Cochrane, where a company has been mining on the outcroppings. He says that good coal will not be obtained there until deeper shafts are sunk to the beds that have not been affected by the upheaval of the mountains. He also says that the Canada Anthracite Company made a mistake in working the outcroppings instead of sinking deep shafts. Mr. Maltby made an examination of land in the vicinity of Vancouver, and expresses the opinion that vast coal beds exist there, but at a depth of 1,000 feet. He thinks it is the same bed that crops out on Vancouver Island. Being asked as to the probable extent of the coal beds in the North-West, Mr. Maltby said there was sufficient coal in the country to supply Canada with fuel for centuries. The C. P. R. will probably open mines in the Crowfoot district next year. Mr. Maltby has been engaged for years in coal mining in England and the United States, and understands the practical as well as the scientific branch of the business. He is now superintendent of several mines in Illinois.

Forced Draught and Coal Consumption.—A forced draught invention calculated to lead to a diminished consumption of coal is at present attracting some attention in the shipping trade. The inventor is Alderman Wilson, of Stockton, England, who has just sent out a first installation to the order of the Irrawaddy Flotilla Company, British Burmah, which has the largest fleet of steamers in the world. An installation has been in operation on board the Cunard Company's steamer "Servia" during the past twelve months, and it has not only increased the speed of the vessel, but has diminished the quantity of coal used between New York and back to the extent of 195 tons. In consequence of this result the Cunard Company have ordered a supply of the installation for all the boats in their fleet. Ald. Wilson's invention, it may be remarked, is one of many that have been recently produced in the direction of coal economy on board steamers. The results in several instances are stated to have been very satisfactory, and in some cases it is anticipated that a market for the worst classes of coal will in the near future be forthcoming.

SAFETY BOILER CO.

MANUFACTURERS OF

The "Field-Stirling" Patent High Pressure Boiler,

The Safest and Cheapest Steam-Generator now in Use.

This Boiler is unusually durable, being made of the best steel and wrought iron exclusively. No cast-iron is employed. It is simple in construction, has a rapid, well-defined circulation, and a large cool mud-drum, where all impurities are collected to be blown off. All parts of the Boiler are readily accessible for the closest inspection. It has great excess of strength and is not liable to be strained by unequal expansion. The water space is divided into sections so arranged that NO EXPLOSION IS POSSIBLE.

The Vancouver Coal Mining and Land Company (Limited).

The semi-annual general meeting of the above company was held at the Cannon street Hotel, London, on Monday, 3rd ult., under the presidency of Mr. John Galsworthy.

The Chairman moved the adoption of the report and accounts, and said the former showed that in the past half-year they had made a profit of £20,858, after deducting £1,937 for repairs and maintenance. That was a most satisfactory state of things, and he did not think they had ever had so much profit in any half-year before. The output for the half-year had exceeded anything they had had before; it amounted to 87,000 tons, and the profits on those sales realized about 5s. a ton. The Chairman then described the state of the shafts and levels at the present time, from which it appeared that the No. 1 north level, which had been reported as running out of coal, was still unfavourable. No. 3 north level in the No. 1 shaft, which also had run out, had now got to a seam of 6 feet good coal. At the No. 2 shaft, they would remember, they had been boring to see if they could get at coal supposed to be underneath, and a telegram which had been received that day told them that at the 590 feet, where they were down, they were in promising conglomerate. With regard to the South Field scope, from whence they had been getting the large bulk of their coal, in the No. 1 shaft No. 3 north level there was 6 feet of good coal; No. 1 level was unfavourable; No. 4 South Field Stope was in poor ground; No. 2 and No. 3 were going well. In the North Field shaft they had got to the bed of rock, and purposed putting a shaft down, and hoped to strike the seam which Mr. Dunsmuir had got not very far off, which was an excellent one. As to the bore-holes, there were seven in the South Field, indicating coal ranging from 1 to 14 feet. In the East Field, where the shaft was, there were four bore-holes, ranging from 6 feet to 9 feet of coal. There were three bore-holes in the West Field, and there was no coal found yet. In the Gabriola they had sunk down to 1,950 feet, and were still in shale, and the coal supposed to underlie it was at any rate some distance ahead. Referring to the balance-sheet, it would be observed that the reserve fund and the insurance had been increased, and the estate fund now amounted to 12,000%, while the land sales reserve amounted to 10,000%. On the other side of the account it would be seen that they had nearly eliminated a deficit balance, bringing it from 20,985% to 127%. The directors had issued 5,000 new shares at a discount, but that turned out, according to decisions given to be illegal; therefore that 12,500% must be provided some day, and it could only properly come out of profits. At the present moment they could only keep the item there and keep the profits available for it when they could deal with it. The motion was seconded by Mr. Joseph Fry and carried.

The meeting was then made special, and the chairman submitted a provisional agreement for bonding the company's property to Messrs. John Rosenfeld & Sons. Referring to the property, he admitted it was an excellent one, but it wanted a capital of £100,000 or £150,000 at the back of any one who wished to make it what it ought to be. They could not get that money from the shareholders. They had tried once, and had the greatest difficulty to get £37,000, and he was sure if they tried to get £50,000 they would fail. That being so, it was not surprising that they should enter into this agreement to give the opportunity to Messrs. Rosenfeld to find the capital to work the property, especially at a price which he ventured to say was an excellent one. The price which they would give the shareholders, supposing Messrs. Rosenfeld took the property to-morrow, would be £12 per share, so that after the misfortunes the company had had, including the explosion, they would get their capital back with a bonus of £2. The acreage of the freehold land was 19,506. Then they had bonded on the other side various other estates which amounted to 23,000 acres, but before they could call them their own they would have to pay £26,000. They had also bonded some other small estates, upon which they would have to pay nearly £12,000 to get them. They had been selling town lots at £300 an acre, but pending the purchase being completed under the agreement, all the profits, all the sales, and all the capital which might be laid out, and all additions of exploration would be added to the price to be paid by the purchasers. They might sell the whole of the town lots at any price they liked and keep the money. The shipments of coal up to the present time since June had been 121,000 tons. In conclusion, the Chairman stated that Mr. Rosenfeld had made this proposition:—"That assuming he formed a combination to carry on the property, he would offer to the shareholders of this company one-third of the capital upon the scale amount which he himself paid for the property." A motion was subsequently put and carried agreeing with these terms.

WANTED.

General Superintendent of Mines to work Asbestos property in the Eastern Townships. Applicants must be experienced. Preference given to a good man having experience in the working of Asbestos mines. Address full particulars to "ASBESTOS,"

MINING REVIEW OFFICE.

The Duty on Mining Machinery.

The question of the remission of the duty on mining machinery having been brought before the Minister of Customs, Mr. Powell said that the matter was one of great importance to every province in the Dominion. He recognized that the mining industry should be encouraged and every facility afforded for the development of our great mineral resources that could legitimately be given. The Government has the whole question of the free admission of mining machinery under consideration. At the present time the Minister recognizes that certain implements and classes of machinery used in mining are at present being made in Canada, that this interest is rapidly being extended, and that great care would have to be exercised to see that this industry was not interfered with.

Asbestos in the United States.

From the "Mineral Resources of the United States" for 1888, just issued, we note that the total product for last year hardly exceeded 150 tons, worth \$4,500. In addition several hundred tons of fibrous actinolite were used for weighting paper. The figures of the production of asbestos during recent years have been: 1882, 1,200 tons, value \$36,000; 1883, 1,000 tons, value, \$30,000; 1884, 1,000 tons, value \$30,000; 1885, 300 tons, value \$9,000; 1886, 200 tons, value, \$6,000; 1887, 150 tons, value \$4,500. No wonder Cousin Jonathan is anxious to acquire some of our rich asbestos lands.

The Phosphate Season of 1888.

The shipping season for phosphate has now closed, and a review of its principal features may be taken.

The total export from Montreal has been 14,392 tons, 384 bags, 30 barrels, or in round figures, 14,432 tons, a falling off from last year, which is mainly owing to the difficulty of transportation on the Lievres river. This will eventually be obviated by the canal now being constructed at the Little Rapids. Work on this was delayed during the best months of the summer in consequence of a lawsuit arising out of a large claim against the Government for right of way. A show of phosphate was struck by the contractors during their excavations, before the price had been settled, and the owner, finding that a "phosphate mine" was to be destroyed, raised his price

some \$50,000. He, however, lost his suit, and the phosphate was soon cut through, and now work is proceeding with a prospect of completion in 1890. In consequence of this trouble in bagging phosphate, considerable quantities have been held over.

SHIPMENTS.

The following have been the shipments of phosphate from Montreal to ports in United Kingdom, France and Germany during season of navigation for 1888, as per Custom House manifests:

KINGSTON DISTRICT.

Capt. Boyd Smith	1,500
Jas. Foxton	500
Total	2,000

Total output for 1888, tons 23,290

FREIGHTS.

Freights during the season have been at 6s. to 7s. per ton until the fall, when they advanced to 12s. 6d. for London. But the break in the Cornwall canal detained cargo from the steamships in Montreal, and they accepted phosphate at 2s. 6d. for Liverpool in order to get away. This enabled some phosphate to be shipped that would otherwise have been held over. Deal freights that opened in the spring at 40s., advanced in the fall to 80s. and greatly checked shipments, so that the supply of ballast tonnage for phosphate from this source was much reduced. It is estimated that 50,000 tons of lumber has been held over in the St. Lawrence, and a large fleet of vessels may be expected next year. This promises cheap phosphate freights.

MARKETS.

Markets abroad have been steady, with some tendency to increase at the close of the season, owing to high freights, which caused a decided advance in the price of Carolina phosphate. Prices for 80 per cent. Canadian were 11d. to 1s. per unit at the beginning of the season, and considerable sales were made at these figures.

Later on the demand turned towards lower grade phosphates, which had been quite neglected the year before. Sales were made of qualities as low as 65 per cent. The markets closed in England at about 9d. per unit for 70 per cent. and 10d. for 75 per cent. Aruba phosphate has been selling in competition with Canadian, and the French phosphates from the Somme district have been largely used in England. The supply of these threatens to be exhausted within two years. The English farmers are distinctly better off than they were last year, and they will be better able to buy artificial manures. Sales have already very much increased. There seems, therefore, good reason to expect better prices and a larger demand for all grades of Canadian phosphate.

The American market for pulverized phosphate of low grade is extending, and a good trade in this direction is assured.

New Discoveries.

The unscrupulous speculator who "booms" properties that he knows to be worthless, and the too gullable newspaper which accepts as gospel his plausible stories, and extensively puffs his reported finds of minerals—be they phosphate lands, coal seams, or gold leads—does incalculable harm to the mining industry and retards the development of the country. We do not say that any of our contemporaries would wilfully misstate the facts in connection with any reported discovery, but it is often apparent that some of them are too easily imposed upon and assume too quickly the truth of flying reports.

The other day a Provincial Government official startled us with the following communication, "in the strictest confidence":

"In a few days the Government will announce important mineral discoveries in the Ottawa Valley which will electrify the whole country. There's millions in it! Gold is nothing to it! I am not at liberty to tell more, but you will soon hear, for I think it will be made public in about a week."

We wondered what could it be. In all probability "Natural Gas!"

Co-operation.

As we have pointed out in these columns, there is much need of greater harmony and combined effort among our miners. Lately we have been pleased to see an improvement in this regard, notably on the Lievre River, where, during the autumn, the steamers of two mines which have in the past treated each other with scant courtesy and indulged in an expensive jealousy, were combined into a joint service, one above the rapids and the other below, thus saving expense to both companies and hindering neither. The dog in the manger spirit that begrudges benefit to others should give place to the sentiment that the prosperity of one tends to the prosperity of all.

Comparative Power Drill Test.

During the past season a test to determine the amount of air consumed respectively by a Rand "Little Giant" and a Sargent rock drill was made at the Laddington mine with the following result. We understand that the Rand drill was taken out of a mine where it had been at work for about nine years, while the other drill, about which so many claims have been made, was practically a new one:

CONSUMPTION OF AIR.		Clearance of Compressors = 1.2%. Receiver 13½ x 4 outside of Engine-house, connected with Compressors by 44 feet of 5" pipe.		Drills boring in hard Granite Boulders.		Drills boring in hard Granite Boulders.	
		Per Inch Drilled.		60-lbs.		60-lbs.	
		Free.	Per Minute.	Free.	Per Minute.	Free.	Per Minute.
Number of Inches Drilled.	Per Min.	41.16		209.1		48.65	
		22.47		24.62		19.73	
Depth of Holes.	Per Min.	114.16		125.11		100.26	
		54.58		50.61		1.016	
Total Time Drilling.	Minutes.	31¼"		31"		49½"	
		57¼'		61¼'		48' 43"	
SIZE OF	Drill Bits.	3½" x 6½"		2¾" x 7"		3½" x 6½"	
		2¾" x 7"		2¾" x 7"		2¾" x 7"	
RAND DUPLEX 18" x 36" COMPRESSOR.	Cu. ft. of air produced per revolution.	60-lbs.		2.641		13.42	
		Free.		17.9%		19.40	
INDICATED	H. P.	Loss.		21.24		17.03	
		St. Cyl. Air Cyl.		20.74		20.29	
Number of Revolutions while Drilling.	Per Min.	8.51		9.32		7.47	
		487		571		364	
DATE.	Test July 24th and 25th.	Rand No. 3		Sargent No. 2		Rand No. 3	
		On Post		On Tripod		Sargent No. 2	
DATE.	Test July 30th and 31st.	Rand No. 3		Sargent No. 2		Rand No. 3	
		On Post		On Tripod		Sargent No. 2	

Studying the amounts of air consumed per inch drilled, we find that in one case (when used on columns) the Sargent drill uses 18.22 per cent more air than the Rand, and in the other case (on tripods) the Sargent uses 40 per cent more air.

The compressor used is an 18x30 duplex, which works 20 drills; at say 4 lbs. coal per H. P. per hour to run the compressor, and £00 working days in the year, the total coal consumption, at \$5 per ton, would be \$12,000 when using the Rand drills. If the Sargent drills be used, in the first case the coal bill would be \$14,186, and in the other case \$16,800, or an average of \$15,493—an increase of \$3,493, which is 5 per cent on a capital of \$69,860.

LETTERS TO

THE EDITOR.

✱✱

We invite Correspondence upon matters consistent with the character of the REVIEW. Be as brief as possible. The writers name in all cases required as a proof of good faith. One dozen copies of the issue containing his communication will be mailed free to any correspondent on request. We do not hold ourselves in any way responsible for the opinions expressed in this section of the REVIEW.

The Utility of Waste Sawdust as Fuel.

BROCKVILLE, ONT., 11th Dec., 1888.

The Editor

THE CANADIAN MINING REVIEW:

DEAR SIR,—I read with much interest the letter from "Engineer" published in your November issue on the "Utility of Waste Sawdust," in which he states that "sawmill waste has been used with economy and success in the manufacture of iron in the United States."

Feeling much interest in the development of the iron industries of Canada, I would like "Engineer" to inform me in what district in the United States "sawmill waste" is now being used for the manufacture of iron.

Now, as this question is of such great importance to the Provinces of Ontario and Quebec, on account of the many large deposits of iron ore available, that could be utilized and manufactured into iron and steel; and (as I understand), all that is wanted is a cheap and economical fuel to attain this end. Therefore, "Engineer" (I consider) would confer a great favour upon the general public if he would give in detail particulars as to how these "waste wood supplies" are being practically, economically and successfully (which I presume means profitably) worked so as to compete with the iron and steel produced by coke fuel in the United States, and I shall feel obliged if "Engineer" will kindly answer the following questions:

1. What kind of wood does this "refuse" consist of for making the charcoal?
2. Is it burned in kilns, or pits?
3. What is the percentage of waste?
4. What is the average percentage of carbon from the coal produced?
5. What is the cost per bushel made ready for use for the furnace?
6. What kind of "ore" is used?
7. What is the percentage of metallic iron?
8. If calcined with sawdust, please describe construction of the furnace?
9. What are the material and labor charges for calcining?
10. Is the "ore" calcined for "Grey" or "Forge" pig?

11. What number of bushels of coal used to produce one ton of "pig," say "grey."
12. What is the size of the furnace, that is, height and "Bosh?"
13. Is "hot" or "cold" blast used and at what pressure per square inch?
14. If used for puddling, or re-heating, please state how prepared?
15. Please state the quantity used to the ton of finished iron?

In asking these questions I presume that "Engineer" will be able to satisfy all who are interested in the iron industry of the provinces named, that we have only to "pluck" up courage enough to emulate our cousins over the border line, and by doing so we shall be able to produce iron at a profit by the use of our "sawmill wastes." Apologizing for troubling, I remain, dear sir,

Yours faithfully,
FRANCIS D. TAYLOR.

In General.

Mr. Adolph Lomer, of Messrs. Lomer, Rohr & Co., has returned from a flying trip to Europe, having been absent only about a month, going and coming by the crack Cunard steamers Etruria and Umbria. He reports a good outlook for next season's business.

Shipments.

The following are the shipments of phosphate from Montreal from 16th of October to close of navigation:

Date.	Name of Vessel	Destination.	Shippers.	Tons.
Oct. 25	s. s. Montreal	Liverpool	Wilson & Green	202
" 25	do	do	Lomer, Rohr & Co.	120
" 27	s. s. Ontario	do	Millar & Co.	165
" 30	s. s. Vancouver	do	Lomer, Rohr & Co.	100
" 31	s. s. Colina	Glasgow	Wilson & Green	200
Nov. 6	s. s. Barcelona	London	Wilson & Green	139
" 7	s. s. Baumwall	Hamburg	Lomer, Rohr & Co.	100
" 7	s. s. Concordia	Glasgow	Wilson & Green	170
" 8	s. s. Toronto	Liverpool	Millar & Co.	85
" 10	s. s. Grassbrook	Hamburg	Wilson & Green	215
" 10	s. s. Avlona	London	Millar & Co.	220
" 10	s. s. Fremont	do	Lomer, Rohr & Co.	100
" 10	do	do	Wilson & Green	150

London	609
Glasgow	370
Hamburg	315

Freight.

Freight prospects for the next season are favourable as the lumber and deal shipments are expected to be very large, but on the other hand the prospects are that the output of Canadian phosphate will be larger than ever before and all the available tonnage can be utilized.

Market.

English markets for phosphate may now be quoted one penny per unit higher than last spring. This is owing mainly to the rise in ocean freights which has put Charleston phosphate almost out of the range of buyers and turns attention to other phosphates less affected by this cause. Canadian phosphate, having the advantage of ballast rates of freight with deal cargoes, is in a favourable position for competition whenever tonnage becomes scarce for full cargoes from

the ports of other phosphate producing countries.

The demand in England is directed towards the lower grades of Canadian phosphate, which is partly owing to the enhanced value of the Carolina phosphate (which analyze 55 to 60 per cent.) and partly to some mysterious change in the opinions of buyers. For years past guarantees of eighty per cent and upwards have been insisted on and woe to the unlucky shipper whose phosphate turned out 79½%. Such "inferior stuff" was not wanted and a heavy reduction had to be made to secure its acceptance. Now however, there is but little demand in England for phosphate over 75 per cent. in quality and large contracts could be made for 70 per cent or even as low as 65 per cent. This will be of great advantage to the Canadian industry as the expense of keeping the quality up to eighty per cent. in the average run of mines has been greater than the increase of price gained. If foreigners wish to buy our phosphates in an impure state, or mixed with dirt instead of buying a pure article and supplying the adulteration themselves it will save expense to miners and permit a large increase of production, as there is any amount of dirt to be had at small labour cost.

Germany still requires a certain proportion of the highest grades and all that Canada can profitably produce at present of this class can be marketed in that country.

The market quotation may be stated to be 9½ for 70 per cent. with ½ d per unit rise up to 75 per cent. but no rise beyond.

Du Lievre.

Mr. S. P. Franchot has presented to the Montreal Amateur Athletic Association five tons of Pulverized Phosphate to try its virtues upon the turf of their new athletic grounds, the only place where this enterprising association "lets the grass grow under its feet."

Mr. J. Keith Reid, who has for several years been connected in business with Capt. R. C. Adams, of Montreal, and has of late aided him in the affairs of the Anglo-Canadian Phosphate Co., has removed his residence to Buckingham, and will be associated with Mr. Franchot in his phosphate, mica and spar enterprises. Mr. Reid is not only one of the most enterprising business men of the day, but is foremost in promoting athletic sports and social entertainments, so that the Lievres River may not only expect a boom in its enterprises, but the little village of Buckingham may look forward to a lively winter.

The Phosphate of Lime Company proposes to increase its capital in order to facilitate its extensive operations. A little over 6,000 tons of their output for the present year have gone to Europe, and some 500 tons have been sold to the Milling Company for shipment to the States.

Messrs. Miller & Co., Montreal, have shipped for the Canadian Company 3,925 tons. Of this quantity 2,392 tons have gone to Europe; 1,420 tons ground, to United States; 195 tons ground, and 18 tons crude, averaging from 80 to 85 per cent., have been sold to home consumers.

We are informed upon good authority that the scheme mooted by American capitalists to establish fertilizing works on a large scale in this district will go through.

It is thought that the shipments of ground phosphate from the Ottawa Valley to points in the United States for quarter ending 31st December, will exceed 300 tons.

Templeton District.

Mr. Robert Blackburn, owner of the celebrated Blackburn mines, informs us that the output of his mines for the year has been 2,500 tons. Of this 1,513 tons have been forwarded to Europe, and the balance is held over at the pits. A large amount of development work has been done on the property.

A rumour is current that a large company is being formed in New York with a capital of one million dollars, to acquire and work the old Goldering mine.

The North American Phosphate Company are still negotiating with New York people with a view to acquiring increased capital, but at the time of writing we have not heard with what success.

Perth District.

At Bobb's Lake mines, in Belford, Ont., the Anglo-Canadian Phosphate Co. will haul out a thousand tons this winter, all mined since June with a force averaging about fifteen men, which is one of the best records ever made in this industry. At the Otty Lake mines, North Burgess, the same Company continues to secure a fair output.

Kingston District.

The Foxton Phosphate mine in Sydenham, is to be offered for sale with 300 to 400 acres of land close by. They have about 300 tons of phosphate on hand, which will be sold with the mine. The shaft is down 120 feet and is provided with steam hoist and machine drills. The whole will be offered for \$50,000.

The shipments from Capt. Boyd Smith's Blessington mines for the year will figure close upon 1200 tons. Of this quantity 400 tons have gone to Hamburg and the balance to Philadelphia. A steady output and a high percentage is being maintained. A saw mill is the latest addition to the plant of these well equipped mines.

A typographical error in our last issue made the quantity exported from this district to the United States 314 tons. From figures received from the American Consulate, we are in a position to state that 814 tons, valued at \$14,652 were exported across the line.

We shall be greatly obliged to mine owners and superintendents for such authentic reports of their operations as may concern shareholders and the public.

Nova Scotia.

Messrs. I. Matheson & Co., of New Glasgow, who make a specialty of gold mining machinery, have supplied the machinery for the mines of the Minnesota Mining Company at Malaga Lake. The new stamp mill, consisting of 21 stamps, is pronounced one of the best equipped mills in the province.

The work now being done at the mines of the Eastern Development Company at Coxheath is showing large bodies of chalcopryite ore. Recent advices show that the anticipations of the existence of extensive veins of this ore are being rapidly realized, while the surface work of the western extension of the lode, known as the "Argyle" mine, which was lately purchased, is thought to demonstrate the con-

tinuance of the same veins that are now being worked on the original area.

The returns for November for the Dufferin mines, Darr's Hill, are 202 ounces of gold from 750 tons of quartz.

At Lake Catcha, the Oxford mill yielded last month 133 $\frac{3}{4}$ ounces of gold from 117 tons of quartz, while 21 $\frac{1}{2}$ ounces from 20 tons of quartz was got from the Cambridge mill.

At South Uniacke the Withrow property yielded 112 ounces from 30 tons crushed.

The Miners' mill, Sherbrooke, reports its product of gold for November to have been 47 ozs. from 250 tons quartz crushed. The Goldenville mill yielded 11 $\frac{1}{4}$ ozs. from 49 tons crushed, and the London mill 14 $\frac{1}{4}$ ozs. from 130 $\frac{1}{2}$ tons. The latter is evidently a new property or an old property, but lately reopened.

Circulars have been sent out by the inspector of mines to the members of the Examining Board and others, informing them that the Government have under consideration the following plan of instruction for those desirous of qualifying themselves for positions in coal mines, and asking suggestions:

"The appointment of, say seven men in the most convenient localities, each of whom would be paid a small retainer, provided that he prepared not less than two candidates; also, a fee for each candidate prepared by him, and passed by the Examining Board as an Overman; and a larger fee for each candidate prepared by him, and passed as an Underground Manager. In addition he would be allowed to charge each candidate instructed by him a small fee, not exceeding \$2. The appointment of teachers to be annual."

The Neptune Mining Co., of Gold River, Ches'er Basin, have just ordered a ten stamp mill, with engine and boiler complete, from I. Matheson & Co., New Glasgow, N. S.

There is considerable excitement in Gay's River over the prospect of the development of the gold mines there on an extensive scale. Mr. William Frost, of Brooklyn, New York, a mining expert of experience, visited the grounds last week in the interest of a number of American and New Brunswick capitalists, and if he reports favorably operations will be commenced on a large scale.

The promising gold mining property situated at Gold River, owned by Messrs. F. B. Wade and Wilson & Wade, was sold on Friday to W. J. Nelson for \$30,000, and by him immediately conveyed to a Minneapolis syndicate at an advanced price. The recent mill, taken from one of the many leads upon the property, gave \$65 to the ton, the lead being twenty inches in width. The purchasers have secured the services of C. E. Willis as manager, and will commence the work of developing and the erection of a ten stamp crusher at once. Experts consider this property one of the best in Nova Scotia. — *Gold Hunter*.

The *Critic* says: It is rumored that the copper mines at Dorchester are again to be operated. The Colonial Copper Mining Company and the Westmorland Mining Company, known as the "Couch" company, are to be amalgamated and the mines worked by one company. Two Amer-

ican gentlemen are expected shortly to complete the necessary arrangements. The increased price of copper is said to have caused the movement.

New Brunswick.

The mines of the Brunswick Antimony company, at Frederickton, have been closed, and for the present, operations have been suspended at the company's works at Glenwood, Mass.

Letters patent have been granted at Frederickton incorporating Daniel W. M'Vicar, of Moose Brook, miner; James H. Stevens, farmer; Alexander Robertson, farmer; Robert Bacon, farmer, of Ardoise; John T. Dimock, farmer; Judson J. Dimock, farmer, of Newport; Frederick Knowles, of Avondale, merchant; Everitt A. O'Brien, of Noel, shipowner; Carwen C. Crow, of Lower Selmah, prospector; Henry T. Harding, of Truro, solicitor; all in the province of Nova Scotia, and John H. Harding, Saint John, for the purpose of developing gold and silver mines and other mining properties, etc., by the name of The Ardoise Gold Company (limited), with a total capital of \$50,000, to be divided into 10,000 shares of \$5 each.

Quebec.

Capt. Adams, of Montreal, confirms his report of the discovery of gold on property of the Anglo-Canadian Phosphate Co., in Wakefield. Though giving a small average to the ton, the immense size of the vein of quartz may make it possible to work it immediately. The vein measures 69 feet in width and extends several hundred feet across a hill and descends into the valley on each side. The late Mr. Venor in several of his reports referred to the probability of gold being found in Wakefield in paying quantities, and it may be worth while for owners of lands in that region to make tests of the quartz.

The Megantic Mining Co. (Messrs Fenwick & Selater) have taken out 100 tons of asbestos since the 15th of August with a force of ten men.

The Wertheim property is being opened up and gives good promise of being an excellent mine. Capt. Learmouth has 14 men at work, and is taking out on an average one ton of asbestos per day, worth \$50 per ton.

Macdonald Bros., Sherbrooke, have made a discovery of asbestos which promises well, on lot 8, 12th range of Coleraine. The fibre is of good length and quality.

Col. DREW GAY has arrived and will superintend operations at the Excelsior Copper Company's mines. The daily reports from the mines are said to be most encouraging. The veins are reported to improve with depth, and richer ore is being taken out.

The shares of the Bell Asbestos Company (Limited), which were issued only a few months ago at £5, are now quoted in London at £19, and are still going up. The directors of this flourishing concern are: John Bell, sole member of the firm of Messrs. John Bell & Son, chairman; Francis Corbett Bell, of the same firm, managing director; Herbert A. Bell, Messrs. Bell & Co., Cardiff; Arthur J. Burnett, Kingston on Thames; James Hartley, D.L. (Messrs. Paton & Charles, Tunnel Soap Works), London; Thomas B. Lightfoot, C.E.,

The Thetford mines continue to turn out satisfactory outputs.

A rich discovery of gold has been made at St. Francis, Beauce, near St. Joseph.

Ontario:

Mr. Robert R. Hedley, analyst, lately of Sudbury and more recently of Sault Ste. Marie, will leave next month to take charge of the metallurgical department of copper mines in Venezuela, South America.

We hear that negotiations for the sale of the Frontenac mica mine to English capitalists are in progress.

Sudbury District.

The output of the mines of the Canadian Copper Company for October was close upon 4,500 tons. At Copper Cliff the smelting works are nearing completion. The trestle-work over the roast heaps is fully two-thirds of a mile in length and is now ready for track-laying. Twelve hundred tons of ore are now in process of roasting. Dr. Peters, an able copper metallurgist, is general manager. Capt. Frank Andrews is the general superintendent, and his extensive practice serves him well in mining and handling the deposits of this district. Mr. John Grigg, late master mechanic of the Tamarack mine, fills the same responsible position here. Mr. Frank L. Sperry, late of Yale College, is the chemist and assayer. Each department appears systematic and orderly.

The Vermilion mine closed down on the 1st ult. This is said to be "a weak invention of the enemy," or, in other words, a game of "freeze out," it being well understood that the discoverer cannot meet the necessary assessments levied upon him. This is an ore deposit comprising a great variety of minerals and two analyses resulted in five ounces of platinum to the ton. Nuggets of gold have also been extracted from this interesting deposit, while the amount of nickel in the ore from special tests made in Toronto for your correspondent resulted in from 17 to 30 per cent of nickel. But, notwithstanding all this rare combination of the "economic and ornamental," work is closed down *pro tem.*, and the poor prospector is left to reflect on the possibility of his having too much of a good thing. — *Engineering and Mining Journal*.

A late despatch reports that the Canadian Copper Company has purchased the interests of the original shareholders of the Vermilion company.

Port Arthur District.

The Badger mine still continues to produce silver ore of the same extraordinary richness as heretofore. So far it has proved a miniature Silver Islet, with this advantage, however, that the cost of operating the former is only a very small per cent of the latter. Every little while a carload is shipped to the States to the smelters.

The Beaver mine, being a close corporation, keeps steadily on full force without making any ado about it. The manager of this mine, we learn, is at the Lake of the Woods gold fields, seeking more fields for investment. The Elgin mine, under his able management, is now a pronounced success, and we expect before long to be able to record some of the solid results after the necessary preliminary work is all in good shape for increased output.

Silver Mountain mine, since last reports, has continually improved in drifting west from No. 3 shaft at the 360 foot level. The management are highly pleased, and an expert from England has just arrived on the ground to make a report on present appearances and future developments.

The "West End" of Silver Mountain is in high feather—every opening shows silver, and the finding of silver at 360 feet deep, just east of the main on the same vein, establishes the value of this magnificent property. The managers have been visiting Denver, Col., to arrange for the smelting of all their shipping ore.

The Silver Fox mine, owned and operated by the "West End" Co., is doing the best it can in that remote region—almost inaccessible for the want of railway facilities. There is nothing new to report since last issue.

The Wolverine mine, about a mile to the east of the Silver Fox, has been purchased by a London syndicate, who have already dispatched a working force to the ground, and will employ one hundred men as soon as they can be worked to advantage.

The iron lands at the Kaministiquia station, west of Port Arthur, are being thoroughly tested by a party from Pittsburgh, who has invested heavily. Iron lands elsewhere are likewise receiving attention from capitalists who are buying up likely properties wherever available.

Several minor sales of silver locations are likewise reported, and a new life seems to have taken hold of this district, now that the Privy Council of England have finally settled the fact that the Province of Ontario can now give indisputable title to lands between Port Arthur and Rat Portage.

The stone quarries and lead mines east of Port Arthur are keeping steadily at work, with nothing special to report.

Port Arthur should have a mining school and a smelter to keep apace with the advancement of the district.

Rat Portage District.

The Privy Council award settling the titles troubles has been received with joy. A by-law granting a \$15,000 bonus to smelting works will now be passed and the works started at once. Already Americans are on their way to Toronto to get their patents, and preparations are being quietly made, plans discussed, for a special boat to bring ores in from all around the Lake of the Woods to the smelter. The boat is to be nearly flat on the bottom and have a novel plan of loading and unloading ore.

British Columbia.

Nanaimo *Free Press*: The foreign coal shipments from the port of Nanaimo, representing the Vancouver Coal Company, the Wellington collieries, and the East Wellington colliery, for the month of November amounted to 46,887 tons, being the largest shipment from this port in the history of Nanaimo. The shipments of last July amounting to 40,158 tons was the largest reached before November. November month therefore beats all previous records by 6,729 tons of coal.

There is an apparent mistake in the London dispatch concerning the bonding of Rosenfeld's Nanaimo coal lands to the Vancouver company. Mr. Rosenfeld has no land in Vancouver island.

The dispatch, doubtless, should have read that the Vancouver company have bonded their property to Mr. Rosenfeld for three years at a certain figure.

A late arrival from Granite Creek states that placer mining is finished for the season, and there is nothing being done at present but a little drifting, preparatory to next year's work. Some new quartz finds have been made in different parts of the district, but their richness has not yet been learned. Work will be resumed in March, when it is expected a large number of new claims will be opened.

At the Hot Springs camp, 30 miles north of Nelson, G. B. Wright has 20 men at work on his No. 1 mine. An assay from an average sample of the ore taken from the full width of the face of the ledge gave \$500 to the ton. Mr. Wright will run a 300-foot tunnel this winter. He is also building a 150-ton steamer to ply between his claims and Bonner's Ferry. Mr. Davenport has made a 30-ton shipment from his Little Donald claim, and is now working 10 men. W. Wheeler has 10 or twelve men at work on his great carbonate ledge. The Hendryx Company are working 20 men; and there are a number of other claims in both the new and old camps working from two to four men each.—*Truth*.

For week ending 8th inst., the Monarch mine at Field shipped 5 cars of ore to the smelter at Vancouver, making 10 cars in the last two weeks. The shipments will approximate 200 tons. The ore carries about \$26 a ton in silver and a large percentage of lead. Pig lead was selling in New York city on November 29th at $3\frac{1}{4}$ to $3\frac{1}{2}$ cents a pound; therefore, it is safe to estimate the metal value of the ore at \$50 a ton, which would make the two weeks' shipment, worth fully \$10,000. British Columbia at last, has become a permanent ore shipper, and in the next twelve months its total output will outrank that of many of the older bullion-producing states and territories south of the boundary line.

The owners of the locations on Toby creek are negotiating with parties with a view of placing a bond on the property. There are five claims in the group, and they ask \$15,000 each for four of the claims. These figures are considered too high by the parties who wish to place the properties.

As an indication of the richness of the ore found in the district tributary to Donald, the following assays, made by Bredemeyer of Vancouver are given. The ore was a picked sample of grey copper: Sample No. 1 carried \$169.41 in silver and \$48.23 in gold to the ton, and 46 per cent copper. Sample No. 2 gave a return of \$146.99 in silver and \$48.25 in gold to the ton and 41 per cent of copper. The owner of the claim, of course, holds it at a high figure. Well, \$300 rock is not to be sneezed at.—*Truth*.

An Electric Omnibus.—An electric omnibus has been successfully tested on some of the most crowded thoroughfares in London. This is said to be the only electric omnibus in the world capable of steering to right and left, and of running on a common road without rails at a speed greater than that of horses.

The Petroleum Fields of Ontario.

ROBERT BELL, B. A., S.C., M. D., L.L.D.

(Continued from November Issue.)

The petroleum of the Enniskillen region was early conceived by Logan and Hunt to occur on the course of the great Cincinnati anticlinal, which was, however, thought to be connected with the anticlinal of the head of Lake Ontario; and, following up this view, maps were published, and much was written by others, tracing the supposed position of the anticlinal, and shewing where oil might be looked for along its course. In the "Geology of Canada" (p. 379) Sir William Logan says: "The general course of the main anticlinal can be readily traced by means of the distribution of the formations. It would appear that the crown of the arch runs in a gentle curve from the western extremity of Lake Ontario, by Woodstock in the neighborhood of which the base of the Corniferous folds over it. Proceeding thence by the Thames in the general course of the Great Western Railway, it would reach the town of Chatham, and then pass to Pigeon Bay, on Lake Erie. The Springs of Enniskillen would appear to lie north of this axis, and they may probably be on a subordinate one, parallel with it; which may be connected with the undulation that has been already mentioned as affecting the outcrop of the Guelph formation at Rockwood." It is stated ("Geology," p. 363) that "a belt of higher Devonian rocks crosses the country from Lake Huron to Lake Erie, and divides the region into two areas. These newer strata occupy a saddle-shaped depression on the great Cincinnati anticlinal, which runs nearly east and west through the peninsula; while the course of this depression or synclinal is nearly north and south from Plympton on Lake Huron to Orford on Lake Erie. There seems to be no doubt that the occurrence of petroleum in Enniskillen is connected with the Cincinnati anticlinal, but the writer, after having done a considerable amount of geological work in Western Canada at various times since 1859, and having carefully studied this question, has come to the conclusion that this anticlinal, coming up from Ohio, does not run eastward, as Logan supposed, into Lake Ontario, but that it maintains its northward course, and runs into the Southern extremity of Lake Huron. This geological axis is not marked by a conspicuously visible fold in the strata, as in narrower and sharper anticlinals, but it nevertheless constitutes a remarkable feature in the geology of North America. Southward of Lake Erie, in the form of a long, wide swell, it is plainly traceable by the geological distribution of the formations through Ohio and Kentucky, and again, in Tennessee and even in Northern Alabama. It separates the Pennsylvania from the Illinois and Michigan coal fields. Northward of Lake Erie, an impartial study of what is actually known of the geographical structure, as well as of the distribution of the formations, indicates that its axis, after crossing the lake, continues on, as we should naturally expect it would, in the same general north-north-eastward bearing through the counties of Essex, Bothwell and Lambton, from about Little's Point on Lake Erie, to about Kettle Point on Lake Huron, from which it probably continues in the same course under the latter lake, and parallel to its eastern shore, to a point opposite Southampton, where, turning a little more to the north-east, it would cross the Indian Peninsula parallel to another anticlinal, that seems to run through Saginaw Bay and the

gap between the extremity of this peninsula and Grand Manitoulin Island.

Following the line of axis above indicated, northward from Kentucky, where the Trenton limestone forms the surface, the different geological formations become successively more and more deeply buried as they fold over this line, one after another, each forming a long curve or "nose" to the north. Judging by the records of the borings, the northern point of the Niagara formation, where it curves round this axis, may touch the north shore of Lake Erie, while the Onondaga formation probably occupies a great part of the county of Essex, and is in turn followed by the Corniferous, Hamilton, and the Portage and Chemung, in Lambton. Northward of Plympton and Bosanquet the axis of the anticlinal gradually rises, and in following it on in the same direction the order of the reappearance of the formations in succession along it becomes, of course, the reverse of what it had been to the south of that region, and we get the Corniferous in the county of Huron, followed by the Onondaga, Guelph and Niagara in that of Bruce. The south west course of the Onondaga formation, on the east side of Lake Huron, first pointed out by the writer in 1861, proves the existence of an anticlinal to the west under the lake. Owing to the existence of the synclinal or belt of higher Devonian rocks, which Sir William describes as crossing the country in a nearly north and south course from Lake Huron to Lake Erie, shewing that the strike is really in that direction it would necessarily follow, from structural considerations, that there must be an accompanying anticlinal to the west of it, and we have just seen that this brings to the surface the older Devonian rocks under the drift in the Enniskillen region, and that it is, in fact, the Cincinnati anticlinal. Prof. Edward Orton, State Geologist of Ohio, has published a valuable report on the recent discoveries of petroleum and inflammable gas in the north-western part of that State. He thinks the Trenton limestone received its low arched form along the Cincinnati anticlinal in that region before the next formation was deposited upon it, which would indicate extensive movement at a very early geological time. He says: "There is a smaller measure for these shales by 200 feet in the central region than there is immediately to the eastward. In other words, there is an arch in the underlying Trenton, revealed by the drillers, of which no hint whatever could be obtained by the surface exposures" (p. 29). A further upward movement of the anticlinal may have taken place in Ontario after the formation of the Corniferous limestone, and before the deposition of the Hamilton shales upon it, for in certain parts we find the Marcellus shale eastward and westward of the axis, but not directly upon it. The Onondaga formation is shewn by borings to carry important beds of salt near its base, and to be greatly augmented in volume in Western Ontario along a belt to the east of the anticlinal, and apparently parallel to its axis, all the way from the county of Huron to Essex; and it is possible that the shallow sea or bay in which these deposits took place had the same general direction, and that it was held in position by the arched form of the older strata, the successive beds of salt being formed as slight changes in the sea level took place from time to time. Beds of salt of considerable thickness are found again westward of the axis, along St. Clair River.

The cause which produced the Cincinnati anticlinal must have begun at a very early geological period, and appears to have been of continental extent. It is worthy of notice in this con-

nection that, if its general course were prolonged northward in the vast regions of the more ancient rocks, it would pass through the central and clearly volcanic portion of the great Huronian trough of the Abitibi region, and further on would follow the deepest and longest part of the immense physical and geological depression of Hudson Bay and Fox Channel. The line would next pass through an elongated Silurian area in the midst of the Archæan, and thence by Smith Strait, Kennedy and Robertson channels, or the direct chain of waters followed by explorers to the most northern points which have ever been reached by man. The long chain of volcanic islands in the eastern part of Hudson Bay lies directly along this line, and the existence of immense north and south dykes of trap for a great distance south of James Bay, was pointed out in my report for 1875. Great north and south masses of trap occur on this line around Lake Temagami; and at the mouth of French River which is also on its course. I am informed by Commander Boulton, R. N., that there is a large abnormal deviation of the compass. The line above indicated measures thousands of miles in length, and, as will be observed, it is almost straight. The fact that the axis of the Cincinnati anticlinal lies in direct continuation of this long chain of geological and geographical features, is probably more than a chance coincidence, as the latter may well be supposed to have constituted a line of weakness which would be affected by any east and west movement or force in the crust of the earth, and slight, but persistent, elevations of the Palæozoic strata south of the Archæan area may have easily taken place along its course, and these disturbances may have occurred at different geological periods, as some of the above mentioned facts would seem to indicate. Leaving the subject of the cause and general course of the Cincinnati anticlinal, some practical results may be obtained by a study of the peculiarities or details of this great arch. The trend of its crown varies locally, of course, but the geological distribution of the formations at the surface show that this axis, coming northward from Kentucky and passing under the town of Findlay, would strike the south shore of Lake Erie about midway between Toledo and Port Clinton; but in this vicinity the general wave is divided by a small synclinal into two subordinate anticlinals. Professor Orton has shown, by the result of borings, that the form of the Trenton area in north-western Ohio, as indicated by a horizontal plane at 500 feet below the sea level, would prove that the axis at that depth points directly towards Toledo. Notwithstanding the difference in the courses of the deeply seated and surface folds, the main axis of the anticlinal will intersect the north shore of Lake Erie in the vicinity of Little's Point, in the county of Essex; then running about north north-east through Essex, Bothwell and Lambton, it will reach the southern shore of Lake Huron near Kettle Point. Its general bearing from Lake Erie to Lake Huron is about N. 30° E., but it appears to curve gently to the south-east of a straight line and to pass under Petrolia.

South of the edge of the Archæan nucleus, which forms the north shore of Lake Huron and Georgian Bay, the axis of the numerous anticlinals in the Palæozoic strata run south and south-west and their average course corresponds with that of the Cincinnati anticlinal but as we recede from the outcrop of the ancient rocks, and the newer strata deepen over them, the inequalities in the old foundation become covered up and more and more obliterated, and smaller undulations running in other directions manifest

themselves. The Cincinnati anticlinal in south-western Ontario, as elsewhere, is a gentle swell of great breadth, but within its general area, and especially near the summit, are minor anticlinals, sometimes of a sharper form, running both parallel with and transverse to its general course. One of these secondary anticlinals, having the former course, is shewn to exist in Euphemia, both by the dip and distribution of the rocks. At Smith's Mills, in this township, it interrupts the overlying Portage group, and brings to the surface the limestones of the Hamilton formation, with a north-westward dip of 40 or 45 feet to the mile. (Report of Mr. Alex. Murray, for 1850, p. 29). Between this undulation and the main axis in Enniskillen, about 150 feet of the black Marcellus shales have lately been found by borings in a trough between the two anticlinals, in the north-eastern part of Dawn. In the Ontario oil field, the drillers consider it a bad sign to strike these black shales, as experience has taught them that, in such cases, no oil is to be found in the underlying Corniferous limestone, the reason apparently being that these shales occupy only the synclinals in the oil-bearing formation.

The transverse undulations appear to follow two principal courses, one about east and west, and the other north-westward. The anticlinal of the head of Lake Ontario, and the sharper one of Rockwood and others further north, are examples of the former. In northern Ohio the formations dip northward at very low angles along the line of the Cincinnati anticlinals, but a transverse uplift seems to run east and west through the natural gas field of Lima, for Prof. Orton says (p. 28) that "the surface of the Trenton limestone is approximately at the same level at Van Wert, Lima, and Upper Sandusky, or along an east and west line 60 to 70 miles in length." The great spread of the Corniferous formation in north-eastern Indiana is probably due, in part, to an elevation of the rocks running in this direction from the vicinity of Lima to the south end of Lake Michigan. About latitude 42° the strata strike east and west all the way from the Hudson River to the Mississippi, except where this parallel intersects the Cincinnati anticlinal, and it is somewhat remarkable that west of the Appalachian range the southern boundaries of all the Archæan areas, just above this latitude, lie in an east and west line across the entire continent. These facts are mentioned as having a possible bearing on the formation of east and west anticlinals in the regions under discussion. The course of the oil producing belt in Enniskillen and Euphemia is probably evidence of the existence of a north-westward undulation in these townships, and the fact that the Bothwell oil-field lies south-east of this region, may be an additional fact pointing in the same direction. An undulation in the Corniferous limestone, running nearly north-west, is to be seen on the 13th lot of the 1st range of Rainham, on the north side of Lake Erie ("Geology of Canada," p. 379.) In the vicinity of Milwaukee there are distinct evidences of north-westerly folds in the strata. It may be worthy of note in this connection that if a straight line be drawn at right angles to the centre of the great north-westward curve in the folded strata of the Alleghany Mountains in Pennsylvania, it would have a west-north-west course, and would pass in the vicinity of the Enniskillen oil-field.

From what has been said in regard to the anticlinal theory and the accumulation of petroleum, it follows that the most probable sites for searching for this fluid in the regions just described, are at points where the great anti-

clinal is intersected by one of the transverse folds whose existence has been indicated. Owing to the depth of the drift and the infrequency of exposure of the underlying rocks, we must depend principally on the "logs" of wells drilled, in various parts of the possible oil region for the data to guide us; hence the importance of preserving these records, even if the wells have failed to answer the purpose for which they were originally sunk. These records are also of much value in determining the actual thickness of the Silurian and Devonian formations in western Ontario, where their increase or decrease goes on at pretty regular rates, so that we are able to predict with tolerable accuracy the depth at which any one of them may be found by boring at a given locality.

Dr. T. Sterry Hunt, in his valuable Report for 1866, has put on record the "logs" of a large number of wells which had been bored up to that time in western Ontario, and which would have been otherwise lost. It is to be regretted that the registers of the still greater number of wells which have been sunk since that time, have not been systematically preserved. In regard to general deductions, from information obtained by well-boring, the extensive experience of our neighbors in the analogous regions of Ohio and Michigan, is of great value to us.

The petroleum of the Enniskillen region has hitherto been supposed to have originated in the Corniferous formation, but from circumstances which have lately come to light, it seems possible that it may have its origin, wholly or in part in the Trenton limestone. Without necessarily adopting this view, the writer may mention the following, among other circumstances which appear to favour it:—

1. The Trenton limestone along the Cincinnati anticlinal has proved to be eminently an oil-producing formation in north-western Ohio, as well as near Barksville and elsewhere in Cumberland County in Kentucky, where great flowing wells of petroleum were found in boring for brine in 1829. Wells sunk in the same region in later years have yielded large quantities of oil. (Dr. Hunt's Report for 1866, p. 253). This formation is not likely to have lost its oil-producing character within a short distance on passing into Canada. On the contrary, we know that much further to the north it yields petroleum on Manitoulin Island, where the writer has seen wells drilled into it near Weginiakong and at Pine Lake. Petroleum, or pitch resulting from it, are found in this formation in other parts of the Dominion. At one of these localities near Chicoutimi on the Saguenay, where petroleum exudes from the Trenton limestone, gallons of it have been collected, by breaking open the cavities in the rock. Again, to the west, the Lower Silurian limestones in the vicinity of Chicago, are said to hold petroleum.

2. The Trenton formation is of a more generally bituminous character than the Corniferous, and it is also much thicker. In various parts of the provinces of Quebec and Ontario it ranges from 600 to 750 feet in thickness, including the Black River and Birds-eye, but not the Utica; and at Findlay in Ohio, the drill has passed through 550 feet of it. (Prof. Orton's Report, p. 18).

3. In the States of New York and Ohio, the Corniferous is not a petroleum-bearing formation. Although oil has been observed in its cavities in some places in the south western part of Ontario, there is nothing to show that it was originally formed in these rocks. Its thickness in western New York is only ninety

feet, but in the townships of Woodhouse and Townsend in Ontario, seventy miles west of Niagara River, it has attained 160 feet. In Ohio, its thickness is from 75 to 175 feet, and at Mackinaw, in the northern part of Michigan, it is 275 feet. In south-western Ontario, well-borings have given the following thickness for limestones believed to represent the Corniferous: Port Lambton, 320 feet; Petrolia, 248 and 378; one mile south-west of Belle River, 209; Leamington, 310; but it is difficult in all cases to draw a line between the limestones of this formation and those of the underlying Lower Helderberg or upper part of the Onondaga (salt) formation. For example, the following thickness of limestones were obtained in wells starting on the Corniferous: Test Well at Petrolia, 623 feet; artesian well at London, 1,000 feet; at Comber, 520 feet; at St. Mary's, 500 feet; at Tilsonburg, 854 feet; at Clinton, 975 feet. In boring salt wells at Goderich, 775 feet, and at Kincardine, 508 feet of limestone of the Onondaga formation alone were passed through.

4. The petroleum of Enniskillen has the same pungent or sulphurous character as that derived from the Trenton limestone of Ohio and Manitoulin Island, and its chemical constitution appears to be identical, as it requires the same peculiarities in the process of refining to deodorise it; whereas petroleum known to originate in Devonian rocks, are of a different character in various respects. Dr. Sterry Hunt, from whose valuable report for 1866, some of the above figures are taken, hinted (on p. 254) at the possible Trenton origin of the petroleum of Oil Springs, although elsewhere he always maintained that its probable source was in the Corniferous limestone. If all the formations are present under Enniskillen, with their probable volumes, and if the writer's estimate of their thickness be correct, the top of the Trenton limestone will lie some 2,600 feet, or half-a-mile, below that of the Corniferous formation. Notwithstanding this considerable depth of the intervening strata, it may have been quite possible for petroleum to have come up from the lower formation and stored itself in the cavities and fissures of the upper one; and indeed it may even now be steadily rising through natural Channels from great accumulation remaining in the deeper source, and this may, perhaps, account for the large, long continued and nearly uniform yield which this small territory has kept up and is still maintaining. But if the Cincinnati anticlinal had been formed in the Trenton in this region before the deposition of the overlying strata, as appears to have been the case under Findlay in Ohio, this formation may lie considerably nearer the surface than has been supposed. A careful comparison of the gas and the bitter saline water which accompany the Enniskillen petroleum with those from the Trenton limestone in Ohio and different parts of Canada, might be of service in helping to determine the question of the original source of the petroleum. In recent years, no wells have been drilled in the Enniskillen oil-field beyond the depth known to give the best return in petroleum, but, in 1878, Mr. J. L. Englehart, with commendable enterprise, sunk a well to a depth of 1,505 feet, on the 12th lot of the 11th concession, about seven-eighths of a mile north of the centre of the town of Petrolia. The last 400 feet were said to consist of gypsum and rock-salt and the 500 feet just above these were stated to be light colored hard limestone with sandy beds.

The strata in this field are so nearly horizontal, and so constant in thickness, that, over considerable areas, the drillers count with cer-

tainty on striking the same beds at nearly the same depths. The following is the average descending section in the thousands of wells which have been drilled around Petrolia:—

	Feet.
Stiff blue clay, with stones and some boulders.....	100
Upper limestone, with a little black shale occasionally at the top.....	50
Bluish gray and drab shale "Soap stone", with a few hard layers.....	120
Middle limestone.....	15
"Soapstone", with two or three hard beds.....	40
Lower limestone (Corniferous) in which oil is found at 45 ft. "upper show" and also "lower show" at.....	135
Total from the Surface.....	460

The Corniferous limestone has a thickness in this vicinity of about 300 feet, but it has been found by experience that it is seldom worth penetrating more than 135 feet into it. In Sarnia township, the drift clay is 145 feet deep, but the oil is met with at 385 feet from the surface, or only 240 feet in the rock, instead of 360, as at Petrolia, shewing that more of the solid strata had been denuded away in Sarnia than at Petrolia before the clay was deposited.

The wells are bored by tubing the drifts deposits, so as to shut off the surface water, when the work of boring in the solid rock is begun—the motive power being a small engine. The drilling apparatus is suspended by wooden rods, which constitute the peculiar, and, it is claimed, a superior feature, of the Canadian method, which is now in universal use in this country. The rods, which are of hardwood, measure 18 feet in length, and two of them fastened together, end to end, make what is called a "length". The lengths are joined to each other by a tapering screw at the one end, fitting into a corresponding treaded socket at the end of the next. They last throughout two or three years of constant use, although unscrewed and screwed together again very frequently. The rods are withdrawn from or lowered into the hole by means of a derrick, and latterly by a tall tripod, erected over the well. Boring for oil has developed into an established trade, and about 100 skilled men are employed in it. The process has become so systematised and cheapened that it costs only about \$400, and requires but one week, working day and night, to sink an average well at Petrolia. Mr. W. K. Gibson, an oil merchant, of that town, informed me that 2,392 wells had been in operation at Oil Springs, Petrolia, and in Sarnia Township, in 1885, but that 193 of these had been shut down during the year, leaving 2,199 in operation on December 31st. The writer is indebted to Mr. James Kerr, the obliging secretary of the Petrolia Oil Exchange, for the most of the following statistics. He states the number of wells which had been pumped in 1886 at nearly 2,600, and the number of new wells sunk during the year at about 200. Some 500 of the above wells are situated around Oil Springs. For the last few years, the proportion of successful wells to the "dry holes," or those not worth pumping, has been 80 per cent. In the early days of the industry a separate engine was used to pump each well, but now, by an ingenious contrivance of rods and cranks, called "jerkers," 20 to 40, and even 50 wells, are pumped by one engine, and this of much smaller power than would be supposed necessary. In one case, Mr. Englehart worked no fewer than 70 wells with a single engine by this means. The rods, which are small, are made of hard wood, spliced together with iron, and, in order to diminish friction, they are hung from a horizontal wooden rail about four feet from the ground, by means of very light iron suspenders, which swing back-

ward and forward with each stroke of the engine. The direction of the force is changed, whenever required, by means of horizontal cranks. With such economy in the cost of pumping, it has become possible to work profitably wells which yield only small quantities of oil. Indeed, in 1886, the average production per well per day in the Petrolia region was only twenty three imperial gallons, or not much more than half-a-barrel. The ten largest wells in the district furnished an average of twenty barrels each, of thirty five imperial gallons, per day. In 1886 the total quantity of crude oil produced in the entire region was 576,000 barrels of the above capacity; and of this amount, Oil Springs contributed 180,000 barrels. At

the latter place the yield diminished rapidly from 1860, the time of the discovery of the spouting wells, till 1865, when operations ceased, and nothing was done for sixteen years. But, in 1881, some of the old wells were revived by means of torpedoes; new wells were drilled in 1882, and operations were again active in 1883, when some 45,000 barrels were produced; in 1884, 130,000, in 1885, 145,000, and in 1886, 180,000 barrels, or a total of 500,000 barrels since the revival.

VALUABLE PLUMBAGO

AND OTHER

Mineral Lands FOR SALE,

IN THE TOWNSHIP OF BUCK-
INGHAM, COUNTY OF
OTTAWA.

1st.—Lot 28, in the 6th range, containing 100 acres, in addition to the salina of the lake.

2nd.—North half of lot 23, in the 5th range, containing 100 acres.

3rd.—Nine acres of lot No. 28, in the 5th range, with water privileges thereto appertaining, being site of mill dam, etc., etc.

The property formerly belonged to the Montreal Plumbago Mining Company, and was worked successfully for several years, until the company's mill was destroyed by fire, but the mill dam remains almost uninjured, and there are on the property several houses, sheds, etc., built for various purposes when mining operations were carried out.

The Plumbago Deposits

upon the property are regarded as amongst the richest and most extensive in the Dominion. As to the quality of the Plumbago, it has been extensively used in the manufacture of crucibles, lubricating leads, stove polish, etc., etc., and given unbounded satisfaction. This is established by the experience of consumers, and by a certificate from the celebrated Battersca Crucible Works, London, England, a copy of which is open for inspection.

MICA

has also been discovered in quantities.

The lands are in the Phosphate region, and recent prospecting has disclosed a rich and extensive deposit of this mineral. There are unrivalled facilities for transporting the ore to and from the mines by the Ottawa River and C. P. Railway. Distance from mines to Railway Station 6 miles. Good road.

All that is required to make these valuable mines handsomely remunerative is a little capital and enterprise.

The Title is Indisputable.

Department of Inland Revenue.

An Act Respecting Agricultural Fertilizers.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly

stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the percentage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one *per centum* of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale*

of agricultural fertilizers," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALI,
15th Dec, 1887. Commissioner.

ONTARIO

Mining Regulations.

The following summary of the principal provisions of the General Mining Act of the Province of Ontario is published for the information of those interested in mining matters in the Algoma District, and that part of the Nipissing District north of the Mattawan River, Lake Nipissing and French River.

Any person or persons may explore for mines or minerals on any Crown Lands surveyed or unsurveyed, not marked or staked out or occupied.

The price of all lands sold as mining locations or as lots in surveyed townships is two dollars per acre cash, the pine timber being reserved to the Crown. Patentees or those claiming under them may cut and use such trees as may be necessary for building, fencing or fuel, or for any other purpose essential to the working of mines.

Mining locations in unsurveyed territory shall be rectangular in shape, and the bearings of the outlines thereof shall be due north and south, and due east and west astronomically, and such locations shall be one of the following dimensions, viz: eighty chains in length by forty chains in width, containing 320 acres, or forty chains square,

containing 160 acres, or forty chains in length by twenty chains in width, containing 80 acres.

All such locations must be surveyed by a Provincial Land Surveyor, and be connected with some known point or boundary at the cost of the applicant, who must file with application surveyor's plan, field notes and description of location applied for.

In all patents for mining locations a reservation of five per cent. of the acreage is made for roads.

Lands patented under the Mining Act are free from all royalties or duties in respect to any ores or minerals thereon, and no reservation or exception of any mineral is made in the patents.

Lands situated south of the Mattawan River, Lake Nipissing and French River are sold under the Mining Act at one dollar per acre cash.

Affidavits showing no adverse occupation, improvement or claim should accompany applications to purchase.

T. B. PARDEE,
Commissioner
Department of Crown Lands, Toronto.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for McGregor's Creek," will be received at this office until Friday, the 23rd November next, for the construction of pile protection work at McGregor's Creek, town of Chatham, Kent County, Ontario, in accordance with a plan and specification to be seen at the Department of Public Works, Ottawa, and on application to Mr. A. McDonnell, C.E., P.L.S., Chatham.

Tenders will not be considered unless made on the form supplied and signed with the actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party declines the contract, or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary.
Department of Public Works,
Ottawa, 29th October, 1888

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING.

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his mining receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:—

"Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR.

A. M. BURGESS,

Deputy Minister of the Interior.
